Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. The usefulness of benzoyl peroxide washes is limited by the short time the products are in contact with the skin. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with a reduction in benzoyl peroxide concentration, frequency, and area of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azeleic acid has antimicrobial and anticomomedonal properties. It may be used as an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face; azeleic acid is less likely to cause local irritation than benzoyl peroxide.

**Topical antibacterials for acne**

In the treatment of mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for children who wish to avoid oral antibacterials or who cannot tolerate them.

Topical preparations of erythromycin and clindamycin may be used to treat *inflamed lesions* in mild to moderate acne when topical benzoyl peroxide or tretinoin is ineffective or poorly tolerated. Topical benzoyl peroxide, azeleic acid, or retinoids used in combination with an antibacterial (topical or systemic) may be more effective than an antibacterial used alone. Topical antibacterials can produce mild irritation of the skin, and on rare occasions
cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant *propionibacteria*);
- do not continue treatment for longer than necessary (but treatment with a topical preparation should be continued for at least 6 months).

**Topical retinoids and related preparations for acne**

Topical tretinoin, its isomer isotretinoin, and adapalene (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

Tretinoin can be used under specialist supervision to treat infantile acne; adapalene can also be used.

**Other topical preparations for acne**

A topical preparation of nicotinamide p. 782 is available for inflammatory acne.

**Acne: oral preparations**

**Oral antibacterials for acne**

Oral antibacterials may be used in *moderate to severe inflammatory acne* when topical treatment is not adequately effective or is inappropriate. Concomitant antimcomedonal treatment with topical benzoyl peroxide or azelaic acid may also be required.

Tetracyclines should not be given to children under 12 years. In children over 12 years, either oxytetracycline p. 367 or tetracycline p. 367 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 364 and lymecycline p. 366 are alternatives to tetracycline in children over 12 years.

Although minocycline p. 366 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Erythromycin is an alternative for the management of moderate to severe acne with inflamed lesions, but *propionibacteria* strains resistant to erythromycin are becoming widespread and this may explain poor response. In cases of erythromycin-resistant *P. acnes* in infants, oral isotretinoin may be used on the advice of a consultant dermatologist.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

**Hormone treatment for acne**

Co-cyprindiol below (cyproterone acetate with ethinyloestradiol) contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in females of child-bearing age who also wish to receive oral contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some females with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

**Oral retinoid for acne**

The retinoid isotretinoin p. 780 reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, acne with scarring, or for acne which has not responded to an adequate course of a systemic antibacterial. Isotretinoin is used for the treatment of severe infantile acne resistant to erythromycin p. 341.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required. The drug is teratogenic and must not be given to females of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. They must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

**Rosacea**

The adult form of rosacea rarely occurs in children. Persistent or repeated use of potent topical corticosteroids may cause periorificial rosacea (steroid acne). The pustules and papules of rosacea may be treated for at least 6 weeks with a topical metronidazole p. 746 preparation, or a systemic antibacterial such as erythromycin, or for a child over 12 years, oxytetracycline p. 367. Tetracyclines are contra-indicated in children under 12 years of age.

**6.1 Acne**

**ANTI-ANDROGENS**

**Co-cyprindiol**

- **INDICATIONS AND DOSE**
  - Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials
  - Moderately severe hirsutism
  - **BY MOUTH**
  - Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 624 - gallstones
  - Heart disease associated with pulmonary hypertension or risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of chorea - history during pregnancy of phephigoid gestations - history during pregnancy of pruritus - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable - history of haemolytic uraemic syndrome - migraine with aura - personal history of venous or arterial thrombosis - presence or history of liver tumours - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease or for venous thromboembolism - systemic lupus erythematosus with (or unknown) antiphospholipid antibodies - transient
cerebral ischaemic attacks without headaches - undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) – seek specialist advice • arterial disease • gene mutations associated with breast cancer (e.g., BRCA 1) • history of severe depression especially if induced by hormonal contraceptive • hyperprolactinaemia – seek specialist advice • inflammatory bowel disease including Crohn’s disease • migraine • personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) • risk factors for venous thromboembolism • sickle-cell disease • undiagnosed breast mass

**CAUTIONS, FURTHER INFORMATION**

- Venous thromboembolism There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

- **SIDE-EFFECTS**
  - Rare or very rare Cholelithiasis • photosensitivity reaction • systemic lupus erythematosus (SLE)
  - **Frequency not known** Abdominal cramps • amenorrhoea (on discontinuation) • breast abnormalities • cervical erosion • chest pain • contact lens intolerance • depression • fluid retention • headache • hepatic impairment • hepatic neoplasia • hypertension • irritability • leg cramps • libido disorder • lipid metabolism change • menstrual disorder • nausea • nervousness • skin reactions • thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) • visual impairment • vomiting • vulvovaginal disorders

- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.

- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (until liver function returns to normal.)

- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Co-cyprindiol (Non-proprietary)**
  - Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Co-cyprindiol 2000microgram/35microgram tablets | £13.70
  - Clairette (Stragen UK Ltd) Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Clairette 2000/35 tablets | £13.70
  - Dianeette (Bayer Plc) Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Dianeette tablets | £13.70
  - Teragezza (Morningside Healthcare Ltd) Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Teragezza 2000microgram/35microgram tablets | £13.70

**INDICATIONS AND DOSE**

- **Acne vulgaris**
  - To the skin
  - Child: Apply twice daily, to be applied thinly

**ZINDACLIN® GEL**

- **Acne vulgaris**
  - To the skin
  - Child: Apply twice daily, to be applied thinly

**INTERACTIONS** → Appendix 1: clindamycin

**SIDE-EFFECTS**

- **Common or very common** Skin reactions
  - **Frequency not known** Abdominal pain • antibiotic associated colitis • folliculitis gram-negative • gastrointestinal disorder

**PATIENT AND CARER ADVICE** Patients and their carers should be advised to discontinue and contact a doctor immediately if severe, prolonged or bloody diarrhoea develops.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Gel**
  - **Zindacin** (Crawford Healthcare Ltd) Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram Zindacin 1% gel | £8.66
  - **Dalacin T** (Pfizer Ltd) Clindamycin (as Clindamycin phosphate) 10 mg per 1 ml Dalacin T 1% topical solution | £0.16
    - Dalacin T 1% topical solution | £0.23
  - **Zindaclin** (LEO Pharma) Clindamycin (as Clindamycin phosphate) 10 mg per 1 ml Zindaclin | £0.34
    - Zindaclin 1% topical solution | £0.39

**SOLUTION**

- **Dalacin T**
  - **Zineryt** (LEO Pharma) Clindamycin (as Clindamycin phosphate) 10 mg per 1 ml Zineryt | £2.02

**LOTION**

- **Zineryt** (LEO Pharma) Clindamycin (as Clindamycin phosphate) 10 mg per 1 ml Zineryt | £2.02

**Erythromycin with zinc acetate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, erythromycin p. 341.

- **INDICATIONS AND DOSE**
  - **Acne vulgaris**
    - To the skin
    - Child: Apply twice daily

- **CAUTIONS** Some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide

- **INTERACTIONS** → Appendix 1: macrolides

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Liquid**
  - **Zineryt** (LEO Pharma) Erythromycin 40 mg per 1 ml Erythromycin 12 mg per 1 ml Erythromycin and zinc acetate lotion | £0.20
## Benzoyl peroxide

### INDICATIONS AND DOSE

**Acne vulgaris**
- **TO THE SKIN**
  - Child 12-17 years: Apply 1–2 times a day, preferably apply after washing with soap and water, start treatment with lower-strength preparations

**Infantile acne**
- **TO THE SKIN**
  - Child 1 month-1 year: Apply 1–2 times a day, start treatment with lower-strength preparations

### UNLICENSED USE
Not licensed for use in treatment of infantile acne.

### CAUTIONS
Avoid contact with broken skin - avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes - avoid excessive exposure to sunlight

### SIDE-EFFECTS
- Common or very common: Skin reactions
- Frequency not known: Facial swelling

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

<table>

### RETINOIDS AND RELATED DRUGS

## Adapalene

### INDICATIONS AND DOSE

**Mild to moderate acne vulgaris**
- **TO THE SKIN**
  - Child 12-17 years: Apply once daily, apply thinly in the evening

**Infantile acne**
- **TO THE SKIN**
  - Child 1 month-1 year: Apply once daily, apply thinly in the evening

### UNLICENSED USE
Not licensed for use in infantile acne.

### CAUTIONS
Avoid accumulation in angles of the nose - avoid excessive exposure to sunlight - avoid contact with mucous membranes - use in severe acne involving large areas - caution in sensitive areas such as the neck

### INTERACTIONS
- Appendix 1: retinoids

### CONCEPTION AND CONTRACEPTION
Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

### PREGNANCY
Avoid.

### BREAST FEEDING
Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.
Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Cream

**CAUTIONARY AND ADVISORY LABELS**

- Adapalene (Non-proprietary)
  - Adapalene 1 mg per 1 gram: Differin 0.1% cream | 45 gram (POM) £16.43 DT = £16.43
  - Differin (Galderma (UK) Ltd): Adapalene 1 mg per 1 gram | 45 gram (POM) £16.43 DT = £16.43

Gel

**CAUTIONARY AND ADVISORY LABELS**

- Adapalene (Non-proprietary)
  - Adapalene 1 mg per 1 gram: Differin 0.1% gel | (POM) £15.85
- Differin (Galderma (UK) Ltd): Adapalene 1 mg per 1 gram | (POM) £16.43 DT = £16.43

Patient and carer advice

- Please consider, adapalene p.
- Combination only. For the properties of the components different medicines containing the same drug.

Indications and dose

**Acne vulgaris**

- **TO THE SKIN**
  - Child 9–17 years: Apply once daily, to be applied thinly in the evening

- **INTERACTIONS** → Appendix 1: retinoids
- **CONCEPTION AND CONTRACEPTION** Females of childbearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PATIENT AND CARER ADVICE** Gel may bleach clothing and hair.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
  - The Scottish Medicines Consortium has advised (March 2014) that Epiduo® should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

**CAUTIONARY AND ADVISORY LABELS**

- Epiduo (Galderma (UK) Ltd): Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram Epiduo 0.1%/2.5% gel | 45 gram (POM) £19.53 DT = £19.53

Isotretinoin

**INDICATIONS AND DOSE**

**Topical treatment of mild to moderate acne**

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly

- **UNLICENSED USE**
  - With oral use Not licensed for use in infantile acne.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: ISOTRETINOIN (ROACCUTANE®): RARE REPORTS OF ERECTILE DYSFUNCTION AND DECREASED LIBIDO (OCTOBER 2017)**

An EU-wide review has concluded that on rare occasions, oral isotretinoin, indicated for severe acne, may cause sexual side-effects, including erectile dysfunction and decreased libido.

**CONTRA-INDICATIONS**

- With oral use Hyperlipidaemia - hypervitaminosis A
- With topical use Perioral dermatitis - rosacea

**CAUTIONS**

- With oral use avoid blood donation during treatment and for at least 1 month after treatment - diabetes - dry eye syndrome (associated with risk of keratitis) - history of depression - monitor for depression
- With topical use allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics - caution in sensitive areas such as the neck - personal or familial history of skin cancer

**INTERACTIONS** → Appendix 1: retinoids

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Skin reactions
  - Rare or very rare Photosensitivity reaction

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - With oral use Alopecia - anaemia - arthralgia - back pain - cheilitis - dry eye - eye discomfort - eye inflammation - haemorrhage - headache - increased risk of infection - myalgia - nasal dryness - neutropenia - proteinuria - skin fragility (trauma may cause blistering) - thrombocytopenia - thrombocytosis
  - Rare or very rare
  - With oral use Anxiety - arthritis - behaviour abnormal - bone disorders - bronchospasm - cataract - corneal opacity - depression - diabetes mellitus - dizziness - drowsiness - dry throat - gastrointestinal disorders - glomerulonephritis - hair changes - hearing impairment - hepatitis - hoarseness -
Patent and Carer Advice

Monitoring Requirements

Breast Feeding

With oral use Rhadomyolysis • severe cutaneous adverse reactions (SCARs)

Side-effects, Further Information

Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

Psychiatric side-effects could require expert referral.

\* Conception and Contraception

Pregnancy prevention

With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 5 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

With topical use Effective contraception (oral progestogen-only contraceptives not considered effective).

Pregnancy Contra-indicated in pregnancy (teratogenic).

Breast Feeding Avoid.

Hepatic Impairment

With oral use Manufacturer advises avoid—limited information available.

Renal Impairment

Dose adjustments With oral use In severe impairment, reduce initial dose and increase gradually, if necessary, up to 1 mg/kg daily as tolerated.

Monitoring Requirements

With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

Prescribing and Dispensing Information

Isotretinoin is an isomer of tretinoin.

Patient and Carer Advice

With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment. Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.

With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

Capsule

CAUTIONARY AND ADVISORY LABELS 10, 11, 21

- Isotretinoin (non-proprietary)

- Isotretinoin 5 mg Isotretinoin 5mg capsules | 30 capsule £10.10–£10.15 | 56 capsule £14.78 DT = £14.78
- Isotretinoin 10 mg Isotretinoin 10mg capsules | 30 capsule £14.54 DT = £14.54
- Isotretinoin 20 mg Isotretinoin 20mg capsules | 30 capsule £20.60 DT = £16.65 | 56 capsule £31.08–£37.85
- Isotretinoin 40 mg Isotretinoin 40mg capsules | 30 capsule £38.98 DT = £38.98

- Roaccutane (Roche Products Ltd)

- Isotretinoin 10 mg Roaccutane 10mg capsules | 30 capsule £14.54 DT = £14.54
- Isotretinoin 20 mg Roaccutane 20mg capsules | 30 capsule £20.02 DT = £16.65

- Isotretinoin with Erythromycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, isotretinoin p. 780, erythromycin p. 341.

Indications and dose

Topical treatment of mild to moderate acne

- To the skin

- Child: (consult product literature)

Interactions

Appendix 1: macrolides - retinoids

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Gel

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Butylated hydroxytoluene

- Isotrexin (Stiefel Laboratories (UK) Ltd)

- Isotrexin 500 microgram per 1 gram, Erythromycin 20 mg per 1 gram Isotrexin gel | 30 gram £7.47 DT = £7.47

Tretinoin with Clindamycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, tretinoin p. 574, clindamycin p. 778.

Indications and dose

Facial acne

- To the skin

- Child 12-17 years: Apply daily, (to be applied thinly at bedtime)

Contra-indications

Perioral dermatitis - personal or familial history of skin cancer - rosacea

Cautions

Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils,
Scalp and hair conditions

782 Scalp and hair conditions

Overview
The detergent action of shampoo removes grease (sebum) from hair. Prepubertal children produce very little grease and require shampoo less frequently than adults. Shampoos can be used as vehicles for medicinal products, but their usefulness is limited by the short time the product is in contact with the scalp and by their irritant nature. Oils and ointments are very useful for scaly, dry scalp conditions; if a greasy appearance is cosmetically

Tretinoin with erythromycin
The properties listed below are those particular to the combination only. For the properties of the components please consider, tretinoin p. 574, erythromycin p. 341.

● INDICATIONS AND DOSE
  Acne
  ▶ TO THE SKIN
  ▶ Child: Apply 1–2 times a day, apply thinly

● CONTRA-INDICATIONS
  Perioral dermatitis · personal or familial history of skin cancer · rosacea

● CAUTIONS
  Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, sunlamps) · avoid in severe acne involving large areas · avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck

● INTERACTIONS
  ▶ Appendix 1: clindamycin · retinoids

● SIDE-EFFECTS
  Dry skin (discontinue if severe) · eye irritation · oedema · photosensitivity reaction · skin pigmentation change (transient) · skin reactions

● CONCESSION AND CONTRACEPTION
  Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

● PREGNANCY
  Contra-indicated in pregnancy.

● BREAST FEEDING
  Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.

● PATIENT AND CARER ADVICE
  If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Liquid
  CAUTIONARY AND ADVISORY LABELS 11
  ▶ Aknemycin Plus (Almirall Ltd)
  Tretinoin 250 microgram per 1 gram, Erythromycin 40 mg per 1 gram Aknemycin Plus solution | 25 ml £7.05 DT + £7.05

VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP

Nicotinamide

● INDICATIONS AND DOSE
  Inflammatory acne vulgaris
  ▶ TO THE SKIN
  ▶ Child: Apply twice daily, reduced to once daily or on alternate days, dose reduced if irritation occurs

● UNLICENSED USE
  Licensed for use in children (age range not specified by manufacturer).

● CAUTIONS
  Avoid contact with eyes · avoid contact with mucous membranes (including nose and mouth) · reduce frequency of application if excessive dryness, irritation or peeling

● SIDE-EFFECTS
  Paraesthesia · skin reactions

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Gel
  ▶ Freedom (Dendron Ltd)
  Nicotinamide 40 mg per 1 gram Freedom Treatment 4% gel | 25 gram £5.56
  ▶ Nicam (Dermal Laboratories Ltd)
  Nicotinamide 40 mg per 1 gram Nicam 4% gel | 60 gram £7.10
unacceptable, the preparation may be applied at night and washed out in the morning. Alcohol-based lotions are rarely used in children; alcohol causes painful stinging on broken skin and the fumes may exacerbate asthma.

Itchy, inflammatory, eczematous scalp conditions may be relieved by a simple emollient oil such as olive oil or coconut oil (arachis oil (ground nut oil, peanut oil) is best avoided in children under 5 years). In more severe cases a topical corticosteroid may be required. Preparations containing coal tar are used for the common scaly scalp conditions of childhood including seborrhoeic dermatitis, dandruff (a mild form of seborrhoeic dermatitis), and psoriasis; salicylic acid p. 791 is used as a keratolytic in some scalp preparations.

Shampoos containing antimicrobials such as selenium below or ketoconazole p. 749 are used for seborrhoeic dermatitis and dandruff in which yeast infection is complicated, and for tinea capitis (ringworm of the scalp). Bacterial infection affecting the scalp (usually secondary to eczema, head lice, or ringworm) may be treated with shampoos containing antimicrobials such as pyrithione zinc, cetrime, or povidone-iodine p. 784

In neonates and infants, cradle cap (which is also a form of seborrhoeic eczema) can be treated by massaging coconut oil or olive oil into the scalp; a bland emollient such as emulsifying ointment can be rubbed onto the affected area once or twice daily before bathing and a mild shampoo used.

Other drugs used for Scalp and hair conditions Coal tar, p. 768 - Coal tar with lacticin, p. 769 - Coal tar with salicylic acid and precipitated sulfur, p. 769

**VITAMINS AND TRACE ELEMENTS**

**Selenium**

- **INDICATIONS AND DOSE**
  - **Seborrhoeic dermatitis** | Dandruff
    - To the skin using shampoo
    - Child 5-17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

- **Pityriasis versicolor**
  - To the skin using shampoo
  - Child 5-17 years: Apply once daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

- **UNLICENSED USE**
  - The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

- **INTERACTIONS**
  - Appendix 1: selenium

- **PATIENT AND CARER ADVICE**
  - With topical use Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Shampoo

- **Excipients**: May contain Fragrances
- **Selsun (Chattem (U.K.) Ltd)**
  - Selenium sulfide 25 mg per 1 ml | Selsun 2.5% shampoo | 50 ml (£)
  - £1.61 DT = £1.61 | 100 ml (£) | £2.15 DT = £2.15 | 150 ml (£) | £3.06 DT = £3.06

**Skin cleansers, antiseptics and desloughing agents**

**Skin cleansers, antiseptics and desloughing agents**

**Skin cleansers and antiseptics**

Soap or detergent is used with water to cleanse intact skin but they can irritate infantile skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry or irritated skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 785 or povidone-iodine p. 784, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required. Preparations containing alcohol, and regular use of povidone-iodine, should be avoided on neonatal skin.

Hydrogen peroxide p. 786, an oxidising agent, is available as a cream and can be used for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.5% solution p. 697 is used but tap water is often appropriate.

Potassium permanganate p. 784 solution 1 in 10 000, a mild antiseptic with astringent properties, can be used as a
Skin cleansers, antiseptics and desloughing agents

**Desloughing agents**
Alginates, hydrogel, and hydrocolloid dressings are effective in wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS. Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised.

**ANTISEPTICS AND DISINFECTANTS**

### Potassium permanganate

**INDICATIONS AND DOSE**
Cleansing and deodorising suppurating eczematous reactions and wounds
- TO THE SKIN
- Child: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

**CAUTIONS** Irritant to mucous membranes

**DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.

**PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

- **Tablet for cutaneous solution**
  - EN-Potab (Enogen Healthcare Ltd)
  - Potassium permanganate 400 mg EN-Potab 400mg tablets for cutaneous solution | 30 tablet | £9.12
  - Permitabs (Alliance Pharmaceuticals Ltd)
  - Potassium permanganate 400 mg Permitabs 400mg tablets for cutaneous solution | 30 tablet | £9.25

**ANTISEPTICS AND DISINFECTANTS >> ALCOHOL DISINFECTANTS**

### Alcohol

(Industrial methylated spirit)

**INDICATIONS AND DOSE**
Skin preparation before injection
- TO THE SKIN
- Child: As required

**CONTRA-INDICATIONS** Neonates

**CAUTIONS** Avoid broken skin - flammable - patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

**PRESCRIBING AND DISPENSING INFORMATION** Industrial methylated spirits defined by the BP as a mixture of 19 volumes of ethyl alcohol of an appropriate strength with 1 volume of approved wood naphtha.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Liquid**
  - Alcohol (Non-proprietary)
    - Industrial methylated spirit 70% | 600 ml £6.56–£7.01

### Povidone-iodine

**INDICATIONS AND DOSE**
Skin disinfection
- TO THE SKIN
- Child: (consult product literature)

**BETADINE ® DRY POWDER SPRAY**
Skin disinfection, particularly minor wounds and infections
- TO THE SKIN
- Child 2-17 years: Not for use in serous cavities (consult product literature)

**VIDENE ® SOLUTION**
Skin disinfection
- TO THE SKIN
- Child: Apply undiluted in pre-operative skin disinfection and general antisepsis

**VIDENE ® SURGICAL SCRUB ®**
Skin disinfection
- TO THE SKIN
- Child: Use as a pre-operative scrub for hand and skin disinfection

**VIDENE ® TINCTURE**
Skin disinfection
- TO THE SKIN
- Child: Apply undiluted in pre-operative skin disinfection

**CONTRA-INDICATIONS** Concomitant use of lithium - corrected gestational age under 32 weeks - infants body-weight under 1.5 kg - regular use in neonates

**VIDENE ® TINCTURE** Neonates

**CAUTIONS**

- Broken skin - large open wounds

**CAUTIONS, FURTHER INFORMATION**

- Large open wounds The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

**VIDENE ® TINCTURE** Procedures involving hot wire cautery and diathermy

**SIDE-EFFECTS**

- Rare or very rare Eye erythema - punctate keratitis
- Frequency not known Cytotoxicity - eye discolouration - hypothyroidism (in neonates)

**PREGNANCY** Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

**BREAST FEEDING** Avoid regular or excessive use.

**RENAL IMPAIRMENT** Avoid regular application to inflamed or broken skin or mucosa.

**EFFECT ON LABORATORY TESTS** May interfere with thyroid function tests.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Spray**
- Betadine (Aspire Pharma Ltd)
  - Povidone-iodine 25 mg per 1 gram Betadine 2.5% dry powder spray | 100 ml | £9.95

**Liquid**

- **CAUTIONARY AND ADVISORY LABELS** 15 (Only for use with alcoholic solutions)
  - Videne (Ecolab Healthcare Division)
    - Povidone-iodine 75 mg per 1 ml Videne 7.5% surgical scrub solution | 500 ml | £7.97

soak for exudative eczematous areas; treatment should be stopped when the skin becomes dry.
Chlorhexidine gluconate with isopropyl alcohol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine above.

**INDICATIONS AND DOSE**

- To the skin
- Child: 2 months–17 years (consult product literature)

**SIDE-EFFECTS**

Skin reactions
786 Skin cleansers, antiseptics and desloughing agents

Chlorhexidine with cetrimide

The properties listed below are those particular to the different medicines containing the same drug.

**INDICATIONS AND DOSE**

- **Skin disinfection such as wound cleansing and obstetrics**
  - **TO THE SKIN**
  - **Child:** To be used undiluted

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **Savlon** (Glanzsmithline Consumer Healthcare)
    - Chlorhexidine gluconate 1 mg per 1 gram, Cetrimide 5 mg per 1 gram, Savlon antiseptic cream | 15 gram (P) £0.90 | 30 gram (P) £1.19 | 60 gram (P) £1.91 | 300 gram (P) £2.78
  - **Sterets Tisept**
    - Chlorhexidine acetate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml, Sterets Tisept solution 3 ml sachets | 10 bottle (P) £6.85 DT = £6.85

**DIETHYL PHALATE WITH METHYL SALICYLATE**

**INDICATIONS AND DOSE**

- **Skin preparation before injection**
  - **TO THE SKIN**
  - **Child:** Apply to the area to be disinfected

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
  - **Liquid**
    - **Sterets Tisept** (Molynlycke Health Care Ltd)
      - Chlorhexidine gluconate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml, Sterets Tisept solution 25ml sachets | 25 sachet (P) £0.53 DT = £0.33
    - Sterets Tisept solution 100ml sachets | 10 sachet (P) £6.85 DT = £6.85

**HYDROGEN PEROXIDE**

**DRUG ACTION**

Hydrogen peroxide is an oxidising agent.

**INDICATIONS AND DOSE**

- **CRYSTACIDE®**
  - **Superficial bacterial skin infection**
  - **TO THE SKIN**
  - **Child:** Apply 2–3 times a day for up to 3 weeks

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

Avoid on eyes - avoid on healthy skin - incompatible with products containing iodine or potassium permanganate

**PRESCRIBING AND DISPENSING INFORMATION**

The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20s) should be dispensed.

Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions.

**HANDLING AND STORAGE**

Hydrogen peroxide bleaches fabric.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **EXCIPIENTS:** May contain Edetic acid (edta), propylene glycol
    - **Crystacide (Reig Jofre UK Ltd)**
      - Hydrogen peroxide 10 mg per 1 gram Crystacide 1% cream | 25 gram (P) £8.07 DT = £8.07 | 40 gram (P) £11.62

**PROFLAVINE**

**INDICATIONS AND DOSE**

- **Infected wounds**
  - **Infected burns**
  - **TO THE SKIN**
  - **Child:** (consult product literature)

**PATIENT AND CARER ADVICE**

Stains clothing.

**MEDICINAL FORMS**

- Forms available from special-order manufacturers include: liquid

**IRRIGATION SOLUTIONS**

- There can be variation in the licensing of different medicines containing the same drug.
  - **Sodium chloride 0.9% irrigation solution 20ml**
    - **NHS indicative price = £0.71 - Drug Tariff (Part IXa)**
  - **Irriclens sodium chloride 0.9% irrigation solution aerosol spray (Convatec Ltd)**
    - Sodium chloride 9 mg per 1 ml 240 ml - NHS indicative price = £3.60 - Drug Tariff (Part IXa)
  - **Normasol sodium chloride 0.9% irrigation solution 100ml sachets (Molynlycke Health Care Ltd)**
    - Sodium chloride 9 mg per 1 ml 10 unit dose - NHS indicative price = £7.97 - Drug Tariff (Part IXa)
  - **Normasol sodium chloride 0.9% irrigation solution 25ml sachets (Molynlycke Health Care Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £6.46 - Drug Tariff (Part IXa)
  - **Sodium chloride 0.9% irrigation solution 20ml Clinipod unit dose (Mayors Healthcare Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.80 - Drug Tariff (Part IXa)
  - **Sodium chloride 0.9% irrigation solution 20ml ISO-POD unit dose (St Georges Medical Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £5.84 - Drug Tariff (Part IXa)

    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.99 - Drug Tariff (Part IXa)
  - **Sodium chloride 0.9% irrigation solution 20ml Salipod unit dose (Ennogen Healthcare Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.80 - Drug Tariff (Part IXa)
  - **Sodium chloride 0.9% irrigation solution 20ml Steripod unit dose (Sai-Meds Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £5.60 - Drug Tariff (Part IXa)
  - **Sodium chloride 0.9% irrigation solution 20ml Sterowash unit dose (Steroplast Healthcare Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £5.40 - Drug Tariff (Part IXa)
  - **Sodium chloride 0.9% irrigation solution 20ml unit dose (C D Medical Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £5.60 - Drug Tariff (Part IXa)
  - **Sodium chloride 0.9% irrigation solution 20ml unit dose (St Georges Medical Ltd)**
    - Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £5.84 - Drug Tariff (Part IXa)
8.1 Minor cuts and abrasions

Minor cuts and abrasions

Management

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulphonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrime is used to treat minor cuts and abrasions and proflavine p. 786 may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 786 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

DERMATOLOGICAL DRUGS 》 COLLODIONS

Castor oil with collodion and colophony

- **INDICATIONS AND DOSE**
  - Used to seal minor cuts and wounds that have partially healed
    - TO THE SKIN
    - Child: (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated if patient has an allergy to collodion in elastic adhesive plasters and tape.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Flexible collodion
  - Castor oil with collodion and colophony (Non-proprietary)
  - Castor oil 25 mg per 1 ml, Collodion 25 mg per 1 ml, Collodion methylated 950 microitre per 1 ml Flexible collodion methylated
    - 100 ml £13.81–£14.09
    - 500 ml £29.47

Skin adhesives

- **SKIN ADHESIVES**

  - **Derma+Flex skin adhesive** (Chemence Ltd)
    - 0.5 ml - NHS indicative price = £5.36 - Drug Tariff (Part IXa)

  - **Dermabond ProPen skin adhesive** (Ethicon Ltd)
    - 0.5 ml - NHS indicative price = £18.64 - Drug Tariff (Part IXa)

  - **Histoacryl skin adhesive** (B. Braun Medical Ltd)
    - 0.5 ml - NHS indicative price = £6.72 - Drug Tariff (Part IXa)

  - **Histoacryl skin adhesive** (B. Braun Medical Ltd)
    - 0.5 ml - NHS indicative price = £6.50 - Drug Tariff (Part IXa)

  - **Indermil skin adhesive** (Coviden (UK) Commercial Ltd)
    - 0.5 gram - NHS indicative price = £6.50 - Drug Tariff (Part IXa)

  - **LiquiBand flow control tissue adhesive** (Advanced Medical Solutions Ltd)
    - 0.5 gram - NHS indicative price = £5.50 - Drug Tariff (Part IXa)

  - **LiquiBand tissue adhesive** (Advanced Medical Solutions Ltd)
    - 0.5 gram - NHS indicative price = £5.50 - Drug Tariff (Part IXa)

9 Skin disfigurement

Camouflagers

Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflagage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflagage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked ‘ACBS’ can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

- **CAMOFLAUGES**

  - **Covermark classic foundation** (Derma UK Ltd)
    - 15 ml (ACBS) - NHS indicative price = £11.86

  - **Covermark finishing powder** (Derma UK Ltd)
    - 25 gram (ACBS) - NHS indicative price = £11.86

  - **Covermark removing cream** (Derma UK Ltd)
    - 200 ml - No NHS indicative price available

  - **Dermablend Dermasmooth Corrective Foundation** (Vichy)
    - 30 ml - No NHS indicative price available

  - **Dermacolor Creme Effectiv** (Kryolan UK Ltd)
    - 50 ml - NHS indicative price = £5.73

  - **Dermacolor body camouflage** (Kryolan UK Ltd)
    - 50 ml - NHS indicative price = £8.94

  - **Dermacolor camouflage creme** (Kryolan UK Ltd)
    - 30 gram - NHS indicative price = £11.00

  - **Dermacolor cleansing cream** (Kryolan UK Ltd)
    - 75 gram - No NHS indicative price available

  - **Dermacolor fixing powder** (Kryolan UK Ltd)
    - 60 gram (ACBS) - NHS indicative price = £9.85

  - **Keromask finishing powder** (Bellavia Ltd)
    - 20 gram (ACBS) - NHS indicative price = £6.27

  - **Keromask masking cream** (Bellavia Ltd)
    - 15 ml (ACBS) - NHS indicative price = £6.27

  - **Veil cover cream** (Thomas Blake Cosmetic Creams Ltd)
    - 19 gram (ACBS) - NHS indicative price = £22.42

  - **Veil finishing powder** (Thomas Blake Cosmetic Creams Ltd)
    - 35 gram (ACBS) - NHS indicative price = £24.58

10 Sun protection and photodamage

Sunscreen

Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as polymorphic light eruption,
solar urticaria, and it provokes the various cutaneous porphyrias. It also provokes (or at least aggravates) skin lesions of lupus erythematosus and may aggravate some other dermatoses. Certain drugs, such as demeclocycline, phenothiazines, or amiiodarone, can cause photosensitivity. All these conditions (as well as sunburn) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent relatively short periods of exposure to the sun. Solar dermatoses.

Certain drugs, such as demeclocycline, lesions of porphyrias. It also provokes (or at least aggravates) skin reactions and photodermatoses. Both UVA and UVB contribute to long-term photodamage and to the changes responsible for skin cancer and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. Protective clothing and sun avoidance (rather than the use of sunscreen preparations) are recommended for children under 6 months of age.

The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a child to remain 8 times longer in the sun without burning. However, in practice users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies. Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification.

Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions. For optimum photoprotection, sunscreen preparations should be applied thickly and frequently (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNFC

Borderline substances

Antelios® XL SPF 50+ Melt-in cream; Senscse® Ultra; Uvistat® Lipscreen SPF 50; and Uvistat® Sunscreen SPF 30 and 50 (see Borderline substances) cannot be prescribed on the NHS except for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity. Preparations with SPF less than 30 should not normally be prescribed.

Photodamage

Overview

Actinic keratoses occur very rarely in healthy children; actinic cheilitis may occur on the lips of adolescents following excessive sun exposure. Diclofenac gel (Solaraze®) and topical preparations of fluouracil are licensed for the treatment of actinic keratoses but they are not licensed for use in children. In children with photosensitivity disorders, such as erythropoietic protoporphyria, specialists may use betacarotene below, mepacrine, chloroquine or hydroxochloroquine to reduce skin reactions.

VITAMINS AND TRACE ELEMENTS > VITAMIN A

Betacarotene

Drug Action

Betacarotene is a precursor to vitamin A.

Indications and Dose

Management of photosensitivity reactions in erythropoietic protoporphyria (specialist use only)

By Mouth

Child 1–4 years: 60–90 mg daily, to be given as a single dose or in divided doses

Child 5–8 years: 90–120 mg daily, to be given as a single dose or in divided doses

Child 9–11 years: 120–150 mg daily, to be given as a single dose or in divided doses

Child 12–15 years: 150–180 mg daily, to be given as a single dose or in divided doses

Child 16–17 years: 180–300 mg daily, to be given as a single dose or in divided doses

Unlicensed Use

Not licensed.

Caution

Monitor vitamin A intake

Caution, Further Information

Protection not total—avoid strong sunlight and use sunscreen preparations; generally 2–6 weeks of treatment (resulting in yellow coloration of palms and soles) necessary before increasing exposure to sunlight; dose should be adjusted according to level of exposure to sunlight.

Side Effects

Rare or very rare Arthralgia > skin reactions

Frequency not known Diarrhoea

Pregnancy

Partially converted to vitamin A, but does not give rise to abnormally high serum concentration; manufacturer advises use only if potential benefit outweighs risk.

Breast Feeding

Use with caution—present in milk.

12 Warts and calluses

Warts and calluses

Overview

Warts (verruca vulgaris) are common, benign, self-limiting, and usually asymptomatic. They are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction and is required only if the warts are painful, unsightly, persistent, or cause distress. In immunocompromised children, warts may be more difficult to eradicate.

Preparations of salicylic acid p. 791, formaldehyde p. 790, glutaraldehyde p. 790 or silver nitrate p. 790 are used for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line in the treatment of warts; it is also suitable for the removal of corns and callouses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts

Anogenital warts (condylomata acuminata) in children are often asymptomatic and require only a simple barrier preparation. If treatment is required it should be supervised by a hospital specialist. Persistent warts on genital skin may require treatment with cryotherapy or other forms of physical ablation under general anaesthesia.

Podophyllotoxin below (the major active ingredient of podophyllum), or imiquimod p. 791 are used to treat external anogenital warts; these preparations can cause considerable irritation of the treated area and are therefore suitable only for children who are able to co-operate with the treatment.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Podophyllotoxin

INDICATIONS AND DOSE

CONDYLINE ®

Condylomata acuminata affecting the penis or the female external genitalia

TO THE LESION

Child 2–17 years (initiated under specialist supervision):
Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3–day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male, maximum 50 single applications (“loops”) per session (consult product literature)

WARTICON ® CREAM

Condylomata acuminata affecting the penis or the female external genitalia

TO THE LESION

Child 2–17 years (initiated under specialist supervision):
Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm²
WARTICON® LIQUID

Condylomata acuminata affecting the penis or the female external genitalia

- TO THE LESION
- Child 2-17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications (‘loops’) per session (consult product literature)

- UNLICENSED USE Not licensed for use in children.
- CAUTIONS Avoid normal skin - avoid open wounds - keep away from face - very irritant to eyes
- SIDE-EFFECTS Balanoposthitis - skin irritation
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cream
EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sorbic acid
- Warticon (Phoenix Labs Ltd)
  Podophyllotoxin 1.5 mg per 1 gram Warticon 0.15% cream | 5 gram PSM £17.83 DT = £17.83

Liquid
CAUTIONARY AND ADVISORY LABELS 15
- Condyline (Takeda UK Ltd)
  Podophyllotoxin 5 mg per 1 ml Condyline 0.5% solution | 3.5 ml PSM £14.49 DT = £14.49
  Podophyllotoxin 5 mg per 1 ml Warticon 0.5% solution | 3 ml PSM £14.86 DT = £14.86

ANTISEPTICS AND DISINFECTANTS ☑ ALDEHYDES AND DERIVATIVES

Formaldehyde

- INDICATIONS AND DOSE
  Warts, particularly plantar warts
  - TO THE LESION
  - Child: Apply twice daily

- UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).
- CAUTIONS Impaired peripheral circulation - not suitable for application to anogenital region - not suitable for application to face - not suitable for application to large areas - patients with diabetes at risk of neuropathic ulcers - protect surrounding skin and avoid broken skin - significant peripheral neuropathy
- SIDE-EFFECTS Asthma - cough - dysphagia - eye irritation - increased risk of infection - laryngospasm - skin reactions

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Liquid
- Formaldehyde (Non-proprietary)
  Formaldehyde 40 mg per 1 ml Formaldehyde 4% solution | 1000 ml £3.90 DT = £3.90
  Formaldehyde 350 mg per 1 gram Formaldehyde solution | 500 ml £7.24 DT = £7.24 | 2000 ml £18.72

Glutaraldehyde

- INDICATIONS AND DOSE
  Warts, particularly plantar warts
  - TO THE LESION
  - Child: Apply twice daily

- UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).
- CAUTIONS Not for application to anogenital areas - not for application to face - not for application to mucosa - protect surrounding skin
- SIDE-EFFECTS Rare or very rare Severe cutaneous adverse reactions (SCARs)
  Frequency not known Rash - skin irritation (discontinue if severe)

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Paint
- Glutarol (Dermal Laboratories Ltd)
  Glutaraldehyde 100 mg per 1 ml Glutarol 10% cutaneous solution | 10 ml P | £2.07 DT = £2.07

ANTISEPTICS AND DISINFECTANTS ☑ OTHER

Silver nitrate

- INDICATIONS AND DOSE
  Common warts
  - TO THE LESION
  - Child: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
  Verrucas
  - TO THE LESION
  - Child: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
  Umbilical granulomas
  - TO THE SKIN
  - Child: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin

- UNLICENSED USE No age range specified by manufacturer.
- CAUTIONS Avoid broken skin - not suitable for application to ano-genital region - not suitable for application to face - not suitable for application to large areas - protect surrounding skin
- SIDE-EFFECTS Rare or very rare Argyria - methaemoglobinaemia
- PATIENT AND CARER ADVICE Patients should be advised that silver nitrate may stain fabric.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Stick
- Avoca (Bray Group Ltd)
  Silver nitrate 400 mg per 1 gram Avoca 40% silver nitrate pencils | 1 applicator P £1.13 DT = £1.13
  Silver nitrate 750 mg per 1 gram Avoca 75% silver nitrate applicators | 100 applicator P £47.82
  Avoca 75% silver nitrate applicators with thick handles | 50 applicator P £47.19
  Silver nitrate 950 mg per 1 gram Avoca 95% silver nitrate applicators | 100 applicator P £51.17
  Avoca 95% silver nitrate pencils | 1 applicator P £2.56 DT = £3.08
Salicylic acid

**INDICATIONS AND DOSE**

**OCCLUSAL®**

- **Common and plantar warts**
  - **TO THE LESION**
  - **Child:** Apply daily, treatment may need to be continued for up to 3 months

- **VERRUGON®**

- **For plantar warts**
  - **TO THE LESION**
  - **Child:** Apply daily, treatment may need to be continued for up to 3 months

**UNLICENSED USE**

- Not licensed for use in children under 2 years.
- **CAUTIONS**
  - Avoid broken skin
  - Impaired peripheral circulation
  - Not suitable for application to anogenital region
  - Not suitable for application to face
  - Not suitable for application to large areas
  - Patients with diabetes at risk of neuropathic ulcers

**SIDE-EFFECTS**

- **Skin irritation**
- **PATIENT AND CARER ADVICE**
  - Advise patient to apply carefully to wart and to protect surrounding skin (e.g., with soft paraffin or specially designed plaster); rub wart surface gently with felt or pumice stone once weekly.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- **Ointment**
  - Verrugon (Optima Consumer Health Ltd)
  - Salicylic acid 500 mg per 1 gram Verrugon complete 50% ointment 6 gram £4.44 DT = £4.44

- **Liquid**
  - Occlusal (Alliance Pharmaceuticals Ltd)
  - Salicylic acid 260 mg per 1 ml Occlusal 26% solution 10 ml £3.56 DT = £3.56

Salicylic acid with lactic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid above.

**INDICATIONS AND DOSE**

**CUPLEX®**

- **Plantar and mosaic warts | Corns | Calluses**
  - **TO THE LESION**
  - **Child:** 2–17 years: Apply once daily, treatment may need to be continued for up to 3 months

1 Immunoglobulin therapy

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Immunoglobulins 04-Oct-2017

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 796 and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 798 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 798 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 796 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting for several weeks.

Normal immunoglobulin (containing 3–12% protein) for intravenous administration is used as replacement therapy for children with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred.

Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

The dose of normal immunoglobulin used as replacement therapy in patients with immunodeficiencies is not the same as the dose required for treatment of acute conditions. For Kawasaki disease a single dose by intravenous infusion should be given with concomitant aspirin p. 93 within 10 days of onset of symptoms (but children with a delayed diagnosis may also benefit).

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for other conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 821 is recommended for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and
New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for prophylaxis in travellers.

Public Health England recommends the use of normal immunoglobulin in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease (including chronic hepatitis B or C infection), or HIV infection (with a CD4 count < 200 cells per microlitre), or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts with chronic liver disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

Measles
Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Children with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:
- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Varicella-zoster immunoglobulin
Varicella-zoster immunoglobulin p. 798 (VZIG) is recommended for individuals who are at increased risk of severe varicella (neonates, pregnant women, and immunosuppressed individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles), can be given measles, mumps and rubella vaccine, live p. 826 for prophylaxis following exposure to measles.

Rubella
Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin p. 796 should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against rubella, see measles, mumps and rubella vaccine, live p. 826.

Disease-specific immunoglobulins
Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as postexposure prophylaxis.

Hepatitis B immunoglobulin
Disease-specific hepatitis B immunoglobulin p. 796 (HBIG) is available for use in association with hepatitis B vaccine for the prevention of infection in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see hepatitis B vaccine). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

Rabies immunoglobulin
Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 798 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 827 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

Tetanus immunoglobulin
For the management of tetanus-prone wounds, tetanus immunoglobulin p. 798 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 344 and wound cleansing, should also be used for the treatment of established cases of tetanus.

Varicella-zoster immunoglobulin
Varicella-zoster immunoglobulin p. 798 (VZIG) is recommended for individuals who are at increased risk of severe varicella (neonates, pregnant women, and immunosuppressed individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, mumps and rubella vaccine). Varicella-zoster virus immunoglobulin G antibody less than 150 mIU/mL and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox (varicella) or shingles (herpes zoster) during the infectious period.

Immunosuppressed children receiving regular intravenous immunoglobulin replacement therapy only require varicella-zoster immunoglobulin if the most recent dose was administered more than 3 weeks before exposure. Immunosuppressed children on long-term aciclovir p. 420 or valaciclovir prophylaxis p. 422 will require a temporary increase in their dose following exposure; for children within 12 months of a stem cell transplant, varicella-zoster immunoglobulin should also be considered.

Anti-D (Rh0) immunoglobulin

- INDICATIONS AND DOSE
- To rhesus-negative woman for prevention of Rh(D) sensitisation, following birth of rhesus-positive infant
  - By deep intramuscular injection
  - Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders
To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

- **BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

- **BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis

- **BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following Rh(D) incompatible blood transfusion

- **BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

RPHOPHYLAC®

To rhesus-negative woman for prevention of Rh(D) sensitisation, following birth of rhesus-positive infant

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
- Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, choriionic villous sampling) up to 12 weeks' gestation

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
- Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
- Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following Rh(D) incompatible blood transfusion

- **BY INTRAVENOUS INJECTION**
- Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CONTRA-INDICATIONS** Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients - treatment of idiopathic thrombocytopenia purpura in splenectomised patients

- **CAUTIONS** Immunoglobulin A deficiency - possible interference with live virus vaccines

**CAUTIONS, FURTHER INFORMATION**

- MMR vaccine MMR vaccine may be given in the postpartum period with anti-D (Rh) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

- **INTERACTIONS** Appendix 1: immunoglobulins

- **SIDE-EFFECTS**
  - Uncommon Chills, fever, headache, malaise, skin reactions
  - Rare or very rare Arthralgia, dyspnoea, hypersensitivity, hypotension, nausea, tachycardia, vomiting
  - Frequency not known Intravascular haemolysis

**HANDLING AND STORAGE**

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156 Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.
  - www.nice.org.uk/TA156

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**

- **D-Gam (Bio Products Laboratory Ltd)** Anti-D (RHO) immunoglobulin 500 unit D-Gam Anti-D immunoglobulin 500 unit solution for injection vials | 1 vial £38.25
- Anti-D (RHO) immunoglobulin 1500 unit D-Gam Anti-D immunoglobulin 1,500 unit solution for injection vials | 1 vial £58.00
- **Rphophylac (CSL Behring UK Ltd)** Anti-D (RHO) immunoglobulin 750 unit per 1 ml Rphophylac 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £46.30
Hepatitis B immunoglobulin

**INDICATIONS AND DOSE**

**Prophylaxis against hepatitis B infection**
- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 1 month–4 years: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 5–9 years: 300 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 10–17 years: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.

**Prevention of transmitted infection at birth**
- **BY INTRAVENOUS INFUSION**
  - Neonate: 200 units, dose to be administered as soon as possible after birth; for full details consult Immunisation against Infectious Disease (www.dh.gov.uk).
- **BY INTRAMUSCULAR INJECTION**
  - Neonate: (consult product literature).

**Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material**
- **BY INTRAVENOUS INFUSION**
  - Child: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature).

**Prophylaxis against re-infection of transplanted liver**
- **BY INTRAVENOUS INFUSION**
  - Child: (consult product literature).

**CAUTIONS**
- IgA deficiency • interference with live virus vaccines

**INTERACTIONS**
- Appendix 1: immunoglobulins

**SIDE-EFFECTS**
- Uncommon: Abdominal pain upper • headache
- Rare or very rare: Cardiac discomfort • fatigue • hypersensitivity • hypertension • hypotension • muscle spasms • nasopharyngitis • oropharyngeal pain • palpitations • skin reactions

**PRESCRIBING AND DISPENSING INFORMATION**
- Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

**HANDLING AND STORAGE**
- Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Hepatitis B immunoglobulin (Non-proprietary)**
  - Hepatitis B immunoglobulin human 500 unit solution for injection vials | 1 vial (£400.00)
  - Zutebra (Biotest (UK) Ltd) Zutebra 500units/1ml solution for injection pre-filled syringes | 5 syringe (£1,500.00)

**Solution for infusion**
- **Hepact CP (Biotest (UK) Ltd)**
  - Hepatitis B immunoglobulin human 50 unit per 1 ml | 1 vial (£55.00)
  - Hepact CP 100units/2ml solution for infusion vials | 1 vial (£1,100.00)
  - Hepact CP 500units/10ml solution for infusion vials | 1 vial (£2,750.00)
  - Omri-Hep-B (Imported (Israel)) Hepatitis B immunoglobulin human 50 unit per 1 ml Omri-Hep-B 500units/100ml solution for infusion vials | 1 vial (£200.00)

**Normal immunoglobulin**

**INDICATIONS AND DOSE**
- **To control outbreaks of hepatitis A**
  - **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1 month–9 years: 250 mg
  - Child 10–17 years: 500 mg

- **Rubella in pregnancy, prevention of clinical attack**
  - **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 750 mg

- **Antibody deficiency syndromes**
  - **BY SUBCUTANEOUS INFUSION**
  - Child: (consult product literature)

- **Kawasaki disease (with concomitant aspirin)**
  - **BY INTRAVENOUS INFUSION**
  - Child: 2 g/kg daily for 1 dose, treatment should be given within 10 days of onset of symptom (but children with a delayed diagnosis may also benefit)

- **SUBGAM®**
  - **Hepatitis A prophylaxis in outbreaks**
  - **BY INTRAMUSCULAR INJECTION**
  - Child 1 month–9 years: 500 mg
  - Child 10–17 years: 750 mg

**UNLICENSED USE**
- **SUBGAM®** Subgamm® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

**CONTRA-INDICATIONS**
- Patients with selective IgA deficiency who have known antibody against IgA

- **PRIVIGEN®** Hyperprolinaemia (contains L-proline)
- **FLEBOGAMMA® DIF** Hereditary fructose intolerance (contains sorbitol)
- **HIZENTRA®** Hyperprolinaemia (contains L-proline)
- **GAMMAPLEX®** Hereditary fructose intolerance (contains sorbitol)

**CAUTIONS**
- **GENERAL CAUTIONS** Agammaglobulinaemia with or without IgA deficiency • hypogammaglobulinaemia with or without IgA deficiency • interference with live virus vaccines

**SPECIFIC CAUTIONS**
- With intravenous use: Ensure adequate hydration • obesity • renal insufficiency • risk factors for arterial or venous thromboembolic events • thrombophilic disorders

**CAUTIONS, FURTHER INFORMATION**
- Interference with live virus vaccines: Normal immunoglobulin may interfere with the immune response to live virus
vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

**OCTAGAM** Falsely elevated results with blood glucose testing systems (contains maltose)

**INTERACTIONS** Appendix 1: immunoglobulins

**SIDE-EFFECTS**

**Common or very common**
- With intramuscular use Chills
- With subcutaneous use Diarrhoea, dizziness, drowsiness, fatigue, gastrointestinal discomfort, headaches, hypotension, local reaction, myalgia, nausea, pain, skin reactions
- Rare or very rare
  - With intramuscular use Abdominal pain, arthralgia, musculoskeletal stiffness, myalgia, peripheral coldness, tremor
  - Frequency not known
    - With intramuscular useChestdiscomfort, dyspnoea, facial swelling, fever, flushing, hyperhidrosis, hypertension, hypotension, malaise, oral paraesthesia, pallor, paraesthesia, tachycardia, vomiting
    - With intravenous use Embolism and thrombosis, gastrointestinal discomfort, haemolytic anaemia, myocardial infarction, stroke

**SIDE-EFFECTS, FURTHER INFORMATION**

Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

**MONITORING REQUIREMENTS** Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

**DIRECTIONS FOR ADMINISTRATION**

Preparations for subcutaneous use may be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.

**GAMUNEX** Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

**KIOVIG** Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

**PRESCRIBING AND DISPENSING INFORMATION**

Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

**HANDLING AND STORAGE**

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES:** May contain Sodium

- **Hizentra** (CSL Behring UK Ltd)
  - Normal immunoglobulin human 200 mg per 1 ml Hizentra 2g/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £108.00

- **Subgam** (Bio Products Laboratory Ltd)
  - Normal immunoglobulin human 160 mg per 1 ml Subgam 1.5g/9.375ml solution for injection vials | 1 vial (P09) £75.00
  - Subgam 4g/25ml solution for injection vials | 1 vial (P09) £200.00
  - Subgam 2g/12.5ml solution for injection vials | 1 vial (P09) £100.00
  - Subgam 4g/6.25ml solution for injection vials | 1 vial (P09) £50.00
  - Subgam 75mg/4.6875ml solution for injection vials | 1 vial (P09) £37.50

**Solution for infusion**

**EXCIPIENTS:** May contain Glucose, maltose, sorbitol, sucrose

- **Normal immunoglobulin (Non-proprietary)**
  - Normal immunoglobulin human 100 mg per 1 ml Normal immunoglobulin human 5g/50ml solution for infusion vials | 1 vial (P09) £690.00
  - Normal immunoglobulin human 2.5g/25ml solution for infusion vials | 1 vial (P09) £50.00
  - Normal immunoglobulin human 20g/200ml solution for infusion vials | 1 vial (P09) £980.00
  - Normal immunoglobulin human 10g/100ml solution for infusion vials | 1 vial (P09) £500.00
  - Normal immunoglobulin human 30g/300ml solution for infusion vials | 1 vial (P09) £1,020.00

- **Flebogammadif** (Grifols UK Ltd)
  - Normal immunoglobulin human 50 mg per 1 ml Flebogamma Dif 1g/200ml solution for infusion vials | 1 vial (P09) £100.00
  - Flebogamma Dif 2.5g/50ml solution for infusion vials | 1 vial (P09) £127.50
  - Flebogamma Dif 5g/100ml solution for infusion vials | 1 vial (P09) £225.00
  - Flebogamma Dif 500mg/10ml solution for infusion vials | 1 vial (P09) £30.00
  - Flebogamma Dif 2g/400ml solution for infusion vials | 1 vial (P09) £1,020.00

- **Gammaplex** (Bio Products Laboratory Ltd)
  - Normal immunoglobulin human 50 mg per 1 ml Gammaplex 1g/200ml solution for infusion vials | 1 vial (P09) £41.00 (Hospital only)
  - Gammaplex 5g/100ml solution for infusion vials | 1 vial (P09) £209.00 (Hospital only)
  - Gammaplex 20g/400ml solution for infusion vials | 1 vial (P09) £836.00 (Hospital only)

- **Gamunex** (Grifols UK Ltd)
  - Normal immunoglobulin human 100 mg per 1 ml Gamunex 10g/50ml solution for infusion vials | 1 vial (P09) £125.50
  - Gamunex 10g/100ml solution for infusion vials | 1 vial (P09) £225.00
  - Gamunex 10g/200ml solution for infusion vials | 1 vial (P09) £470.00
  - Gamunex 10g/400ml solution for infusion vials | 1 vial (P09) £980.00

- **Hizentra** (CSL Behring UK Ltd)
  - Normal immunoglobulin human 200 mg per 1 ml Hizentra 2g/10ml solution for infusion vials | 1 vial (P09) £108.00
  - Hizentra 2g/5ml solution for infusion vials | 1 vial (P09) £54.00
  - Hizentra 4g/20ml solution for infusion vials | 1 vial (P09) £216.00

- **Kiovig** (Baxalta UK Ltd)
  - Normal immunoglobulin human 100 mg per 1 ml Kiovig 5g/50ml solution for infusion vials | 1 vial (P09) £245.00
  - Kiovig 20g/200ml solution for infusion vials | 1 vial (P09) £980.00
  - Kiovig 10g/100ml solution for infusion vials | 1 vial (P09) £490.00
  - Kiovig 30g/300ml solution for infusion vials | 1 vial (P09) £1,470.00
  - Kiovig 2.5g/25ml solution for infusion vials | 1 vial (P09) £122.50
  - Kiovig 1g/10ml solution for infusion vials | 1 vial (P09) £49.00

- **Octagam** (Octapharma Ltd)
  - Normal immunoglobulin human 50 mg per 1 ml Octagam 5g/200ml solution for infusion vials | 1 bottle (P03) £480.00 (Hospital only)
  - Octagam 5g/100ml solution for infusion vials | 1 bottle (P03) £240.00 (Hospital only)
  - Normal immunoglobulin human 100 mg per 1 ml Octagam 10g/100ml solution for infusion vials | 1 bottle (P03) £690.00 (Hospital only)
Tetanus immunoglobulin

- **INDICATIONS AND DOSE**
  - **Post-exposure prophylaxis**
    - **By intramuscular injection**
    - **Child:** Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
  - **Treatment of tetanus infection**
    - **By intramuscular injection**
    - **Child:** 150 units/kg, dose may be given over multiple sites

- **CAUTIONS**
  - IgA deficiency - interference with live virus vaccines
- **INTERACTIONS**
  - → Appendix 1: immunoglobulins
- **SIDE-EFFECTS**
  - Rare or very rare: Anaphylactic reaction - hypotension
  - Frequency not known: Arthralgia - chest pain - dizziness - dyspnoea - face oedema - oral disorders - tremor

- **HANDLING AND STORAGE**
  - Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Tetanus immunoglobulin (Non-proprietary)**
      - Tetanus immunoglobulin human 250 unit
      - Tetanus immunoglobulin human 250 unit solution for injection vials | 1 vial (POM) £170.00

Varicella-zoster immunoglobulin (Antivariella-zoster Immunoglobulin)

- **INDICATIONS AND DOSE**
  - **Prophylaxis against varicella infection**
    - **By deep intramuscular injection**

- **Solution for injection**
  - **Rabies immunoglobulin (Non-proprietary)**
    - Rabies immunoglobulin human 500 unit
      - Rabies immunoglobulin human 500 unit solution for injection vials | 1 vial (POM) £800.00

Rabies immunoglobulin

- **INDICATIONS AND DOSE**
  - **Post-exposure prophylaxis for rabies infection**
    - **By local infiltration, or by intramuscular injection**
    - **Child:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

- **CAUTIONS**
  - IgA deficiency - interference with live virus vaccines
- **INTERACTIONS**
  - → Appendix 1: immunoglobulins
- **SIDE-EFFECTS**
  - Rare or very rare: Arthralgia - chills - fatigue - fever - headache - hypersensitivity - hypotension - influenza like illness - malaise - nausea - skin reactions - tachycardia - vomiting

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.
  - Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

- **HANDLING AND STORAGE**
  - Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Tetanus immunoglobulin (Non-proprietary)**
      - Tetanus immunoglobulin human 250 unit
      - Tetanus immunoglobulin human 250 unit solution for injection vials | 1 vial (POM) £170.00

Octagam 10% 20g/200ml solution for infusion bottles | 1 bottle (POM) £1,380.00 (Hospital only)
Octagam 10% 5g/50ml solution for infusion bottles | 1 bottle (POM) £345.00 (Hospital only)
Octagam 10% 2g/20ml solution for infusion vials | 1 vial (POM) £138.00 (Hospital only)
- **Panzyga** (Octapharma Ltd)
  - Normal immunoglobulin human 100 mg per 1 ml
  - Panzyga 10g/100ml solution for infusion bottles | 1 bottle (POM) £586.50 (Hospital only)
  - Panzyga 2g/20ml solution for infusion bottles | 1 bottle (POM) £1,173.00 (Hospital only)
  - Panzyga 5g/50ml solution for infusion bottles | 1 vial (POM) £293.25 (Hospital only)
- **Privigen** (CSL Behring UK Ltd)
  - Normal immunoglobulin human 100 mg per 1 ml
  - Privigen 5g/50ml solution for infusion vials | 1 vial (POM) £270.00
  - Privigen 20g/200ml solution for infusion vials | 1 vial (POM) £1,080.00
  - Privigen 10g/100ml solution for infusion vials | 1 vial (POM) £540.00
  - Privigen 2.5g/25ml solution for infusion vials | 1 vial (POM) £135.00

Varicella-zoster immunoglobulin

- **INDICATIONS AND DOSE**
  - **Prophylaxis against varicella infection**
    - **By deep intramuscular injection**

- **Solution for injection**
  - **Rabies immunoglobulin (Non-proprietary)**
    - Rabies immunoglobulin human 500 unit
      - Rabies immunoglobulin human 500 unit solution for injection vials | 1 vial (POM) £800.00
Post-exposure prophylaxis

Immune sera and immunoglobulins

Botulism antitoxin

**Drug Action** A preparation containing the specific antitoxin globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum.*

**Indications and Dose**
- **Post-exposure prophylaxis of botulism**
- **Child:** (consult product literature)

**Side-effects** Hypersensitivity

**Side-effects, further information** It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

**Pre-treatment screening** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

**Prescribing and dispensing information** Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241). For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Varicella-Zoster** (Bio Products Laboratory Ltd)
  - Varicella-Zoster immunoglobulin human 250 mg
  - Varicella-Zoster immunoglobulin human 250mg solution for injection vials
    - 1 vial £60.00

**3 Tuberculosis diagnostic test**

**Diagnostic agents**

Tuberculin purified protein derivative (Tuberculin PPD)

**Indications and dose**
- **Mantoux test**
  - **Child:** 2 units for one dose
  - **Mantoux test (if first test is negative and a further test is considered appropriate)**
    - **Child:** 10 units for 1 dose

**Dose equivalence and conversion**
- 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- 10 units is equivalent to 0.1 mL of 100 units/mL strength.

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Diphtheria antitoxin (Non-proprietary)**
  - Diphtheria antitoxin 1000 unit per 1 mL Antidiphtheria serum
  - 10,000 units/10 mL solution for injection ampoules
  - 1 ampoule £30.00

**Prescribing and dispensing information** Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).
Vaccines and HIV infection

HIV-positive children with or without symptoms can receive the following live vaccines:
- MMR (but avoid if immunity significantly impaired), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; use of normal immunoglobulin should be considered after exposure to measles and varicella–zoster immunoglobulin considered after exposure to chickenpox or herpes zoster), rotavirus; and the following inactivated vaccines:
  - anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis (inactivated poliomyelitis vaccine is now used instead of oral poliomyelitis vaccine for routine immunisation of children), rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive children should **not** receive:
- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought).

The above advice differs from that for other immunocompromised patients; Immunisation of HIV infected Children issued by Children’s HIV Association (CHIVA) are available at [www.chiva.org.uk](http://www.chiva.org.uk).

Vaccines and asplenia

The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:
- Haemophilus influenzae type b with meningococcal group C vaccine p. 818;
- Influenza vaccine p. 825;
- Meningococcal groups A with C and W135 and Y vaccine p. 819 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 818;
- pneumococcal polysaccharide vaccine.

**Children first diagnosed under 1 year of age** should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type b with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

**Children first diagnosed between 1 and 2 years of age** should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type b with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

**Children first diagnosed over 2 years of age** should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type
**Routine immunisation schedule**

<table>
<thead>
<tr>
<th>When to immunise</th>
<th>Vaccine given and dose schedule (for details of dose, see under individual vaccines)</th>
</tr>
</thead>
</table>
| **Neonates at risk only** | ▶ Bacillus Calmette-Guérin vaccine p. 817 (at birth, see BCG vaccine p. 802)  
▶ Hepatitis B vaccine p. 822 (at birth, see Hepatitis B vaccine p. 805) |
| **8 weeks** | ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 816 (*Inflanrix hexa*®). First dose  
▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 818 (*Bexsero*®). First dose  
▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 819 (*Prevenar 13*®). First dose  
▶ Rotavirus vaccine p. 827 (*Rotarix*®). First dose |
| **12 weeks** | ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (*Inflanrix hexa*®). Second dose  
▶ Rotavirus vaccine (*Rotarix*®). Second dose |
| **16 weeks** | ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (*Inflanrix hexa*®). Third dose  
▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (*Bexsero*®). Second dose  
▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) (*Prevenar 13*®). Second dose |
| **1 year (on or after first birthday)** | ▶ Measles, mumps and rubella vaccine, live p. 826 (*MMR VaxPRO*® or *Priorix*®). First dose  
▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (*Bexsero*®). Single booster dose  
▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) (*Prevenar 13*®). Single booster dose  
▶ Haemophilus influenzae type b with meningococcal group C vaccine p. 818 (*Menitorix*®). Single booster dose |
| **2-10 years on 31st August 2019 (including children in reception class and school years 1, 2, 3, 4, 5, and 6)** | ▶ Influenza vaccine p. 825 Each year from September. Note: live attenuated influenza nasal spray is recommended (*Fluenz Tetra®*). If contra-indicated and child is in clinical risk group, use inactivated influenza vaccine (see Influenza vaccine p. 806) |
| **3 years and 4 months, or soon after** | ▶ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 816 (*Repevax*®). Single booster dose.  
▶ Measles, mumps and rubella vaccine, live (*MMR VaxPRO*® or *Priorix*®). Second dose |
| **11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-13 years of age in Scotland. For females aged 15 years and older, see Human papillomavirus vaccine p. 805.** | ▶ Human papillomavirus vaccines p. 824 (*Gardasil*®), 2 doses; second dose 6-24 months after first dose. If a 3-dose course of HPV vaccine has been started, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). Only *Gardasil*® is offered as part of the national immunisation programme. Therefore for those females who started the schedule with *Cervarix*®, but did not complete the vaccination course, the course can be completed with *Gardasil*®. Ideally one vaccine should be used for the entire course.  
▶ Meningococcal groups A with C and W135 and Y vaccine p. 819 (*Nimenrix®* or *Menveo®*). Single booster dose |
▶ Measles, mumps and rubella vaccine, live (*MMR VaxPRO*® or *Priorix*®). Second dose  
▶ Note: Can be given at the same time as the dose of meningococcal groups A with C and W135 and Y vaccine at 13-15 years of age. |
| **13-18 years** | ▶ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus (*Boostrix-IPV*®). 1 dose from the 16th week of pregnancy, preferably after the fetal anomaly scan (weeks 18-20)  
▶ Influenza vaccine (inactivated). Single dose administered from September, regardless of the stage of pregnancy (see Influenza vaccine p. 806) |

---

**Vaccines and antisera availability**

*Anthrax vaccine and yellow fever vaccine, live p. 829, botulism antitoxin p. 799, diphtheria antitoxin p. 799, and snake and spider venom antitoxins are available from local designated holding centres. For antivenom, see Emergency Treatment of Poisoning. Enquiries for vaccines not available commercially can also be made to:*

Vaccines and Countermeasures Response Department  
Public Health England  
Wellington House  
133–155 Waterloo Road  
London  
SE1 8UG  
vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff  
CF14 4XW

For further details of availability, see under individual vaccines.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Immunisation schedule 23-Apr-2019
Routine immunisations, sources of information
The following recommendations reflect advice produced by Public Health England. Recommendations specific to each vaccine can be found in Immunisation against infectious disease– the ‘Green Book’. Public Health England at:

The immunisation schedule reflects advice from ‘The complete routine immunisation schedule’ produced by Public Health England (2018). For the most up to date immunisation schedule see: www.gov.uk/government/publications/the-complete-routine-immunisation-schedule

Vaccines for the immunisation schedule should be obtained from ImmForm at: www.immform.dh.gov.uk

Preterm birth
Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for respiratory complications for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring.

Individuals with unknown or incomplete immunisation history
For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

Anthrax vaccine
Overview
Anthrax vaccine is rarely required for children.

Useful Resources

BCG vaccine
Overview
BCG (Bacillus Calmette-Guérin vaccine p. 817) is a live attenuated strain derived from Mycobacterium bovis which stimulates the development of hypersensitivity to M. tuberculosis. Bacillus Calmette-Guérin vaccine should be given intradermally by operators skilled in the technique.

The expected reaction to successful Bacillus Calmette-Guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule and then ulcerates and subsides. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring.

Individuals with unknown or incomplete immunisation history
For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

Botulism antitoxin

Overview

A polyvalent botulism antitoxin p. 799 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Cholera vaccine

Overview

Oral cholera vaccine p. 817 contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for children from 2 years of age who are travelling to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least one week before potential exposure. However, there is no requirement for cholera vaccination for international travel. After a full risk assessment, immunisation can be considered for the following children:

- children travelling with remote itineraries in areas where cholera epidemics are occurring and there is limited access to medical care;
- children travelling to potential cholera risk areas, for whom vaccination is considered potentially beneficial.

For dosing schedule, see cholera vaccine. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

All suspected cases of cholera must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Contacts

Contacts of children with cholera should maintain high standards of personal hygiene to avoid becoming infected. Cholera vaccine should not be used in the management of contacts of cases or in controlling the spread of infection.

Useful Resources

Diphtheria vaccine

Overview

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 816 (*Infanrix hexa®*) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], *tetanus* and *poliomyelitis* (inactivated) vaccine.
A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed). For children who have been vaccinated following a tetanus-prone wound, see tetanus vaccines.

Travel
Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

Contacts
Advice on the management of cases of diphtheria, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected children and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. Also see advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune child.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Haemophilus influenzae type B conjugate vaccine

Overview
Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis vaccine (Infanrix hexa®), as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing Haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 1 year of age, on or after the child’s first birthday.

Children 1–10 years who have not been immunised against Haemophilus influenzae type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, children born before August 2017 should be given 3 doses of the combined vaccine they were started on. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive H. influenzae type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

Invasive Haemophilus influenzae type b disease
After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation.

Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

Also see use of rifampicin p. 379 in the prevention of secondary cases of Haemophilus influenzae type b disease.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Hepatitis A vaccine

Overview
Hepatitis A vaccine p. 821 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- residents of homes for those with severe learning difficulties;
- children with haemophilia or other conditions treated with plasma-derived clotting factors;
- children with severe liver disease;
- children travelling to high-risk areas;
- adolescents who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- children with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose of hepatitis A vaccine is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

In children under 16 years, a single dose of the combined vaccine Ambirix® can be used to provide rapid protection against hepatitis A. Public Health England recommends the
use of intramuscular normal immunoglobulin p. 796 in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed. For further guidance, see Immunoglobulins p. 793.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Hepatitis B vaccine
Overview
Hepatitis B vaccine p. 822 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto an adjuvant. It is made biosynthetically using recombinant DNA technology.

From August 2017, vaccination against hepatitis B is recommended as part of the routine immunisation schedule. Primary immunisation (see Routine immunisation schedule) requires 3 doses, given at intervals of 1 month from the age of 2 months, to be given as part of the combined diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 816 (Infanrix hexa®).

As part of the selective neonatal immunisation programme, vaccination is recommended for neonates whose mothers have had acute hepatitis B during pregnancy or who are positive for hepatitis B surface antigen (regardless of e-antigen markers). Hepatitis B vaccination is started immediately after birth with a dose of the monovalent hepatitis B vaccine (no later than 24 hours after delivery), followed by a second dose at 4 weeks; the routine immunisation combination vaccine (Infanrix hexa®) at weeks 8, 12 and 16; and a further dose of the monovalent hepatitis B vaccine at one year of age.

Neonates born to highly infectious mothers should also receive hepatitis B immunoglobulin p. 796 at the same time as the first dose of monovalent hepatitis B vaccine, but administered at a different site—more detailed guidance is given in the handbook Immunisation against Infectious Disease www.gov.uk/government/publications/hepatitis-b-the-green-book-chapter-18.

Following significant exposure to hepatitis B (e.g. through needle-stick injury or unprotected sex) and for pre-exposure prophylaxis in high-risk groups, ‘an accelerated schedule’ using the single, monovalent hepatitis B vaccine is recommended immediately, with the second dose given 1 month after the initial dose, and the third dose given 2 months after the initial dose. For those at continued high risk following exposure, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook Immunisation against Infectious Disease.

Specific hepatitis B immunoglobulin can also be indicated for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection. If hepatitis B immunoglobulin is indicated, it should be given as soon as possible, ideally at the same time or within 24 hours of the first dose of vaccine, but not after seven days have elapsed since exposure. See also hepatitis B immunoglobulin in Immunoglobulins p. 793.

In the UK, groups at high-risk of hepatitis B include:
- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- adolescents who are at risk from their sexual behaviour;
- close family contacts of an individual with chronic hepatitis B infection;
- children with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- children with chronic renal failure including those on haemodialysis. Children receiving haemodialysis should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- children with chronic liver disease
- patients of day-care or residential accommodation for those with severe learning difficulties;
- children in custodial institutions;
- children travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Following a primary course of immunisation, most children do not require a reinforcing dose of a hepatitis B-containing vaccine. A single booster dose should be offered to healthcare workers around five years after primary immunisation, to patients on renal dialysis with anti-HBs levels below 10mIU/mL, and at the time of a subsequent significant exposure.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

A combined hepatitis A and B vaccine p. 821 is also available.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). Human papillomavirus vaccine
Overview
Human papillomavirus vaccine is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Since 2012, only Gardasil® is offered as part of the national immunisation programme. Cervarix® is licensed for use in
Vaccines

Vaccines

806 Vaccination

Influenza vaccine

Overview

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure, as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 825 in use contain the H and N components of the prevalent strain or strains recommended each year by the World Health Organization.

The influenza vaccines recommended for immunisation in children are the standard egg-grown quadrivalent influenza vaccine (inactivated), and the live attenuated influenza vaccine. The choice of vaccine is dependent on the child’s age and contra-indications.

The ideal time for immunisation is between September and early November.

Immunisation is recommended for children at high risk from influenza, and to reduce transmission of infection.

Annual immunisation is strongly recommended for children (including infants that were preterm or low birth-weight) aged 6 months and over with the following conditions:

- chronic respiratory disease;
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone p. 458: child under 20 kg, 1 mg/kg or more daily; child over 20 kg, 20 mg or more daily), and chemotherapy;
- HIV infection (regardless of immune status);
- morbid obesity (BMI of 40 kg/m² and above).

Annual influenza vaccine is also recommended for:

- children of specific ages see Immunisation schedule p. 802;
- all pregnant females (including those who become pregnant during the flu season);
- children living in long-stay facilities;
- carers of children whose welfare may be at risk if the carer falls ill;
- household contacts of immunocompromised individuals.

Children aged 6 months to less than 2 years of age in clinical risk groups should be offered the standard egg-grown quadrivalent inactivated influenza vaccine.

Children aged 2–17 years of age (including those in clinical risk groups) should be offered the live attenuated influenza vaccine administered as a nasal spray (Fluenz tetra®). The live attenuated vaccine is thought to provide broader protection than inactivated vaccines. If the child is in a clinical risk group and the live attenuated vaccine is contra-indicated or otherwise unsuitable, offer standard egg-grown quadrivalent inactivated influenza vaccine.

Children aged 6 months to less than 9 years of age in clinical risk groups who have not had the influenza vaccine previously should be offered two doses of the appropriate influenza vaccine, four weeks apart.

In the 2019/2020 national influenza immunisation programme, annual influenza vaccine will be offered to all children aged 2–10 years on 31st August 2019 (including those in reception class and school years 1, 2, 3, 4, 5, and 6). For the management of influenza, see Influenza p. 443.

Japanese encephalitis vaccine 14-Nov-2018

Overview
Japanese encephalitis is a mosquito-borne viral encephalitis caused by a Flavivirus. Japanese encephalitis vaccine p. 826 (IXIARO) is an inactivated vaccine adsorbed onto an adjuvant. It is recommended for children who are going to reside in an area where Japanese encephalitis is endemic or epidemic. Children travelling to South and South-East Asia and the Far East should be immunised if staying for a month or longer in endemic areas during the transmission season. Other children travelling with shorter exposure periods should also be immunised if the risk is considered sufficient.

The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Children (aged 2 months and over) at ongoing risk (such as long-term travellers), should receive a single booster dose 12 months after the primary immunisation course. For other children travelling, a single booster dose should be given within 12–24 months after primary immunisation, before potential re-exposure to the Japanese encephalitis virus.

Cases of Japanese encephalitis should be managed with supportive treatment.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre.

National Travel Health Network and Centre nathnc.net

Measles, Mumps and Rubella vaccine

Overview
Measles vaccine has been replaced by a combined measles, mumps and rubella vaccine, live p. 826 (MMR vaccine).

A combined measles, mumps and rubella vaccine, live (MMR vaccine) aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children at 1 year of age, on or after their first birthday. A second dose is given before starting school at 3 years and 4 months of age, or soon after (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in seronegative women of childbearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require vaccination.

Contacts
Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin p. 796 after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children with impaired immune response should not receive live vaccines (for advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel
Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book
Meningococcal vaccine
Overview
Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C and **meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

**Meningococcal group B vaccines**, Bexsero® and Trumenba®, are licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B. The use of Bexsero® is recommended in the Immunisation Schedule. Bexsero® contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B. Trumenba® contains 2 recombinant *Neisseria meningitidis* serogroup B proteins. The proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation
**Meningococcal group C conjugate vaccine** provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type b with meningococcal group C vaccine p. 818) and a second dose given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 819) (see Immunisation Schedule).

**Meningococcal group B vaccine** provides protection against infection by serogroup B of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see Immunisation Schedule above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 818 followed by a second dose two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type b with meningococcal group C vaccine), followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Children with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel
Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org/).

Proof of vaccination with the tetravalent (meningococcal groups A, C, W135, and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts
For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidelines for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Pertussis vaccine
Overview
**Pertussis vaccine** is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months. All children up to the age of 10 years should receive primary immunisation with a combination vaccine of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 816 (Infanrix hexa®).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is
not routinely recommended in individuals over 10 years of age.

**Vaccination of pregnant women against pertussis**

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred, through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis [acellular, component] and poliomyelitis (inactivated) vaccine; *Boostrix-IPV®*) between 16 and 32 weeks of pregnancy.

Public Health England has advised (2016) that the vaccine is probably best offered on or after the fetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

**Contacts**

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

**Side-effects**

Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

**Useful Resources**

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: [www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

---

### Pneumococcal vaccine

**Overview**

The pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 819 and the pneumococcal polysaccharide vaccine p. 820 protect against infection with *Streptococcus pneumoniae* (pneumococcus). Both vaccines contain polysaccharide from capsular pneumococci. The pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococcus, whereas the pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either 10 capsular types (*Synflorix®*) or 13 capsular types (*Prevenar 13®*). Both vaccines are inactivated.

*Prevenar 13®* is the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) used in the childhood Immunisation schedule p. 802. The schedule consists of 3 doses given at separate intervals.

The 23-valent pneumococcal polysaccharide vaccine is recommended for children aged 2 years and over in the following at-risk groups:

- asplenia or splenic dysfunction (including homozgyous sickle cell disease and coeliac syndrome which could lead to splenic dysfunction);
- chronic respiratory disease (including severe asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immunosuppression because of disease (e.g. HIV infection, and genetic disorders affecting the immune system) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: *child under 20 kg, 1 mg/kg or more daily; child over 20 kg, 20 mg or more daily, and chemotherapy*);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur.

Where possible, the vaccine should be given at least 2 weeks (ideally 4–6 weeks) before splenectomy, chemotherapy, or radiotherapy; children and their parents, or carers should be given advice about the increased risk of pneumococcal infection. If it is not possible to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy, and at least 3 months after completion of chemotherapy or radiotherapy. For children with leukaemia or who have had a bone marrow transplant, refer to Chapter 25, Pneumococcal, in *Immunisation against infectious disease– The Green Book* for vaccination advice. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Government, Health Protection Division (Tel (0131) 244 2879).

**Choice of vaccine**

Vaccination regimens may differ depending on the child’s age, risk of pneumococcal disease, vaccination history, and immune status. Children in at-risk groups may require additional protection.

**Children with unknown or incomplete vaccination histories**

Unimmunised or partially immunised children who present late for vaccination and before the age of 1 year should receive 2 doses of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) 2 months apart, and a further dose on their first birthday, at least 2 months after the previous dose (intervals can be reduced to 1 month to allow the immunisation schedule to be completed promptly).

Children aged between 1 year and under 2 years of age who are unimmunised or partially immunised should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

**Children diagnosed with at-risk conditions under 2 years of age**

Children under 1 year in at-risk group should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) according to the Immunisation schedule p. 802.

Those who present late for vaccination should be immunised according to ‘Children with unknown or incomplete vaccination histories’ above. A single dose of the 23-valent
pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children under 2 years who are severely immunocompromised or those with asplenia, splenic dysfunction, or complement disorders, should have an additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), given at least 2 months after the routine dose due on their first birthday. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children diagnosed with at-risk conditions from 2 years to under 10 years of age

Children diagnosed or first presenting with an at-risk condition aged 2 years to under 10 years of age who have completed their routine immunisation schedule should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine, at least 2 months after the last dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children previously unvaccinated or partially vaccinated with the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine at least 2 months later.

Severely immunocompromised children may have a sub-optimal immunological response to the vaccine and should be given an additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), even if they are fully vaccinated. This should be followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine, at least 2 months after the last dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed). If the 23-valent pneumococcal polysaccharide vaccine has already been given, the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 6 months after.

Children diagnosed with at-risk conditions aged 10 years and over

Children diagnosed or first presenting with an at-risk condition should be given a single dose of the 23-valent pneumococcal polysaccharide vaccine. No additional doses should be given.

Severely immunocompromised individuals should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) followed by the 23-valent pneumococcal polysaccharide vaccine at least 2 months later, irrespective of their previous pneumococcal vaccinations. The 23-valent pneumococcal polysaccharide vaccine has already been given, the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 6 months after.

For further information on vaccination in patients with asplenia, see Vaccination, general principles p. 800.

Revaccination

In children with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces side effects (e.g. chills, asthenia, and myalgia). Revaccination is therefore not recommended, except for children in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and chronic renal disease), where revaccination is recommended every 5 years.

Management of cases

For the management of cases, contacts and outbreaks, refer to Chapter 25, Pneumococcal, in Immunisation against infectious disease – ‘The Green Book’.

Useful Resources

Poliomyelitis vaccine

Overview

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccines (for injection) and live (oral) poliomyelitis vaccines. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation; it is given by injection and contains inactivated strains of human poliovirus types 1, 2 and 3.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised children; no child should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses should be given every 10 years only to individuals at special risk.

Live (oral) poliomyelitis vaccines is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk/ or from the National Travel Health Network and Centre, (www.nathnac.org/).

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book
Rabies vaccine

Overview
Rabies vaccine p. 827 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and postexposure prophylaxis.

Pre-exposure prophylaxis
Immunisation should be offered to children at high risk of exposure to rabies—where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk. Transmission of rabies by humans has not been recorded but it is advised that those caring for children with the disease should be vaccinated.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org/) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk/).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk.

Post-exposure management
Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel. (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a child has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin p. 798 is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proved that the child was not at risk.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Rotavirus vaccine

Overview
Rotavirus vaccine p. 827 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Smallpox vaccine

Overview
Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.gov.uk/phe.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:
**Tetanus vaccine**

**Overview**

Tetanus vaccine contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation Schedule).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diptheria [low dose], tetanus and poliomyelitis (inactive) vaccine are given with an interval of 1 month between doses.

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be advised about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if their immunisation status is not known or who have been fully immunised but are now immunocompromised (see Immunisation Schedule).

All laboratory staff should be offered a primary course if unimmunised.

**Wounds**

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)

- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure).

Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

**Useful Resources**

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). ---

**Tick-borne encephalitis vaccine**

**Overview**

Tick-borne encephalitis vaccine, inactivated p. 828 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those at risk working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

**Useful Resources**

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

---

**Typhoid vaccine**

**Overview**

Typhoid vaccine p. 820 is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live, attenuated *Salmonella typhi* vaccine for oral use.

Typhoid immunisation is advised for children travelling to:

- areas where typhoid is endemic and whose planned activities put them at higher risk (country-by-country information is available from the National Travel Health Network and Centre);
- endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely.

Capsular polysaccharide typhoid vaccine is given as a single dose, usually by intramuscular injection. Children under 2 years [unlicensed] may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). A single booster dose should be given at 3-year intervals in children over 2 years of age who remain at risk from typhoid fever.

Oral typhoid vaccine is a live, attenuated vaccine contained in an enteric-coated capsule recommended in children aged 6 years and over. One capsule taken on
Varicella-zoster vaccine

Overview
Varicella-zoster vaccine p. 828 (live) is licensed for immunisation against varicella (chickenpox) in seronegative individuals. It is not recommended for routine use in children but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infection.

Rarity, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:
- varicella-susceptible pregnant females;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Varicella-zoster immunoglobulin p. 798 is used to protect susceptible children at increased risk of severe varicella infection (see Immunoglobulins p. 793).

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Yellow fever vaccine

Overview
Yellow fever vaccine, live p. 829 is an attenuated preparation of yellow fever virus grown in chick eggs. Yellow fever vaccine, live is recommended for:
- children aged 9 months or older who are travelling to, or living in areas or countries with a risk of yellow fever transmission;
- children aged 9 months or older who are travelling to, or living in countries that require an International Certificate of Vaccination or Prophylaxis (ICVP) for entry (information about countries at risk of yellow fever is available from the National Health Network and Centre). Children aged under 9 months are at risk of vaccine-associated encephalitis, with the risk being inversely proportional to age. Children aged under 6 months should not be vaccinated. Children aged 6–9 months should only be vaccinated if a detailed risk assessment, and vaccination is generally only recommended if the risk of yellow fever transmission is high (such as during epidemics/outbreaks). If travel is unavoidable, seek expert advice on whether to vaccinate.

A single-dose of yellow fever vaccine, live confers life-long immunity against yellow fever disease. Immunisation should be performed at least 10 days before travelling to an endemic area to allow protective immunity to develop and for the ICVP (if required) to become valid.

Reinforcing immunisation is not needed, except for a small subset of children at continued risk who may not have developed long-term protection from their initial yellow fever vaccine, live vaccination—seek expert advice.

Yellow fever vaccine, live should be avoided in HIV-infected and immunosuppressed children. If the yellow fever risk is unavoidable, consult the Children’s HIV Association of UK and Ireland (www.chiva.org.uk/guidelines/immunisation) or other specialist advice.

All suspected cases of yellow fever must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Chapter 33 National Travel Health Network and Centre
nathnet.net

Vaccines for travel

Immunisation for travel
See advice on Malaria, treatment p. 407.
No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/pha); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination
Vaccines

from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, www.dh.gov.uk).

Immunisation against *meningococcal meningitis* is recommended for a number of areas of the world. Protection against *hepatitis A* is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is recommended and it is likely to be effective even if given shortly before departure; Public Health England recommends travellers can be vaccinated with hepatitis A vaccine up to the day of travel, and no longer recommends the use of normal immunoglobulin for travel prophylaxis. Special care must also be taken with food hygiene.

*Hepatitis B* vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against *rabies* is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a *tetanus* booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

*Typhoid vaccine* is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but *oral cholera vaccine* should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on *diphtheria*, on *Japanese encephalitis*, and on *tick-borne encephalitis* is included in *Health Information for Overseas Travel*.

**Food hygiene**

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

**Information on health advice for travellers**

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org.

The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website. Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

**VACCINES**

**IMPORANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED NOVEMBER 2017)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF-a) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF-a inhibitors and other immunosuppressive biological medicines in utero, PHE advise that any live attenuated vaccination (e.g. BCG vaccine) should be deferred until the infant is age 6 months;
- PHE advise if there is any doubt as to whether an infant due to receive a live attenuated vaccine may be immunosuppressed due to the mother’s therapy, including exposure through breast-feeding, specialist advice should be sought.

**CONTRA-INDICATIONS**

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Impaired immune response Severeley immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

**CAUTIONS**

Acute illness • minor illnesses

CAUTIONS, FURTHER INFORMATION Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

- Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in
immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg or more or 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

- Predisposition to neurological problems When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a low-grade seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended. Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule when they are at least 1 year old.

- When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

- SIDE-EFFECTS
  - Common or very common Appetite decreased · arthralgia · diarrhoea · dizziness · fatigue · fever · headache · irritable bowel syndrome · lymphadenopathy · malaise · myalgia · nausea · skin rashes · vomiting
  - Uncommon Hypersensitivity

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibiotics in viral vaccines).

- PREGNANCY Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

- BREAST FEEDING Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding if the theoretical risk of exposure to disease is significant and the risk of disease is high. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.

- DIRECTIONS FOR ADMINISTRATION If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

- When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also Bacillus Calmette-Guérin vaccine p. 817, and Cautions, further information in measles, mumps and rubella vaccine, live p. 826.

- Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

- The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting blood-borne infections, such as HIV.

- Particular attention should be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

- HANDLING AND STORAGE Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary: many vaccines need to be stored at 2°C–8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

VACCINES ▶ BACTERIAL AND VIRAL VACCINES, COMBINED

Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

- INDICATIONS AND DOSE
  - Primary immunisation
    - By intramuscular injection
      - Child 2 months–9 years: 0.5 mL every month for 3 doses
  - UNLICENSED USE Infanrix-IPV+Hib® not licensed for use in children over 36 months; Pediacel® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

- SIDE-EFFECTS
  - Common or very common Crying abnormal · drowsiness · restlessness
  - Uncommon Cough · extensive swelling of vaccinated limb · increased risk of infection · rhinorrhoea
  - Frequency not known Angioedema · apnoea · hypotonic-hyporesponsiveness episode · seizure

SIDE-EFFECTS, FURTHER INFORMATION The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.
Diphtheria with pertussis, poliomyelitis and tetanus vaccine

**INDICATIONS AND DOSE**

**First booster dose**
- **BY INTRAMUSCULAR INJECTION**
  - Child 3-9 years: 0.5 mL, to be given 3 years after primary immunisation

**Vaccination of pregnant women against pertussis (using low dose vaccines)**
- **BY INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 0.5 mL for 1 dose

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - drowsiness - extensive swelling of vaccinated limb
- **Uncommon** Apathy - asthma - chills - dry throat - oral herpes - pain - paraesthesia - sleep disorder
- **Frequency not known** Angioedema - asthma - hypotonic-hyporesponsive episode - seizure

**SIDE-EFFECTS, FURTHER INFORMATION** The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

**PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

**PRESCRIBING AND DISPENSING INFORMATION** Pregnant women should be vaccinated using low dose vaccines (brands may include *Boostrix-IPV* or *Repevax*).

Available as part of childhood immunisation schedule from health organisations or ImmForm.

Available for vaccination of pregnant women from ImmForm.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **EXCIPIENTS:** May contain Neomycin, polymyxin b, streptomycin
- **Boostrix-IPV** *(GlaxoSmithKline UK Ltd)*
  - *Boostrix-IPV* suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection (PBS) £22.74 DT = £20.00
- **Repevax** *(Sanofi Pasteur)*
  - *Repevax* vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection (PBS) £20.00 DT = £20.00

---

Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine

**INDICATIONS AND DOSE**

**Primary immunisation**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 2 months: 0.5 mL for 1 dose

**Primary immunisation (second dose)**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 3 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of first dose

**Primary immunisation (third dose)**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 4 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of second dose

**SIDE-EFFECTS**
- **Common or very common** Anxiety - crying abnormal
**Bacillus Calmette-Guérin vaccine**

*Infanrix Hexa* vaccine powder and suspension for suspension for injection

**MEDICINAL FORMS** Available as part of childhood schedule from health organisations or ImmForm.

**PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmForm www.immform.gov.uk (SSI brand, multidose vial with diluent).

**CONTRA-INDICATIONS** Generalised septic skin conditions - neonate in household contact with known or suspected case of active tuberculosis

**CONTRA-INDICATIONS, FURTHER INFORMATION** A lesion-free site should be used to administer BCG vaccine to patients with eczema.

**CAUTIONS** When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

**INTERACTIONS** Appendix 1: live vaccines

**SIDE-EFFECTS**

- Rare or very rare Increased risk of infection - osteitis

**PRE-TREATMENT SCREENING** Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculin protein (see tuberculin purified protein derivative p. 799). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

**INDICATIONS AND DOSE**

**Immunisation against tuberculosis**

- **BY INTRADERMAL INJECTION**
  - Neonate: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Child 1-11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

**CONTRA-INDICATIONS** Acute gastro-intestinal illness

**INTERACTIONS** Appendix 1: cholera vaccine

**SIDE-EFFECTS**

- Uncommon Gastrointestinal discomfort - gastrointestinal disorders

**DIRECTIONS FOR ADMINISTRATION** Intradermal injection technique: Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb = 0.1 mL injection, 3 mm bleb = 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

**Medicines**

- **Rare or very rare** Angioedema • anaphylaxis • hypotonic-hyperopic responsiveness episode • seizure • swelling • thrombocytopenia

- **Uncommon** Cough • drowsiness • extensive swelling of vaccinated limb • increased risk of infection

- **Very rare** Angioedema • anaphylaxis • hypotonic-hyperopic responsiveness episode • seizure • swelling • thrombocytopenia

- **Uncommon or very rare** Different medicines containing the same drug.
medicines should be avoided for 1 hour before and after vaccination.

**PATIENT AND CARER ADVICE** Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Haemophilus influenzae type b with meningococcal group C vaccine

**INDICATIONS AND DOSE**
- **Booster dose** (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae type b* component) and primary immunisation against *Neisseria meningitidis*  
  - **BY INTRAMUSCULAR INJECTION**  
  - Child 12-13 months: 0.5 mL for 1 dose
- **Immunisation against *Neisseria meningitidis* in an unimmunised patient**  
  - **BY INTRAMUSCULAR INJECTION**  
  - Child 1-9 years: 0.5 mL for 1 dose

**Booster dose** (for children who have not been immunised against *Haemophilus influenzae type b*)  
- **Booster dose after recovery from *Haemophilus influenzae type b* disease** (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)  
  - **BY INTRAMUSCULAR INJECTION**  
  - Child 1-9 years: 0.5 mL for 1 dose

**Booster dose** (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)  
- **BY INTRAMUSCULAR INJECTION**  
  - Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of *Haemophilus influenzae type b* vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

**Booster dose** (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)  
- **BY INTRAMUSCULAR INJECTION**  
  - Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)

**UNLICENSED USE** Not licensed for use in patients over 2 years.

**SIDE-EFFECTS**
- Common or very common Drowsiness
- Uncommon Crying
- Rare or very rare Abdominal pain · Insomnia

**FREQUENCY NOT KNOWN** Apnoea (in neonates) · Fibrile seizure · Meningism (but no evidence that vaccine causes meningococcal C meningitis) · Muscle tone decreased

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of the childhood immunisation schedule from ImmForm.

**Meningococcal group B vaccine (rDNA, component, adsorbed)**

**INDICATIONS AND DOSE**
- **BEXSERO®**  
  - Immunisation against *Neisseria meningitidis*, primary immunisation  
    - **BY DEEP INTRAMUSCULAR INJECTION**  
      - Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 278.
      - Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 278.
  - **Immunisation against *Neisseria meningitidis*, primary immunisation booster dose**  
    - **BY DEEP INTRAMUSCULAR INJECTION**  
      - Child 12-23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

- **Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)**  
  - **BY DEEP INTRAMUSCULAR INJECTION**  
    - Child 6-11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
    - Child 2-10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
    - Child 11-17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

**TRUMENBA®**  
- Immunisation against *Neisseria meningitidis*, primary immunisation  
  - **BY INTRAMUSCULAR INJECTION**  
    - Child 10–17 years: 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature
MENINGOCOCCAL GROUP C VACCINE

INDICATIONS AND DOSE

Patients with confirmed serogroup C disease (who have previously been immunised)

BY INTRAMUSCULAR INJECTION

Child 1-17 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

SIDE-EFFECTS

Common or very common Anxiety, cough, crying, drowsiness, gastrointestinal discomfort, hypothermia, increased risk of infection, pain, sleep disorders

Uncommon Asthenia, chills, eyelid oedema, flushing, joint stiffness, musculoskeletal stiffness, nasal congestion, oedema, respiratory disorders, seizures, sensation abnormal, syncope

Rare or very rare Circulatory collapse, influenza-like illness

Frequency not known Angioedema, apnoea, dyspnoea, hypotonic-hyporesponsiveness episode, immune thrombocytopenic purpura, meningitis (but no evidence that vaccine causes meningococcal C meningitis), Stevens-Johnson syndrome

PRESCRIBING AND DISPENSING INFORMATION

Available as part of childhood immunisation schedule from www.immunform.dh.gov.uk

MEDICINAL FORMS

There can be a variation in the licensing of different medicines containing the same drug.

Suspension for injection

Nimenrix (Pfizer Ltd)

Nimenrix vaccine powder and solvent for solution for injection 0.5 mL prefilled vials (250) = £30.00

Primary immunisation against Neisseria meningitidis in those at risk of exposure to prevent invasive disease

BY INTRAMUSCULAR INJECTION

Child 3-11 months: 0.5 mL every month for 2 doses, dose preferably injected into deltoid region

Child 1-17 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Patients attending university for the first time (who have not received the routine meningococcal groups A with C and W135 Y conjugate vaccine over the age of 10 years)

BY INTRAMUSCULAR INJECTION

Child 16-17 years: 0.5 mL for 1 dose

NIMENRIX

Primary immunisation against Neisseria meningitidis

Child 13-15 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region

Immunisation against Neisseria meningitidis in an unimmunised patient

BY INTRAMUSCULAR INJECTION

Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against Neisseria meningitidis in those at risk of exposure

BY INTRAMUSCULAR INJECTION

Child 1-17 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in child ≥12 months), then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of Neisseria meningitidis serogroup A infection

Patients attending university for the first time (who have not received the routine meningococcal groups A with C and W135 Y conjugate vaccine over the age of 10 years)

BY INTRAMUSCULAR INJECTION

Child 16-17 years: 0.5 mL for 1 dose

UNLICENSED USE

MENVEO ® Menveo ® is not licensed for use in children under 2 years.

SIDE-EFFECTS

Common or very common Crying abnormal, drowsiness, eating disorder

Uncommon Seizures, vascular disorders

Frequency not known Extensive swelling of vaccinated limb - hypotonic-hyporesponsiveness episode

Meningococcal groups A with C and W135 and Y vaccine

INDICATIONS AND DOSE

MENVEO ®, PREVENAR 13 ®, Pneumococcal polysaccharide conjugate vaccine (adsorbed)

Vaccines
Vaccines

Primary immunisation against pneumococcal infection [second dose]
▶ By Intramuscular Injection
- Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year

Primary immunisation against pneumococcal infection [booster dose]
▶ By Intramuscular Injection
- Child 1 year: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year; deltoid muscle is preferred in older children

Immunisation against pneumococcal infection [in patients who are unimmunised or partially immunised]
▶ By Intramuscular Injection
- Child 3-11 months: 0.5 mL for 2 doses, given 2 months apart (interval may be reduced to 1 month to ensure immunisation schedule is completed), followed by 0.5 mL for 1 dose on their first birthday, given at least 2 months after the last dose. Anterolateral thigh is preferred site of injection in infants under 1 year
- Child 12-23 months: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection [immunised patients at increased risk]
▶ By Intramuscular Injection
- Child 14 months-17 years: 0.5 mL for 1 dose, given at least 2 months after primary immunisation booster dose, deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection [unimmunised or partially immunised patients at increased risk]
▶ By Intramuscular Injection
- Child 3-11 months: 0.5 mL for 2 doses, given 2 months apart (interval may be reduced to 1 month to ensure immunisation schedule is completed), followed by 0.5 mL for 1 dose on their first birthday, given at least 2 months after the last dose, followed by 0.5 mL for 1 dose, given at least 2 months after the last dose. Anterolateral thigh is preferred site of injection in infants under 1 year
- Child 1-9 years: 0.5 mL for 1 dose, an additional dose is recommended (at least 2 months later) in those who are severely immunocompromised. Deltoid muscle is preferred site of injection in children
- Child 10-17 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

**SYNFLORIX®**

Immunisation against pneumococcal infection
▶ By Intramuscular Injection
- Child 6 weeks-4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

- **UNLICENSED USE**
  - PREVENAR 13®: The dose in BNF publications may differ from that in product literature.

- **SIDE-EFFECTS**
  - Common or very common: Drowsiness
  - Uncommon: Apnoea - crying abnormal - extensive swelling of vaccinated limb
  - Rare or very rare: Angioedema - hypotonic-hyporesponsiveness episode - Kawasaki disease - seizure

- **PRESCRIBING AND DISPENSING INFORMATION**
  - PREVENAR 13®: Available as part of childhood immunisation schedule from ImnForm www.imnform.dh.gov.uk.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Suspension for injection
    - Prevenar (Pfizer Ltd)
      - Prevenar 13 vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £49.10 | 10 pre-filled disposable injection £491.00
    - Synflorix (GliaoSmithKline UK Ltd)
      - Synflorix vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £27.60

---

**Pneumococcal polysaccharide vaccine**

01-May-2019

- **INDICATIONS AND DOSE**
  - Immunisation against pneumococcal infection [in patients at increased risk]
    - By Intramuscular Injection
      - Child 2-17 years: 0.5 mL for 1 dose, dose should be administered at least 2 months after the last dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), deltoid muscle is preferred site of injection in children and adults

  - Immunisation against pneumococcal infection [revaccination; booster dose in patients with no spleen, splenic dysfunction or chronic kidney disease]
    - By Intramuscular Injection
      - Child 7-17 years: 0.5 mL every 5 years, deltoid muscle is preferred site of injection in children and adults

- **SIDE-EFFECTS**
  - Angioedema - arthritis - asthma - chills - febrile seizure - haemolytic anaemia - injected limb mobility decreased - leucocytosis - lymphadenitis - nerve disorders - paraesthesia - peripheral oedema - thrombocytopenia

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Pneumococcal polysaccharide vaccine (Non-proprietary)
      - Pneumococcal polysaccharide vaccine solution for injection 0.5mL vials | 1 vial £18.32
    - Pneumovax 23 (Merck Sharp & Dohme Ltd)
      - Pneumovax 23 solution for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £16.80

---

**Typhoid vaccine**

- **INDICATIONS AND DOSE**
  - Immunisation against typhoid fever in children at high risk of typhoid fever
    - By Intramuscular Injection
      - Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

  - Immunisation against typhoid fever
    - By Intramuscular Injection
      - Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
        - By Mouth
          - Child 6-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)

- **UNLICENSED USE**
  - With intramuscular use: Not licensed for use in children under 2 years.

- **CONTRA-INDICATIONS**
  - With oral use: Acute gastro-intestinal illness

- **INTERACTIONS**
  - Appendix 1: live vaccines
**SIDE-EFFECTS**
- Common or very common
  - With oral use: Gastrointestinal discomfort, influenza-like illness
- Rare or very rare
  - With oral use: Asthenia, back pain, chills, flatulence, paraesthesia

**DIRECTIONS FOR ADMINISTRATION**
Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

**HANDLING AND STORAGE**
It is important to store capsules in a refrigerator.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Typhim Vi (Sanofi Pasteur)
  - Salmonella typhi Vi capsular polysaccharide 50 microgram per 1 ml Typhim Vi 25micrograms/0.5ml vaccine solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £11.16 DT = £11.16 | 10 pre-filled disposable injection (POM) £111.60 DT = £11.60

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS**
- 25

**Vaccines**

**Hepatitis A and B vaccine**
The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine below, hepatitis B vaccine p. 822.

**INDICATIONS AND DOSE**

**AMBIRIX**

**Immunisation against hepatitis A and hepatitis B infection (primary course)**
- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months for 1 dose, the deltoid region is the preferred site of injection; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX**

**Immunisation against hepatitis A and hepatitis B infection (primary course)**
- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Precautions**
- Rare or very rare
- Common or very common

**AMBIRIX**

**Immunisation against hepatitis A and hepatitis B infection (primary course)**
- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be continued...
used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

HAVRIX MONODOSE

Immunisation against hepatitis A infection
- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
  - Child 16–17 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

VAQTA ® PEDIATRIC

Immunisation against hepatitis A infection
- **BY INTRAMUSCULAR INJECTION**
  - Child 17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

- **SIDE-EFFECTS**
  - **Uncommon** Anxiety · asthenia · cough · crying · drowsiness · gastrointestinal discomfort · nasal complaints · pain · sleep disorders
  - **Rare or very rare** Allergic rhinitis · asthma · ataxia · burping · chest pain · constipation · dehydration · ear pain · eyelid crusting · feeling hot · flushing · gait abnormal · gastrointestinal disorders · infantile spitting up · influenza like illness · musculoskeletal stiffness · oropharyngeal pain · paraesthesia · respiratory tract congestion · sneezing · sensation of tightness · sweat changes · synovitis
  - **Frequency not known** Guillain-Barre syndrome · thrombocytopenia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
EXCIPIENTS: May contain Neomycin
- **Avarix** (Sanofi Pasteur)
  - Avarix vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection £21.72 | 10 pre-filled disposable injection £217.20
- **Havrix** (GlaxoSmithKline UK Ltd)
  - Havrix Monodose vaccine suspension for injection 1 mL pre-filled syringes | 1 pre-filled disposable injection £22.14 DT + £22.14 |
  - 10 pre-filled disposable injection £221.43
  - Havrix Junior Monodose vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection £16.77 |
  - 10 pre-filled disposable injection £167.68
- **VAQTA** (Merck Sharp & Dohme Ltd)
  - VAQTA Paediatric vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection £14.74

- **Hepatitis A with typhoid vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 821, typhoid vaccine p. 820.

- **INDICATIONS AND DOSE**

HEPATYRIX ®

Immunisation against hepatitis A and typhoid infection (primary course)
- **BY INTRAMUSCULAR INJECTION**
  - Child 15–17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

VIATIM ®

Immunisation against hepatitis A and typhoid infection (primary course)
- **BY INTRAMUSCULAR INJECTION**
  - Child 16–17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
EXCIPIENTS: May contain Neomycin
- **VIATIM** (Sanofi Pasteur)
  - VIATIM vaccine suspension for injection 1 mL pre-filled syringes | 1 pre-filled disposable injection £35.76 DT + £35.76

- **Hepatitis B vaccine**

- **INDICATIONS AND DOSE**

ENGERIX B ®

Immunisation against hepatitis B infection
- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.

  - Child 1 month–15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
  - Child 16–17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)
- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to
be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.

- **Child 1 month-15 years:** 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- **Child 16-17 years:** 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

### Immunisation against hepatitis B infection, alternative accelerated schedule

- **By intramuscular injection**

- **Child 11-15 years:** 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- **Child 16-17 years:** 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

### Immunisation against hepatitis B infection for neonates born to hepatitis B surface antigen positive mother

- **By intramuscular injection**

- **Neonate:** 10 micrograms once a month for 3 doses, first dose to be given at birth with hepatitis B immunoglobulin injection (separate site), followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

### Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

- **By intramuscular injection**

- **Neonate:** 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- **Child 1 month-15 years:** 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- **Child 16-17 years:** 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

### Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

- **By intramuscular injection**

- **Neonate:** 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- **Child 1 month-15 years:** 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

### Immunisation against hepatitis B infection (including pre-haemodialysis and haemodialysis patients)

- **By intramuscular injection**

- **Child 15-17 years:** 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

### HBVAXPRO®

### Immunisation against hepatitis B infection

- **By intramuscular injection**

- **Neonate:** 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- **Child 1 month-15 years:** 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- **Child 16-17 years:** 10 micrograms every month for 1 dose, followed by 10 micrograms after 1 month for 1 dose, then 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

### Immunisation against hepatitis B infection (accelerated schedule)

- **By intramuscular injection**

- **Neonate:** 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- **Child 1 month-15 years:** 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
thigh is preferred site in infants; not to be injected into the buttck (vaccine efficacy reduced)

- Child 16–17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttck (vaccine efficacy reduced)

Neonate born to hepatitis B surface antigen-positive mother

- By intramuscular injection

- Neonate: 5 micrograms every month for 3 doses, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced)

### Chronic haemodialysis patients

- By intramuscular injection

- Child 16–17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttck (vaccine efficacy reduced)

### Side-effects

- Common or very common: Drowsiness - gastrointestinal disorder
- Rare or very rare: Influenza like illness

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

EXCIPIENTS: May contain Thiomersal

- Engerix B (GlaxoSmithKline UK Ltd)
- Hepatitis B virus surface antigen 20 microgram per ml Engerix B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection | £8.95 DT = £8.95
- Hepatitis B 20micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection | £12.99 DT + £12.99 | 10 pre-filled disposable injection | £129.92
- Fendrix (GlaxoSmithKline UK Ltd)
- Hepatitis B virus surface antigen 40 microgram per ml Fendrix 20micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection | £27.60 DT = £27.60
- HBVAXPRO (Merck Sharp & Dohme Ltd)
- Hepatitis B virus surface antigen 10 microgram per ml HBVAXPRO 5micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection | £8.95 DT = £8.95
- Hepatitis B virus surface antigen 10 microgram per ml HBVAXPRO 40micrograms/1ml vaccine suspension for injection vials | 1 vial | £38.10 DT = £38.10

### Human papillomavirus vaccines

#### Cervarix®

Prevention of pre-malignant genital lesions and cervical cancer

- By intramuscular injection

- Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

#### Gardasil®

Prevention of pre-malignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

- By intramuscular injection

- Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

#### Indications and dose

**Prevention of pre-malignant genital lesions and cervical cancer**

- By intramuscular injection

- Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
Influenza vaccine

25-Oct-2018

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **Cervarix** (GlaxoSmithKline UK Ltd) Cervarix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £80.50
- **Gardasil** (Merck Sharp & Dohme Ltd) Gardasil vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £86.50 OT = £86.50

**VACCINES**

- **FLUENZ TETRA** (AstraZeneca UK Ltd) Fluenz Tetra vaccine nasal suspension 0.5ml pre-filled syringes

**INDICATIONS AND DOSE**

- **Annual immunisation against seasonal influenza**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 6 months-17 years: 0.5 mL for 1 dose
  - **BY INTRANASAL ADMINISTRATION**
    - Child 2-17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

- **Annual immunisation against seasonal influenza (for children in clinical risk groups who have not received seasonal influenza vaccine previously)**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 6 months-8 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, after at least 4 weeks
  - **BY INTRANASAL ADMINISTRATION**
    - Child 2-8 years: 0.1 mL for 1 dose, followed by 0.1 mL for 1 dose, after at least 4 weeks. 0.1 mL dose to be administered to each nostril

- **UNLICENSED USE** The Joint Committee on Vaccination and Immunisation advises offering a second dose of vaccine for annual immunisation against seasonal influenza to children in clinical risk groups only.

- **CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

- **FLUENZ TETRA** Active wheezing - comitant use with antiviral therapy for influenza - comitant use with salicylates - severe asthma

- **CONTRA-INDICATIONS, FURTHER INFORMATION**

- **CONTRA-INDICATIONS**
  - Concomitant use with antiviral therapy for influenza
  - Avoid influenza antiviral agents for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the influenza antiviral agent.

- **CAUTIONS** Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

- **INTERACTIONS** Appendix 1: live vaccines

- **SIDE-EFFECTS**
  - Common or very common
    - With intramuscular use: Chills, hyperhidrosis, induration, local reactions, pain
    - With intranasal use: Nasal complaints
  - Uncommon
    - With intranasal use: Epistaxis, face oedema
    - Frequency not known
      - With intramuscular use: Angioedema, encephalomyelitis, extensive swelling of vaccinated limb, febrile seizure, nerve disorders, nervous system disorder, parasthesia, shock, syncope, thrombocytopenia, vasculitis
      - With intranasal use: Guillain–Barre syndrome

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY** Inactivated vaccines not known to be harmful.

- **FLUENZ TETRA** Avoid in pregnancy.

- **BREAST FEEDING** Inactivated vaccines not known to be harmful.

- **FLUENZ TETRA** Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION** The available preparations are not licensed for use in all age-groups—further information can be found in the product literature for the individual vaccines.

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**

- **FLUENZ TETRA** Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Spray**
  - **EXCIPIENTS:** May contain Gelatin, gentamicin
    - **Fluenz TETRA** (AstraZeneca UK Ltd) Fluenz Tetra vaccine nasal suspension for injection 0.5ml pre-filled syringes | 1 unit dose £118.00

- **Suspension for injection**
    - **EXCIPIENTS:** May contain Gentamicin, kanamycin, neomycin, polymyxin b
      - **Influenza vaccine (non-proprietary)**
    - **Trivalent influenza vaccine (split virion, inactivated)**
      - High Dose suspension for injection 0.5ml pre-filled syringes | 5 pre-filled disposable injection (PFS) £20.00
      - Influenza vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection (PFS) £65.90
    - **Quadrivalent influenza vaccine (split virion, inactivated)**
      - Suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £8.00 | 10 pre-filled disposable injection (PFS) £80.00
      - Influenza Tetra MYL vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £8.00 | 10 pre-filled disposable injection (PFS) £80.00
      - Influenza MYL vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £6.59 | 10 pre-filled disposable injection (PFS) £65.90
    - **Flud (Seqirus Vaccines Ltd)** Flud vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £9.79 | 10 pre-filled disposable injection (PFS) £97.90
    - **Fluarix Tetra** (GlaxoSmithKline UK Ltd)
      - Fluarix Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £9.94 | 10 pre-filled disposable injection (PFS) £99.40
    - **Flucelvax Tetra** (Seqirus Vaccines Ltd)
      - Flucelvax Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £9.94 | 10 pre-filled disposable injection (PFS) £99.40
    - **Imuvac** (Mylan)
      - Imuvac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £6.59 | 10 pre-filled disposable injection (PFS) £65.90
    - **Influvac Sub-unit** (Mylan)
      - Influvac Sub-unit vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £5.22 | 10 pre-filled disposable injection (PFS) £52.20
      - Influvac Sub-unit Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) £9.94 | 10 pre-filled disposable injection (PFS) £99.40
Japanese encephalitis vaccine

**Indications and dose**

**Immunisation against Japanese encephalitis**
- **By intramuscular injection**
  - Child 2-35 months: 0.25 mL every 28 days for 2 doses, alternatively 0.25 mL every 7 days for 2 doses, anterolateral thigh may be used as the injection site in infants; deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure
  - Child 3-17 years: 0.5 mL every 28 days for 2 doses, alternatively 0.5 mL every 7 days for 2 doses, deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure

**First booster**
- **By intramuscular injection**
  - Child 12 months: live vaccine should not be given second may be considered.

**Unlicensed use**

- When used for immunisation against Japanese encephalitis The rapid schedule administered at days 0 and 7 is not licensed in children or the elderly.

**Side-effects**

- Abdominal pain · cough · influenza like illness

**Pregnancy**

- Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Japanese encephalitis GCVC vaccine (non-proprietary)
  - Japanese encephalitis GCVC vaccine solution for injection 1ml vials |
  - 1 vial (Valneva UK Ltd)
  - Japanese encephalitis GCVC vaccine solution for injection 20ml vials |
  - 1 vial (Valneva UK Ltd)
  - Japanese encephalitis GCVC vaccine solution for injection 10ml vials |
  - 1 vial (Valneva UK Ltd)

**Suspension for injection**

- Ixiaro vaccine suspension for injection 0.5ml pre-filled syringes |
  - 1 pre-filled disposable injection (Post) £59.50

---

Measles, mumps and rubella vaccine, live

**Indications and dose**

**Primary immunisation against measles, mumps, and rubella (first dose)**
- **By intramuscular injection, or by deep subcutaneous injection**
  - Child 12-13 months: 0.5 mL for 1 dose

**Primary immunisation against measles, mumps, and rubella (second dose)**
- **By intramuscular injection, or by deep subcutaneous injection**
  - Child 40 months-5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)

- By intramuscular injection, or by deep subcutaneous injection
  - Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose)

- Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course
  - Control of measles outbreak
  - Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation

**Unlicensed use**

- Not licensed for use in children under 9 months.

---

**Important safety information**

**MMR vaccination and bowel disease or autism**

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/imunication.

**Caution**

- Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion– leave an interval of at least 3 months before MMR immunisation

**Caution, further information**

- Administration with other vaccines MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

- MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

**Interactions**

- Appendix 1: live vaccines

**Side-effects**

- Uncommon: Angioedema · arthritis · ataxia · cough · encephalopathy · eye inflammation · meningitis aseptic · nerve deafness · nerve disorders · ocular motor nerve paralysis · oedema · panniculitis · papillitis · paraesthesia · regional lymphadenopathy · respiratory disorders · seizures · Stevens-Johnson syndrome · subacute sclerosing panencephalitis · syncope · throat pain · thrombocytopenia · vasculitis

**Side-effects, further information**

- Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days.

- Febrile seizures occur rarely to 11 days after MMR vaccination (the incidence is lower than that following measles infection).
Vaccination 827

MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. Samples should be sent to the Virus Reference Laboratory of the Health Protection Agency.

**Frequency of side effects** Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

- **ALLERGY AND CROSS-SENSITIVITY** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or Immunform www.immunform.dh.gov.uk.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection** EXCIPIENTS: May contain Gelatin, neomycin

- M-M-RVAXPRO (Merck Sharp & Dohme Ltd)

  M-M-RVAXPRO vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £11.00

**Powder and solvent for solution for injection** EXCIPIENTS: May contain Neomycin

- Priorix (GliaoxSmithKline UK Ltd)

  Priorix vaccine powder and solvent for solution for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £7.64

---

**Rabies vaccine**

- **INDICATIONS AND DOSE**

  **Pre-exposure prophylaxis**

  - BY INTRAMUSCULAR INJECTION
  - Child: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

  **Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)**

  - BY INTRAMUSCULAR INJECTION
  - Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies

  **Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)**

  - BY INTRAMUSCULAR INJECTION
  - Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants

---

**Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)**

- BY INTRAMUSCULAR INJECTION

  - Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary

  **Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)**

  - BY INTRAMUSCULAR INJECTION

  - Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

---

**Rotavirus vaccine**

- **DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

---

**INTERACTIONS** → Appendix 1: rabies vaccine

**SIDE-EFFECTS**

- **Common or very common** Asthenia · gastrointestanal discomfort

- **Rare or very rare** Angioedema · chills · encephalitis · Guillain-Barre syndrome · hyperhidrosis · paraesthesia · syncope · vertigo

**PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

---

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection** EXCIPIENTS: May contain Neomycin

- Rabies vaccine (Non-proprietary) Rabies vaccine powder and solvent for suspension for injection 1ml vials | 1 vial £0.84

**Powder and solvent for solution for injection** EXCIPIENTS: May contain Neomycin

- Rabipur (GliaoxSmithKline UK Ltd) Rabipur vaccine powder and solvent for solution for injection 1ml vials | 1 vial £34.56

Rabipur vaccine powder and solvent for solution for injection 1ml pre-filled syringes | 1 pre-filled disposable injection £34.56

---

**Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)**

- BY INTRAMUSCULAR INJECTION

  - Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary

  **Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)**

  - BY INTRAMUSCULAR INJECTION

  - Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of

---

**Rotavirus vaccine**

- **DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.
be completed before 24 weeks of age (preferably before 16 weeks)

**CONTRA-INDICATIONS** History of intussusception - predisposition to intussusception - severe combined immunosuppression

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Immunosuppression With the exception of severe combined immunodeficiency (children born to mothers who received immunosuppressive biological therapy during pregnancy, see Important safety information), rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.
- **CAUTIONS** Diarrhoea (postpone vaccination) - immunosuppressed close contacts - vomiting (postpone vaccination).

**CAUTIONS, FURTHER INFORMATION** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

**INTERACTIONS** → Appendix 1: live vaccines

**SIDE-EFFECTS**
- Frequency not known: Apreo - haematochezia

**PATIENT AND CARER ADVICE** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- **Rotarix** (GlaxoSmithKline UK Ltd)
  - Rotarix vaccine live oral suspension 1.5ml pre-filled syringes | 1 unit dose £34.76
  - Rotarix vaccine live oral suspension 1.5ml tube | 1 tube £34.76

---

**Varicella-zoster vaccine**

**INDICATIONS AND DOSE**

**VARILRIX®**

**Prevention of varicella infection (chickenpox)**
- **BY SUBCUTANEOUS INJECTION**
  - Child 1-17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh

**VARIVAX®**

**Prevention of varicella infection (chickenpox)**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
  - Child 13-17 years: 0.5 mL for 2 doses, interval of 4–8 weeks between each dose, to be administered preferably into the deltoid region

**Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1-12 years: 0.5 mL for 2 doses, interval of 12 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)

**CAUTIONS** Post-vaccination close contact with susceptible individuals

---

**Tick-borne encephalitis vaccine, inactivated**

**INDICATIONS AND DOSE**

**Initial immunisation against tick-borne encephalitis**
- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

**Child 16-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved**

**Immunisation against tick-borne encephalitis, booster doses**
- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)

---

**SIDE-EFFECTS**
- Common or very common: Restlessness - sleep disorder
- Uncommon: Chills - gastrointestinal discomfort
- Rare or very rare: Asthenia - dyspnoea - encephalitis - eye pain - gait abnormal - hyperhidrosis - influenza like illness - meningism - motor dysfunction - musculoskeletal stiffness - nerve disorders - oedema - pain - seizures - sensory disorder - tinnitus - vertigo - vision disorders

**ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

---

**INTERACTIONS**
- Appendix 1: live vaccines
CAUTIONS, FURTHER INFORMATION Rarely, the varicella–zoster virus vaccine has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:
- varicella–susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised poplar or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- Administration with MMR vaccine Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.
- INTERACTIONS → Appendix 1: live vaccines
- SIDE-EFFECTS
  - Uncommon Cough; drowsiness; increased risk of infection
  - Rare or very rare Abdominal pain; conjunctivitis; Kawasaki disease; seizure; stroke; thrombocytopenia; vasculitis
- CONCEPTION AND CONTRACEPTION Avoid pregnancy for 3 months after vaccination.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
  - Powder and solvent for suspension for injection EXCIPIENTS: May contain Gelatin, neomycin
    - Varivax (Merck Sharp & Dohme Ltd) Varivax vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial £30.28
  - Powder and solvent for solution for injection EXCIPIENTS: May contain Neomycin
    - Varilrix (GlaxoSmithKline UK Ltd) Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial £27.31

Yellow fever vaccine, live

- INDICATIONS AND DOSE
  - Immunisation against yellow fever
    - BY DEEP SUBCUTANEOUS INJECTION
      - Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
      - Child 9 months–17 years: 0.5 mL for 1 dose
  - IMPORTANT SAFETY INFORMATION
    - MHRA/CHM ADVICE: YELLOW FEVER VACCINE (STAMARIL®) AND FATAL ADVERSE REACTIONS: EXTREME CAUTION NEEDED IN PEOPLE WHO MAY BE IMMUNOSUPPRESSED (APRIL 2019)

The yellow fever vaccine (Stamaril®) has been associated with an increased risk of life-threatening reactions and must not be given to patients with a history of thymus dysfunction (including myasthenia gravis and thymoma), to patients that are immunosuppressed, or that have had a thymectomy. Prior to administering yellow fever vaccines, healthcare professionals are advised to familiarise themselves with any contra-indications and special precautions, and to defer vaccination if it is suspected that a patient is immunosuppressed, until specialist advice can be sought.

Healthcare professionals administering vaccines should consult information in the YF Vaccine Centre code of practice and strengthen protocols and checklists to avoid inappropriate administration.

- CONTRA-INDICATIONS Children under 6 months; history of thymus dysfunction
- CAUTIONS
- CAUTIONS, FURTHER INFORMATION
  - Administration with MMR vaccine Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.
  - INTERACTIONS → Appendix 1: live vaccines
  - SIDE-EFFECTS
    - Common or very common Asthenia; crying; drowsiness
    - Uncommon Abdominal pain
    - Rare or very rare Rhinitis; yellow fever vaccine-associated neurotropic disease; yellow fever vaccine-associated viscerotropic disease
  - Frequency not known Angioedema; influenza-like illness; paraesthesia

SIDE-EFFECTS, FURTHER INFORMATION Very rare vaccine-associated adverse effects may occur, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity. Increased risk of fatal reactions reported in patients aged 60 years and older and those who are immunosuppressed.

- ALLERGY AND CROSS-SENSITIVITY Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.

- PREGNANCY Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

- BREAST FEEDING Avoid; seek specialist advice if exposure to virus cannot be avoided.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection
- Stamaril (Sanofi Pasteur) Stamaril vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial £39.72

22-May-2019
Chapter 15
Anaesthesia

General anaesthesia

Anaesthesia (general)

Overview
Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated children and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics
Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’).

Total intravenous anaesthesia
This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations; specific models with paediatric pharmacokinetic data should be used for children.

Drugs used for intravenous anaesthesia
Propofol p. 832, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures.

Thiopental sodium p. 228 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect particularly in neonates and recovery is much slower.

Etomidate p. 831 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 846 causes less hypotension than thiopental sodium and propofol during induction. It is sometimes used in children requiring repeat anaesthesia (such as for serial burns dressings), however recovery is relatively slow and there is a high incidence of extraneous muscle movements. Ketamine can cause hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 226 or midazolam p. 229.

Inhalational anaesthetics
Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 835 is being administered.

Volatile liquid anaesthetics
Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 834 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise. Systemic arterial pressure and cardiac...
output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is not recommended for induction of anaesthesia in infants and children of all ages because of the occurrence of cough, breath-holding, desaturation, increased secretions, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 834 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 835 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia.

Nitrous oxide
Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, it is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox® , Equanox® ) is used. Self-administration using a demand valve may be used in children who are able to self-regulate their intake (usually over 5 years of age) for painful dressing changes, as an aid to postoperative physiotherapy, for wound debridement and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in children with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 840 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in children at high risk of malignant hyperthermia.

Dantrolene sodium p. 848 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice
Overview
Sedation for dental procedures should be limited to conscious sedation whenever possible. Nitrous oxide p. 835 alone and midazolam p. 229 are effective for many children.

Surgery and long-term medication
Overview
The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period.

Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include drugs for epilepsy, asthma, immunosuppression, and metabolic, endocrine and cardiovascular disorders (but see potassium sparing diuretics). Expert advice is required for children receiving antivirals for HIV infection. See general advice on surgery in children with diabetes in Diabetes, surgery and medical illness p. 466.

Children taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 97 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 512. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped.

Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

ANAESTHETICS, GENERAL > INTRAVENOUS

Etomidate

- INDICATIONS AND DOSE
  - Induction of anaesthesia
    - By slow intravenous injection
      - Child 1 month–14 years: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous), increased if necessary to 400 micrograms/kg
      - Child 15–17 years: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous)
**UNLICENSED USE** Hypnomidate® licensed for use in children (age range not specified by manufacturer). Etomidate-Lipuro® not licensed for children under 6 months except for imperative indications during inpatient treatment. Doses in BNF for Children may differ from those in the product literature.

**CAUTIONS** Acute circulatory failure (shock) · adrenal insufficiency · Avoid in Acute porphyrias p. 624 · cardiovascular disease · fixed cardiac output · hypovolaemia

**CAUTIONS, FURTHER INFORMATION**
- Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.
- **INTERACTIONS** Appendix 1: etomidate
- **SIDE-EFFECTS**
  - **Common or very common** Apathy, hypotension, movement disorders, nausea, respiratory disorders, skin reactions, vascular pain, vomiting
  - **Uncommon** Arrhythmias, cough, hiccups, hypersalivation, hypertension, muscle rigidity, neuromuscular dysfunction, nystagmus, procedural complications
  - **Frequency not known** Adrenal insufficiency, atrioventricular block, cardiac arrest, embolism and thrombosis, seizures, shock, Stevens-Johnson syndrome, trismus

**SIDE-EFFECTS, FURTHER INFORMATION** Pain on injection Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**HEPATIC IMPAIRMENT**
- **Dose adjustments** Manufacturer advises reduce dose in liver cirrhosis.
- **DIRECTIONS FOR ADMINISTRATION** To be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).

**PATIENT AND CAREER ADVICE**
- **Driving and skilled tasks** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Etomidate 2 mg per 1 ml** Hypnomidate 20mg/10ml solution for injection ampoules | 1 ampoule (PSt) £6.30

---

**Propofol**

**INDICATIONS AND DOSE**

**Induction of anaesthesia using 0.5% or 1% injection**
- **By slow intravenous injection**
  - Child 1 month–16 years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response
  - Child 17 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

**Induction of anaesthesia using 2% injection**
- **By intravenous infusion**
  - Child 3–16 years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response
  - Child 17 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

**Maintenance of anaesthesia using 1% injection**
- **By continuous intravenous infusion**
  - Child 1 month–16 years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response
  - Child 17 years: Usual dose 4–12 mg/kg/hour, adjusted according to response

**Maintenance of anaesthesia using 2% injection**
- **By continuous intravenous infusion**
  - Child 3–16 years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response
  - Child 17 years: Usual dose 4–12 mg/kg/hour, adjusted according to response

**Sedation of ventilated patients in intensive care using 1% or 2% injection**
- **By continuous intravenous infusion**
  - Child 16–17 years: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

**Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection**
- **By slow intravenous injection**
  - Child 1 month–16 years: Initially 1–2 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response
  - Child 17 years: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

**Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection**
- **Initially by intravenous infusion**
  - Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required)

**Maintenance of sedation for surgical and diagnostic procedures using 1% injection**
- **Initially by intravenous infusion**
  - Child 1 month–16 years: Usual dose 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) up to 1 mg/kg, (if rapid increase in sedation required)
  - Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow
### General anaesthesia

**Anaesthesia**

**Volatile halogenated anaesthetics**

**Important Safety Information**

- Should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

#### Contra-indications

- Children under 16 years receiving intensive care.

#### Further Information

- Use in intensive care associated with a risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).

### Interactions

- Appendix 1: propofol

### Side-effects

- Common or very common: Apnoea, arrhythmias, headache, hypotension, localised pain, nausea, vomiting.

- Uncommon: Thrombosis.

- Rare or very rare: Epileptiform seizure (may be delayed), pancreatitis, post-procedural complications, pulmonary oedema, sexual disinhibition, soft tissue necrosis, urine discoloration.

### Frequency not known

- Drug use disorders, dyskinesia, euphoric mood, heart failure, hepatomegaly, hyperkalaemia, hyperlipidaemia, metabolic acidosis, renal failure, respiratory depression, rhabdomyolysis.

### Side-effects, Further Information

- Bradycardia.

- Bradyarrhythmia may be profound and may be treated with intravenous lidocaine.

### Propofol infusion syndrome

- Prolonged infusion of propofol doses exceeding 4mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

### Pregnancy

- May depress neonatal respiration if used during delivery.

### Dose adjustments

- Max. dose for maintenance of anaesthesia 6mg/kg/hour.

### Breastfeeding

- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

### Hepatic impairment

- Manufacturer advises caution.

### Renal impairment

- Use with caution.

### Monitoring requirements

- Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.

### DIRECTIONS FOR ADMINISTRATION

- Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%.

#### 0.5% Emulsion

- For injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1mg/ml. 1% Emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro®) only; dilute to a concentration not less than 2mg/ml; use within 6 hours of preparation. 2% Emulsion for infusion; do not dilute.

### Patient and Carer Advice

- Driving and skilled tasks.

### Medicinal forms

- There can be variation in the licensing of different medicines containing the same drug.

#### Emulsion for infusion

- **Propofol (Non-proprietary)**

  - **Propofol 10 mg per 1 ml** Propofol 500mg/50ml emulsion for infusion vials | 1 vial £15.00 (Hospital only)
  - **Propofol-Lipuro 1% emulsion for infusion 50ml vials** | 10 vial £97.56 (Hospital only)
  - **Propofol 1g/100ml emulsion for infusion vials** | 1 vial £15.00 (Hospital only)
  - **Propofol-Lipuro 1% emulsion for infusion 100ml vials** | 10 vial £186.64 (Hospital only)
  - **Propofol 20 mg per 1 ml** Propofol 1g/50ml emulsion for infusion vials | 1 vial £15.00 (Hospital only)
  - **Propofol-Lipuro 2% emulsion for infusion 50ml vials** | 10 vial £186.64 (Hospital only)
  - **Propofol (Aspen Pharma Trading Ltd)**
    - **Propofol 10 mg per 1 ml** Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection £10.68
    - **Propofol 20 mg per 1 ml** Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection £15.16
  - **Propoven (Fresenius Kabi Ltd)**
    - **Propofol 10 mg per 1 ml** Propoven 1% emulsion for infusion 50ml vials | 10 vial £210.60 (Hospital only)
    - **Propoven 10% emulsion for infusion 100ml vials** | 10 vial £241.50 (Hospital only)
    - **Propofol 20 mg per 1 ml** Propoven 2% emulsion for infusion 50ml vials | 10 vial £241.50 (Hospital only)

#### Emulsion for injection

- **Propofol (Non-proprietary)**

  - **Propofol 10 mg per 1 ml** Propofol 200mg/20ml emulsion for injection vials | 5 vial £20.00 (Hospital only)
  - **Propofol-Lipuro 1% emulsion for injection 20ml ampoules** | 5 ampoule £15.36 (Hospital only)
  - **Diprivan (Aspen Pharma Trading Ltd)**
    - **Propofol 10 mg per 1 ml** Diprivan 1% emulsion for injection 20ml ampoules | 5 ampoule £15.15
  - **Propofol-Lipuro (B.Braun Melsungen AG)**
    - **Propofol 5 mg per 1 ml** Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoule £23.90 (Hospital only)
  - **Propoven (Fresenius Kabi Ltd)**
    - **Propofol 10 mg per 1 ml** Propoven 1% emulsion for injection 20ml ampoules | 5 ampoule £15.15
adequate training in anaesthesia and airway
management, and when resuscitation equipment is
available.

- **CONTRA-INDICATIONS**  Susceptibility to malignant
hyperthermia
- **CAUTIONS**  Can trigger malignant hyperthermia -
neuromuscular disease (inhalational anaesthetics are very
rarely associated with hyperkalaemia, resulting in cardiac
arrhythmias and death) - raised intracranial pressure (can
increase cerebrospinal pressure)
- **SIDE-EFFECTS**
  - **Common or very common**  Agitation • apnoea • arrhythmias •
  chills • cough • dizziness • headache • hypersalivation •
  hypertension • hypotension • nausea • respiratory disorders •
  vomiting
  - **Uncommon**  Hyoxia
  - **Frequency not known**  Breath holding • cardiac arrest •
  haemorrhage • hepatic disorders • hyperkalaemia •
  malignant hyperthermia • Q-T interval prolongation •
  rhabdomyolysis • seizures
- **ALLERGY AND CROSS-SENSITIVITY**  Can cause
hepatotoxicity in those sensitised to halogenated
anaesthetics.
- **DIRECTIONS FOR ADMINISTRATION**  Volatile liquid
anaesthetics are administered using calibrated vapourisers,
using air, oxygen, or nitrous oxide–oxygen mixtures as the
carrier gas. To prevent hypoxia, the inspired gas mixture
should contain a minimum of 25% oxygen at all times.
- **DRIVING AND SKILLED TASKS**  Patients given sedatives and
analgesics during minor outpatient procedures should be
very carefully warned about the risks of driving or
undertaking skilled tasks afterwards. For a short general
anaesthetic, the risk extends to at least 24 hours after
administration. Responsible persons should be available to
take patients home. The dangers of taking alcohol should
also be emphasised.

### Isoflurane

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia (in oxygen or nitrous oxide–
  oxygen)** (but indication not recommended in infants and
  children of all ages)
    - **BY INHALATION**
      - Neonate: Initially 0.5 %, increased to 3 %, adjusted
        according to response, administered using specifically
        calibrated vaporiser.
      - Child: Initially 0.5 %, increased to 3 %, adjusted
        according to response, administered using specifically
        calibrated vaporiser
      - **Maintenance of anaesthesia (in nitrous oxide–oxygen)**
        - **BY INHALATION**
          - Neonate: 1 – 2.5 %, to be administered using specifically
            calibrated vaporiser; an additional 0.5 – 1% may be
            required when given with oxygen alone.
          - Child: 1 – 2.5 %, to be administered using specifically
            calibrated vaporiser; an additional 0.5 – 1% may be
            required when given with oxygen alone
    - **Maintenance of anaesthesia in caesarean section (in
      nitrous oxide–oxygen)**
      - **BY INHALATION**
        - Child: 0.5 – 0.75 %, to be administered using specifically
          calibrated vaporiser

- **INTERACTIONS**  → Appendix 1: volatile halogenated
  anaesthetics
- **SIDE-EFFECTS**
  - **Common or very common**  Coagulation disorder •
    conjunctivitis
  - **Uncommon**  Myalgia • myocardial infarction • myocardial
    ischaemia • vasodilation
- **FREQUENCY NOT KNOWN**  Abdominal pain • asthenia • heart
  failure • hypokalaemia • malaise • metabolic acidosis •
  pancreatitis acute • shock • skin reactions • ventricular
  dysfunction • visual acuity decreased
- **PREGNANCY**  May depress neonatal respiration if used
during delivery.
- **BREAST FEEDING**  Breast-feeding can be resumed as soon
  as mother has recovered sufficiently from anaesthesia.

- **MEDICINAL FORMS**  There can be variation in the licensing of
different medicines containing the same drug.
  **Inhalation vapour**
  - Desflurane (Non-proprietary)
    - Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml (Hospital only)

### Desflurane

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia (but not recommended)**
    - **BY INHALATION**
      - Child 12-17 years: 4 – 11 %, to be inhaled through
        specifically calibrated vaporiser
  - **Maintenance of anaesthesia (in nitrous oxide–oxygen)**
    - **BY INHALATION**
      - Neonate: 2 – 6 %, to be inhaled through a specifically
        calibrated vaporiser.
      - Child: 2 – 6 %, to be inhaled through a specifically
        calibrated vaporiser
  - **Maintenance of anaesthesia (in oxygen or oxygen–
    enriched air)**
    - **BY INHALATION**
      - Neonate: 2.5 – 8.5 %, to be inhaled through a specifically
        calibrated vaporiser.
      - Child: 2.5 – 8.5 %, to be inhaled through a specifically
        calibrated vaporiser
  - **INTERACTIONS**  → Appendix 1: volatile halogenated
    anaesthetics
  - **SIDE-EFFECTS**
    - **Common or very common**  Coagulation disorder •
      conjunctivitis
    - **Uncommon**  Myalgia • myocardial infarction • myocardial
      ischaemia • vasodilation
  - **IMPORTANCE SAFETY INFORMATION**
    - Isoflurane is not recommended for induction of
      anaesthesia in infants and children of all ages because of
      the occurrence of cough, breath-holding, desaturation,
      increased secretions, and laryngospasm.
Nitrous oxide

**INDICATIONS AND DOSE**

Maintenance of anaesthesia in conjunction with other anaesthetic agents

- **BY INHALATION**
  - Neonate: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen.
  - Child: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen.

Analgesia

- **BY INHALATION**
  - Neonate: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs.
  - Child: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs.

**CAUTIONS**

- Entrapped air following recent underwater dive · pneumothorax · presence of intracranial air after head injury · recent intra–ocular gas injection

**CAUTIONS, FURTHER INFORMATION**

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra–ocular gas injection.

**INTERACTIONS** → Appendix 1: nitrous oxide

**SIDE-EFFECTS**

- Abdominal distension · addiction · agranulocytosis · disorientation · dizziness · euphoria · mood · megaloblastic anaemia · middle ear damage · myeloneuropathy · nausea · paraesthesia · sedation · subacute combined cord degeneration · tinnitus · membrane perforation · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.

**PREGNANCY**

- May depress neonatal respiration if used during delivery.

**BREAST FEEDING**

Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**MONITORING REQUIREMENTS**

- Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.

**IMPORTANT SAFETY INFORMATION**

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**INHALATION gas**

- **Nitrous oxide (Non-proprietary)**
  - Nitrous oxide 1 ml per 1 ml Nitrous oxide cylinders size E | 1800 litre P £
  - Medical Nitrous Oxide cylinders size D | 900 litre P £
  - Medical Nitrous Oxide cylinders size G | 9000 litre P £
  - Nitrous oxide cylinders size F | 3600 litre P £
  - Nitrous oxide cylinders size J | 18000 litre P £
  - Medical Nitrous Oxide cylinders size F | 3600 litre P £
  - Medical Nitrous Oxide cylinders size E | 1800 litre P £

**Sevoflurane**

**INDICATIONS AND DOSE**

Induction of anaesthesia (in oxygen or nitrous oxide–oxygen)

- **BY INHALATION**
  - Neonate: Up to 4 %, adjusted according to response, to be administered using specifically calibrated vaporiser.
  - Child: Initially 0.5–1 %, then increased to up to 8 %, increased gradually, according to response, to be administered using specifically calibrated vaporiser.

**Maintenance of anaesthesia (in oxygen or nitrous oxide–oxygen)**

- **BY INHALATION**
  - Neonate: 0.5–2 %, adjusted according to response, to be administered using specifically calibrated vaporiser.
  - Child: 0.5–3 %, adjusted according to response, to be administered using specifically calibrated vaporiser.

**CAUTIONS**

- Susceptibility to QT-interval prolongation

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS**

- Common or very common Drowsiness · fever · hypothermia
  - Uncommon Asthma · atrioventricular block · confusion
  - Frequency not known Dystonia · intracranial pressure increased · muscle rigidity · nephritis tubulointerstitial · oedema · pancreatitis

**PREGNANCY**

- May depress neonatal respiration if used during delivery.

**BREAST FEEDING**

Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**RENAL IMPAIRMENT** Use with caution.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
1 Anaesthesia adjuvants

Pre-medication and peri-operative drugs

Drugs that affect gastric pH
Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be a complication of general anaesthesia, particularly in obstetrics and in gastro-oesophageal reflux disease; prophylaxis against acid aspiration is not routinely used in children but may be required in high-risk cases.

An H₂-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure.

Antimuscarinic drugs
Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 672 to prevent bradyarrhythmia, excessive salivation, and other muscarinic actions of neostigmine.

They also prevent bradyarrhythmia and hypotension associated with drugs such as propofol p. 832 and suxamethonium chloride p. 840.

Atropine sulfate p. 837 is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in cardiopulmonary resuscitation.

Hyoscine hydrobromide p. 273 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 838 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising muscle relaxants.

Glycopyrronium bromide or hyoscine hydrobromide are also used to control excessive secretions in upper airways or hypersalivation in palliative care and in children unable to control posture or with abnormal swallowing reflex; effective dose varies and tolerance may develop. The intramuscular route should be avoided if possible. Hyoscine hydrobromide transdermal patches may also be used.

Sedative drugs
Premedication
Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of preoperative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities.

The choice also varies between elective and emergency procedures. Oral administration is preferred if possible; the rectal route should only be used in exceptional circumstances.

Premedication can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Oral midazolam p. 229 is the most common premedicant for children; temazepam p. 847 may be used in older children. The antihistamine alimemazine tartrate p. 180 is occasionally used orally, but when given alone it may cause postoperative restlessness in the presence of pain.

Benzodiazepines
Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used for sedation prior to clinical procedures and for sedation in intensive care.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil p. 887 is used to antagonise the effects of benzodiazepines.

Midazolam, a water-soluble benzodiazepine, is the preferred benzodiazepine for premedication and for sedation for clinical procedures in children. It has a fast onset of action, and recovery is faster than for other benzodiazepines.

Recovery may be longer in children with a low cardiac output, or after repeated dosing.

Midazolam can be given by mouth [unlicensed], but its bitter acidic taste may need to be disguised. It can also be given buccally [unlicensed indication] or intranasally [unlicensed]. Midazolam is associated with prolonged sedation when high doses are given or when it is used with certain other drugs. It can cause severe disinhibition and restlessness in some children. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

Temazepam is given by mouth for premedication in older children and has a short duration of action. Anxiolytic and sedative effects last about 90 minutes, although there may be residual drowsiness. Temazepam is rarely used for dental procedures in children.

Lorazepam p. 228 produces more prolonged sedation than temazepam and it has marked amnesic effects. Peri-operative use of diazepam p. 226 is not recommended in children; onset and magnitude of response are unreliable, and paradoxical effects may occur. Diazepam is not used for dental procedures in children.

Antagonists for central and respiratory depression
Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by an opioid antagonist. Naloxone hydrochloride p. 869 given intravenously immediately reverses opioid-induced respiratory depression but the dose may have to be repeated because of its short duration of action.

Intramuscular injection of naloxone hydrochloride produces a more gradual and prolonged effect but absorption may be erratic. Care is required in children requiring pain relief because naloxone hydrochloride also antagonises the analgesic effect of opioids.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Neonates
Naloxone hydrochloride is used in newborn infants to reverse respiratory depression and sedation resulting from the use of opioids by the mother, usually for pain during labour. In neonates the effects of opioids may persist for up to 48 hours and in such cases naloxone hydrochloride is often given by intramuscular injection for its prolonged effect. In severe respiratory depression after birth, breathing should first be established (using artificial means if necessary) and naloxone hydrochloride administered only if use of opioids by the mother is thought to cause the respiratory depression; the infant should be monitored.
closely and further doses of naloxone hydrochloride administered as necessary.

**ANTIMUSCARINICS**

**Atropine sulfate**

- **INDICATIONS AND DOSE**
  - Brachyarrhythmia due to acute massive overdosage of beta-blockers
    - **BY INTRAVENOUS INJECTION**
      - Child: 40 micrograms/kg (max. per dose 3 mg)
  - Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)
    - **BY INTRAVENOUS INJECTION**
      - Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
  - Premedication
    - **BY INTRAVENOUS INJECTION**
      - Neonate: 10 micrograms/kg, to be administered immediately before induction of anaesthesia.
      - Child 1 month–11 years: 20 micrograms/kg, to be administered immediately before induction of anaesthesia (minimum 100 micrograms, max. 600 micrograms)
      - Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Neonate: 10 micrograms/kg, to be administered 30–60 minutes before induction of anaesthesia.
      - Child 1 month–11 years: 10–30 micrograms/kg, to be administered 30–60 minutes before induction of anaesthesia (minimum 100 micrograms, max. 600 micrograms)
      - Child 12–17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
    - **BY MOUTH**
      - Neonate: 20–40 micrograms/kg, to be administered 1–2 hours before induction of anaesthesia.
      - Child: 20–40 micrograms/kg (max. per dose 900 micrograms), to be administered 1–2 hours before induction of anaesthesia
  - **Intra-operative bradycardia**
    - **BY INTRAVENOUS INJECTION**
      - Neonate: 10–20 micrograms/kg.
      - Child 1 month–11 years: 10–20 micrograms/kg
      - Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies
  - **Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block**
    - **BY INTRAVENOUS INJECTION**
      - Neonate: 20 micrograms/kg.
      - Child 1 month–11 years: 20 micrograms/kg (max. per dose 1.2 mg)
      - Child 12–17 years: 0.6–1.2 mg
  - **UNLICENSED USE** Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication.
  - With oral use Not licensed for use by oral route.

**IMPORTANT SAFETY INFORMATION**

- With systemic use for Premedication Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **INTERACTIONS** → Appendix 1: atropine

- **SIDE-EFFECTS**
  - Common or very common
    - With intravenous use Abdominal distension - anhidrosis - anxiety - arrhythmias - bronchial secretion decreased - dysphagia - gastrointestinal disorders - hallucination - hyperthermia - movement disorders - mydriasis - speech disorder - taste loss - thirst
  - Uncommon
    - With intravenous use Psychotic disorder

  - **PREGNANCY** Not known to be harmful; manufacturer advises caution.

  - **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.

- **MONITORING REQUIREMENTS**
  - Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block. Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use For administration by mouth, injection solution may be given orally.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - With intramuscular use or intravenous use or subcutaneous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion, eye drops, eye ointment

**Tablet**

- **Atropine sulfate (Non-proprietary)**
  - Atropine sulfate 600 microgram per 1 ml
    - Atropine 600microgram/tablet Atropine 600microgram/tablet | 28 tablet £5.92 DT = £5.92
  - **Solution for injection**
    - **Atropine sulfate (Non-proprietary)**
      - Atropine sulfate 100 microgram per 1 ml
        - Atropine 500micrograms/ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £13.00 | 10 pre-filled disposable injection £130.00
        - Atropine sulfate 200 microgram per 1 ml
          - Atropine 1mg/ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £7.29 | 10 pre-filled disposable injection £72.90
        - Atropine sulfate 300 microgram per 1 ml
          - Atropine 3mg/ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £72.90
        - Atropine sulfate 400 microgram per 1 ml
          - Atropine 4mg/ml solution for injection ampolules | 10 ampoule £102.26 DT = £102.26
      - Atropine sulfate 600 microgram per 1 ml
        - Atropine 600micrograms/ml solution for injection ampolules | 10 ampoule £11.71 DT = £11.71
Glycopyrronium bromide
(Glycopyrrolate)

**INDICATIONS AND DOSE**

Premedication at induction
- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Neonate: 5 micrograms/kg.
  - Child 1 month–11 years: 4–8 micrograms/kg (max. per dose 200 micrograms)
  - Child 12–17 years: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)

*Intra-operative bradycardia*
- **BY INTRAVENOUS INJECTION**
  - Neonate: 10 micrograms/kg, repeated if necessary.
  - Child: 4–8 micrograms/kg (max. per dose 200 micrograms), repeated if necessary

*Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block*
- **BY INTRAVENOUS INJECTION**
  - Neonate: 10 micrograms/kg.
  - Child 1 month–11 years: 10 micrograms/kg (max. per dose 500 micrograms)
  - Child 12–17 years: 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered

*Control of upper airways secretion | Hypersalivation*
- **BY MOUTH**
  - Child: 40–100 micrograms/kg 3–4 times a day (max. per dose 2 mg), adjusted according to response, dose to be administered using tablets or injection solution, see *Directions for administration*

- **BY SUBCUTANEOUS INFUSION**
  - Child 1 month–11 years: 12–40 micrograms/kg (max. per dose 1.2 mg) over 24 hours
  - Child 12–17 years: 0.6–1.2 mg/24 hours

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–11 years: 4–10 micrograms/kg 4 times a day (max. per dose 200 micrograms) as required
  - Child 12–17 years: 200 micrograms every 4 hours as required

*SIALANAR® ORAL SOLUTION*

**Severe siaiolorrhoea (chronic pathological drooling)**
- **BY MOUTH**
  - Child 3-7 years: (consult product literature)

**UNLICENSED USE** Not licensed for use in control of upper airways secretion and hypersalivation.

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

**CAUTIONS**

*SIALANAR® ORAL SOLUTION* Compromised blood-brain barrier—monitor for behavioural changes

**INTERACTIONS** ➔ Appendix 1: glycopyrronium

**SIDE-EFFECTS**
- Common or very common
  - With oral use Akathisia, anxiety, behaviour abnormal, bronchial secretion decreased, concentration impaired, crying, depressed mood, diarrhoea, fever, increased risk of infection, mood altered, nasal congestion
  - Uncommon
  - With oral use Breathlessness, dehydration, eye disorders, gastrointestinal disorders, insomnia, seizure, thirst
  - Frequency not known
  - With oral use Anhidrosis, dry eyes, dysphagia, epistaxis, speech disorder
  - With parenteral use Anhidrosis, bronchial secretion decreased, mydriasis

**PREGNANCY**

*SIALANAR® ORAL SOLUTION* Manufacturer advises avoid—no information available.

**BREAST FEEDING**

*SIALANAR® ORAL SOLUTION* Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

*SIALANAR® ORAL SOLUTION* Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

*Dose adjustments* Manufacturer advises reduce dose by 30% if estimated glomerular filtration rate is 30–89 mL/minute/1.73 m²—consult product literature.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use for Control of upper airways secretion or Hypersalivation: For administration *by mouth*, injection solution may be given or crushed tablets suspended in water.

*SIALANAR® ORAL SOLUTION* Doses should be given at least 1 hour before or 2 hours after food, or at consistent times with respect to food if co-administration with food is required—high-fat food should be avoided; for administration by a nasogastric or feeding tube, flush with 10 mL of water immediately after dosing.

**PRESCRIBING AND DISPENSING INFORMATION**

- With oral use Tablets may be available on a named-patient basis from specialist importing companies.

**PATIENT AND CARER ADVICE**

*SIALANAR® ORAL SOLUTION* Manufacturer advises patients and their carers should be informed to stop treatment and seek medical advice if constipation, urinary retention, pneumonia, allergic reaction, pyrexia, or changes in behaviour occur; treatment should also be stopped and medical advice sought in very hot weather.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (July 2017) that glycopyrronium bromide (Sialanar®) is accepted for use within NHS Scotland for the symptomatic treatment of severe siaiolorrhoea (chronic pathological drooling) in children and adolescents aged 3 years and older with chronic neurological disorders.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

- **Tablet**
  - Glycopyrronium bromide (Non-proprietary)
    - Glycopyrronium bromide 1 mg Glycopyrronium bromide 1mg tablets | 30 tablet | £20.72 DT + £230.71
    - Glycopyrronium bromide 2 mg Glycopyrronium bromide 2mg tablets | 30 tablet | £254.24 DT + £254.24

**Solution for injection**

- **Glycopyrronium bromide (Non-proprietary)**
  - Glycopyrronium bromide 200 microgram per 1 ml Glycopyrronium bromide 200micrograms/1ml solution for injection ampoules | 10 ampoule | £5.72–£14.00 DT + £9.99
Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Children who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine. Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium bromide, atracurium besilate, and vecuronium bromide, and the benzylisoquinolinium group, comprising atracurium besilate and cisatracurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–60 minutes), and long-acting (>60 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or anergic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for longer-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in children with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute. Neonates may be more sensitive to the effects of atracurium besilate and lower doses may be required.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects. In children aged 1 month to 12 years, cisatracurium has a shorter duration of action and produces faster spontaneous recovery.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection. In children under 12 years mivacurium has a faster onset, shorter duration of action, and produces more rapid spontaneous recovery.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in children receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension. The half-life of pancuronium bromide is prolonged in neonates; neonates should receive postoperative intermittent positive pressure ventilation.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity. In most children, the duration of action of rocuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects. In most children, the duration of action of vecuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

Depolarising neuromuscular blocking drugs

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required e.g. with tracheal intubation. Neonates and young children are less sensitive to suxamethonium chloride and a higher dose may be required. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. Bradycardia may occur; premedication with atropine sulfate p. 837 reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Children with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or no histaminergic response to suxamethonium chloride.

Neuromuscular blockade 839
atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

**NEUROMUSCULAR BLOCKING DRUGS**

**DEPOLARISING**

**Suxamethonium chloride**

(Succinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

- **INDICATIONS AND DOSE**

  - **Neuromuscular blockade (short duration) during surgery**
    - **BY INTRAVENOUS INJECTION**
      - Neonate: 2 mg/kg, produces 5–10 minutes neuromuscular blockade.
      - Child 1-11 months: 2 mg/kg
      - Child 1-17 years: 1 mg/kg
      - **BY INTRAMUSCULAR INJECTION**
        - Neonate: Up to 4 mg/kg, produces 10–30 minutes neuromuscular blockade.
        - Child 1-11 months: Up to 5 mg/kg
        - Child 1-11 years: Up to 4 mg/kg (max. per dose 150 mg)

  - **PHARMACOKINETICS**
    - Intramuscular injection has a duration of onset of 2–3 minutes.

- **SIDE-EFFECTS**
  - Bronchospasm
  - Cardiac arrest
  - Hypotension
  - Hypothermia (activity prolonged, lower doses required)
  - Myasthenia gravis (activity prolonged, lower doses required)
  - Myopathy (after prolonged use in intensive care)
  - Muscle weakness • myopathy (after prolonged use in intensive care)

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy • family history of malignant hyperthermia • hyperkalaemia • low plasma-cholinesterase activity (including severe liver disease) • major trauma • neurological disease involving acute wasting of major muscle • personal or family history of congenital myotonic disease • prolonged immobilisation (risk of hyperkalaemia) • severe burns

- **CAUTIONS** Cardiac disease • neuromuscular disease • raised intra-ocular pressure (avoid in penetrating eye injury) • respiratory disease • severe sepsis (risk of hyperkalaemia)

- **INTERACTIONS**
  - Lamotrigine reduces risk of ventilatory depression
  - **Non-depolarising neuromuscular blocking drugs** should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS**
  - Duchenne muscular dystrophy • family history of malignant hyperthermia • hyperkalaemia • low plasma-cholinesterase activity (including severe liver disease) • major trauma • neurological disease involving acute wasting of major muscle • personal or family history of congenital myotonic disease • prolonged immobilisation (risk of hyperkalaemia) • severe burns

- **CAUTIONS** Cardiac disease • neuromuscular disease • raised intra-ocular pressure (avoid in penetrating eye injury) • respiratory disease • severe sepsis (risk of hyperkalaemia)

- **INTERACTIONS**
  - Lamotrigine reduces risk of ventilatory depression
  - **Non-depolarising neuromuscular blocking drugs** should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **SIDE-EFFECTS**
  - **Common or very common**
    - Arrhythmias • flushing • muscle contractions involuntary • myoglobinuria • myoglobinuria • post procedural muscle pain • rash
  - **Rare or very rare**
    - Apnoea • cardiac arrest • hypersensitivity • malignant hyperthermia • respiratory disorders • trismus

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Premedication with atropine reduces bradycardia associated with suxamethonium use.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY**
  - Mildly prolonged maternal neuromuscular blockade may occur.

- **BREAST FEEDING**
  - Unlike to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother recovered from neuromuscular block.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution, particularly in end stage hepatic failure (increased risk of prolonged apnoea due to reduced hepatic synthesis of plasma cholinesterase).

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous injection, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS**
  - There can be variation in the labelling of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

  - **Solution for injection**
    - Suxamethonium chloride (Non-proprietary) Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride 100mg/2ml solution for injection ampoules | 10 ampoule (£) £28.80–£50.00
    - Anectine (Aspen Pharma Trading Ltd) Suxamethonium chloride 50 mg per 1 ml Anectine 100mg/2ml solution for injection ampoules | 5 ampoule (£) £3.57

**NEUROMUSCULAR BLOCKING DRUGS**

**Non-depolarising**

**neuromuscular blocking drugs**

**IMPORTANT SAFETY INFORMATION**

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CAUTIONS**
  - Burns (resistance can develop, increased doses may be required) • cardiovascular disease (reduce rate of administration) • electrolyte disturbances (response unpredictable) • fluid disturbances (response unpredictable) • hypothermia (activity prolonged, lower doses required) • myasthenia gravis (activity prolonged, lower doses required) • neuromuscular disorders (response unpredictable)

- **SIDE-EFFECTS**
  - Common or very common
    - Flushing • hypotension
  - Uncommon
    - Bronchospasm • hypersensitivity • skin reactions
  - Rare or very rare
    - Muscle weakness • myopathy (after prolonged use in intensive care)

- **ALLERGY AND CROSS-SENSITIVITY**
  - Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY**
  - Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

- **BREAST FEEDING**
  - Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.
Atracurium besilate (Atracurium besilate)

**INDICATIONS AND DOSE**

**Neuromuscular blockade (short to intermediate duration) for surgery**
- **INITIALLY BY INTRAVENOUS INJECTION**
- **Neonate**: Initially 300–500 micrograms/kg, followed by (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–400 micrograms/kg/hour, adjusted according to response.
- **Child**: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response.

**SIDE-EFFECTS**
- **Hypotension, skin flushing, and bronchospasm** is associated with histamine release by administering over a period of 5 minutes. Manufacturer advises minimising effects of histamine release by administering over 5 minutes in neonates with cardiovascular disease or sensitivity to histamine. Neonates may be more sensitive to the effects of atracurium and lower doses may be required.
- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute to a concentration of 0.1–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent.
- **In neonates** Neonatal intensive care, dilute 60 mg/kg bodyweight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; minimum concentration of 500 micrograms/mL, maximum concentration of 5 mg/mL; an intravenous infusion rate of 0.1 mL/hour provides a dose of 120 micrograms/kg/hour.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
  - Rare or very rare Cardiac arrest, circulatory collapse, shock
  - Frequency not known Seizure
- **SIDE-EFFECTS, FURTHER INFORMATION** Hypotension, skin flushing, and bronchospasm is associated with histamine release. Manufacturer advises minimising effects of histamine release by administering over 1 minute in neonates with cardiovascular disease or sensitivity to histamine. Neonates may be more sensitive to the effects of atracurium and lower doses may be required.

**UNLICENSED USE**
- In neonates Not licensed for use in neonates.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Atracurium besilate** (Non-proprietary)
  - Atracurium besilate 2 mg per mL Atracurium besilate 250mg/25ml solution for injection vials | 1 vial (PODD) £16.50 (Hospital only)

---

Cisatracurium

**INDICATIONS AND DOSE**

**Neuromuscular blockade (intermediate duration) during surgery**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - **Child 1 month–1 year**: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required
  - **Child 2–11 years**: Initially 150 micrograms/kg, 80–100 micrograms/kg if not for intubation, then (by intravenous injection) 20 micrograms/kg every 10 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response
  - **Child 12–17 years**: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
  - Common or very common Bradycardia

**DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute to a concentration of 0.1–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Cisatracurium** (Non-proprietary)
  - Cisatracurium (as Cisatracurium besilate) 2 mg per mL Cisatracurium besilate 20mg/10ml solution for injection ampoules | 5 ampoule (PODD) £33.75 (Hospital only) | 10 ampoule (PODD) £67.50
  - Cisatracurium besilate 20mg/10ml solution for injection ampoules | 5 vial (PODD) £33.75 | 10 vial (PODD) £33.86
  - Cisatracurium (as Cisatracurium besilate) 5 mg per mL Cisatracurium besilate 150mg/30ml solution for injection vials | 1 vial (PODD) £45.00 (Hospital only) | 1 vial (PODD) £26.43–£29.54

- **Nimbex** (Aspen Pharma Trading Ltd)
  - Cisatracurium (as Cisatracurium besilate) 2 mg per mL Nimbex 20mg/10ml solution for injection vials | 5 ampoule (PODD) £33.75
  - Cisatracurium (as Cisatracurium besilate) 5 mg per mL Nimbex Forte 150mg/30ml solution for injection vials | 1 vial (PODD) £13.09
Mivacurium

- **INDICATIONS AND DOSE**
  - Neuromuscular blockade (short duration) during surgery
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Child 2–5 months: Initially 150 micrograms/kg, then (by intravenous injection) 100 micrograms/kg every 6–9 minutes as required, alternatively (by intravenous infusion) 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 11–14 micrograms/kg/minute
      - Child 6 months–11 years: Initially 200 micrograms/kg, then (by intravenous injection) 100 micrograms/kg every 6–9 minutes as required, alternatively (by intravenous infusion) 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 11–14 micrograms/kg/minute
      - Child 12–17 years: Initially 70–250 micrograms/kg, then (by intravenous injection) 100 micrograms/kg every 15 minutes as required, alternatively (by intravenous infusion) 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6–7 micrograms/kg/minute

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **CAUTIONS** Burns (low plasma cholinesterase activity; dose titration required)
- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
  - Uncommon Tachycardia
- **HEPATIC IMPAIRMENT**
  - Dose adjustments Reduce dose in severe impairment.
- **RENAL IMPAIRMENT**
  - Dose adjustments Clinical effect prolonged in renal failure—reduce dose according to response.
- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous injection, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%.
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - [Mivacurium (as Mivacurium chloride)] 2 mg per 1 ml
      - Mivacurium 10mg/5ml solution for injection ampoules | 5 ampoule | £13.95
      - Mivacurion 20mg/10ml solution for injection ampoules | 5 ampoule | £22.57

Rocuronium bromide

- **INDICATIONS AND DOSE**
  - Neuromuscular blockade (intermediate duration) during surgery
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Neonate: Initially 600 micrograms/kg, then (by intravenous injection) 150 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response.
      - Child: Initially 600 micrograms/kg, then (by intravenous injection) 150 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–600 micrograms/kg/hour first hour, then (by intravenous infusion), adjusted according to response

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE**
  - Not licensed for use in children for assisted ventilation in intensive care.
- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
  - Uncommon Procedural complications · tachycardia
  - Rare or very rare Angioedema · circulatory collapse · face oedema · malignant hyperthermia · paralysis · shock
- **HEPATIC IMPAIRMENT**
  - Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT**
  - Dose adjustments Reduce maintenance dose; prolonged paralysis.
- **DIRECTIONS FOR ADMINISTRATION**
  - For continuous intravenous infusion or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%.

Pancuronium

- **INDICATIONS AND DOSE**
  - Neuromuscular blockade (long duration) during surgery
    - **BY INTRAVENOUS INJECTION**
      - Neonate: Initially 100 micrograms/kg, then 50 micrograms/kg, repeated if necessary.
      - Child: Initially 100 micrograms/kg, then 20 micrograms/kg, repeated if necessary.
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
    - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
**1.2 Neuromuscular blockade reversal**

**Neuromuscular blockade reversal**

**Anticholinesterases**

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 838 or alternatively atropine sulfate, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade Sugammadex below is a modified gamma cyclodextrin which can be used in children for the routine reversal of neuromuscular blockade induced by rocuronium bromide.

**ANTICHOLINESTERASES**

**Neostigmine with glycopyrronium bromide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 672, glycopyrronium bromide p. 838.

- **INDICATIONS AND DOSE**
  - **Reversal of non-depolarising neuromuscular blockade**
    - **BY INTRAVENOUS INJECTION**
    - Child: 0.02 mL/kilogram, repeated if necessary, alternatively dilute to 1 in 10 solution and give 0.2 mL/kg; maximum 2 mL per course
  - **INTERACTIONS** → Appendix 1: glycopyrronium · neostigmine
  - **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, may be diluted with Sodium Chloride 0.9%, give over 10–30 seconds
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **Neostigmine with glycopyrronium bromide (Non-proprietary)**
    - Glycopyrronium bromide 500 microgram per 1 mL Neostigmine methylsulfate 2.5 mg per 1 mL
    - Neostigmine 2.5mg/1ml / Glycopyrronium bromide 500micrograms/1ml solution for injection ampoules | 10 ampoule £11.50

**Sugammadex**

- **INDICATIONS AND DOSE**
  - **Routine reversal of neuromuscular blockade induced by rocuronium**
    - **BY INTRAVENOUS INJECTION**
    - Child 2-17 years: 2 mg/kg (consult product literature)

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS** Cardiovascular disease (recovery may be delayed) · pre-existing coagulation disorders · recurrence of neuromuscular blockade—monitor respiratory function until fully recovered · use of anticoagulants (unrelated to surgery) · wait 24 hours before re-administering rocuronium

- **INTERACTIONS** → Appendix 1: sugammadex

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · arrhythmias · cough · dizziness · headache · nausea · procedural complications · skin reactions · taste altered · vomiting
  - Uncommon Hypersensitivity · Frequency not known Bronchospasm

- **PREGNANCY** Use with caution—no information available.

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection dose may be diluted to a concentration of 10 mg/mL with Sodium Chloride 0.9%.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
    - The Scottish Medicines Consortium, has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **Bridion (Merck Sharp & Dohme Ltd)**
    - Sugammadex (as Sugammadex sodium) 100 mg per 1 ml Bridion 500mg/5ml solution for injection vials | 10 vial £1,491.00 (Hospital only)
    - Bridion 200mg/2ml solution for injection vials | 10 vial £596.40 (Hospital only)

**1.3 Peri-operative analgesia**

**Peri-operative analgesia**

**Non-opioid analgesics**

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Diclofenac sodium p. 676, diclofenac potassium p. 675, ibuprofen p. 679, paracetamol p. 278, and ketorolac trometamol p. 844 are used to relieve postoperative pain in children; diclofenac sodium and paracetamol can be given parenterally and rectally as well as by mouth. Ketorolac trometamol is given by intravenous injection.
**Opioid analgesics**

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to children who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; see general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 836.

**Intra-operative analgesia**

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Afentanil p. 845, fentanyl p. 286, and remifentanil p. 845 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of afentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

**ANALGESICS > NON-Steroidal Anti-INFLAMMATORY DRUGS**

**Ketorolac trometamol**

13-Aug-2018

**INDICATIONS AND DOSE**

**Short-term management of moderate to severe acute postoperative pain only**

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 16–17 years (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
  - Child 16–17 years (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
  - **BY INTRAVENOUS INJECTION**
    - Child 6 months–15 years: Initially 0.5–1 mg/kg (max. per dose 15 mg), then 500 micrograms/kg every 6 hours (max. per dose 15 mg) as required for maximum duration of treatment 2 days; maximum 60 mg per day

**UNLICENSED USE** Not licensed for use in children under 16 years.

**CONTRA-INDICATIONS** Active or history of gastrointestinal bleeding - active or history of gastrointestinal ulceration - coagulation disorders - complete or partial syndrome of nasal polyposis - confirmed or suspected cerebrovascular bleeding - dehydration - following operations with high risk of haemorrhage or incomplete haemostasis - haemorrhagic diatheses - history of gastrointestinal perforation - hypovolaemia - severe heart failure

**CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease -

coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 674

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises caution—may increase risk of renal impairment; avoid in hepatic failure.

**RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre.

**Dose adjustments** The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection.

**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use. For intravenous injection, give over at least 15 seconds.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Ketorolac trometamol (Non-proprietary)
  - Ketorolac trometamol 30 mg per 1 ml Ketorolac 30mg/1ml solution for injection ampoules | 5 ampoules (£5.36) £17.60-22.00 DT (£5.36)

(Hospital only)
**Analgesics > Opioids**

### Alfentanil

**INDICATIONS AND DOSE**

**Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures**
- BY INTRAVENOUS INJECTION

- Neonate: Initially 5–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg.
- Child: Initially 10–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg.

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures**
- BY INTRAVENOUS INFUSION

- Neonate: Initially 10–50 micrograms/kg, dose to be administered over 10 minutes, followed by 30–60 micrograms/kg/hour.
- Child: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes, followed by 30–120 micrograms/kg/hour, usual dose with intravenous anaesthetic, 60 micrograms/kg/hour.

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**PHARMACOKINETICS**
- Half-life is prolonged in neonates and accumulation is likely with prolonged use. Clearance may be increased in children 1 month–12 years and higher infusion doses might be needed.

**CAUTIONS**
- CAUTIONS, FURTHER INFORMATION
  - Repeated intra-operative doses. Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.
- INTERACTIONS: Appendix 1: opioids

**SIDE-EFFECTS**
- Common or very common: Apnoea · Chills · Fatigue · Hypertension · Movement disorders · Muscle rigidity · Procedural complications
- Uncommon: Coma · Hiccups · Hypercapnia · Pain · Post procedural complications · Respiratory disorders
- Rare or very rare: Agitation · Crying · Epistaxis · Vascular pain
- Frequency not known: Cardiac arrest · Cough · Fever · Loss of consciousness · Seizure

**SIDE-EFFECTS, FURTHER INFORMATION**
- Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

**BREAST FEEDING**
- Present in milk—withhold breast-feeding for 24 hours.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution.
- Dose adjustments: Manufacturer advises dose reduction and cautious titration.

**RENAL IMPAIRMENT**
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**
- 5 mg/mL injection to be diluted before use. For continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- Alfentanil (Non-proprietary)
  - Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml
  - Alfentanil 1mg/2ml solution for injection ampoules | 10 ampoule | £5.95 + £6.34 (Hospital only) £14.90 (OD)
  - Alfentanil 25mg/50ml solution for injection vials | 1 vial | £27.80 (OD)
  - Alfentanil 5mg/10ml solution for injection ampoules | 10 ampoule | £21.95 + £6.34 (Hospital only) £23.19 (OD)

- Rapifen (Piramal Critical Care Ltd)
  - Rapifen (as Alfentanil hydrochloride) 500 microgram per 1 ml
  - Rapifen 5mg/10ml solution for injection ampoules | 5 ampoule | £14.50 (OD)
  - Rapifen 1mg/2ml solution for injection ampoules | 10 ampoule | £6.34 + £6.34 (OD)

- Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml
  - Alfentanil 5mg/1ml solution for injection ampoules | 10 ampoule | £23.19 (Hospital only) £23.19 (OD)

**Remifentanil**

**INDICATIONS AND DOSE**

**Analgesia and enhancement of anaesthesia at induction (initial bolus injection)**
- BY INTRAVENOUS INJECTION

- Child 12–17 years: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

**Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose**
- BY INTRAVENOUS INFUSION

- Child 12–17 years: 30–60 micrograms/kg/hour, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)**
- BY INTRAVENOUS INJECTION

- Child 1 month–11 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)
- Child 12–17 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose**
- BY INTRAVENOUS INFUSION

- Neonate: 24–60 micrograms/kg/hour, additional doses of 1 microgram/kg can be given by intravenous injection during the intravenous infusion.

- Child 1 month–11 years: 3–78 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, continued →
additional doses can be given by intravenous injection during the intravenous infusion
- Child 12-17 years: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, additional doses can be given by intravenous injection during the intravenous infusion

**Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**
- **BY INTRAVENOUS INFUSION**
- Child 12-17 years: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**SIDE-EFFECTS**
- Frequency not known
- Uncommon

**CONTRA-INDICATIONS**
- Anaesthesia in conscious patients

**INTERACTIONS**
- Appendix 1: opioids

**SIDE-EFFECTS**
- Common or very common: Apnoea, muscle rigidity, post-procedural complications
- Uncommon: Hypoxia
- Rare or very rare: Cardiac arrest
- Frequency not known: Agitation, atrioventricular block, hypertension, seizure

**SIDE-EFFECTS, FURTHER INFORMATION**
- In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by plasma esterases; it has short duration of action which is independent of dose and duration of infusion.
- **Muscle rigidity**
- Remifentanil can cause muscle rigidity that can be managed by the use of neuromuscular blocking drugs.

**PREGNANCY**
- No information available.

**BREAST FEEDING**
- Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in severe impairment (limited information available).

**RENAL IMPAIRMENT**
- **Dose adjustments** No dose adjustment necessary in renal impairment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: For intravenous injection, reconstitute to a concentration of 1 mg/mL; for continuous intravenous infusion, dilute further with glucose 5% or sodium chloride 0.9% to a concentration of 20–25 micrograms/mL for child 1–12 years or 20–250 micrograms/mL (usually 50 micrograms/mL) for child 12–18 years.

**PRESCRIBING AND DISPENSING INFORMATION**
- Remifentanil should not be given by intravenous injection intra-operatively, but is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

**M EDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Remifentanil (as Remifentanyl hydrochloride) 1 mg**
  - Remifentanil 1 mg powder for concentrate for solution for injection vials | 5 vial (Hospital only) £25.60
  - Remifentanil 1 mg powder for concentrate for solution for injection vials | 5 vial (Hospital only) £31.13

- **Remifentanil (as Remifentanyl hydrochloride) 2 mg**
  - Remifentanil 2 mg powder for concentrate for solution for injection vials | 5 vial (Hospital only) £31.13

- **Remifentanil (as Remifentanyl hydrochloride) 5 mg**
  - Remifentanil 5 mg powder for concentrate for solution for injection vials | 5 vial (Hospital only) £127.90

**SIDE-EFFECTS, FURTHER INFORMATION**
- Agitation
- Atrioventricular block
- Hypertension
- Hypoxia
- Apnoea

**ANTAGONISTS**
- Opioid
- Non-opioid analgesia

**ANAESTHETICS, GENERAL**
- NMDA RECEPTOR ANTAGONISTS

**1.4 Peri-operative sedation**

**Conscious sedation for clinical procedures**

**Overview**
- Sedation of children during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure and whether the child is cooperative; some procedures are safer and more successful under anaesthesia.
- Midazolam p. 229 and chloral hydrate p. 302 are suitable for sedating children for painless procedures, such as imaging. For painful procedures, alternative choices include nitrous oxide p. 835, local anaesthesia, ketamine below, or concomitant use of sedation with opioid or non-opioid analgesia.

**Ketamine**

**INDICATIONS AND DOSE**

**Induction and maintenance of anaesthesia for short procedures**
- **BY INTRAMUSCULAR INJECTION**
- Neonate: 4 mg/kg, adjusted according to response, a dose of 4 mg/kg usually produces 15 minutes of surgical anaesthesia.

- Child: 4–13 mg/kg, adjusted according to response, a dose of 4 mg/kg sufficient for some diagnostic procedures, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

- **BY INTRAVENOUS INJECTION**
- Neonate: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia.

- Child 1 month–11 years: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia.

- Child 12-17 years: 1–4.5 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

**Induction and maintenance of anaesthesia for long procedures**
- **INITIALLY BY INTRAVENOUS INJECTION**
- Neonate: Initially 0.5–2 mg/kg, followed by (by continuous intravenous infusion) 8 micrograms/kg/minute, adjusted according to response, doses up to 30 micrograms/kg/minute may be used to produce deep anaesthesia.
Hypnotics, sedatives and anxiolytics > Benzodiazepines

## Temazepam

### Indications and dose

Premedication before surgery or investigatory procedures

- **By mouth**
  - Child 12-17 years: 10–20 mg, to be taken 1 hour before procedure

### Unlicensed use

Tablets not licensed for use in children.

### Contraindications

- CNS depression.
- Compromised airway.
- Hyperkinesia.
- Obsessional state.
- Phobic states.
- Respiratory depression.

### Caution

- Hypoaalbuminaemia.
- Muscle weakness.
- Organic brain changes.

### Side-effects

- Paradoxical effects: A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

### Interactions

- **Appendix 1: temazepam**

### Side-effects

- Drug abuse.
- Dry mouth.
- Hypersalivation.
- Speech slurred.

### Breast feeding

- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

### Renal impairment

- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

### Patient and carer advice

- Driving and skilled tasks: Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see Drugs and driving under Guidance on prescribing p. 1.

## Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

### Solution for injection

- **Ketamine (non-proprietary)**
  - Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml
  - Curamed 50mg/5ml solution for injection ampoules | 10 ampoules £9.00 (Hospital only)
  - Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml
  - Ketamine 500mg/10ml solution for injection vials | 10 vial £30.00 (Hospital only)
  - Ketamin 100mg/2ml solution for injection ampoules | 10 ampoules £9.00 (Hospital only)

### HYPNOTICS, SEDATIVES AND ANXIOLYTICS

### BENZODIAZEPINES

- **Benzodiazepines**
  - Temazepam Tablets and Oral Solution may be prescribed.

### Important safety information

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

### Contraindications

- Acute porphyrias p. 624 - eclampsia - head trauma - hypertension - pre-eclampsia - raised intracranial pressure - severe cardiac disease - stroke

### Caution

- Acute circulatory failure (shock).
- Cardiovascular disease.
- Dehydration.
- Fixed cardiac output.
- Hallucinations.
- Head injury.
- Hypertension.
- Hypovolaemia.
- Increased cerebrospinal fluid pressure.
- Intracranial mass lesions.
- Nightmares.
- Predisposition to seizures.
- Psychotic disorders.
- Increased intraocular pressure.
- Respiratory tract infection.
- Thyroid dysfunction.

### Interactions

- Appendix 1: ketamine

### Side-effects

- Common or very common: Anxiety.
- Behavioural abnormal.
- Confusion.
- Diplopia.
- Hallucination.
- Muscle tone increased.
- Nausea.
- Nystagmus.
- Skin reactions.
- Sleep disorders.
- Tonic clonic movements.
- Vomiting.

### Rare or very rare

- Apnoea.
- Cystitis.
- Cystitis haemorrhagic.
- Delirium.
- Dysphoria.
- Flashback.
- Hypersalivation.

### Frequency not known

- Drug-induced liver injury.

### Side-effects, further information

- Incidence of hallucinations can be reduced by premedicating with a benzodiazepine (such as midazolam).
- May depress neonatal respiration if used during delivery.

### Breastfeeding

- Avoid for at least 12 hours after last dose.

### Hepatic impairment

- Dose adjustments: Manufacturer advises consider dose reduction—increased risk of accumulation.

### Directions for administration

- For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9%. For continuous intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia.

### Patient and carer advice

- Driving and skilled tasks: Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see Drugs and driving under Guidance on prescribing p. 1.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

### Solution for injection

- **Ketamine (non-proprietary)**
  - Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml
  - Curamed 50mg/5ml solution for injection ampoules | 10 ampoules £9.00 (Hospital only)
  - Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml
  - Ketamine 500mg/10ml solution for injection vials | 10 vial £30.00 (Hospital only)
  - Ketamin 100mg/2ml solution for injection ampoules | 10 ampoules £9.00 (Hospital only)

### CAUTIONS

- Hypoaalbuminaemia.
- Muscle weakness.
- Organic brain changes.

### Side-effects, further information

- Paradoxical effects: A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

### Interactions

- **Appendix 1: temazepam**

### Side-effects

- Drug abuse.
- Dry mouth.
- Hypersalivation.
- Speech slurred.

### Breast feeding

- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

### Renal impairment

- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

### Patient and carer advice

- Driving and skilled tasks: Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

### Profession specific information

Dental practitioners’ formulary.

Temazepam Tablets and Oral Solution may be prescribed.
### Local anaesthesia

#### Anaesthesia (local)

**Local anaesthetic drugs**

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in...
water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 850 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Levobupivacaine p. 852, an isomer of bupivacaine hydrochloride, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 852 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 854) is about 90 minutes.

Application of a mixture of lidocaine and prilocaine (EMLA®) under an occlusive dressing provides surface anaesthesia for 1–2 hours. EMLA® does not appear to be effective in providing local anaesthesia for heel lancing in neonates.

Prilocaine hydrochloride p. 856 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. Ropivacaine hydrochloride p. 857 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 858, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. Tetracaine is effective for 4–6 hours after a single application in most children. It is not recommended prior to neonatal heel lancing.

Tetracaine is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration by injection

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The child’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity. NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should never be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is combined with general anaesthesia for certain surgical procedures in children.

Vasoconstrictors in combination with local anaesthetics

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is not advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. In children with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these children an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine. The amide-type local anaesthetics articaine and mepivacaine hydrochloride p. 855 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine, and articaine is available with adrenaline/epinephrine. In children with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in children with coronary artery disease.

Toxicity induced by local anaesthesia

For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity below.

Severe local anaesthetic-induced cardiovascular toxicity

Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed. In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid® [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further
bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment. Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity - Accompanying notes.

### Anaesthetics, Local

**Adrenaline with articaine hydrochloride**

(Carticaine hydrochloride with epinephrine)

[28-Mar-2017]

- **INDICATIONS AND DOSE**
  - **Infiltration anaesthesia in dentistry**
    - **BY REGIONAL ADMINISTRATION**
    - **Child 4-17 years:** Consult expert dental sources

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **CONTRA-INDICATIONS**
  - Application to damaged skin
  - Application to the middle ear (may cause ototoxicity)
  - Complete heart block
  - Injection into infected tissues
  - Injection into inflamed tissues
  - Preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block)

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- **Injection site**
  - Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.
  - Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS**
  - Arrhythmias
  - Cardiovascular disease
  - Cerebrovascular disease
  - Children (consider dose reduction)
  - Cor pulmonale
  - Debilitated patients (consider dose reduction)
  - Diabetes mellitus
  - Epilepsy
  - Hypercalcaemia
  - Hyperreflexia
  - Hypertension
  - Hyperthyroidism
  - Hypokalaemia
  - Hypovolaemia
  - Impaired cardiac conduction
  - Impaired respiratory function
  - Ischaemic heart disease
  - Myasthenia gravis
  - Obstructive cardiomyopathy
  - Occlusive vascular disease
  - Organic brain damage
  - Phaeochromocytoma
  - Prostate disorders
  - Psychoneurosis
  - Severe angina
  - Shock
  - Susceptibility to angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION**

- **Use of vasconstrictors**
  - In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- **INTERACTIONS**
  - **Appendix 1:** articaine
  - Sympathomimetics, vasconstrictor

- **SIDE-EFFECTS**
  - Face oedema
  - Gingivitis
  - Headache
  - Nausea
  - Sensation abnormal

**SIDE-EFFECTS, FURTHER INFORMATION**

Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection.

The toxicity mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity

  - Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine.

  - Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY**
  - Use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Avoid breast-feeding for 48 hours after administration.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (increased risk of toxicity in severe impairment).

- **RENAI IMPAIRMENT**
  - Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS**
  - Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Sulphites

- Septanest (Septodont Ltd)
  - Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml
  - Articaine hydrochloride 40 mg per 1 ml
  - Articaine hydrochloride 40 mg per 1 ml
  - Septanest 1 in 100,000 solution for injection cartridges 50 cartridge £24.95

**Bupivacaine hydrochloride**

[13-Jun-2018]

- **INDICATIONS AND DOSE**
  - **Surgical anaesthesia / Acute pain**
    - **BY REGIONAL ADMINISTRATION**
    - **Child:** Doses adjusted according to child’s physical status and nature of procedure, seek expert advice (consult product literature or local protocols)

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered
Bupivacaine hydrochloride 5 mg per 1 ml
Bupivacaine hydrochloride 2.5 mg per 1 ml

### Important Safety Information

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 ml/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

### Indications and Dose

**Surgical Anaesthesia**
- By Lumbar Epidural, or by Local Infiltration, or by Caudal Epidural
- Child 12-17 years: (consult product literature)

**Acute Pain Management**
- By Lumbar Epidural, or by Local Infiltration
- Child 1-17 years: (consult product literature)

### Contraindications

- Local anaesthetics should not be injected into inflamed or inflected tissues nor should they be applied to damaged skin. Injection site reaction site increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- Cardiovascular disease - cerebral atheroma - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypertension - hypotension - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - myocardial depression may be more severe and more resistant to treatment - shock
- Neurotoxicity
- Arachnoiditis - cardiac arrest - diplopia - nerve disorders - paraplegia - paresis - respiratory depression

### Side-Effects

- Toxic effects after administration of local anaesthetics are a result of excessive plasma concentrations; severe toxicity usually results from inadvertent intravascular injection.
- The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

### Allergy and Cross-Sensitivity

- Hypersensitivity and cross-sensitivity
- Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levo-bupivacaine, lidocaine, meptivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

### Pregnancy

- Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.
- Dose adjustments
- Use lower doses for intrathecal use during late pregnancy.

### Breast Feeding

- Amount too small to be harmful.

### Hepatic Impairment

- Manufacturer advises use with caution in advanced liver dysfunction.

### Renal Impairment

- Use with caution in severe impairment.

### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

### Solution for Injection

- Bupivacaine hydrochloride (Non-proprietary)
  - Bupivacaine hydrochloride 5 mg per 1 ml
  - Bupivacaine hydrochloride 2.5 mg per 1 ml

### Infusion

- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 1 mg per 1 ml
  - Bupivacaine hydrochloride 2.5 mg per 1 ml
  - Bupivacaine hydrochloride 10 mg per 1 ml

### Indications and Dose

**Surgical Anaesthesia**
- By Lumbar Epidural, or by Local Infiltration, or by Caudal Epidural
- Child 12-17 years: (consult product literature)

**Acute Pain Management**
- By Lumbar Epidural, or by Local Infiltration
- Child 1-17 years: (consult product literature)

### Important Safety Information

- In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

### Interactions

- Appendix 1: Anaesthetics, Local - sympathomimetics, vasoconstrictor

### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug.

### Solution for Injection

- **Bupivacaine with adrenaline (Non-proprietary)**
  - Adrenaline (as Adrenaline acid tartrate) 5 micrograms per 1 ml
  - Bupivacaine hydrochloride 2.5 mg per 1 ml

### Infusion

- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 10 mg per 1 ml
  - Bupivacaine hydrochloride 20 mg per 1 ml

### Indications and Dose

**Surgical Anaesthesia**
- By Lumbar Epidural, or by Local Infiltration, or by Caudal Epidural
- Child 12-17 years: (consult product literature)

**Acute Pain Management**
- By Lumbar Epidural, or by Local Infiltration
- Child 1-17 years: (consult product literature)

### Important Safety Information

- Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 ml/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

### Contraindications

- Local anaesthetics should not be injected into inflamed or inflected tissues nor should they be applied to damaged skin. Injection site reaction site increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- Cardiovascular disease - cerebral atheroma - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypertension - hypotension - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - myocardial depression may be more severe and more resistant to treatment - shock
- Neurotoxicity
- Arachnoiditis - cardiac arrest - diplopia - nerve disorders - paraplegia - paresis - respiratory depression

### Side-Effects

- Toxic effects after administration of local anaesthetics are a result of excessive plasma concentrations; severe toxicity usually results from inadvertent intravascular injection.
- The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

### Allergy and Cross-Sensitivity

- Hypersensitivity and cross-sensitivity
- Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levo-bupivacaine, lidocaine, meptivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

### Pregnancy

- Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.
- Dose adjustments
- Use lower doses for intrathecal use during late pregnancy.

### Breast Feeding

- Amount too small to be harmful.

### Hepatic Impairment

- Manufacturer advises use with caution in advanced liver dysfunction.

### Renal Impairment

- Use with caution in severe impairment.

### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

### Solution for Injection

- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 5 mg per 1 ml
  - Bupivacaine hydrochloride 2.5 mg per 1 ml

### Infusion

- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 10 mg per 1 ml
  - Bupivacaine hydrochloride 20 mg per 1 ml
**Hypersensitivity** and cross-sensitivity

- **Frequency not known**

**SIDE-EFFECTS**
- Injection site
  - Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Application to the middle ear (can cause ototoxicity).
- Avoid injection into infected tissues.
- Avoid injection into inflamed tissues.
- Complete heart block.
- Preparations containing preservatives should not be used for caudal, epidural, or spinal block.

**CAUTIONS**
- Cardiovascular disease.
- Children.
- Decrease dose.
- Debilitated patients.
- Apparent increase in the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**INTERACTIONS**
- Appendices: anaesthetics, local

**SIDE-EFFECTS**
- Common or very common
  - Anaemia.
  - Back pain.
  - Dizziness.
  - Fever.
  - Headache.
  - Hypotension.
  - Nausea.
  - Procedural pain.
  - Vomiting.

- Frequency not known
  - Angioedema.
  - Aponoea.
  - Arrhythmias.
  - Asthenia.
  - Atiroventricular block.
  - Bladder disorder.
  - Cardiac arrest.
  - Drowsiness.
  - Eye disorders.
  - Faecal incontinence.
  - Flushing.
  - Loss of consciousness.
  - Muscle twitching.
  - Muscle weakness.
  - Nerve disorders.
  - Neurological injury.
  - Oral hypoesthesia.
  - Paralysis.
  - Priapism.
  - Respiratory disorders.
  - Seizure.
  - Sensation abnormal.
  - Skin reactions.
  - Sneezing.
  - Sweaty.
  - Syncope.
  - Vomiting.

**SIDE-EFFECTS, FURTHER INFORMATION**
- The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. Systemic toxicity can occur due to inadvertent intravascular injection. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

**ALLERGY AND CROSS-SENSITIVITY**
- Hypersensitivity and cross-sensitivity
  - Reactions occur mainly with the ester-type local anaesthetics, such as tetracaine.
  - Reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine.
  - Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PREGNANCY**
- Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.
- Avoid if possible in the first trimester—toxicity in animal studies. May cause fetal distress syndrome.
- Do not use for paracervical block in obstetrics.
- Do not use 7.5 mg/mL strength in obstetrics.

**BREAST FEEDING**
- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in patients with reduced hepatic blood flow

**DIRECTIONS FOR ADMINISTRATION**
- For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**
- Levobupivacaine is an isomer of bupivacaine.

**INDICATIONS AND DOSE**
- **Surgical anaesthesia | Acute pain**
  - **By Regional Administration**
    - Child: Doses adjusted according to the child’s physical status and nature of procedure, seek expert advice (consult product literature or local protocols). DOSE AT EXTREMES OF BODY-WEIGHT
    - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**UNLICENSED USE**
- Not licensed for use in children except for analgesia by ilioinguinal or iliohypogastric block.

**IMPORTANT SAFETY INFORMATION**
- The licensed doses stated may not be appropriate in some settings and expert advice should be sought.
- Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.
- Should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**
- Application to the middle ear (can cause ototoxicity).
- Avoid injection into infected tissues.
- Avoid injection into inflamed tissues.
- Complete heart block.
- Preparations containing preservatives should not be used for caudal, epidural, or spinal block.
- For intravenous regional anaesthesia (Bier’s block).
- Should not be applied to damaged skin.

**MEDICINAL FORMS**
- There can be variation in the listing of different medicines containing the same drug.

**Solution for injection**
- Levobupivacaine (Non-proprietary)
  - Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml
  - Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml
  - Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml
  - Levobupivacaine (as Levobupivacaine hydrochloride) 10 mg per 1 ml
  - Chirocaine (AbbVie Ltd)
  - Chirocaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml
  - Chirocaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml
  - Chirocaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml

**Infusion**
- Levobupivacaine (Non-proprietary)
  - Levobupivacaine (as Levobupivacaine hydrochloride) 0.25 mg/mL strength in obstetrics.
  - Levobupivacaine (as Levobupivacaine hydrochloride) 0.5 mg/mL strength in obstetrics.
  - Levobupivacaine (as Levobupivacaine hydrochloride) 1 mg/mL strength in obstetrics.
  - Chirocaine (AbbVie Ltd)
  - Chirocaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml
  - Chirocaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml

**Lidocaine hydrochloride**

- **Infiltration anaesthesia**
  - **By Local Infiltration**
    - Neonate: Up to 3 mg/kg, dose to be given according to patient’s weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.3 mL/kg of 1% solution.
    - Child 1 month–11 years: Up to 3 mg/kg, dose to be given according to patient’s weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.3 mL/kg of 1% solution.
    - Child 12–17 years: (max. per dose 200 mg), dose to be given according to child’s weight and nature of procedure, dose may be repeated not more often than every 4 hours.
DOSES AT EXTREMES OF BODY-WEIGHT

- When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

Intravenous regional anaesthesia and nerve block

- By Regional Administration
- Child: Seek expert advice

Dental anaesthesia

- By Regional Administration
- Child: Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis) | Lubricant in cystoscopy | Lubricant in proctoscopy

- To the skin using ointment
- Child: Apply 1–2 mL as required, avoid long-term use

LMX 4

Anaesthesia before venous cannulation or venepuncture

- TO THE SKIN
- Child 1-2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 3-11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 1-17 years: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

IMPORTANT SAFETY INFORMATION

- When used by local infiltration
  The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS

- When used by regional administration
  All grades of atrioventricular block - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin - severe myocardial depression - sino-atrial disorders

CONTRA-INDICATIONS, FURTHER INFORMATION

- When used by regional administration
  Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

CAUTIONS

- When used by regional administration
  Acute porphyrias p. 624 (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose) - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

INTERACTIONS → Appendix 1: antidiarrhoeics

SIDE-EFFECTS Anxiety - arrhythmias - atiroventricular block - cardiac arrest - circulatory collapse - confusion - dizziness - drowsiness - euphoric mood - headache - hypotension (may lead to cardiac arrest) - loss of consciousness - methaemoglobinemia - muscle twitching - myocardial contractility decreased - nausea - neurological effects - nystagmus - pain - psychosis - respiratory disorders - seizure - sensation abnormal - temperature sensation altered - tinnitus - tremor - vision blurred - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinemia

Methylthioninium chloride can be used for the acute symptomatic treatment of drug-induced methaemoglobinemia.

ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity
  Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, meptivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

PREGNANCY

Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

BREAST FEEDING

Present in milk but amount too small to be harmful.

HEPATIC IMPAIRMENT

Caution—increased risk of side-effects.

RENAL IMPAIRMENT

Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

MONITORING REQUIREMENTS

- With systemic use
  Monitor ECG and have resuscitation facilities available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, ointment.

Solution for injection

- Lidocaine hydrochloride (Non-proprietary)
  Lidocaine hydrochloride 5 mg per 1 ml
  Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (£0.70)
  Lidocaine hydrochloride 10 mg per 1 ml
  Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule (£0.70)
  £1.15–£1.21
  Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule (£0.70)
  £4.00–£4.40
  Lidocaine 200mg/20ml (3%) solution for injection vials | 10 vial (£0.70)
  £19.00–£22.00
  Lidocaine 200mg/20ml (3%) solution for injection ampoules | 10 ampoule (£0.70)
  £7.00–£11.00
  Lidocaine 50mg/5ml (1%) solution for injection ampoules | 10 ampoule (£0.70)
  £2.59–£12.00
  Lidocaine 200mg/20ml (3%) solution for injection Mini-Plasco ampoules | 20 ampoule (£0.70)
  £12.00
  Lidocaine 50mg/5ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule (£0.70)
  £6.50
  Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule (£0.70)
  £8.00
Lidocaine hydrochloride 20 mg per 1 ml
Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule £2.70–£12.00 DT | £2.70
Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial £19.50–£23.00 DT | £23.00
Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule £14.95
Lidocaine 400mg/20ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule £12.00 DT | £12.00
Lidocaine 100mg/5ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule £7.50
Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule £8.00–£11.40 DT | £11.40

Cream
EXCIPIENTS: May contain Benzyl alcohol, propylene glycol
- LMX 4 (Ferndale Pharmaceuticals Ltd)
  Lidocaine 40 mg per 1 gram
  LMX 4 cream | 5 gram £2.98 DT | £2.98
- Vagisil medicated (Combe International Ltd)
  Lidocaine 20 mg per 1 gram
  Vagisil 2% medicated cream | 30 gram £2.99 DT | £2.99

Ointment
- Lidocaine hydrochloride (Non-proprietary)
- Lidocaine hydrochloride 50 mg per 1 gram
  Lidocaine 5% ointment | 15 gram £9.00 DT | £6.18

## Lidocaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 852, adrenaline/epinephrine p. 138.

### INDICATIONS AND DOSE

**Local anaesthesia**
- BY LOCAL INFILTRATION
- Child 12-17 years: Dosage according to the type of nerve block required (consult product literature)

### IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mg/L of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

### INTERACTIONS

- Appendix 1: antiarrhythmics, sympathomimetics, vasoconstrictor

### PROFESSION SPECIFIC INFORMATION

**Dental information**

A variety of lidocaine injections with adrenaline is available in dental cartridges.

Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Sulphites
- Lignospan Special (Septodont Ltd)
  Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml
  Lidocaine hydrochloride 20 mg per 1 ml
  Lignospan Special 2% injection 2.2ml cartridges | 50 cartridge £21.95
  Lignospan Special 2% injection 1.8ml cartridges | 50 cartridge £21.95
- REXOCaine (Henry Schein Ltd)
  Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml
  Lidocaine hydrochloride 20 mg per 1 ml
  REXOCaine 2% injection 2.2ml cartridges | 50 cartridge £23.29

### INDICATIONS AND DOSE

**Anaesthesia and disinfection in dental practice**

- TO MUCOUS MEMBRANES USING OROMUCOSAL SPRAY
  - Child 4-17 years: 10–20 mg, no more than 30 mg should be applied to the same quadrant of the buccal cavity—consult product literature, dose expressed as lidocaine

**Anaesthesia in dental practice**

- TO MUCOUS MEMBRANES USING DENTAL GEL
  - Child 4-17 years: Apply 100–500 mg, use cotton pellet for application to dried mucosa, dose expressed as weight of gel

**DOSE EQUIVALENCE AND CONVERSION**

- 1 metered dose of Xylonor® spray is equivalent to 10 mg of lidocaine.
- 2 millimetres of Xylonor® gel is approximately equivalent to 100 mg of gel (approximately equivalent to 5 mg of lidocaine).

### CAUTIONS

Sepsis (risk of rapid systemic absorption) - traumatised mucosa (risk of rapid systemic absorption)

### INTERACTIONS

- Appendix 1: antiarrhythmics

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Oromucosal gel**

- Xylonor (Septodont Ltd)
  Cetrimide 1.5 mg per 1 gram
  Lidocaine 50 mg per 1 gram
  Xylonor 5% gel sugar-free | 15 gram £4.00

**Spray**

- Xylonor (Septodont Ltd)
  Cetrimide 100 microgram per 1 gram
  Lidocaine 10 mg per 1 gram
  Xylonor 10% spray sugar-free | 36 gram £20.15

## Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 852, phenylephrine hydrochloride p. 127.

### INDICATIONS AND DOSE

**Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose**

- BY INTRANASAL ADMINISTRATION
- Child 12-17 years: Up to 8 sprays

### INTERACTIONS

- Appendix 1: antiarrhythmics - sympathomimetics, vasoconstrictor

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- Lidocaine with phenylephrine (Non-proprietary)
  Phenylephrine hydrochloride 5 mg per 1 ml
  Lidocaine hydrochloride 50 mg per 1 ml
  Xylocaine (2%) 50 mg/5 ml | 50 ml £12.90 DT | £12.90

---

**854 Local anaesthesia**

**Lidocaine with cetrizine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 852.

### INDICATIONS AND DOSE

**Anaesthesia and disinfection in dental practice**

- TO MUCOUS MEMBRANES USING OROMUCOSAL SPRAY
  - Child 4-17 years: 10–20 mg, no more than 30 mg should be applied to the same quadrant of the buccal cavity—consult product literature, dose expressed as lidocaine

**Anaesthesia in dental practice**

- TO MUCOUS MEMBRANES USING DENTAL GEL
  - Child 4-17 years: Apply 100–500 mg, use cotton pellet for application to dried mucosa, dose expressed as weight of gel

**DOSE EQUIVALENCE AND CONVERSION**

- 1 metered dose of Xylonor® spray is equivalent to 10 mg of lidocaine.
- 2 millimetres of Xylonor® gel is approximately equivalent to 100 mg of gel (approximately equivalent to 5 mg of lidocaine).

### CAUTIONS

Sepsis (risk of rapid systemic absorption) - traumatised mucosa (risk of rapid systemic absorption)

### INTERACTIONS

- Appendix 1: antiarrhythmics
Lidocaine with prilocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 852, prilocaine hydrochloride p. 856.

- **INDICATIONS AND DOSE**
  - Anaesthesia before minor skin procedures including venepuncture
  - **TO THE SKIN**
  - Neonate: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day.
  - Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day.
  - Child 3-11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day.
  - Child 1-11 years: Apply 1–5 hours before procedure, a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day.
  - Child 12-17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca).
  - **Anaesthesia on genital skin before injection of local anaesthetics**
    - **TO THE SKIN**
    - Child 12-17 years: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure.
  - **Anaesthesia before surgical treatment of lesions on genital mucosa**
    - **TO THE SKIN**
    - Child 12-17 years: Apply up to 10 g, to be applied 5–10 minutes before procedure, maximum dose should be proportionally reduced in adolescents with body-weight less than 20 kg.
  - **Anaesthesia before cervical curettage**
    - **TO THE SKIN**
    - Child 12-17 years: Apply 10 g in lateral vaginal fornices for 10 minutes.

- **CONTRA-INDICATIONS** Use in child less than 37 weeks corrected gestational age.
- **INTERACTIONS** → Appendix 1: anaesthetics, local - antihistamines
- **SIDE-EFFECTS**
  - Rare or very rare Methaemoglobinemia - skin reactions
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: EMLA cream for local anaesthesia www.medicinesforchildren.org.uk/emla-cream-local-anaesthesia

Mepivacaine hydrochloride

- **INDICATIONS AND DOSE**
  - Infiltration anaesthesia and nerve block in dentistry
  - Child 3-17 years: Consult expert dental sources
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
    - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
  - **IMPORTANT SAFETY INFORMATION**
    - Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.
  - **CONTRA-INDICATIONS** Application to the middle ear (can cause oto toxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin.
  - **CAUTIONS** Cardiovascular disease - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock
  - **INTERACTIONS** → Appendix 1: anaesthetics, local
  - **SIDE-EFFECTS**
    - Common or very common Arrhythmias - dizziness - hypertension - hypotension - nausea - paraesthesia - vomiting
    - Uncommon Neurotoxicity
    - Rare or very rare Arachnoiditis - cardiac arrest - diplopia - nerve disorders - respiratory depression
  - **SIDE-EFFECTS, FURTHER INFORMATION** Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.
ALLERGY AND CROSS-SENSITIVITY

Hypersensitivity and cross-sensitivity. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

PREGNANCY
Use with caution. Mepivacaine may cause nucleic acid damage in the developing embryo.

CONTRA-INDICATIONS
Acquired methaemoglobinaemia - anaemia - application to the middle ear (can cause ototoxicity); avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - congenital methaemoglobinaemia - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) - should not be applied to damaged skin.

CONTRA-INDICATIONS, FURTHER INFORMATION
Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

CAUTIONS
Cardiovascular disease - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - neonates and infants under 6 months are particularly susceptible to methaemoglobinaemia (in neonates) - severe or untreated hypertension - shock.

INTERACTIONS
Appendix 1: anaesthetics, local - sympathomimetics, vasoconstrictor.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Scandonest plain (Septodont Ltd)
  Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge £21.95

Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride p. 855, adrenaline/epinephrine p. 138.

INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry
- By local infiltration
- Child: consult product literature.

IMPORTANT SAFETY INFORMATION
Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

INTERACTIONS
Appendix 1: anaesthetics, local - sympathomimetics, vasoconstrictor.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
EXCIPIENTS: May contain Sulphites
- Scandonest special (Septodont Ltd)
  Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge £21.95

Prilocaine hydrochloride

INDICATIONS AND DOSE

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

CITANEST 1% ®

Infiltration anaesthesia | Nerve block
- By regional administration
  - Child 6 months-11 years: Up to 5 mg/kg, dose adjusted according to site of administration and response; maximum 400 mg per course
  - Child 12-17 years: 100–200 mg/minute, alternatively, may be given in incremental doses; dose adjusted according to site of administration and response; maximum 400 mg per course

IMPORTANT SAFETY INFORMATION
Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS
Acquired methaemoglobinaemia - anaemia - application to the middle ear (can cause ototoxicity); avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - congenital methaemoglobinaemia - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) - should not be applied to damaged skin.

CONTRA-INDICATIONS, FURTHER INFORMATION
Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

CAUTIONS
Cardiovascular disease - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - neonates and infants under 6 months are particularly susceptible to methaemoglobinaemia (in neonates) - severe or untreated hypertension - shock.

INTERACTIONS
Appendix 1: anaesthetics, local.

SIDE-EFFECTS

Common or very common
- Arrhythmias - dizziness - hypertension - hypotension - nausea - paraesthesia - vomiting
- Neurotoxicity
- Rare or very rare
- Cardiac arrest - methaemoglobinaemia - nerve disorders
- Frequency not known
- Diplopia - respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION
Toxic effects. Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

Methaemoglobinaemia
Methaemoglobinaemia can be treated with an intravenous injection of methyleneblue chloride.

ALLERGY AND CROSS-SENSITIVITY

Hypersensitivity and cross-sensitivity. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

PREGNANCY
Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).

Dose adjustments
Use lower doses for intrathecal use during late pregnancy.
Prilocaine hydrochloride With Felypressin
The properties listed below are those particular to the combination only. For the properties of the components please consider, prilocaine hydrochloride p. 856.

- **INDICATIONS AND DOSE**
  - **Dental anaesthesia**
  - **BY REGIONAL ADMINISTRATION**
  - **Child:** Consult expert dental sources for specific advice

- **INTERACTIONS** ➔ Appendix 1: anaesthetics, local

- **SIDE-EFFECTS**
  - Bradycardia, cardiac arrest, dizziness, drowsiness, hypotension, loss of consciousness, methaemoglobinaemia, myocardial contractility decreased, nervousness, respiratory arrest, seizure, tremor, vision blurred

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - **Citasten (Aspen Pharma Trading Ltd)**
  - **Prilocaine hydrochloride 10 mg per 1 ml** Citasten 1% solution for injection 50ml vials | 1 vial (PSt) £5.06

Ropivacaine hydrochloride

- **INDICATIONS AND DOSE**
  - **Acute pain / Surgical anaesthesia**
  - **BY REGIONAL ADMINISTRATION**
  - **Child:** Adjust according to child’s physical status and nature of procedure, seek expert advice

  **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

- **UNLICENSED USE**
  - 2 mg/mL strength not licensed for use in children under 12 years except for acute pain management by caudal epidural block and continuous epidural infusion. 7.5 mg/mL and 10 mg/mL strengths not licensed for use in children under 12 years.

- **IMPORTANT SAFETY INFORMATION**
  - Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  - Application to the middle ear (can cause ototoxicity), avoid injection into infected tissues, avoid injection into inflamed tissues, complete heart block, preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block), should not be applied to damaged skin

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS**
  - Acute porphyrias p. 624, cardiovascular disease - children (consider dose reduction), debilitated patients (consider dose reduction), epilepsy, hypovolaemia, impaired cardiac conduction, impaired respiratory function, myasthenia gravis, shock

- **INTERACTIONS** ➔ Appendix 1: anaesthetics, local

- **SIDE-EFFECTS**
  - Common or very common: Arrhythmias, back pain, chill, cramping, dizziness, headache, hypertension, hypotension, nausea, sensation abnormal, urinary retention, vomiting
  - Uncommon: Anxiety, dyspnoea, hypothermia, neurotoxicity, syncope
  - Rare or very rare: Cardiac arrest
  - Frequency not known: Dyskinesia

SIDE-EFFECTS, FURTHER INFORMATION: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity: Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY**
  - Not known to be harmful. Do not use for paracervical block in obstetrics.

- **BREAST FEEDING**
  - Not known to be harmful.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment.

  **Dose adjustments**
  - Manufacturer advises consider dose reduction for repeat doses in severe impairment.

- **RENAL IMPAIRMENT**
  - Caution in severe impairment. Increased risk of systemic toxicity in chronic renal failure.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - **Ropivacaine hydrochloride 10 mg per 1 ml** Naropin 10mg/1ml solution for injection ampoules | 10 ampoule (PSt) £15.90 (Hospital only)
  - **Ropivacaine hydrochloride 7.5 mg per 1 ml** Naropin 7mg/10ml solution for injection ampoules | 10 ampoule (PSt) £11.79
  - **Ropivacaine hydrochloride 2 mg per 1 ml** Naropin 2mg/10ml solution for injection ampoules | 5 ampoule (PSt) £12.79
  - **Ropivacaine hydrochloride 7.5 mg per 1 ml** Naropin 7mg/10ml solution for injection ampoules | 5 ampoule (PSt) £11.22

  Ropivacaine hydrochloride 2 mg per 1 ml Ropivacaine
  400mg/200ml infusion bags | 5 bag pack £75.55 (Hospital only) | 10 bag pack £137.00 (Hospital only)
- **Naropin** (Aspen Pharma Trading Ltd)
  Ropivacaine hydrochloride 2 mg per 1 ml Naropin 400mg/200ml infusion Polybags | 5 bag pack £86.70

**Tetracaine**
(Amethocaine)

- **INDICATIONS AND DOSE**
  Anaesthesia before venepuncture or venous cannulation
  → **TO THE SKIN**
  - Neonate: Apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.
  - Child 1 month–4 years: Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.
  - Child 5–17 years: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.

- **UNLICENSED USE**
  Not licensed for use in neonates.

- **CONTRA-INDICATIONS**
  Should not be applied to damaged skin

- **SIDE-EFFECTS**
  Oedema · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION
The systemic toxicity of local anaesthetics mainly involves the central nervous system; systemic side effects unlikely as minimal absorption following topical application.

- **ALLERGY AND CROSS-SENSITIVITY**
  Hypersensitivity and cross-sensitivity
  Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**Poisoning, emergency treatment**

**Overview**

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about the degree of risk or about management.

Most childhood poisoning is accidental. Other causes include intentional overdose, drug abuse, iatrogenic and deliberate poisoning. The drugs most commonly involved in childhood poisoning are paracetamol, ibuprofen and aspirin, orally ingested creams, aspirin, iron preparations, cough medicines, and the contraceptive pill.

**Hospital admission**

Children who have features of poisoning should generally be admitted to hospital. Children who have taken poisons with delayed actions should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, Lomotil®) p. 50; the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

**Further information**

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

**General care**

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

**Respiration**

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

The potential for pulmonary aspiration of gastric contents should be considered.

**Blood pressure**

Hypotension is common in severe poisoning with central nervous system depressants; if severe, this may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 610 or a colloid. Vasocostrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service or a paediatric intensive care unit.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with
sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

**Heart**

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

**Body temperature**

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate rewarming as clinically indicated. Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

**Convulsions during poisoning**

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 228 or diazepam p. 226 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 229 can be given by the buccal route or diazepam can be administered as a rectal solution.

**Methaemoglobinaemia**

Drug- or chemical-induced methaemoglobinaemia should be treated with methylthioninium chloride p. 870 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride p. 870 reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinaemia.

**Poison removal and elimination**

**Prevention of absorption**

Given by mouth, charcoal, activated p. 866 can adsorb many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

A second dose may occasionally be required when blood-drug concentration continues to rise suggesting delayed drug release or delayed gastric emptying.

**Active elimination techniques**

Repeated doses of charcoal, activated by mouth may *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing, it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should not be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalisation of the urine for salicylates.

**Removal from the gastro-intestinal tract**

Gastric lavage is rarely required as benefit rarely outweighs risk; advice should be sought from the National Poisons Information Service if a significant quantity of iron or lithium has been ingested within the previous hour.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with lithium salts, and if illicit drugs are carried in the gastro-intestinal tract (‘body-packing’). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

The administration of laxatives alone has no role in the management of the poisoned child and is not a recommended method of gut decontamination. The routine use of a laxative in combination with charcoal, activated has mostly been abandoned. Laxatives should not be administered to young children because of the likelihood of fluid and electrolyte imbalance.

**Alcohol, acute intoxication**

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur. Patients are managed supportivey, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

**Aspirin poisoning**

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid–base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young, and clinical and biochemical assessment is necessary. Generally, the clinical
severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinaisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis, convulsions, respiratory failure, pulmonary oedema or persistently high plasma-salicylate concentrations unresponsive to urinary alkalinaisation.

**Opioid poisoning**

Opioids (narcotic analgesics) cause varying degrees of coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 865 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead of the rate of infusion adjusted according to vital signs. All children should be observed for at least 6 hours after the last dose of naloxone. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required.

Norgestimate, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 607 or magnesium sulfate p. 618, or both. Arrhythmias may occur for up to 12 hours.

**Paracetamol poisoning**

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, children who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese children who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 870 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

**Acute overdose**

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour.

Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Children who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 866 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Children at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in children:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine treatment should commence if the plasma-paracetamol concentration is later reported to be below the treatment line on the paracetamol treatment graph, provided that the child is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

'Staggered' overdose, uncertain time of overdose, or therapeutic excess

A ‘staggered’ overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a ‘staggered’ overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, children who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; for some children this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose. Clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g.
carbamazepine p. 200, efavirenz p. 429, nevirapine p. 430, phenobarbital p. 223, phenytoin p. 211, primidone p. 224, rifabutin p. 378, rifampicin p. 379, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Children with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

**Antidepressant poisoning**

**Tricyclic and related antidepressants**
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer.

Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam p. 226 given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)**
Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam p. 228, diazepam p. 226, or buccal midazolam p. 229 (see Convulsions). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.
Antimalarial poisoning
Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotic poisoning
Phenothiazines and related drugs
Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 263 or diazepam (emulsion preferred).

Second-generation antipsychotic drugs
Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 866 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepine poisoning
Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 867 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in children with a reduced level of consciousness.

Beta blockers poisoning
Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in children with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions. The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the child’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Emergency treatment of poisoning
Overdose with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Calcium-channel blockers poisoning
Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated p. 866 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepine poisoning
Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 867 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in children with a reduced level of consciousness.

Benzodiazepine poisoning
Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in children with a reduced level of consciousness.
Stimulant-drug poisoning

Amphetamines
Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be treated with lorazepam p. 228; advice should be sought from the National Poisons Information Service. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine
Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves cooling measures for hyperthermia (see Body temperature); agitation, hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy
Ecstasy (methylenedioxymethamphetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hypotension and intraocular haemorrhage; hyponatraemia has also been associated with ecstasy use and syndrome of inappropriate antidiuretic hormone secretion (SIADH) can occur.

Treatment of methylenedioxymethamphetamine poisoning is supportive, with diazepam to control persistent convulsions and close monitoring including ECG. For the management of agitation, seek specialist advice. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline poisoning

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of charcoal, activated p. 866 can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 271 may be effective for severe vomiting that is resistant to other antiemetics. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 623 and may be so severe as to require high doses under ECG monitoring. Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). For the management of agitation associated with theophylline overdose, seek specialist advice.

Provided the child does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Cyanide poisoning

Oxygen should be administered to children with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 866 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 866 followed by sodium thiosulfate p. 866 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 595 (Cyanokit®—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol poisoning

Fomepizole (available from “special-order” manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metal poisoning

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases poisoning

Carbon monoxide
Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The patient should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered as soon as available. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The child should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 143. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning such as if the patient is or has been unconscious or has psychiatric or neurological features other than a headache or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, and ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.
CS spray poisoning
CS spray, which is used for riot control, irritates the eyes (hence 'tear' gas) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents poisoning
Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing pralidoxime chloride p. 867 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticide poisoning
Organophosphorus insecticides
Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the child to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 837 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings
Snake bites
Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (Vipera berus). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 138. Indications for European viper snake venom antiserum treatment p. 871 include systemic envenoming, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those children who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service.

Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

European viper snake venom antiserum is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings
Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible.

Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine: self-administered (or administered by a carer) intramuscular adrenaline/epinephrine (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings
The severe pain of weeverfish (Trachinus virens) and Portuguese man-of-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-of-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.
Other poisons
Consult either the National Poisons Information Service day and night or TOXBASE. The National Poisons Information Service (Tel: 0344 892 0111) will provide specialist advice on all aspects of poisoning day and night.

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS

Charcoal, activated

- **INDICATIONS AND DOSE**
  Reduction of absorption of poisons in the gastro-intestinal system
  - BY MOUTH
    - Neonate: 1 g/kg,
    - Child 1-month-11 years: 1 g/kg (max. per dose 50 g)
    - Child 12-17 years: 50 g
  - Active elimination of poisons
    - BY MOUTH
      - Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.
      - Child 1-month-11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.
      - Child 12-17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy.

- **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) or drowsy patient (risk of aspiration—ensure airway protected) or reduced gastrointestinal motility (risk of obstruction).
- **SIDE-EFFECTS** Bezoar · constipation · diarrhoea · gastrointestinal disorders
- **DIRECTIONS FOR ADMINISTRATION** Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - **Charcodote** (Teva UK Ltd)
      - Activated charcoal 200 mg per 1 ml Charcodote 200mg/ml oral suspension sugar-free | 250 ml [P] £11.48
    - **Carbonix** (Kent Pharmaceuticals Ltd)
      - Activated charcoal 813 mg per 1 gram Carbonix 81.3% granules sugar-free | 50 gram [P] £11.90

2 Chemical toxicity

2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

Dicobalt edetate

- **INDICATIONS AND DOSE**
  Severe poisoning with cyanides
  - BY INTRAVENOUS INJECTION
    - Child: Consult the National Poisons Information Service

- **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness
- **SIDE-EFFECTS** Reflex tachycardia · vomiting
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - **Dicobalt edetate (Non-proprietary)**
      - Dicobalt edetate 15 mg per 1 ml Dicobalt edetate 300mg/20ml solution for injection ampoules | 6 ampoule (£11.72) DT = £11.72

Sodium nitrite

- **INDICATIONS AND DOSE**
  Poisoning with cyanides (used in conjunction with sodium thiosulfate)
  - BY INTRAVENOUS INJECTION
    - Child: Consult the National Poisons Information Service

- **SIDE-EFFECTS** Arrhythmias · dizziness · headache · hypotension · palpitations
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - **Sodium nitrite (Non-proprietary)**
      - Sodium nitrite 30 mg per 1 ml Sodium nitrite 300mg/10ml solution for injection vials | 1 vial (£0.5)

Sodium thiosulfate

- **INDICATIONS AND DOSE**
  Poisoning with cyanides
  - BY INTRAVENOUS INJECTION
    - Child: Consult the National Poisons Information Service

- **DOSE EQUIVALENCE AND CONVERSION**
  - 12.5 g equates to 50 mL of a 25% solution or 25 mL of a 50% solution.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.
2.2 Organophosphorus toxicity

Other drugs used for Organophosphorus toxicity
Atropine sulfate, p. 837

ANTIDOTES AND CHELATORS

Pralidoxime chloride

- **INDICATIONS AND DOSE**
  Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent
  - **BY INTRAVENOUS INFUSION**
    - **Child:** Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
  - **UNLICENSED USE**
    Pralidoxime chloride doses may differ from those in product literature.
  - **CONTRA-INDICATIONS**
    Poisoning with carbamates - poisoning with organophosphorus compounds without anticholinesterase activity
  - **CAUTIONS**
    Myasthenia gravis
  - **SIDE-EFFECTS**
    Dizziness, drowsiness, headache, hyperventilation, muscle weakness, nausea, tachycardia, visual impairment
  - **RENAL IMPAIRMENT**
    Use with caution.
  - **DIRECTIONS FOR ADMINISTRATION**
    The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.
    For intravenous infusion, reconstitute each vial with 20 mL water for injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres.
  - **EXCEPTIONS TO LEGAL CATEGORY**
    Prescription only medicine restriction does not apply where administration is for saving life in emergency.
  - **MEDICINAL FORMS**
    There can be variation in the licensing of different medicines containing the same drug.
    - Protosan Chloride (Imported (United States))
    - Pralidoxime chloride 1 gram Protosan Chloride 1g powder for solution for injection vials | 6 vial

Flumazenil

- **INDICATIONS AND DOSE**
  Reversal of sedative effects of benzodiazepines
  - **BY INTRAVENOUS INJECTION**
    - **Neonate:** 10 micrograms/kg every 1 minute if required, dose to be administered over 15 seconds.
    - **Child:** 10 micrograms/kg every 1 minute (max. per dose 200 micrograms) if required, dose to be administered over 15 seconds; maximum 1 mg per course; maximum 50 micrograms/kg per course
  - **UNLICENSED USE**

IMPORTANT SAFETY INFORMATION
Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS**
  Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines
- **CAUTIONS**
  Avoid rapid injection following major surgery - avoid rapid injection in high-risk or anxious patients - benzodiazepine dependence (may precipitate withdrawal symptoms) - children - ensure neuromuscular blockade cleared before giving - head injury (rapid reversal of benzodiazepine sedation may cause convulsions) - history of panic disorders (risk of recurrence) - prolonged benzodiazepine therapy for epilepsy (risk of convulsions) - short-acting (repeat doses may be necessary) - benzodiazepine effects may persist for at least 24 hours
- **SIDE-EFFECTS**
  - **Common or very common**
    Anxiety, diplopia, dry mouth, eye disorders, flushing, headache, hiccups, hyperhidrosis, hyperventilation, hypotension, insomnia, nausea, palpitations, paraesthesia, speech disorder, tremor, vertigo, vomiting
  - **Uncommon**
    Abnormal hearing, arrhythmias, chest pain, chills, cough, dyspnoea, nasal congestion, seizure (more common in patients with epilepsy)
- **Frequency not known**
  Withdrawal syndrome
- **PREGNANCY**
  Not known to be harmful.
- **BREAST FEEDING**
  Avoid breast-feeding for 24 hours.
3.2 Digoxin toxicity

ANTIDOTES AND CHELATORS ➔ ANTIBODIES

Digoxin-specific antibody

- INDICATIONS AND DOSE
  Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradycardia unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary
  - BY INTRAVENOUS INFUSION
  - Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

- MEDICINAL FORMS
  - Solution for injection
    - Flumazenil (Non-proprietary)
      - Flumazenil 100 microgram per 1 ml Flumazenil 500 micrograms/5ml solution for injection ampoules
      - 5 ampoule | £7.24 (Hospital only) | 5 ampoule | £65.50–£70.00 | 10 ampoule | £140.00

3.3 Heparin toxicity

ANTIDOTES AND CHELATORS

Protamine sulfate

- INDICATIONS AND DOSE
  Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (less than 30 minutes lapsed since overdose)
    - BY INTRAVENOUS INJECTION
    - Child: 1 mg (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin
  Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if 30–60 minutes lapsed since overdose)
    - BY INTRAVENOUS INJECTION
    - Child: 500–750 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

- MEDICINAL FORMS
  - Solution for injection
    - Protamine sulfate (Non-proprietary)
      - Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules
      - 5 ampoule | £4.10
      - Protamine sulfate 50mg/5ml solution for injection ampoules
      - 10 ampoule | £49.55
3.4 Opioid toxicity

**OPIOID RECEPTOR ANTAGONISTS**

### Naloxone hydrochloride

#### INDICATIONS AND DOSE

**Overdosage with opioids**
- **BY INTRAVENOUS INJECTION**
  - Neonate: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a max. of 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action.
  - Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.

**Reversal of postoperative respiratory depression**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: 1 microgram/kg, repeated every 2–3 minutes if required.
  - Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.

**Reversal of postoperative respiratory depression**
- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 200 micrograms, alternatively 60 micrograms/kg, to be given as a single dose at birth.

#### PHARMACOKINETICS
- Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

#### UNLICENSED USE
- Naloxone doses in BNF may differ from those in product literature.

#### IMPORTANT SAFETY INFORMATION

**SAFE PRACTICE**
- Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

**CAUTIONS**
- Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported) • maternal physical dependence on opioids (may precipitate withdrawal in newborn) • pain • physical dependence on opioids (precipitates withdrawal)
- **FURTHER INFORMATION**
  - Titrated dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.

**SIDE-EFFECTS**
- **Common or very common**
  - Arrhythmias • dizziness • headache • hypertension • hypotension • nausea • vomiting
  - **Uncommon**
    - Diarrhoea • dry mouth • hyperhidrosis • hyperventilation • inflammation localised • pain • tremor • vomiting • respiratory depression
  - **Rare or very rare**
    - Anxiety • cardiac arrest • erythema multiforme • pulmonary oedema • seizure
  - **Frequency not known**
    - Analgesia reversed • asthenia • chills • death • dyspnoea • fever • irritability • nasal complaints • piloerection • yawning

**PREGNANCY**
- Use only if potential benefit outweighs risk.

**BREAST FEEDING**
- Not orally bioavailable.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For continuous intravenous infusion, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Naloxone hydrochloride (Non-proprietary)**
  - Naloxone hydrochloride 20 microgram per 1 ml
  - Naloxone 40 micrograms/2 ml solution for injection ampoules | 10 ampoule [Price] £55.00
  - Naloxone hydrochloride dihydrate 400 microgram per 1 ml
  - Naloxone 400 micrograms/1 ml solution for injection ampoules | 10 ampoule [Price] £36.05–£53.70 DT + £40.79
  - Naloxone hydrochloride 1 mg per 1 ml
  - Naloxone 2 mg/2 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [Price] £16.80
3.5 Paracetamol toxicity

**Antidotes and Chelators**

**Acetylcysteine**

- **Indications and Dose**
  - **Paracetamol Overdose**
    - **By Intravenous Infusion**
      - Neonate: Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
      - Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
      - Child (body-weight 20 kg up to 100 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%.
      - Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%.

**Meconium Ileus**

- **By Mouth**
  - Neonate: 200–400 mg up to 3 times a day if required.

**Treatment of distal intestinal obstructive syndrome**

- **By mouth**
  - Child 1 month–1 year: 0.4–3 g as a single dose
  - Child 2–6 years: 2–3 g as a single dose
  - Child 7-17 years: 4–6 g as a single dose

**Prevention of distal intestinal obstruction syndrome**

- **By mouth**
  - Child 1 month–1 year: 100–200 mg 3 times a day
  - Child 2-11 years: 200 mg 3 times a day
  - Child 12-17 years: 200–400 mg 3 times a day

**Doses at Extremes of Body-weight**

- To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdose.

- **Unlicensed Use**
  - With oral use Not licensed for use in meconium ileus or for distal intestinal obstructive syndrome in children with cystic fibrosis.

**Important Safety Information**

MHRA/CHM Advice: Intravenous Acetylcysteine for Paracetamol Overdose: Reminder of Authorised Dose Regimen; Possible Need for Continued Treatment (January 2017)

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

**Continued Treatment**

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

- **CAUTIONS**
  - With intravenous use asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment). Atopy may slightly increase INR - may slightly increase prothrombin time.
  - With oral use Asthma - history of peptic ulceration.

- **Side-effects**

- **Side-effects, Further Information**
  - Anaphylactoid reactions (with intravenous use) can be managed by suspending treatment and initiating appropriate management. Treatment may then be restarted at lower rate.

- **Directions for Administration**
  - With oral use For oral administration, use oral granules or dilute injection solution (200 mg/mL) to a concentration of 50 mg/mL; orange or blackcurrant juice or cola drink may be used as a diluent to mask the bitter taste.
  - With intravenous use Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if glucose 5% unsuitable.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: effervescent tablet, granules.

**Granules**

CAUTIONARY AND ADVISORY LABELS: 13

- **A-CYS** (Ennogen Healthcare Ltd)
  - Acetylcysteine 200 mg A-CYS 200mg granules sachets | 20 sachets
  - £75.00

**Solution for infusion**

**Electrolytes**

- May contain Sodium

- **Acetylcysteine (Non-proprietary)**
  - Acetylcysteine 200 mg per 1 mL
  - Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule £21.26–£24.99 DT = £21.26
  - **Parvolex** (Phoenix Labs Ltd)
  - Acetylcysteine 200 mg per 1 mL
  - Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule £22.50 DT = £21.26

4. Methaemoglobinemia

**Antidotes and Chelators**

**Methylthioninium chloride**

(Methylene blue)

- **Indications and Dose**
  - Drug- or chemical-induced methaemoglobinemia
    - **By Slow Intravenous Injection**
      - Neonate: Seek advice from National Poisons Information Service.
      - Child 1–2 months: Seek advice from National Poisons Information Service.
      - Child 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course.
**ANITOXINS > IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS**

### European viper snake venom antiserum

**INDICATIONS AND DOSE**

*Systemic envenomming from snake bites > Marked local envenomming*

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child:** Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenomming persist after the first dose, if symptoms of systemic

---

**5 Snake bites**

**IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS**

**European viper snake venom antiserum**

- **CAUTIONS**
  - Children under 3 months (more susceptible to methaemoglobinemia from high doses of methylthioninium) - chlorate poisoning (reduces efficacy of methylthioninium) - G6PD deficiency (seek advice from National Poisons Information Service) - methaemoglobinemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) - pulse oximetry may give false estimation of oxygen saturation
- **INTERACTIONS**
  - Appendix 1: methylthioninium chloride
- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, anxiety, chest pain, dizziness, headache, hyperhidrosis, nausea, pain in extremity, paraesthesia, skin reactions, taste altered, urinary discoulouration, vomiting
  - Frequency not known: Aphasia, arrhythmias, confusion, faeces discoloured, fever, haemolytic anaemia, hyperbilirubinaemia (in infants), hypertension, injection site necrosis, mydriasis, tremor
- **PREGNANCY**
  - No information available, but risk to fetus of untreated methaemoglobinemia likely to be significantly higher than risk of treatment.
- **BREAST FEEDING**
  - Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.
- **RENAL IMPAIRMENT**
  - Dose adjustments: Use with caution in severe impairment; dose reduction may be required.
- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous injection, may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **European viper snake venom antiserum (Non-proprietary)**
  - European viper snake venom antiserum 100 mg per 1 ml Viper venom antiserum, European (equine) 1g/10ml solution for injection vials | 1 vial (BNF)
Appendix 1

Interactions

Changes have been made to the interactions content in BNF publications. For more information, see www.bnf.org/new-bnf-interactions/.

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse reactions to drugs p. 14), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function.

Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

Pharmacodynamic interactions
These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They might be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs.

Pharmacokinetic interactions
These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs.

Affecting absorption
The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

Affecting distribution
Due to changes in protein binding: To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug will usually be eliminated.

Displacement from protein binding plays a part in the potentiating of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

Induction or inhibition of drug transporter proteins: Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

Affecting metabolism
Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g. glucuronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug’s metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer of CYP3A4, ketoconazole is potent inhibitor of CYP3A4, and midazolam is a substrate of CYP3A4. Carbamazepine reduces midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

Less is known about the enzymes involved in phase II reactions. These include UDP-glucurononyltransferases which, for example, might be induced by rifampicin, resulting in decreased metabolism of mycophenolate (a substrate for this enzyme) to its active form, mycophenolic acid.

Affecting renal excretion
Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.
Relative importance of interactions

Levels of severity: Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

Severe—the result may be a life-threatening event or have a permanent detrimental effect.

Moderate—the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be life-threatening or result in long-term effects.

Mild—the result is unlikely to cause concern or incapacitate the majority of patients.

Unknown—used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome.

Levels of evidence: Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

Study—for interactions where the information is based on formal study including those for other drugs with same mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).

Anecdotal—interactions based on either a single case report or a limited number of case reports.

Theoretical—interactions that are predicted based on sound theoretical considerations. The information may have been derived from in vitro studies or based on the way other members in the same class act.

Action messages: Each interaction describes the effect that occurs, and the action to be taken, either based on manufacturer’s advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. Pharmacodynamic interactions, with the exception of interactions with drugs that may prolong the QT interval, do not have an action message included as these will depend on individual patient circumstances.

Appendix 1 structure

1. **Drugs**
   - Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.
   - Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer’s advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

2. **Drug classes**
   - The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3. **Supplementary information**
   - If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

4. **Pharmacodynamic effects**
   - Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.
   - Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.
TABLE 1
Drugs that cause hepatotoxicity

The following is a list of some drugs that cause hepatotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

</table>
The following is a list of some drugs that prolong the QT interval (note that this list is not exhaustive). Concurrent use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).

Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation include: domperidone, fingoilmol, granisetron, ivabradine, metlofloxine, mizolastine, palonosetron, and intravenous pentamidine. Most manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.

TABLE 9
Drugs that prolong the QT interval
The following is a list of some drugs that prolong the QT interval (note that this list is not exhaustive). Concurrent use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).

TABLE 10
Drugs with antimuscarinic effects
The following is a list of some drugs that have antimuscarinic effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of these effects occurring. Drugs with antimuscarinic effects decrease the absorption of levodopa.

TABLE 11
Drugs with CNS depressant effects
The following is a list of some drugs with CNS depressant effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of CNS depressant effects, such as drowsiness, which might affect the ability to perform skilled tasks (see ‘Drugs and Driving’ in Guidance on Prescribing p. 1).
### Table 12: Drugs that cause peripheral neuropathy
The following is a list of some drugs that cause peripheral neuropathy (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

### TABLE 16
Drugs that increase serum potassium

The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia (hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone).

### TABLE 17
Drugs that reduce serum potassium

The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive and that other drugs can cause hypokalaemia in overdose). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval (see table of drugs that prolong the QT interval). Drugs that reduce serum potassium are predicted to increase the risk of digoxin toxicity.

</table>
List of drug interactions

The following is an alphabetical list of drugs and their interactions, to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

Abacavir
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abacavir. (Moderate) Theoretical
- HIV-protease inhibitors (tipranavir) slightly decrease the exposure to abacavir. Avoid. (Severe) Study

Abatacept
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Abatacept is predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies (golimumab). Avoid. (Severe) Theoretical

Abemaciclib
- Antiarhythmics (dronedarone) are predicted to increase the exposure to abemaciclib. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to abemaciclib. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe) Study
- Aprepitant is predicted to increase the exposure to abemaciclib. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to abemaciclib. (Moderate) Study
- Cobicistat is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe) Study
- Crizotinib is predicted to increase the exposure to abemaciclib. (Moderate) Study
- Enzalutamide is predicted to markedly decrease the exposure to abemaciclib. Avoid. (Severe) Study
- Grapefruit juice is predicted to increase the exposure to abemaciclib. Avoid. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe) Study
- Idelalisib is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe) Study
- Imatinib is predicted to increase the exposure to abemaciclib. (Moderate) Study
- Macrolides (clarithromycin) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe) Study
- Mitotane is predicted to markedly decrease the exposure to abemaciclib. (Moderate) Study
- Nilotinib is predicted to increase the exposure to abemaciclib. (Moderate) Study
- Rifampicin is predicted to markedly decrease the exposure to abemaciclib. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to abemaciclib. Avoid. (Severe) Study

Abiraterone
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study
- Abiraterone is predicted to increase the exposure to beta blockers, selective (metoprolol). (Moderate) Study
- Abiraterone is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study

Acarbose
- See table 7. p. 875 (first-dose hypotension)
- Acarbose decreases the concentration of digoxin. (Moderate) Study

Acetaminophen
- See NSAIDs

Acenocoumarol
- See coumarins

Acetazolamide
- See theophylline, non-sedating
- See antihistamines, non-sedating
- See NSAIDs
- See coumarins

Acrivastine
- See antihistamines, non-sedating

Acrizol
- See theophylline.

Adefovir
- See table 2. p. 874 (nephrotoxicity)
- See table 10. p. 876 (antimuscarinics)
- See NSIDs
- See monoclonal antibodies

Acrizol
- See theophylline.

Adefovir
- See table 2. p. 874 (nephrotoxicity)
Adefovir (continued)  
▶ Leflunomide is predicted to increase the exposure to adefovir.  
(Moderate) Theoretical  
▶ Teriflunomide is predicted to increase the exposure to adefovir.  
(Moderate) Study  
Adenosine → see antiarrhythmics  
Adrenaline/epinephrine → see sympathomimetics, vasoconstrictor  
Afatinib → see TABLE 15 p. 877 (myelosuppression)  
▶ Antiarhythmics (amiodarone, dronedarone) are predicted to increase the exposure to afatinib. Separate administration by 12 hours. (Moderate) Study  
▶ Antiepileptics (carbamazepine) are predicted to decrease the exposure to afatinib. (Moderate) Study  
▶ HIV-protease inhibitors (ritonavir) decrease the exposure to afatinib. (Moderate) Study  
Albendazole  
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of albendazole. (Moderate) Study  
▶ H₂-receptor antagonists (cimetidine) decrease the clearance of albendazole. (Moderate) Study  
▶ HIV-protease inhibitors (ritonavir) decrease the exposure to albendazole. (Moderate) Study  
Albendazole slightly decreases the exposure to levamisole and levamisole moderately decreases the exposure to albendazole. (Moderate) Study  
Alcohol (beverage) → see TABLE 1 p. 874 (hepatotoxicity), TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)  
▶ Alcohol (beverage) potentially increases the risk of visual disturbances when given with antiepileptics (retigabine). (Moderate) Study  
▶ Alcohol (beverage) potentially causes a disulfiram-like reaction when given with antifungals, azoles (itraconazole, ketoconazole). Avoid. (Moderate) Aneodyal  
▶ Alcohol (beverage) causes serious, potentially fatal, CNS depression when given with clonethiazole. Avoid. Severe Study → Also see TABLE 11 p. 876  
▶ Alcohol (beverage) (in those who drink heavily) potentially decreases the anticoagulant effect of coumarins. Severe Study  
▶ Alcohol (beverage) (excessive consumption) potentially increases the risk of gastrointestinal side-effects when given with dimethyl fumarate. Avoid. (Moderate) Theoretical  
▶ Alcohol (beverage) causes an extremely unpleasant systemic reaction when given with disulfiram. Avoid for at least 24 hours before and up to 14 days after stopping treatment. Severe Study  
▶ Alcohol (beverage) potentially causes a disulfiram-like reaction when given with griseofulvin. (Moderate) Aneodyal  
▶ Alcohol (beverage) potentially causes a disulfiram-like reaction when given with levamisole. (Moderate) Study  
▶ Alcohol (beverage) (excessive consumption) potentially increases the risk of lactic acidosis when given with metformin. Avoid excessive alcohol consumption. (Moderate) Theoretical  
▶ Alcohol (beverage) potentially causes a disulfiram-like reaction when given with metronidazole. Avoid for at least 48 hours stopping treatment. (Moderate) Study  
▶ Alcohol (beverage) causes rapid release of opioids (hydromorphone, morphine) (from extended-release preparatory) → Also see TABLE 11 p. 876  
▶ Alcohol (beverage) (in those who drink heavily) causes severe liver damage when given with paracetamol. Severe Study → Also see TABLE 1 p. 874  
▶ Alcohol (beverage) increases the risk of facial flushing and skin irritation when given with topical pimecrolimus. (Moderate) Study  
▶ Alcohol (beverage) potentially causes a disulfiram-like reaction when given with procarbazine. (Moderate) Aneodyal  
▶ Alcohol (beverage) potentially increases the concentration of retinoids (acitretin). Avoid and for 2 months after stopping acitretin. (Moderate) Study  
▶ Alcohol (beverage) increases the risk of facial flushing and skin irritation when given with topical tacrolimus. (Moderate) Study  
▶ Alcohol (beverage) potentially causes a disulfiram-like reaction when given with tinidazole. Avoid for 72 hours stopping treatment. (Moderate) Theoretical  
Aldosterone antagonists → see TABLE 18 p. 878 (hyponatraemia), TABLE 8 p. 875 (hypotension), TABLE 16 p. 878 (increased serum potassium)  
Eplerenone → spironolactone.  
▶ Antiarhythmics (amiodarone) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Theoretical  
▶ Antiarhythmics (dronedarone) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study  
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eplerenone. Avoid. (Moderate) Theoretical → Also see TABLE 18 p. 878
Aldosterone antagonists — Alkylating agents 881

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study

- Apalutamide is predicted to decrease the exposure to eplerenone. Avoid or monitor. (Moderate) Study

- Aprepitant is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Cobicistat is predicted to markedly increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Eplerenone very slightly increases the exposure to digoxin. (Mid) Study

- Enalaprilat is predicted to decrease the exposure to eplerenone. Avoid. (Moderate) Theoretical

- HIV-protease inhibitors are predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study

- Idelalisib is predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study

- Imatinib is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Eplerenone potentially increases the concentration of lithium. Avoid. (Moderate) Theoretical

- Spironolactone potentially increases the concentration of lithium. (Moderate) Study

- Macrolides (azithromycin) are predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study

- Macrolides (erythromycin) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Mitotane is predicted to decrease the exposure to eplerenone. Avoid. (Moderate) Theoretical

- Netupitant is predicted to decrease the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Nimotop is predicted to decrease the exposure to eplerenone. Avoid. (Severe) Study

- Rifampicin is predicted to decrease the exposure to eplerenone. Avoid. (Moderate) Theoretical

- St John's Wort is predicted to slightly decrease the exposure to eplerenone. Avoid. (Moderate) Study

- Alemtuzumab 
  - see monoclonal antibodies

- Alendronic acid 
  - see bisphosphonates

- Alfentanil 
  - see opioids

- Alfuzosin 
  - see alpha blockers

- Alimemazine 
  - see antihistamines, sedating

- Aminoglycosides 
  - see aminoglycosides

- Aliskiren is predicted to markedly increase the exposure to aliskiren. Avoid. (Severe) Study

- Antiarrhythmics (amiodarone, droxidopa) are predicted to increase the exposure to aliskiren. (Severe) Study

- Antidepressants (carbamazepine) decrease the exposure to aliskiren. (Moderate) Study

- Antifungals, azoles (itraconazole) markedly increase the exposure to aliskiren. Avoid. (Severe) Study

- Antifungals, azoles (ketoconazole) moderately increase the exposure to aliskiren. (Moderate) Study

- Calcium channel blockers (verapamil) moderately increase the exposure to aliskiren. (Moderate) Study

- Certitin is predicted to increase the exposure to aliskiren. (Moderate) Theoretical

- Ciclosporin markedly increases the exposure to aliskiren. Avoid. (Severe) Study

- Eliglustat is predicted to increase the exposure to aliskiren. Adjust dose. (Moderate) Study

- Grapefruit juice moderately decreases the exposure to aliskiren. Avoid. (Severe) Study

- HIV-protease inhibitors (ritonavir, saquinavir) are predicted to increase the exposure to aliskiren. (Moderate) Theoretical

- Lapatinib is predicted to increase the exposure to aliskiren. (Moderate) Theoretical

- Aliskiren slightly decreases the exposure to loop diuretics (furosemide). (Moderate) Study

- Aliskiren is predicted to increase the exposure to aliskiren. (Moderate) Study

- Mirabegron is predicted to increase the exposure to aliskiren. (Mid) Theoretical

- Paroxetine (with ritonavir and omeprazole) is predicted to increase the exposure to aliskiren. (Moderate) Study

- Pibrentasvir is predicted to decrease the exposure to aliskiren. (Moderate) Study

- Prasugrel is predicted to decrease the exposure to aliskiren. (Mid) Theoretical

- Ranolazine is predicted to increase the exposure to aliskiren. (Moderate) Theoretical

- Rifampicin decreases the exposure to aliskiren. (Moderate) Study

- St John's Wort decreases the exposure to aliskiren. (Moderate) Study

- Statins (atorvastatin) slightly to moderately increase the exposure to aliskiren. (Moderate) Study

- Velpatasvir is predicted to increase the exposure to aliskiren. (Moderate) Study

- Aliskiren is predicted to increase the exposure to aliskiren. Adjust with caution and adjust dose. (Moderate) Theoretical

- Alitretinoin 
  - see retinoids

- Antacids are predicted to decrease the absorption of estramustine. Avoid. (Moderate) Study

- Antifungals, azoles (isavuconazole) are predicted to increase the exposure to cyclophosphamide. (Moderate) Study

- Antifungals, azoles (itraconazole) increase the risk of busulfan toxicity when given with busulfan. Monitor and adjust dose. (Moderate) Study

- Antifungals, azoles (miconazole) are predicted to increase the concentration of busulfan. Use with caution and adjust dose. (Moderate) Theoretical

- Aprepitant is predicted to increase the exposure to ifosfamide. (Severe) Theoretical

- Oral calcium salts decrease the absorption of estramustine. (Severe) Study

- Fosaprepitant is predicted to increase the exposure to ifosfamide. (Severe) Theoretical

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

- Metronidazole increases the risk of toxicity when given with busulfan. (Severe) Study

- Netupitant very slightly increases the exposure to cyclophosphamide. (Moderate) Study

- Netupitant is predicted to increase the exposure to ifosfamide. (Moderate) Study

- Bendamustine • busulfan • carmustine • chlorambucil • cyclophosphamide • dacarbazine • estramustine • ifosfamide • lomustine • melphalan • temozolomide • thiopeta • treosulfan

- Anticancer agents are predicted to increase the exposure to busulfan. Increase dose of busulfan. (Moderate) Study

FOOD AND LIFESTYLE

- Avoid apple juice and orange juice as they greatly decrease aliskiren concentrations and plasma renin activity.

- ACE Inhibitors increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients. (Severe) Study

- Angiotensin II receptor antagonists increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients. (Severe) Study

- Antiarrhythmics (amiodarone, droxidopa) are predicted to increase the exposure to aliskiren. (Severe) Study

- Antidepressants (carbamazepine) decrease the exposure to aliskiren. (Moderate) Study

- Spironolactone increases the concentration of digoxin. Monitor and adjust dose. (Moderate) Study

- HIV-protease inhibitors are predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study

- Idelalisib is predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study

- Imatinib is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. (Severe) Study

- Eplerenone potentially increases the concentration of lithium. Avoid. (Moderate) Theoretical
Alkylating agents (continued)

- **Paracetamol** is predicted to decrease the clearance of busulfan. [Moderate] [Theoretical]
- **Cyclophosphamide** (high-dose) increases the risk of toxicity when given with **pentostatin**. Avoid. [Severe] Anecdotal → Also see TABLE 15, p. 877 → Also see TABLE 8, p. 874
- **Rolapitant** is predicted to increase the exposure to bendamustine. Avoid or monitor. [Moderate] [Study]
- **Cyclophosphamide** increases the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] [Study]

**Allopurinol**

- **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with **allopurinol**. [Severe] Anecdotal
- **Allopurinol** potentially increases the risk of haematological toxicity when given with **azathioprine**. Adjust **azathioprine** dose. p. 536. [Severe] [Study]
- **Allopurinol** is predicted to decrease the effects of **capecilibine**. Avoid. [Severe] [Study]
- **Allopurinol** moderately increases the exposure to **didanosine**. Avoid. [Severe] [Study]
- **Allopurinol** potentially increases the risk of haematological toxicity when given with **mercaptoptilin**. Adjust **mercaptoptilin** dose. p. 562. [Severe] [Study]
- **Allopurinol** increases the risk of skin rash when given with **penicillins** (**amoxicillin, ampicillin**). [Moderate] [Study]
- **Allopurinol** is predicted to increase the risk of hyperuricemia when given with **pyrazinamide**. [Moderate] [Theoretical]
- **Thiadizide diuretics** are predicted to increase the risk of hypersensitivity reactions when given with **allopurinol**. [Severe] [Theoretical]

**Almotriptan** | see TABLE 13, p. 877 (serotonin syndrome)

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** increase the exposure to **almotriptan**. [MED] [Study]
- **Cobicistat** increases the exposure to **almotriptan**. [MED] [Study]
- **Almotriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. Ergotamine should be taken at least 24 hours before or 6 hours after **almotriptan**. [Severe] [Theoretical]
- **HIV-protease inhibitors** increase the exposure to **almotriptan**. [MED] [Study]
- **Idelalisib** increases the exposure to **almotriptan**. [MED] [Study]
- **Macrolides (clarithromycin)** increase the exposure to **almotriptan**. [MED] [Study]

**Allopamitin** | see TABLE 14, p. 877 (anti-diabetic drugs)

**Alpha blockers** | see TABLE 7, p. 875 (first-dose hypotension), TABLE 8, p. 875 (hypotension)

- **Alfuzosin, doxazosin, indoramin, prazosin, tamsulosin, terazosin** are predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **doxazosin**. [Moderate] [Study]
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **Calcium channel blockers (diltiazem, verapamili)** are predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical] → Also see TABLE 8, p. 875
- **Cobicistat** is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] [Study]
- **Cobicistat** is predicted to increase the exposure to **doxazosin**. [Moderate] [Study]
- **Cobicistat** is predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] [Study]
- **HIV-protease inhibitors** are predicted to increase the exposure to **doxazosin**. [Moderate] [Study]
- **Idelalisib** is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] [Study]
- **Idelalisib** is predicted to increase the exposure to **doxazosin**. [Moderate] [Study]
- **Imatinib** is predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **doxazosin**. [Moderate] [Study]
- **Macrolides (erythromycin)** are predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] [Study]
- **Monoamine oxidase A and B inhibitors, irreversible** are predicted to increase the effects of **indoramin**. Avoid. [Severe] [Theoretical] → Also see TABLE 8, p. 875
- **Netupitant** is predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **Nilotinib** is predicted to increase the exposure to **tamsulosin**. [Moderate] [Theoretical]
- **Alpha blockers** cause significant hypotensive effects when given with **phosphodiesterase type-5 inhibitors**. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. [Severe] [Study] → Also see TABLE 8, p. 875
- **Ribociclib** (high-dose) is predicted to increase the exposure to **alfuzosin**. Avoid. [Moderate] [Theoretical]
- **Alpha tocopherol** | see vitamin E substances
- **Alpha tocopheryl acetate** | see vitamin E substances
- **Alprazolam** | see TABLE 11, p. 876 (CNS depressant effects)
- **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **alprazolam**. [Severe] [Study]
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] [Theoretical] → Also see TABLE 11, p. 876
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **alprazolam**. [Severe] [Study]
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** moderately increase the exposure to **alprazolam**. Avoid. [Moderate] [Study]
- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **alprazolam**. Use with caution and adjust dose. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to **alprazolam**. [Severe] [Study]
- **Calcium channel blockers (diltiazem, verapamili)** are predicted to increase the exposure to **alprazolam**. [Severe] [Study]
- **Cobicistat** moderately increases the exposure to **alprazolam**. Adjust dose. [Moderate] [Theoretical]
- **Crizotinib** is predicted to increase the exposure to **alprazolam**. [Severe] [Study]
- **Enzalutamide** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] [Theoretical]
- **Fosaprepitant** is predicted to increase the exposure to **alprazolam**. [Moderate] [Study]
- **HIV-protease inhibitors** moderately increase the exposure to **alprazolam**. Avoid. [Moderate] [Study]
- **Idelalisib** moderately increases the exposure to **alprazolam**. Avoid. [Moderate] [Study]
- **Imatinib** is predicted to increase the exposure to **alprazolam**. [Severe] [Study]
- **Alprazolam** is predicted to increase the exposure to **tomitapride**. Separate administration by 12 hours. [Moderate] [Theoretical]
- **Macrolides (clarithromycin)** moderately increase the exposure to **alprazolam**. Avoid. [Moderate] [Study]
- **Macrolides (erythromycin)** are predicted to increase the exposure to **alprazolam**. [Severe] [Study]
Alprazolam – Aminophylline 883

- Mitotane is predicted to decrease the exposure to alprazolam. Adjust dose. [Moderate] Theoretical
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to alprazolam. Monitor and adjust dose. [Moderate] Theoretical
- Neutrapen is predicted to increase the exposure to alprazolam. [Severe] Study
- Nilotinib is predicted to increase the exposure to alprazolam. [Severe] Study
- Rifampicin is predicted to decrease the exposure to alprazolam. Adjust dose. [Moderate] Theoretical
- SSRIs (fluvoxamine) moderately increase the exposure to alprazolam. Adjust dose. [Moderate] Study
- St John's Wort moderately decreases the exposure to alprazolam. [Moderate] Study
- Allopurinol (amfenetamine) see TABLE B p. 875 (hypotension)
- Alteplase see TABLE 3 p. 874 (anticoagulant effects)
- Aluminium hydroxide see antacids
- Amantadine see dopamine receptor agonists
- Ambrisantan
- Ciclosporin moderately increases the exposure to ambrisantan. Adjust ambrisantan dose. [Moderate] Study
- Rifampicin transiently increases the exposure to ambrisantan. [Moderate] Study
- Amfetamines see TABLE 13 p. 877 (serotonin syndrome)
- dexamfetamine - lisdexamfetamine
- Amfetamines are predicted to decrease the effects of apraclonidine. Avoid. [Severe] Theoretical
- Amfetamines are predicted to increase the risk of side-effects when given with atomoxetine. [Severe] Theoretical
- Dexamfetamine decreases the effects of guanethidine. [Severe] Study
- HIV-protase inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to amfetamines. [Severe] Theoretical
- Moclomide is predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid. [Severe] Theoretical
- Also see TABLE 13 p. 877
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid and for 14 days after stopping the MAOI. [Severe] Anecdotal Also see TABLE 13 p. 877
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical Also see TABLE 13 p. 877
- Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical Also see TABLE 13 p. 877
- Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical Also see TABLE 13 p. 877
- Methylphenidate is predicted to increase the risk of cardiovascular side-effects when given with amfetamines. Avoid. [Severe] Theoretical Also see TABLE 13 p. 877
- Phenothiazines are predicted to decrease the effects of amfetamines and amfetamines are predicted to decrease the effects of phenothiazines. [Moderate] Study
- SSRIs (escitalopram, paroxetine) are predicted to increase the exposure to amfetamines. [Severe] Theoretical Also see TABLE 13 p. 877
- Aminoflurane see TABLE 9 p. 876 (QF-interval prolongation)
- Amikacin see aminoglycosides
- Amiloride see potassium-sparing diuretics
- Aminoglycosides see TABLE 2 p. 874 (nephrotoxicity), TABLE 19 p. 878 (ototoxicity), TABLE 20 p. 878 (neuromuscular blocking effects)
- amikacin - gentamicin - streptomycin - tobramycin
- Since systemic absorption can follow topical application, the possibility of interactions with topical gentamicin should be borne in mind.
- Since systemic absorption can follow topical application, the possibility of interactions with topical tobramycin should be borne in mind.
- Aminoglycosides are predicted to decrease the effects of apalasidase. Avoid. [Moderate] Theoretical
- Antifungals, azoles (micazole) potentially decrease the exposure to tobramycin. [Moderate] Anecdotal
- Ataluren is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. [Severe] Study
- Aminoglycosides increase the risk of hypocalcaemia when given with bisphophonates. [Moderate] Anecdotal Also see TABLE 2 p. 874
- Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. [Mild] Study
- Loop diuretics increase the risk of nephrotoxicity when given with aminoglycosides. Avoid. [Moderate] Study Also see TABLE 19 p. 878
- Aminoglycosides are predicted to decrease the effects of neostigmine. [Moderate] Theoretical
- Aminoglycosides are predicted to decrease the effects of pyridostigmine. [Moderate] Theoretical
- Aminophylline see TABLE 17 p. 878 (reduced serum potassium)

FOOD AND LIFESTYLE Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.
- Aciclovir increases the exposure to aminophylline. Monitor and adjust dose. [Severe] Anecdotal
- Aminophylline is predicted to decrease the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. [Mild] Theoretical
- Antiepileptics (fosphenytoin) are predicted to decrease the exposure to aminophylline. Adjust dose. [Moderate] Study
- Antiepileptics (phenobarbital) are predicted to decrease the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Antiepileptics (phenytoin) decrease the exposure to aminophylline. Adjust dose. [Moderate] Study
- Antiepileptics (primidone) are predicted to increase the clearance of aminophylline. Adjust dose. [Moderate] Theoretical
- Antiepileptics (stiripentol) are predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical
- Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. [Severe] Theoretical
- Beta blockers, selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. [Severe] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Aminophylline increases the risk of agitation when given with doxapram. [Moderate] Study
- Esketamine is predicted to increase the risk of seizures when given with aminophylline. Avoid. [Severe] Theoretical
- H2 receptor antagonists see TABLE 10 p. 874 (hyperproteinaemia)
- HIV-protase inhibitors (ritonavir) decrease the exposure to aminophylline. Adjust dose. [Mild] Study
- Interferons are predicted to slightly increase the exposure to aminophylline. Adjust dose. [Mild] Theoretical
- Iron chelators (deferasirox) are predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical
- Isoniazid is predicted to affect the clearance of aminophylline. [Severe] Theoretical
- Leflunomide decreases the exposure to aminophylline. Adjust dose. [Mild] Study
- Aminophylline is predicted to decrease the concentration of lithium. [Moderate] Theoretical
- Macrolides (azithromycin) are predicted to increase the exposure to aminophylline. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to decrease the exposure to aminophylline. Adjust dose. [Severe] Study
- Methotrexate is predicted to decrease the clearance of aminophylline. [Moderate] Theoretical
- Mexiletine is predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Monoclonal antibodies (bilatuzumab) are predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
Aminophylline (continued)

- Monoclonal antibodies (sarilumab) potentially affect the exposure to aminophylline. Monitor and adjust dose. (Moderate) Theoretical
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to aminophylline. Monitor and adjust dose. (Moderate) Theoretical
- Pentoxifylline is predicted to increase the concentration of aminophylline. Use with caution or avoid. (Severe) Theoretical
- Thiopurines (azathioprine, mercaptopurine) are predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical
- Rifampicin decreases the exposure to aminophylline. Adjust dose. (Moderate) Study
- Aminophylline is predicted to slightly increase the exposure to ropivacaine. Avoid. (Moderate) Theoretical
- Rucaparib is predicted to increase the exposure to aminophylline. Monitor and adjust dose. (Moderate) Study
- SSRIs (fluvoxamine) moderately to markedly increase the exposure to aminophylline. Avoid. (Severe) Study
- St John's Wort is predicted to decrease the concentration of aminophylline. (Severe) Theoretical
- Symathomimetics, vasoconstrictor (ephedrine) increase the risk of side-effects when given with aminophylline. Avoid in children. (Moderate) Study
- Teriflunomide decreases the exposure to aminophylline. Adjust dose. (Moderate) Study
- Valaciclovir is predicted to increase the exposure to aminophylline. (Severe) Anecdotal

Aminosalicylic acid

- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with topical amines. (Severe) Theoretical
- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with dapsone. (Severe) Theoretical
- Amiodarone → see antiarrhythmics
- Amlodipine → see calcium channel blockers
- Amoxicillin → see penicillins
- Amphotericin → see Table 2 p. 874 (nephrotoxicity), Table 17 p. 878 (reduced serum potassium)
- Amphotericin increases the risk of toxicity when given with fluvoxamine. (Severe) Study
- Micafungin slightly increases the exposure to amphotericin. Avoid or monitor toxicity. (Moderate) Study
- Sodium stibogluconate increases the risk of cardiovascular side-effects when given with amphotericin. Separate administration by 14 days. (Severe) Study
- Ampicillin → see penicillins
- Amsacrine → see Table 15 p. 877 (myelosuppression)
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Anaesthetics, local → see Table 11 p. 876 (CNS depressant effects)

ROUTE-SPECIFIC INFORMATION: Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Severe) Theoretical
- Anaesthetics, local are predicted to increase the risk of cardiodepression when given with antihypertensives. (Severe) Theoretical → Also see Table 11 p. 876

- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Severe) Theoretical → Also see Table 11 p. 876
- Antiepileptics (phenytoin) are predicted to decrease the exposure to ropivacaine. (Moderate) Theoretical
- Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Severe) Theoretical
- Dapsone is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Severe) Theoretical
- HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to ropivacaine. (Moderate) Theoretical
- Metoclopramide is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid. (Severe) Theoretical
- Nitrofurantoin is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Severe) Theoretical
- Paracetamol is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid. (Severe) Theoretical
- Rifaximin is predicted to decrease the exposure to ropivacaine. (Moderate) Theoretical
- Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Severe) Theoretical
- Sulfonamides potentially increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Severe) Anecdotal
- Teriflunomide is predicted to decrease the exposure to ropivacaine. (Moderate) Theoretical
- Anagrelide → see Table 9 p. 876 (QT-interval prolongation), Table 4 p. 874 (antiplatelet effects)
- Combined hormonal contraceptives are predicted to increase the exposure to anagrelide. (Moderate) Theoretical
- Mexiletine is predicted to increase the exposure to anagrelide. (Moderate) Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to anagrelide. (Moderate) Theoretical
- SSRIs (fluvoxamine) decrease the clearance of ropivacaine. Avoid prolonged use. (Moderate) Study
- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Avoid. (Severe) Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anakinra. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies (gilumab). Avoid. (Severe) Theoretical

Antiangiotensin-II receptor antagonists → see Table 7 p. 875 (first-dose hypotension), Table 8 p. 875 (hypotension), Table 16 p. 878 (increased serum potassium)

Azilsartan → candesartan → eprosartan → irbesartan → losartan → olmesartan → telmisartan → valsartan

- Angiotensin-II receptor antagonists increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients. (Severe) Study → Also see Table 8 p. 875 → Also see Table 16 p. 878
- Angiotensin-II receptor antagonists potentially increase the concentration of lithium. Monitor concentration and adjust dose. (Severe) Anecdotal
Antacids

- aluminium hydroxide - magnesium carbonate - magnesium trisilicate

**SEPARATION OF ADMINISTRATION** Antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- Antacids are predicted to decrease the absorption of alkylation agents (estramusine). Avoid. [Moderate] Study
- Antacids decrease the absorption of antiepileptics ( gabapentin). Gabapentin should be taken 2 hours after antacids. [Moderate] Study
- Antacids decrease the absorption of antifungals, azoles (itraconazole) (capsule). Antacids should be taken 1 hour before or 2 hours after itraconazole. [Moderate] Study
- Antacids decrease the absorption of antifungals, azoles (ketocanozole). Separate administration by at least 2 hours. [Moderate] Study
- Antacids decrease the absorption of antihistamines, non-sedating (fexofenadine). Separate administration by 2 hours. [Mild] Study
- Antacids decrease the absorption of antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Study
- Antacids are predicted to decrease the absorption of antimalarials (propoquin). Separate administration by at least 2 hours. [Moderate] Study
- Antacids decrease the absorption of aspirin (high-dose). Separate administration by at least 2 hours. [Moderate] Study
- Antacids decrease the exposure to bictegravir. Separate administration by at least 2 hours. [Moderate] Study
- Antacids decrease the absorption of bisphosphonates (alendronic acid). Alendronic acid should be taken at least 30 minutes before antacids. [Moderate] Study
- Antacids are predicted to decrease the absorption of bisphosphonates (ibandronic acid). Avoid antacids for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Antacids decrease the absorption of bisphosphonates (risedronate). Separate administration by at least 2 hours. [Moderate] Study
- Antacids decrease the absorption of bisphosphonates (sodium clonodronate). Avoid antacids for 2 hours before or 1 hour after sodium clonodronate. [Moderate] Study
- Antacids are predicted to decrease the absorption of bosutinib. Bosutinib should be taken at least 12 hours before antacids. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. [Moderate] Theoretical
- Oral aluminium hydroxide decreases the absorption of chenodeoxycholic acid. [Moderate] Study
- Antacids are predicted to decrease the absorption of cholic acid. Separate administration by 5 hours. [Mild] Theoretical
- Antacids are predicted to decrease the absorption of corticosteroids (deflazacort). Separate administration by 2 hours. [Moderate] Theoretical
- Antacids decrease the absorption of corticosteroids (dexamethasone). [Moderate] Study
- Antacids decrease the absorption of dasatinib. Separate administration by at least 2 hours. [Moderate] Study
- Aluminium hydroxide is predicted to decrease the absorption of deferiprone. Avoid. [Moderate] Theoretical
- Antacids decrease the absorption of digoxin. Separate administration by 2 hours. [Mild] Study
- Antacids are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical
- Antacids moderately decrease the exposure to dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
- Antacids decrease the absorption of eltrombopag. Ettrombopag should be taken 2 hours before or 4 hours after antacids. [Severe] Study
- Antacids moderately decrease the exposure to elvitegravir. Separate administration by at least 4 hours. [Moderate] Study
- Antacids are predicted to decrease the absorption of erlotinib. Antacids should be taken 4 hours before or 2 hours after erlotinib. [Moderate] Theoretical
- Antacids are predicted to slightly to moderately decrease the exposure to fibrates (gemfibrozil). [Moderate] Study
- Antacids are predicted to slightly decrease the exposure to gefitinib. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of HIV-protease inhibitors (atazanavir). Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
- Antacids are predicted to decrease the absorption of HIV-protease inhibitors (tipranavir). Separate administration by 2 hours. [Moderate] Study
- Antacids are predicted to decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Study
- Antacids decrease the absorption of iron (oral). Iron (oral) should be taken 1 hour before or 2 hours after antacids. [Moderate] Study
- Antacids are predicted to decrease the absorption of iron chelators (deferasirox). Avoid. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of lentinib. Avoid. [Moderate] Theoretical
- Antacids are predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. [Moderate] Theoretical
- Antacids decrease the exposure to mycophenolate. [Moderate] Study
- Antacids are predicted to decrease the absorption of nilotinib. Separate administration by at least 2 hours. [Moderate] Theoretical
- Magnesium trisilicate decreases the absorption of nitrofurantoin. [Moderate] Study
- Antacids are predicted to decrease the absorption of pazopanib. Pazopanib should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
- Antacids decrease the absorption of penicillamine. Separate administration by 2 hours. [Mild] Study
- Antacids decrease the absorption of phenothiazines. [Moderate] Anecdotal
- Antacids increase the risk of metabolic alkalosis when given with polystyrene sulfonate. [Severe] Anecdotal
- Antacids decrease the absorption of quinolones. Quinolones should be taken 2 hours before or 4 hours after antacids. [Moderate] Study
- Antacids slightly decrease the exposure to raltegravir. Avoid. [Moderate] Study
- Antacids decrease the absorption of rifampicin. Rifampicin should be taken 1 hour before antacids. [Moderate] Study
- Antacids are predicted to decrease the exposure to ripivirine. Antacids should be taken 2 hours before or 4 hours after ripivirine. [Severe] Theoretical
- Antacids slightly decrease the exposure to riociguat. Antacids should be taken 2 hours before or 1 hour after riociguat. [Mild] Study
- Antacids moderately decrease the absorption of statins (rosuvastatin). Separate administration by 2 hours. [Moderate] Study
- Antacids decrease the absorption of sulpiride. Separate administration by 2 hours. [Moderate] Study
- Antacids decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Study
- Antacids are predicted to decrease the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours. [Moderate] Anecdotal
- Antacids are predicted to decrease the absorption of ursodeoxycholic acid. Separate administration by 2 hours. [Moderate] Theoretical
- Antacids are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Theoretical
- Antazoline → see antihistamines, sedating
- Anthracyclines → see TABLE 15 p. 877 (myelosuppression), TABLE 5 p. 874 (thromboembolism)
INTERACTIONS

Antiarrhythmics

Daunorubicin - doxorubicin - epirubicin - idarubicin - mitoxantrone - pimonidazole

**GENERAL INFORMATION**

Caution is necessary with concurrent use of cardioactive drugs, or drugs that reduce cardiac contractility.

- **Calcium channel blockers** (verapamil) moderately increase the exposure to doxorubicin. (Moderate) Study
- **Ciclosporin** increases the concentration of antiarrhythmics (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). (Severe) Study
- **H₂ receptor antagonists** (cimetidine) slightly increase the exposure to epirubicin. Avoid. (Moderate) Study
- **Leflunomide** is predicted to increase the exposure to antiarrhythmics (daunorubicin, doxorubicin, mitoxantrone). (Moderate) Study
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anthracyclines. Public Health England advises avoid (refer to **Green Book**). (Severe) Theoretical
- **Antiarrhythmics** are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid. (Severe) Theoretical
- **Rolapitant** is predicted to increase the exposure to antiarrhythmics (doxorubicin, mitoxantrone). Avoid or monitor. (Moderate) Study
- **Teriflunomide** is predicted to increase the exposure to antiarrhythmics (daunorubicin, doxorubicin, mitoxantrone). (Moderate) Theoretical
- **Anti-D (Rh0) immunoglobulin** → see immunoglobulins

**Antithrombolytics** → see thrombolytics

**Antihistamines** → see antihistamines

**Antivirals** → see antivirals

**Anti-D (Rh0) immunoglobulin**

**Anti-D (Rh0) immunoglobulin** → see immunoglobulins

**Antithrombolytics** → see thrombolytics

**Antihistamines** → see antihistamines

**Antivirals** → see antivirals

**Adenosine - amiodarone - disopyramide - dronedarone - flecainide - lidocaine - propafenone**

- Amiodarone has a long half-life; there is potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.
- Since systemic absorption can follow topical application of lidocaine, the possibility of interactions should be borne in mind.

**Dronedarone** is predicted to increase the exposure to abemaciclib. (Moderate) Study

**Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to abemaciclib. Separate administration by 12 hours. (Moderate) Study

**Amiodarone** is predicted to decrease the effects of agalsidase. Avoid. (Moderate) Theoretical

**Amiodarone** is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. (Severe) Theoretical

**Dronedarone** is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. (Severe) Study

**Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. (Severe) Study

**Dronedarone** is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. (Severe) Study

**Dronedarone** is predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate) Theoretical

**Dronedarone** is predicted to increase the exposure to alprazolam. (Severe) Study

**Aminophylline** is predicted to decrease the efficacy of adenosine. Separate administration by 24 hours. (Mild) Theoretical

**Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with antiarrhythmics. (Severe) Theoretical

**Antiarrhythmics** (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (amiodarone). Monitor and adjust dose. (Severe) Theoretical

**Antiarrhythmics** (amiodarone) increase the concentration of antiarrhythmics (flecainide). Adjust flecainide dose and monitor side effects. (Severe) Study → Also see TABLE 6 p. 875 → Also see TABLE 9 p. 876

**Antiarrhythmics** (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (lidocaine). (Moderate) Study

**Antiarrhythmics** (dronedarone) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Moderate) Study

**Amiodarone** increases the risk of bradycardia when given with anticholinesterases, centrally acting. (Moderate) Anecdotal

**Antiepileptics** (clobazam, clobazam, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of propafenone. (Moderate) Study

**Antiepileptics** (fosphenytoin, phenytoin) are predicted to decrease the exposure to lidocaine. (Severe) Anecdotal

**Antiepileptics** (clobazam, clobazam, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Study

**Amiodarone** is predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. (Severe) Study → Also see TABLE 12 p. 877

**Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure of disopyramide, dronedarone. (Moderate) Theoretical

**Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to disopyramide. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 876

**Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to disopyramide. Use with caution and adjust dose. (Severe) Theoretical

**Antifungals, azoles** (posaconazole) are predicted to increase the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Theoretical

**Dronedarone** is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). (Severe) Theoretical

**Dronedarone** is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). Avoid. (Moderate) Study

**Dronedarone** is predicted to increase the concentration of antimalarials (piperaquine). (Severe) Theoretical

**Dronedarone** is predicted to increase the exposure to apixaban. (Moderate) Theoretical

**Aprepitant** increases the exposure to dronedarone. (Severe) Theoretical

**Aprepitant** is predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

**Dronedarone** is predicted to increase the exposure to axitinib. (Moderate) Theoretical

**Dronedarone** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Theoretical → Also see TABLE 9 p. 876

**Antiarrhythmics** (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. (Severe) Study → Also see TABLE 6 p. 875 → Also see TABLE 9 p. 876

**Propafenone** is predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective (labetalol, levobunolol, nadolol, pindolol, sotalol). Use with caution or avoid. (Severe) Study

**Anthracyclines** (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone)

**Anthracyclines** (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone) are predicted to increase the risk of cardiotoxicity when given with antiepileptics (propafenone). Monitor and adjust dose. (Moderate) Study
- Propafenone increases the risk of cardiovascular side-effects when given with beta blockers, non-selective (propranolol). Use with caution or avoid. (Severe) Study

- Propafenone is predicted to increase the exposure to beta blockers, non-selective (timolol) and beta blockers, selective (metoprolol). Monitor and adjust dose. (Moderate) Study

- Propafenone is predicted to increase the exposure to beta blockers, selective (metoprolol). (Moderate) Study

- Propafenone is predicted to increase the exposure to beta blockers, selective (nebivolol) and beta blockers, selective (nebulol) are predicted to increase the risk of cardiovascular side-effects when given with propafenone. Avoid. (Severe) Theoretical

- Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiac arrhythmias. (Severe) Theoretical

- Bosentan is predicted to decrease the exposure to dronedarone. (Severe) Theoretical

- Dronedarone is predicted to increase the exposure to bosentan. Avoid or adjust dose. (Severe) Theoretical

- Calcium channel blockers (diltiazem, verapamil) increase the exposure to dronedarone and dronedarone increases the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Study

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

- Calcium channel blockers (diltiazem, verapamil) increase the risk of cardiovascular side-effects when given with flecainide. (Severe) Theoretical

- Dronedarone is predicted to increase the exposure to calcium channel blockers (amiodarone, dipyridamole, fesoterodine, propafenone). Monitor and adjust dose. (Moderate) Study

- Amiodarone is predicted to increase the risk of cardiovascular side-effects when given with calcium channel blockers (verapamil). Avoid. (Severe) Theoretical

- Disopyramide is predicted to increase the risk of cardiovascular side-effects when given with calcium channel blockers (verapamil). Avoid. (Severe) Theoretical

- Dronedarone is predicted to increase the exposure to ciclosporin. Avoid. (Severe) Study

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to ciclosporin. (Severe) Theoretical

- Dronedarone increases the concentration of ciclosporin. Monitor and adjust dose. (Severe) Study

- Cobicistat potentially increases the concentration of antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine). (Severe) Theoretical

- Cobicistat very markedly increases the exposure to dronedarone. Avoid. (Severe) Study

- Cobicistat is predicted to increase the exposure to propafenone. Monitor and adjust dose. (Severe) Study

- Dronedarone is predicted to increase the exposure to cobimetinib. (Severe) Theoretical

- Dronedarone is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. (Severe) Study

- Dronedarone is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study

- Amiodarone increases the anticoagulant effect of coumarins. Avoid. (Severe) Study

- Propafenone increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Moderate) Study

- Crizotinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

- Dronedarone increases the exposure to dabigatran. Adjust dabigatran dose. (Moderate) Study

- Dronedarone slightly increases the exposure to dabigatran. Avoid. (Severe) Study

- Darifenacin is predicted to increase the concentration of flecainide. (Moderate) Theoretical

- Dronedarone is predicted to moderately increase the exposure to dasatinib. (Severe) Study → Also see TABLE 9 p. 876

- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 82. (Severe) Study → Also see TABLE 9 p. 875

- Propafenone increases the concentration of digoxin. Monitor and adjust dose. (Severe) Study

- Dronedarone increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study

- Dronedarone is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). (Severe) Theoretical

- Dronedarone is predicted to increase the concentration of dopamine receptor agonists (caboergoline). (Severe) Theoretical

- Dronedarone is predicted to moderately increase the exposure to dutasteride. (HiId) Study

- Amiodarone slightly increases the exposure to edoxaban. Adjust edoxaban dose. (Severe) Study

- Dronedarone slightly increases the exposure to edoxaban. Adjust edoxaban dose. (Severe) Study

- Efavirenz is predicted to decrease the exposure to dronedarone. (Severe) Theoretical → Also see TABLE 9 p. 876

- Antiarrhythmics (dronedarone, propafenone) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study

- Dronedarone is predicted to moderately increase the exposure to encorafenib. (Moderate) Study → Also see TABLE 9 p. 876

- Enzalutamide is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Study

- Enzalutamide is predicted to decrease the efficacy of propafenone. (Moderate) Study

- Dronedarone is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical

- Dronedarone is predicted to increase the risk of ergotism when given with ergonovine. (Severe) Theoretical

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to erlotinib. (Severe) Theoretical

- Dronedarone is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study

- Dronedarone is predicted to increase the exposure to febuxostat. Adjust febuxostat dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. (HiId) Study

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

- Dronedarone is predicted to increase the exposure to gefitinib. (Severe) Theoretical

- Dronedarone potentially increases the exposure to glecaprevir. (Moderate) Theoretical

- Grapefruit juice increases the exposure to amiodarone. Avoid. (Moderate) Study
Antiarrhythmics (continued)

- **Grapefruit juice** moderately increases the exposure to dronedarone. Avoid. [Severe] Study
- **Grapefruit juice** increases the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Dronedarone** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 237. [Moderate] Theoretical
- **H₂ receptor antagonists** (cemidetine) increase the exposure to amiodarone. [Moderate] Study
- **H₂ receptor antagonists** (cimetidine) slightly increase the exposure to flecainide. Monitor and adjust dose. [Mild] Study
- **H₂ receptor antagonists** (cimetidine) increase the exposure to lidocaine. Monitor and adjust dose. [Moderate] Study
- **Dronedarone** are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to amiodarone. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- **HIV-protease inhibitors** are predicted to increase the exposure to disopyramide. [Severe] Theoretical → Also see TABLE 9 p. 876
- **HIV-protease inhibitors** very markedly increase the exposure to dronedarone. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- **HIV-protease inhibitors** (ritonavir) are predicted to increase the exposure to flecainide. Avoid or monitor side effects. [Severe] Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to lidocaine. Avoid. [Severe] Study
- **Dronedarone** are predicted to increase the exposure to propafenone. Adjust dose. [Moderate] Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to amiodarone. Avoid. [Severe] Study
- **Dronedarone** are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Amiodarone** is predicted to increase the exposure to ibritinib. Adjust ibritinib dose. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to ibritinib. Adjust ibritinib dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor or tezacaftor with ivacaftor p. 189 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to lapatinib. [Moderate] Study → Also see TABLE 9 p. 876
- **Lediaparin** increases the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. [Severe] Anecdotal
- **Letemovir** is predicted to increase the concentration of amiodarone. [Moderate] Theoretical
- **Amiodarone** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose. [Moderate] Study
- **Macrolides** (clarithromycin) very markedly increase the exposure to dronedarone. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- **Macrolides** (clarithromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Severe] Study
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to lidocaine. [Moderate] Theoretical
- **Macrolides** (erythromycin) are predicted to moderately increase the exposure to dronedarone. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Macrolides** (erythromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Mexiletine** increases the risk of torsade de pointes when given with antiarrhythmics. Avoid. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- **Mitotane** is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study
- **Mitotane** is predicted to decrease the efficacy of propafenone. [Moderate] Study
- **Dronedarone** increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Nevirapine** is predicted to decrease the exposure to dronedarone. [Severe] Theoretical
- **Amiodarone** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to nintedanib. [Moderate] Study
- **NSAIDs** (celecoxib) are predicted to increase the exposure to antiarrhythmics (flecainide, propafenone). Monitor and adjust dose. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **Amiodarone** is predicted to increase the concentration of opioids (fentanyl). [Moderate] Theoretical → Also see TABLE 6 p. 875
- **Dronedarone** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Dronedarone** is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Dronedarone** is predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Propafenone** is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. [Moderate] Study → Also see TABLE 9 p. 876
- **Dronedarone** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Amiodarone** is predicted to increase the exposure to pibrentasvir. [Moderate] Theoretical
- **Dronedarone** potentially increases the exposure to pibrentasvir. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to pimozone. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Dronedarone** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- Quinolones (ciprofloxacin) slightly increase the exposure to lidocaine. (Mild) Study
- Dronedarone is predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 876
- Amiodarone is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose. (Moderate) Theoretical
- Ribocil (high-dose) is predicted to increase the exposure to amiodarone. Avoid. (Moderate) Theoretical → Also see TABLE 9 p. 876
- Dronedarone is predicted to increase the exposure to ribocil. (Moderate) Study → Also see TABLE 9 p. 876
- Rifampicin is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Study
- Rifampicin is predicted to decrease the efficacy of propafenone. (Moderate) Study
- Dronedarone is predicted to increase the exposure to rivaroxaban. Avoid. (Moderate) Theoretical
- Rolapitant is predicted to increase the exposure to propafenone. (Severe) Study
- Dronedarone is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical
- Dronedarone is predicted to increase the exposure to saxagliptin. (Mild) Study
- Amiodarone is predicted to increase the concentration of sirolimus. (Severe) Anecdotal
- Dronedarone increases the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study
- Sofosbuvir is predicted to increase the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. (Severe) Anecdotal
- SSRIs (fluvoxamine) are predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study
- Dronedarone is predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline). Theoretical → Also see TABLE 9 p. 876
- Dronedarone is predicted to increase the exposure to SSRIs (dopoxetine). Adjust dopoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to dronedarone. Avoid. (Severe) Theoretical
- Amiodarone is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). Monitor and adjust dose. (Moderate) Theoretical
- Dronedarone is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Study
- Amiodarone is predicted to increase the exposure to statins (fluvastatin). (Severe) Theoretical
- Dronedarone slightly increases the exposure to statins (rosuvastatin). Adjust dose. (Severe) Study
- Amiodarone increases the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 136. (Severe) Study
- Dronedarone is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 136. (Severe) Study
- Amiodarone is predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. (Moderate) Study
- Dronedarone is predicted to increase the exposure to suniflumethion. Use with caution and adjust suniflumethion dose, p. 136. (Severe) Study
- Amiodarone is predicted to increase the concentration of tacrolimus. (Severe) Anecdotal
- Dronedarone is predicted to increase the concentration of tacrolimus. (Severe) Study
- Dronedarone is predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical
- Dronedarone is predicted to increase the exposure to taxanes (paclitaxel). (Severe) Theoretical
- Dronedarone is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical
- Dronedarone is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
- Theophylline decreases the efficacy of adenosine. Separate administration by 24 hours. (Mild) Study
- Amiodarone is predicted to increase the risk of thyroid dysfunction when given with thyroid hormones. Avoid. (Moderate) Study
- Amiodarone is predicted to increase the exposure to ticagrelor. Use with caution or avoid. (Severe) Study
- Dronedarone given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. (Moderate) Study
- Dronedarone is predicted to increase the exposure to tolterodine. (Mild) Theoretical → Also see TABLE 9 p. 876
- Dronedarone is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to topotecan. (Severe) Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
- Dronedarone is predicted to increase the exposure to trazodone. (Moderate) Theoretical
- Dronedarone is predicted to increase the exposure to tricyclic antidepressants. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 876
- Propafenone is predicted to increase the concentration of tricyclic antidepressants. (Moderate) Theoretical → Also see TABLE 10 p. 876
- Dronedarone is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study
- Amiodarone is predicted to increase the concentration of vedolizumab. Avoid or monitor. (Moderate) Theoretical
- Amiodarone is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical
- Dronedarone is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study
- Dronedarone is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical → Also see TABLE 9 p. 876
- Dronedarone is predicted to increase the exposure to topotecan. Adjust dose. (Moderate) Study

Anticholinesterases, centrally acting
- Donepezil - galantamine - rivastigmine

- Antiarrhythmics (amiodarone) increase the risk of bradycardia when given with anticholinesterases, centrally acting. (Moderate) Anecdotal → Also see TABLE 6 p. 875
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to donepezil. (Mild) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study
- Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. (Moderate) Anecdotal → Also see TABLE 6 p. 875
- Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, selective. (Moderate) Anecdotal → Also see TABLE 6 p. 875
- Bupropion is predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study
- Cobicistat is predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study
- Enalaprilam is predicted to decrease the exposure to donepezil. (Mild) Study
- HIV-protease inhibitors are predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study
- Idelalisib is predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study
Anticholinesterases, centrally acting (continued)

- **Macrolides** (clarithromycin) are predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate Study)

- **Mirtazapine** is predicted to decrease the exposure to donepezil. (High Study)

- **Anticholinesterases, centrally acting** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Theoretical → Also see TABLE 6 p. 875

- **Alcohol (beverage)** are predicted to decrease the exposure to donepezil. (High Study)

- **Anticholinesterases, centrally acting** increase the effects of suxamethonium. (Moderate) Theoretical

- **Terbutaline** is predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate Study)

### Antiepileptics

- See TABLE 1 p. 874 (hepatotoxicity), TABLE 18 p. 878 (hyponatraemia), TABLE 15 p. 877 (myelosuppression), TABLE 12 p. 877 (peripheral neuropathy), TABLE 11 p. 876 (CNS depressive effects)

### Food and lifestyle

- Avoid taking milk, dairy products, carbonated drinks, fruit juices, or caffeine-containing food and drinks at the same time as stiripentol.

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abacavir. (Moderate) Theoretical

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to abemaciclib. Avoid. (Severe Study)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abiraterone. Avoid. (Severe Study)

- **Acetazolamide** potentially increases the risk of toxicity when given with valproate. (Severe Study)

- **Acetazolamide** potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. (Severe) Theoretical

- **Carbamazepine** is predicted to decrease the exposure to abemaciclib. (Moderate) Study

- **Antiepileptics** (fosphenytoin, phenytoin) are predicted to decrease the exposure to agomelatine. (Moderate) Theoretical

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of albendazole. (Moderate) Study

- **Alcohol (beverage)** potentially increases the risk of visual disturbances when given with retigabine. (Moderate) Study

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to aldosterone antagonists (eplerenone). Avoid. (Moderate) Theoretical → Also see TABLE 18 p. 878

- **Carbamazepine** decreases the exposure to aliskiren. (Moderate) Study

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Study

- **Phenytoin** is predicted to decrease the exposure to amnopyridine. Adjust dose. (Moderate Theoretical → Also see TABLE 11 p. 876

- **Fosphenytoin** is predicted to decrease the exposure to amnopyridine. Adjust dose. (Moderate) Study

- **Phenytoin** is predicted to decrease the exposure to amnopyridine. Adjust dose. (Moderate) Theoretical

- **Phenytoin** decreases the exposure to amnopyridine. Adjust dose. (Moderate) Study

- **Primidone** is predicted to increase the clearance of amnopyridine. Adjust dose. (Moderate) Theoretical

- **Stiripentol** is predicted to increase the exposure to amnopyridine. Avoid. (Moderate) Theoretical

### Antiepileptics, centrally acting

- **Antiepileptics** (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. (Severe Theoretical)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antihistamines (disopyramide, droxidopa). Avoid. (Severe Study)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antihistamines (amiodarone). Are predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. (Severe Study) → Also see TABLE 12 p. 877

- **Antiepileptics** (fosphenytoin, phenytoin) are predicted to decrease the exposure to antihistamines (lidocaine). (Severe Anecdotal)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of antihistamines (propafenone). (Moderate) Study

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). (High Study)

- **Antiepileptics** (carbamazepine) decrease the concentration of antiepileptics (brivaracetam). (Moderate) Study

- **Antiepileptics** (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (brivaracetam). (Moderate) Study

- **Antiepileptics** (lamotrigine) potentially increase the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) decrease the concentration of antiepileptics (lamotrigine). Adjust lamotrigine dose and monitor carbamazepine concentration, p. 207, p. 200. (Moderate) Study

- **Antiepileptics** (phenobarbital) affect the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the concentration of antiepileptics (phenobarbital). Adjust dose. (Moderate) Study

- **Antiepileptics** (topiramate) increase the concentration of antiepileptics (carbamazepine, phenobarbital). Avoid in Dravet syndrome. (Severe Study)

- **Antiepileptics** (carbamazepine) slightly decrease the exposure to antiepileptics (eslicarbazepine, oxcarbazepine). Monitor and adjust dose. (Moderate) Study

- **Antiepileptics** (stiripentol) are predicted to increase the concentration of antiepileptics (fosphenytoin). (Severe Study)

- **Antiepileptics** (carbamazepine) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. (Severe Study)

- **Antiepileptics** (eslicarbazepine) increase the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the exposure to antiepileptics (eslicarbazepine). Monitor and adjust dose. (Severe Study)

- **Antiepileptics** (valproate) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (valproate). (Severe) Study

- **Antiepileptics** (vigabatrin) decrease the concentration of antiepileptics (fosphenytoin, phenytoin). (High) Study

- **Antiepileptics** (fosphenytoin) decrease the concentration of antiepileptics (lamotrigine). Monitor and adjust lamotrigine dose, p. 207. (Moderate) Study

- **Antiepileptics** (phenobarbital, phenytoin, primidone) decrease the concentration of antiepileptics (lamotrigine). Monitor and
### Antiepileptics

**Antiepileptics** (valproate) increase the exposure to antiepileptics (lamotrigine). Adjust lamotrigine dose and monitor rash, p. 207. **Severe** Study

Antiepileptics (lamotrigine) are predicted to increase the concentration of antiepileptics (oxcarbazepine) and antiepileptics (oxcarbazepine) are predicted to decrease the concentration of antiepileptics (lamotrigine). Monitor side effects and adjust dose. **Moderate** Study

Antiepileptics (carbamazepine, fosphenytoin) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. **Moderate** Study

Antiepileptics (oxcarbazepine) decrease the concentration of antiepileptics (perampanel) and antiepileptics (perampanel) increase the concentration of antiepileptics (oxcarbazepine). Monitor and adjust dose. **Moderate** Study

Antiepileptics (phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. **Moderate** Study

Antiepileptics (phenytoin) increase the concentration of antiepileptics (phenobarbital) and antiepileptics (phenobarbital) affect the concentration of antiepileptics (phenytoin). **Moderate** Study

Antiepileptics (fosphenytoin) increase the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) affect the concentration of antiepileptics (fosphenytoin). **Moderate** Study

Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (phenytoin). Monitor concentration and adjust dose. **Moderate** Study

Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (phenytoin). Avoid in Dravet syndrome. **Severe** Theoretical

Antiepileptics (carbamazepine) potentially decrease the concentration of antiepileptics (primidone) and antiepileptics (primidone) potentially decrease the concentration of antiepileptics (carbamazepine). Adjust dose. **Moderate** Aneodal

Antiepileptics (phenytoin) increase the concentration of antiepileptics (phenobarbital) and antiepileptics (phenobarbital, primidone) affect the concentration of antiepileptics (phenytoin). **Moderate** Study

Antiepileptics (valproate) affect the concentration of antiepileptics (primidone). Monitor and adjust dose. **Severe** Study

Antiepileptics (carbamazepine) slightly increase the clearance of antiepileptics (retigabine). **Moderate** Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to slightly increase the clearance of antiepileptics (retigabine). **Moderate** Study

Antiepileptics (valproate) increase the exposure to antiepileptics (rufinamide). Adjust rufinamide dose, p. 212. **Moderate** Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to antiepileptics (tiagabine). Monitor and adjust tiagabine dose, p. 217. **Moderate** Study

Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (topiramate) and antiepileptics (topiramate) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. **Moderate** Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (topiramate). **Mild** Study

Antiepileptics (phenobarbital) decrease the concentration of antiepileptics (valproate) and antiepileptics (valproate) increase the concentration of antiepileptics (phenobarbital). **Moderate** Study

Antiepileptics (topiramate) increase the concentration of antiepileptics (topiramate). **Severe** Study

Antiepileptics (carbamazepine) slightly to moderately decrease the concentration of antiepileptics (zonisamide) and antiepileptics (zonisamide) affect the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. **Moderate** Study

Antiepileptics (fosphenytoin, phenytoin) slightly to moderately decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. **Moderate** Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. **Moderate** Study

Antiepileptics (topiramate) potentially increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. **Severe** Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very slightly increase the exposure to perampanel. **Mild** Study

Antifungals, azoles (miconazole) increase the risk of carbamazepine toxicity when given with carbamazepine. Monitor and adjust dose. **Severe** Aneodal

Antifungals, azoles (miconazole) increase the risk of phenytoin toxicity when given with fosphenytoin. Monitor and adjust dose. **Severe** Aneodal

Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (flucanazole) and antifungals, azoles (fluconazole) increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 200. **Severe** Theoretical → Also see **TABLE 1** p. 874

Antifungals, azoles (fluconazole) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. **Moderate** Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antifungals, azoles. Avoid (itraconazole, posaconazole). **Severe** Study

Fosphenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid and for 14 days after stopping fosphenytoin. **Moderate** Study

Phenobarbital decreases the concentration of antifungals, azoles (itraconazole). Avoid and for 14 days after stopping phenobarbital. **Moderate** Study

Phenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid and for 14 days after stopping phenytoin. **Moderate** Study

Primidone is predicted to decrease the concentration of antifungals, azoles (itraconazole). **Moderate** Theoretical

Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of carbamazepine. Avoid or adjust dose. **Moderate** Theoretical → Also see **TABLE 1** p. 874

Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (ketoconazole) and antifungals, azoles (ketoconazole) slightly increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 200. **Moderate** Study

Phenobarbital is predicted to decrease the concentration of antifungals, azoles (ketoconazole). Avoid. **Moderate** Study

Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to antifungals, azoles (ketoconazole). Avoid. **Moderate** Study

Antiepileptics (ketoconazole) are predicted to decrease the concentration of antifungals, azoles (ketoconazole). Avoid. **Moderate** Study

Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (ketoconazole) and antifungals, azoles (ketoconazole) increase the concentration of carbamazepine. Avoid or adjust dose. **Moderate** Theoretical

Phenobarbital is predicted to decrease the concentration of antifungals, azoles (ketoconazole). Avoid. **Moderate** Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid. **Moderate** Study

Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (posaconazole) and antifungals, azoles (posaconazole) increase the concentration of carbamazepine. Avoid or adjust dose. **Moderate** Study
Antiepileptics (continued)

- the exposure to fosphenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 392. [Moderate] Study

  - Fosphenytoin decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to phenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 392, p. 211. [Moderate] Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antifungals, azoles (voriconazole). Avoid. [Moderate] Theoretical

  - Antihistamines, sedating (hydroxyzine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antimalarials (artemether) (with lumeferantrine). Avoid. [Severe] Study

  - Antimalarials (pyrimethamine) increase the risk of haematological toxicity when given with antiepileptics (fosphenytoin, phenytoin). [Severe] Study

  - Antimalarials (pyrimethamine) are predicted to increase the risk of haematological toxicity when given with antiepileptics (phenobarbital, primidone). [Severe] Theoretical

- Antiepileptics [carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone] are predicted to decrease the concentration of antimalarials (piperazine). Avoid. [Moderate] Theoretical

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) potentially increase the risk of toxicity when given with antimalarials (quinine). [Unknown] Study

- Apalutamide potentially decreases the exposure to valproate. [Mild] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to apremilast. Avoid. [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to apixaban. Adjust or adjust dose. [Moderate] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to apixaban. Avoid or adjust dose. [Moderate] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to bedaquiline. Avoid. [Severe] Study → Also see TABLE 11 p. 876

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study → Also see TABLE 1 p. 874

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). [Moderate] Theoretical

  - Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (propranolol). [Moderate] Study

  - Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol). [Moderate] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Study

  - Oxcarbazepine is predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Theoretical

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. [Severe] Study → Also see TABLE 12 p. 877

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to bosentan. Avoid. [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to brigitinib. Avoid. [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to bupropion. [Severe] Study

  - Valproate increases the exposure to bupropion. [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bupropion. Use with caution and adjust dose. [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to cabozantinib. Avoid. [Moderate] Study

  - Antiepileptics (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study

  - Calcium channel blockers (diltiazem) increase the concentration of carbamazepine and carbamazepine is predicted to decrease the exposure to calcium channel blockers (diltiazem). Monitor concentrations and adjust dose. [Severe] Anecdotal

  - Calcium channel blockers (verapamil) increase the concentration of carbamazepine and carbamazepine is predicted to decrease the exposure to calcium channel blockers (verapamil). [Severe] Anecdotal

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 876

  - Capcetabine increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal

  - Carbapenems decrease the concentration of valproate. Avoid. [Severe] Anecdotal

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to carbapenems. Avoid. [Severe] Anecdotal

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 876

  - Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 386. [Moderate] Theoretical

  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ceritinib. Avoid. [Severe] Study

  - Antiepileptics (phenobarbital, primidone) are predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. [Moderate] Theoretical

  - Antiepileptics (phenobarbital, primidone) decrease the concentration of chlorpheniramine. [Moderate] Study

  - Intravenous chlorpheniramine increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous chlorpheniramine. Monitor concentration and adjust dose. [Severe] Study

  - Chloroxazone affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Study

  - Phenobarbital decreases the effects of cholic acid. Avoid. [Moderate] Study
Antiepileptics – Antiepileptics 893

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of ciclosporin. (Severe) Study
- Oxcarbazepine decreases the concentration of ciclosporin. (Severe) Aneodal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of ciclosporin. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Monitor and adjust dose. (Moderate) Study
- Carbamazepine is predicted to increase the risk of haematological toxicity when given with oral claidobrine. (Moderate) Theoretical
- Clobazam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Aneodal
- Stiripentol increases the concentration of clobazam. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study → Also see TABLE 11 p. 876
- Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Aneodal
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to clobazam. (Severe) Study
- Oxcarbazepine is predicted to decrease the concentration of cobicistat. (Severe) Theoretical
- Cobicistat is predicted to very slightly increase the exposure to perampanel. (MILD) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. (Severe) Aneodal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ciclosporin. (Severe) Aneodal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Study
- Combined hormonal contraceptives alter the exposure to lamotrigine. Adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ciclosporin. (Severe) Aneodal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ciclosporin. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the concentration of ciclosporin. (Severe) Aneodal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ciclosporin. (Severe) Theoretical
- Carbamazepine decreases the effects of ciclosporin. Monitor and adjust dose. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ciclosporin. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ciclosporin. (Severe) Theoretical
- Carbamazepine is predicted to decrease the exposure to dabigatran. Avoid. (Severe) Study
- Phenytoin is predicted to decrease the exposure to dabigatran. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. (Moderate) Theoretical
- Danazol moderately increases the concentration of carbamazepine. Monitor and adjust dose. (Severe) Study
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with dapsone. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dasabuvir. Avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasatinib. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to deltamethrin. Avoid. (Moderate) Study
- Lamotrigine is predicted to increase the risk of hyponatraemia when given with desmopressin. (Severe) Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- Desogestrel is predicted to increase the exposure to lamotrigine. (Moderate) Study
- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. (Moderate) Aneodal
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. (Moderate) Aneodal
- Diazoxide increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to dolutegravir. Adjust dose. (Severe) Study
- Oxcarbazepine is predicted to decrease the exposure to dolutegravir. Adjust dose. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to doravirine. Avoid. (Severe) Study
- Oxcarbazepine is predicted to decrease the exposure to doravirine. Avoid. (Severe) Study
- Phenytoin is predicted to decrease the exposure to dolutegravir. (Moderate) Theoretical
- Carbamazepine is predicted to decrease the exposure to edoxaban. (Moderate) Study
- Phenytoin is predicted to decrease the exposure to edoxaban. (Moderate) Theoretical
- Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Theoretical
- Carbamazepine slightly decreases the exposure to efavirenz and efavirenz slightly decreases the exposure to carbamazepine. (Severe) Study
- Phenobarbital is predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of phenobarbital. (Severe) Theoretical
- Efavirenz is predicted to affect the efficacy of primidone and primidone is predicted to slightly decrease the exposure to efavirenz. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elgilustat. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
Antiepileptics – Antiepileptics

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to encorafenib. [Severe] Theoretical

Enteral feeds decrease the absorption of phenytoin. [Severe]

Enzalutamide is predicted to slightly decrease the exposure to brivaracetam. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eslicarbazepine and oxcarbazepine. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to esketamine. Adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 876

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etoposide. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fingolet. Avoid. [Moderate] Study

Fluorouracil increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Theoretical

Folates are predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to glecaprevir. Avoid. [Severe] Study

Valproate potentially opposes the effects of glycerol phenylbutyrate. [Moderate] Theoretical

Grapefruit juice slightly increases the exposure to carbamazepine. Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

Antiepileptics (phenobarbital, primidone) decrease the effects of griseofulvin. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 237. [Moderate] Study → Also see TABLE 11 p. 876

Oxcarbazepine is predicted to decrease the concentration of guanfacine. Monitor and adjust guanfacine dose, p. 237. [Moderate] Theoretical

Guanfacine increases the concentration of valproate. Monitor and adjust dose. [Moderate] Study

H₂-receptor antagonists (cimetidine) transiently increase the concentration of carbaamazepine. Monitor concentration and adjust dose. [Severe] Study

H₂-receptor antagonists (cimetidine) increase the concentration of carbaamazepine. Monitor concentration and adjust dose. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 876

Haloperidol potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical

HIV-protease inhibitors are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical

HIV-protease inhibitors are predicted to affect the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to carbamazepine and carbamazepine is predicted to decrease the exposure to HIV-protease inhibitors. Monitor and adjust dose. [Severe] Theoretical

HIV-protease inhibitors (ritonavir) slightly decrease the exposure to lamotrigine. [Severe] Study

HIV-protease inhibitors are predicted to very slightly increase the exposure to perampanel. [Mild] Study

HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of valproate. [Severe] Anecdotal

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal

Hormone replacement therapy is predicted to alter the exposure to lamotrigine. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ibritinib. Avoid or adjust ibritinib dose. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study

Idelalisib is predicted to very slightly increase the exposure to perampanel. [Mild] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study

Oxcarbazepine decreases the exposure to imatinib. Avoid. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Theoretical

Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study → Also see TABLE 12 p. 877

Isoniazid markedly increases the concentration of carbamazepine and carbamazepine increases the risk of hepatotoxicity when given with isoniazid. Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 1 p. 874

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivacaftor. Avoid. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to isavuconazol. Avoid. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Theoretical
> Carbamazepine is predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Study
> Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the concentration of levetiracetam. [Moderate] Theoretical
> Letermovir is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of letrozol. [Moderate] Theoretical
> Antiepileptics (fosphenytoin, phenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of levedopa. [Moderate] Study
> Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to increase the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lithium. [Severe] Anecdotal
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. [Moderate] Theoretical
> Also see TABLE 11 p. 874
> Antiepileptics (fosphenytoin, phenytoin) decrease the effects of loop diuretics (furosemide). [Moderate] Study
> Lumacaftor is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study → Also see TABLE 11 p. 876
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maclentan. Avoid. [Severe] Study
> Macrolides (clarithromycin) slightly increase the concentration of carbamazepine. Monitor concentration and adjust dose. [Severe] Study
> Macrolides (erythromycin) are predicted to very slightly increase the exposure to perampanel. [Mild] Study
> Macrolides (erythromycin) markedly increase the concentration of carbamazepine. Monitor concentration and adjust dose. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mycophenolate. Adjust dose. [Severe] Study
> Phenytoin is predicted to decrease the exposure to melatonin. [Moderate] Theoretical
> Levetiracetam decreases the clearance of methotrexate. [Severe] Anecdotal
> Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metronidazole. [Moderate] Study
> Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of metyrapone. Avoid. [Moderate] Study
> Phenytoin is predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study
> Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. [Moderate] Study → Also see TABLE 11 p. 876
> Carbamazepine markedly decreases the exposure to mianserin. Adjust dose. [Moderate] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 876
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirzapine. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 876
> Mitotane is predicted to decrease the exposure to perampanel. Monitor and adjust dose. [Moderate] Study
> Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the exposure to modafinil. [Mild] Theoretical
> Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. [Moderate] Theoretical
> Antiepileptics (phenobarbital, primidone) are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. [Severe] Theoretical
> Carbamazepine is predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
> Carbamazepine is predicted to decrease the effects of monoclonal antibodies (brentuximab vedotin). [Severe] Theoretical
> Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Moderate] Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to montelukast. [Mild] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to nateglinide. [Mild] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to netupitant. Avoid. [Severe] Study
> Carbamazepine is predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). Monitor and adjust dose. [Moderate] Study
> Antiepileptics (fosphenytoin, phenytoin) decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). [Moderate] Study
> Nevirapine is predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of nevirapine. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nintedanib. Avoid. [Severe] Study
> Carbamazepine is predicted to decrease the exposure to nintedanib. [Moderate] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nitoxime. Adjust dose. [Moderate] Theoretical
> Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
Antiepileptics (continued)

- Carbamazepine potentially decreases the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Phenytoin is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alaparin. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ondansetron. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study → Also see TABLE 11 p. 876
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (methadone). Monitor and adjust dose. (Severe) Study → Also see TABLE 11 p. 876
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phenytoin, primidone. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to omeprazole. Study → Also see TABLE 11 p. 876
- Carbamazepine decreases the concentration of opioids (tramadol). Adjust dose. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to osimertinib. Avoid. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to osphenfine. (Moderate) Study
- Oxycodone potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to palbociclib. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paliperidone. Avoid. (Severe) Study → Also see TABLE 11 p. 876
- Valproate slightly increases the exposure to paliperidone. Adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to panobinostat. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to paracetamol. (Moderate) Study → Also see TABLE 1 p. 874
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pazopanib. Avoid. (Severe) Theoretical
- Valproate increases the risk of side-effects when given with penicillins (pimelicillin). Avoid. (Severe) Anecdotal
- Phenothiazines (chlorpromazine) decrease the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of phenothiazines (chlorpromazine). (Moderate) Study → Also see TABLE 11 p. 876
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avancafil, tadafilaf). Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafa). (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately to markedly decrease the exposure to rifampicin and rifapicin. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Study

Also see TABLE 11
Antiepileptics – Antiepileptics

- Carbamazepine is predicted to decrease the concentration of rilpivirine. Avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study → Also see TABLE 11 p. 876
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to rivaroxaban. Unless patient cannot be monitored for signs of thrombosis. Avoid or adjust rivaroxaban dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the concentration of sirolimus. Avoid. (Severe) Study
- Valproate is predicted to increase the exposure to selexipag. Adjust dose. (Moderate) Study
- Valproate is predicted to increase the exposure to sodium oxybate. Adjust sodium oxybate dose. (Moderate) Study
- Valproate is predicted to increase the effects of sodium phenylbutyrate. (Moderate) Anecdotal
- Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Carbamazepine is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Study
- Carbamazepine is predicted to decrease the exposure to statins (simvastatin). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to statins (simvastatin, simvastatin). (Moderate) Anecdotal
- Carbamazepine moderately decreases the exposure to statins (simvastatin). Monitor and adjust dose. (Severe) Study → Also see TABLE 1 p. 874
- Eslicarbazepine moderately decreases the exposure to statins (simvastatin). Monitor and adjust dose. (Moderate) Study
- Sulfonamides (sulfadiazine) are predicted to increase the concentration of fosphenytoin. Monitor and adjust dose. (Moderate) Study
- Sulfonamides (sulfadiazine) increase the concentration of phenytoin. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sumitabine. Avoid or adjust sumitabine dose. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) increase the effects of suxamethonium. Avoid. (Moderate) Study
- Carbamazepine increases the risk of prolonged neuromuscular blockade when given with suxamethonium. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. (Severe) Study → Also see TABLE 12 p. 877
- Fegatuf potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to tetracyclines (doxycycline). Monitor and adjust dose. (Moderate) Study → Also see TABLE 1 p. 874
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to theophylline. Adjust dose. (Moderate) Study
- Antiepileptics (phenobarbital, primidone) are predicted to increase the clearance of theophylline. Adjust dose. (Moderate) Theoretical
- Carbamazepine potentially increases the clearance of theophylline and theophylline decrease the exposure to carbamazepine. Adjust dose. (Moderate) Anecdotal
- Stiripentol is predicted to increase the exposure to theophylline. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with thyroid hormones. (Moderate) Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of thyroid hormones. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tivozanib. Avoid. (Severe) Study
- Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to tivozanib. Avoid. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. (Severe) Study
- Antiepileptics (fosphenytoin, phenytoin) increase the clearance of topotecan. (Moderate) Study
Antiepileptics (continued)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to toremifene. Adjust dose. (Moderate Study)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to trabectedin. Avoid. (Severe Theoretical) Also see TABLE 1 p. 874
- Carbamazepine decreases the concentration of trazodone. Adjust dose. (Moderate Study) Also see Anecdotal Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to tricyclic antidepressants. (Moderate Study)
- Carbamazepine decreases the exposure to tricyclic antidepressants. Adjust dose. (Moderate Study) Also see TABLE 18 p. 878
- Tricyclic antidepressants (clomipramine, imipramine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. (Severe Theoretical)
- Trimethoprim increases the concentration of antiepileptics (fosphenytoin, phenytoin). (Moderate Study)
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) decrease the efficacy of ulipristal. For FSHR guidance, see Contraceptives, interactions p. 516. (Severe Anecdotal)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vandetanib. Avoid. (Moderate Study)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to velpatavir. Avoid. (Severe Study)
- Oxcarbazepine is predicted to decrease the exposure to vemurafenib. Avoid. (Severe Theoretical)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to venetoclax. Avoid. (Severe Study)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vinodesine). (Severe Theoretical) Also see TABLE 1 p. 874 Also see TABLE 12 p. 877
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. (Severe Theoretical) Also see TABLE 12 p. 877
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vismodegib. Avoid. (Moderate Theoretical)
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of vitamin D substances. (Moderate Study)
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of vitamin D substances. (Moderate Theoretical)
- Carbamazepine is predicted to decrease the effects of vitamin D substances. (Moderate Study)
- Antiepileptics (phenobarbital, primidone) potentially increase the risk of nephrotoxicity when given with volatile halogenated anaesthetics (methoxyflurane). Avoid. (Severe Theoretical) Also see TABLE 11 p. 876
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. (Moderate Study)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of voxilaprevir. Avoid. (Severe Study)
- Oxcarbazepine is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe Theoretical)
- Valproate slightly increases the exposure to zidovudine. (Moderate Study)
- Carbamazepine moderately decreases the exposure to zolpidem. (Moderate Study)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to zopiclone. Adjust dose. (Moderate Study) Also see TABLE 11 p. 876
- Antifungals, azoles → see TABLE 1 p. 874 (Hepatotoxicity), TABLE 9 p. 876 (QT-interval prolongation)
- Since systemic absorption can follow topical application, the possibility of interactions with topical clotrimazole and ketoconazole should be borne in mind.
- In general, fluconazole interactions relate to multiple-dose treatment.
- The use of carbonated drinks, such as cola, improves irtraconazole, ketoconazole and posaconazole bioavailability.
- Interactions of miconazole apply to the oral gel formulation, as a sufficient quantity can be absorbed to cause systemic effects. Systemic absorption from intravaginal and topical formulations might also occur.
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to abemaciclib. (Moderate Study)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe Study)
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to afatinib. Separate administration by 12 hours. (Moderate Study)
- Alcohol (beverage) potentially causes a disulfiram-like reaction when given with ketoconazole. Avoid. (Moderate Anecdotal)
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. (Severe Study)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. (Severe Study)
- Itraconazole markedly increases the exposure to aliskiren. Avoid. (Severe Study)
- Ketoconazole moderately increases the exposure to aliskiren. (Moderate Study)
- Itraconazole increases the risk of busulfan toxicity when given with alkylating agents (busulfan). Monitor and adjust dose. (Moderate Study)
- Miconazole is predicted to increase the concentration of alkylating agents (busulfan). Use with caution and adjust dose. (Moderate Theoretical)
- Isavuconazole is predicted to increase the exposure to alkylating agents (cyclophosphamide). (Moderate Study)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to almitrtpian. (Mild Study)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate Study)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alpha blockers (doxazosin). (Moderate Study)
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate Theoretical)
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alprazolam. (Severe Study)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to alprazolam. Avoid. (Moderate Study)
- Miconazole is predicted to increase the exposure to alprazolam. Use with caution and adjust dose. (Moderate Theoretical)
Antifungals, azoles

Miconazole potentially decreases the exposure to aminoglycosides (tobramycin). [Moderate] Anecdot al

Antacids decrease the absorption of itraconazole (capsule). Antacids should be taken 1 hour before or 2 hours after itraconazole. [Moderate] Study

Antacids decrease the absorption of ketoconazole. Separate administration by at least 2 hours. [Moderate] Study

Miconazole is predicted to increase the exposure to antihistamines (disopyramide). Use with caution and adjust dose. [Severe] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines (disopyramide). Avoid. [Severe] Theoretical

Posaconazole is predicted to increase the exposure to antihistamines (disopyramide, dronedarone). Avoid. [Severe] Study

Fluconazole is predicted to increase the exposure to antihistamines (dronedarone). [Severe] Theoretical → Also see TABLE 9 p. 876

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very markedly increase the exposure to antihistamines (dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 876

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antihistamines (propafenone). Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines (propafenone). Monitor and adjust dose. [Severe] Study

Antiepileptics (carbamazepine) are predicted to decrease the efficacy of fluconazole and fluconazole increases the concentration of antiepileptics (carbamazepine). Avoid or monitor carbamazepine concentration and adjust dose accordingly. p. 200. [Severe] Theoretical → Also see TABLE 1 p. 874

Antiepileptics (carbamazepine) are predicted to decrease the efficacy of ketoconazole and ketoconazole slightly increases the concentration of antiepileptics (carbamazepine). Avoid or monitor carbamazepine concentration and adjust dose accordingly. p. 200. [Moderate] Study

Antiepileptics (carbamazepine) are predicted to decrease the efficacy of posaconazole and posaconazole increases the concentration of antiepileptics (carbamazepine). Avoid. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Study

Antiepileptics (fosphenytoin) very markedly decrease the exposure to itraconazole. Avoid and for 14 days after stopping fosphenytoin. [Moderate] Study

Antiepileptics (fosphenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (fosphenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 392. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to ketoconazole. Avoid. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to posaconazole. Avoid. [Moderate] Study

Antiepileptics (phenobarbital) decrease the concentration of itraconazole. Avoid and for 14 days after stopping phenobarbital. [Moderate] Study

Antiepileptics (phenobarbital) are predicted to decrease the concentration of ketoconazole. Avoid. [Moderate] Study

Antiepileptics (phenobarbital) are predicted to decrease the concentration of posaconazole. Avoid. [Moderate] Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of voriconazole. Avoid. [Moderate] Theoretical

Antiepileptics (phenytoin) very markedly decrease the exposure to itraconazole. Avoid and for 14 days after stopping phenytoin. [Moderate] Study

Antiepileptics (phenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (phenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 392, p. 211. [Moderate] Study

Antiepileptics (primidone) are predicted to decrease the concentration of itraconazole. [Moderate] Theoretical

Miconazole increases the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine). Monitor and adjust dose. [Severe] Anecdot al

Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (fosphenytoin). Monitor and adjust dose. [Severe] Anecdot al

Fluconazole increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Study

Antiepileptics (Carbamazepine) are predicted to decrease the efficacy of antifungals, azoles (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of antiepileptics (carbamazepine). Avoid or adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 874

Antiepileptics (primidone) are predicted to decrease the concentration of antifungals, azoles (ketocazolame, posaconazole). Avoid. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very slightly increase the exposure to antifungals (perampanel). [Moderate] Study

Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (phenytoin). Monitor and adjust dose. [Severe] Anecdot al

Antifungals, azoles (fluconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. [Severe] Study

Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid. [Moderate] Study

Ketoconazole increases the exposure to antimalarials (mefloquine). [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Moderate] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antimalarials (mefloquine). [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to antimalarials, non-sedating (mizolastine). Avoid. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antimalarials (mefloquine). [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antimalarials (mefloquine). [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of antimalarials (piperperaquine). [Severe] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to apalutamide. [Mild] Study → Also see TABLE 9 p. 876

Itraconazole is predicted to increase the exposure to apixaban. Avoid. [Severe] Theoretical

Ketoconazole slightly to moderately increases the exposure to apixaban. Avoid. [Severe] Study

Voriconazole is predicted to increase the exposure to apixaban. Avoid. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to apreparant. [Moderate] Study

Fluconazole is predicted to increase the exposure to apreparant. [Moderate] Theoretical

Apreparant is predicted to increase the exposure to isavuconazole. [Moderate] Theoretical

*Also see p. 876*
Antifungals, azoles – Antifungals, azoles

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (betamethasone) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide, ciclesonide, deflazacort, desamethasone, fluocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study
- Miconazole is predicted to increase the concentration of corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
- Fluconazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
- Itraconazole potentially increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- Ketocnazole potentially increases the anticoagulant effect of coumarins (warfarin). Monitor INR and adjust dose. [Severe] Anecdotal
- Miconazole greatly increases the anticoagulant effect of coumarins. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. [Severe] Study
- Voriconazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
- Itraconazole is predicted to markedly increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see TABLE 9 p. 876
- Itraconazole, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabigatran. Avoid. [Severe] Study
- Itraconazole, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasatinib. [Severe] Study → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to delamanid. [Severe] Study → Also see TABLE 9 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to diazepam. Monitor and adjust dose. [Moderate] Study
- Didanosine (served) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. [Severe] Study → Also see TABLE 1 p. 874
- Isavuconazole slightly increases the exposure to digoxin. Monitor and adjust dose. [Moderate] Study
- Voriconazole is predicted to markedly increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study
- Ketoconazole is predicted to markedly increase the concentration of digoxin. [Severe] Study
- Voriconazole is predicted to increase the concentration of digoxin. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole, posaconazole) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine). [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to dopamine receptor agonists (bromocriptine). [Severe] Study
- Itraconazole is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to doxepin. [Severe] Study
- Ketocnazole moderately increases the exposure to drospirenone. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
- Itraconazole is predicted to slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Efavirenz is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Theoretical
- Efavirenz slightly decreases the exposure to itraconazole. Avoid for 14 days after stopping efavirenz. [Moderate] Study
- Ketocnazole moderately decreases the exposure to ketoconazole. [Severe] Study
- Efavirenz slightly decreases the exposure to posaconazole. Avoid. [Moderate] Study
- Efavirenz moderately decreases the exposure to voriconazole and voriconazole slightly increases the exposure to efavirenz. Adjust dose. [Severe] Study → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eledtriptan. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to efavirenz. Avoid or adjust dose—consult product literature. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to enfuvirtide. Avoid or monitor. [Severe] Study → Also see TABLE 9 p. 876
- Enzalutamide is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ergonovine. Avoid or monitor. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergonovine. [Severe] Theoretical
- Itraconazole, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- Miconazole is predicted to increase the exposure to ergotamine. Avoid. [Moderate] Theoretical
Antifungals, azoles (continued)

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to erlotinib. [Moderate] Theoretical

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to esketamine. Adjust dose. [Moderate] Study

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole, posaconazole) are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

> Posaconazole is predicted to increase the exposure to fosaprepitant. [Moderate] Study

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 237. [Moderate] Theoretical

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 237. [Moderate] Study

> H₂ receptor antagonists are predicted to decrease the absorption of itraconazole. Administer itraconazole capsules with a dry beverage. [Moderate] Study

> H₂ receptor antagonists are predicted to decrease the absorption of ketoconazole. Administer ketoconazole with an acidic beverage. [Moderate] Study

> H₂ receptor antagonists are predicted to decrease the absorption of ketoconazole. Avoid use of ketoconazole oral suspension. [Moderate] Study

> Itraconazole increases the concentration of haloperidol. [Moderate] Study

> Fluconazole slightly increases the exposure to HIV-protease inhibitors (tipranavir). Avoid or adjust dose. [Moderate] Study

> HIV-protease inhibitors are predicted to increase the exposure to isavuconazole. Avoid or monitor side effects. [Severe] Study

> HIV-protease inhibitors are predicted to increase the exposure to itraconazole. Use with caution and adjust dose. [Severe] Study

> HIV-protease inhibitors are predicted to increase the exposure to ketoconazole. Use with caution and adjust dose. [Moderate] Study

> Miconazole is predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. [Moderate] Theoretical

> Posaconazole is predicted to increase the concentration of HIV-protease inhibitors. [Moderate] Study

> HIV-protease inhibitors are predicted to affect the exposure to voriconazole and posaconazole potentially affects the exposure to HIV-protease inhibitors. [Severe] Study → Also see TABLE 9 p. 876

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibritunib. Adjust ibritunib dose with moderate inhibitors of CYP3A4. [Severe] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very markedly increase the exposure to ibritunib. Avoid potent inhibitors of CYP3A4 or adjust ibritunib dose. [Severe] Study

> Idelalisib is predicted to increase the exposure to isavuconazole. Avoid or monitor side effects. [Severe] Study

> Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to imatinib. [Moderate] Study

> Imatinib is predicted to decrease the exposure to isavuconazole. [Moderate] Theoretical

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose. [Severe] Theoretical

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole, posaconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor or tezacaftor with ivacaftor, p. 189 dose with moderate inhibitors of CYP3A4. [Severe] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor, p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor with ivacaftor, p. 189 dose with potent inhibitors of CYP3A4. [Severe] Study

> Lanthanum is predicted to decrease the absorption of ketoconazole. Separate administration by at least 2 hours. [Moderate] Theoretical

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to laptapinib. [Moderate] Study → Also see TABLE 9 p. 876

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to laptapinib. Avoid. [Severe] Study → Also see TABLE 9 p. 876

> Leternovir slightly decreases the exposure to voriconazole. [Moderate] Study

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lorlatinib. Avoid. [Moderate] Study

> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lorlatinib. Avoid or monitor side effects. [Moderate] Theoretical

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lorlatinib. Avoid. [Severe] Study → Also see TABLE 1 p. 874

> Clotrimazole is predicted to increase the exposure to lorlatinib. Separate administration by 12 hours. [Moderate] Theoretical

> Lumacaftor is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole). Avoid or monitor efficacy. [Moderate] Theoretical

> Lumacaftor is predicted to decrease the exposure to fluconazole. Adjust dose. [Mild] Theoretical

> Antifungals, azoles (fluconazole, isavuconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose. [Moderate] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

> Posaconazole moderately increases the exposure to lurasidone. Avoid. [Severe] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to macitentan. [Moderate] Study

> Macrolides (clarithromycin) are predicted to increase the exposure to isavuconazole. Avoid or monitor side effects. [Severe] Study

> Macrolides (erythromycin) are predicted to increase the exposure to isavuconazole. [Moderate] Theoretical
Antifungals, azoles – Antifungals, azoles

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- Metoclopramide potentially decreases the absorption of posaconazole (oral suspension). [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, ketoconazole) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study
- Miconazole is predicted to increase the exposure to intravenous midazolam. Use with caution and adjust dose. [Moderate] Theoretical
- Miconazole is predicted to increase the exposure to oral midazolam. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, itraconazole, voriconazole) are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- Isavuconazole increases the exposure to mycophenolate. [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, voriconazole) are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to netupitant. [Moderate] Study
- Netupitant is predicted to decrease the exposure to isavuconazole. [Moderate] Theoretical
- Fluconazole slightly to moderately increases the exposure to nevirapine. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Theoretical
- Nevirapine moderately decreases the exposure to itraconazole. Avoid and for 14 days after stopping nevirapine. [Moderate] Study
- Nevirapine moderately decreases the exposure to ketoconazole. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to voriconazole and voriconazole increases the exposure to nevirapine. Monitor and adjust dose. [Severe] Theoretical
- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to nilotinib. [Moderate] Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitidasine. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitis Rin. Adjust dose. [Moderate] Theoretical
- Fluconazole moderately increases the exposure to NSAIDs (celecoxib). Adjust celecoxib dose. [Moderate] Study
- Voriconazole slightly increases the exposure to NSAIDs (diclofenac). Monitor and adjust dose. [Moderate] Study
- Voriconazole moderately increases the exposure to NSAIDs (ibuprofen). Adjust dose. [Moderate] Study
- Fluconazole increases the exposure to NSAIDs (paracetamol). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. [Moderate] Study
- Miconazole is predicted to increase the exposure to opioids (alfentanil). Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to opioids (methadone). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to omeprazole. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Fluconazole increases the exposure to omeprazole. Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to oxycodone. [Mild] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxycodone. [Mild] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to palbociclib. Adjust palbociclib dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 876
- Posaconazole is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paripariphir. Avoid. [Severe] Study
- Posaconazole is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir) and paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to posaconazole. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate] Study → Also see TABLE 9 p. 876
- Miconazole greatly increases the anticoagulant effect of phenindione. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 876
Antifungals, azoles (continued)

- **Miconazole** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Use with caution and adjust dose. (Severe) Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4. (Moderate) Study → Also see TABLE 9 p. 876

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. (Severe) Study → Also see TABLE 9 p. 876

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). (Severe) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. (Severe) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 876

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pibrentasvir. (Moderate) Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pimozide. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 876

- **Miconazole** is predicted to increase the exposure to pimozide. Avoid. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to praziquantel. (Mild) Study

- **Proton pump inhibitors** decrease the absorption of itraconazole. Administer itraconazole capsules with an acidic beverage, p. 460. (Moderate) Study

- **Proton pump inhibitors** decrease the absorption of ketoconazole. Administer ketoconazole with an acidic beverage, p. 460. (Moderate) Study

- **Proton pump inhibitors** decrease the absorption of voriconazole. (Oral suspension). Avoid. (Moderate) Study

- Voriconazole increases the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. (Moderate) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 876

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study → Also see TABLE 9 p. 876

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to reboxetine. (Mild) Study

- Miconazole is predicted to increase the concentration of reboxetine. Use with caution and adjust dose. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to regorafenib. Avoid. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. (Moderate) Study

- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole) are predicted to increase the exposure to retinoids (tretinoin). Adjust all tretinoin dose. (Moderate) Theoretical

- Antifungals, azoles (fluconazole, ketoconazole, voriconazole) are predicted to increase the risk of tretinoin toxicity when given with retinoids (tretinoin). (Moderate) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ribociclib. (Moderate) Study → Also see TABLE 9 p. 876

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. (Moderate) Study → Also see TABLE 9 p. 876

- Antifungals, azoles (itraconazole, posaconazole) increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. (Severe) Study

- Fluconazole increases the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Study

- Rifabutin is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Theoretical

- Ketoconazole is predicted to increase the concentration of rifabutin and rifabutin is predicted to decrease the concentration of ketoconazole. Avoid. (Severe) Theoretical

- Miconazole is predicted to increase the concentration of rifabutin. Use with caution and adjust dose. (Moderate)

- Rifabutin decreases the concentration of voriconazole and voriconazole increases the concentration of rifabutin. Avoid or adjust voriconazole dose, p. 390. (Severe) Study

- Rifampicin slightly decreases the exposure to fluconazole. Adjust dose. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Study

- Rifampicin markedly decreases the exposure to itraconazole. Avoid and for 14 days after stopping rifampicin. (Moderate) Study

- Rifampicin markedly decreases the exposure to ketoconazole and ketoconazole potentially decreases the exposure to rifampicin. Avoid. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to posaconazole. Avoid. (Moderate) Anecdotal

- Rifampicin markedly decreases the exposure to voriconazole. Avoid. (Moderate) Study

- Itraconazole is predicted to increase the exposure to riociguat. Avoid. (Moderate) Study

- Ketoconazole moderately increases the exposure to riociguat. Avoid. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study → Also see TABLE 9 p. 876

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to rivaroxaban. Avoid. (Severe) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to rituximab. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to rituximab. Adjust dose and monitor side effects. (Moderate) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to saxagliptin. (Mild) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. (Moderate) Study

- Fluconazole is predicted to increase the exposure to selexipag. (Unknown) Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) increase the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study
Interactions | Appendix 1

Antifungals, azoles – Antifungals, azoles 905

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Avoid. (Severe) Study
- Miconazole is predicted to increase the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study
- Oral sodium bicarbonate decreases the absorption of ketoconazole. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to solifenacin. Adjust solifenacin or tomasulosin with solifenacin dose; avoid in hepatic and renal impairment. (Severe) Study
- Voriconazole is predicted to increase the exposure to SSRIs (citalopram). (Severe) Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to SSRIs (dopoxetine). Adjust dopoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to SSRIs. (atorvastatin). (Anecdotal) Theoretical
- Miconazole potentially increases the exposure to statins (atorvastatin). (Anecdotal) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Study → Also see TABLE 1 p. 874
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study → Also see TABLE 1 p. 874
- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to statins (fluvastatin). (Severe) Theoretical → Also see TABLE 1 p. 874
- Isavuconazole is predicted to increase the exposure to statins (fluvastatin, rosuvastatin). (Moderate) Theoretical
- Miconazole is predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 136. (Suicide) Study → Also see TABLE 1 p. 874
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Study → Also see TABLE 1 p. 874
- Isavuconazole is predicted to increase the exposure to statins (fluvastatin, rosuvastatin). (Anecdotal) Theoretical
- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. (Moderate) Study
- Voriconazole is predicted to increase the concentration of sulfonylureas. Use with caution and adjust dose. (Moderate) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to suntinib. (Moderate) Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to suntinib. Avoid or adjust suntinib dose. (Moderate) Study → Also see TABLE 9 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study
- Miconazole is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the increase the exposure to taxanes (docetaxel). Use with caution and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (paclitaxel). (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. (Moderate) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolterodine. (Mild) Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolterodine. Avoid. (Severe) Study → Also see TABLE 9 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to topotecan. (Severe) Study
- Isavuconazole is predicted to increase the exposure to topotecan. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to toremifene. (Moderate) Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 1 p. 874
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to trazodone. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Moderate) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study
Antifungals, azoles (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vemurafenib. Severe
  - Theoretical
  - Also see TABLE 9 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to venooclax. Avoid or adjust dose—consult product literature. Severe
  - Study
  - Also see TABLE 9 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to vinca alkaloids. Severe
  - Theoretical
  - Also see TABLE 1 p. 874 → Also see TABLE 9 p. 876
- Miconazole is predicted to increase the concentration of vinca alkaloids. Use with caution and adjust dose. Moderate
  - Theoretical
- Antifungals, azoles (clofotrimazole, ketoconazole) are predicted to decrease the exposure to vitamin D substances (colecalciferol). Moderate
  - Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vitamin D substances (paricalcitol). Moderate
  - Study
- Fluconazole slightly increases the exposure to zidovudine. Moderate
  - Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to zopiclone. Adjust dose. Moderate
  - Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to zopiclone. Adjust dose. Moderate
  - Theoretical

Antihistamines, non-sedating → see TABLE 9 p. 876 (QT-interval prolongation)

acrivastine · azelastine · bilastine · cetirizine · desloratadine · fexofenadine · levocetirizine · loratadine · mizolastine · rupatadine

- Since systemic absorption can follow topical application, the possibility of interactions with topical azelastine should be borne in mind.
- Apple juice and orange juice decrease the exposure to fexofenadine.

Antacids decrease the absorption of fexofenadine. Separate administration by 2 hours. Mild
- Study

Antiarhythmics (dronedarone) are predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study

Antiarhythmics (dronedarone) are predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). Severe
- Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to mizolastine. Severe
- Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. Severe
- Study
- Antifungals, azoles (miconazole) are predicted to increase the exposure to mizolastine. Avoid. Moderate
- Theoretical

Aplutamide slightly decreases the exposure to fexofenadine. Mild
- Study
- Aprepitant is predicted to increase the exposure to mizolastine. Severe
- Theoretical
- Aprepitant is predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Antihistamines, non-sedating are predicted to decrease the effects of betahistine. Moderate
- Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to mizolastine. Severe
- Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Certitinib is predicted to increase the exposure to fexofenadine. Moderate
- Theoretical

Cobicistat is predicted to increase the exposure to mizolastine. Avoid. Severe
- Study
- Cobicistat is predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Crizotinib is predicted to increase the exposure to mizolastine. Severe
- Theoretical
- Crizotinib is predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Elaglutin is predicted to increase the exposure to fexofenadine. Adjust dose. Moderate
- Study
- Grapefruit juice slightly decreases the exposure to bilastine. Bilastine should be taken 1 hour before or 2 hours after grapefruit juice. Moderate
- Study
- Grapefruit juice increases the exposure to rupatadine. Avoid. Moderate
- Study
- HIV-protease inhibitors are predicted to increase the exposure to mizolastine. Avoid. Severe
- Study
- HIV-protease inhibitors are predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Idelalisib is predicted to increase the exposure to mizolastine. Avoid. Severe
- Study
- Idelalisib is predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Lapatinib is predicted to increase the exposure to fexofenadine. Moderate
- Theoretical
- Leflunomide is predicted to increase the exposure to fexofenadine. Moderate
- Theoretical
- Letemovir is predicted to increase the concentration of fexofenadine. Moderate
- Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to mizolastine. Avoid. Severe
- Study
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Macrolides (erythromycin) are predicted to increase the exposure to mizolastine. Severe
- Theoretical
- Mirabegron is predicted to increase the exposure to fexofenadine. Mild
- Theoretical
- Monoamine oxidase A and B inhibitors, irreversible are predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, non-sedating. Avoid. Severe
- Theoretical
- Netupitant is predicted to increase the exposure to mizolastine. Severe
- Theoretical
- Netupitant is predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Nilotinib is predicted to increase the exposure to mizolastine. Severe
- Theoretical
- Nilotinib is predicted to increase the exposure to rupatadine. Avoid. Moderate
- Study
- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to fexofenadine. Moderate
- Study
- Pitolisant is predicted to increase the exposure to fexofenadine. Mild
- Theoretical
- Rifampicin is predicted to decrease the exposure to bilastine. Moderate
- Theoretical
- Rifampicin increases the clearance of fexofenadine. Moderate
- Study
- Teriflunomide is predicted to increase the exposure to fexofenadine. Moderate
- Study
- Velpatasvir is predicted to increase the exposure to fexofenadine. Severe
- Theoretical
- Venooclax is predicted to increase the exposure to fexofenadine. Moderate
- Theoretical

Antihistamines, sedating → see TABLE 9 p. 876 (QT-interval prolongation), TABLE 11 p. 876 (CNS depressant effects), TABLE 10 p. 876 (antimuscarinics)

GENERAL INFORMATION Drugs with antimuscarinic effects might reduce the absorption of levodopa → see TABLE 10 p. 876

alimemazine · antazoline · buclizine · chlorphenamine · cinnarizine · Clemastine · cyclizine · cyproheptadine · doxylamine · hydroxyzine ·
Antihistamines, sedating – Antimalarials 907

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application of ketotifen, the possibility of interactions should be borne in mind.

- **Hydroxyzine** potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. ([Severe] Theoretical)
- **Antihistamines, sedating** are predicted to decrease the effects of beta-histine. ([Moderate] Theoretical)
- **Cyprophedantadine** decreases the effects of metapyrone. Avoid. ([Moderate] Study)
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, sedating. Avoid. ([Severe] Theoretical)
- **Antihistamines, sedating** are predicted to decrease the efficacy of pitolisant. ([Moderate] Theoretical)
- **Cyprophedantadine** potentially decreases the effects of SSRI. ([Moderate] Anecdotal)

### Antimalarials
- **See TABLE 15 p. 877 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)**
  - artemether · arteminol · atovaquone · chloroquine · lumeafantrine · mefloquine · piperaquine · primaquine · proguanil · pyrimethamine · quinine

**PHARMACOLOGY** Piperquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped.

- **Chloroquine** is predicted to decrease the effects of agalasidase. Avoid. ([Moderate] Theoretical)
- **Antimalarials** (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (pilocaine). Use with caution or avoid. ([Severe] Theoretical)
- **Antacids** decrease the absorption of chloroquine. Separate administration by at least 4 hours. ([Moderate] Study)
- **Antacids** are predicted to decrease the absorption of proguanil. Separate administration by at least 2 hours. ([Moderate] Study)
- **Antihistamines, sedating** (dronedarone) are predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to artemether (with lumeafantrine). Avoid. ([Severe] Study)
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of piperaquine. Avoid. ([Moderate] Theoretical)
- **Antiepileptics** (carbamazepine, phenobarbital, primidone) potentially increase the risk of toxicity when given with quinine. ([Unknown] Study)
- **Pyrimethamine** increases the risk of haematological toxicity when given with antiepileptics (fosphenytoin, phenytoin). ([Severe] Study)
- **Pyrimethamine** is predicted to increase the risk of haematological toxicity when given with antiepileptics (phenobarbital, primidone). ([Severe] Theoretical)
- **Antifungals, azoles** (fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Antifungals, azoles** (fluconazole, itraconazole, posaconazole, voriconazole) are predicted to increase the exposure to mefloquine. ([Moderate] Theoretical)
- **Antimalarials** (proguanil) are predicted to increase the risk of side-effects when given with antimalarials (pyrimethamine). ([Severe] Theoretical)
- **Aprepitant** is predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Mefloquine** is predicted to increase the risk of bradyardia when given with beta blockers, non-selective. ([Severe] Theoretical)
- **Mefloquine** is predicted to increase the risk of bradyardia when given with beta blockers, selective. ([Severe] Theoretical)
- **Mefloquine** is predicted to increase the risk of bradyardia when given with calcium channel blockers. ([Severe] Theoretical)

- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Calcium salts** (calcium carbonate) decrease the absorption of chloroquine. Separate administration by at least 4 hours. ([Moderate] Study)
- **Calcium salts** (calcium carbonate) are predicted to decrease the absorption of proguanil. Separate administration by at least 2 hours. ([Moderate] Study)
- **Chloroquine** decreases the efficacy of oral cholera vaccine. ([Severe] Theoretical)
- **Cobicistat** is predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Crizotinib** is predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Antimalarials** (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinemia when given with dapsone. ([Severe] Theoretical)
- **Mefloquine** is predicted to increase the risk of bradyardia when given with digoxin. ([Severe] Theoretical)
- **Quinine increases the concentration of digoxin.** Monitor and adjust digoxin dose, p. 82. ([Severe] Anecdotal)
- **Efavirenz** decreases the concentration of artemether. ([Severe] Study) → Also see TABLE 9 p. 876
- **Efavirenz** moderately decreases the exposure to atovaquone. Avoid. ([Moderate] Study)
- **Efavirenz affects the exposure to proguanil. Avoid. ([Moderate] Study)
- **Enzalutamide** is predicted to decrease the exposure to artemether (with lumeafantrine). Avoid. ([Severe] Study)
- **Enzalutamide** is predicted to decrease the concentration of piperaquine. Avoid. ([Moderate] Theoretical)
- **Etravirine** decreases the exposure to artemether. ([Moderate] Study)
- **Grapefruit juice** increases the exposure to artemether. ([Unknown] Study)
- **Grapefruit juice** is predicted to increase the concentration of piperaquine. Avoid. ([Severe] Theoretical)
- **H1 receptor antagonists** (cimetidine) decrease the clearance of chloroquine. ([Moderate] Study)
- **H1 receptor antagonists** (cimetidine) slightly increase the exposure to quinine. ([Moderate] Study)
- **HIV-protease inhibitors** decrease the exposure to atovaquone. Avoid if boosted with ritonavir. ([Moderate] Study)
- **HIV-protease inhibitors** are predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **HIV-protease inhibitors** are predicted to decrease the exposure to proguanil. Avoid. ([Moderate] Study)
- **HIV-protease inhibitors** are predicted to affect the exposure to quinine. ([Severe] Study) → Also see TABLE 9 p. 876
- **Idealisib** is predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Imatinib** is predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Lanthanum** is predicted to decrease the absorption of chloroquine. Separate administration by at least 2 hours. ([Moderate] Theoretical)
- **Chloroquine** is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. ([Severe] Theoretical)
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
- **Mepacrine** is predicted to increase the concentration of primaquine. Avoid. ([Moderate] Theoretical)
- **Pyrimethamine** is predicted to increase the risk of side-effects when given with mefloquine. ([Severe] Theoretical) → Also see TABLE 15 p. 877
- **Metoclopramide** decreases the concentration of atovaquone. Avoid. ([Moderate] Study)
- **Mitotane** is predicted to decrease the exposure to artemether (with lumeafantrine). Avoid. ([Moderate] Study)
- **Mitotane** is predicted to decrease the concentration of piperaquine. Avoid. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the concentration of piperaquine. ([Severe] Theoretical)
Antimalarials (continued)

▶ Nilotinib is predicted to increase the concentration of piperazine. (Severe) Theoretical
▶ Pyrimethamine is predicted to increase the risk of side-effects when given with pemetrexed. (Severe) Theoretical → Also see TABLE 15 p. 877
▶ Chloroquine is predicted to increase the risk of haematological toxicity when given with penicillinamide. Avoid. (Severe) Theoretical
▶ Chloroquine moderately decreases the exposure to praziquantel. Use with caution and adjust dose. (Moderate) Study
▶ Chloroquine decreases the efficacy of rabies vaccine. Avoid. (Moderate) Study
▶ Rifabutin slightly decreases the exposure to atovaquone. Avoid. (Moderate) Study
▶ Rifampicin moderately decreases the exposure to artemether (with lumefantrine). Avoid. (Severe) Study
▶ Rifampicin moderately decreases the exposure to atovaquone and atovaquone slightly increases the exposure to rifampicin. Avoid. (Moderate) Study
▶ Rifampicin moderately decreases the exposure to mefloquine. (Severe) Study
▶ Rifampicin is predicted to decrease the concentration of piperazine. Avoid. (Moderate) Theoretical
▶ Rifampicin decreases the exposure to quinine. (Severe) Study
▶ St John’s Wort is predicted to decrease the concentration of piperazine. Avoid. (Moderate) Theoretical
▶ Pyrimethamine increases the risk of side-effects when given with sulfonamides. (Severe) Study → Also see TABLE 15 p. 877
▶ Tetracyclines (tetracycline) decrease the concentration of atovaquone. (Moderate) Study
▶ Pyrimethamine increases the risk of side-effects when given with trimethoprim. (Severe) Study
▶ Pyrimethamine is predicted to increase the concentration of side-effects when given with zidovudine. (Severe) Theoretical → Also see TABLE 15 p. 877

Antithymocyte immunoglobulin (rabbit) → see immunoglobulins

Apalutamide → see TABLE 9 p. 876 (QT-interval prolongation)
▶ Apalutamide is predicted to decrease the exposure to aldosterone antagonists (episterone). Avoid or monitor. (Moderate) Study
▶ Apalutamide potentially decreases the exposure to antiepileptics (valproate). (Mild) Theoretical
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to apalutamide. (Mild) Study → Also see TABLE 9 p. 876
▶ Apalutamide slightly decreases the exposure to antihistamines, non-sedating (fexofenadine). (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to beta2 agonists (salmeterol). Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to bosutinib. Avoid or monitor. (Moderate) Study → Also see TABLE 9 p. 876
▶ Apalutamide is predicted to decrease the exposure to buspirone. Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to calcium channel blockers (felodipine, lercanidipine). Avoid or monitor. (Moderate) Study
▶ Clopidogrel is predicted to increase the exposure to apalutamide. (Mild) Study
▶ Cobicistat is predicted to increase the exposure to apalutamide. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to colchicine. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to corticosteroids (budesonide, flucicasone). Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to coumarins. Avoid or monitor. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to dabigatran. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to darifenacin. Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to dasatinib. Avoid or monitor. (Moderate) Study → Also see TABLE 9 p. 876
▶ Apalutamide is predicted to decrease the exposure to diazepam. Avoid or monitor. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to digoxin. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to everolimus. Avoid or monitor. (Moderate) Study
▶ Fibrates (gemfibrozil) are predicted to increase the exposure to apalutamide. (Mild) Study
▶ HIV- protease inhibitors are predicted to increase the exposure to apalutamide. (Mild) Study → Also see TABLE 9 p. 876
▶ Idelalisib is predicted to increase the exposure to apalutamide. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to ivacaftor. Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to lomitapide. Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to lurasidone. Avoid or monitor. (Moderate) Study
▶ Macrolides (clarithromycin) are predicted to increase the exposure to apalutamide. (Mild) Study → Also see TABLE 9 p. 876
▶ Apalutamide is predicted to decrease the exposure to maraviroc. Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to methotrexate. (Mild) Study
▶ Apalutamide markedly decreases the exposure to midazolam. Avoid or monitor. (Severe) Study
▶ Apalutamide is predicted to decrease the exposure to moclobemide. Avoid or monitor. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to naloxegol. Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to opioids (alfentanil, methadone). Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, sildenafil, vardenafil, tadalafil). Avoid or monitor. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to proton pump inhibitors (lansoprazole, rabeprazole). Avoid or monitor. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to quetiapine. Avoid or monitor. (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to sirolimus. Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to SSRIs (citalopram). Avoid or monitor. (Mild) Study → Also see TABLE 9 p. 876
▶ Apalutamide slightly decreases the exposure to statins (rosuvastatin). (Mild) Study
▶ Apalutamide is predicted to decrease the exposure to statins (simvastatin). Avoid or monitor. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to temsirolimus. Avoid or monitor. (Moderate) Study
▶ Apalutamide potentially decreases the exposure to thyroid hormones (levothyroxine). (Mild) Theoretical
▶ Apalutamide is predicted to decrease the exposure to ticagrelor. Monitor and adjust dose. (Moderate) Study
▶ Apalutamide is predicted to decrease the exposure to tolvaptan. Avoid or monitor. (Moderate) Study

Apixaban → see TABLE 3 p. 874 (anticoagulant effects)
▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to apixaban. (Moderate) Theoretical
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study
▶ Antifungals, azoles (itraconazole) are predicted to increase the exposure to apixaban. Avoid. (Severe) Theoretical
▶ Antifungals, azoles (ketoconazole) slightly to moderately increase the exposure to apixaban. Avoid. (Severe) Study
Antifungals, azoles (voriconazole) are predicted to increase the exposure to apixaban. Avoid. [Moderate] Theoretical
Calcium channel blockers (verapamil) are predicted to increase the exposure to apixaban. Avoid. [Moderate] Theoretical
Cobicistat is predicted to increase the exposure to apixaban. Avoid. [Moderate] Theoretical
Enzalutamide is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study
HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to apixaban. Avoid. [Severe] Theoretical
Macrolides (erythromycin) are predicted to increase the exposure to apixaban. [Moderate] Theoretical
Mitotane is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study
Rifampin is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study
St John’s Wort is predicted to decrease the exposure to apixaban. Use with caution or avoid. [Moderate] Theoretical
Apomorphine is predicted to markedly increase the exposure to aripiprazole. Avoid. [Moderate] Theoretical
Apriomin (tricyclic antidepressant) is predicted to increase the exposure to aripiprazole. Avoid. [Severe] Study
Amfebutamone is predicted to decrease the effects of apromelanotide. Avoid. [Severe] Study
Methylphenidate is predicted to decrease the effects of apromelanotide. Avoid. [Severe] Study
Sympathomimetics, inotropic are predicted to decrease the effects of apromelanotide. Avoid. [Severe] Study
Apremilast
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to apremilast. Avoid. [Severe] Study
Enzalutamide moderately decreases the exposure to apremilast. Avoid. [Severe] Study
Mitotane moderately decreases the exposure to apremilast. Avoid. [Severe] Study
Rifampin moderately decreases the exposure to apremilast. Avoid. [Severe] Study
St John’s Wort is predicted to decrease the exposure to apremilast. Avoid. [Severe] Study
Aprepitant
Aprepitant is predicted to increase the exposure to aripiprazole. Avoid. [Severe] Study
Aprepitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical
Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
Aprepitant is predicted to increase the exposure to beta, agonists (salmeterol). [Moderate] Study
Bosantan is predicted to decrease the exposure to apremilast. [Moderate] Study
Aprepitant is predicted to increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Theoretical
Aprepitant is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
Aprepitant is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to apremilast and apremitap is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Study
Aprepitant is predicted to increase the exposure to calcium channel blockers (amiodarone, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Aprepitant is predicted to increase the exposure to carbiprazine. Avoid. [Severe] Study
Aprepitant is predicted to increase the exposure to ceritinib. [Moderate] Theoretical
Aprepitant is predicted to increase the concentration of ciclosporin. [Severe] Study
Cobicistat is predicted to markedly increase the exposure to ciclosporin. [Severe] Study
Aprepitant is predicted to increase the exposure to cabemizinetin. [Severe] Theoretical
Aprepitant is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
Aprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, Interactions p. 516. [Severe] Study
Aprepitant is predicted to increase the exposure to oral corticosteroids (budesonide). [Moderate] Study
Aprepitant moderately increases the exposure to corticosteroids (dexamethasone). Monitor and adjust dose. [Moderate] Study
Aprepitant is predicted to increase the exposure to corticosteroids (fluticasone). [Moderate] Study
Aprepitant is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
Aprepitant decreases the anticoagulant effect of coumarin. [Severe] Study
Aprepitant is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
Aprepitant is predicted to increase the exposure to dasatinib. [Severe] Study
Aprepitant is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. [Severe] Theoretical
Aprepitant increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
Aprepitant is predicted to increase the exposure to dopaminergic receptor agonists (bromocriptine). [Severe] Theoretical
Aprepitant is predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal
Aprepitant is predicted to moderately increase the exposure to dutasteride. [Mild] Study
Efavirenz is predicted to decrease the exposure to aprepitant. [Moderate] Study
Aprepitant is predicted to increase the exposure to eletriptan. [Moderate] Study
Aprepitant is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
Aprepitant is predicted to moderately increase the exposure to enocafenib. [Moderate] Study
Enzalutamide is predicted to markedly decrease the exposure to apremitap. Avoid. [Moderate] Study
Aprepitant (continued)
▶ Aprepitant is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
▶ Aprepitant is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
▶ Aprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 316. [Severe] Theoretical
▶ Aprepitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild]
▶ Aprepitant is predicted to increase the exposure to gefitinib. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 223. [Moderate] Theoretical
▶ HIV-protease inhibitors are predicted to markedly increase the exposure to aprepitant. [Moderate] Study
▶ Aprepitant is predicted to decrease the effects of hormone replacement therapy. [Moderate] Aneocolal
▶ Aprepitant is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
▶ Idelalisib is predicted to markedly increase the exposure to aprepitant. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to imatinib. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to intravenous irinotecan. [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
▶ Aprepitant is predicted to increase the exposure to lapatinib. [Moderate] Study
▶ Aprepitant is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to lomitapide. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to luraside. Adjust luraside dose. [Moderate] Study
▶ Macrolides (clarithromycin) are predicted to markedly increase the exposure to aprepitant. [Moderate] Study
▶ Macrolides (erythromycin) are predicted to increase the exposure to aprepitant. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to maraviroc. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
▶ Aprepitant is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
▶ Mitotane is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
▶ Nevirapine is predicted to decrease the exposure to aprepitant. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to nilotinib. [Moderate] Theoretical
▶ Aprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Aneocolal
▶ Aprepitant is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to oxazepam. [Mild] Theoretical
▶ Aprepitant is predicted to increase the exposure to pazopanib. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to ranolazine. [Severe] Study
▶ Aprepitant is predicted to increase the exposure to ribociclib. [Moderate] Study
▶ Rifampicin is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to saxagliptin. [Mild] Study
▶ Aprepitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to SSRI. (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
▶ St John’s Wort is predicted to decrease the exposure to aprepitant. Avoid. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Study
▶ Aprepitant is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
▶ Aprepitant is predicted to increase the exposure to sunitinib. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the concentration of tacrolimus. [Severe] Study
▶ Aprepitant is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
▶ Aprepitant is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical
▶ Aprepitant is predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
▶ Aprepitant given with a potent CYP3A19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to tolcavast. [Mild] Theoretical
▶ Aprepitant is predicted to increase the exposure to tollvapant. Manufacturer advises caution or adjust tollvapant dose with moderate inhibitors of CYP3A4. [Moderate] Study
▶ Aprepitant is predicted to increase the exposure to trazodone. [Moderate] Theoretical
▶ Aprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Aneocolal
▶ Aprepitant is predicted to increase the exposure to venooclax. Avoid or adjust dose—consult product literature. [Severe] Study
▶ Aprepitant is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical
▶ Aprepitant is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

Argatroban ▶ see TABLE 3 p. 874 (anticoagulant effects)
Ranibizumab is predicted to increase the risk of bleeding events when given with argatroban. [Severe] Theoretical

Aripiprazole ▶ see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

Antidepressants (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study ▶ Also see TABLE 11 p. 876

Antifungals (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Bupropion is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Cinacalcet is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Aripiprazole is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical ▶ Also see TABLE 8 p. 875

Enzalutamide is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

HIV-protease inhibitors are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Ivermectin is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Aripiprazole is predicted to decrease the effects of levodopa. [Severe] Theoretical ▶ Also see TABLE 8 p. 875

Macrolides (clarithromycin) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Mitotane is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Rifampicin is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

Terbinafine is predicted to moderately increase the exposure to aripiprazole dose, p. 255. [Moderate] Study

Arsenic trioxide ▶ see TABLE 15 p. 877 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)

Artemether ▶ see antimalarials

Articaine ▶ see TABLE 11 p. 876 (CNS depressant effects)

Ascorbic acid ▶

Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with deferiprone. [Severe] Theoretical

Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with iron chelators (desferrioxamine). [Severe] Theoretical

Asenapine ▶ see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

Asenapine is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. [Moderate] Theoretical ▶ Also see TABLE 8 p. 875

Asenapine is predicted to decrease the effects of levodopa. Adjust dose. [Severe] Theoretical ▶ Also see TABLE 8 p. 875

SSRIs (fluvoxamine) increase the exposure to asenapine. [Moderate] Study

SSRIs (paroxetine) moderately increase the exposure to asenapine. [Moderate] Study

Aspirin ▶ see TABLE 1 p. 874 (hepatoxicity), TABLE 15 p. 877 (myelosuppression)

Aspirin is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical ▶ Also see TABLE 15 p. 877

Aspirin affects the efficacy of methotrexate. [Severe] Amodiated ▶ Also see TABLE 1 p. 874 ▶ Also see TABLE 15 p. 877

Aspirin potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before aspirin. [Severe] Amodiated ▶ Also see TABLE 1 p. 874 ▶ Also see TABLE 15 p. 877

Amodiated ▶ see TABLE 4 p. 874 (antiplatelet effects)

Acetazolamide increases the risk of severe toxic reaction when given with aspirin (high-dose). [Severe] Study

Antacids decrease the absorption of aspirin (high-dose). [Moderate] Study

Amodiated ▶ also see TABLE 1 p. 874

Amodiated ▶ also see TABLE 1 p. 874

Amodiated ▶ also see TABLE 1 p. 874

Amodiated ▶ also see TABLE 1 p. 874

Amodiated ▶ also see TABLE 1 p. 874

Amodiated ▶ also see TABLE 1 p. 874
Axitinib → see TABLE 15 p. 877 (myelosuppression)
Antiarrhythmics (dronedarone) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
Aprepitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical
Bosentan is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
Cobicistat is predicted to increase the exposure to axitinib. [Moderate] Theoretical
Axitinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
Crizotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical
Efravirenz is predicted to decrease the exposure to axitinib. [Moderate] Theoretical → also see TABLE 15 p. 877
Enalapril is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
Idelalisib is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study → also see TABLE 15 p. 877
Imatinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → also see TABLE 15 p. 877
Macrolides (clarithromycin) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
Macrolides (erythromycin) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
Netupitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical
Neuraminine is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
Nilotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → also see TABLE 15 p. 877
Axitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
Rifampicin is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
St John’s Wort is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
Azathioprine → see TABLE 15 p. 877 (myelosuppression)
ACE inhibitors are predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. [Severe] Anecdotal
Allopurinol potentially increases the risk of haematological toxicity when given with azathioprine. Adjust azathioprine dose, p. 536. [Severe] Study
Azaithioprine decreases the anticogulant effect of coumarins. [Moderate] Study
Fexofenadine is predicted to increase the exposure to azathioprine. Avoid. [Severe] Theoretical
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with azathioprine (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Study
Azelastine → see antihistamines, non-sedating
Amitizaltel → see angiotensin II receptor antagonists
Azithromycin → see macrolides
Bacillus Calmette-Guérin vaccine → see live vaccines
Bacitracin → see TABLE 2 p. 874 (nephrotoxicity)
Baclofen → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects), TABLE 10 p. 876 (antimuscarinics)
Baclofen is predicted to increase the risk of side-effects when given with levodopa. [Severe] Anecdotal → also see TABLE 8 p. 875
Balsalazide → see TABLE 15 p. 877 (myelosuppression)
Balsalazide is predicted to decrease the concentration of digoxin. [Moderate] Theoretical
Bambuterol → see beta agonists
Baricitinib
Leflunomide potentially increases the exposure to baricitinib. [Moderate] Theoretical
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with baricitinib. Avoid. [Severe] Theoretical
Teriflunomide potentially increases the exposure to baricitinib. [Moderate] Theoretical
Basiliximab → see monoclonal antibodies
Bazedoxifene
Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
Rifampicin is predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
Beclometasone → see corticosteroids
Bedaquiline → see TABLE 1 p. 874 (hepatotoxicity), TABLE 9 p. 879 (QT-interval prolongation)
Antiarrhythmics (dronedarone) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → also see TABLE 9 p. 876
Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → also see TABLE 1 p. 874 → also see TABLE 9 p. 876
Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → also see TABLE 1 p. 874 → also see TABLE 9 p. 876
Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
Bosentan is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → also see TABLE 1 p. 874 → also see TABLE 9 p. 876
Idelalisib is predicted to increase the exposure to bedaquiline. Avoid. [Severe] Study
Imatinib is predicted to decrease the exposure to bedaquiline. Avoid prolonged use. [Mild] Study
Crizotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → also see TABLE 9 p. 876
Efavirenz is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → also see TABLE 9 p. 876
Amitizaltel decreases the exposure to bedaquiline. Avoid. [Severe] Study
Etravirine is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Theoretical
HIV-protase inhibitors are predicted to decrease the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → also see TABLE 1 p. 874
Clofazimine potentially increases the risk of QT-prolongation when given with bedaquiline. [Severe] Study
Cobicistat is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study
Rifampicin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → also see TABLE 9 p. 876
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → also see TABLE 9 p. 876
St John’s Wort is predicted to increase the exposure to bedaquiline. Avoid. [Severe] Study
Macrolides (clarithromycin) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → also see TABLE 9 p. 876
Amitizaltel decreases the exposure to bedaquiline. Avoid. [Severe] Study
Azithioprine decreases the exposure to bedaquiline. Avoid. [Severe] Study
Belatacept

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Bellimump > see monoclonal antibodies

Bendroflumethiazide > see thiazide diuretics

Benperidol > see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

- Benperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical > Also see TABLE 8 p. 875

- Benperidol is predicted to decrease the effects of guanethidine. [Moderate] Theoretical > Also see TABLE 8 p. 875

- Benperidol is predicted to decrease the effects of levodopa. [Severe] Study > Also see TABLE 8 p. 875

Benzymadine > see NSAIDs

Benzylenepicillin > see penicillins

Beta blockers, non-selective > see TABLE 8 p. 875 (bradycardia), TABLE 8 p. 875 (hypotension), TABLE 9 p. 876 (QT-interval prolongation)

- carvedilol, labetalol, levo-bunolol, nadolol, pindolol, propranolol, sotalol, timolol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of levo-bunolol and timolol the possibility of interactions should be borne in mind.

- Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. [Severe] Theoretical

  - Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecaainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. [Severe] Study > Also see TABLE 6 p. 875 (see amlodipine, benzydamine, benzylenepicillin, beta blockers, non-selective, calcium channel blockers, diuretics, flunarizine, fludrocortisone, guanethidine, lidocaine, metoprolol, midodrine, propranolol, timolol, verapamil, xenamem)

  - Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with propranolol. Use with caution or avoid. [Severe] Study

  - Antiarrhythmics (propafenone) are predicted to increase the exposure to timolol and timolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). [Severe] Anecdotal

  - Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. [Moderate] Anecdotal > Also see TABLE 6 p. 875

  - Antiarrhythmics (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). [Severe] Anecdotal

  - Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovasular side-effects when given with beta blockers, non-selective (labetalol, levo-bunolol, nadolol, pindolol, sotalol). Use with caution or avoid. [Severe] Study

- Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Moderate] Anecdotal > Also see TABLE 6 p. 875

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to propranolol. [Moderate] Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nadolol. [Moderate] Study

- Antimalarias (mefloquine) are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Severe] Theoretical
Beta blockers, selective (continued)

- **Antiarrhythmics** *(propranolol)* are predicted to increase the exposure to metoprolol. **(Moderate Study)**
- **Antiarrhythmics** *(propranolol)* are predicted to increase the exposure to nebivolol and nebivolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics *(propranolol).* **Avoid. (Severe) Theoretical**
- **Antiarrhythmics** *(propranolol)* are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective *(acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol).* Use with caution or avoid. **(Severe) Study**
- **Anticholinesterases, centrally acting** *(duloxetine)* are predicted to increase the risk of hypotension when given with beta blockers, selective. **(Severe) Study**
- **Calcium channel blockers** *(diltiazem)* are predicted to increase the risk of cardiodepression when given with beta blockers, selective. **(Severe) Study**
- **Bisoprolol, metoprolol, nebivolol)* reduce the exposure to cisapride when given with beta blockers, selective. **(Severe) Study**
- **Cisapride** is predicted to decrease the exposure to metoprolol. **(Severe) Study**
- **Cimetidine** is predicted to increase the exposure to metoprolol, nebivolol. **(Severe) Study**
- **Cimetidine** is predicted to increase the exposure to metoprolol, nebivolol. **(Severe) Study**
- **Duloxetine** is predicted to increase the exposure to metoprolol. **(Moderate Study)**
- **Eliglustat** is predicted to increase the exposure to metoprolol. **(Moderate Study)**
- **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. **(Severe) Study**
- **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. **(Severe) Study**
- **Grapefruit juice** greatly decreases the exposure to cefipime. **(Severe) Study**
- **HIV-1 protease inhibitors** *(ritonavir)* are predicted to increase the exposure to metoprolol. **(Severe) Study**
- **Beta blockers, selective** are predicted to increase the risk of cardiodepression when given with lanreotide. **(Moderate Theoretical)**
- **Mexiletine** potentially increases the risk of cardiovascular side-effects when given with beta blockers, selective. **Avoid or monitor. (Severe) Study**
- **Mirabegron** is predicted to increase the exposure to metoprolol. **(Moderate Study)**
- **Panobinostat** is predicted to increase the exposure to metoprolol, metoprolol. Monitor and adjust dose. **(Moderate Theoretical)**
- **Panobinostat** is predicted to increase the exposure to nebivolol. Monitor and adjust dose. **(High) Theoretical**
- **Rifampicin** slightly decreases the exposure to beta blockers, selective *(bisoprolol, metoprolol).* **(High) Study**
- **Rifampicin** moderately decreases the exposure to celiprolol. **(Moderate Study)**
- **Rolapitant** is predicted to moderately increase the exposure to metoprolol. **(Severe) Study**
- **SSRI (fluoxetine, paroxetine)** are predicted to increase the exposure to beta blockers, selective *(metoprolol, nebivolol).* **(Moderate Study)**
- **Beta blockers, selective** increase the risk of hypertension and bradycardia when given with sympathomimetics, inotropic *(dobutamine).* **(Moderate Theoretical)**
- **Beta blockers, selective** are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor *(adrenaline/epinephrine, noradrenaline/norepinephrine).* **(Severe) Study**
- **Terbinafine** is predicted to increase the exposure to beta blockers, selective *(metoprolol, nebivolol).* **(Moderate Study)**
- **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with theophylline. **Avoid. (Severe) Theoretical**
- **Beta, agonists** → see **TABLE 17. p. 878** *(reduced serum potassium)*
- **Bicalutamide** is predicted to increase the exposure to salmeterol. **Avoid. (Severe) Study**
- **Aplatunderol, formoterol - indacaterol - olodaterol - salbutamol - salmeterol - terbutaline - vilanterol** are predicted to increase the exposure to salmeterol. **Avoid. (Severe) Study**
- **Antiarrhythmics, Selective** *(flupirtine, mexiletine)* are predicted to increase the risk of glaucoma when given with **(High) Theoretical**
- **Beta, agonists** are predicted to increase the risk of severe hypertension when given with beta, agonists. **Avoid. (Severe) Study**
- **Idelalisib** is predicted to increase the exposure to salmeterol. **Avoid. (Severe) Study**
- **Cobicistat** is predicted to increase the exposure to salmeterol. **Avoid. (Severe) Study**
- **HIV-1 protease inhibitors** are predicted to increase the exposure to salmeterol. **Avoid. (Severe) Study**
- **Beta, agonists** are predicted to increase the risk of severe hypertension when given with beta, agonists. **(High-dose). (Moderate) Study**
- **Beta, agonists** are predicted to increase the risk of severe hypertension when given with beta, agonists. **(Severe) Theoretical**
- **Netupitant** is predicted to increase the exposure to salmeterol. **(Moderate Study)**
- **Beta, agonists** are predicted to increase the risk of glaucoma when given with **(High) Theoretical**
- **Beta, agonists** are predicted to increase the risk of severe hypertension when given with beta, agonists. **(High) Theoretical**
- **Bicalutamide** is predicted to increase the exposure to salmeterol. **(Moderate Study)**
- **Beta, agonists** are predicted to increase the risk of severe hypertension when given with beta, agonists. **(High-dose). (Moderate) Study**
- **Beta, agonists** are predicted to increase the risk of severe hypertension when given with beta, agonists. **(Severe) Theoretical**
- **Netupitant** is predicted to increase the exposure to salmeterol. **(Moderate Study)**
- **Betalastine** are predicted to decrease the effects of betahistine. **(Moderate) Theoretical**
- **Antihistamines, non-sedating** are predicted to decrease the effects of betahistine. **(Moderate) Theoretical**
- **Antihistamines, sedating** are predicted to decrease the effects of betahistine. **(Moderate) Theoretical**
- **Betamethasone** → see corticosteroids
- **Betaxolol** → see beta blockers, selective
- **Bevacizumab** → see monoclonal antibodies
- **Bexarotene** → see retinoids
- **Bicalutamide** → see fibers
- **Bicalutamide** is predicted to increase the exposure to **lomiptamide.** Separate administration by 12 hours. **(Moderate) Theoretical**
- **Bicalutamide** is predicted to increase the exposure to **lomiptamide.** Separate administration by at least 2 hours. **(Moderate) Study**
- **Antacids** decrease the exposure to **bicalutamide.** Separate administration by at least 2 hours. **(Moderate) Study**
- **Beta blockers, selective** are predicted to increase the exposure to **bicalutamide.** Use with caution or avoid. **(Moderate) Theoretical**
- **Antiepileptics** *(carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)* are predicted to decrease the exposure to **bicalutamide.** Avoid. **(Moderate) Study**
- **Antiepileptics** *(oscarbazepine)* are predicted to decrease the exposure to **bicalutamide.** Avoid. **(Moderate) Theoretical**
- **Antifungals, azoles** *(itraconazole, ketoconazole, voriconazole)* are predicted to decrease the exposure to **bicalutamide.** Avoid. **(Moderate) Study**
• Calcium channel blockers (verapamil) are predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

• Cyclosporin is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

• Ezetimibe is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Study

• HIV-protease inhibitors (atazanavir) moderately increase the exposure to bictegravir. Avoid. (Severe) Study

• HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

• Iron (oral) decrease the exposure to bictegravir. Bictegravir should be taken 2 hours before iron (oral). (Moderate) Study

• Lapatinib is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

• Macrolides are predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

• Bictegravir slightly increases the exposure to metformin. (Moderate) Study

• Mitotane is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Study

• Bictegravir is predicted to increase the exposure to opioids (methadone). (Moderate) Theoretical

• Randazone is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

• Rifabutin slightly decreases the exposure to bictegravir. Avoid. (Moderate) Study

• Rifampicin is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Study

• St John’s Wort is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Theoretical

• Sucralfate is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Theoretical

• Venlafaxine is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

• Bilastine → see antihistamines, non-sedating

• Bisoprolol → see beta blockers, selective

• Bisphosphonates → see TABLE 2 p. 874 (nephrotoxicity)

• Aminoglycosides increase the risk of hypocalcaemia when given with bisphosphonates. (Moderate) Anecdotal → also see TABLE 2 p. 874

• Antacids decrease the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before antacids. (Moderate) Study

• Antacids are predicted to decrease the absorption of ibandronic acid. Avoid antacids for at least 4 hours before or 1 hour after ibandronic acid. (Moderate) Theoretical

• Antacids decrease the absorption of risedronate. Separate administration by at least 2 hours. (Moderate) Study

• Antacids decrease the absorption of sodium clodronate. Avoid antacids for 2 hours before or 1 hour after sodium clodronate. (Moderate) Study

• Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). (Moderate) Study

• Aspirin (high-dose) is predicted to increase the risk of renal impairment when given with sodium clodronate. (Severe) Theoretical

• Oral calcium salts decrease the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before calcium salts. (Moderate) Study

• Oral calcium salts are predicted to decrease the absorption of oral ibandronic acid. Avoid calcium salts for at least 6 hours before or 1 hour after ibandronic acid. (Moderate) Theoretical

• Oral calcium salts decrease the absorption of risedronate. Separate administration by at least 2 hours. (Moderate) Study

• Oral calcium salts decrease the absorption of sodium clodronate. Avoid calcium salts for 2 hours before or 1 hour after sodium clodronate. (Moderate) Study

• Iron (oral) is predicted to decrease the absorption of oral ibandronic acid. Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. (Moderate) Theoretical

• Iron (oral) decreases the absorption of risedronate. Separate administration by at least 2 hours. (Moderate) Study

• Iron (oral) decreases the absorption of sodium clodronate. Avoid iron (oral) for 2 hours before or 1 hour after sodium clodronate. (Moderate) Study

• Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). (Severe) Theoretical

• Oral magnesium decreases the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before magnesium. (Moderate) Study

• Oral magnesium is predicted to decrease the absorption of oral ibandronic acid. Avoid magnesium for at least 6 hours before or 1 hour after ibandronic acid. (Moderate) Theoretical

• Oral magnesium decreases the absorption of risedronate. Separate administration by at least 2 hours. (Moderate) Study

• Oral magnesium decreases the absorption of sodium clodronate. Avoid magnesium for at least 6 hours before or 1 hour after sodium clodronate. (Moderate) Study

• NSAIDs are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). (Moderate) Study

• NSAIDs are predicted to increase the risk of renal impairment when given with sodium clodronate. (Severe) Theoretical

• Bisphosphonates are predicted to decrease the effects of parathyroid hormone. Avoid. (Moderate) Study

• Oral zinc decreases the absorption of oral alendronic acid. Zinc should be taken at least 50 minutes before alendronic acid. (Moderate) Study

• Oral zinc is predicted to decrease the absorption of oral ibandronic acid. Avoid zinc for at least 6 hours before or 1 hour after ibandronic acid. (Moderate) Theoretical

• Oral zinc decreases the absorption of oral risedronate. Separate administration by at least 2 hours. (Moderate) Study

• Oral zinc decreases the absorption of oral sodium clodronate. Avoid zinc for 2 hours before or 1 hour after sodium clodronate. (Moderate) Study

• Bivalirudin → see TABLE 3 p. 874 (anticoagulant effects)

• Ranibizumab is predicted to increase the risk of bleeding events when given with bivalirudin. (Moderate) Theoretical

• Bleomycin → see TABLE 15 p. 875 (myelosuppression), TABLE 5 p. 874 (thromboembolism)

• Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with bleomycin. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

• Monoclonal antibodies (brentuximab vedotin) increase the risk of pulmonary toxicity when given with bleomycin. Avoid. (Severe) Study → also see TABLE 15 p. 877

• Platinum compounds (cisplatin) increase the risk of pulmonary toxicity when given with bleomycin. (Severe) Study → also see TABLE 15 p. 877

• Blinatumomab → see monoclonal antibodies

• Bortezomib → see TABLE 8 p. 875 (hypotension), TABLE 15 p. 877 (myelosuppression), TABLE 12 p. 877 (peripheral neuropathy)

• Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. (Severe) Study → also see TABLE 12 p. 877

• Antifungals (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to bortezomib. (Moderate) Study

• Cobicistat slightly increases the exposure to bortezomib. (Moderate) Study

• Enalapril slightly decreases the exposure to bortezomib. Avoid. (Severe) Study

• HIV-protease inhibitors slightly increase the exposure to bortezomib. (Moderate) Study

• Idelalisib slightly increases the exposure to bortezomib. (Moderate) Study → also see TABLE 15 p. 877

• Macrolides (clarithromycin) slightly increase the exposure to bortezomib. (Moderate) Study

• Mitotane slightly decreases the exposure to bortezomib. Avoid. (Severe) Study → also see TABLE 15 p. 877

• Rifampicin slightly decreases the exposure to bortezomib. Avoid. (Severe) Study
Bosentan

- **Bosentan** is predicted to decrease the exposure to antiarrhythmics (dronedarone). **(Severe) Theoretical**
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to **bosentan**. Avoid. **(Severe) Study**
- Antifungals, azoles (fluconazole) are predicted to increase the exposure to **bosentan**. Avoid. **(Severe) Study**
- Antifungals, azoles (itraconazole) are predicted to increase the exposure to **bosentan**. **(Moderate) Theoretical**
- Antifungals, azoles (ketoconazole) moderately increase the exposure to **bosentan**. **(Moderate) Study**
- Antifungals, azoles (voriconazole) are predicted to increase the exposure to **bosentan**. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to aprepitant. **(Moderate) Study**
- **Bosentan** is predicted to decrease the exposure to axitinib. Avoid. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to bedaquiline. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to bosutinib. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to cabozantinib. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine). Monitor and adjust dose. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the exposure to cariprazine. Avoid. **(Severe) Theoretical**
- **Bosentan** moderately decreases the exposure to ciclosporin and ciclosporin moderately increases the exposure to **bosentan**. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to ciclosporin. Avoid. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to cisplatin. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to cisplatin. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to desogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. **(Severe) Study**
- **Bosentan** decreases the anticoagulant effect of coumarins. **(Moderate) Study**
- **Bosentan** is predicted to decrease the exposure to crizotinib. Avoid. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to crizotinib. **(Severe) Study**
- **Bosentan** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. **(Severe) Study**
- **Bosentan** decreases the anticoagulant effect of coumarins. **(Moderate) Study**
- **Bosentan** is predicted to decrease the exposure to crizotinib. **(Severe) Theoretical**
- **Bosentan** decreases the exposure to dolutegravir. Adjust dose. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. **(Severe) Theoretical**
- **Bosentan** is predicted to moderately decrease the exposure to elbasvir. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to eliglustat. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the concentration of elvitegravir. Avoid. **(Severe) Theoretical**
- Enzalutamide affects the exposure to **bosentan**. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the effects of ergotamine. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the exposure to erlotinib. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to eritravine. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the concentration of everolimus. Avoid or adjust dose. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to fosaprepitant. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the exposure to gefitinib. Avoid. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to glecaprevir. Avoid. **(Severe) Study**
- **Bosentan** is predicted to markedly decrease the exposure to grazoprevir. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the concentration of guanfacine. Adjust dose. **(Moderate) Theoretical**
- HIV-protease inhibitors are predicted to increase the exposure to **bosentan**. **(Severe) Study**
- **Bosentan** is predicted to decrease the effects of hormone replacement therapy. **(Moderate) Anecdotial**
- **Bosentan** is predicted to decrease the exposure to idelalisib. Avoid. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the exposure to imatinib. **(Moderate) Study**
- **Bosentan** is predicted to decrease the exposure to ivacaftor. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to lapatinib. Avoid. **(Severe) Study**
- Leflunomide is predicted to increase the exposure to **bosentan**. Avoid. **(Moderate) Study**
- Letemovir is predicted to increase the concentration of bosentan. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. **(Moderate) Theoretical**
- Macrolides (clarithromycin) are predicted to increase the exposure to **bosentan**. **(Moderate) Theoretical**
- **Bosentan** is predicted to increase the exposure to maraviroc. Avoid. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the concentration of midazolam. Monitor and adjust dose. **(Moderate) Theoretical**
- Mitotane affects the exposure to **bosentan**. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to nilotinib. Avoid. **(Severe) Theoretical**
- **Bosentan** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. **(Severe) Anecdotial**
- **Bosentan** is predicted to decrease the exposure to olaparib. Avoid. **(Moderate) Theoretical**
- **Bosentan** decreases the exposure to opioids (methadone). Monitor and adjust dose. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to osimertinib. **(Moderate) Theoretical**
- **Bosentan** is predicted to decrease the exposure to ospemifene. **(Moderate) Study**
- **Bosentan** is predicted to decrease the exposure to paritaprevir (with ritonavir and ombravirus). Avoid. **(Severe) Study**
- **Bosentan** decreases the exposure to phosphodiesterase type-5 inhibitors. **(Moderate) Study**
- **Bosentan** is predicted to decrease the exposure to pibrentasvir. Avoid. **(Severe) Study**
- **Bosentan** is predicted to decrease the exposure to quetiapine. **(Moderate) Study**
- **Bosentan** is predicted to decrease the exposure to ribociclib. **(Moderate) Study**
- Rifampicin affects the exposure to **bosentan**. Avoid. **(Severe) Study**
**Bosentan** is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical

**Bosentan** is predicted to decrease the exposure to rolipitant. Avoid. (Severe) Study

**Bosentan** is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical

**Bosentan** is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. (Severe) Theoretical

**St John’s Wort** is predicted to decrease the exposure to bosentan. Avoid. (Moderate) Theoretical

**Bosentan** slightly decreases the exposure to statins (atorvastatin). (Minimal) Study

**Bosentan** moderately decreases the exposure to statins (simvastatin). (Moderate) Study

**Bosentan** increases the risk of hepatotoxicity when given with sulfonyleures (glibenclamide). Avoid. (Severe) Study

**Bosentan** is predicted to decrease the concentration of tacrolimus and tacrolimus potentially increases the concentration of bosentan. Avoid. (Severe) Theoretical

**Bosentan** is predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study

**Bosentan** is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical

**Teriflunomide** is predicted to increase the exposure to bosentan. (Moderate) Study

**Bosentan** is predicted to decrease the exposure to ticagrelor. (Moderate) Theoretical

**Bosentan** is predicted to decrease the exposure to tofacitinib. (Moderate) Study

**Bosentan** decreases the efficacy of ulipristal. For FSHR guidance, see Contraceptives, interactions p. 516. Severe Anecdotal

**Bosentan** is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study

**Venetoclax** is predicted to increase the exposure to bosentan. (Moderate) Theoretical

**Bosentan** is predicted to increase the concentration of vinblastine. Avoid. (Severe) Theoretical

**Bosutinib** → see TABLE 15 p. 877 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)

**Antacids** are predicted to decrease the absorption of bosutinib. (Moderate) Theoretical

**Bosutinib** should be taken at least 12 hours before antacids. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 876

**Antihydmics (dronedarone)** are predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 876

**Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly decrease the exposure to bosutinib. Avoid. (Severe) Study

**Antifungals, azoles (itraconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 876

**Antiepileptics (carbamazepine, febrerophenytin, phenobarbital, phentoin, primidone)** are predicted to very markedly decrease the exposure to bosutinib. Avoid. (Severe) Study

**Efavirenz** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 876

**Enzalutamide** is predicted to very markedly decrease the exposure to bosutinib. Avoid. (Severe) Study

**Etiravirine** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical

**Fosaprepitant** is predicted to increase the exposure to bosutinib. (Severe) Theoretical

**Grapefruit juice** is predicted to increase the exposure to bosutinib. Avoid. (Moderate) Theoretical

**H₂ receptor antagonists** are predicted to decrease the absorption of bosutinib. (Moderate) Theoretical

**HIV-protease inhibitors** are predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Study → Also see TABLE 9 p. 876

**Idelalisib** is predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Study → Also see TABLE 15 p. 877

**Imatinib** is predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 15 p. 877

**Macrolides (clarithromycin)** are predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 876

**Macrolides (erythromycin)** are predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical

**Modafinil** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical

**Netupitant** is predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical

**Nevirapine** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical

**Nilutamide** is predicted to increase the exposure to bosutinib. Avoid. (Severe) Theoretical

**Proton pump inhibitors** are predicted to decrease the absorption of bosutinib. (Moderate) Study

**Rilpivirine** is predicted to very markedly decrease the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 15 p. 877

**St John’s Wort** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical

**Brigatinib** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Study

**Bowel cleansing preparations**

**Separation of administration** Other oral drugs should not be taken 1 hour before, or after, administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

**Brentuximab vedotin** → see monoclonal antibodies

**Brigatinib**

**Antiepileptics (carbamazepine, fosphenytin, phenobarbital, phentoin, primidone)** are predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study

**Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to brigatinib. Adjust brigatinib dose. (Severe) Study

**Bosentan** is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study

**Cobicistat** is predicted to increase the exposure to brigatinib. Adjust brigatinib dose. (Severe) Study

**Brigatinib** decreases the exposure to combined hormonal contraceptives. Use additional contraceptive precautions. (Severe) Theoretical
Brigatinib (continued)

- Brigatinib potentially increases the concentration of dabigatran. [Moderate] Theoretical
- Brigatinib potentially increases the concentration of digoxin. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- Enalapril is predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- Ertapenem is predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the concentration of brigatinib. Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to brigatinib. Adjust brigatinib dose. [Severe] Study
- Iloperidone is predicted to increase the exposure to brigatinib. Adjust brigatinib dose. [Severe] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to brigatinib. Adjust brigatinib dose. [Severe] Study
- Mitotane is predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- Brigatinib potentially decreases the concentration of opioids (alfentanil, fentanyl). Avoid. [Moderate] Theoretical
- Rifabutin is predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- Brigatinib potentially decreases the concentration of sirolimus. Avoid. [Moderate] Theoretical
- Tigecycline is predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- Brigatinib potentially decreases the concentration of tacrolimus. Avoid. [Moderate] Theoretical

**BRIMONIDINE**

- See also TABLE 6 p. 875 (bradycardia), TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

**ROUTE-SPECIFIC INFORMATION**

- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

**BRIVARACETAM**

- See also antiepileptics

**BRODULAMAB**

- See monoclonal antibodies

**BROMFENAC**

- See NSAIDs

**BROMOCRIPTINE**

- See dopamine receptor agonists

**BUCLIZINE**

- See antihistamines, sedating

**BUDESONIDE**

- See corticosteroids

**BUMETANIDE**

- See loop diuretics

**BUPIVACAINE**

- See anaesthetics, local

**BUPRENORPHINE**

- See opioids

**BUPROPION**

- See TABLE 13 p. 877 (serotonin syndrome)

- Bupropion is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to bupropion. [Severe] Study

- Antiepileptics (valproate) increase the exposure to bupropion. [Severe] Study

- Antifungals, azoles (isavuconazole) slightly increase the exposure to bupropion. Adjust dose. [Moderate] Study

- Bupropion is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

- Bupropion is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

- Bupropion is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

- Bupropion is predicted to slightly increase the exposure to darifenacil. [HiID] Study

- Bupropion increases the risk of side-effects when given with dopamine receptor agonists (amantadine). [Moderate] Study

- Efavirenz is predicted to decrease the exposure to bupropion. [Moderate] Study

- Bupropion is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

- HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to bupropion. [Moderate] Study

- Bupropion increases the risk of side-effects when given with levodopa. [Moderate] Study

- Bupropion is predicted to increase the risk of intraoperative hypertension when given with linezolid. [Severe] Anecdotal → Also see TABLE 13 p. 877

- Methylenidium chloride is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 877

- Bupropion is predicted to increase the exposure to mexiteline. [Moderate] Study

- Moclobemide is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 877

- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of severe hypertension when given with bupropion. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 877

- Monoamine-oxidase B inhibitors are predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [Moderate] Theoretical → Also see TABLE 13 p. 877

- Bupropion is predicted to decrease the efficacy of opioids (codeine). [Moderate] Theoretical

- Bupropion is predicted to decrease the efficacy of opioids (tramadol). [Severe] Study → Also see TABLE 13 p. 877

- Bupropion is predicted to moderately increase the exposure to pilocarpine. Use with caution and adjust dose. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to bupropion. [Moderate] Study

- Bupropion is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

- Bupropion is predicted to increase the exposure to SSRIs (dapoxetine). [Moderate] Theoretical → Also see TABLE 13 p. 877

- Bupropion is predicted to decrease the efficacy of tamoxifen. Avoid. [Severe] Study

- Bupropion is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 877

- Bupropion is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 877

**BUSPIRONE**

- See TABLE 13 p. 877 (serotonin syndrome)

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to buspirone. Use with caution and adjust dose. [Severe] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study

- Antifungals, azoles (miconazole) are predicted to increase the concentration of buspirone. Use with caution and adjust dose. [Moderate] Theoretical

- Aplutamide is predicted to decrease the exposure to buspirone. Avoid or monitor. [Moderate] Study

- Aprepitant is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

- Cobimetinib is predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study

- Crizotinib is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

- Enzalutamide is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. [Severe] Study

- Grapefruit juice increases the exposure to buspirone. Avoid. [Severe] Study
> **HIV-protease inhibitors** are predicted to increase the exposure to buspirone. Adjust buspirone dose. **(Severe) Study**
> **Idelalisib** is predicted to increase the exposure to buspirone. Adjust buspirone dose. **(Severe) Study**
> **Imatinib** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**
> **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **(Severe) Theoretical → Also see TABLE 13 p. 877**
> **Macrolides (clarithromycin)** are predicted to increase the exposure to buspirone. Adjust buspirone dose. **(Severe) Study**
> **Macrolides (erythromycin)** are predicted to increase the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**
> **Mitotane** is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**
> **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **(Severe) Theoretical → Also see TABLE 13 p. 877**
> **Macrolides (clarithromycin)** are predicted to increase the exposure to buspirone. Adjust buspirone dose. **(Severe) Study**
> **Macrolides (erythromycin)** are predicted to increase the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**
> **Nilotinib** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**
> **Rifampicin** is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. **(Severe) Study**
> **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **(Severe) Theoretical → Also see TABLE 13 p. 877**
> **Macrolides (clarithromycin)** are predicted to increase the exposure to buspirone. Adjust buspirone dose. **(Severe) Study**
> **Macrolides (erythromycin)** are predicted to increase the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**
> **Mitotane** is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. **(Severe) Study**

---

**Caffeine citrate**

> **Caffeine citrate** decreases the efficacy of **antiarrhythmics** (adenosine). Separate administration by 24 hours. **(Moderate) Study**
> **Antiepileptics (fosphenytoin, phenytoin)** are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. **(Moderate) Study**
> **HIV-protease inhibitors (ritonavir)** are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. **(Moderate) Study**
> **SSRIs (flusoxamine)** markedly decrease the clearance of **caffeine citrate**. Monitor and adjust dose. **(Severe) Study**
> **Teriflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. **(Moderate) Study**
> **Buspirone** decreases the clearance of **theophylline**. **(Moderate) Study**

---

**Calcipotriol**

> **Calcipotriol** is predicted to see vitamin D substances
> **Calcitonin (salmon)** decreases the concentration of **lithium**. Monitor concentration and adjust dose. **(Moderate) Study**

---

**Calcium channel blockers**

> **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to **abemaciclib**. **(Moderate) Study**
> **Verapamil** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. **(Moderate) Study**
> **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to **aldosterone antagonists** (eplerenone). Adjust eplerenone dose. **(Severe) Study → Also see TABLE 8 p. 875**
> **Verapamil** moderately increases the exposure to **alisikiren**. **(Moderate) Study → Also see TABLE 8 p. 875**
> **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to **alpha blockers** (tamsulosin). **(Moderate) Theoretical → Also see TABLE 8 p. 875**
> **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to **alprazolam**. **(Severe) Study**
> **Verapamil** moderately increases the exposure to **anthracyclines** (doxorubicin). **(Moderate) Study**
> **Antiarrhythmics (disopyramide)** are predicted to increase the risk of cardiodepression when given with **verapamil**. **(Severe) Theoretical**
> **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil). Monitor and adjust dose. **(Moderate) Study**
> **Antiarhythmics (amiodarone)** are predicted to increase the risk of cardiodepression when given with calcium channel blockers (diltiazem, verapamil). Avoid. **(Severe) Theoretical → Also see TABLE 6 p. 875**
> **Calcium channel blockers** (diltiazem, verapamil) increase the exposure to antiarrhythmics (dronedarone) and antiarrhythmics (amiodarone) increases the exposure to calcium channel blockers (diltiazem, verapamil). **(Moderate) Study**

---

**Antiepileptics**

> **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to cabozantinib. **(Moderate) Study → Also see TABLE 9 p. 876**
> **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical → Also see TABLE 9 p. 876**
> **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** moderately decrease the exposure to cabozantinib. **(Moderate) Study**
> **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to cabozantinib. **(Moderate) Study → Also see TABLE 9 p. 876**
> **Aprepitant** is predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical**
> **Bosentan** is predicted to decrease the exposure to cabozantinib. **(Moderate) Theoretical**
> **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical**
> **Cobicistat** is predicted to slightly increase the exposure to cabozantinib. **(Moderate) Study**
> **Cabozantinib** is predicted to increase the risk of bleeding events when given with **coumarins**. **(Severe) Theoretical**
> **Crizotinib** is predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876**
> **Efavirenz** is predicted to decrease the exposure to cabozantinib. **(Moderate) Theoretical → Also see TABLE 9 p. 876**
> **Enzalutamide** moderately decreases the exposure to cabozantinib. **Avoid. (Moderate) Study**
> **Grapefruit juice** is predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical**
> **HIV-protease inhibitors** slightly increase the exposure to cabozantinib. **(Moderate) Study → Also see TABLE 9 p. 876**
> **Idelalisib** slightly increases the exposure to cabozantinib. **(Moderate) Study → Also see TABLE 15 p. 877**
> **Imatinib** is predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical → Also see TABLE 15 p. 877**
> **Macrolides (clarithromycin)** slightly increase the exposure to cabozantinib. **(Moderate) Study → Also see TABLE 9 p. 876**
> **Macrolides (erythromycin)** are predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical → Also see TABLE 9 p. 876**
> **Mitotane** moderately decreases the exposure to cabozantinib. **Avoid. (Moderate) Study → Also see TABLE 15 p. 877**
Calcium channel blockers (continued)

- **Verapamil** increases the risk of cardiodepression when given with antiarrhythmics (flecainide). **Moderate** Anecdotal → Also see TABLE 6 p. 875
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. **Moderate** Study
- **Calcium channel blockers** (diltiazem, verapamil) increase the risk of bradycardia when given with anticholinesterases, centrally acting (such as donepezil). **Anecdotal** → Also see TABLE 6 p. 875
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study
- **Diltiazem** increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to diltiazem. **Severe** Anecdotal
- **Verapamil** increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to verapamil. **Severe** Anecdotal
- **Antiepileptics** (phenobarbital, primidone) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil, verapamil). **Severe** Study
- **Calcium channel blockers** (diltiazem, verapamil) potentially increase the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). **Severe** Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lercanidipine. Avoid. **Severe** Study
- **Antifungals, azoles** (miconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, clevidipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil). Use with caution and adjust dose. **Moderate** Theoretical
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil). Monitor and adjust dose. **Moderate** Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). **Moderate** Theoretical
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Severe** Study
- **Antifungals, azoles** (posaconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Moderate** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). **Severe** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to antihistamines, non-sedating (rapatadine). Avoid. **Moderate** Study
- **Antimalarials** (mefloquine) are predicted to increase the risk of bradycardia when given with calcium channel blockers. **Severe** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the concentration of antimalarials (piperazine). **Severe** Theoretical
- **Apalutamide** is predicted to decrease the exposure to calcium channel blockers (felodipine, lercanidipine). Avoid or monitor. **Moderate** Study
- **Verapamil** is predicted to increase the exposure to apixaban. **Moderate** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to aprepitant and aprepitant is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Moderate** Study
- **Aprepitant** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to axitinib. **Moderate** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. **Pregnancy** Theoretical
- **Diltiazem** is predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. **Severe** Study → Also see TABLE 6 p. 875 → Also see TABLE 8 p. 875
- **Intravenous verapamil** increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. **Severe** Study → Also see TABLE 6 p. 875 → Also see TABLE 8 p. 875
- **Diltiazem** is predicted to increase the risk of cardiodepression when given with beta blockers, selective. **Severe** Study → Also see TABLE 6 p. 875 → Also see TABLE 8 p. 875
- **Intravenous verapamil** increases the risk of cardiovascular side-effects when given with beta blockers, selective. Avoid. **Severe** Study → Also see TABLE 6 p. 875 → Also see TABLE 8 p. 875
- **Oral verapamil** increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. **Severe** Study → Also see TABLE 6 p. 875 → Also see TABLE 8 p. 875
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the risk of cardiodepression when given with beta blockers, selective. **Severe** Study → Also see TABLE 6 p. 875 → Also see TABLE 8 p. 875
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective. **Severe** Study → Also see TABLE 6 p. 875 → Also see TABLE 8 p. 875
- **Verapamil** is predicted to increase the exposure to bictegravir. Use with caution or avoid. **Moderate** Theoretical
- **Boventan** is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. **Moderate** Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to cannabis. **Moderate** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust dose. **Moderate** Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to buspirone. **Moderate** Study → Also see TABLE 8 p. 875
- **Calcium channel blockers** (verapamil) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study → Also see TABLE 8 p. 875
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to apixaban. **Moderate** Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the concentration of ciclosporin. **Severe** Study
- **Ciclosporin** moderately increases the exposure to lercanidipine. Use with caution or avoid. **Severe** Study
- **Nicardipine** increases the concentration of ciclosporin. **Severe** Study
- **Cobicistat** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine), **Moderate** Study
Calcium channel blockers

- **Enzalutamide** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate Study]
- **Cobicistat** is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe Study]
- **Cobicistat** is predicted to markedly increase the exposure to lercanidipine. Avoid. [Severely]
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
- **Crixivane** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- **Verapamil** increases the exposure to dabigatran. Adjust dabigatran dose. [Severe Study]
- Intravenous dantrolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe] Anecdotal
- Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine). [Severe] Theoretical → Also see Table 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- **Verapamil** is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine) with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- **Verapamil** is predicted to increase the exposure to fexofenadine. Avoid. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fingolimod. Avoid. [Moderate] Theoretical → Also see Table 6 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- Grapefruit juice very slightly increases the exposure to amiodipine. Avoid. [Mild] Study
- **Grapefruit juice** increases the exposure to calcium channel blockers (nifedipine, verapamil). Avoid. [Mild] Study
- **Grapefruit juice** increases the exposure to felodipine. Avoid. [Mild] Study
- **Grapefruit juice** is predicted to increase the exposure to lercanidipine. Avoid. [Moderate] Theoretical
- **Grapefruit juice** increases the exposure to nicardipine. [Mild] Study
- **Grazoprevir** is predicted to increase the concentration of calcium channel blockers. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose. p. 237 [Moderate] Theoretical → Also see Table 8 p. 875
- **H₂ receptor antagonists (cimetidine)** (high-dose) are predicted to increase the exposure to lercanidipine. [Moderate] Theoretical
- **H₂ receptor antagonists (cimetidine)** moderately increase the exposure to nifedipine. Monitor and adjust dose. [Severe] Study
- **H₂ receptor antagonists (cimetidine)** increase the exposure to verapamil. [Moderate] Study
- **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to calcium channel blockers (diltiazem, nimodipine). Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Severe] Study
- **Ibrutinib** is predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- **Ibrutinib** is predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- **Ibrutinib** is predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- **Ibrutinib** is predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- **Ibrutinib** is predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lercanidipine. Avoid. [Severe] Study
Calcium channel blockers (continued)

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose. [Moderate] Study → Also see TABLE 8 p. 875
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to diltiazem. [Severe] Theoretical
- Macrolides (erythromycin) are predicted to increase the exposure to verapamil. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Intravenous magnesium potentially increases the risk of hypotension when given with calcium channel blockers (amlodipine, clevidipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil) (in pregnant woman). [Severe] Anecdotal
- Mexiletine increases the risk of cardiovascular side-effects when given with diltiazem. Avoid or monitor. [Severe] Theoretical
- Mexiletine potentially increases the risk of cardiovascular side-effects when given with verapamil. Avoid or monitor. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine). Monitor and adjust dose. [Moderate] Study
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to calcium channel blockers. Monitor and adjust dose. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to nilotinib. Adjust naxoselogol dose and monitor side effects. [Moderate] Study
- Nevirapine is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Verapamil is predicted to increase the exposure to nitrendipin. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate]
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 6 p. 875

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxybutynin. [Moderate] Theoretical
- Verapamil is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. [Moderate] Theoretical → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4. [Moderate] Study → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pimecrolimus. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pimecrolimus. [Moderate] Study → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ranolazine. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ribociclib. [Moderate] Study
- Rivampicin is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine). Monitor and adjust dose. [Moderate] Study
- Rivampicin greatly decreases the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Rivampicin moderately decreases the exposure to nifedipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to saxagliptin. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Amlodipine slightly increases the exposure to statins (simvastatin). Adjust simvastatin dose, p. 136. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose. p. 136. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Niacardipine potentially increases the concentration of tacrolimus. Monitor concentration and adjust dose. [Severe]
- Amlodipine slightly increases the exposure to statins (simvastatin). Adjust simvastatin dose, p. 136. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose. p. 136. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Niacardipine potentially increases the concentration of tacrolimus. Monitor concentration and adjust dose. [Severe]
Calcium channel blockers — Capecitabine 923

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of temsiroliimus. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacafor. p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) given with a potent CYP3A4/5 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolterodine. [High] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. [Moderate] Study
- Verapamil is predicted to increase the exposure to topotecan. [Severe] Study
- Verapamil is predicted to increase the concentration of trametinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to trazodone. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to venetoclax. Avoid or adjust dose consult product literature. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

Calcium chloride → see calcium salts
Calcium gluconate → see calcium salts
Calcium lactate → see calcium salts
Calcium phosphate → see calcium salts

Calcium salts

Calcium acetate - calcium carbonate - calcium chloride - calcium gluconate - calcium lactate - calcium phosphate

**SEPARATION OF ADMINISTRATION**

Calcium carbonate-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- Oral calcium salts decrease the absorption of alkylating agents (estramustine). [Severe] Study
- Calcium carbonate decreases the absorption of antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Study
- Calcium carbonate is predicted to decrease the absorption of antimalarials (propaunil). Separate administration by at least 2 hours. [Moderate] Study
- Oral calcium salts are predicted to decrease the absorption of antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Study
- Oral calcium salts are predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid calcium salts for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral calcium salts are predicted to decrease the absorption of bisphosphonates (ralendronate). Separate administration by at least 2 hours. [Moderate] Study
- Oral calcium salts are predicted to decrease the absorption of bisphosphonates (sodium clodronate). Avoid calcium salts for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- Cefephalosporins (ceftriaxone) increase the risk of cardio-respiratory arrest when given with calcium chloride. Avoid. [Severe] Anecdotal
- Cefephalosporins (ceftriaxone) increase the risk of cardio-respiratory arrest when given with intravenous calcium gluconate. Avoid. [Severe] Anecdotal
- Intravenous calcium salts increase the concentration of digoxin. Avoid. [Moderate] Anecdotal
- Oral calcium salts decrease the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study
- Oral calcium salts decrease the absorption of etrombopag. Etrombopag should be taken 2 hours before or 4 hours after calcium salts. [Severe] Study
- Calcium carbonate decreases the absorption of hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Study
- Calcium carbonate decreases the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). [Moderate] Study
- Calcium carbonate is predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. [Moderate] Theoretical
- Calcium carbonate decreases the absorption of quinolones (ciprofloxacin). Separate administration by 2 hours. [Moderate] Study
- Calcium carbonate greatly decreases the exposure to raltegravir (high-dose). Avoid. [Severe] Study
- Calcium carbonate is predicted to slightly decrease the exposure to rifapirvine. Calcium carbonate should be taken 2 hours before or 4 hours after rifapirvine. [Severe] Theoretical
- Calcium carbonate is predicted to decrease the absorption of tetracyclines. Separate administration by at least 2 to 3 hours. [Moderate] Theoretical
- Thiazide diuretics increase the risk of hypercalcaemia when given with calcium salts. (Severe) Anecdotal
- Oral calcium salts are predicted to decrease the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours. [Moderate] Anecdotal
- Calcium carbonate is predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Anecdotal
- Oral calcium salts decrease the absorption of zinc. [Moderate] Study

Canagliflozin → see TABLE 14 p. 877 (antidiabetic drugs), TABLE 8 p. 875 (Hypertension)

Rifampicin moderately decreases the exposure to canagliflozin. Adjust canagliflozin dose. [Moderate] Study

Canakinumab → see monoclonal antibodies
Canedesartan → see angiotensin-II receptor antagonists
Cangrelor → see TABLE 4 p. 874 (antiplatelet effects)
Cannabis extract → see TABLE 11 p. 876 (NS depressant effects)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Enalaprilamid is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical
- HIV- protease inhibitors are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Idealalisib is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical
- Capecitabine → see TABLE 15 p. 877 (myelosuppression)
- Allopurinol is predicted to decrease the effects of Capecitabine. Avoid. [Severe] Study
- Capecitabine increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
Capcetabine

- **Capcetabine** increases the effects of **coumarins**, Monitor INR and adjust dose. **(Moderate) Anecdotal**

- **Folates** are predicted to increase the risk of toxicity when given with **capcetabine**. **(Severe) Anecdotal**

- H₂-receptor antagonists (cimetidine) are predicted to slightly increase the exposure to **capcetabine**. **(Severe) Theoretical**

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **capcetabine**. Public Health England advises avoid (refer to Green Book). **(Severe) Theoretical**

- **Metronidazole** is predicted to increase the risk of capcetabine toxicity when given with **capcetabine**. **(Severe) Theoretical**

- **Capreomycin** → **Table 2 p. 874** (nephrotoxicity), **Table 19 p. 878** (ototoxicity)

Captorpli → see ACE inhibitors

Carbamazepine → see antiepileptics

**Carbapenems**

- *ertapenem,* *imipenem,* *meropenem*

- **Carbenems** decrease the concentration of antiepileptics (valproate). **(Severe) Anecdotal**

- **Ganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. **(Severe) Anecdotal**

- **Valganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. **(Severe) Anecdotal**

Carbidoa

- **Iron (oral)** is predicted to decrease the exposure to **carbidoa**. **(Moderate) Theoretical**

Carbimazole → see **Table 15 p. 877** (myelosuppression)

- **Carbamazepine** affects the concentration of **digoxin**. Monitor and adjust dose. **(Moderate) Theoretical**

- **Carbamazepine** decreases the effect of **metyrapone**. Avoid. **(Moderate) Theoretical**

- **Carboplatin** → see platinum compounds

Carfilzomib → see **Table 15 p. 877** (myelosuppression)

Cariprazine → see **Table 8 p. 875** (hypotension), **Table 11 p. 876** (CNS depressant effects)

- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical** → Also see **Table 11 p. 876**

- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Aprepitant** is predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Boseant** is predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical**

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study** → Also see **Table 8 p. 875**

- **Cobicistat** is predicted to moderately increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Crizotinib** is predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Efavirenz** is predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical**

- **Enalaprilat** is predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical**

- **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Iralisib** is predicted to moderately increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Imatinib** is predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Macrolides (erythromycin)** are predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Mitotane** is predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical**

- **Netupitant** is predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Nevirapine** is predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical**

- **Nilotinib** is predicted to increase the exposure to **cariprazine**. Avoid. **(Severe) Study**

- **Rifampicin** is predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical**

- **St John’s Wort** is predicted to decrease the exposure to **cariprazine**. Avoid. **(Severe) Theoretical**

Carmustine → see alkylating agents

Carvedilol → see beta blockers, non-selective

- **Caspofungin** is predicted to decrease the concentration of **caspofungin**. Adjust caspofungin dose, p. 386. **(Moderate) Theoretical**

- **Ciclosporin** slightly increases the exposure to **caspofungin**. **(Severe) Study**

- **Corticosteroids (dexamethasone)** are predicted to decrease the concentration of **caspofungin**. Adjust caspofungin dose, p. 386. **(Moderate) Theoretical**

- **Efavirenz** is predicted to decrease the concentration of **caspofungin**. Adjust dose. **(Moderate) Study**

- **Nevirapine** is predicted to decrease the concentration of **caspofungin**. Adjust dose. **(Moderate) Theoretical**

- **Rifampicin** decreases the concentration of **caspofungin**. Adjust caspofungin dose, p. 386. **(Moderate) Study**

Cefadroxil → see cephalosporins

Cefalexin → see cephalosporins

Cefazolin → see cephalosporins

Cefazidime → see cephalosporins

Ceftabiprole → see cephalosporins

Cefotaxime → see cephalosporins

Ceftriaxone → see cephalosporins

Ceftaroline → see cephalosporins

Ceftazidime → see cephalosporins

- **Ceftobiprole** → see cephalosporins

Ceftriaxone → see cephalosporins

Ceftobiprole → see cephalosporins

Cefuroxime → see cephalosporins

Celecoxib → see NSAIDS

Celirol → see beta blockers, selective

Cephalosporins → see **Table 2 p. 874** (nephrotoxicity)

- **Ceftobiprole** is predicted to increase the exposure to **bosentan**. **(Moderate) Theoretical**

- **Ceftriaxone** increases the risk of cardio-respiratory arrest when given with **calcium salts (calcium chloride)**. Avoid. **(Severe) Anecdotal**

- **Ceftriaxone** increases the risk of cardio-respiratory arrest when given with intravenous **calcium salts (calcium gluconate)**. Avoid. **(Severe) Anecdotal**

- **Ceftriaxone** potentially increases the risk of bleeding events when given with **counmarins**. **(Severe) Anecdotal**

- **Leflunomide** is predicted to increase the exposure to **cefaclor**. **(Moderate) Theoretical**

- **Ceftriaxone** potentially increases the risk of bleeding events when given with **phenindione**. **(Severe) Anecdotal**

- **Ceftobiprole** is predicted to increase the concentration of **statins**. **(Moderate) Theoretical**

- **Ceftobiprole** is predicted to increase the concentration of **sulfonilureas (glibenclamide)**. **(Moderate) Theoretical**

- **Teriflunomide** is predicted to increase the exposure to **cefaclor**. **(Moderate) Study**

Ceritinib → see **Table 15 p. 877** (myelosuppression), **Table 9 p. 876** (QT-interval prolongation)

- **Ceritinib** is predicted to increase the exposure to **aliskiren**. **(Moderate) Theoretical**
Ceritinib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Avoid. [Severe] Theoretical

Ceritinib is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical

Proton pump inhibitors are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

Ranolazine is predicted to increase the exposure to ceritinib. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to ceritinib. [Severe] Study

Ceritinib is predicted to increase the exposure to sirolimus. Avoid. [Severe] Theoretical

St John's Wort is predicted to decrease the exposure to ceritinib. Avoid. [Severe] Theoretical

Ceritinib is predicted to increase the exposure to sulfonyleurals (glibipide). Adjust dose. [Moderate] Theoretical

Ceritinib is predicted to increase the exposure to tacrolimus. Avoid. [Severe] Theoretical

Ceritinib is predicted to increase the exposure to taxanes (paclitaxel). [Moderate] Theoretical

Ceritinib is predicted to increase the exposure to topotecan. [Moderate] Theoretical

CertoZumab pegol → see monoclonal antibodies

Cetirizine → see antihistamines, non-sedating

Cetuximab → see monoclonal antibodies

Chenodeoxycholic acid

Oral antacids (aluminium hydroxide) decrease the absorption of chenodeoxycholic acid. [Moderate] Study

Antiepileptics (phenobarbital, primidone) are predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. [Moderate] Theoretical

Ciclosporin is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. [Moderate] Theoretical

Oral combined hormonal contraceptives potentially decrease the efficacy of chenodeoxycholic acid. Avoid. [Moderate] Theoretical

Sirolimus is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. [Moderate] Theoretical

Chloral hydrate → see TABLE 11 p. 876 (CNS depressant effects)

Intravenous loop diuretics (furosemide) potentially increase the risk of sweating, variable blood pressure, and tachycardia when given after chloral hydrate. [Moderate] Aneecdotal

Chlorambucil → see alkylating agents

Chlorpromazine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Antiepileptics (phenobarbital, primidone) decrease the concentration of chlorpromazine. [Moderate] Study

Intravenous chlorpromazine increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous chlorpromazine. Monitor concentration and adjust dose. [Severe] Study

Chlorpromazine potentially increases the anticoagulant effect of coumarins. [Moderate] Aneecdotal

Chlorpromazine is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 227. [Moderate] Theoretical

Chlorpromazine decreases the efficacy of intravenous iron (injectable). [Moderate] Aneecdotal

Chlorpromazine decreases the efficacy of oral iron (oral). [Moderate] Theoretical

Chlorpromazine increases the concentration of chloramphenicol. [Moderate] Study

Chlorpromazine is predicted to increase the exposure to sirolimus. [Moderate] Study

Chlorpromazine increases the concentration of tacrolimus. [Severe] Study

Chloral hydrate 

Chlorpromazine is predicted to increase the exposure to sulfonyleurals. [Severe] Study

Chlorpromazine increases the concentration of tacrolimus. [Severe] Study

Chlorpromazine 

Chloral hydrate → see TABLE 11 p. 876 (CNS depressant effects)

Chloral hydrate affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Study

Rifampicin is predicted to decrease the exposure to chloralhydrate. [Moderate] Theoretical

Chloroquine → see antimalarials
Ciclosporin is predicted to affect the efficacy of <em>chendoxycholic acid</em>. Monitor and adjust dose. [Moderate] Theoretical

Ciclosporin affects the concentration of <em>cholic acid</em>. Avoid. [Moderate] Study

Ciclosporin increases the exposure to <em>colchicine</em>. Avoid or adjust <em>colchicine</em> dose. [Severe] Study

Ciclosporin is predicted to increase the concentration of <em>ciclesonide</em>. Avoid. [Severe] Study

Ciclosporin increases the concentration of <em>ciclesonide</em>. Avoid. [Severe] Study

Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with <em>daptomycin</em>. [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>darifenacine</em>. Monitor and adjust dose. [Severe] Theoretical

Ciclosporin increases the concentration of <em>digoxin</em>. Monitor and adjust dose. [Severe] Study

Ciclosporin slightly increases the exposure to <em>edoxaban</em>. Adjust edoxaban dose. [Severe] Study

Efavirenz decreases the concentration of ciclosporin. Monitor concentration and adjust dose. [Moderate] Study

Ciclosporin decreases the exposure to <em>elotrombopag</em>. Monitor and adjust dose. [Moderate] Study

Enalapril decreases the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to <em>erlotinib</em>. [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>etoposide</em>. Monitor and adjust dose. [Severe] Theoretical

Ciclosporin moderately increases the exposure to <em>everolimus</em>. Avoid or adjust dose. [Severe] Study

Ciclosporin moderately increases the exposure to <em>ezetimibe</em> and <em>ezetimibe</em> slightly increases the exposure to ciclosporin. [Moderate] Study

Fibrates (bezafibrate) are predicted to increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Theoretical

Fibrates (fenofibrate) increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to <em>fidaxomicin</em>. Monitor and adjust dose. [Moderate] Study

Ciclosporin is predicted to increase the exposure to <em>glecaprevir</em>. Avoid or monitor. [Severe] Study

Grapefruit juice increases the concentration of ciclosporin. Avoid. [Severe] Study

Ciclosporin greatly increases the exposure to <em>grazoprevir</em>. Avoid. [Severe] Study

<em>H</em>2 receptor antagonists (cimetidine) increase the concentration of ciclosporin. [Mild] Study

HIV-protease inhibitors increase the concentration of ciclosporin. [Severe] Study

Idelalisib increases the concentration of ciclosporin. [Severe] Study

Imatinib is predicted to increase the concentration of ciclosporin. [Severe] Study

Lanreotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. [Severe] Theoretical

Letermovir increases the exposure to ciclosporin and ciclosporin increases the exposure to <em>letemovir</em>. Monitor and adjust <em>letemovir</em> dose. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with ciclosporin. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>lomitapide</em>. Separate administration by 12 hours. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to ciclosporin. Avoid. [Severe] Theoretical

Macrolides (clarithromycin) increase the concentration of ciclosporin. [Severe] Study

Macrolides (erythromycin) are predicted to increase the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to affect the efficacy of <em>chendoxycholic acid</em>. Monitor and adjust dose. [Moderate] Theoretical

Ciclosporin affects the concentration of <em>cholic acid</em>. Avoid. [Moderate] Study

Colchicstat increases the concentration of ciclosporin. Avoid. [Moderate] Study

Ciclosporin is predicted to increase the exposure to dabigatran. Avoid. [Severe] Theoretical

Danazol increases the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with <em>daptomycin</em>. [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>darifenacine</em>. Avoid. [Moderate] Theoretical

Ciclosporin increases the concentration of <em>digoxin</em>. Monitor and adjust dose. [Severe] Theoretical

Ciclosporin increases the concentration of <em>edoxaban</em>. Adjust edoxaban dose. [Severe] Study

Efavirenz decreases the concentration of ciclosporin. Monitor concentration and adjust dose. [Moderate] Study

Ciclosporin decreases the exposure to <em>elotrombopag</em>. Monitor and adjust dose. [Moderate] Study

Enalapril decreases the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to <em>erlotinib</em>. [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>etoposide</em>. Monitor and adjust dose. [Severe] Theoretical

Ciclosporin moderately increases the exposure to <em>everolimus</em>. Avoid or adjust dose. [Severe] Study

Ciclosporin moderately increases the exposure to <em>ezetimibe</em> and <em>ezetimibe</em> slightly increases the exposure to ciclosporin. [Moderate] Study

Fibrates (bezafibrate) are predicted to increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Theoretical

Fibrates (fenofibrate) increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to <em>fidaxomicin</em>. Avoid or adjust dose. [Moderate] Study

Ciclosporin is predicted to increase the exposure to <em>glecaprevir</em>. Avoid or monitor. [Severe] Study

Grapefruit juice increases the concentration of ciclosporin. Avoid. [Severe] Study

Ciclosporin greatly increases the exposure to <em>grazoprevir</em>. Avoid. [Severe] Study

<em>H</em>2 receptor antagonists (cimetidine) increase the concentration of ciclosporin. [Mild] Study

HIV-protease inhibitors increase the concentration of ciclosporin. [Severe] Study

Idelalisib increases the concentration of ciclosporin. [Severe] Study

Imatinib is predicted to increase the concentration of ciclosporin. [Severe] Study

Lanreotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. [Severe] Theoretical

Letermovir increases the exposure to ciclosporin and ciclosporin increases the exposure to <em>letemovir</em>. Monitor and adjust <em>letemovir</em> dose. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with ciclosporin. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>lomitapide</em>. Separate administration by 12 hours. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to ciclosporin. Avoid. [Severe] Theoretical

Macrolides (clarithromycin) increase the concentration of ciclosporin. [Severe] Study

Macrolides (erythromycin) are predicted to increase the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to affect the efficacy of <em>chendoxycholic acid</em>. Monitor and adjust dose. [Moderate] Theoretical

Ciclosporin affects the concentration of <em>cholic acid</em>. Avoid. [Moderate] Study

Colchicstat increases the concentration of ciclosporin. Avoid. [Moderate] Study

Ciclosporin is predicted to increase the exposure to dabigatran. Avoid. [Severe] Theoretical

Danazol increases the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with <em>daptomycin</em>. [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>darifenacine</em>. Avoid. [Moderate] Theoretical

Ciclosporin increases the concentration of <em>digoxin</em>. Monitor and adjust dose. [Severe] Theoretical

Ciclosporin slightly increases the exposure to <em>edoxaban</em>. Adjust edoxaban dose. [Severe] Study

Efavirenz decreases the concentration of ciclosporin. Monitor concentration and adjust dose. [Moderate] Study

Ciclosporin decreases the exposure to <em>elotrombopag</em>. Monitor and adjust dose. [Moderate] Study

Enalapril decreases the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to <em>erlotinib</em>. [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to <em>etoposide</em>. Monitor and adjust dose. [Severe] Theoretical

Ciclosporin increases the concentration of <em>edoxaban</em>. Adjust edoxaban dose. [Severe] Study

Efavirenz decreases the concentration of ciclosporin. Monitor concentration and adjust dose. [Moderate] Study
Ciclosporin is predicted to decrease the efficacy of mifepristone. Avoid. (Severe) Theoretical

Mitotane decreases the concentration of ciclosporin. (Severe) Study

Monoclonal antibodies (binatumomab) are predicted to transiently increase the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Theoretical

Monoclonal antibodies (sarilumab) potentially affect the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Theoretical

Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Theoretical

Netupitant is predicted to increase the concentration of ciclosporin. (Severe) Study

Nevirapine is predicted to decrease the concentration of ciclosporin. (Moderate) Study

Nilotinib is predicted to increase the concentration of ciclosporin. (Severe) Study

Ciclosporin is predicted to increase the exposure to nintedanib. (Moderate) Study

Ciclosporin increases the concentration of NSAIDs (diclofenac). See also TABLE 2 p. 874 Also see TABLE 16 p. 878

Octreotide decreases the absorption of oral ciclosporin. Adjust ciclosporin dose, p. 537. (Severe) Anecdotal

Palbociclib is predicted to increase the exposure to ciclosporin. Adjust dose. (Severe) Theoretical

Pitolisant is predicted to decrease the exposure to ciclosporin. Avoid. (Severe) Theoretical

Ciclosporin is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the exposure to ciclosporin. (Moderate) Theoretical

Ciclosporin moderates the increase in the exposure to repaglinide. (Moderate) Study

Ribociclib is predicted to increase the exposure to ciclosporin. Use with caution and adjust dose. (Moderate) Theoretical

Rifampicin decreases the concentration of ciclosporin. (Severe) Study

Ciclosporin very markedly increases the exposure to rifaximin. (Severe) Study

Ciclosporin is predicted to increase the exposure to riociguat. (Moderate) Theoretical

Rucaparib is predicted to increase the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Study

Ciclosporin moderately increases the exposure to sirolimus. Separate administration by 6 hours. (Severe) Study

St John’s Wort decreases the concentration of ciclosporin. Avoid. (Moderate) Study

Ciclosporin very markedly increases the exposure to statins (atorvastatin). Avoid or adjust atorvastatin dose, p. 134. (Severe) Study

Ciclosporin moderately increases the exposure to statins (fluvastatin). Avoid or adjust fluvastatin dose, p. 134. (Severe) Study

Ciclosporin markedly increases the exposure to statins (pravastatin). Adjust dose. (Severe) Study

Ciclosporin markedly increases the exposure to statins (rosuvastatin, simvastatin). Avoid. (Severe) study

Ciclosporin increases the concentration of tacrolimus. Avoid. (Severe) Study Also see TABLE 2 p. 874 Also see TABLE 16 p. 878

Ciclosporin is predicted to increase the exposure to tenofovir alafenamide. (Moderate) Theoretical

Ciclosporin is predicted to increase the exposure to tenofovir disoproxil. (Moderate) Theoretical Also see TABLE 2 p. 874

Ciclosporin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. (Severe) Study

Ciclosporin increases the exposure to tofacitinib. Avoid. (Severe) Study

Ciclosporin is predicted to increase the exposure to toptotecan. (Severe) Study

Ciclosporin is predicted to increase the concentration of trametinib. (Moderate) Theoretical

Ursodeoxycholic acid affects the concentration of ciclosporin. Use with caution and adjust dose. (Severe) Anecdotal

Ciclosporin is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical

Vitamin E substances affect the exposure to ciclosporin. (Moderate) Study

Ciclosporin increases the concentration of voxpilapriv. Avoid. (Severe) Study

Cidofovir → see TABLE 2 p. 874 (nephrotoxicity)

Cilostazol → see TABLE 4 p. 874 (antiplatelet effects)

GENERAL INFORMATION

Concurrent use with 2 or more antiplatelets or anticoagulants is contra-indicated.

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of cilostazol. (Moderate) Theoretical

Antifungals, azoles (fluconazole) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Antifungals, azoles (miconazole) are predicted to increase the exposure to cilostazol. Use with caution and adjust dose. (Moderate) Theoretical

Cobicistat is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Enzalutamide is predicted to alter the effects of cilostazol. (Moderate) Theoretical

HIV protease inhibitors are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Idelalisib is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Cilostazol is predicted to increase the exposure to lipitapide. Separate administration by 12 hours. (Moderate) Theoretical

Macrolides (clarithromycin) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Macrolides (erythromycin) slightly increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Mitotane is predicted to alter the effects of cilostazol. (Moderate) Theoretical

Moclobemide is predicted to increase the exposure to cilostazol. (Moderate) Theoretical

Proton pump inhibitors (omeprazole) are predicted to increase the exposure to cilostazol. (Moderate) Theoretical

Proton pump inhibitors (omeprazole) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Rifampicin is predicted to alter the effects of cilostazol. (Moderate) Theoretical

SSRIs (fluoxetine, fluvoxamine) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Theoretical Also see TABLE 4 p. 874

St John’s Wort is predicted to alter the effects of cilostazol. (Moderate) Theoretical

Cimetidine → see H2 receptor antagonists

Cinacalcet

FOOD AND LIFESTYLE: Dose adjustment might be necessary if smoking started or stopped during treatment.

Cinacalcet is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. (Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study

Cinacalcet is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. (Moderate) Study

Cinacalcet is predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study
Cinacalcet — Clonipogrel

Cinacalcet (continued)

- Clonipogrel is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Cinacalcet is predicted to slightly increase the exposure to darifenacin. (Mild) Study
- Clonipogrel is predicted to increase the exposure to eliglustrast. Avoid or adjust dose—consult product literature. (Severe) Study
- Clobazam is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. (Moderate) Study
- Clonipogrel increases the risk of hypocalcaemia when given with etelcalcetide. Avoid. (Severe) Theoretical
- HIV-protease inhibitors are predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Idealisib is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Cinacalcet is predicted to increase the exposure to mexiletine. (Moderate) Study
- Mitotane is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. (Moderate) Study
- Clonipogrel is predicted to moderately increase the exposure to opioids (tramadol). (Severe) Study
- Cinacalcet is predicted to moderately increase the exposure to piritolidine. Use with caution and adjust dose. (Moderate) Study
- Rifampcin is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. (Moderate) Study
- Clonipogrel is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- SSRIs (fluvoxamine) are predicted to increase the exposure to cinacalcet. Adjust dose. (Moderate) Theoretical
- Cinacalcet is predicted to increase the exposure to SSRIs (dapoxetine). (Moderate) Theoretical
- Cinacalcet is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study
- Clonipogrel is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study
- Cinacalcet is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. (Moderate) Study
- Cinnarizine → see antihistamines, sedating
- Ciprofloxacin → see quinolones
- Cladribacurium → see neumoscular blocking drugs, non-depolarising
- Clonipogrel increases the exposure to platinum compounds
- Citalopram → see SSRIs
- Cladribine ← see TABLE 15 p. 877 (myelosuppression)

Separation of administration

Oral cladribine might affect the absorption of concurrently administered drugs—consider separating administration by at least 3 hours.

- Antiepileptics (carbamazepine) are predicted to increase the risk of haematological toxicity when given with oral cladribine. (Moderate) Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Clarihromycin → see macrolides
- Clavulanic acid → see TABLE 1 p. 874 (hepatotoxicity)
- Clemastine → see antihistamines, sedating
- Clevipidine → see calcium channel blockers
- Clindamycin

Route-specific information

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Clindamycin increases the effects of neumoscular blocking drugs, non-depolarising. (Severe) Anecdotal
- Clindamycin increases the effects of suxamethonium. (Severe) Anecdotal
- Clindamycin → see TABLE 11 p. 876 (CNS depressant effects)
- Antiepileptics (stiripentol) increase the concentration of clobazam. (Severe) Study
- Clobazam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Anecdotal
- Antifungals, azoles (fluconazole, voriconazole) potentially increase the exposure to clobazam. Adjust dose. (Moderate) Theoretical
- Moclobemide potentially increases the exposure to clobazam. Adjust dose. (Moderate) Theoretical
- Proton pump inhibitors (esomeprazole, omeprazole) potentially increase the exposure to clobazam. Adjust dose. (Moderate) Theoretical
- SSRIs (fluoxetine, fluvoxamine) potentially increase the exposure to clobazam. Adjust dose. (Moderate) Theoretical
- Clorofarabine ← see TABLE 15 p. 877 (myelosuppression)
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with clorafabine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Clorofazime

- Clorofazime potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study
- Clofethiazole ← see TABLE 11 p. 876 (CNS depressant effects)
- Alcohol (beverage) causes serious, potentially fatal, CNS depression when given with clomethiazole. Avoid. (Severe) Study
- Clomipramine ← see tricyclic antidepressants
- Clonazepam ← see TABLE 11 p. 876 (CNS depressant effects)
- Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Anecdotal
- Clonidine ← see TABLE 6 p. 875 (bradycardia), TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)
- Tricyclic antidepressants decrease the antihypertensive effects of clonidine. Monitor and adjust dose. (Moderate) Anecdotal
- Clonipogrel ← see TABLE 8 p. 875
- Clobazam is predicted to increase the exposure to apalutamide. (Mild) Study
- Cloripogrel is predicted to increase the exposure to dabrafenib. (Moderate) Theoretical
- Cloripogrel is predicted to very markedly increase the exposure to dasabuvir. Avoid. (Severe) Study
- Cloripogrel moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose. (Severe) Study
- Grapefruit juice markedly decreases the exposure to clobazam. (Severe) Study
- Cloripogrel is predicted to moderately increase the exposure to montelukast. (Moderate) Study
- Cloripogrel increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. (Severe) Study
- Cloripogrel is predicted to moderately increase the exposure to pioglitazone. Monitor blood glucose and adjust dose. (Severe) Study
- Cloripogrel is predicted to increase the exposure to repaglinide. Avoid. (Severe) Study
- Cloripogrel is predicted to increase the exposure to retinoids (allretinoin). Adjust altretinoin dose. (Moderate) Theoretical
Clarithromycin → see antibiotics, azoles

Clomipramine see TABLE 8 p. 875 (hypotension), TABLE 15 p. 877 (myelosuppression), TABLE 11 p. 876 (CNS depressant effects), TABLE 10 p. 876 (antimuscarinics)

Dose adjustment might be necessary if smoking started or stopped during treatment.

Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

Antiepileptics (carbamazepine) are predicted to increase the risk of myelosuppression when given with clozapine. Avoid. (Severe) Anecdotal

Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to clozapine. (Moderate) Anecdotal → Also see TABLE 11 p. 876

Combined hormonal contraceptives are predicted to increase the risk of myelosuppression when given with clozapine. Monitor side effects and adjust dose. (Severe) Study

Clonazepam is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 10 p. 876

Enalapril is predicted to decrease the exposure to clozapine. (Moderate) Theoretical

HIV- protease inhibitors (ritonavir) are predicted to affect the exposure to clozapine. Avoid. (Severe) Theoretical

Iron chelators (deferasirox) are predicted to increase the exposure to clozapine. Avoid. (Moderate) Theoretical

Leflunomide is predicted to decrease the exposure to clozapine. (Moderate) Theoretical → Also see TABLE 15 p. 877

Clonazepam is predicted to decrease the effects of levodopa. (Severe) Theoretical → Also see TABLE 8 p. 875

Macrolides (erythromycin) potentially increase the risk of toxicity when given with clonazepam. (Severe) Anecdotal

Mexitelone increases the concentration of clonazepam. Monitor side effects and adjust dose. (Severe) Study

Quinolones (ciprofloxacin) increase the concentration of clonazepam. Monitor side effects and adjust dose. (Severe) Study

Rifampin decreases the exposure to clonazepam. (Severe) Anecdotal

SSRIs (fluvoxamine) increase the concentration of clonazepam. Monitor side effects and adjust dose. (Severe) Study

Teriflunomide is predicted to decrease the exposure to clonazepam. (Moderate) Theoretical

Cobicistat

Cobicistat is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. (Severe) Study

Cobicistat is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. (Severe) Study

Cobicistat increases the exposure to almogitran. (Mild) Study

Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study

Cobicistat is predicted to increase the exposure to alpha blockers (doxazosin). (Moderate) Study

Cobicistat moderately increases the exposure to alprazolam. Avoid. (Moderate) Study

Cobicistat potentially increases the concentration of antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine). (Severe) Theoretical

Cobicistat very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Severe) Study

Cobicistat is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of cobicistat. (Severe) Theoretical

Cobicistat is predicted to very slightly increase the exposure to antiepileptics (perampanel). (Mild) Study

Cobicistat is predicted to increase the exposure to antifungals, azoles (fluconazole, posaconazole). (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Avoid or monitor side effects. (Severe) Study

Cobicistat is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Adjust dose. (Moderate) Theoretical

Cobicistat is predicted to affect the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. (Moderate) Study

Cobicistat is predicted to increase the concentration of antimalarials (piperazine). (Severe) Theoretical

Cobicistat is predicted to increase the exposure to beta blockers (atenolol, metoprolol). Avoid. (Severe) Theoretical

Cobicistat slightly increases the exposure to bortezomib. (Moderate) Study

Bosentan is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Cobicistat is predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Study

Cobicistat is predicted to increase the exposure to brigatinib. Adjust brigatinib dose. (Severe) Study

Cobicistat is predicted to increase the exposure to buspirone. Adjust buspirone dose. (Severe) Study

Cobicistat slightly increases the exposure to cabozantinib. (Moderate) Study

Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Cobicistat is predicted to markedly increase the exposure to calcium channel blockers (laropiprant). Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. (Moderate) Theoretical

Cobicistat is predicted to moderately increase the exposure to cariprazine. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study

Cobicistat increases the concentration of ciclosporin. (Severe) Study

Cobicistat is predicted to increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study

Cobicistat is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study

Cobicistat is predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. (Severe) Study

</tbody>
</table>
> Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study

> Cobicistat is predicted to increase the exposure to pimozide. Avoid. [Severe] Study

> Cobicistat is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

> Cobicistat is predicted to moderately increase the exposure to praziquantel. [Mild] Study

> Cobicistat is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study

> Cobicistat is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study

> Cobicistat is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

> Cobicistat is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

> Cobicistat is predicted to increase the exposure to repaglinide. [Moderate] Study

> Cobicistat is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose. [Moderate] Theoretical

> Cobicistat is predicted to increase the exposure to riticlib. Avoid or adjust riticlib dose. [Moderate] Study

> Rifabutin decreases the concentration of cobicistat and cobicistat increases the exposure to rifabutin. Avoid or adjust dose. [Severe] Study

> Rifampicin is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

> Cobicistat is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

> Cobicistat is predicted to increase the exposure to rivaroxaban. Avoid. [Severe] Theoretical

> Cobicistat is predicted to increase the exposure to roxulitixtin. Adjust dose and monitor side effects. [Moderate] Study

> Cobicistat is predicted to increase the exposure to saxagliptin. [Moderate] Study

> Cobicistat is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

> Cobicistat is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

> Cobicistat is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study

> Sultana’s Wort is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

> Cobicistat is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

> Cobicistat is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

> Cobicistat is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study

> Cobicistat is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

> Cobicistat is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study

> Cobicistat is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study

> Cobicistat is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical

> Cobicistat is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

> Cobicistat is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor. p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study

> Cobicistat is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

> Cobicistat is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study

> Cobicistat is predicted to increase the exposure to tolterodine. Avoid. [Severe] Study

> Cobicistat is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. [Severe] Study

> Cobicistat is predicted to increase the exposure to toremifene. [Moderate] Theoretical

> Cobicistat is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

> Cobicistat is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study

> Cobicistat is predicted to slightly increase the exposure to tricyclic antidepressants. [Mild] Study

> Cobicistat is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

> Cobicistat is predicted to increase the exposure to vemurafenib. [Severe] Theoretical

> Cobicistat is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. [Severe] Study

> Cobicistat is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical

> Cobicistat is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study

> Cobicistat is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical

**Cobimetinib**

> Antiarrhythmics (dronedarone) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

> Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study

> Aripiprazole is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Bosantan is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

> Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Cobimetinib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study

> Crizotinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Efavirenz is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

> Enzalutamide is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

> Grapefruit juice is predicted to increase the exposure to cobimetinib. Avoid. [Severe] Theoretical

> HIV protease inhibitors are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study

> Idelalisib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study

> Imatinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Macrolides (clarithromycin) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study

> Mitotane is predicted to markedly increase the exposure to cobimetinib. Avoid. [Severe] Theoretical

> Netupitant is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Nevirapine is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

>Nilotinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

> Rifaximin is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

> St John’s Wort is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

**Codeine** → see opioids
Colchicine

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- Apalutamide is predicted to decrease the exposure to colchicine. [Mild] Study
- Aprepitant is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Certitinib is predicted to increase the exposure to colchicine. [Moderate] Theoretical
- Ciclosporin increases the exposure to colchicine. Avoid or adjust colchicine dose. [Severe] Study
- Ciclosporin is predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- Crizotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Eltrombopag is predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- Colchicine increases the risk of rhabdomyolysis when given with fibrates. [Severe] Aneotal
- HIV-protease inhibitors are predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- Idelalisib is predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- Imatinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Lapatinib is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. [Moderate] Theoretical
- Macrolides (azithromycin) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Mirabegron is predicted to increase the exposure to colchicine. [Mild] Theoretical
- Nitazoxanide is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- Pemetrexed (with gemcapped) is predicted to increase the exposure to colchicine. [Moderate] Study
- Prednisone is predicted to decrease the exposure to colchicine. [Mild] Theoretical
- Ranolazine is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. [Severe] Theoretical
- Rolapitant is predicted to increase the exposure to colchicine. [Moderate] Study
- Colchicine increases the risk of rhabdomyolysis when given with statins. [Severe] Aneotal
- Velpatasvir is predicted to increase the exposure to colchicine. [Severe] Theoretical
- Venlafaxine is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. [Severe] Theoretical

Colecalciferol \(\rightarrow\) see vitamin D substances

Colestyramine

- Combined hormonal contraceptives are predicted to increase the exposure to agomelatine. [Moderate] Study
- Combined hormonal contraceptives are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- Combined hormonal contraceptives alter the exposure to antiepileptics (lamotrigine). Adjust dose. [Moderate] Study
- Aprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- Bosentan is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- Brigatinib decreases the exposure to combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- Oral combined hormonal contraceptives potentially decrease the efficacy of chenodeoxycholic acid. Avoid. [Moderate] Theoretical
- Combined hormonal contraceptives increase the concentration of clozapine. Monitor side effects and adjust dose. [Severe] Study
- Macrolides (azithromycin) are predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Study
- Combined hormonal contraceptives (containing ethinylestradiol) increase the risk of increased ALT concentrations when given with dasabuvir. Avoid. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. [Moderate] Study
- Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- Encorafenib is predicted to affect the exposure to combined hormonal contraceptives. [Severe] Theoretical
- Combined hormonal contraceptives slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study
- Fosaprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with gliclazepir. Avoid. [Severe] Study
- Griseofulvin potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- HIV-protease inhibitors (atazanavir) are predicted to decrease the efficacy of combined hormonal contraceptives. Adjust dose. [Severe] Study
Combined hormonal contraceptives increase the exposure to tizanidine. Avoid. [Moderate] Study

Ulipristal is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical

Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with voxilaprevir (with sofosbuvir and velpatasvir). Avoid. [Severe] Study

Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Theoretical

Corticosteroids → see Table 17 p. 878 (reduced serum potassium)

beclometasone · betamethasone · budesonide · ciclesonide · deflazacort · dexamethasone · fluocortisone · fluticasone · hydrocortisone · methylprednisolone · mometasone · prednisolone · triamcinolone

Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified.

With intravitreal use of dexamethasone in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.

Antacids are predicted to decrease the absorption of deflazacort. Separate administration by 2 hours. [Moderate] Theoretical

Antacids decrease the absorption of dexamethasone. [Moderate] Study

Antihistamines (dronedarone) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fluticasone. [UnKnown] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose.

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

Antifungals, azoles (miconazole) are predicted to increase the concentration of methylprednisolone. Monitor and adjust dose. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study

Apalutamide is predicted to decrease the exposure to corticosteroids (budesonide, fluticasone). Avoid or monitor. [Moderate] Study

Apreamiptant is predicted to increase the exposure to oral budesonide. [Moderate] Study

Apreamiptant moderately increases the exposure to dexamethasone. Monitor and adjust dose. [Moderate] Study

Apreamiptant is predicted to increase the exposure to fluticasone. [Moderate] Study

Apreamiptant is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

Corticosteroids are predicted to decrease the concentration of aspirin (high-dose) and aspirin (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study

Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid. [Severe] Theoretical

Oral combined hormonal contraceptives slightly increase the exposure to loxapine. Avoid. [Unknown] Theoretical

Lumacaftor is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical

Combined hormonal contraceptives are predicted to increase the exposure to melatonin. [Moderate] Theoretical

Combined hormonal contraceptives decrease the effects of metyrapone. Avoid. [Moderate] Theoretical

Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Study]

Combined hormonal contraceptives slightly increase the exposure to monoamine-oxidase B inhibitors (rasagiline). [Moderate] Study

Combined hormonal contraceptives increase the exposure to monoamine-oxidase B inhibitor (selegiline). Avoid. [Severe] Study

Monoclonal antibodies (sarilumab) potentially decrease the exposure to combined hormonal contraceptives. [Severe] Theoretical

Neuvirine is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study

NSAIDs (etoricoxib) slightly increase the exposure to combined hormonal contraceptives. [Moderate] Study

Combined hormonal contraceptives potentially oppose the effects of ospemifene. Avoid. [Severe] Theoretical

Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

Combined hormonal contraceptives are predicted to increase the exposure to pirfenidone. Use with caution and adjust dose. [Moderate] Study

Pitolisant is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical

Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with pomalidomide. Avoid. [Severe] Theoretical

Combined hormonal contraceptives potentially oppose the effects of rolflumilast. Avoid. [Severe] Theoretical

St John’s Wort decreases the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Sugammadex is predicted to decrease the exposure to oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical

Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. [Severe] Study

Combined hormonal contraceptives are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical

Modafinil is predicted to decrease the exposure to tolmetin. Avoid. [Moderate] Study

Pomalidomide (with ritonavir and ombitasvir). Avoid. [Severe] Study

Sulindac is predicted to decrease the concentration of deflazacort. Avoid. [Moderate] Study

Budesonide is predicted to decrease the concentration of deflazacort. Avoid. [Moderate] Study

Combined hormonal contraceptives are predicted to increase the exposure to zopiclone. [Severe] Study

Lumiraftor is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical

Combined hormonal contraceptives increase the exposure to tizanidine. Avoid. [Moderate] Study

Ulipristal is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical

Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with voxilaprevir (with sofosbuvir and velpatasvir). Avoid. [Severe] Study

Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Theoretical
Corticosteroids (continued)

- **Dexamethasone** is predicted to decrease the concentration of *caspofungin*. Adjust *caspofungin* dose; p. 386. [Moderate] Theoretical

- **Corticosteroids** are predicted to decrease the concentration of *choline salicylate*. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to *beclometasone* (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- **Cobicistat** is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study

- **Corticosteroids** are predicted to increase the effects of *coumarins*. [Moderate] Study

- **Crizotinib** is predicted to increase the exposure to *methylprednisolone*. Monitor and adjust dose. [Moderate] Study

- **Enalapril** is predicted to decrease the exposure to *flucanazole*. [Unknown] Theoretical

- **Corticosteroids** increase the risk of gastrointestinal perforation when given with *erlotinib*. [Severe] Theoretical

- **Corticosteroids** potentially oppose the effects of *glycerol phenylbutyrate*. [Moderate] Theoretical

- **Grapefruit juice** moderately increases the exposure to oral *budesonide*. Avoid. [Moderate] Study

- **HIV-protease inhibitors** are predicted to increase the exposure to *beclometasone* (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- **HIV-protease inhibitors** are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study

- **Idelalisib** is predicted to increase the exposure to *beclometasone* (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- **Idelalisib** is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study

- **Imatinib** is predicted to increase the exposure to *methylprednisolone*. Monitor and adjust dose. [Moderate] Study

- **Corticosteroids** are predicted to increase the risk of gastrointestinal bleeding when given with *iron chelators* (deferasirox). [Severe] Theoretical

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with corticosteroids (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

- **Lumacaftor** is predicted to increase the exposure to *methylprednisolone*. Adjust dose. [Severe] Theoretical

- **Macrolides (clarithromycin)** are predicted to increase the exposure to *beclometasone* (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- **Macrolides (erythromycin)** are predicted to increase the exposure to *methylprednisolone*. Monitor and adjust dose. [Moderate] Study

- **Macrolides (clarithromycin)** are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study

- **Corticosteroids** are predicted to decrease the efficacy of *mifamurtide*. Avoid. [Severe] Theoretical

- **Mifepristone** is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. [Moderate] Theoretical

- **Mitotane** is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study

- **Mitotane** is predicted to decrease the exposure to *fluticasone*. [Unknown] Theoretical

- **Corticosteroids** (betamethasone, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone) are predicted to decrease the efficacy of monoclonal antibodies (atezolizumab, ipilimumab, nivolumab, pembrolizumab). Use with caution or avoid. [Severe] Theoretical

- **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Theoretical

- **Corticosteroids** are predicted to increase the risk of immunosuppression when given with monoclonal antibodies (dinituximab). Avoid except in life-threatening situations. [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to oral *budesonide*. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to *dexamethasone*. Adjust dose. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to *fluticasone*. [Unknown] Theoretical

- **Corticosteroids** increase the risk of gastrointestinal perforation when given with *nicorandil*. [Severe] Anecdotal

- **Nilotinib** is predicted to increase the exposure to *methylprednisolone*. Monitor and adjust dose. [Moderate] Study

- **NSAIDs** increase the risk of gastrointestinal bleeding when given with corticosteroids. [Severe] Study

- **Corticosteroids** are predicted to increase the effects of *neuromuscular blocking drugs, non-depolarising*. [Severe] Anecdotal

- **Corticosteroids** increase the risk of gastrointestinal perforation when given with *nicorandil*. [Severe] Anecdotal

- **Nilotinib** is predicted to increase the exposure to *methylprednisolone*. Monitor and adjust dose. [Moderate] Study

- **Corticosteroids** are predicted to increase the effects of *phenindione*. [Moderate] Anecdotal

- **Dexamethasone** decreases the exposure to *praziquantel*. [Moderate] Study

- **Rifampicin** is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study

- **Rifampicin** is predicted to decrease the exposure to *fluticasone*. [Unknown] Theoretical

- **Dexamethasone** is predicted to decrease the concentration of *rilpivirine*. Avoid multiple-dose dexamethasone. [Severe] Theoretical

- **Corticosteroids** potentially decrease the effects of *sodium phenylbutyrate*. [Moderate] Anecdotal

- **Corticosteroids** are predicted to decrease the effects of *somatropin*. [Moderate] Theoretical

- **Corticosteroids** are predicted to decrease the effects of *suxamethonium*. [Severe] Anecdotal

### Coumarins

- **COUMARINS**

  -  → **TABLE 3** p. 874 (anticoagulant effects)

<table>
<thead>
<tr>
<th>Acenocoumarol</th>
<th>Warfarin</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Food and Lifestyle</strong></td>
<td>The effects of coumarins can be reduced or abolished by vitamin K, including that found in healthy foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control. Pomegranate juice is predicted to increase the INR in response to acenocoumarol and warfarin.</td>
</tr>
</tbody>
</table>
• Antirrhythmic (amiodarone) increase the anticoagulant effect of coumarins. (Severe) Study
• Antirrhythmic (propafenone) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Moderate) Study
• Antiepileptics (carbamazepine) decrease the effects of coumarins. Monitor and adjust dose. (Severe) Study
• Antiepileptics (fosphenytoin, phenytoin) are predicted to alter the anticoagulant effect of coumarins. (Moderate) Theoretical
• Antiepileptics (phenobarbital, primidone) decrease the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Moderate) Study
• Antifungals, azoles (fluconazole) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. Monitor INR and adjust dose. (Moderate) Study
• Apalutamide increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Moderate) Study
• Axitinib is predicted to increase the risk of bleeding events when given with coumarins. Avoid or monitor. (Severe) Study
• Aprepitant decreases the anticoagulant effect of coumarins. (Moderate) Study
• Azathioprine decreases the anticoagulant effect of coumarins. (Moderate) Study
• Bosutinib decreases the anticoagulant effect of coumarins. (Moderate) Study
• Bosutinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Cabozantinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Certitinib is predicted to increase the exposure to warfarin. Avoid. (Severe) Theoretical
• Chloramphenicol potentially increases the anticoagulant effect of coumarins. (Moderate) Anecdotal
• Corticosteroids are predicted to increase the effects of coumarins. (Moderate) Study
• Cranberry juice potentially increases the anticoagulant effect of warfarin. Avoid. (Severe) Anecdotal
• Crizotinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. (Severe) Theoretical
• Danazol potentially increases the anticoagulant effect of coumarins. (Severe) Anecdotal
• Dasatinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Disulfiram increases the anticoagulant effect of coumarins. Monitor and adjust dose. (Severe) Study
• Efavirenz is predicted to affect the concentration of coumarins. Adjust dose. (Moderate) Theoretical
• Eltsegravir is predicted to decrease the anticoagulant effect of coumarins. (Moderate) Theoretical
• Enteral feeds (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. (Severe) Anecdotal
• Enzalutamide potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. (Severe) Study
• Erlotinib increases the anticoagulant effect of coumarins. (Severe) Anecdotal
•埃特拉韦林 increases the anticoagulant effect of coumarins. (Moderate) Theoretical
• Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Study
• Fluorouracil increases the anticoagulant effect of coumarins. (Severe) Anecdotal
• Fosaprepitant is predicted to decrease the anticoagulant effect of coumarins. (Moderate) Theoretical
• Gefitinib is predicted to increase the anticoagulant effect of coumarins. (Severe) Anecdotal
• Glucagon increases the anticoagulant effect of warfarin. (Severe) Study
• Glucosamine potentially decreases the anticoagulant effect of acenocoumarol. (Moderate) Anecdotal
• Glucosamine potentially decreases the anticoagulant effect of warfarin. Avoid. (Moderate) Anecdotal
• Griseofulvin potentially decreases the anticoagulant effect of coumarins. (Moderate) Anecdotal
• H2 receptor antagonists (cimetidine) increase the anticoagulant effect of coumarins. (Severe) Study
• Imafitinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Ivenafarin is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Ivermectin potentially increases the anticoagulant effect of warfarin. (Severe) Theoretical
• Leflunomide increases the anticoagulant effect of coumarins. (Moderate) Anecdotal
• Letermovir is predicted to decrease the concentration of warfarin. Monitor and adjust dose. (Moderate) Theoretical
• Lomitapide increases the exposure to warfarin. Monitor INR and adjust dose. (Severe) Study
• Macrolides (clarithromycin, erythromycin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Anecdotal
• Mercaptopurine decreases the anticoagulant effect of coumarins. (Moderate) Anecdotal
• Metronidazole increases the anticoagulant effect of coumarins. (Severe) Anecdotal
• Mexiletine increases the anticoagulant effect of warfarin. (Severe) Study
• Methylene potentially affects the exposure to warfarin. Avoid. (Unknown) Theoretical
• Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to warfarin. Monitor and adjust dose. (Moderate) Theoretical
• Monoclonal antibodies (sarilumab) potentially affect the exposure to warfarin. Monitor and adjust dose. (Severe) Theoretical
• Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to warfarin. Monitor and adjust dose. (Moderate) Theoretical
• Nandrolone is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. (Severe) Theoretical
• Nevirapine potentially alters the anticoagulant effect of coumarins. (Severe) Anecdotal
• Nilotinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Obeticholic acid decreases the anticoagulant effect of warfarin. (Severe) Study
• Oxymetholone increases the anticoagulant effect of coumarins. (Severe) Anecdotal
• Paracetamol increases the anticoagulant effect of coumarins. (Severe) Anecdotal
• Partaprevir (in fixed-dose combination with dasabuvir) decreases the anticoagulant effect of acenocoumarol. Monitor INR and adjust dose. (Severe) Anecdotal
• Partaprevir (in fixed-dose combination) decreases the anticoagulant effect of warfarin. Monitor INR and adjust dose. (Severe) Anecdotal
• Pazopanib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
• Penicillins potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Anecdotal

Coumarins – Coumarins 935

Appendix 1
Coumarins (continued)

- **Pitolisant** is predicted to decrease the exposure to warfarin. [Mild] Theoretical
- **Ponatinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Quinolones** increase the anticoagulant effect of coumarins. [Severe] Anecdotal
- **Ranibizumab** increases the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Rifampicin** decreases the anticoagulant effect of coumarins. [Severe] Study
- **Rucaparib** slightly increases the exposure to warfarin. Monitor and adjust dose. [Severe] Study
- **Ruxolitinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Sorafenib** increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- **St John's Wort** decreases the anticoagulant effect of coumarins. Avoid. [Severe] Anecdotal
- **Statins (fluvastatin, rosuvastatin)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- **Sucralfate** potentially decreases the effects of warfarin. Separate administration by 2 hours. [Moderate] Anecdotal
- **Sulfonamides (sulfadiazine)** are predicted to increase the anticoagulant effect of coumarins. [Severe] Theoretical
- **Sulfonamides (sulfamethoxazole)** increase the anticoagulant effect of coumarins. [Severe] Study
- **Sunitinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Tamoxifen** increases the anticoagulant effect of coumarins. [Severe] Study
- **Tegafur** increases the anticoagulant effect of coumarins. [Theoretical]
- **Teriflunomide** affects the anticoagulant effect of coumarins. [Severe] Study
- **Tetracyclines** increase the risk of bleeding events when given with coumarins. [Moderate] Anecdotal
- **Tindazole** is predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Theoretical
- **Toremifene** is predicted to increase the anticoagulant effect of coumarins. [Severe] Theoretical
- **Trimethoprim** is predicted to increase the anticoagulant effect of coumarins. [Severe] Study
- **Vandetanib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Venetoclax** slightly increases the exposure to warfarin. [Moderate] Study
- **Cranberry juice** potentially increases the anticoagulant effect of coumarins (warfarin). [Avoid. Severe] Anecdotal
- **Crisantaspase** → see Table 1 p. 874 (hepatotoxicity), Table 15 p. 877 (myelosuppression)
  - Crisataspase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see Table 15 p. 877
  - Crisantaspase affects the efficacy of methotrexate. [Severe] Anecdotal → Also see Table 1 p. 874 → Also see Table 15 p. 877
  - Crisantaspase potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before crisantaspase, p. 571. [Severe] Anecdotal → Also see Table 1 p. 874 → Also see Table 15 p. 877
- **Crizotinib** see Table 6 p. 875 (bradycardia), Table 15 p. 877 (myelosuppression), Table 9 p. 876 (QT-interval prolongation)
  - General information: Caution with concurrent use of drugs that cause gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs.
  - **Crizotinib** is predicted to increase the exposure to abemaciclib. [Moderate] Study
  - **Crizotinib** is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study
  - **Crizotinib** is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
  - **Crizotinib** is predicted to increase the exposure to alprazolam. [Severe] Study
  - **Crizotinib** is predicted to increase the exposure to antiarrhythmics (propranolone). Monitor and adjust dose. [Moderate] Study
  - **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
  - **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see Table 9 p. 876
  - **Crizotinib** is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical
  - **Crizotinib** is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study
  - **Crizotinib** is predicted to increase the concentration of antimalarials (piperazine). [Severe] Theoretical
  - **Crizotinib** is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see Table 15 p. 877
  - **Crizotinib** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see Table 9 p. 876
  - **Bosentan** is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical
  - **Crizotinib** is predicted to increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Theoretical → Also see Table 15 p. 877 → Also see Table 9 p. 876
  - **Crizotinib** is predicted to increase the exposure to capecitabine. Use with caution and adjust dose. [Moderate] Study
  - **Crizotinib** is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical → Also see Table 15 p. 877 → Also see Table 9 p. 876
  - **Crizotinib** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
  - **Crizotinib** is predicted to increase the exposure to cariprazine. Avoid. [Severe] Study
  - **Crizotinib** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical → Also see Table 15 p. 877 → Also see Table 9 p. 876
  - **Crizotinib** is predicted to increase the concentration of ciclesonide. [Severe] Study
  - **Cobicistat** is predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study
  - **Cemiplimab** is predicted to increase the exposure to cemiplimab. Avoid. Study
  - **Cranberry juice** is predicted to increase the concentration of corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
  - **Crizotinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
  - **Crizotinib** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
  - **Crizotinib** is predicted to increase the exposure to dasatinib. [Severe] Study → Also see Table 15 p. 877 → Also see Table 9 p. 876
  - **Crizotinib** increases the risk of QT-prolongation when given with dorperidone. Avoid. [Severe] Study
  - **Crizotinib** is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). [Severe] Theoretical
  - **Crizotinib** is predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal
  - **Crizotinib** is predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - **Efavirenz** is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical → Also see Table 9 p. 876
  - **Crizotinib** is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
  - **Crizotinib** is predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see Table 9 p. 876
  - **Enzalutamide** is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
Crizotinib is predicted to increase the risk of ergotism when given with ergonovine. (Severe) Theoretical

Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to erlotinib. (Moderate) Theoretical

Crizotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study → Also see TABLE 15 p. 877

Crizotinib is predicted to increase the exposure to fosfoterodine. Adjust fosfoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. (Mild) Study

Crizotinib is predicted to increase the exposure to gefitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877

Crizotinib potentially decreases the exposure to glecaprevir. Avoid. (Severe) Theoretical

Grapefruit juice is predicted to increase the exposure to crizotinib. Avoid. (Moderate) Theoretical

Grapefruit juice is predicted to decrease the exposure to guanfacine. Adjust guanfacine dose, p. 237. (Moderate) Theoretical

HIV-protease inhibitors are predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to ibritinib. Adjust ibritinib dose with moderate inhibitors of CYP3A4. (Severe) Study → Also see TABLE 9 p. 876

Idelalisib is predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study → Also see TABLE 15 p. 877

Crizotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. (Severe) Theoretical → Also see TABLE 6 p. 875

Crizotinib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose. (Severe) Study. Avoid or adjust dose. (Moderate) Study → Also see TABLE 15 p. 877

Crizotinib is predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to lomipidine. Avoid. (Moderate) Theoretical

Crizotinib is predicted to increase the exposure to lurasidone. Adjust lurasidone dose. (Moderate) Study

Macrolides (clarithromycin) are predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to midozolam. Monitor side effects and adjust dose. (Severe) study

Crizotinib is predicted to increase the exposure to midostaurin. (Moderate) Theoretical

Mitotane is predicted to markedly decrease the exposure to crizotinib. Avoid. (Severe) Study → Also see TABLE 9 p. 877

Crizotinib is predicted to increase the exposure to naltrexone. Adjust naltrexone dose and monitor side effects. (Moderate) Study

Nevirapine is predicted to decrease the exposure to crizotinib. Avoid. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical → Also see TABLE 15 p. 877

Crizotinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study → Also see TABLE 6 p. 875

Crizotinib is predicted to increase the exposure to oxycodone. (Mild) Theoretical → Also see TABLE 6 p. 875 → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to oxycodone. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to pazopanib. (Moderate) Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanaflil). Adjust avanaflil dose. (Moderate) Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 120. (Moderate) Study → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). (Severe) Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 876

Crizotinib potentially decreases the exposure to pibrentasvir. Avoid. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to pimozide. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 876

Pitolisant is predicted to decrease the exposure to crizotinib. Avoid. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Crizotinib is predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to ribociclib. (Moderate) Study → Also see TABLE 9 p. 876

Rifampicin is predicted to markedly decrease the exposure to crizotinib. Avoid. (Severe) Study

Crizotinib is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877

Crizotinib is predicted to increase the exposure to saxagliptin. (Mild) Study

Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study

Crizotinib is predicted to increase the exposure to SSRIs (doxepin). Adjust doxepin dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical

St John’s Wort is predicted to decrease the exposure to crizotinib. Avoid. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Study

Crizotinib is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 136. (Severe) Study

Crizotinib is predicted to increase the exposure to sunitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the concentration of tacrolimus. (Severe) Study

Crizotinib is predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical → Also see TABLE 15 p. 877

Crizotinib is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical → Also see TABLE 15 p. 877

Crizotinib is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study

Crizotinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. (Moderate) Study

Crizotinib is predicted to increase the exposure to tolterodine. (Mild) Theoretical → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study

Crizotinib is predicted to increase the exposure to trazodone. (Moderate) Theoretical

Crizotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

Crizotinib is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study

Crizotinib is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876

Crizotinib is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Study

Cyclizine → see antihistamines, sedating
Cyclophosphamide → see CYCLOPHOSPHAMIDE p. 174 (antimuscarnics)
Cyclophosphamide → see alkylating agents

Cycloserine

Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. (Moderate) Study

Cyproheptadine → see antihistamines, sedating
Cytarabine \(\rightarrow\) see TABLE 15 p. 877 (myelosuppression)

- Cytarabine decreases the concentration of flucytosine. Avoid. [Severe] Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

**Dabigatran** \(\rightarrow\) see TABLE 3 p. 874 (anticoagulant effects)

- Antiarrhythmics (amiodarone) increase the exposure to dabigatran. Adjust dabigatran dose. [Moderate] Study
- Antiarrhythmics (dronedarone) slightly increase the exposure to dabigatran. Avoid. [Severe] Study
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study
- Antiepileptics (phenytoin) are predicted to decrease the exposure to dabigatran. Avoid. [Severe] Theoretical
- Antiepileptics (azoles [itraconazole, ketoconazole, voriconazole]) are predicted to increase the exposure to dabigatran. Use with caution or avoid. [Moderate] Study
- Clopidogrel is predicted to increase the exposure to dabigatran. [Moderate] Theoretical
- Ciclosporin is predicted to increase the exposure to dabigatran. Use with caution or avoid. [Moderate] Study
- Danaparoid is predicted to increase the exposure to dabigatran. Avoid. [Severe] Study
- Dapoxetine is predicted to increase the exposure to dabigatran. Avoid or adjust dose. [Severe] Study
- Dapagliflozin \(\rightarrow\) see TABLE 14 p. 877 (antidiabetic drugs), TABLE 8 p. 875 (hypotension)
- Dapoxetine \(\rightarrow\) see SSRIs

**Dabrafenib** \(\rightarrow\) see TABLE 15 p. 877 (myelosuppression)

- Antiangiopetics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- CYP3A4 inhibitors (ritonavir and ombitasvir) are predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- Delavirdine is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. [Severe] Theoretical
- Dabrafenib is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Fibrates (gemfibrozil) are predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Dabrafenib and tramadol are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dabrafenib. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

**Dacarbazine** \(\rightarrow\) see alkylating agents

**Dactinomycin** \(\rightarrow\) see TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression)

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

**Dairy products**

- Dairy products are predicted to decrease the absorption of eltorbopag. Etorbopag should be taken 2 hours before or 4 hours after dairy products. [Severe] Theoretical
- Dairy products decrease the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid. [Moderate] Study

**Dalteparin** \(\rightarrow\) see low molecular-weight heparins

**Danaparoid** \(\rightarrow\) see TABLE 3 p. 874 (anticoagulant effects)

- Ranibizumab is predicted to increase the risk of bleeding events when given with danaparoid. [Severe] Theoretical

**Danzol**

- Danazol moderately increases the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. [Severe] Study
- Danazol increases the concentration of ciclosporin. [Severe] Study
- Danazol potentially increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- Danazol is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). [Severe] Theoretical
- Danazol increases the risk of rhabdomyolysis when given with statins (simvastatin). Avoid. [Severe] Anecdotal
- Danazol potentially increases the concentration of tacrolimus. [Severe] Anecdotal

**Dantrolene** \(\rightarrow\) see TABLE 1 p. 874 (hepatotoxicity)

- Intravenous dantrolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe] Anecdotal

**Dapagliflozin** \(\rightarrow\) see TABLE 14 p. 877 (antidiabetic drugs), TABLE 8 p. 875 (hypotension)

**Dapoxetine** \(\rightarrow\) see SSRIs
Dapsone

- **Aminosalicylic acid** is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe**
- **Theoretical**
- **Dapsone** is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. **Severe**
- **Theoretical**
- **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe**
- **Theoretical**
- **Antimalariais (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe**
- **Theoretical**
- **Nitrate**s are predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe**
- **Theoretical**
- **Nitrofurantoin** is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe**
- **Theoretical**
- **Paracetamol** is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe**
- **Theoretical**
- **Darifenacin** is predicted to increase the exposure to trimethoprim and decreases the exposure to dapsone. **Severe**
- **Study**

Daptomycin

- **Aspirin (high-dose)** increases the risk of renal impairment when given with daptomycin. **Moderate**
- **Theoretical**
- **Ciclosporin** is predicted to increase the risk of rhabdomyolysis when given with daptomycin. **Severe**
- **Theoretical**
- **Fibrates** are predicted to increase the risk of rhabdomyolysis when given with daptomycin. **Severe**
- **Theoretical**
- **NSAIDs** increase the risk of renal impairment when given with daptomycin. **Moderate**
- **Theoretical**
- **Statins** are predicted to increase the risk of rhabdomyolysis when given with daptomycin. **Severe**
- **Theoretical**
- **Dapsone** increases the exposure to trimethoprim and terbinafine and decreases the exposure to daptomycin. **Severe**
- **Study**

Darifenacin

- **See** Table 10 p. 876 (thromboembolism), Table 16 p. 876 (increased serum potassium)
- **Table 15** p. 877 (antimuscarinics)
- **Antiarhythmics (dronedaron)** are predicted to slightly increase the exposure to darifenacin. **Moderate**
- **Theoretical**
- **Antifungals, azoles (fluconazole, itraconazole, posaconazole)** are predicted to slightly increase the exposure to darifenacin. **Moderate**
- **Study**
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to darifenacin. **Avoid.**
- **Severe**
- **Study**
- **Apalutamide** is predicted to decrease the exposure to darifenacin. **Avoid or monitor.**
- **Moderate**
- **Study**
- **Aprepitant** is predicted to slightly increase the exposure to darifenacin. **Moderate**
- **Study**
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to slightly increase the exposure to darifenacin. **Moderate**
- **Study**
- **Ciclosporin** is predicted to increase the exposure to darifenacin. **Avoid.**
- **Moderate**
- **Theoretical**
- **Cinacalcet** is predicted to slightly increase the exposure to darifenacin. **Moderate**
- **Study**
- **Cobicistat** is predicted to markedly to very markedly increase the exposure to darifenacin. **Avoid.**
- **Severe**
- **Study**
- **Crizotinib** is predicted to slightly increase the exposure to darifenacin. **Moderate**
- **Study**
- **Enzalutamide** is predicted to decrease the exposure to darifenacin. **Moderate**
- **Theoretical**
- **Table 13** p. 877 (QT-interval prolongation), Table 4 p. 874 (antiplatelet effects)
- **Anticols** decrease the absorption of dapsinib. Separate administration by at least 2 hours. **Moderate**
- **Study**
- **Antiarhythmics (dronedaron)** are predicted to increase the exposure to darifenacin. **Severe**
- **Study**
- **Also see Table 9 p. 876

Dasabuvir

- **See** Table 10 p. 876 (antimuscarinics)
- **Antitarhythmics (dronedaron)** are predicted to slightly increase the exposure to dasabuvir. **Severe**
- **Study**
- **Clopiprodil** is predicted to very markedly increase the exposure to dasabuvir. **Avoid.**
- **Severe**
- **Study**
- **Combined hormonal contraceptives** (containing ethinylestradiol) increase the risk of increased ALT concentrations when given with dasabuvir. **Avoid.**
- **Severe**
- **Study**
- **Efavirenz** increases the concentration of loop diuretics (furosemide). **Adjust dose.** **Moderate**
- **Study**
- **Enzalutamide** is predicted to decrease the exposure to dasabuvir. **Avoid.**
- **Severe**
- **Study**
- **Etravirine** is predicted to decrease the exposure to dasabuvir. **Avoid.**
- **Severe**
- **Study**
- **Darunavir** is predicted to very markedly increase the exposure to dasabuvir. **Avoid.**
- **Severe**
- **Study**
- **Dasabuvir** (with ombitasvir, paritaprevir, and ritonavir) decreases the concentration of HIV-protective inhibitors (darunavir). **Avoid or adjust dose.** **Moderate**
- **Study**
- **Dasabuvir** (with ombitasvir, paritaprevir, and ritonavir) increases the concentration of loop diuretics (furosemide). **Adjust dose.** **Moderate**
- **Study**
- **Mitosone** is predicted to decrease the exposure to dasabuvir. **Avoid.**
- **Severe**
- **Study**
- **Netralavir** is predicted to decrease the exposure to dasabuvir. **Avoid.**
- **Severe**
- **Study**
- **Darifenacin** is predicted to increase the exposure to tricyclic antidepressants. **Moderate**
- **Theoretical**
- **Also see Table 10 p. 876

Dasetinib

- **See** Table 4 p. 876 (thromboembolism), Table 9 p. 876 (QT-interval prolongation), Table 15 p. 877 (myelosuppression), Table 10 p. 876
### Interactions

**Dasatinib** (continued)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasatinib. Avoid. (Severe) Study
- Delfungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to dasatinib. (Severe) Study, See also Table 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study, See also Table 9 p. 876
- Aprepitant is predicted to decrease the exposure to dasatinib. Avoid or monitor. (Moderate) Study, See also Table 9 p. 876
- Bosantan is predicted to decrease the exposure to dasatinib. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. (Severe) Study
- Cobastic is predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study
- Dasatinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- Cimetidine is predicted to increase the exposure to dasatinib. (Severe) Study, See also Table 15 p. 877, See also Table 9 p. 876
- Efavirenz is predicted to decrease the exposure to dasatinib. (Severe) Study, See also Table 9 p. 876
- Enzalutamide is predicted to markedly decrease the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study
- Idelalisib is predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study, See also Table 9 p. 876
- Imatinib is predicted to increase the exposure to dasatinib. (Severe) Study, See also Table 9 p. 876
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study, See also Table 9 p. 876
- Macrolides (erythromycin) are predicted to increase the exposure to dasatinib. (Severe) Study, See also Table 9 p. 876
- Mitotane is predicted to markedly decrease the exposure to dasatinib. Avoid. (Severe) Study, See also Table 15 p. 877
- Netupitant is predicted to increase the exposure to dasatinib. (Severe) Study
- Nevirapine is predicted to decrease the exposure to dasatinib. (Severe) Study
- Nitrofurantoin is predicted to increase the exposure to dasatinib. (Severe) Study, See also Table 15 p. 877, See also Table 9 p. 876
- Dasatinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Pitolisan is predicted to decrease the exposure to dasatinib. Avoid. (Severe) Study
- Proton pump inhibitors are predicted to slightly to moderately decrease the exposure to dasatinib. Avoid. (Severe) Study
- Rifampicin is predicted to markedly decrease the exposure to dasatinib. Avoid. (Severe) Study
- St. John’s Wort is predicted to decrease the exposure to dasatinib. Avoid. (Severe) Study
- Dasatinib is predicted to increase the exposure to statins (simvastatin). (Moderate) Theoretical
- Daunorubicin—see anthracyclines
- Decitabine—see Table 15 p. 877 (myelosuppression)
- Deferasirox—see iron chelators
- deferoxprone—see Table 15 p. 877 (myelosuppression)
- Antacids (aluminium hydroxide) are predicted to decrease the absorption of deferiprone. Avoid. (Moderate) Theoretical
- Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with deferiprone. (Severe) Theoretical
- Delflazocort—see corticosteroids
- Delamanid—see Table 9 p. 876 (Q-T interval prolongation)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to delamanid. Avoid. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very slightly increase the exposure to delamanid. (Severe) Study, See also Table 9 p. 876
- Cobastic is very slightly increases the exposure to delamanid. (Severe) Study
- Enzalutamide is predicted to slightly decrease the exposure to delamanid. Avoid. (Moderate) Study
- HIV-protease inhibitors very slightly increase the exposure to delamanid. (Severe) Study, See also Table 9 p. 876
- Idelalisib very slightly increases the exposure to delamanid. (Severe) Study
- Macrolides (clarithromycin) very slightly increase the exposure to delamanid. (Severe) Study
- Nevirapine is predicted to increase the risk of bleeding events when given with delamanid. Avoid. (Severe) Study, See also Table 15 p. 877
- Mitotane is predicted to markedly decrease the exposure to delamanid. Avoid. (Moderate) Study
- Rifampicin is predicted to slightly decrease the exposure to delamanid. Avoid. (Moderate) Study
- Demeclocycline—see tetracyclines
- Desferrioxamine—see iron chelators
- Desflurane—see volatile halogenated anaesthetics
- Desloratadine—see antihistamines, non-sedating
- Desmopressin—see Table 18 p. 878 (hypoprolactinaemias). (Severe) Theoretical
- Antiepileptics (lamotrigine) are predicted to increase the risk of hypoprolactinaemia when given with desmopressin. (Severe) Theoretical
- Loperamide greatly increases the absorption of oral desmopressin (and possibly sublingual). (Moderate) Study
- Phenothiazines (chlorpromazine) are predicted to increase the risk of hypoprolactinaemia when given with desmopressin. (Severe) Theoretical
- Desogestrel
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- Desogestrel is predicted to increase the exposure to antiepileptics (lamotrigine). (Moderate) Study
- Aprepitant is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Moderate) Theoretical
- Efavirenz is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- Bosantan is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- Griseofulvin potentially decreases the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- Modafinil is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- Nevirapine is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- Rifabutin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
- Rifampicin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. S16. (Severe) Theoretical
**St John’s Wort** is predicted to decrease the efficacy of desogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical

**Sugammadex** is predicted to decrease the exposure to desogestrel. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical

**Ulipristal** is predicted to decrease the efficacy of desogestrel. Avoid. [Severe] Theoretical

**Dexamethasone** → see corticosteroids

**Dexamfetamine** → see amphetamines

**Dexibuprofen** → see NSAIDs

**Dexketoprofen** → see NSAIDs

**Dexmedetomidine** → see TABLE 11 p. 876 (CNS depressant effects)

**Dexrazoxane** → see iron chelators

**Diazepam** → see opioids

**Diazepam** → see TABLE 11 p. 876 (CNS depressant effects)

**Diazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin) Monitor concentration and adjust dose. [Severe] Study**

**Antifungals, azoles (fluconazole, voriconazole) moderately increase the exposure to diazepam. Monitor and adjust dose. [Moderate] Study**

**Apalutamide** is predicted to decrease the exposure to diazepam. Avoid. [Moderate] Study

**SSRIs (fluvoxamine) moderately increase the exposure to diazepam. [Moderate] Study**

**Diazoxide** → see TABLE B p. 875 (hypotension)

**Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anaesthetic**

**Diazoxide increases the risk of severe hypotension when given with hydralazine. [Severe] Study → Also see TABLE B p. 875**

**Diclofenac** → see NSAIDs

**Dicycloverine** → see TABLE 10 p. 876 (antimuscarinics)

**Didanosine** → see TABLE 1 p. 874 (hepatotoxicity), TABLE 12 p. 877 (peripheral neuropathy)

**ROUTE-SPECIFIC INFORMATION** Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

**Allopurinol** moderately increases the exposure to didanosine. Avoid. [Severe] Study

**Didanosine (buffered) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. [Moderate] Study**

**Fexofenadine** is predicted to increase the exposure to didanosine. [Severe] Theoretical

**Ganciclovir** is predicted to increase the exposure to didanosine. [Moderate] Study

**HIV-protease inhibitors (tipranavir) decrease the exposure to didanosine. Separate administration by 2 hours. [Moderate] Study**

**Didanosine (buffered) decreases the exposure to HIV-protease inhibitors (atazanavir). Didanosine should be taken 2 hours after atazanavir. [Severe] Study**

**Didanosine (buffered) is predicted to decrease the exposure to HIV-protease inhibitors (darunavir boosted with ritonavir). Didanosine should be taken 1 hour before or 2 hours after darunavir. [Moderate] Theoretical**

**Hydroxyurea** increases the risk of toxicity when given with didanosine. Avoid. [Severe] Study

**Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with didanosine. [Severe] Theoretical → Also see TABLE 1 p. 874 → Also see TABLE 12 p. 877

**Didanosine is predicted to increase the risk of pancreatitis when given with pentamidine. Avoid. [Severe] Study**

**Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. [Moderate] Study**

**Ribavirin** is predicted to increase the exposure to didanosine. Avoid. [Severe] Study

**Didanosine increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study → Also see TABLE 12 p. 877**

**Tenofivir disoproxil increases the risk of toxicity when given with didanosine. [Moderate] Study**

**Valganciclovir** is predicted to increase the exposure to didanosine. [Moderate] Study

**Digoxin** → see TABLE 6 p. 875 (bradycardia)

**Acarbose** decreases the concentration of digoxin. [Moderate] Study

**Aldosterone antagonists (epelone) very slightly increase the exposure to digoxin. [Mid] Study**

**Aldosterone antagonists (spironolactone) increase the concentration of digoxin. Monitor and adjust dose. [Moderate] Study**

**Aminoglycosides** potentially increase the concentration of digoxin. Monitor and adjust dose. [Mid] Study

**Antacids** decrease the absorption of digoxin. Separate administration by 2 hours. [Moderate] Study

**Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust dose. p. 82. [Severe] Study → Also see TABLE 6 p. 875**

**Antiarrhythmics (propafenone) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study**

**Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anaesthetic**

**Antifungals, azoles (isavuconazole) slightly increase the exposure to digoxin. Monitor and adjust dose. [Moderate] Study**

**Antifungals, azoles (posaconazole) are predicted to markedly increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study**

**Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with digoxin. [Severe] Theoretical**

**Antimalarials (quinine) increase the concentration of digoxin. Monitor and adjust digoxin dose. p. 82. [Severe] Anaesthetic**

**Apalutamide** is predicted to decrease the exposure to digoxin. [Mid] Study

**Balsalazide** is predicted to decrease the concentration of digoxin. [Moderate] Theoretical

**Brigatinib potentially increases the concentration of digoxin. [Moderate] Theoretical**

**Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study → Also see TABLE 6 p. 875**

**Intravenous calcium salts increase the concentration of digoxin. Avoid. [Moderate] Anaesthetic**

**Carbamazepine affects the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical**

**Cetirizine is predicted to increase the risk of bradycardia when given with digoxin. Avoid. [Severe] Theoretical**

**Ciclosporin increases the concentration of digoxin. Monitor and adjust dose. [Severe] Theoretical**

**Eliglustat increases the exposure to digoxin. Adjust dose. [Moderate] Study**

**Glucarpidase (with pirbuterol) increases the exposure to digoxin. [Moderate] Study**

**Ivacaftor slightly increases the exposure to digoxin. [Moderate] Study**

**Lapatinib is predicted to increase the exposure to digoxin. [Moderate] Theoretical**

**Ledipasvir is predicted to increase the exposure to digoxin. Monitor and adjust dose. [Moderate] Theoretical**

**Macrolides increase the concentration of digoxin. [Severe] Anaesthetic**

**GENERAL INFORMATION** Drugs that reduce serum potassium are predicted to increase the risk of digoxin toxicity, see TABLE 17 p. 878.
Digoxin — Domperidone

Diluhydrine → see opioids
Diluhydrin → see vitamin D substances
Diltiazem + see calcium channel blockers
Dimenhydrinate → see Table 10 p. 876 (antimuscarinics)

Dimethyl fumarate
- Alcohol (beverage) (excessive consumption) potentially increases the risk of gastrointestinal side-effects when given with dimethyl fumarate. Avoid. [Moderate] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dimethyl fumarate. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Dexamethasone + see monoclonal antibodies
- Diphenoxylate → see opioids
- Dipropionate → see opioids
- Dipyrnidamoto → see Table 8 p. 875 (hypotension), Table 4 p. 874 (antiplatelet effects)
- Antacids are predicted to decrease the absorption of dipyrnidamoto (immediate release tablets). [Moderate] Theoretical
- Dipyrnidamoto increases the exposure to antiarrhythmics (adenosine). Avoid or adjust dose. [Severe] Study

H₂-receptor antagonists are predicted to decrease the absorption of dipyrnidamoto (immediate release tablets). [Moderate] Theoretical
- Proton pump inhibitors are predicted to decrease the absorption of dipyrnidamoto (immediate release tablets). [Moderate] Theoretical
- Disopyramide → see antiarrhythmics
- Disulfiram → see Table 12 p. 877 (peripheral neuropathy)
- Alcohol (beverage) causes an extremely unpleasant systemic reaction when given with disulfiram. Avoid for at least 24 hours before and up to 14 days after stopping treatment. [Severe] Study
- Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Disulfiram increases the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Study
- Disulfiram increases the risk of acute psychoses when given with metronidazole. [Severe] Study → Also see Table 12 p. 877
- Pitolisant is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical
- Dobutamine → see sympathomimetics, inotropic
- Docetaxel → see taxanes
- Docusate sodium

ROUTE-SPECIFIC INFORMATION
Interactions do not generally apply to topical use of docusate unless specified.

Dolutegravir
- Antacids moderately decrease the exposure to dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after antacids, p. 427. [Moderate] Study
- Dolutegravir interaction with phenytoin, primidone) is predicted to decrease the exposure to dolutegravir. Adjust dose. [Moderate] Study
- Dolutegravir increases the risk of peripheral neuropathy. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- Dolutegravir increases the risk of generalised rash when given with dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- Dolutegravir increases the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Study
- Dolutegravir decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Oral calcium salts decrease the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study
- Dolutegravir is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Study
- Mocazenren decreases the exposure to dolutegravir. Adjust dose. [Moderate] Study
- Dolutegravir decreases the exposure to dolutegravir. Refer to specialist literature. [Severe] Study
- Enulatamim decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- EFavirenz decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Encorafenib is predicted to increase the exposure to dolutegravir. [Moderate] Theoretical

Etravirine moderately decreases the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- HIV-protease inhibitors (fosamprenavir boosted with ritonavir) moderately decrease the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
- HIV-protease inhibitors (tipranavir) moderately decrease the exposure to dolutegravir. Refer to specialist literature. [Severe] Study

Iron (oral) decreases the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study
- Dolutegravir increases the exposure to metformin. Use with caution and adjust dose. [Severe] Study
- Mitotene decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Nevirapine decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Rifampicin decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- St John’s Wort decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Sucralfate decreases the absorption of dolutegravir. [Moderate] Study
- Domperidone → see Table 9 p. 876 (QT-interval prolongation)
**Domperidone — Dopamine receptor agonists**

- Antiarhythmics (dronedarone) increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole) increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Aprepitant increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Cobicistat increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Crizotinib increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Domperidone is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). (Moderate) Theoretical
- Idelalisib increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Imatinib increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Netupitant increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Dopamine receptor agonists are predicted to increase the risk of QT-prolongation. (Hyponatremia, Table 9, p. 876) (OR-interval prolongation, Table 10, p. 876) (antimuscarinics)

**FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment with ropinirole.

- Amisulpride is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see Table 9, p. 876
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the concentration of cabergoline. (Severe) Anecdotal
- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to bromocriptine. (Severe) Study
- Aprepitant is predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Aprepitant is predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Ariziprazole is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see Table 8, p. 875
- Asenapine is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. (Moderate) Theoretical → Also see Table 8, p. 875
- Benperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see Table 8, p. 875
- Bupropion increases the risk of side-effects when given with amantadine. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bromocriptine. (Severe) Theoretical → Also see Table 8, p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of cabergoline. (Moderate) Anecdotal → Also see Table 8, p. 875
- Clozapine is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see Table 8, p. 875 → Also see Table 10, p. 876
- Cobicistat increases the exposure to bromocriptine. (Severe) Study
- Cobicistat is predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Combined hormonal contraceptives are predicted to increase the exposure to ropinirole. Adjust dose. (Moderate) Study
- Crizotinib is predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Domperidone is predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Duloxetine is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study
- Domperidone is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study
- Dopamine receptor agonists (bromocriptine, cabergoline) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine). Avoid. (Moderate) Theoretical → Also see Table 8, p. 875
- Dopamine receptor agonists (bromocriptine, cabergoline) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (pergolide). Avoid. (Moderate) Theoretical → Also see Table 8, p. 875
- Dopamine receptor agonists (amantadine) are predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. (Moderate) Theoretical → Also see Table 8, p. 875
- Droperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see Table 8, p. 875 → Also see Table 9, p. 876
- Ergometrine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (cabergoline, pergolide). Avoid. (Moderate) Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. (Moderate) Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with pergolide. (Moderate) Theoretical
- Flupenthixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see Table 8, p. 875
- Apomorphine is predicted to increase the risk of severe hypotension when given with gramineuron. (Severe) Theoretical
- H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study
- Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see Table 8, p. 875 → Also see Table 9, p. 876 → Also see Table 10, p. 876
- HIV-protease inhibitors increase the exposure to bromocriptine. (Severe) Study
- HIV-protease inhibitors are predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Hormone replacement therapy decreases the clearance of ropinirole. Monitor and adjust dose. (Moderate) Study
- Idelalisib increases the exposure to bromocriptine. (Severe) Study
- Idelalisib is predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Imatinib is predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Imatinib is predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Loxapine is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see Table 8, p. 875 → Also see Table 10, p. 876
- Macrolides (clarithromycin) increase the exposure to bromocriptine. (Severe) Study

Interactions | Appendix 1
Dopamine receptor agonists

- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of cabergoline. Avoid. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Amantadine increases the risk of CNS toxicity when given with memantine. Use with caution or avoid. (Severe) Theoretical
- Memantine is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. (Moderate) Theoretical
- Metoclopramide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. (Moderate) Theoretical
- Apomorphine is predicted to increase the exposure to ropinirole. Adjust dose. (Moderate) Study
- Netupitant is predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Netupitant is predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Nilotinib is predicted to increase the exposure to bromocriptine. (Severe) Theoretical
- Nilotinib is predicted to increase the concentration of cabergoline. (Moderate) Anecdotal
- Olanzapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875
- Apomorphine increases the risk of severe hypotension when given with ondansetron. Avoid. (Severe) Study → Also see TABLE 9 p. 876
- Paliperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876 → Also see TABLE 10 p. 876
- Pimozide is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876 → Also see TABLE 10 p. 876
- Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875
- Quinolones (ciprofloxacin) are predicted to increase the exposure to ropinirole. Adjust dose. (Moderate) Study
- Ranolazine is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study
- Risperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876
- SSRIs (fluvoxamine) are predicted to increase the exposure to ropinirole. Adjust dose. (Moderate) Study
- Sultopride is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876
- Sympathomimetics, vasoconstrictor (isomethaneptene) potentially increase the risk of side-effects when given with bromocriptine. Avoid. (Severe) Anecdotal
- Trimethoprim is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study
- Vandetanib is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study
- Zuclopenthixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876

Doravirine

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the exposure to doravirine. Avoid. (Severe) Study
- Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to doravirine. Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to doravirine. (Moderate) Study
- Bosentan is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. (Severe) Theoretical
- Cobimetinib is predicted to increase the exposure to doravirine. (Moderate) Study
- Dabrafenib is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. (Severe) Theoretical
- Efavirenz is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. (Severe) Theoretical
- Enzalutamide is predicted to decrease the exposure to doravirine. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to doravirine. (Moderate) Study
- Idealisib is predicted to increase the exposure to doravirine. (Moderate) Study
- Lumacaftor is predicted to decrease the exposure to doravirine. Avoid. (Severe) Study
- Modafinil is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. (Severe) Theoretical
- Rifabutin moderately decreases the exposure to doravirine. Adjust doravirine dose. (Severe) Study
- Rilpamycin is predicted to decrease the exposure to doravirine. Avoid. (Severe) Study
- Doravirine is predicted to decrease the exposure to sirolimus. Monitor sirolimus concentration and adjust dose, p. 539. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to doravirine. Avoid. (Severe) Study
- Doravirine is predicted to decrease the exposure to tacrolimus. Monitor tacrolimus concentration and adjust dose, p. 540. (Moderate) Theoretical
- Telotristat ethyl is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. (Severe) Theoretical

Dorzolamide

ROUTE-SPECIFIC INFORMATION
Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Dosulepin → see tricyclic antidepressants
Doxapram
- Aminophylline increases the risk of agitation when given with doxapram. (Moderate) Study
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the effects of doxapram. (Moderate) Theoretical
- Theophylline increases the risk of agitation when given with doxapram. (Moderate) Study
- Doxazosin → see alpha blockers
- Doxepin → see tricyclic antidepressants
- Doxorubicin → see anthracyclines
- Doxycycline → see tetracyclines
- Doxytamine → see antibacterials, sedating
- Drocnodare → see antihistimics
- Droperidol → see TABLE 8 p. 875 (hypotension), TABLE 9 p. 876 (QT-interval prolongation), TABLE 11 p. 876 (CNS depressant effects)
- Droperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876
- Droperidol is predicted to decrease the effects of guanethidine. Monitor and adjust dose. (Moderate) Theoretical → Also see TABLE 8 p. 875
- Droperidol decreases the effects of levodopa. Avoid. (Severe) Study → Also see TABLE 8 p. 875
- Drosperenone → see TABLE 16 p. 878 (increased serum potassium)
- Antifungals, azoles (ketoconazole) moderately increase the exposure to drosperenone. (Severe) Study
- Dulaglutide → see TABLE 14 p. 877 (antidiabetic drugs)
- Duloxetine → see TABLE 18 p. 878 (hyponatremia), TABLE 13 p. 877 (serotonin syndrome), TABLE 4 p. 874 (antiplatelet effects)
Duloxetine – Efavirenz 945

- Antiepileptics (phenytoin) are predicted to decrease the exposure to duloxetine. [Moderate] Theoretical
- Duloxetine is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Study
- Duloxetine is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
- HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to duloxetine. [Moderate] Theoretical
- Leflunomide is predicted to decrease the exposure to duloxetine. [Moderate] Theoretical
- Duloxetine is predicted to increase the exposure to pitolisant.
  Use with caution and adjust dose. [Moderate] Study
- Quinolones (ciprofloxacin) are predicted to increase the exposure to duloxetine. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to duloxetine. [Moderate] Theoretical
- SSRI (fluvoxamine) markedly increased the exposure to duloxetine. Avoid. [Severe] Study → Also see TABLE 18 p. 878 → Also see TABLE 13 p. 877 → Also see TABLE 4 p. 874
- Teriflunomide is predicted to decrease the exposure to duloxetine. [Moderate] Theoretical
- Dupilumab → see monoclonal antibodies
- Dutasteride
  - Antiarhythmics (dronedarone) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
  - Aprepitant is predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dutasteride. [Mild] Study
  - Cobimetinib is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
  - Crizotinib is predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - HIV-protease inhibitors are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
  - Idealisib is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
  - Imatinib is predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - Macrolides (clarithromycin) are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
  - Macrolides (erythromycin) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - Nilotinib is predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - Eculizumab → see monoclonal antibodies

Edoxaban → see TABLE 3 p. 874 (anticoagulant effects)
- Antiarhythmics (amiodarone) slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Antiarhythmics (dronedarone) slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to edoxaban. [Moderate] Study
- Antiepileptics (phenytoin) are predicted to decrease the exposure to edoxaban. [Moderate] Theoretical
- Antifungals, azoles (itraconazole) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Antifungals, azoles (ketoconazole) slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Calcium channel blockers (verapamil) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Ceritinib is predicted to increase the exposure to edoxaban. [Moderate] Theoretical
- Ciclosporin slightly increases the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Cobimetinib is predicted to increase the exposure to edoxaban. Avoid. [Severe] Theoretical
- Eliglustat is predicted to increase the exposure to edoxaban. Adjust dose. [Moderate] Study
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Lapatinib is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Macrolides (azithromycin, clarithromycin) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Macrolides (erythromycin) slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Mirabegron is predicted to increase the exposure to edoxaban. [Mild] Theoretical
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to edoxaban. [Severe] Study
- Pipobendavir (with glecaprevir) is predicted to increase the exposure to edoxaban. [Moderate] Study
- Edoxaban and dabigatran is predicted to increase the exposure to edoxaban. [Severe] Study
- Edoxaban and warfarin is predicted to increase the exposure to edoxaban. Avoid. [Severe] Theoretical
- Efavirenz → see TABLE 9 p. 876 (QT-interval prolongation)
- Efavirenz is predicted to decrease the exposure to antiarhythmics (dronedarone). [Severe] Theoretical → Also see TABLE 9 p. 876
- Antiepileptics (carbamazepine) slightly decrease the exposure to efavirenz and efavirenz slightly decreases the exposure to antiepileptics (carbamazepine). [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz slightly decreases the exposure to antiepileptics (fosphenytoin, phenytoin). [Severe] Theoretical
- Antiepileptics (phenobarbital) are predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (phenobarbital). [Severe] Theoretical
- Efavirenz is predicted to slightly increase the efficacy of antiepileptics (primidone) and antiepileptics (primidone) are predicted to slightly decrease the exposure to efavirenz. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical
- Efavirenz slightly decreases the exposure to antifungals, azoles (itraconazole), Avoid and for 14 days after stopping efavirenz. [Moderate] Study
- Efavirenz moderately decreases the exposure to antifungals, azoles (ketoconazole). [Severe] Study
- Efavirenz slightly decreases the exposure to antifungals, azoles (posaconazole). Avoid. [Moderate] Study
- Efavirenz moderately decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) slightly increase the exposure to efavirenz. Adjust dose. [Severe] Study → Also see TABLE 9 p. 876
- Efavirenz decreases the concentration of antimalarials (artemether). [Severe] Study → Also see TABLE 9 p. 876
- Efavirenz moderately decreases the exposure to antimalarials (atovaquone). Avoid. [Moderate] Study
- Efavirenz affects the concentration of antimalarials (proguanil). Avoid. [Moderate] Study
- Efavirenz is predicted to decrease the exposure to aprepitant. [Moderate] Study
- Efavirenz is predicted to decrease the exposure to xitinib. [Moderate] Theoretical

Study

Theoretical
Efavirenz (continued)

- **Efavirenz** is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the exposure to **briganitinib**. Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **bupropion**. [Moderate] Study
- **Efavirenz** is predicted to decrease the exposure to **cabozaantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the exposure to calcium channel blockers (amiodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **cariprazine**. Avoid. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- **Efavirenz** is predicted to decrease the concentration of **ciclosporin**. Adjust dose. [Moderate] Study
- **Efavirenz** is predicted to decrease the concentration of **cilostazol**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **clobetasol (bbam) replacement therapy**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **cyclobenzaprine**. Avoid. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **dabrafenib**. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the exposure to **dalsatrinib**. [Severe] Study → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to increase the concentration of **deltanabin**. Increase dose. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **doravirine**. Avoid or adjust doravirine dose. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **elgicultinib**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the efficacy of **etanercept**. For FSRH guidance, see Contra-ceptives, interactions p. 516. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **etatravirine**. Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **fasaprepitant**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- **Efavirenz** decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Severe] Study → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- **Efavirenz** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- **Efavirenz** is predicted to decrease the exposure to **invacafor**. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the concentration of **intermover**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
- **Efavirenz** decreases the exposure to macrolides (clarithromycin). [Moderate] Study → Also see TABLE 9 p. 876
- **Efavirenz** decreases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Theoretical
- **Efavirenz** is predicted to alter the effects of **midazolam**. Avoid. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **netupitan**. [Moderate] Theoretical
- **Nevirapine** decreases the concentration of efavirenz. Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the efficacy of **noretinesterone**. For FSRH guidance, see Contra-ceptives, interactions p. 516. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **olapitinib**. Avoid. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
- **Efavirenz** decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the exposure to **osimertinib**. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the exposure to **osmidine**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombravistat). Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Efavirenz** is predicted to decrease the exposure to **pibrentavir**. Avoid. [Severe] Study
- **Pitolisant** is predicted to decrease the exposure to efavirenz. [Mild] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- **Efavirenz** is predicted to decrease the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 876
- **Efavirenz** slightly decreases the exposure to **rifabutin**. Adjust dose. [Severe] Study
- **Rifampicin** slightly decreases the exposure to efavirenz. Adjust dose. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **rolipamatin**. Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to **ruoxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the concentration of efavirenz. Avoid. [Severe] Theoretical
- **Efavirenz** slightly decreases the exposure to **statins (atorvastatin)**. [Mild] Study
- **Efavirenz** moderately decreases the exposure to **statins (simvastatin)**. [Moderate] Study
- **Efavirenz** is predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
Efavirenz is predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study
Efavirenz is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical
Efavirenz is predicted to decrease the exposure to ticagrelor. (Moderate) Theoretical
Efavirenz is predicted to decrease the exposure to tofacitinib. (Moderate) Study
Efavirenz decreases the efficacy of elipristal. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal
Efavirenz is predicted to decrease the exposure to velpatasvir. Avoid. (Moderate) Theoretical
Efavirenz is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study
Efavirenz is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
Elbasvir
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, Primidone) are predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Bosentan is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study
- Elbasvir is predicted to decrease the concentration of dabigatran. (Moderate) Theoretical
- Elbasvir is predicted to decrease the exposure to eliglustat. Avoid. (Severe) Study
- Enalapril is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Erlotinib is predicted to decrease the concentration of erlotinib. (Unknown) Theoretical
- Mitotane is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Modafinil is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Nevirapine is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- St John's Wort is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study
- Elbasvir increases the exposure to statins (atorvastatin). Adjust atorvastatin dose, p. 124. (Moderate) Study
- Elbasvir is predicted to increase the exposure to statins (fluvastatin). Adjust fluvastatin dose, p. 124. (Unknown) Theoretical
- Elbasvir increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 135. (Moderate) Study
- Elbasvir is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 136. (Unknown) Theoretical
- Elbasvir is predicted to increase the concentration of sunitinib. Use with caution and adjust dose. (Moderate) Theoretical
Eliletriptan  see TABLE 13 p. 877 (serotonin syndrome)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eliletriptan. Avoid. (Severe) Study
- Aprepitant is predicted to increase the exposure to eliletriptan. (Moderate) Study
- Cobicistat is predicted to markedly increase the exposure to eliletriptan. Avoid. (Severe) Study
- Eliletriptan increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. (Severe) Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to eliletriptan. Avoid. (Severe) Study
- Idealisib is predicted to markedly increase the exposure to eliletriptan. Avoid. (Severe) Study
- Eliletriptan increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. (Severe) Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to eliletriptan. Avoid. (Severe) Study
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to eliletriptan. Avoid. (Severe) Study
- Macrolides (erythromycin) moderately increase the exposure to eliletriptan. Avoid. (Moderate) Study
- Netupitant is predicted to increase the exposure to eliletriptan. (Moderate) Study
- Abiraterone is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Eliglustat is predicted to increase the exposure to aliskiren. Adjust dose. (Moderate) Study
- Antiarhythmics (dronedarone, propafenone) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eliglustat. Avoid. (Severe) Study
- Antifungals (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Eliglustat is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). Adjust dose. (Moderate) Study
- Aprepitant is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Eliglustat is predicted to increase the exposure to atorvastatin. Adjust dose. (Moderate) Theoretical
- Eliglustat is predicted to increase the exposure to beta blockers, non-selective (propranolol). Adjust dose. (Moderate) Study
- Eliglustat is predicted to increase the exposure to beta blockers, selective (metoprolol). Adjust dose. (Moderate) Study
- Bosentan is predicted to decrease the exposure to eliglustat. (Moderate) Theoretical
- Bupropion is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Cinacalcet is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Cobicistat is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Eliglustat is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. (Severe) Theoretical
- Crizotinib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Eliglustat is predicted to increase the exposure to dabigatran. Adjust dose. (Moderate) Study
- Eliglustat increases the exposure to digoxin. Adjust dose. (Moderate) Study
- Duloxetine is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Eliglustat is predicted to increase the exposure to edoxaban. Adjust dose. (Moderate) Study
- Efavirenz is predicted to decrease the exposure to eliglustat. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to eliglustat. Avoid. (Severe) Study
- Eliglustat is predicted to increase the exposure to everolimus. Adjust dose. (Moderate) Study
- Grapefruit juice is predicted to increase the exposure to eliglustat. Avoid. (Severe) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Idealisib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Imitinib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Bivalirudin is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Mirabegron is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Mitotane is predicted to decrease the exposure to eliglustat. Avoid. (Severe) Study
Eliglustat (continued)

- **Moclobemide** is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Theoretical
- **Netupitant** is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- **Nevirapine** is predicted to decrease the exposure to eliglustat. (Moderate) Theoretical
- **Nilotinib** is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- **Quinolones** are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- **Rifampicin** is predicted to decrease the exposure to eliglustat. Avoid. (Severe) Study
- **Eliglustat** is predicted to increase the exposure to sirolimus. Adjust dose. (Moderate) Study
- **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- **St John’s Wort** is predicted to increase the exposure to eliglustat. Avoid. (Severe) Study
- **Eliglustat** is predicted to increase the exposure to taxanes (paclitaxel). Avoid. (Severe) Study
- **Terbinafine** is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- **Eliglustat** is predicted to increase the exposure to tolterodine. Adjust dose. (Moderate) Theoretical
- **Eliglustat** is predicted to increase the exposure to topotecan. Adjust dose. (Moderate) Study
- **Eliglustat** is predicted to increase the exposure to tricyclic antidepressants (nortriptyline). Adjust dose. (Moderate) Theoretical
- **Elotuzumab** → see monoclonal antibodies

**Eltrombopag**

- **Antacids** decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after antacids. (Severe) Study
- **Oral calcium salts** decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after calcium salts. (Severe) Study
- **Dairy products** are predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after dairy products. (Severe) Theoretical
- **Iron (oral)** is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after iron (oral). (Severe) Theoretical
- **Eltrombopag** is predicted to increase the concentration of itos闪ezuvir. (Moderate) Study
- **Eltrombopag** is predicted to increase the concentration of methotrexate. (Moderate) Theoretical
- **Rifampicin** is predicted to decrease the exposure to eltrombopag and eltrombopag is predicted to increase the concentration of rifampicin. (Moderate) Theoretical
- **Oral selenium** is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after selenium. (Severe) Theoretical
- **SSRIs (fluvoxamine)** are predicted to increase the exposure to eltrombopag. (Moderate) Theoretical
- **Eltrombopag** is predicted to increase the exposure to statins. Monitor and adjust dose. (Moderate) Study
- **Eltrombopag** is predicted to increase the exposure to tenofovir alafenamide. (Moderate) Theoretical
- **Eltrombopag** is predicted to increase the exposure to tenofovir disoproxil. (Moderate) Theoretical
- **Eltrombopag** is predicted to increase the exposure to tenofovir. Eltrombopag should be taken 2 hours before or 4 hours after zinc. (Severe) Theoretical

**Elvitegravir**

- **Antacids** moderately decrease the exposure to elvitegravir. Separate administration by at least 4 hours. (Moderate) Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **Bosentan** is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **Elvitegravir** is predicted to decrease the anticoagulant effect of coumarins. (Moderate) Theoretical
- **Efavirenz** is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **Enalapril** is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **Elvitegravir** markedly increases the exposure to grazoprevir. Avoid. (Severe) Study
- **HIV-protease inhibitors** (atazanavir, lopinavir) (boosted with ritonavir) increase the concentration of elvitegravir. Refer to specialist literature. (Moderate) Study
- **Mitotane** is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **Nevirapine** is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **St John’s Wort** is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- **Empagliflozin** → see TABLE 14 p. 877 (antidiabetic drugs), TABLE 8 p. 875 (hypotension)

**Emtricitabine** → see AC inhibitors

**Encorafenib** → see TABLE 9 p. 876 (QT-interval prolongation)
- **Antiarrhythmics (dronedarone)** are predicted to moderately increase the exposure to encorafenib. (Moderate) Study → Also see TABLE 9 p. 876
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to encorafenib. (Severe) Theoretical
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to encorafenib. (Moderate) Study → Also see TABLE 9 p. 876
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study → Also see TABLE 9 p. 876
- **Aprepitant** is predicted to moderately increase the exposure to encorafenib. (Moderate) Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to moderately increase the exposure to encorafenib. (Moderate) Study
- **Cobicistat** is predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study
- **Encorafenib** is predicted to affect the exposure to combined hormonal contraceptives. (Severe) Theoretical
- **Crizotinib** is predicted to moderately increase the exposure to encorafenib. (Moderate) Study → Also see TABLE 9 p. 876
- **Encorafenib** is predicted to increase the exposure to dolutegravir. (Moderate) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to encorafenib. (Severe) Theoretical
- **Grapefruit juice** is predicted to increase the exposure to encorafenib. Avoid. (Moderate) Study
- **HIV-protease inhibitors** are predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study → Also see TABLE 9 p. 876
- **Idelalisib** is predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study → Also see TABLE 9 p. 876
- **Macrolides** (clarithromycin) are predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study → Also see TABLE 9 p. 876
- **Macrolides (erythromycin)** are predicted to moderately increase the exposure to encorafenib. (Moderate) Study → Also see TABLE 9 p. 876
- **Mitotane** is predicted to decrease the exposure to encorafenib. (Severe) Theoretical
- **Netupitant** is predicted to moderately increase the exposure to encorafenib. (Moderate) Study
- **Nilotinib** is predicted to moderately increase the exposure to encorafenib. (Moderate) Study → Also see TABLE 9 p. 876
- **Encorafenib** is predicted to increase the exposure to raltegravir. (Moderate) Theoretical
Enzalutamide is predicted to markedly decrease the exposure to aprepitant. Avoid. (Moderate) Study

Enzalutamide is predicted to moderately decrease the exposure to apiprazole. Adjust apiprazole dose, p. 255. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to axitinib. Avoid or adjust dose. (Moderate) Study

Enzalutamide decreases the exposure to bedaquiline. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Study

Enzalutamide slightly decreases the exposure to bortezomib. Avoid. (Severe) Study

Enzalutamide is predicted to very markedly decrease the exposure to bosutinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to cabozantinib. Avoid. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Enzalutamide decreases the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Enzalutamide is predicted to decrease the exposure to cannabis extract. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to cariprazine. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study

Enzalutamide decreases the concentration of ciclosporin. (Severe) Study

Enzalutamide is predicted to alter the effects of cilostazol. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Study

Enzalutamide decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study

Clopidogrel moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose. (Severe) Study

Enzalutamide is predicted to decrease the exposure to clozapine. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to cobimetinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to corticosteroids (fluticasone). (Unknown) Study

Enzalutamide potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. (Severe) Study

Enzalutamide is predicted to markedly decrease the exposure to crizotinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to dabrafenib. Avoid. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to dasatinib. Avoid. (Severe) Study

Enzalutamide is predicted to markedly decrease the exposure to dasabuvir. Avoid. (Severe) Study

Enzalutamide is predicted to markedly decrease the exposure to dasabuvir. Avoid. (Severe) Study

Enzalutamide is predicted to slightly decrease the exposure to delamanid. Avoid. (Moderate) Study

Enzalutamide decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
Enzalutamide (continued)

- Enzalutamide is predicted to decrease the exposure to doravirine. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to elvitegravir. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the concentration of encorafenib. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- Enzalutamide moderately decreases the exposure to exemestane. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to fexofenadine. Avoid. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to fingolimod. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Enzalutamide is predicted to greatly decrease the concentration of gliclazide. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 237. [Moderate] Study
- Enzalutamide decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to ibritinib. Avoid or adjust ibritinib dose. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study
- Enzalutamide is predicted to greatly decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical
- Enzalutamide is predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to lapiatinib. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to linagliptin. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to luradoline. Avoid. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to montelukast. [Mild] Study
- Enzalutamide is predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
- Enzalutamide is predicted to slightly decrease the exposure to nateglinide. [Mild] Study
- Enzalutamide is predicted to decrease the exposure to netupitant. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to nevirapine. [Severe] Theoretical
- Enzalutamide is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to nitrofurantoin. Adjust dose. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to ondansetron. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical
- Enzalutamide decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to oseltamivir. Avoid or adjust dose. [Moderate] Study
- Enzalutamide is predicted to moderately decrease the exposure to paroxetine. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to phosphodiesterase-type-5 inhibitors (avanafil, tadalfil). Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to phosphodiesterase-type-5 inhibitors (sildenafil, vardenafil). [Moderate] Theoretical
- Enzalutamide is predicted to moderately to markedly decrease the exposure to pimecrolimus. Avoid. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to pimobendan. Avoid. [Severe] Study
- Enzalutamide is predicted to increase the exposure to propranolol. Adjust dose. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to quetiapine. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to reboxetine. [Moderate] Anecdotal
- Enzalutamide is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study
- Enzalutamide is predicted to markedly decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
Enzalutamide – Ergotamine

- Enzalutamide is predicted to decrease the exposure to roluminast. Avoid. [Moderate] Study
- Enzalutamide is predicted to markedly decrease the exposure to rolipitant. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study
- Enzalutamide is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to sorafenib. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to statins (simvastatin). [Severe] Study
- Enzalutamide is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study
- Enzalutamide decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to taxanes (docetaxel). [Severe] Theoretical
- Enzalutamide is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study
- Enzalutamide is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to tivozanib. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to tofacitinib. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to trabectedin. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to markedly decrease the exposure to ulipristal. Avoid and for 4 weeks after stopping ulipristal. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Enzalutamide is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to venooclax. Avoid. [Severe] Study
- Enzalutamide is predicted to increase the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vinca alkaloids (vinorelide). Use with caution or avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the concentration of voxtiaprevir. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study

Ephedrine – see sympathomimetics, vasoconstrictor
Ephedrine → see sympathomimetics, vasoconstrictor
Ephedrinerone → see aldosterone antagonists
Epoetin alfa → see TABLE 5 p. 874 (thromboembolism), TABLE 16 p. 878 (increased serum potassium)
Ergotamine – Erlotinib

**Ergotamine (continued)**

- Antiarhythmics (dronedarone) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical
- Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. **Severe** Study
- Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. **Severe** Study
- Bosantan is predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- Ceritinib is predicted to increase the exposure to ergotamine. Avoid. **Severe** Theoretical
- Cobimetinib is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical
- Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. **Moderate** Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (pergolide). **Moderate** Theoretical
- Elafin is predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Erlotinib increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. **Severe** Study
- Enalaprilamide is predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Grapefruit juice is predicted to increase the exposure to ergotamine. **Severe** Theoretical
- HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical
- Idelalisib is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical
- Imatinib is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- Letermovir is predicted to increase the concentration of ergotamine. Avoid. **Severe** Theoretical
- Macrolides (clarithromycin) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical
- Macrolides (erythromycin) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- Mitotane is predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Naratriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. **Severe** Theoretical
- Nevirapine is predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Nilotinib is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- Palbociclib is predicted to increase the exposure to ergotamine. Adjust dose. **Moderate** Theoretical
- Ribociclib (high-dose) is predicted to increase the exposure to ergotamine. Avoid. **Moderate** Theoretical
- Rifampicin is predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Rizatriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after rizatriptan. **Severe** Theoretical
- Rucaparib is predicted to increase the exposure to ergotamine. Monitor and adjust dose. **Moderate** Study
- St John’s Wort is predicted to decrease the effects of ergotamine. **Moderate** Theoretical
- Sumatriptan increases the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. **Severe** Study
- Ticagrelor is predicted to increase the exposure to ergotamine. Avoid. **Severe** Theoretical

**Erlotinib**

- See TABLE 15, p. 877 (myelosuppression), TABLE 12 p. 877 (peripheral neuropathy), TABLE 9 p. 876 (QT-interval prolongation)

**Erlotinib**

**FOOD AND LIFESTYLE** Dose adjustment may be necessary if smoking started or stopped during treatment.

- Antacids are predicted to decrease the absorption of erlotinib. Avoid. Be taken 4 hours before or 2 hours after erlotinib. **Moderate** Theoretical
- Antiarhythmics (amiodarone, dronedarone) are predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. **Severe** Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study
- Aprepitant is predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). **Severe** Theoretical
- Bosantan is predicted to decrease the exposure to erlotinib. **Severe** Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- Ciclosporin is predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- Cobimetinib is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study
- Combined hormonal contraceptives slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. **Moderate** Study
- Corticosteroids increase the risk of gastrointestinal perforation when given with erlotinib. **Severe** Theoretical
- Erlotinib increases the anticoagulant effect of warfarin. **Severe** Anecdotal
- Erlotinib is predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- Erlotinib is predicted to decrease the exposure to erlotinib. **Severe** Theoretical
- Enalapril is predicted to decrease the exposure to erlotinib. **Severe** Study
- Grapefruit juice is predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- H1 receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H1 receptor antagonists. **Moderate** Study
- HIV-protease inhibitors are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study
- Idelalisib is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study
- Imatinib is predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- Lapatinib is predicted to increase the exposure to erlotinib. **Moderate** Theoretical
Estramustine → Esomeprazole → Eslicarbazepine

Esketamine

Rifampicin → HIV-protease inhibitors → Cobicistat

Antifungals, azoles → Esketamine → Ertugliflozin

Ertapenem → Rifaximin

Erlotinib → Nilotinib

Nevirapine → Netupitant

Mitotane → Modafinil

Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to etoricoxib. (Moderate) Theoretical

Macrolides (clarithromycin) are predicted to slightly increase the exposure to etoricoxib. Use with caution and adjust dose. (Moderate) Study

Mexitelone slightly increases the exposure to etoricoxib. Monitor side effects and adjust dose. (Moderate) Study

Mitotane is predicted to decrease the exposure to etoricoxib. Avoid or adjust etoricoxib dose. (Severe) Study

Netupitant is predicted to increase the exposure to etoricoxib. (Moderate) Theoretical

Nevirapine is predicted to decrease the exposure to etoricoxib. (Severe) Theoretical

Nilotinib is predicted to increase the exposure to etoricoxib. (Moderate) Theoretical

Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with NSAIps. (Severe) Theoretical

Erlotinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

Proton pump inhibitors are predicted to slightly decrease the exposure to etoricoxib. Avoid or adjust etoricoxib dose. (Moderate) Study

Quinolones (ciprofloxacin) slightly increase the exposure to etoricoxib. Monitor side effects and adjust dose. (Moderate) Study

Ranolazine is predicted to increase the exposure to etoricoxib. (Moderate) Theoretical

St John’s Wort is predicted to decrease the exposure to etoricoxib. (Severe) Theoretical

Vemurafenib is predicted to increase the exposure to etoricoxib. (Moderate) Theoretical

Erlapenem → see carbapenems

Ertugliflozin → see TABLE 14 p. 877 (antidiabetic drugs), TABLE 8 p. 875 (hypotension)

Erythromycin → see macrolides

Escitalopram → see SSRIs

Esketamine → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

Esketamine is predicted to increase the risk of seizures when given with aminophylline. Avoid. (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone, rifampin, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Aprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Bosantan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Efavirenz is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Fosaprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Griseofulvin decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Nevirapine is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Etanercept

Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Avoid. (Severe) Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

Etelecalcetide

Cinacalcet increases the risk of hypocalcaemia when given with etelcalcetide. Avoid. (Severe) Theoretical

Ethambutol

Isoniazid increases the risk of optic neuropathy when given with ethambutol. (Severe) Anecdotal

Ethosuximide → see antiepileptics

Etodolac → see NSAIDs

Etomideate → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

Etonogestrel

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rifampin, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Aprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Bosantan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Efavirenz is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Fosaprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Griseofulvin decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Nevirapine is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, Interactions p. 516. (Severe) Theoretical

Etanercept

Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Avoid. (Severe) Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

Etelecalcetide

Cinacalcet increases the risk of hypocalcaemia when given with etelcalcetide. Avoid. (Severe) Theoretical

Ethambutol

Isoniazid increases the risk of optic neuropathy when given with ethambutol. (Severe) Anecdotal

Ethosuximide → see antiepileptics

Etodolac → see NSAIDs

Etomideate → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)
Etravirine

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine decreases the exposure to antimalarials (artemether). (Moderate) Study
- Etravirine is predicted to decrease the exposure to bedaquiline. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to etravirine. Avoid. (Mild) Theoretical
- Etravirine increases the anticoagulant effect of coumarins. (Mild) Theoretical
- Etravirine is predicted to decrease the exposure to dasabuvir. Avoid. (Severe) Theoretical
- Etravirine moderately decreases the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). (Severe) Study
- Efavirenz is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to efavirenz. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to grazoprevir. Avoid. (Mild) Theoretical
- HIV- protease inhibitors (tipranavir) decrease the exposure to etravirine. Avoid. (Severe) Study
- Etravirine increases the exposure to HIV- protease inhibitors (fosamprenavir boosted with ritonavir). Refer to specialist literature. (Moderate) Study
- Etravirine is predicted to decrease the exposure to etermovir. (Moderate) Theoretical
- Etravirine decreases the exposure to macrolides (clarithromycin) and macrolides (clarithromycin) slightly increase the exposure to etravirine. (Severe) Study
- Etravirine (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to paritaprevir. Avoid. (Severe) Theoretical
- Etravirine moderately decreases the exposure to phosphodiesterase type-5 inhibitors. Adjust dose. (Moderate) Study
- Rifabutin decreases the exposure to etravirine. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- St John's Wort is predicted to decrease the exposure to etravirine. Avoid. (Severe) Study
- Everolimus is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Everolimus potentially increases the risk of angioedema when given with ACE inhibitors. (Severe) Anecdotal
- Antiarrhythmics (dronedaron) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the concentration of everolimus. Avoid. (Severe) Study
- Apalutamide is predicted to decrease the exposure to everolimus. Avoid or monitor. (Moderate) Study
- Aprepitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Bosentan is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Ceritinib is predicted to increase the exposure to everolimus. (Moderate) Theoretical. Also see TABLE 15 and p. 877
- Ciclosporin moderately increases the exposure to everolimus. Avoid or adjust dose. (Severe) Study
- Ciclosporin is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Cobicistat is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Grapefruit juice is predicted to increase the exposure to everolimus. Avoid. (Severe) Study
- HIV- protease inhibitors are predicted to increase the concentration of everolimus. Avoid. (Severe) Study
- Ibalipivir is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Imatinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Lipitor is predicted to increase the exposure to everolimus. Adjust dose. (Moderate) Study
- Enalapril is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Everolimus is predicted to increase the exposure to loratadine. Separate administration by 12 hours. (Moderate) Theoretical
- Lumacaftor is predicted to decrease the exposure to everolimus. Avoid. (Severe) Theoretical
- Macrolides (clarithromycin) are predicted to increase the concentration of everolimus. Avoid. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Miraclon is predicted to increase the exposure to everolimus. (Mild) Theoretical
- Mitotane is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Mitotane is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Netupitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Nevirapine is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Nilotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Everolimus is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- St John's Wort is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
Everolimus – Fibrates

Interactions | Appendix 1

- Velpatasvir is predicted to increase the exposure to everolimus. [Severe] Theoretical
- Venetoclax is predicted to increase the exposure to everolimus. Avoid or adjust dose. [Severe] Study
- Exemestane
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. [Moderate] Study
  - Enzalutamide moderately decreases the exposure to exemestane. [Moderate] Study
  - Mitotane moderately decreases the exposure to exemestane. [Moderate] Study
  - Rifampicin moderately decreases the exposure to exemestane. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to exemestane. [Moderate] Theoretical

Exenatide → see Table 14 p. 877 (antidiabetic drugs)

Ferrous fumarate
- Ferric maltol
- Ferric carboxymaltose
- Fentanyl
- Fenofibrate

Fenofibrate → see fibrates
- Fesoterodine is predicted to decrease the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- Enzalutamide is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- HIV- protease inhibitors are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

Idelalisib is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study
- Imatinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- Macrolides (erythromycin) are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4 in hepatic and renal impairment. [Severe] Study
- Mitotane is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- Netupitant is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- Nilotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- Rifampicin is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to fesoterodine. Avoid. [Severe] Theoretical
- Exemestane
- Velpatasvir

- Ezetimibe
  - Ciclosporin moderately increases the exposure to ezetimibe and ezetimibe slightly increases the exposure to ciclosporin. [Moderate] Study
  - Fibrates are predicted to increase the risk of gallstones when given with ezetimibe. [Severe] Theoretical
  - Ezetimibe potentially increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal

- Famotidine → see H₂ receptor antagonists
- Fampidine
  - H₂ receptor antagonists (cimetidine) increase the concentration of fampridine. Avoid. [Severe] Theoretical
- Fexofenadine → see antihistamines, non-sedating
- Felbinac → see NSAIDs
- Felodipine → see calcium channel blockers
- Fenofibrate → see fibrates
- Fentanyl → see opioids
- Ferric carboxymaltose → see iron (injectable)
- Ferric maltol → see iron (oral)
- Ferrous fumarate → see iron (oral)
- Ferrous gluconate → see iron (oral)
- Ferrous sulfate → see iron (oral)
- Fosoterodine → see Table 10 p. 876 (antimuscarinics)

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study
- Aprepitant is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- Cobicistat is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

- H₂ receptor antagonists (cimetidine) increase the concentration of fampridine. Avoid. [Severe] Theoretical
- Nitric oxide (nitroglycerin) are predicted to decrease the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- Antacids slightly to moderately decrease the exposure to gemfibrozil. [Moderate] Study
- Gemfibrozil is predicted to increase the exposure to apalutamide. [Mild] Study
- Bezlazebacil is predicted to increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Theoretical
- Fenofibrate increases the risk of nephrotoxicity when given with ciclosporin. [Severe] Study
- Colchicine increases the risk of rhabdomyolysis when given with fibrates. [Severe] Anecdotal
- Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- Fibrates are predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical
- Gemfibrozil is predicted to very markedly increase the exposure to dasabuvir. Avoid. [Severe] Study
- Gemfibrozil moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose. [Severe] Study
- Fibrates are predicted to increase the risk of gallstones when given with ezetimibe. [Severe] Theoretical
- Fibrates are predicted to increase the risk of hypoglycaemia when given with insulins. [Moderate] Theoretical
- Gemfibrozil is predicted to increase the exposure to irinotecan. Avoid. [Moderate] Theoretical
- Gemfibrozil is predicted to increase the concentration of letermovir. [Moderate] Study
- Gemfibrozil is predicted to moderately increase the exposure to montelukast. [Moderate] Study
- Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Study
Fibrates (continued)

- Gemfibrozil increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. (Severe) Study
- Gemfibrozil increases the exposure to repaglinide. Avoid. (Severe) Study
- Gemfibrozil is predicted to increase the exposure to retinoids (allitretinoin). Adjust allitretinoin dose. (Moderate) Theoretical
- Gemfibrozil increases the concentration of retinoids (bexarotene). Avoid. (Severe) Study
- Gemfibrozil increases the exposure to selexipag. Avoid. (Severe) Study
- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin). Avoid or adjust dose. (Severe) Study
- Bezafibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). (Severe) Study
- Fenofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, simvastatin). Adjust fenofibrate dose, p. 133. (Severe) Anecdotal
- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (fluvastatin). Adjust fenofibrate dose, p. 133. (Severe) Theoretical
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (fluvastatin). Adjust fenofibrate dose, p. 133. (Severe) Theoretical
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. (Severe) Study
- Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust rosuvastatin dose, p. 135. (Severe) Study
- Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 136. (Severe) Study
- Gemfibrozil increases the risk of rhabdomyolysis when given with statins. Avoid. (Severe) Anecdotal
- Fibrates are predicted to increase the risk of hypoglycaemia when given with sulfonlureas. (Moderate) Theoretical
- Gemfibrozil is predicted to increase the concentration of taxanes (paclitaxel). (Severe) Anecdotal
- Fibrates are predicted to decrease the efficacy of ursoodeoxycholic acid. Avoid. (Severe) Theoretical

Fidaxomicin

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Ciclosporin is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Lapatinib is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Ranolazine is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Venmurasfemib is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Fingolimod

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fingolimod. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fingolimod. Avoid. (Moderate) Theoretical
- Also see TABLE 6 p. 875
- Fingolimod increases the risk of QT-prolongation when given with drugs that prolong the QT interval. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to decrease the exposure to fingolimod. (Moderate) Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fingolimod. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Mitotane is predicted to decrease the exposure to fingolimod. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to fingolimod. (Moderate) Study
- St John’s Wort is predicted to decrease the exposure to fingolimod. Avoid. (Moderate) Theoretical

Flavoxate → see TABLE 10 p. 876 (antimuscarinics)
Flecainide → see antiarrhythmics
Fluoxacinil → see penicillins
Flucloxacillin → see antifungals, azoles
Flucytosine
- Amphotericin increases the risk of toxicity when given with flucytosine. (Severe) Study
- Cytarabine decreases the concentration of flucytosine. Avoid. (Severe) Study
- Zidovudine increases the risk of haematological toxicity when given with flucytosine. Monitor and adjust dose. (Severe) Theoretical

Fludarabine

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Fludarabine increases the risk of pulmonary toxicity when given with pentostatin. Avoid. (Severe) Study → Also see TABLE 15 p. 877

Fludrocortisone → see corticosteroids

Fluvastatin

- Fluphenazine increases the anticoagulant effect of warfarin (coumarins). Monitor concentration and adjust dose. (Severe) Theoretical
- Fluphenazine is predicted to decrease the exposure to fingolimod. (Severe) Study
- Fluphenazine increases the risk of severe skin reaction when given with topical fludarabine. Avoid. (Severe) Study
- Fluphenazine increases the risk of pulmonary toxicity when given with fludrocortisone. Avoid. (Severe) Study
- Fluphenazine increases the risk of QT-prolongation when given with drugs that prolong the QT interval. Avoid. (Severe) Theoretical
- Fluphenazine is predicted to decrease the exposure to fingolimod. (Moderate) Study
- Fluvoxamine increases the risk of toxicity when given with fluvoxamine. (Severe) Study
- Foscarnet decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. (Severe) Theoretical → Also see TABLE 8 p. 875

Fulturne → see SSRIs
Flumazenil → see SEDS
Flupentixol → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)
Flupentixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875
Flupentinol decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. (Severe) Theoretical → Also see TABLE 8 p. 875

Fulturne → see phenothiazines
Flurazepam — Geﬁtinib 957

Gefitinib—Grapefruit juice

Gefitinib (contd.)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gefitinib. [Moderate] Study
- Aprepitant is predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to gefitinib. [Moderate] Study
- Gefitinib is predicted to increase the anticoagulant effect of coumarins. [Severe] Anecdotal
- Crizotinib is predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- Enalapril is predicted to decrease the exposure to gefitinib. [Moderate] Study
- Gefitinib is predicted to increase the exposure to gemcitabine. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to gefitinib. [Moderate] Study
- Imatinib is predicted to increase the exposure to gefitinib. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to gefitinib. [Moderate] Study
- Macrolides (erythromycin) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- Gefitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to gefitinib. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- Gemcitabine is predicted to decrease the exposure to gefitinib. [Moderate] Theoretical
- Live vaccines are predicted to increase the risk of generalised infarction (possibly life-threatening) when given with gemcitabine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Gemfibrozil is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- Gentamicin is predicted to decrease the exposure to gefitinib. [Severe] Theoretical
- Glucarpidase is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Aminophospholipids (dronedarone) potentially increase the exposure to glecaprevir. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to glecaprevir. Avoid. [Severe] Study
- Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to glecaprevir. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) potentially increase the exposure to glecaprevir. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- Ciclosporin increases the exposure to glecaprevir. Avoid or monitor. [Severe] Study
- Cobicistat potentially increases the exposure to glecaprevir. [Moderate] Theoretical
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with glecaprevir. Avoid. [Severe] Study
- Crizotinib potentially decreases the exposure to glecaprevir. Avoid. [Severe] Theoretical
- Glecaprevir with pibrentasvir increases the exposure to dabigatran. Avoid. [Moderate] Study
- Glecaprevir with pibrentasvir is predicted to increase the exposure to digoxin. [Moderate] Study
- Efavirenz is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- Enalapril is predicted to greatly decrease the concentration of glecaprevir. Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, lopinavir) increase the exposure to glecaprevir. Avoid. [Severe] Theoretical
- HIV-protease inhibitors (ritonavir) increase the exposure to glecaprevir. Avoid. [Severe] Study
- Lumacatmorf potentially decreases the exposure to glecaprevir. Avoid. [Severe] Theoretical
- Mitotane is predicted to greatly decrease the concentration of glecaprevir. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- Rifampicin markedly affects the exposure to glecaprevir. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- Glecaprevir with pibrentasvir markedly increases the exposure to statins (atorvastatin). Avoid. [Severe] Study
- Glecaprevir with pibrentasvir is predicted to increase the exposure to statins (fluvastatin). [Moderate] Theoretical
- Glecaprevir with pibrentasvir is predicted to increase the exposure to statins (pravastatin). Use with caution and adjust pravastatin dose. [Moderate] Study
- Glecaprevir with pibrentasvir increases the exposure to statins (rosuvastatin). Use with caution and adjust rosuvastatin dose. p. 125. [Moderate] Theoretical
- Glecaprevir with pibrentasvir increases the exposure to statins (simvastatin). Avoid. [Moderate] Study
- Glecaprevir with pibrentasvir increases the exposure to statins. Monitor and adjust dose. [Mil] Study
- Gilbencamide is predicted to decrease the exposure to tacrolimus. [Mild] Study
- Glipizide is predicted to slightly increase the exposure to sulfonylureas. See sulfonylureas
- Glycylcholine is predicted to decrease the exposure to sulfonylureas. See sulfonylureas
- Glucagon increases the anticoagulant effect of coumarins (warfarin). [Severe] Study
- Glucopyramine increases the anticoagulant effect of coumarins (acenocoumarol). [Moderate] Anecdotal
- Glucosamine potentially decreases the anticoagulant effect of coumarins (acenocoumarol). [Moderate] Anecdotal
- Glycerol phenylbutyrate
- Antiepileptics (valproate) potentially oppose the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- Corticosteroids potentially oppose the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- Haloperidol potentially opposes the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- Glyceryl trinitrate is predicted to decrease the effects of nitrites. See nitrites
- Glycycopyronium is predicted to increase the effects of antimuscarinics. See antimuscarinics

ROUTE-SPECIFIC INFORMATION: Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Golimumab is predicted to increase the effects of monoclonal antibodies. See monoclonal antibodies
- Granisetron is predicted to increase the effects of antimuscarinics. See antimuscarinics
- Dopamine receptor agonists (apomorphine) are predicted to increase the risk of severe hypotension when given with granisetron. [Severe] Theoretical
- Grapefruit juice increases the anticoagulant effect of coumarins (warfarin). [Severe] Study
- Grapefruit juice is predicted to increase the exposure to abacavir. Avoid. [Moderate] Theoretical
- Grapefruit juice moderately decreases the exposure to aliskiren. Avoid. [Severe] Study

Grapefruit juice

Grapefruit juice is predicted to increase the exposure to abacavir. Avoid. [Moderate] Theoretical
- Grapefruit juice moderately decreases the exposure to aliskiren. Avoid. [Severe] Study
Grapefruit juice increases the exposure to antiarrhythmics (amiodarone). Avoid. (Moderate) Study
Grapefruit juice moderately increases the exposure to antiarrhythmics (dronedarone). Avoid. (Severe) Study
Grapefruit juice increases the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Moderate) Study
Grapefruit juice slightly increases the exposure to antiepileptics (carbamazepine). Monitor and adjust dose. (Moderate) Study
Grapefruit juice slightly decreases the exposure to antiarrhythmics, non-sedating (bilastine). Bilastine should be taken 1 hour before or 2 hours after grapefruit juice. (Moderate) Study
Grapefruit juice increases the exposure to antihistamines, non-sedating (rufapadine). Avoid. (Moderate) Study
Grapefruit juice increases the exposure to antimalarials (artemether). (Unkown) Study
Grapefruit juice is predicted to increase the concentration of antimalarials (piperaquine). Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to azithromycin. Avoid. (Moderate) Theoretical
Grapefruit juice greatly decreases the exposure to beta blockers, selective (celiprolol). (Moderate) Study
Grapefruit juice is predicted to increase the exposure to bosutinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the concentration of brigatinnib. Avoid. (Severe) Study
Grapefruit juice increases the exposure to buspirone. Avoid. (Mild) Study
Grapefruit juice is predicted to increase the exposure to calcium channel blockers (amlodipine). Avoid. (Mild) Study
Grapefruit juice increases the exposure to calcium channel blockers (felodipine). Avoid. (Moderate) Study
Grapefruit juice very slightly increases the exposure to calcium channel blockers (lercanidipine). Avoid. (Moderate) Theoretical
Grapefruit juice increases the exposure to calcium channel blockers (nicardipine). (Mild) Study
Grapefruit juice increases the exposure to calcium channel blockers (nifedipine, verapamil). Avoid. (Mild) Study
Grapefruit juice is predicted to increase the exposure to cariprazine. Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to ceftriaxone. (Severe) Theoretical
Grapefruit juice increases the concentration of ciclosporin. Avoid. (Severe) Study
Grapefruit juice markedly decreases the exposure to clopidogrel. (Severe) Study
Grapefruit juice is predicted to increase the exposure to cobicistat. Avoid. (Severe) Theoretical
Grapefruit juice moderately increases the exposure to oral corticosteroids (budesonide). Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to crizotinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to darifenacin. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to dasatinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to eliglustat. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to encorafenib. Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to ergometrine. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to ergotamine. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to erlotinib. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to everolimus. Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to guanfacine. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to ibritinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to imatinib. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to ivabradine. Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to ivacaftor. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to lapatinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to lurasidone. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to naldemedion. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to nilotinib. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to olaparib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to palbociclib. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to pazopanib. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to phosphodiesterase type 5 inhibitors. Use with caution or avoid. (Moderate) Study
Grapefruit juice increases the exposure to pimozide. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to ponatinib. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to praziquantel. Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to quetiapine. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the concentration of raloxifene. Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to ruxolitinib. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to saxagliptin. (Mild) Theoretical
Grapefruit juice increases the concentration of sirolimus. Avoid. (Mild) Study
Grapefruit juice moderately increases the exposure to SSRIs (sertraline). Avoid. (Moderate) Study
Grapefruit juice increases the exposure to statins (atorvastatin). (Mild) Study
Grapefruit juice increases the exposure to statins (simvastatin). Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to suntinib. Avoid. (Moderate) Theoretical
Grapefruit juice greatly increases the concentration of tacrolimus. Avoid. (Severe) Study
Grapefruit juice is predicted to increase the concentration of temsirolimus. Use with caution or avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to tezacaftor. Avoid. (Severe) Study
Grapefruit juice moderately increases the exposure to ticagrelor. (Moderate) Study
Grapefruit juice increases the exposure to tolvaptan. Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to venetoclax. Avoid. (Severe) Theoretical

Grass pollen extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).
Grazoprevir

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. [Severe] Study
- Aripiprazole, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately to markedly increase the exposure to grazoprevir. [Avoid] [Severe] Study
- Bosentan is predicted to markedly decrease the exposure to grazoprevir. [Avoid] [Severe] Study
- Grazoprevir is predicted to increase the concentration of calcium channel blockers. [Moderate] [Theoretical]
- Ciclosporin greatly increases the exposure to grazoprevir. [Avoid] [Severe] Study
- Elvitegravir markedly increases the exposure to grazoprevir. [Avoid] [Severe] Study
- Etravirine is predicted to decrease the exposure to grazoprevir. [Avoid] [Mild] [Theoretical]
- HIV- protease inhibitors are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Idelalisib is predicted to moderately markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Macrolides (clarithromycin) are predicted to moderately markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Mitotane is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Modafinil is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Nevirapine is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- St John’s Wort is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Grazoprevir increases the exposure to statins (atorvastatin). Adjust atorvastatin dose, p. 134. [Moderate] [Study]
- Grazoprevir is predicted to increase the exposure to statins (fluvastatin). Avoid fluvastatin dose, p. 134. [Unknown] [Theoretical]
- Grazoprevir increases the exposure to statins (rosuvastatin). Avoid rosuvastatin dose, p. 135. [Moderate] [Study]
- Grazoprevir is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 136. [Unknown] [Theoretical]
- Grazoprevir is predicted to increase the concentration of sunitinib. Use with caution and adjust dose. [Moderate] [Theoretical]
- Grazoprevir increases the exposure to tacrolimus. [Moderate] Study

Griseofulvin

ROUTE-SPECIFIC INFORMATION

- Alcohol (beverage) potentially causes a disulfiram-like reaction when given with griseofulvin. [Moderate] [Anecdotal]
- Antiepileptics (phenobarbital, primidone) decrease the effects of griseofulvin. [Moderate] Study
- Griseofulvin potentially decreases the efficacy of combined hormonal contraceptives. ForFSRH guidance, see Contraceptives, interactions p. 516. [Severe] [Anecdotal]
- Griseofulvin potentially decreases the anticoagulant effect of coumarins. [Moderate] [Anecdotal]
- Griseofulvin potentially decreases the efficacy of desogestrel. For FSRR guidance, see Contraceptives, interactions p. 516. [Severe] [Anecdotal]
- Griseofulvin decreases the efficacy of etonogestrel. ForFSRH guidance, see Contraceptives, interactions p. 516. [Severe] [Anecdotal]
- Griseofulvin potentially decreases the efficacy of oral levonorgestrel. ForFSRH guidance, see Contraceptives, interactions p. 516. [Severe] [Anecdotal]
- Griseofulvin potentially decreases the efficacy of norethisterone. ForFSRH guidance, see Contraceptives, interactions p. 516. [Severe] [Anecdotal]
- Griseofulvin potentially decreases the efficacy of ulipristal. ForFSRH guidance, see Contraceptives, interactions p. 516. [Severe] [Anecdotal]
- Guanethidine decreases the effectiveness of griseofulvin. [Severe] Study
- Benperidol is predicted to decrease the effects of guanethidine. [Moderate] [Theoretical] Also see TABLE 8, p. 875
- Droperidol is predicted to decrease the effects of guanethidine. Monitor and adjust dose. [Moderate] [Theoretical] Also see TABLE 8, p. 875
- Haloperidol is predicted to decrease the antihypertensive effects of guanethidine. Monitor and adjust dose. [Moderate] [Theoretical]
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to decrease the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. [Severe] [Theoretical] Also see TABLE 8, p. 875
- Phenothiazines are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] [Theoretical] Also see TABLE 8, p. 875
- Guanethidine is predicted to increase the effects of sympathomimetics, inotropic (dopamine). [Severe] [Theoretical]
- Guanethidine is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] [Study]
- Guanethidine increases the effects of sympathomimetics, vasoconstrictor (metaraminol). [Severe] [Anecdotal]
- Guanethidine increases the effects of sympathomimetics, vasoconstrictor (phenylephrine). [Severe] [Study]
- Tricyclic antidepressants are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] [Study] Also see TABLE 8, p. 875

Guanethidine

- Guanethidine decreases the effectiveness of griseofulvin. [Severe] Study
- Antiarhythmics (dronedarone) are predicted to increase the concentration of guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Antitussives (codeine) increases the effects of sympathomimetics (vasoconstrictor). [Unknown] [Theoretical]
- Anecdotal
- Guanethidine increases the concentration of antiepileptics (valproate). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the concentration of guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Bosantan is predicted to decrease the concentration of guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Chloramphenicol is predicted to increase the exposure to guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Cobicistat is predicted to increase the exposure to guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Crizotinib is predicted to increase the concentration of guanethidine. Adjust guanethidine dose, p. 237. [Moderate] [Theoretical]
- Efavirenz is predicted to decrease the concentration of guanethidine. Adjust dose. [Moderate] [Theoretical]
Cimetidine is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 237. Moderate Study

Fosaprepitant is predicted to increase the concentration of guanfacine. Moderate Theoretical

Grapefruit juice is predicted to increase the exposure to guanfacine. Avoid. Moderate Theoretical

HIV-protease inhibitors are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 237. Moderate Study

Idealisib is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 237. Moderate Study

Imatinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 237. Moderate Theoretical

Macrolides (clarithromycin) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 237. Moderate Theoretical

Guselkumab ➝ see monoclonal antibodies

H₂ receptor antagonists

cimetidine • famotidine • nizatidine • ranitidine

Cimetidine decreases the clearance of albendazole. Moderate Study

Cimetidine increases the concentration of aminophylline. Adjust dose. Severe Study

Cimetidine slightly increases the exposure to anthracyclines (epirubicin). Avoid. Moderate Study

Cimetidine increases the exposure to antiarrhythmics (amiodarone). Moderate Study

Cimetidine slightly increases the exposure to antiarrhythmics (flecainide). Monitor and adjust dose. Mild Study

Cimetidine increases the exposure to antiarrhythmics (lidocaine). Monitor and adjust dose. Moderate Study

Cimetidine is predicted to increase the exposure to antiarrhythmics (propanofol). Monitor and adjust dose. Moderate Theoretical

Cimetidine transiently increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. Moderate Study

H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. Moderate Study

H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. Moderate Study

H₂ receptor antagonists are predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid use of posaconazole oral suspension. Moderate Study

Cimetidine decreases the clearance of antimalarials (chloroquine). Moderate Study

Cimetidine slightly increases the exposure to antimalarials (quinine). Moderate Study

H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. Moderate Theoretical

Cimetidine slightly increases the exposure to calcium channel blockers (diltiazem, nimodipine). Monitor and adjust dose. Moderate Study

Cimetidine (high-dose) is predicted to increase the exposure to calcium channel blockers (lercanidipine). Moderate Theoretical

Cimetidine moderately increases the exposure to calcium channel blockers (nifedipine). Monitor and adjust dose. Severe Study

Cimetidine increases the exposure to calcium channel blockers (verapamil). Moderate Study

Cimetidine is predicted to slightly increase the exposure to capcetabine. Severe Theoretical

H₂ receptor antagonists are predicted to decrease the decrease of cerititinib. Moderate Theoretical

Cimetidine increases the concentration of ciclosporin. Mild Study

Cimetidine increases the antiangiogenic effect of coumarins. Severe Study

H₂ receptor antagonists are predicted to decrease the exposure to dasatinib. Avoid. Moderate Study

H₂ receptor antagonists are predicted to decrease the absorption of dipyriramole (immediate release tablets). Moderate Theoretical

Cimetidine is predicted to increase the exposure to dopamine receptor agonist (pramipexole). Adjust dose. Moderate Study

H₂ receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. Moderate Study

Cimetidine increases the concentration of fampridine. Avoid. Severe Theoretical

Cimetidine slightly increases the exposure to fluorouracil. Severe Study

H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to gefitinib. Moderate Study

H₂ receptor antagonists decrease the exposure to HIV-protease inhibitors (atazanavir). Monitor and adjust dose. Moderate Study

Cimetidine is predicted to decrease the clearance of hydrochlorothiazide. Monitor and adjust dose. Moderate Theoretical

H₂ receptor antagonists are predicted to decrease the absorption of laptatinib. Avoid. Moderate Theoretical

H₂ receptor antagonists are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 416. Moderate Study

Leflunomide is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). Moderate Theoretical

Cimetidine increases the concentration of mebendazole. Moderate Study

Cimetidine increases the exposure to metformin. Monitor and adjust dose. Moderate Study

Cimetidine slightly increases the exposure to mirtazapine. Use with caution and adjust dose. Moderate Theoretical

Cimetidine increases the exposure to moclobemide. Adjust moclobemide dose. Mild Study

H₂ receptor antagonists are predicted to decrease the absorption of nilotinib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after nilotinib. Mild Theoretical

Cimetidine increases the clearance of opioids (alfentanil). Use with caution and adjust dose. Severe Study

Cimetidine increases the exposure to opioids (fentanyl). Moderate Study

H₂ receptor antagonists are predicted to decrease the exposure to pazopanib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. Moderate Theoretical

Cimetidine increases the exposure to phenindione. Severe Anecdotal

Cimetidine moderately increases the exposure to praziquantel. Moderate Study

H₂ receptor antagonists are predicted to decrease the exposure to ripovirine. H₂ receptor antagonists should be taken 12 hours before or 4 hours after ripovirine. Severe Study

Cimetidine slightly increases the exposure to roflumilast. Moderate Study
H₂ receptor antagonists (continued)

- H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 416, sofosbuvir with velpatasvir, and sofosbuvir with velpatasvir and voxilaprevir. [Moderate] Study
- Cimétidine slightly increases the exposure to SSRIs (citalopram, escitalopram). Adjust dose. [Moderate] Study
- Cimétidine slightly increases the exposure to SSRIs (paroxetine, sertraline). [Moderate] Study
- Cimétidine is predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical
- Teriflunomide is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). [Moderate] Study
- Cimétidine increases the concentration of theophylline. Adjust dose. [Severe] Study
- Cimétidine increases the exposure to tricyclic antidepressants. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir. [Moderate] Study
- Cimétidine slightly increases the exposure to venlafaxine. [Mild] Study
- Cimétidine slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 306. [Mild] Study

Haloperidol → see TABLE 8 p. 875 (hypotension), TABLE 9 p. 876 (QT-interval prolongation), TABLE 11 p. 876 (CNS depressant effects), TABLE 10 p. 876 (antimuscarinics)  

**FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 876
- Haloperidol potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- Antifungals, azoles (itraconazole) increase the concentration of haloperidol. [Moderate] Study
- Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Study → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876 → Also see TABLE 10 p. 876
- Enzalutamide decreases the concentration of haloperidol. [Theoretical]
- Haloperidol potentially opposes the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- Haloperidol is predicted to decrease the antihypertensive effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 875
- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to haloperidol. [Severe] Theoretical
- Haloperidol decreases the effects of levodopa. [Severe] Study → Also see TABLE 8 p. 875
- Mitotane decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- Rifampicin decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- Haloperidol potentially decreases the effects of sodium phenylbutyrate. [Moderate] Anecdotal
- SSRIs (fluoxetine) increase the concentration of haloperidol. Adjust dose. [Moderate] Study
- SSRIs (fluvoxamine) increase the concentration of haloperidol. Adjust dose. [Moderate] Study
- Venlafaxine slightly increases the exposure to haloperidol. [Severe] Study → Also see TABLE 9 p. 876 → Also see TABLE 11 p. 876
- Heparin (unfractionated) → see TABLE 16 p. 878 (increased serum potassium), TABLE 3 p. 874 (anticoagulant effects)
- Ranibizumab increases the risk of bleeding events when given with heparin (unfractionated). [Severe] Theoretical

**Hepatitis B immunoglobulin** → see immunoglobulins

**HIV-protease inhibitors** → see TABLE 9 p. 876 (QT-interval prolongation)

- Caution on concurrent use of atazanavir, lopinavir with ritonavir, and ritonavir with drugs that prolong the PR interval.
- Concurrent use of saquinavir with drugs that prolong the PR interval is contra-indicated.
- Caution with concurrent use of tipranavir with drugs that increase risk of bleeding.
- Tipranavir slightly decreases the exposure to acaivir. Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. [Severe] Study
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to alfatinib. Separate administration by 12 hours. [Moderate] Study
- Ritonavir is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- Ritonavir decreases the exposure to albendazole. [Moderate] Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to aldosterone antagonists (spironolactone). Avoid. [Severe] Study
- HIV-protease inhibitors (lopinavir, saquinavir) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical
- Ritonavir decreases the exposure to amiflamine. Adjust dose. [Moderate] Study
- Ritonavir is predicted to decrease the exposure to anaesthetics, local (ropivacaine). [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of atazanavir. Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
- Antacids are predicted to decrease the absorption of ritonavir. Separate administration by 2 hours. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to antiarrhythmics (amiodarone). Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to decrease the exposure to antiarrhythmics (disopyramide). [Severe] Theoretical → Also see TABLE 9 p. 876
- HIV-protease inhibitors very markedly increase the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Ritonavir is predicted to increase the exposure to antiarrhythmics (flexinidine). Avoid or monitor side effects. [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to antiarrhythmics (lidocaine). Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to HIV-protease inhibitors. [Severe] Theoretical
- HIV-protease inhibitors are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical
- Ritonavir slightly decreases the exposure to antiepileptics (lamotrigine). [Severe] Study
HIV-protease inhibitors are predicted to very slightly increase the exposure to antiepileptics (perampanel). [Mild] Study

HIV-protease inhibitors are predicted to slightly increase the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical

Ritonavir is predicted to decrease the concentration of antiepileptics (valproate). [Severe] Antiepileptic

Antifungals, azoles (fluconazole) slightly increase the exposure to tipranavir. Avoid or adjust dose. [Moderate] Study

Antifungals, azoles (miconazole) are predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. [Moderate] Theoretical

Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (itraconazole). Use with caution and adjust dose. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (ketoconazole). Use with caution and adjust dose. [Moderate] Study

HIV-protease inhibitors are predicted to affect the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) potentially affect the exposure to HIV-protease inhibitors. [Severe] Study → Also see TABLE 9 p. 876

HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (itraconazole) and antifungals, azoles (itraconazole) are predicted to affect the concentration of antimalarials (atovaquone). Avoid if boosted with ritonavir. [Moderate] Study

HIV-protease inhibitors are predicted to increase the concentration of antimalarials (piperaquaine). [Severe] Theoretical

HIV-protease inhibitors are predicted to decrease the exposure to antimalarials (proguanil). Avoid. [Moderate] Study

HIV-protease inhibitors are predicted to affect the exposure to antimalarials (quinine). [Severe] Study → Also see TABLE 9 p. 876

HIV-protease inhibitors are predicted to increase the exposure to apalutamide. [Mild] Study → Also see TABLE 9 p. 876

Ritonavir is predicted to increase the exposure to apixaban. Avoid. [Severe] Theoretical

HIV-protease inhibitors are predicted to markedly increase the exposure to aprepitant. [Moderate] Study

HIV-protease inhibitors are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to bedaquiline. Avoid prolong use. [Mild] Study → Also see TABLE 9 p. 876

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study

Ritonavir is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to beta, agonists (salmeterol). Avoid. [Severe] Study

Atazanavir moderately increases the exposure to bictegravir. Avoid. [Severe] Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical

HIV-protease inhibitors slightly increase the exposure to bortezomib. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to bosentan. [Severe] Study

HIV-protease inhibitors are predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 876

HIV-protease inhibitors are predicted to increase the exposure to brigitinib. Adjust brigitinib dose. [Severe] Study

Ritonavir is predicted to decrease the exposure to bupropion. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to bupropine. Adjust bupropine dose. [Severe] Study

HIV-protease inhibitors slightly increase the exposure to cabazantinib. [Moderate] Study → Also see TABLE 9 p. 876

Ritonavir is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

HIV-protease inhibitors are predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical

HIV-protease inhibitors are predicted to moderately increase the exposure to cariprazine. Avoid. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. [Severe] Study → Also see TABLE 9 p. 876

HIV-protease inhibitors increase the concentration of ciclosporin. [Severe] Study

HIV-protease inhibitors are predicted to moderately increase the exposure to ciclosporin. Adjust ciclosporin dose. Adjust ciclosporin dose. [Moderate] Study

HIV-protease inhibitors are predicted to moderately increase the exposure to cladribine. Avoid. [Severe] Study

HIV-protease inhibitors are predicted to increase the concentration of cladribine. Avoid or monitor for toxicity. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study

Atazanavir (unboosted) increases the exposure to combined hormonal contraceptives. Adjust dose. [Severe] Study

Ritonavir is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRM guidance, see Contraceptives, interactions p. 516. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study

HIV-protease inhibitors are predicted to affect the anticoagulant effect of coumarins. [Moderate] Study

HIV-protease inhibitors are predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study

Ritonavir is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRM guidance, see Contraceptives, interactions p. 516. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to dabigatran. Avoid. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

HIV-protease inhibitors are predicted to markedly increase the exposure to darifenacin. Avoid. [Severe] Study

Dasabuvir (with ombitasvir, paritaprevir, and ritonavir) decreases the concentration of darunavir. Avoid or adjust dose. [Moderate] Study
HIV-protease inhibitors (continued)

- HIV-protease inhibitors are predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study  Also see TABLE 9 p. 876
- HIV-protease inhibitors very slightly increase the exposure to delamin. (Severe) Study  Also see TABLE 9 p. 876
- Ritonavir is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- Ritonavir is predicted to increase the exposure to diazepam. Avoid. (Moderate) Theoretical
- Didanosine (buffered) decreases the exposure to atazanavir. Didanosine should be taken 2 hours after atazanavir. (Severe) Study
- Didanosine (buffered) is predicted to decrease the exposure to darunavir (boosted with ritonavir). Didanosine should be taken 1 hour before or 2 hours after darunavir. (Moderate) Theoretical
- Tipranavir decreases the exposure to didanosine. Separate administration by 2 hours. (Moderate) Study
- Ritonavir increases the concentration of digoxin. Adjust dose and monitor concentration. (Severe) Study
- Fosamprenavir (boosted with ritonavir) slightly decreases the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. (Severe) Study
- Tipranavir moderately decreases the exposure to dolutegravir. Refer to specialist literature. (Severe) Study
- HIV-protease inhibitors increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- HIV-protease inhibitors increase the exposure to dopamine receptor agonists (bromocriptine). (Severe) Study
- HIV-protease inhibitors are predicted to increase the concentration of dopamine receptor agonists (cabergoline). (Moderate) Anecdotal
- HIV-protease inhibitors are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical
- Efavirenz decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. (Severe) Study  Also see TABLE 9 p. 876
- HIV-protease inhibitors are predicted to markedly increase the exposure to elagritrptan. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to elagritrptan. Avoid or adjust dose—consult product literature. (Severe) Study
- HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) increase the concentration of elavatrigitrptan. Refer to specialist literature. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to encaferelin. Avoid or monitor. (Severe) Study  Also see TABLE 9 p. 876
- HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Severe) Theoretical
- HIV-protease inhibitors are predicted to slightly increase the exposure to elotristib. Use with caution and adjust dose. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to esketamine. Adjust dose. (Moderate) Study
- Ritonavir is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- Etravirine increases the exposure to fosamprenavir (boosted with ritonavir). Refer to specialist literature. (Moderate) Study
- Tipranavir decreases the exposure to etravirine. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the concentration of everolimus. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. (Severe) Study
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to fidaxomycin. Avoid. (Moderate) Study
- Ritonavir is predicted to increase the exposure to fluazepton. Avoid. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to fosaprepitant. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to gefitinib. (Moderate) Study
- HIV-protease inhibitors (atazanavir, darunavir, lopinavir) (boosted with ritonavir) increase the exposure to glecaptreon. Avoid. (Severe) Study
- Ritonavir increases the exposure to glecaptreon. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to moderately to markedly increase the exposure to grazopretron. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to guanafacine. Adjust guanafacine dose. p. 237. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to imatinib. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the risk of toxicity when given with irinoctcan. Avoid. (Moderate) Study
- Ritonavir is predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to ivabradine. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to ivacafactor p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study  Also see TABLE 9 p. 876
- Tipranavir (boosted with ritonavir) is predicted to decrease the exposure to leupasb. Avoid. (Severe) Theoretical
- HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) are predicted to increase the concentration of letomervar. (Moderate) Study
- Ritonavir is predicted to decrease the concentration of letomervar. (Moderate) Theoretical
- Ritonavir is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- HIV-protease inhibitors are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to lurasidone. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to macitentan. (Moderate) Study
- HIV-protease inhibitors (clarithromycin) increase the exposure to saquinavir and saquinavir increases the exposure to macitentan (clarithromycin). Avoid. (Severe) Study  Also see TABLE 9 p. 876
- HIV-protease inhibitors (erythromycin) are predicted to increase the exposure to saquinavir. Avoid. (Severe) Theoretical  Also see TABLE 9 p. 876
- Atazanavir is predicted to increase the exposure to macitentan (clarithromycin). Adjust dose in renal impairment. (Severe) Study
- Ritonavir increases the exposure to macitentan (clarithromycin). Adjust dose in renal impairment. (Severe) Study.
HIV-protease inhibitors – HIV-protease inhibitors

- Tipranavir (boosted with ritonavir) increases the exposure to macrolides (clarithromycin) and macrolides (clarithromycin) increase the exposure to tipranavir (boosted with ritonavir). Monitor; adjust dose in renal impairment. (Severe) Study
- HIV-protease inhibitors (darunavir, fosamprenavir, lopinavir) (boosted with ritonavir) are predicted to increase the exposure to macrolides (clarithromycin). Adjust dose in renal impairment. (Severe) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, tipranavir) are predicted to increase the exposure to macrolides (erythromycin). (Severe) Theoretical
- Darunavir (boosted with ritonavir) markedly increases the exposure to maraviroc. Refer to specialist literature. (Severe) Study
- Maraviroc potentially decreases the exposure to fosamprenavir and fosamprenavir potentially decreases the exposure to maraviroc. Avoid. (Severe) Study
- HIV-protease inhibitors (atazanavir, saquinavir) moderately to markedly increase the exposure to maraviroc. Refer to specialist literature. (Severe) Study
- Lopinavir (boosted with ritonavir) moderately increases the exposure to maraviroc. Refer to specialist literature. (Severe) Study
- Ritonavir markedly increases the exposure to maraviroc. Refer to specialist literature. (Severe) Study
- Ritonavir is predicted to decrease the exposure to melatonin. (Moderate) Theoretical
- Ritonavir is predicted to increase the clearance of mexiletine. Monitor and adjust dose. (Moderate) Study
- HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Severe) Study
- HIV-protease inhibitors are predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to mirtazapine. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to modafinil. (Mild) Theoretical
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to netupitant. (Moderate) Study
- Nevirapine decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to nitazoxanide. Adjust dose. (Moderate) Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study → Also see TABLE 9 p. 876
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to nintedanib. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to nitisinone. Adjust dose. (Moderate) Theoretical
- Ritonavir is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Aneclotal
- Ritonavir is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Ombitasvir (in fixed-dose combination with dasabuvir) decreases the concentration of darunavir. Avoid or adjust dose. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study
- HIV-protease inhibitors (boosted with ritonavir) are predicted to decrease the exposure to opioids (methadone). (Moderate) Study → Also see TABLE 9 p. 876
- Ritonavir is predicted to decrease the concentration of opioids (morphine). (Moderate) Theoretical
- Ritonavir increases the risk of CNS toxicity when given with opioids (pethidine). Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to ospemifene. Avoid in poor CYP2C9 metabolisers. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to oxybutynin. (Mild) Study
- HIV-protease inhibitors are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. (Moderate) Study → Also see TABLE 9 p. 876
- Atazanavir (boosted with ritonavir) markedly increases the exposure to paritaprevir. Avoid or give unboosted. (Moderate) Study
- Darunavir (boosted with ritonavir) slightly decreases the exposure to paritaprevir. Avoid or give unboosted. (Moderate) Study
- HIV-protease inhibitors (fosamprenavir, tipranavir) (boosted with ritonavir) are predicted to increase the exposure to paritaprevir. Avoid. (Severe) Study
- Lopinavir (boosted with ritonavir) moderately increases the exposure to paritaprevir. Avoid or give unboosted. (Severe) Study
- Saquinavir is predicted to increase the exposure to paritaprevir (in fixed-dose combination). Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. (Moderate) Study → Also see TABLE 9 p. 876
- HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study → Also see TABLE 9 p. 876
- HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil, tadalafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. (Severe) Study → Also see TABLE 9 p. 876
- HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. (Severe) Study
- HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) increase the exposure to pibrentasvir. Avoid. (Severe) Study
- Ritonavir potentially increases the exposure to pibrentasvir. (Severe) Theoretical
- Saquinavir is predicted to increase the exposure to pibrentasvir. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to pimozide. Avoid. (Severe) Study → Also see TABLE 9 p. 876
- Ritonavir is predicted to decrease the exposure to pirenidone. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. (Moderate) Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to praziquantel. (Mild) Study
- Proton pump inhibitors decrease the exposure to atazanavir. Avoid or adjust dose. (Severe) Study
- Proton pump inhibitors increase the exposure to saquinavir. Avoid. (Severe) Study
- Tipranavir decreases the exposure to proton pump inhibitors. Avoid. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study
- Atazanavir increases the exposure to raltegravir (high-dose). Avoid. (Moderate) Study
- Darunavir increases the risk of rash when given with raltegravir. (Moderate) Study
HIV-protease inhibitors (continued)

▶ Fosamprenavir (boosted with ritonavir) decreases the exposure to raltegravir and raltegravir decreases the exposure to fosamprenavir (boosted with ritonavir). Avoid. [Severe] Study
▶ Tipranavir (boosted with ritonavir) is predicted to decrease the exposure to raltegravir (high-dose). Avoid. [Moderate] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the exposure to rifabutin. Avoid. [Severe] Study  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the exposure to ripafibutin. Avoid. [Severe] Study
▶ Tipranavir markedly increases the exposure to rifabutin. Avoid or adjust dose. [Severe] Study
▶ Rifampicin is predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, fosamprenavir, lopinavir, saquinavir, tipranavir) (boosted with ritonavir) increase the exposure to rifabutin. Monitor and adjust dose. [Severe] Study
▶ Ritonavir markedly increases the exposure to rifabutin. Avoid or adjust dose. [Severe] Study
▶ Rifampicin is predicted to markedly decrease the exposure to rifapentine. Adjust dose. [Moderate] Study  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the exposure to rifapentine. Adjust dose and monitor side effects. [Moderate] Study
▶ HIV-protease inhibitors are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
▶ Tipranavir is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to sofosbuvir. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to SSRIs (dapoxetine). Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study
▶ St John's Wort is predicted to decrease the exposure to HIV-protease inhibitors. Avoid. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to statins (atrovasstatin). Avoid or adjust dose and monitor cholesterolyis. [Severe] Study
▶ HIV-protease inhibitors slightly to moderately increase the exposure to statins (rosuvastatin). Avoid or adjust dose. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to statins (simvastatin). Avoid or adjust dose. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to simvastatin. Avoid or adjust simvastatin dose. [Moderate] Study  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study
▶ HIV-protease inhibitors are predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical
▶ HIV-protease inhibitors are predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical
▶ HIV-protease inhibitors (atazanavir, darunavir, lopinavir) increase the exposure to tenofovir alafenamide. Avoid or adjust dose. [Moderate] Study
▶ HIV-protease inhibitors are predicted to decrease the exposure to tenofovir alafenamide. Avoid. [Moderate] Theoretical
▶ HIV-protease inhibitors (atazanavir, darunavir, lopinavir) are predicted to increase the risk of renal impairment when given with tenofovir disoproxil. [Severe] Anecdotal
▶ HIV-protease inhibitors are predicted to increase the exposure to tezacafar. Adjust tezacafar with ivacafar to 190 mg with potent inhibitors of CYP3A4. [Severe] Study
▶ Ritonavir is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
▶ Ritonavir decreases the concentration of thyroid hormones (levothyroxine). MHR advises monitor TSH for at least one month after starting or stopping ritonavir. [Moderate] Anecdotal
▶ HIV-protease inhibitors are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
▶ Ritonavir moderately decreases the exposure to tizanidine. [Mild] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to tolterodine. Avoid. [Severe] Study  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. [Severe] Study
▶ HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to totopecan. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to toremifene. [Moderate] Theoretical  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical
▶ HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the concentration of trametinib. [Moderate] Theoretical
▶ HIV-protease inhibitors are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study
▶ HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical
▶ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
▶ Ritonavir decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
▶ Tipranavir is predicted to increase the exposure to velpatasvir. [Severe] Theoretical
▶ HIV-protease inhibitors are predicted to increase the exposure to vemurafenib. [Severe] Theoretical  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. [Severe] Study
▶ HIV-protease inhibitors are predicted to increase the exposure to vinflazane. [Moderate] Study  Also see TABLE 9 p. 876
▶ HIV-protease inhibitors are predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study
▶ Atazanavir (boosted with ritonavir) increases the concentration of voxilaprevir. Avoid. [Severe] Study
▶ Lopinavir (boosted with ritonavir) is predicted to increase the concentration of voxilaprevir. Avoid. [Severe] Theoretical
▶ Tipranavir (boosted with ritonavir) is predicted to increase the concentration of voxilaprevir. [Severe] Theoretical
Hydroxychloroquine is predicted to decrease the effects of vitamin K antagonists (warfarin, acenocoumarol, phenprocoumon), but not vitamin K antagonists (nimodipine, diltiazem). Avoid. Study

Hydroxychloroquine is predicted to decrease the risk of haematological toxicity when given with penicillamine. Avoid. Theoretical

Hydroxychloroquine is predicted to increase the risk of heart failure when given with amiodarone. Avoid. Theoretical

Hydroxychloroquine is predicted to increase the risk of thrombocytopenia when given with ciprofloxacin, clindamycin (oral), clindamycin (IV), levofloxacin, moxifloxacin, norfloxacin, ofloxacin, piperacillin/tazobactam, quinupristin/dalfopristin, rifampicin, trimethoprim, vancomycin. Avoid. Theoretical

Hydroxychloroquine is predicted to increase the risk of ototoxicity when given with aminoglycosides (amikacin, gentamicin, tobramycin, neomycin, streptomycin). Avoid. Theoretical

Hydroxychloroquine is predicted to increase the risk of dermatomyositis when given with cobicistat. Avoid. Theoretical

Hydroxychloroquine, antimalarials, chloroquine, primaquine, hydroxychloroquine, quinine are predicted to increase the risk of bone fracture when given with bisphosphonates. Avoid. Theoretical

Hydroxychloroquine is predicted to increase the risk of cardiovascular events when given with verapamil. Avoid. Study

Hydroxychloroquine is predicted to increase the risk of retinopathy when given with vitamin A. Avoid. Study

Hydroxychloroquine is predicted to increase the risk of phototoxicity when given with isoniazid. Avoid. Study

Hydroxychloroquine increases the risk of toxicity when given with hydroxyurea. Avoid. Study

Hydroxychloroquine increases the risk of toxicity when given with hydroxyurea, chlorambucil, 6-mercaptopurine, mercaptopurine, methotrexate. Avoid. Study

Hydroxychloroquine increases the risk of toxicity when given with cyclosporine. Avoid. Study

Hydroxychloroquine increases the risk of toxicity when given with cyclophosphamide, azathioprine, 6-mercaptopurine, mercaptopurine. Avoid. Theoretical

Hydroxychloroquine increases the risk of toxicity when given with retinoic acid. Avoid. Study

Hydroxychloroquine increases the risk of toxicity when given with retinoids. Avoid. Study

Hydroxychloroquine increases the risk of toxicity when given with immunomodulators (cyclosporine, tacrolimus, mycophenolate mofetil, sirolimus, thalidomide). Avoid. Study

Hydroxychloroquine increases the risk of toxicity when given with extracorporeal membrane oxygenation (ECMO). Avoid. Study
Ibrutinib (continued)

- Macrolides (erythromycin) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study

- Mitotane is predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Study Also see TABLE 15 p. 877

- Netupitant is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study

- Nilotinib is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study Also see TABLE 15 p. 877

- Quinolones (ciprofloxacin) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose. [Severe] Study

- Rifampicin is predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Study

- St John’s Wort is predicted to decrease the exposure to ibrutinib. Avoid. [Severe] Theoretical

- Ibuprofen is predicted to decrease the efficacy of ibatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. [Moderate] Theoretical

- Ibrutinib is predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. [Moderate] Theoretical

- Ibrutinib is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. [Severe] Study

- Ibrutinib is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study

- Ibrutinib increases the exposure to alprazolam. Use with caution or avoid. [Moderate] Study

- Ibrutinib is predicted to increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

- Ibrutinib is predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study

- Ibrutinib moderately increases the exposure to alprazolam. Avoid. [Moderate] Study

- Ibrutinib is predicted to increase the exposure to antihistamines (amiodarone). Avoid. [Moderate] Theoretical

- Ibrutinib is predicted to increase the exposure to antihistamines (dronedarone). Avoid. [Severe] Study

- Ibrutinib is predicted to increase the exposure to antihistamines (propafenone). Monitor and adjust dose. [Severe] Study

- Ibrutinib is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study

- Ibrutinib is predicted to very slightly increase the exposure to antiepileptics (perampanel). [Mild] Study

- Ibrutinib is predicted to increase the exposure to antifungals, azoles (itraconazole). Avoid or monitor side effects. [Severe] Study

- Ibrutinib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Severe] Study

- Ibrutinib is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study

- Ibrutinib is predicted to increase the concentration of antimalarials (piperazine). [Severe] Theoretical

- Ibrutinib is predicted to increase the exposure to apalutamide. [Mild] Study

- Ibrutinib is predicted to markedly increase the exposure to aripiprazole. Adjust aripiprazole dose, p 255. [Moderate] Study

- Ibrutinib is predicted to increase the exposure to aripiprazole. Adjust dose. [Moderate] Study Also see TABLE 15 p. 877

- Ibrutinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study

- Ibrutinib is predicted to increase the exposure to beta, agonists (salmeterol). Avoid. [Severe] Study

- Ibrutinib slightly increases the exposure to bortezomib. [Moderate] Study Also see TABLE 15 p. 877

- Bosantan is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical

- Ibrutinib is predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Study Also see TABLE 15 p. 877

- Ibrutinib is predicted to increase the exposure to brigatinib. Adjust brigatinib dose. [Severe] Study

- Ibrutinib is predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study

- Ibrutinib slightly increases the exposure to cabozantinib. [Moderate] Study Also see TABLE 15 p. 877

- Ibrutinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

- Ibrutinib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

- Ibrutinib is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. [Severe] Study

- Ibrutinib is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical

- Ibrutinib is predicted to moderately increase the exposure to cariprazine. Avoid. [Severe] Study

- Ibrutinib is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. [Severe] Study Also see TABLE 15 p. 877

- Ibrutinib increases the concentration of ciclosporin. [Severe] Study

- Ibrutinib is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study

- Ibrutinib is predicted to moderately increase the exposure to cinacalcet. Adjust dose. [Moderate] Study

- Ibrutinib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study

- Ibrutinib is predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study

- Ibrutinib is predicted to increase the exposure to corticosteroids (beclometasonide) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- Ibrutinib is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study

- Ibrutinib is predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study Also see TABLE 15 p. 877

- Ibrutinib is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study Also see TABLE 15 p. 877

- Ibrutinib is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

- Ibrutinib is predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. [Severe] Study Also see TABLE 15 p. 877

- Ibrutinib very slightly increases the exposure to delamanid. [Severe] Study

- Ibrutinib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study

- Ibrutinib increases the exposure to dopamine receptor agonists (bromocriptine). [Severe] Study

- Ibrutinib is predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Mild] Aneocolial

- Ibrutinib is predicted to increase the exposure to doravirine. [Mild] Study

- Ibrutinib is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical

- Efavirenz is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical

- Ibrutinib is predicted to markedly increase the exposure to eletriptan. Avoid. [Severe] Study
Idelalisib is predicted to increase the exposure to elisibastat. Avoid or adjust dose—consult product literature. [Severe] Study

Idelalisib is predicted to increase the exposure to encorafenib. Avoid or monitor. [Severe] Study

Enzalutamide is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study

Idelalisib is predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical

Idelalisib is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical

Idelalisib is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to esketamine. Adjust dose. [Moderate] Study

Idelalisib is predicted to increase the concentration of everolimus. Avoid. [Severe] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

Idelalisib is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to gefitinib. [Moderate] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to moderately to markedly increase the exposure to gefitinib. Avoid potent inhibitors of CYP3A4 or adjust gefitinib dose. [Severe] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 237. [Moderate] Study

Idelalisib is predicted to very markedly increase the exposure to irinotecan. Avoid. [Severe] Study

Idelalisib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study

Idelalisib is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study

Idelalisib is predicted to markedly increase the exposure to lomitapide. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to macitentan. [Moderate] Study

Idelalisib markedly increases the exposure to maraviroc. Adjust dose. [Severe] Theoretical

Idelalisib is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study

Idelalisib is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. [Moderate] Study

Idelalisib is predicted to increase the exposure to mirtazapine. [Moderate] Study

Mitotane is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to mofafenil. [Mild] Theoretical

Idelalisib is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] TheoreticalAlso see TABLE 15 p. 877

Idelalisib is predicted to markedly increase the exposure to naloxone. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to netupitant. [Moderate] Study

Nevirapine is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical

Idelalisib is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to nitidine. Adjust dose. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. [Moderate] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to opioids (methadone). [Severe] Theoretical

Idelalisib is predicted to increase the exposure to ospemifene. Avoid in poor CYP2C9 metabolisers. [Moderate] Study

Idelalisib is predicted to increase the exposure to oxybutynin. [Mild] Study

Idelalisib is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study

Idelalisib is predicted to increase the exposure to panobinostat. Adjust panobinostat dose, in hepatic impairment avoid. [Moderate] Study. Also see TABLE 15 p. 877

Paritaprevir is predicted to increase the exposure to idelalisib. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. [Severe] Study

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to pimozide. Avoid. [Severe] Study

Idelalisib is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

Idelalisib is predicted to moderately increase the exposure to paziquantel. [Mild] Study

Idelalisib is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

Idelalisib is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to reglaxidine. [Moderate] Study

Idelalisib is predicted to increase the exposure to retinoids (all-transretinoin). Adjust all-transretinoin dose. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study. Also see TABLE 15 p. 877

Idelalisib is predicted to increase the exposure to saxagliptin. [Mild] Study

Idelalisib is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

Idelalisib is predicted to moderately increase the exposure to SSRIs. [Moderate] Study. Also see dapoxetine dos. [Severe] Study

St John’s Wort is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical
Idelalisib (continued)

- **Idelalisib** is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Study
- **Idelalisib** is predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. (Moderate) Study → Also see TABLE 15 p. 877
- **Idelalisib** is predicted to increase the concentration of **tocrolimus**. Monitor and adjust dose. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study → Also see TABLE 15 p. 877
- **Idelalisib** is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. (Severe) Study → Also see TABLE 15 p. 877
- **Idelalisib** is predicted to increase the exposure to taxanes (paclitaxel). (Severe) Theoretical → Also see TABLE 15 p. 877
- **Idelalisib** is predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical → Also see TABLE 15 p. 877
- **Idelalisib** is predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
- **Idelalisib** is predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. (Moderate) Study
- **Idelalisib** is predicted to increase the exposure to tolterodine. Avoid. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to toremifene. (Moderate) Theoretical
- **Idelalisib** is predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 15 p. 877
- **Idelalisib** is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Moderate) Study
- **Idelalisib** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to vemurafenib. (Severe) Theoretical
- **Idelalisib** is predicted to increase the exposure to venlafaxine. (Moderate) Study
- **Idelalisib** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical → Also see TABLE 15 p. 877
- **Idelalisib** is predicted to increase the exposure to vitamin D receptor agonists (tamsulosin). (Moderate) Theoretical
- **Idelalisib** is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Theoretical
- **Ilosframide** → see alkylating agents
- **Iloprost** → see TABLE 4 p. 874 (antiplatlet effects)
- **Imatinib** is predicted to increase the exposure to abemaciclib. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate) Theoretical
- **Imatinib** is predicted to increase the exposure to alprazolam. (Severe) Study
- **Imatinib** is predicted to increase the exposure to antihypertensives (dronedarone). (Severe) Theoretical
- **Imatinib** is predicted to increase the exposure to antihypertensives (propafenone). Monitor and adjust dose. (Moderate) Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study
- **Antiepileptics** (oxcarbazepine) decrease the exposure to imatinib. Avoid. (Moderate) Study
- **Antifungals**, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to imatinib. (Moderate) Theoretical
Imatinib

- Imatinib is predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical
- Imatinib is predicted to increase the exposure to erlotinib. (Moderate) Theoretical
- Imatinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. (Severe) Study
- Imatinib is predicted to increase the exposure to gefitinib. (Moderate) Theoretical
- Grapefruit juice is predicted to increase the exposure to imatinib. (Moderate) Theoretical
- Imatinib is predicted to increase the concentration of guanafacine. Adjust guanafacine dose, p. 237. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to imatinib. (Moderate) Study
- Imatinib is predicted to increase the exposure to irinotecan. Avoid. (Moderate) Theoretical
- Imatinib is predicted to increase the exposure to lenalidomide. Avoid. (Moderate) Theoretical
- Idelalisib is predicted to increase the exposure to imatinib. (Moderate) Study
- Imatinib is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical
- Imatinib is predicted to increase the exposure to lurasonone. Adjust lurasonone dose. (Moderate) Study
- Macrolides (erythromycin) are predicted to increase the exposure to imatinib. (Moderate) Study
- Mitotane is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to naltrexone. Adjust naltrexone dose and monitor side effects. (Moderate) Study
- Netupitant is predicted to increase the exposure to imatinib. (Moderate) Theoretical
- Nevirapine is predicted to decrease the exposure to imatinib. (Moderate) Study
- Imatinib is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- Imatinib is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical
- Imatinib is predicted to increase the exposure to oxystigmat. Avoid. (Moderate) Study
- Imatinib increases the risk of hepatotoxicity when given with paracetamol. (Severe) Anecdotal
- Imatinib is predicted to increase the exposure to pazopanib. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Pegasparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. (Severe) Theoretical → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Adjust sildenafil dose. (Moderate) Theoretical
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 120. (Moderate) Study
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). (Severe) Theoretical
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors ( vardenafl). Adjust dose. (Severe) Theoretical
- Imatinib is predicted to increase the exposure to pimozide. Avoid. (Severe) Theoretical
- Imatinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Imatinib is predicted to increase the exposure to ranolazine. (Severe) Study
- Imatinib is predicted to increase the exposure to ribociclib. (Moderate) Study
- Rifampcin is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study
- Imatinib is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to saxagliptin. (Mild) Study
- St John’s Wort is predicted to decrease the exposure to imatinib. (Moderate) Study
- Imatinib is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Study
- Imatinib is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 136. (Severe) Study
- Imatinib is predicted to increase the concentration of tacrolimus. (Severe) Study
- Imatinib is predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical → Also see TABLE 15 p. 877
- Vedolizol is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. (Moderate) Study
- Imatinib is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
- Imatinib is predicted to increase the exposure to tepotinib. Adjust tepotinib dose. (Moderate) Study
- Imatinib is predicted to increase the exposure to tolgodirone. (Mild) Theoretical
- Imatinib is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study
- Imatinib is predicted to increase the exposure to trazodone. (Moderate) Theoretical
- Imatinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study
- Imatinib is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study
- Imatinib is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Study
- Indacaterol see ACE inhibitors
- Imipenem see carbapenems
- Impiramine see tricyclic antidepressants

Immunoglobulins

- Anti-D (Rh), immunoglobulin - antithymocyte immunoglobulin (rabbit) - hepatitis B immunoglobulin - normal immunoglobulin - rabies immunoglobulin - tetanus immunoglobulin - varicella-zoster immunoglobulin

- Immunoglobulins are predicted to alter the effects of monoclonal antibodies (dinutuzumab). Avoid. (Severe) Theoretical

Indacaterol see beta, agonists

Imatinib — Indacaterol 971
Interactions
Appendix 1

Irinotecan
▶ Rifampicin are predicted to increase the risk of hypoglycaemia when given with insulin. [Moderate] Theoretical

Insulins → Deferasirox are predicted to decrease the exposure to oral iron chelators. Monitor serum ferritin and adjust dose. [Moderate] Theoretical

Iron (oral) decreases the absorption of oral iron (oral). Dolutegravir should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Iron (oral) decreases the absorption of oral bisphosphonates (ibandronic acid). Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Iron (oral) decreases the absorption of bisphosphonates (risendronate). Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of bisphosphonates (sodium clodronate). Avoid iron (oral) for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Calcium salts (calcium carbonate) decrease the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). [Moderate] Study

Iron (oral) is predicted to decrease the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Efalizumab is predicted to decrease the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Infliximab is predicted to increase the exposure to irinotecan. [Severe] Study

Insulins are predicted to increase the risk of hypoglycaemia when given with irinotecan. Avoid. [Severe] Study

Iron (oral) decreases the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Efalizumab is predicted to decrease the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Iron (oral) decreases the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Efalizumab decreases the efficacy of intravenous iron (injectable). [Moderate] Anecdotal

Iron (injectable)
ferric carboxymaltose - iron dextran - iron isomaltoside 1000 - iron sucrose

Chloramphenicol decreases the efficacy of intravenous iron (injectable). [Moderate] Anecdotal

Iron (oral)
ferric maltol - ferrous fumarate - ferrous gluconate - ferrous sulfate - sodium ferederate

Antacids decrease the absorption of iron (oral). Iron (oral) should be taken 1 hour before or 2 hours after antacids. [Moderate] Study

Iron (oral) decreases the exposure to bictegravir. Bictegravir should be taken 2 hours before iron (oral). [Moderate] Study

Iron (oral) is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Iron (oral) decreases the absorption of bisphosphonates (risendronate). Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of bisphosphonates (sodium clodronate). Avoid iron (oral) for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Calcium salts (calcium carbonate) decrease the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). [Moderate] Study

Iron (oral) is predicted to decrease the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Efalizumab is predicted to decrease the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Efalizumab decreases the efficacy of iron (oral). [Moderate] Theoretical

Iron (oral) decreases the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Iron (oral) decreases the absorption of oral efalizumab. Efalizumab should be taken 2 hours before or 6 hours after iron (oral). [Moderate] Study

Efalizumab decreases the efficacy of iron (oral). [Moderate] Theoretical

Iron (oral) decreases the absorption of levodopa. [Moderate] Study

Iron (oral) decreases the effects of methyldopa. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. [Hrud] Study

Iron (oral) decreases the exposure to quinolones. Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral). [Moderate] Study

Iron (oral) decreases the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours. [Moderate] Study

Iron (oral) potentially decreases the absorption of iron (oral). [Moderate] Theoretical

Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) is predicted to decrease the efficacy of zinc. [Moderate] Study

Iron chelators
deferasirox - desferrioxamine - dextrazene

Deferasirox is predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical

Antacids (aluminium hydroxide) are predicted to decrease the exposure to deferasirox. Avoid. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. [Moderate] Theoretical

Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with desferrioxamine. [Severe] Theoretical

Indapamide
▶ see thiazide diuretics

Indometacin → see NSAIDs

Indoramin → see alpha blockers

Infliximab → see mononuclear antibodies

Influenza vaccine (live) → see live vaccines

Inotuzumab ozogamicin → see mononuclear antibodies

Insulins → see TABLE 14 p. 877 (antiplatlet effects)
▶ Fibrates are predicted to increase the risk of hypoglycaemia when given with insulin. [Moderate] Theoretical

Interferon alfa → see interferons

Interferons → see TABLE 15 p. 877 (myelosuppression)

Interferons - interferon beta - peginterferon alfa

Interferons are predicted to slightly increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical

Interferon alfa is predicted to increase the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Study

Interferons are predicted to slightly increase the exposure to theophylline. Adjust dose. [Moderate] Study

Peginterferon alfa increases the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Study

Interferons are predicted to slightly increase the exposure to theophylline. Adjust dose. [Moderate] Study

Ipratropium → see TABLE 10 p. 876 (antimuscarinics)

Beta2 agonists are predicted to increase the risk of glaucoma when given with ipratropium. [Moderate] Anecdotal

Irbesartan → see angiotensin-receptor antagonists

Irinotecan → see TABLE 15 p. 877 (myelosuppression)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Aprepitant is predicted to increase the exposure to intravenous irinotecan. [Severe] Theoretical

Cobicistat is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Enalaprilat is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Fibrates (gemfibrozil) are predicted to increase the exposure to irinotecan. Avoid. [Moderate] Theoretical

Fosaprepitant is predicted to increase the exposure to intravenous irinotecan. [Severe] Theoretical

HIV-protease inhibitors are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Idelalisib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study → Also see TABLE 15 p. 877

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Macrolides (clarithromycin) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Mitotane is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study → Also see TABLE 15 p. 877

Netupitant is predicted to increase the exposure to irinotecan. [Moderate] Study

Irinotecan is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical

Pitolisant is predicted to decrease the exposure to irinotecan. [Hrud] Theoretical

Rifampicin is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Rolapitant is predicted to increase the exposure to irinotecan. Avoid or monitor. [Moderate] Study

St John’s Wort slightly decreases the exposure to irinotecan. Avoid. [Severe] Study

Irinotecan is predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. [Moderate] Theoretical
Isoniazid potentially increases the risk of nephrotoxicity when given with volatile halogenated anaesthetics (methoxyflurane). Avoid. (Severe) Theoretical

Isosorbide dinitrate → see nitrates
Isosorbide mononitrate → see nitrates
Isoretinoin → see retinoids
Itraconazole → see antifungals, azoles
Ivabradine → see TABLE 6 p. 875 (bradycardia), TABLE 9 p. 876 (QT-interval prolongation)
Antiarhythms (dronedarone) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose. (Severe) Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. (Moderate) Theoretical
Antifungals, azoles (itraconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose. (Severe) Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Avoid. (Severe) Study
Aprepitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. (Severe) Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivabradine. Avoid. (Moderate) Study Also see TABLE 6 p. 875
Cobicistat is predicted to increase the exposure to ivabradine. (Severe) Study
Crizotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. (Severe) Theoretical Also see TABLE 6 p. 875
Ivabradine is predicted to increase the risk of torsade de pointes when given with drugs that prolong the QT interval. Avoid. (Severe) Theoretical
Enzalutamide is predicted to decrease the exposure to ivabradine. Adjust dose. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to ivabradine. Avoid. (Moderate) Study
HIV-protease inhibitors are predicted to increase the exposure to ivabradine. Avoid. (Severe) Study
Ivatropine is predicted to decrease the exposure to ivabradine. Adjust dose. (Moderate) Theoretical
St John's Wort decreases the exposure to ivabradine. Avoid. (Moderate) Study

Ivacaftor

FOOD AND LIFESTYLE Avoid bitter (Seville) oranges as they are predicted to increase the exposure to ivacaftor.

Antiarhythms (dronedarone) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. (Severe) Study
Antifungals, azoles (itraconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor
Ivacaftor (continued)

with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study

▶ Apalutamide is predicted to decrease the exposure to ivacaftor. Avoid or monitor. (Moderate) Study
▶ Aprepitant is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
▶ Bosantan is predicted to decrease the exposure to ivacaftor. (Severe) Theoretical
▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
▶ Cobicistat is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
▶ Crizotinib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
▶ Idelalisib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
▶ Imatinib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
▶ Ivacaftor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
▶ Miconazole (clarithromycin) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
▶ Macrolides (erythromycin) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or lumacaftor with ivacaftor p. 190 or tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
▶ Memantine is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
▶ Mitotane is predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. (Severe) Study
▶ Netupitant is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
▶ Nevirapine is predicted to decrease the exposure to ivacaftor. (Severe) Theoretical
▶ Nilotinib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
▶ Rifampicin is predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. (Severe) Study
▶ St John’s Wort is predicted to decrease the exposure to ivacaftor. (Severe) Theoretical

Ivermectin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

▶ Ivermectin potentially increases the anticoagulant effect of coumarins. (Severe) Anecdotal
▶ Levamisole increases the exposure to ivermectin. (Moderate) Study

Ivacaftor

▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivacaftor. Avoid. (Severe) Study
▶ Enzalutamide is predicted to decrease the exposure to ivacaftor. Avoid. (Severe) Study
▶ Mitotane is predicted to decrease the exposure to ivacaftor. Avoid. (Severe) Study
▶ Rifampicin is predicted to decrease the exposure to ivacaftor. Avoid. (Severe) Study
▶ St John’s Wort is predicted to decrease the exposure to ivacaftor. Avoid. (Severe) Theoretical

Ivacaftor with moderate inhibitors of CYP3A4.

Avoid or monitor.

Ivacaftor with moderate inhibitors of CYP3A4.

Adjust ivacaftor.

Ivacaftor with moderate inhibitors of CYP3A4.

Avoid or monitor.
Interactions

Lapatinib is predicted to increase the exposure to 
panobinostat. Adjust dose. (Moderate) Theoretical → Also see TABLE 9 p. 876

Lapatinib is predicted to increase the risk of bleeding events when given with 
phenindione. (Severe) Theoretical

Lapatinib is predicted to increase the exposure to 
piobrentasvir. (Moderate) Theoretical

Pitolisant is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study

Lapatinib is predicted to increase the exposure to 
sirolimus. (Moderate) Theoretical

St John’s Wort is predicted to decrease the exposure to 
lapatinib. Avoid. (Moderate) Theoretical

Lapatinib is predicted to increase the concentration of 
trametinib. (Moderate) Theoretical

Lapatinib is predicted to increase the exposure to 
venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical

Laronidase

Antimalarials (chloroquine) are predicted to decrease the 
exposure to laronidase. Avoid simultaneous administration. (Severe) Theoretical

Hydroxychloroquine is predicted to decrease the exposure to 
laronidase. Avoid simultaneous administration. (Severe) Theoretical

Ledipasvir

Antacids are predicted to decrease the exposure to 
ledipasvir. Separate administration by 4 hours. (Moderate) Theoretical

Ledipasvir increases the risk of severe bradycardia or heart 
block when given with antiarrhythmics (amiodarone). Refer to 
specialist literature. (Severe) Anecdotal

Antiepileptics (carbamazepine) are predicted to decrease the 
exposure to ledipasvir. Avoid. (Severe) Study

Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, 
phenytoin, primidone) are predicted to decrease the exposure to 
ledipasvir. Avoid. (Severe) Theoretical

Calcium salts (calcium carbonate) are predicted to decrease the 
exposure to ledipasvir. Separate administration by 4 hours. (Moderate) Theoretical

Leflunomide

→ see TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression)
Leflunomide – Letermovir

**PHARMACOLOGY** Leflunomide has a long half-life; washout procedure recommended before switching to other DMARDs (consult product literature).

- **Leflunomide** is predicted to increase the exposure to *adefovir*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to decrease the exposure to *agonolatine*.  
  - **[Moderate] Theoretical**
- **Leflunomide** decreases the exposure to *aminophylline*. Adjust dose.  
  - **[Moderate] Study**
- **Leflunomide** is predicted to decrease the exposure to *anaesthetics, local* (*ropivacaine*).  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *antracyclines* (*daunorubicin, doxorubicin, mitoxantrone*).  
  - **[Moderate] Theoretical → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the exposure to *antihistamines, non-sedating* (*fexofenadine*).  
  - **[Moderate] Study**
- **Leflunomide** potentially increases the exposure to *barticinib*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *bosentan*.  
  - **[Moderate] Study**
- **Leflunomide** is predicted to moderately increase the clearance of *caffeine citrate*. Monitor and adjust dose.  
  - **[Moderate] Study**
- **Leflunomide** is predicted to increase the exposure to *cephalosporins* (*cefaclor*).  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to decrease the exposure to *clozapine*.  
  - **[Moderate] Theoretical → Also see TABLE 15 p. 877**
- **Leflunomide** increases the anticoagulant effect of *coumarins*.  
  - **[Severe] Anecdotal**
- **Leflunomide** is predicted to decrease the exposure to *duloxetine*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *ganciclovir*.  
  - **[Moderate] Theoretical → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the exposure to *H₂ receptor antagonists* (*cimetidine, famotidine*).  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the concentration of *letermovir*.  
  - **[Moderate] Study**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with leflunomide. Public Health England advises avoid (refer to Green Book).  
  - **[Severe] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *loop diuretics* (*furosemide*).  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to decrease the exposure to *melatonin*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *methotrexate*.  
  - **[Moderate] Theoretical → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the clearance of *mexiteline*. Monitor and adjust dose.  
  - **[Moderate] Study**
- **Leflunomide** is predicted to increase the exposure to *nateglinide*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *NSAIDs* (*indometacin, ketoprofen*).  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to decrease the exposure to *olanzapine*. Monitor and adjust dose.  
  - **[Moderate] Study → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the exposure to *oseltamivir*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *penicillins* (*benzylicillin*).  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *pioglitazone*.  
  - **[Moderate] Study**
- **Leflunomide** is predicted to decrease the exposure to *pifithrin*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *quinolones* (*ciprofloxacin*).  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *repaglinide*.  
  - **[Moderate] Study**
- **Leflunomide** is predicted to increase the exposure to *rifampicin*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *selexipag*. Adjust dose.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *statins* (*atorvastatin, fluvastatin, pravastatin, simvastatin*).  
  - **[Moderate] Study → Also see TABLE 1 p. 874**
- **Leflunomide** is predicted to increase the exposure to *statins* (*rosuvastatin*). Adjust dose.  
  - **[Moderate] Study → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the exposure to *sulfsalazine*.  
  - **[Moderate] Study → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the exposure to *sulfonylureas* (*glibenclamide*).  
  - **[Moderate] Study**
- **Leflunomide** is predicted to increase the concentration of *taxanes* (*paclitaxel*).  
  - **[Severe] Anecdotal → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the exposure to *tenofovir alafenamid*.  
  - **[Moderate] Theoretical**
- **Leflunomide** is predicted to increase the exposure to *tenofovir disoproxil*.  
  - **[Theoretical] Theoretical**
- **Leflunomide** is predicted to decrease the exposure to *theophylline*. Adjust dose.  
  - **[Moderate] Study**
- **Leflunomide** moderately decreases the exposure to *tizianidine*.  
  - **[Anecdotal] Study**
- **Leflunomide** is predicted to increase the exposure to *topotecan*.  
  - **[Moderate] Study → Also see TABLE 15 p. 877**
- **Leflunomide** is predicted to increase the exposure to *zidovudine*.  
  - **[Moderate] Theoretical → Also see TABLE 15 p. 877**
- **Lenalidomide** → see TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression), TABLE 5 p. 874 (thromboembolism)
- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid.  
  - **[Severe] Theoretical**
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with lenalidomide.  
  - **[Severe] Theoretical**
- **Lenvatinib** → see TABLE 9 p. 876 (QT-interval prolongation)
- **Lercanidipine** → see calcium channel blockers

**Letermovir**

- **Letermovir** is predicted to increase the concentration of *antiarrhythmics* (*amiodarone*).  
  - **[Moderate] Theoretical**
- **Antiepileptics* (*carbamazepine, phenobarbital, primidone*) are predicted to decrease the concentration of *letermovir*.  
  - **[Moderate] Theoretical**
- **Letermovir** is predicted to decrease the concentration of *antiepileptics* (*fosphenytoin, phenytoin*) and antiepileptics (*fosphenytoin, phenytoin*) are predicted to decrease the concentration of *letermovir*.  
  - **[Moderate] Theoretical**
- **Letermovir** slightly decreases the exposure to *antifungals*, *azoles* (*voriconazole*).  
  - **[Moderate] Study**
- **Letermovir** is predicted to increase the concentration of *antihistamines, non-sedating* (*fexofenadine*).  
  - **[Moderate] Theoretical**
- **Letermovir** is predicted to increase the concentration of *boventan*.  
  - **[Moderate] Theoretical**
- **Letermovir** increases the exposure to *ciclosporin* and *ciclosporin* increases the exposure to *letermovir*. Monitor and adjust *letermovir* dose.  
  - **[Severe] Study**
- **Letermovir** is predicted to decrease the concentration of *coumarins* (*warfarin*). Monitor and adjust dose.  
  - **[Moderate] Theoretical**
- **Letermovir** is predicted to decrease the concentration of *dabigatran*. Avoid.  
  - **[Severe] Theoretical**
- **Efavirenz** is predicted to decrease the concentration of *letermovir*.  
  - **[Moderate] Theoretical**
- **Eltrombopag** is predicted to increase the concentration of *letermovir*.  
  - **[Moderate] Study**
- **Letermovir** is predicted to increase the concentration of *ergometrine*.  
  - **[Severe] Theoretical**
- **Letermovir** is predicted to increase the concentration of *ergotamine*.  
  - **[Severe] Theoretical**
- **Etravirine** is predicted to decrease the exposure to *letermovir*.  
  - **[Moderate] Theoretical**
- **Letermovir** is predicted to increase the concentration of *everolimus*. Monitor and adjust dose.  
  - **[Severe] Study**
- **Fibrates* (*gemfibrozil*) are predicted to increase the concentration of *letermovir*.  
  - **[Moderate] Study**
- HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) are predicted to increase the concentration of letermovir. [Moderate] Study
- HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- Leflunomide is predicted to increase the concentration of letermovir. [Moderate] Study
- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of letermovir. [Moderate] Study
- Levetiracetam is predicted to decrease the effects of letermovir. [Moderate] Study
- Levofolinic acid increases the risk of side-effects when given with levetiracetam. Monitor and adjust dose. [Moderate] Study
- Modafinil is predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- Letrozole is predicted to increase the exposure to opioids (alfentanil, fentanyl). Avoid. [Moderate] Theoretical
- Letrozole is predicted to increase the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
- Modafinil is predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- Letrozole is predicted to increase the exposure to opioids (alfentanil, fentanyl). Monitor and adjust dose. [Moderate] Study
- Letrozole is predicted to increase the concentration of pimozide. Avoid. [Moderate] Theoretical
- Letrozole is predicted to increase the concentration of repaglinide. Avoid. [Moderate] Theoretical
- Rifabutin is predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- Rifampicin is predicted to affect the concentration of letermovir. [Severe] Theoretical
- Letrozole moderately increases the exposure to sirolimus. Monitor and adjust dose. [Severe] Study
- St John’s Wort is predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- Letrozole moderately increases the exposure to statins (atorvastatin). Avoid or adjust atorvastatin dose, p. 134. [Severe] Study
- Letrozole is predicted to increase the exposure to statins (fluvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Letrozole is predicted to increase the exposure to statins (pravastatin). Avoid or adjust dose. [Moderate] Theoretical
- Letrozole is predicted to increase the exposure to statins (rosuvastatin, simvastatin). Avoid. [Severe] Study
- Letrozole is predicted to increase the concentration of sulfonylureas (glibenclamide). [Moderate] Theoretical
- Letrozole moderately increases the exposure to tacrolimus. Monitor and adjust dose. [Severe] Study
- Teriflunomide is predicted to decrease the concentration of letermovir. [Moderate] Study

### Levamisole
- Albendazole slightly decreases the exposure to levamisole and levamisole moderately decreases the exposure to albendazole. [Moderate] Study
- Alcohol (beverage) potentially causes a disulfiram-like reaction when given with levamisole. [Moderate] Study
- Levamisole increases the exposure to ivermectin. [Moderate] Study
- Levetiracetam is predicted to decrease the effects of levetirapine. See antiepileptics
- Levobunolol is predicted to decrease the effects of levetirapine. See beta blockers, non-selective
- Levobupivacaine is predicted to decrease the effects of levetirapine. See anaesthetics, local
- Levocetirizine is predicted to decrease the effects of levetirapine. See antihistamines, non-sedating
- Levodopa is predicted to increase the concentration of levetirapine. See general information.
- Levofolinic acid is predicted to decrease the effects of levetirapine. See folates
- Levomethadone is predicted to decrease the effects of levetirapine. See general information.
- Levonorgestrel is predicted to decrease the effects of levetirapine. See general information.
- Levonorgestrel is predicted to decrease the effects of levetirapine. See general information.
- Levonorgestrel is predicted to decrease the effects of levetirapine. See general information.
Levonorgestrel (continued)

- **Fosaprepitant** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **Lactose** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **Lumacaftor** is predicted to decrease the efficacy of levonorgestrel. Use additional contraceptive precautions. (Severe) Theoretical
- **Modafinil** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **Nevirapine** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **Rifabutin** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **St John’s Wort** is predicted to decrease the efficacy of levonorgestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- **Sugammadex** is predicted to decrease the efficacy of levonorgestrel. Use additional contraceptive precautions. (Severe) Theoretical
- **Ulipristal** is predicted to decrease the efficacy of levonorgestrel. Avoid. (Severe) Theoretical

Levothyroxine → see thyroid hormones
Linagliptin → see antihyperglycemics
Linagliptin → see antihyperglycemics
Linagliptin → see antihyperglycemics

**Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to linagliptin. (Moderate) Study

**Enalaprilamide** is predicted to decrease the exposure to linagliptin. (Moderate) Study

**Linagliptin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Mitotane** is predicted to decrease the exposure to linagliptin. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to linagliptin. (Moderate) Study

**Linezolid** → see Table 15 p. 877 (serotonin syndrome), Table 9 p. 876 (QT-interval prolongation)

**ACE inhibitors** are predicted to increase the concentration of lithium. Monitor and adjust dose. (Severe) Anecdotal

**Acetazolamide** alters the concentration of lithium. (Severe) Anecdotal

**Aldosterone antagonists** (eplerenone) potentially increase the concentration of lithium. Avoid. (Moderate) Theoretical

**Aldosterone antagonists** (spironolactone) potentially increase the concentration of lithium. Avoid. (Moderate) Study

**Aminophylline** is predicted to decrease the concentration of lithium. (Moderate) Theoretical

**Angiotensin-II receptor antagonists** potentially increase the concentration of lithium. Monitor concentration and adjust dose. (Severe) Anecdotal

**Antiepileptics** (carbamazepine, oxcarbazepine) are predicted to increase the risk of neurotoxicity when given with lithium. (Severe) Anecdotal

**Calcitonin (salmon)** decreases the concentration of lithium. Monitor concentration and adjust dose. (Moderate) Study

**Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the risk of neurotoxicity when given with lithium. (Severe) Anecdotal

**Loop diuretics** increase the concentration of lithium. Monitor and adjust dose. (Severe) Study

**Methyl dopa** increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal

**Mexiletine** potentially affects the exposure to lithium. Avoid. (Unknown) Theoretical

**NSAIDs** increase the concentration of lithium. Monitor and adjust dose. (Severe) Study

**Phenothiazines** potentially increase the risk of neurotoxicity when given with lithium. (Severe) Anecdotal → Also see Table 9 p. 876

**Potassium-sparking diuretics** (triamterene) potentially increase the clearance of lithium. (Moderate) Study

**Quetiapine** potentially increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal

**Risperidone** potentially increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal → Also see Table 9 p. 876

**Sodium bicarbonate** decreases the concentration of lithium. (Severe) Anecdotal

**Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. Avoid. (Severe) Theoretical → Also see Table 13 p. 877

**Monoamine-oxidase B inhibitors** (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. Avoid. (Severe) Theoretical → Also see Table 13 p. 877

**Rifaximin** is predicted to increase the risk of a hypertensive crisis when given with linezolid. Avoid. (Severe) Theoretical

**Rifampicin** slightly decreases the exposure to linezolid. (Moderate) Study

**Sympathomimetics, inotropic** are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Theoretical

**Sympathomimetics, vasoconstrictor** (adrenaline/epinephrine, ephedrine, isometheptene, noradrenaline/norepinephrine, phenylephrine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Theoretical

**Sympathomimetics, vasoconstrictor (pseudoephedrine)** increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Study

**Lothyrone** → see thyroid hormones

**Liraglutide** → see Table 14 p. 877 (antidiabetic drugs)

**Lisdexamfetamine** → see amphetamines

**Lisinopril** → see ACE inhibitors

**Lithium** → see Table 13 p. 877 (serotonin syndrome), Table 9 p. 876 (QT-interval prolongation)

**FOOD AND LIFESTYLE** Patients taking linezolid should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring. Bovril®, Oxo®, Marmitex® or any similar meat or yeast extract or fermented soybean extract, and some beers, lagers or wines).
Live vaccines

Bacillus Calmette-Guérin vaccine - influenza vaccine (live) - measles, mumps and rubella vaccine, live - rotavirus vaccine - typhoid vaccine, oral - varicella-zoster vaccine - yellow fever vaccine, live

GENERAL INFORMATION Oral typhoid vaccine is inactivated by concurrent administration of antibacterials or antimalarials; antibacterials should be avoided for 5 days before and after oral typhoid vaccination; melamine should be avoided for at least 12 hours before or after oral typhoid vaccination; for other antimalarials oral typhoid vaccine vaccination should be completed at least 3 days before and after oral typhoid vaccination; for other antimalarial oral typhoid vaccine vaccination should be completed at least 5 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which can be given concurrently).

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylation agents. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anakinra. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with baricitinib. Avoid. (Severe theoretical).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with bleomycin. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with capcitabine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cisplatin. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with corticosteroids (high-dose). Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fluorouracil. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with gemcitabine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxyurea. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with iron chelators (dextrazoxane). Avoid. (Severe theoretical).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with leflunomide. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mercaptopurine. Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with methotrexate (high-dose). Public Health England advises avoid (refer to Green Book).
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mitomycin. Public Health England advises avoid (refer to Green Book).
Live vaccines (continued)

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies. Public Health England advises avoid (refer to Green Book).** Moderated Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mycophenolate. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with pemtrexed. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with teriflunomide. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with platinum compounds. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with ralitrexed. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with streptozocin. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with sirolimus. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with lomitapide. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tegafur. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with temsirolimus. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with teriflunomide. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with trabectedin. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with venca alkaloids. Public Health England advises avoid (refer to Green Book).** Severe Theoretical**

**Table 14:** This table contains the separation of administration of diabetics.

- **Lixisenatide** → see **Table 14** p. 877 (antidiabetic drugs)
- **Separation of Administration** Some orally administered drugs should be taken at least 1 hour before, or 4 hours after, lixisenatide injection.
- **Lofepramine** → see tricyclic antidepressants
- **Lofezinidex** → see **Table 8** p. 875 (hypotension), **Table 9** p. 876 (QT-interval prolongation), **Table 11** p. 876 (CNP depressant effects)

**Lomitapide** → see **Table 1** p. 874 (hepatotoxicity)

**FOOD AND LIFESTYLE** Bitter (Seville) orange is predicted to increase the exposure to lomitapide; separate administration by 12 hours.

- **Alprazolam** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Antituberculosis (rifampicin and isoniazid)** are predicted to increase the exposure to lomitapide. Avoid.** Moderate Theoretical**
- **Antituberculosis (rifampicin and isoniazid)** are predicted to increase the exposure to lomitapide. Avoid.** Moderate Theoretical**
- **Antivirals (NRTIs)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Bicarbonate** is predicted to decrease the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Bicarbonate** is predicted to decrease the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Bicarbonate** is predicted to decrease the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**

**Table 1:** This table contains the combined hormonal contraceptives.

- **Combined Hormonal Contraceptives** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Combined Hormonal Contraceptives** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**

**Table 9:** This table contains the study information.

- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to decrease the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to decrease the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to decrease the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**

**Table 11:** This table contains the separation of administration.

- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**

**Table 12:** This table contains the study information.

- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**

**Table 13:** This table contains the study information.

- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**

**Table 14:** This table contains the separation of administration.

- **Study** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**

- **H₂ receptor antagonists (cimetidine, ranitidine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.** Moderate Theoretical**
- **HIV- protease inhibitors** are predicted to markedly increase the exposure to lomitapide. Avoid.** Severe Study**
- **Idelalisib** is predicted to markedly increase the exposure to lomitapide. Avoid.** Severe Study**
Imatinib is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

Isoniazid is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical → Also see Table 11 p. 874

Ivacafant is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Lapatinib is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Linaclotide is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Macrolides (azithromycin) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Macrolides (clarithromycin) are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study

Macrolides (erythromycin) are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

Mitozolate is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical

Netrapinid is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

Nilotinib is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

Pazopanib is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Peppermint oil is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Propiverine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Ranolazine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Rifampin is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical

SSRIs (fluoxetine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical

SSRIs (fluvoxamine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical

Lomitapide increases the exposure to statins (atorvastatin). Adjust lomitapide dose or separate administration by 12 hours. (Severe) Study → Also see Table 1 p. 874

Lomitapide increases the exposure to statins (simvastatin). Monitor and adjust simvastatin dose, p. 136. (Moderate) Study → Also see Table 1 p. 874

Tacrolimus is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Tigecycline is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Tolvaptan is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Loop diuretics are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Loop diuretics increase the concentration of lithium. Monitor and adjust dose. (Severe) Study

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to furosemide. Adjust dose. (Moderate) Theoretical

Reboxetine is predicted to increase the risk of hypokalaemia when given with loop diuretics. (Moderate) Theoretical

Teriflunomide is predicted to increase the exposure to furosemide. (Moderate) Study

Loperamide

Antiarrhythmics (dronedarone) are predicted to increase the exposure to loperamide. (Severe) Theoretical

Ceritinib is predicted to increase the exposure to loperamide. (Severe) Theoretical

Eperisone greatly increases the absorption of oral desmopressin (and possibly sublingual). (Moderate) Study

Eliglustat is predicted to increase the exposure to loperamide. Adjust dose. (Moderate) Study

Lapatinib is predicted to increase the exposure to loperamide. (Moderate) Theoretical

Mirabegron is predicted to increase the exposure to loperamide. (Mild) Theoretical

Opicapone is predicted to increase the exposure to loperamide. Avoid. (Moderate) Study

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to loperamide. (Moderate) Study

Pivalentevir (with geracaparin) is predicted to increase the exposure to loperamide. (Moderate) Study

Pitolisant is predicted to decrease the exposure to loperamide. (Mild) Theoretical

Velpatasvir is predicted to increase the exposure to loperamide. (Severe) Theoretical

Lopinavir → see HIV-protective inhibitors

Loprazolam → see Table 11 p. 876 (CNS depressant effects)

Loratadine → see antihistamines, non-sedating

Lorazepam → see Table 11 p. 876 (CNS depressant effects)

Rifampicin increases the clearance of lorazepam. (Moderate) Study

Lormetazepam → see Table 11 p. 876 (CNS depressant effects)

Losartan → see angiotensin receptor antagonists

Low molecular-weight heparins → see Table 16 p. 878 (increased serum potassium), Table 3 p. 874 (anticoagulant effects)

Dalteparin - enoxaparin - tinzaparin

Ranibizumab increases the risk of bleeding events when given with low molecular-weight heparins. (Severe) Theoretical

Loxapine → see Table 8 p. 875 (hypotension), Table 111 p. 876 (CNS depressant effects), Table 10 p. 876 (antimuscarinics)

Combined hormonal contraceptives are predicted to increase the exposure to lopinavir. Avoid. (Unknown) Theoretical

Lopinavir is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see Table 8 p. 875

Lopinavir is predicted to decrease the effects of levodopa. (Severe) Theoretical → Also see Table 8 p. 875

Mexitilene is predicted to increase the exposure to lorzapame. Avoid. (Unknown) Theoretical

Quinolones (ciprofloxacin) are predicted to increase the exposure to lopinavir. Avoid. (Unknown) Theoretical

SSRIs (fluvoxamine) are predicted to increase the exposure to lorzapame. Avoid. (Unknown) Theoretical

Lumacaftor

Lumacaftor is predicted to decrease the exposure to antifeptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. (Severe) Theoretical

Lumacaftor is predicted to decrease the exposure to antifyngals, azoles (fluconazole). Adjust dose. (Mild) Theoretical

Lumacaftor is predicted to decrease the exposure to antifyngals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole). Avoid or monitor efficacy. (Moderate) Theoretical

Lumacaftor is predicted to decrease the exposure to ciclosporin. Avoid. (Severe) Theoretical

Lumacaftor is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. (Severe) Theoretical
Lumacaftor (continued)

▶ Lumacaftor is predicted to decrease the exposure to corticosteroids (methylprednisolone). Adjust dose.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to doravirine. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to everolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor potentially decreases the exposure to glecaprevir. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the efficacy of levonorgestrel. Use additional contraceptive precautions.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin).  [Moderate] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to midazolam. Avoid.  [Severe] Theoretical

▶ Lumacaftor potentially decreases the exposure to pibrentasvir. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to rifabutin. Adjust dose.  [Moderate] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to temsirolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sitatunga. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid.  [Severe] Theoretical

▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid.  [Severe] Theoretical

▶ Antiarhythmic (dronedarone) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Antiproliferative (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lurasidone. Avoid.  [Moderate] Study

▶ Antifungal, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Antifungal, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Antifungal, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Antiinflammatory  see antimalarials

Lurasidone  see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

▶ Antiarhythmics (dronedarone) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Antiproliferative (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lurasidone. Avoid.  [Moderate] Study  Also see TABLE 11 p. 876

▶ Antifungal, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Antifungal, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Apalutamide is predicted to decrease the exposure to lurasidone. Avoid or monitor.  [Moderate] Study

▶ Aprepitant is predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Bosentan is predicted to decrease the exposure to lurasidone. Monitor and adjust dose.  [Moderate] Theoretical

▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study  Also see TABLE 8 p. 875

▶ Cobimetpat is predicted to increase the exposure to lurasidone. Avoid.  [Severe] Study

▶ Crizotinib is predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Efavirenz is predicted to decrease the exposure to lurasidone. Monitor and adjust dose.  [Moderate] Theoretical

▶ Enzalutamide is predicted to decrease the exposure to lurasidone. Avoid.  [Moderate] Study

▶ Grapefruit juice is predicted to increase the exposure to lurasidone. Avoid.  [Severe] Theoretical

▶ HIV-protease inhibitors are predicted to increase the exposure to lurasidone. Avoid.  [Severe] Study

▶ Idealalisib is predicted to increase the exposure to lurasidone. Avoid.  [Severe] Study

▶ Imatinib is predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Lurasidone is predicted to decrease the effects of levodopa.  [Severe] Theoretical  Also see TABLE 8 p. 875

▶ Macrolides (clarithromycin) are predicted to increase the exposure to lurasidone. Avoid.  [Severe] Study

▶ Macrolides (erythromycin) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Mitotane is predicted to decrease the exposure to lurasidone. Avoid.  [Moderate] Study

▶ Nevirapine is predicted to decrease the exposure to lurasidone. Monitor and adjust dose.  [Moderate] Theoretical

▶ Nilotinib is predicted to increase the exposure to lurasidone. Adjust lurasidone dose.  [Moderate] Study

▶ Rifampicin is predicted to decrease the exposure to lurasidone. Avoid.  [Moderate] Study

▶ St John’s Wort is predicted to decrease the exposure to lurasidone. Monitor and adjust dose.  [Moderate] Theoretical

Lymecycline  see tetracyclines

Macitentan

▶ Antiinflammatory (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to macitentan. Avoid.  [Severe] Study

▶ Antifungal, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to macitentan.  [Moderate] Study

▶ Cobimetpat is predicted to increase the exposure to macitentan.  [Moderate] Study

▶ Enalapril is predicted to decrease the exposure to macitentan. Avoid.  [Severe] Study

▶ HIV-protease inhibitors are predicted to increase the exposure to macitentan.  [Moderate] Study

▶ Idealalisib is predicted to increase the exposure to macitentan.  [Moderate] Study

▶ Macrolides (clarithromycin) are predicted to increase the exposure to macitentan.  [Moderate] Study

▶ Mitotane is predicted to decrease the exposure to macitentan. Avoid.  [Severe] Study

▶ Rifampicin is predicted to decrease the exposure to macitentan. Avoid.  [Severe] Study

▶ St John’s Wort is predicted to decrease the exposure to macitentan. Avoid.  [Severe] Theoretical

Macrolides  see TABLE 8 p. 876 (QT-interval prolongation)

azithromycin - clarithromycin - erythromycin

▶ Interactions do not generally apply to topical use of azithromycin unless specified.

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

▶ Clarithromycin is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose.  [Severe] Study

▶ Erythromycin is predicted to increase the exposure to abemaciclib.  [Moderate] Study

▶ Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren.  [Moderate] Theoretical

▶ Clarithromycin increases the exposure to almotriptan.  [MID] Study

▶ Clarithromycin is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid.  [Moderate] Study

▶ Clarithromycin is predicted to increase the exposure to alpha blockers (doxazosin).  [Moderate] Study

▶ Erythromycin is predicted to increase the exposure to alpha blockers (tamsulosin).  [Moderate] Theoretical

▶ Clarithromycin moderately increases the exposure to alprazolam. Avoid.  [Moderate] Study

▶ Erythromycin is predicted to increase the exposure to alprazolam.  [Severe] Study

▶ Azithromycin is predicted to increase the exposure to aminophylline.  [Moderate] Theoretical
Clarithromycin is predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

Aminophylline is predicted to decrease the exposure to erythromycin. Adjust dose. (Severe) Study

Clarithromycin very markedly increases the exposure to antirhythmic drugs (dronedarone). Avoid. (Severe) Study  Also see TABLE 9 p. 876

Erythromycin is predicted to moderately increase the exposure to antirhythmic drugs (dronedarone). Avoid. (Severe) Theoretical  Also see TABLE 9 p. 876

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to antirhythmic drugs (lidocaine). (Moderate) Theoretical

Clarithromycin is predicted to increase the exposure to antirhythmic drugs (propafenone). Monitor and adjust dose. (Severe) Study

Erythromycin is predicted to increase the exposure to antirhythmic drugs (propafenone). Monitor and adjust dose. (Moderate) Study

Clarithromycin slightly increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. (Severe) Study

Erythromycin markedly increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. (Severe) Study

Clarithromycin is predicted to very slightly increase the exposure to antiepileptics (perampanel). (Mild) Study

Clarithromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. (Severe) Study

Erythromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). (Moderate) Theoretical

Clarithromycin is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Study

Erythromycin is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). (Severe) Theoretical

Clarithromycin is predicted to increase the exposure to antimalarials. Avoid. (Severe) Study  Also see TABLE 9 p. 876

Erythromycin is predicted to increase the exposure to antimalarials. (Severe) Theoretical

Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of antimalarials (piperquina). (Severe) Theoretical

Clarithromycin is predicted to increase the exposure to apalutamide. (Mild) Study  Also see TABLE 9 p. 876

Erythromycin is predicted to increase the exposure to apalutamide. (Moderate) Theoretical

Clarithromycin is predicted to markedly increase the exposure to apreplint. (Moderate) Study

Erythromycin is predicted to increase the exposure to apreplint. (Moderate) Study

Clarithromycin is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. (Moderate) Study

Clarithromycin is predicted to increase the exposure to axtinib. Avoid or adjust dose. (Moderate) Study

Erythromycin is predicted to increase the exposure to axtinib. (Moderate) Theoretical

Clarithromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Study  Also see TABLE 9 p. 876

Erythromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Theoretical  Also see TABLE 9 p. 876

Macrolides are predicted to increase the exposure to beta blockers, non-selective (nadolol). (Moderate) Study

Clarithromycin is predicted to increase the exposure to beta2 agonists (salmeterol). Avoid. (Severe) Study

Macrolides are predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

Clarithromycin slightly increases the exposure to bortezomib. (Moderate) Study

Clarithromycin is predicted to increase the exposure to bosantan. (Moderate) Theoretical

Clarithromycin is predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Study  Also see TABLE 9 p. 876

Erythromycin is predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical  Also see TABLE 9 p. 876

Clarithromycin is predicted to increase the exposure to brigitanib. Adjust brigitanib dose. (Severe) Study

Clarithromycin is predicted to increase the exposure to buspirone. Adjust buspirone dose. (Severe) Study

Erythromycin is predicted to increase the exposure to buspirone. Use with caution and adjust dose. (Moderate) Study

Clarithromycin slightly increases the exposure to cabozantinib. (Moderate) Study  Also see TABLE 9 p. 876

Erythromycin is predicted to increase the exposure to cabozantinib. (Moderate) Theoretical  Also see TABLE 9 p. 876

Erythromycin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Clarithromycin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Erythromycin is predicted to increase the exposure to calcium channel blockers (diltiazem). (Severe) Theoretical

Clarithromycin is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Clarithromycin is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. (Severe) Study

Erythromycin is predicted to increase the exposure to calcium channel blockers (verapamil). (Severe) Study

Clarithromycin is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. (Moderate) Theoretical

Clarithromycin is predicted to moderately increase the exposure to cariprazine. Avoid. (Severe) Study

Erythromycin is predicted to increase the exposure to cariprazine. Avoid. (Severe) Study

Clarithromycin is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study  Also see TABLE 9 p. 876

Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical  Also see TABLE 9 p. 876

Clarithromycin increases the concentration of ciclosporin. (Severe) Study

Erythromycin is predicted to increase the concentration of ciclosporin. (Severe) Study

Clarithromycin is predicted to moderately increase the exposure to colchicine. Adjust colchicine dose. (Moderate) Study

Erythromycin potentially increases the risk of toxicity when given with colchicine. (Severe) Anecdotal

Clarithromycin is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study

Clarithromycin is predicted to increase the exposure to cobimetinib. (Severe) Theoretical

Azithromycin is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. (Severe) Theoretical

Clarithromycin is predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. (Severe) Study

Clarithromycin is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. (Severe) Study

Clarithromycin is predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). (Moderate) Theoretical

Clarithromycin is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, ...
Macrolides (continued)

deflazacort, dexamethasone, fluordcortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. (Severe) Study

- Erythromycin is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor INR and adjust dose. (Moderate) Study

- Macrolides (clarithromycin, erythromycin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Anecdotal

- Clarithromycin is predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 876

- Macrolides are predicted to increase the exposure to dabrafenib. Use with caution or avoid. (Moderate) Study

- Clarithromycin is predicted to markedly increase the exposure to dabrafenib. Avoid. (Severe) Study

- Erythromycin is predicted to slightly increase the exposure to dabrafenib. Avoid. (Severe) Study

- Clarithromycin is predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study → Also see TABLE 9 p. 876

- Erythromycin is predicted to slightly increase the exposure to dasatinib. (Severe) Study → Also see TABLE 9 p. 876

- Clarithromycin very slightly increases the exposure to delamanid. (Severe) Study → Also see TABLE 9 p. 876

- Macrolides increase the concentration of digoxin. (Severe) Anecdotal

- Clarithromycin increases the exposure to dopamine receptor agonists (bromocriptine). (Severe) Study

- Erythromycin is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). (Severe) Theoretical

- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of dopamine receptor agonists (caberetine). Avoid. (Severe) Study

- Clarithromycin is predicted to increase the exposure to doravirine. (Severe) Study

- Clarithromycin is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical

- Erythromycin is predicted to moderately increase the exposure to dutasteride. (Severe) Study

- Erythromycin slightly increases the exposure to edoxaban. Adjust dose. (Severe) Study

- Macrolides (azithromycin, clarithromycin) are predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical

- Efavirenz decreases the exposure to clarithromycin. (Moderate) Study → Also see TABLE 9 p. 876

- Clarithromycin is predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study

- Erythromycin moderately increases the exposure to eletriptan. Avoid or adjust dose—consult product literature. (Severe) Study

- Clarithromycin is predicted to increase the exposure to encofarenib. Avoid or monitor. (Severe) Study → Also see TABLE 9 p. 876

- Erythromycin is predicted to moderately increase the exposure to encofarenib. (Moderate) Study → Also see TABLE 9 p. 876

- Clarithromycin is predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical

- Erythromycin is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical

- Clarithromycin is predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical

- Erythromycin is predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical

- Clarithromycin is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. (Moderate) Study

- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to erlotinib. (Moderate) Theoretical

- Clarithromycin is predicted to increase the exposure to esetamitine. Adjust dose. (Moderate) Study

- Etravirine decreases the exposure to clarithromycin and clarithromycin slightly increases the exposure to etravirine. (Severe) Study

- Clarithromycin is predicted to increase the concentration of everolimus. Avoid. (Severe) Study

- Erythromycin is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study

- Clarithromycin is predicted to moderately increase the exposure to fosiderotinone. Adjust fosiderotinone dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. (Severe) Study

- Erythromycin is predicted to increase the exposure to fosiderotinone. Adjust fosiderotinone dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. (Mild) Study

- Macrolides are predicted to increase the exposure to fidaxomycin. Avoid. (Moderate) Study

- Clarithromycin is predicted to increase the exposure to fosaprinotinone. (Moderate) Theoretical

- Clarithromycin is predicted to increase the exposure to gefitinib. (Moderate) Study

- Erythromycin is predicted to increase the exposure to gefitinib. (Moderate) Theoretical

- Clarithromycin is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study

- Clarithromycin is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 237. (Moderate) Study

- Erythromycin is predicted to increase the concentration of guanfacine. Adjust guanfacine dose. p. 237. (Moderate) Theoretical

- H₂ receptor antagonists (cinetidine) slightly increase the exposure to erythromycin. (Moderate) Study

- HIV- protease inhibitors (atazanavir) are predicted to increase the exposure to clarithromycin. Adjust dose in renal impairment. (Severe) Study

- HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, tipranavir) are predicted to increase the exposure to erythromycin. (Severe) Theoretical

- HIV- protease inhibitors (darunavir, fosamprenavir, lopinavir) (boosted with ritonavir) are predicted to increase the Theophyl to clarithromycin. Adjust dose in renal impairment. (Severe) Study

- HIV- protease inhibitors (ritonavir) increase the exposure to clarithromycin. Adjust dose in renal impairment. (Severe) Study

- HIV- protease inhibitors (ritonavir) increase the exposure to clarithromycin. Adjust dose in renal impairment. (Severe) Study

- HIV- protease inhibitors (ritonavir) increase the exposure to clarithromycin. Adjust dose in renal impairment. (Severe) Study

- HIV- protease inhibitors (ritonavir) increase the exposure to clarithromycin. Adjust dose in renal impairment. (Severe) Study

- Clarithromycin increases the exposure to HIV- protease inhibitors (saquinavir) and HIV- protease inhibitors (saquinavir) increase the exposure to clarithromycin. Avoid. (Severe) Study → Also see TABLE 9 p. 876

- Erythromycin is predicted to increase the exposure to HIV- protease inhibitors (saquinavir). Avoid. (Severe) Theoretical → Also see TABLE 9 p. 876

- Clarithromycin is predicted to very markedly increase the exposure to ibrutinib. Avoid potent inhibitors of CYP3A4 or adjust ibrutinib dose. (Severe) Study

- Erythromycin is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. (Severe) Study

- Clarithromycin is predicted to increase the exposure to imatinib. (Moderate) Study

- Erythromycin is predicted to increase the exposure to imatinib. (Moderate) Theoretical

- Clarithromycin is predicted to increase the exposure to irinotecan. Avoid. (Moderate) Study

- Clarithromycin is predicted to increase the exposure to ivabradine. Avoid. (Severe) Study
Macrolides — Macrolides 985

- Clarithromycin is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Erythromycin is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study
- Clarithromycin is predicted to increase the exposure to ospemifene. Avoid in poor P2C9 metabolisers. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to ozanimod. (High) Study
- Clarithromycin is predicted to increase the exposure to olsuranib. Avoid or adjust olsuranib dose. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. (Moderate) Study
- Erythromycin is predicted to increase the exposure to pazopanib. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Avoid. (Severe) Study
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. (Severe) Study
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. (Severe) Study
- Clarithromycin is predicted to increase the exposure to pimozide. Avoid. (Severe) Study
- Clarithromycin is predicted to increase the exposure to pimozone. Avoid. (Severe) Study
- Clarithromycin is predicted to increase the exposure to ponatinib. Adjust dose. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to praziquantel. (High) Study
- Clarithromycin is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Clarithromycin is predicted to increase the exposure to ivabradine. Avoid. (Severe) Theoretical
- Clarithromycin is predicted to increase the exposure to ivacofor. Adjust ivacofor p. 199 or lumacosin with ivacofor p. 199 or tezacosin with ivacofor, p. 190 dose with potent inhibitors of CYP3A4. (Severe) Study
- Erythromycin is predicted to increase the exposure to ivacofor. Adjust ivacofor p. 199 or tezacosin with ivacofor, p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
- Clarithromycin is predicted to increase the exposure to lapatinib, Avoid. (Moderate) Study 
  → Also see TABLE 9 p. 876
- Erythromycin is predicted to increase the exposure to lapatinib, (Moderate) Study 
  → Also see TABLE 9 p. 876
- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of letemovir. (Moderate) Study
- Clarithromycin increases the exposure to linezolid. (Moderate) Theoretical
- Azithromycin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Study
- Clarithromycin is predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study
- Erythromycin is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical
- Lumacosin is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to luradoline. Avoid. (Severe) Study
- Erythromycin is predicted to increase the exposure to luradoline. Adjust luradoline dose. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to macrifen, (High) Theoretical
- Clarithromycin is predicted to markedly increase the exposure to maraviroc. Adjust dose. (Severe) Study
- Clarithromycin is predicted to markedly increase the exposure to mildazolam. Avoid or adjust dose. (Severe) Study
- Erythromycin is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- Clarithromycin is predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. (Severe) Study
- Erythromycin is predicted to increase the exposure to midostaurin. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to mirabegron, Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to mirtazapine. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to modafinil. (High) Theoretical
- Clarithromycin increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. (Severe) Theoretical
- Clarithromycin is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. (Severe) Theoretical
- Clarithromycin is predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study
- Erythromycin is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to netupitant. (Moderate) Study
- Nevirapine decreases the exposure to clarithromycin. (Moderate) Study
- Clarithromycin is predicted to moderately increase the exposure to nitotinib. Avoid. (Severe) Study 
  → Also see TABLE 9 p. 876
- Erythromycin is predicted to increase the exposure to nitotinib, (Moderate) Theoretical 
  → Also see TABLE 9 p. 876
- Macrolides are predicted to increase the exposure to nintedanib. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to nitinol. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to nitinol. (Moderate) Theoretical 
  → Also see TABLE 9 p. 876
- Macrolides are predicted to increase the exposure to nitisinone. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to nitisinone. Adjust dose. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Erythromycin is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical
- Erythromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study
- Clarithromycin is predicted to increase the exposure to opioids (methadone). (Severe) Theoretical 
  → Also see TABLE 9 p. 876
- Erythromycin is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical 
  → Also see TABLE 9 p. 876
- Clarithromycin is predicted to increase the exposure to ospemifene. Avoid in poor P2C9 metabolisers. (Moderate) Study
- Clarithromycin is predicted to increase the exposure to oxybutynin. (High) Study
- Erythromycin is predicted to increase the exposure to oxybutynin. (High) Theoretical
- Clarithromycin is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. (Severe) Study
- Clarithromycin is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. (Moderate) Study 
  → Also see TABLE 9 p. 876
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to panobinostat. Adjust dose. (Moderate) Theoretical 
  → Also see TABLE 9 p. 876
- Clarithromycin is predicted to increase the exposure to paritaprevir. Avoid. (Severe) Study
- Erythromycin is predicted to increase the exposure to paritaprevir. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. (Moderate) Study 
  → Also see TABLE 9 p. 876
- Erythromycin is predicted to increase the exposure to pazopanib. (Moderate) Theoretical 
  → Also see TABLE 9 p. 876
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. (Moderate) Theoretical
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study 
  → Also see TABLE 9 p. 876
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. (Severe) Study 
  → Also see TABLE 9 p. 876
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. (Moderate) Study 
  → Also see TABLE 9 p. 876
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. (Severe) Study
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Avoid. (Severe) Study
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Adjust dose. (Moderate) Theoretical
Macrolides (continued)

- Erythromycin is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to tadalafil. Avoid. [Severe] Study  Also see TABLE 9 p. 876

- Erythromycin is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study  Also see TABLE 9 p. 876

- Clarithromycin is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to repaglinide. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study  Also see TABLE 9 p. 876

- Erythromycin is predicted to increase the exposure to ribociclib. [Moderate] Study  Also see TABLE 9 p. 876

- Clarithromycin increases the risk of neutropenia when given with rifabutin. [Severe] Study

- Erythromycin increases the risk of neutropenia when given with rifabutin. Adjust dose. [Severe] Study

- Azithromycin increases the risk of neutropenia when given with rifabutin. Study  Also see p. 876

- Rifampicin decreases the concentration of clarithromycin. [Severe] Study

- Clarithromycin is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study  Also see TABLE 9 p. 876

- Erythromycin is predicted to increase the exposure to risperidone. Study

- Erythromycin is predicted to increase the exposure to saxagliptin. [Moderate] Study

- Erythromycin is predicted to increase the exposure to saxagliptin. [Severe] Study

- Clarithromycin is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

- Erythromycin increases the concentration of sirolimus. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

- Clarithromycin is predicted to moderately increase the exposure to SSRIs. (dapoxetine). Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study

- Erythromycin is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

- Erythromycin is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Study

- Clarithromycin moderately increases the exposure to statins (pravastatin). [Severe] Study

- Erythromycin is predicted to increase the exposure to statins (pravastatin). [Severe] Study

- Clarithromycin is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

- Erythromycin is predicted to increase the exposure to statins (simvastatin). With use with caution and adjust simvastatin dose, p. 136. [Severe] Study

- Clarithromycin is predicted to slightly increase the exposure to sulfonylureas. [Moderate] Theoretical

- Clarithromycin is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study  Also see TABLE 9 p. 876

- Erythromycin is predicted to increase the exposure to sunitinib. [Moderate] Theoretical  Also see TABLE 9 p. 876

- Clarithromycin is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

- Erythromycin is predicted to increase the concentration of tacrolimus. [Severe] Study

- Clarithromycin is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study

- Erythromycin is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical

- Clarithromycin is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study

- Clarithromycin is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical

- Clarithromycin is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

- Erythromycin is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study

- Erythromycin is predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study

- Erythromycin decreases the clearance of theophylline and theophylline potentially decreases the clearance of erythromycin. Adjust dose. [Severe] Study

- Macrolides (azithromycin, clarithromycin) are predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Anecdotal

- Azithromycin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study

- Clarithromycin is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

- Clarithromycin is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study

- Erythromycin given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to tolterodine. Avoid. [Severe] Study  Also see TABLE 9 p. 876

- Erythromycin is predicted to increase the exposure to tolterodine. [Moderate] Theoretical  Also see TABLE 9 p. 876

- Clarithromycin is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. [Severe] Study

- Erythromycin is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. [Moderate] Study

- Macrolides are predicted to increase the exposure to topotecan. [Severe] Study

- Clarithromycin is predicted to increase the exposure to toremifene. [Moderate] Theoretical  Also see TABLE 9 p. 876

- Clarithromycin is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

- Macrolides are predicted to increase the concentration of trametinib. [Moderate] Theoretical

- Clarithromycin is predicted to moderately increase the exposure to trazodone. Avoid. [Severe] Study

- Clarithromycin is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

- Erythromycin is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to vemurafenib. [Severe] Theoretical  Also see TABLE 9 p. 876

- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to venlafaxine. [Moderate] Study  Also see TABLE 9 p. 876

- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical  Also see TABLE 9 p. 876
Macrolides — Mesalazine 987

- Clarithromycin is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study
- Clarithromycin decreases the absorption of zidovudine. Separate administration by at least 2 hours. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- Erythromycin is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

**Magnesium**

- Oral magnesium decreases the absorption of bisphosphonates (alendronic acid). Alendronic acid should be taken at least 30 minutes before magnesium. [Moderate] Study
- Oral magnesium is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid magnesium for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral magnesium decreases the absorption of bisphosphonates (risedronate). Separate administration by at least 2 hours. [Moderate] Study
- Intravenous magnesium potentially increases the risk of hypotension when given with calcium channel blockers (amlodipine, clevidipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil) (in pregnant women). [Severe] Anecdotal
- Intravenous magnesium increases the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study
- Intravenous magnesium is predicted to increase the effects of suxamethonium. [Moderate] Study

**Maraviroc**

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- Aprepitant is predicted to increase the exposure to maraviroc. Avoid or monitor. [Moderate] Study
- Bosentan is predicted to decrease the exposure to maraviroc. Avoid. [Moderate] Theoretical
- Cobicistat markedly increases the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- Efavirenz decreases the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- Etravirine (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, saquinavir) moderately to markedly increase the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- HIV-protease inhibitors (darunavir boosted with ritonavir) markedly increase the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- HIV-protease inhibitors (lopinavir boosted with ritonavir) moderately increase the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- HIV-protease inhibitors (ritonavir) markedly increase the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- Maraviroc potentially decreases the exposure to HIV-protease inhibitors (fosamprenavir) and HIV-protease inhibitors (fosamprenavir) potentially decrease the exposure to maraviroc. Avoid. [Severe] Study
- Idealalis markedly increases the exposure to maraviroc. Adjust dose. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- Mitotane is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- Netupitant is predicted to increase the exposure to maraviroc. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to maraviroc. Avoid. [Severe] Theoretical

**Mebendazole**

- H₂ receptor antagonists (cimetidine) increase the concentration of mebendazole. [Moderate] Study

**Medroxyprogesterone**

- Sugammadex is predicted to decrease the exposure to medroxyprogesterone. Use additional contraceptive precautions. [Severe] Theoretical

**Mefloquine**

- See antimalarials

**Melatonin**

- See antipsychotics, mood stabilisers

**Mefloquine**

- See NSAIDs

**Melfalan**

- See alkylating agents

**Mendapine**

- Dopamine receptor agonists (amantadine) increase the risk of CNS toxicity when given with mendapine. Use with caution or avoid. [Severe] Theoretical
- Memantine is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). [Moderate] Theoretical
- Memantine is predicted to increase the risk of CNS side-effects when given with ketamine. Avoid. [Severe] Theoretical
- Memantine is predicted to increase the effects of levodopa. [Moderate] Theoretical

**Mepacrine**

- Mepacrine is predicted to increase the concentration of antimalarials (primquine). Avoid. [Moderate] Theoretical

**Mepivacaine**

- See anaesthetics, local

**Meprobamate**

- See TABLE 11 p. 876 (CNS depressant effects)

**Meptazinol**

- See opioids

**Mercaptothione**

- See TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression)
- Allopurinol potentially increases the risk of haematological toxicity when given with mercaptothione. Adjust mercaptothione dose. p. 562. [Severe] Study
- Mercaptothione decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- Febuxostat is predicted to increase the exposure to mercaptothione. Avoid. [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mercaptothione (high–dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

**Mepronem**

- See carbapenems

**Mesalazine**

- See TABLE 15

**ROUTE-SPECIFIC INFORMATION** The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol MR tablets, Ipocol, Salofalk granules) suggest that
Mesalazine (continued)

preparations that lower stool pH (e.g. lactulose) might prevent the release of mesalazine.

> **Preparations**

Metaraminol → see sympathomimetics, vasoconstrictor

Metformin → see TABLE 14 p. 877 (antidiabetic drugs)

▶ Alcohol (beverage) (excessive consumption) potentially increases the risk of lactic acidosis when given with metformin. Avoid excessive alcohol consumption. 

Moderate Theoretical

▶ Bictegravir slightly increases the exposure to metformin.

Moderate Study

▶ Dolutegravir increases the exposure to metformin. Use with caution and adjust dose. 

Severe Study

▶ Guanfacine is predicted to increase the concentration of metformin. 

Moderate Theoretical

▶ H₂ receptor antagonists (cimetidine) increase the exposure to metformin. Monitor and adjust dose. 

Moderate Study

▶ Methylphenidate is predicted to affect the exposure to metformin. 

Unknown Theoretical

▶ Pitolisant is predicted to increase the exposure to metformin. 

High Theoretical

▶ Ribocil is predicted to increase the exposure to methotrexate. 

Moderate Theoretical

▶ Vandetanib increases the exposure to metformin. Monitor and adjust dose. 

Moderate Study

Methadone → see opioids

Methenamine

▶ Acetazolamide is predicted to decrease the efficacy of methenamine. Avoid. 

Moderate Theoretical

▶ Potassium citrate is predicted to decrease the efficacy of methenamine. Avoid. 

Moderate Theoretical

▶ Sodium bicarbonate is predicted to decrease the efficacy of methenamine. Avoid. 

Moderate Theoretical

▶ Sodium citrate is predicted to decrease the efficacy of methenamine. Avoid. 

Moderate Theoretical

Methocarbamol → see TABLE 11 p. 876 (CNS depressant effects)

Methotrexate → see TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression), TABLE 2 p. 874 (nephrotoxicity), TABLE 5 p. 874 (thromboembolism)

▶ Acetazolamide increases the urinary excretion of methotrexate. 

Moderate Study

▶ Methotrexate is predicted to decrease the clearance of aminophylline. 

Moderate Theoretical

▶ Antiepileptics (levetiracetam) decrease the clearance of methotrexate. 

Severe Anecdotal

▶ Antimalarials (pyrimethamine) are predicted to increase the risk of side-effects when given with methotrexate. 

Severe Theoretical

▶ Apalutamide is predicted to decrease the exposure to methotrexate. 

Mild Study

▶ Asparaginase affects the efficacy of methotrexate. 

Severe Anecdotal → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877

▶ Aspirin (high-dose) is predicted to increase the risk of toxicity when given with methotrexate. 

Severe Study

▶ Brigitinib potentially increases the concentration of methotrexate. 

Moderate Theoretical

▶ Crisantaspase affects the efficacy of methotrexate. 

Severe Anecdotal → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877

▶ Etofiban is predicted to increase the concentration of methotrexate. 

Moderate Theoretical

▶ Methotrexate potentially increases the risk of severe skin reaction when given with topical fluorouracil. 

Severe Anecdotal → Also see TABLE 15 p. 877 → Also see TABLE 5 p. 874

▶ Leflunomide is predicted to increase the exposure to methotrexate. 

Moderate Theoretical → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877

▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with methotrexate (high-dose). Public Health England advises avoid (refer to Green Book). 

Severe Theoretical

▶ Nitrous oxide potentially increases the risk of methotrexate toxicity when given with methotrexate. Avoid. 

Severe Study → Also see TABLE 2 p. 874

▶ Pegaspargase affects the efficacy of methotrexate. 

Severe Anecdotal → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877

▶ Penicillins are predicted to increase the risk of toxicity when given with methotrexate. 

Severe Anecdotal → Also see TABLE 1 p. 874

▶ Potassium aminobenzoate increases the concentration of methotrexate. 

Moderate Theoretical

▶ Proton pump inhibitors decrease the clearance of methotrexate (high-dose). Use with caution or avoid. 

Severe Study

▶ Quinolones (ciprofloxacin) potentially increase the risk of toxicity when given with methotrexate. 

Severe Anecdotal

▶ Regorafenib is predicted to increase the exposure to methotrexate. 

Moderate Theoretical → Also see TABLE 15 p. 877

▶ Retinoids (acetretin) are predicted to increase the concentration of methotrexate. Avoid. 

Moderate Anecdotal

▶ Rolapitant is predicted to increase the exposure to methotrexate. Avoid or monitor. 

Moderate Study

▶ Methotrexate is predicted to decrease the efficacy of saporin. 

Moderate Theoretical

▶ Sulfonamides are predicted to increase the exposure to methotrexate. Use with caution or avoid. 

Severe Theoretical → Also see TABLE 15 p. 877

▶ Tegafur is predicted to increase the exposure to methotrexate. 

Moderate Anecdotal

▶ Methotrexate decreases the clearance of theophylline. 

Moderate Study

▶ Trimethoprim is predicted to increase the risk of side-effects when given with methotrexate. Avoid. 

Severe Theoretical → Also see TABLE 2 p. 874

Methoxyflurane → see volatile halogenated anaesthetics

Methyldopa → see TABLE 8 p. 875 (hypotension)

▶ Entacapone is predicted to increase the exposure to methyldopa. 

Moderate Theoretical

▶ Iron (oral) decreases the effects of methyldopa. 

Moderate Study

▶ Methyldopa increases the risk of neurotoxicity when given with lithium. 

Severe Anecdotal

▶ Monoamine-oxidase A and B inhibitors, irreversible are predicted to alter the antihypertensive effects of methyldopa. 

Avoid. 

Severe Theoretical → Also see TABLE 8 p. 875

Methylphenidate

▶ Methylphenidate is predicted to decrease the effects of aparcadine. Avoid. 

Severe Theoretical

▶ Methylphenidate is predicted to increase the risk of elevated blood pressure when given with linezolid. 

Avoid. 

Severe Theoretical

▶ Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with moclobemide. 

Severe Theoretical

▶ Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. 

Avoid and for 14 days after stopping the MAOI. 

Severe Theoretical

▶ Monoamine-oxidase B inhibitors (rasagline, selegiline) are predicted to increase the risk of a hypertensive crisis when given with methylphenidate. 

Avoid. 

Severe Theoretical

▶ Methylphenidate increases the risk of dyskinesias when given with paliperidone. 

Severe Theoretical

▶ Risperidone increases the risk of dyskinesias when given with methylphenidate. 

Severe Anecdotal

Methylprednisolone → see corticosteroids

Methylylthioninium chloride → see TABLE 13 p. 877 (serotonin syndrome)

Methylthioninium chloride is predicted to increase the risk of severe hypertension when given with bupropion. 

Avoid. 

Severe Theoretical → Also see TABLE 13 p. 877

Metoclopramide

Metoclopramide is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetic, local (prilocaine). Avoid. 

Severe Theoretical
Metoclopramide potentially decreases the absorption of antifungals, azoles (posaconazole) (oral suspension). [Moderate] Study

Metoclopramide decreases the concentration of antimalarials (atovaquone). Avoid. [Moderate] Study

Metoclopramide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. [Moderate] Study

Metoclopramide decreases the effects of levodopa. Avoid. [Moderate] Study

Metoclopramide is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study

Antiepileptics

Metoclopramide increases the effects of suxamethonium. [Moderate] Study

Metolazone → see thiazide diuretics

Metoprolol → see beta blockers, selective

Metronidazole → see TABLE 12 p. 877 (peripheral neuropathy)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Alcohol (beverage) potentially causes a disulfiram-like reaction when given with metronidazole. Avoid for at least 48 hours stopping treatment. [Moderate] Study

Metronidazole increases the risk of toxicity when given with alkylating agents (busulfan). [Severe] Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metronidazole. [Moderate] Study

Metronidazole is predicted to increase the risk of capcetabine toxicity when given with capcetabine. [Severe] Theoretical

Metronidazole increases the anticoagulant effect of warfarin. Use with caution and adjust dose. [Severe] Study

Disulfiram increases the risk of acute psychoses when given with metronidazole. [Severe] Study → Also see TABLE 12 p. 877

Metronidazole increases the risk of toxicity when given with fluorouracil. [Severe] Study

Metyrapone

Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of metyrapone. Avoid. [Moderate] Study

Antihistamines, sedating (cyproheptadine) decrease the effects of metyrapone. Avoid. [Moderate] Study

Carbamazepine decreases the effects of metyrapone. Avoid. [Moderate] Theoretical

Combined hormonal contraceptives decreases the effects of metyrapone. Avoid. [Moderate] Theoretical

Phenothiazines (chlorpromazine) decrease the effects of metyrapone. Avoid. [Moderate] Theoretical

Propylthiouracil is predicted to decrease the effects of metyrapone. Avoid. [Moderate] Theoretical

Tricyclic antidepressants (amitriptyline) decrease the effects of metyrapone. Avoid. [Moderate] Theoretical

Mexiletine

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

Mexiletine is predicted to increase the exposure to agomelatine. [Moderate] Study

Mexiletine is predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical

Mexiletine is predicted to increase the exposure to anagrelide. [Moderate] Theoretical

Mexiletine increases the risk of torsade de pointes when given with antiarrhythmics. Avoid. [Severe] Theoretical

Antiepileptics (phenytoin) are predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study

Mexiletine potentially increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid or monitor. [Severe] Theoretical

Mexiletine potentially increases the risk of cardiovascular side-effects when given with beta blockers, selective. Avoid or monitor. [Severe] Theoretical

Bupropion is predicted to increase the exposure to mexiletine. [Moderate] Study

Mexiletine increases the risk of cardiovascular side-effects when given with calcium channel blockers (diltiazem). Avoid or monitor. [Severe] Theoretical

Mexiletine potentially increases the risk of cardiovascular side-effects when given with calcium channel blockers (verapamil). Avoid or monitor. [Severe] Theoretical

Cinacalcet is predicted to increase the exposure to mexiletine. [Moderate] Study

Mexiletine increases the concentration of clozapine. Monitor side effects and adjust dose. [Severe] Study

Cobicistat potentially increases the exposure to mexiletine. [Severe] Theoretical

Mexiletine potentially affects the exposure to coumarins (warfarin). Avoid. [Unknown] Theoretical

Mexiletine is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. [Moderate] Study

Mexiletine slightly increases the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study

HIV protease inhibitors (ritonavir) are predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study

Leflunomide is predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study

Mexiletine potentially affects the exposure to lithium. Avoid. [Unknown] Theoretical

Mexiletine is predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical

Mexiletine is predicted to increase the exposure to melatonin. [Moderate] Theoretical

Mexiletine is predicted to affect the exposure to metformin. [Unknown] Theoretical

Mexiletine slightly increases the exposure to monoamine-oxidase B inhibitors (rasagline). [Moderate] Study

Mexiletine is predicted to increase the exposure to olanzapine. Adjust dose. [Moderate] Aneotaulc

Opioids potentially decrease the absorption of oral mexiletine. [Moderate] Study

Mexiletine is predicted to increase the exposure to pirenidone. Use with caution and adjust dose. [Moderate] Study

Rifampicin is predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study

Mexiletine is predicted to increase the exposure to rifuzole. [Moderate] Theoretical

Mexiletine is predicted to increase the exposure to roflumilast. [Moderate] Theoretical

SSRI (fluoxetine, fluvoxamine, paroxetine) are predicted to increase the exposure to mexiletine. [Moderate] Study

Tertibafine is predicted to increase the exposure to mexiletine. [Moderate] Study

Mexiletine is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical

Mexiletine increases the exposure to tizanidine. Avoid. [Moderate] Study

Mexiletine is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Theoretical

Mianserin → see TABLE 13 p. 877 (serotonin syndrome), TABLE 11 p. 876 (CNS depressant effects)

Antiepileptics (carbamazepine) markedly decrease the exposure to mianserin. Adjust dose. [Moderate] Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. [Moderate] Study → Also see TABLE 11 p. 876

Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid and for 1 week after stopping mianserin. [Severe] Theoretical → Also see TABLE 13 p. 877

Mianserin is predicted to increase the risk of toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 877
Mianserin (continued)

- **Mianserin** is predicted to decrease the efficacy of **pitolisant**.
  - **Moderate** Theoretical
- Mianserin decreases the effects of **sympathomimetics, vasoconstrictor** (ephedrine).
  - **Severe** Anecdotal

*Micafungin* → see TABLE 1 p. 876 (Hepatotoxicity)

- *Micafungin* slightly increases the exposure to **amphotericin**.
  - Avoid or monitor toxicity. **Moderate** Study
- *Miconazole* → see antifungals, azoles
- *Midazolam* → see TABLE 1 p. 876 (CNS depressant effects)
  - Antiarhythmic drugs (dronedarone) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. **Moderate** Study  
  - Also see TABLE 1 p. 876
  - Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
  - Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. **Severe** Study
  - Antifungals, azoles (miconazole) are predicted to increase the exposure to intravenous midazolam. Use with caution and adjust dose. **Moderate** Theoretical
  - Antifungals, azoles (miconazole) are predicted to increase the exposure to oral midazolam. Avoid. **Moderate** Theoretical
  - *Apalutamide* markedly decreases the exposure to midazolam. 
  - Avoid or monitor. **Severe** Study
  - *Aprepitant* is predicted to decrease the concentration of midazolam. Monitor and adjust dose. **Moderate** Theoretical
  - *Bosantan* is predicted to decrease the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
  - *Efavirenz* is predicted to alter the effects of midazolam. Avoid. **Moderate** Theoretical
  - *Enzalutamide* is predicted to decrease the exposure to midazolam. Monitor and adjust dose. **Moderate** Study
  - *Fosaprepitant* slightly increases the exposure to midazolam. **Moderate** Study
  - HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. **Severe** Study
  - *Idelalisib* is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. **Severe** Study
  - *Letrozomib* is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
  - *Letemovir* slightly to moderately increases the exposure to midazolam. Monitor and adjust dose. **Moderate** Study
  - *Lumacaftor* is predicted to decrease the exposure to midazolam. Avoid. **Severe** Theoretical
  - Macrolides (clarithromycin) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. **Severe** Study
  - Macrolides (erythromycin) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
  - *Mitotane* is predicted to decrease the exposure to midazolam. Monitor and adjust dose. **Moderate** Theoretical
  - Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. **Moderate** Theoretical
  - *Netupitant* is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
  - *Nevirapine* decreases the concentration of midazolam. Monitor and adjust dose. **Moderate** Study
  - *Nilotinib* is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
  - *Pabliciclib* increases the exposure to midazolam. **Moderate** Study
  - *Pabliciclib* moderately increases the exposure to midazolam. Avoid. **Moderate** Study
  - *Rifampicin* is predicted to decrease the exposure to midazolam. Monitor and adjust dose. **Moderate** Study
  - *Rucaparib* slightly increases the exposure to midazolam. Monitor and adjust dose. **Severe** Study
  - *St John’s Wort* decreases the exposure to midazolam. **Moderate** Study
  - *Telotristat ethyl* decreases the exposure to midazolam. **Moderate** Study

*Midostaurin*

- Antiarhythmic drugs (dronedarone) are predicted to increase the exposure to midostaurin. **Moderate** Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midostaurin. Avoid. **Severe** Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to midostaurin. **Moderate** Theoretical
- *Aprepitant* is predicted to increase the exposure to midostaurin. **Moderate** Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midostaurin. **Moderate** Theoretical
- *Cobicistat* is predicted to markedly to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. **Severe** Study
- *Crizotinib* is predicted to increase the exposure to midostaurin. **Moderate** Theoretical
- *Enzalutamide* is predicted to decrease the exposure to midostaurin. Avoid. **Severe** Study
- HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. **Severe** Study
- *Idelalisib* is predicted to markedly to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. **Severe** Study
- *Imatinib* is predicted to markedly to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. **Severe** Study
- *Mitotane* is predicted to decrease the exposure to midostaurin. Avoid. **Severe** Study
- *Netupitant* is predicted to increase the exposure to midostaurin. **Moderate** Theoretical
- *Nilotinib* is predicted to increase the exposure to midostaurin. **Moderate** Theoretical
- *Rifampicin* is predicted to decrease the exposure to midostaurin. Avoid. **Severe** Study
- *St John’s Wort* is predicted to decrease the exposure to midostaurin. Avoid. **Severe** Theoretical
- *Tacrolimus* is predicted to affect the efficacy of mifamurtide. Avoid. **Severe** Theoretical
- Clopofibrate decreases the efficacy of mifamurtide. **Moderate** Theoretical
- Corticosteroids are predicted to decrease the efficacy of mifamurtide. Avoid. **Severe** Theoretical
- NSAAH (high-dose) are predicted to decrease the efficacy of mifamurtide. Avoid. **Severe** Theoretical
- Pimecrolimus is predicted to decrease the efficacy of mifamurtide. Avoid. **Severe** Theoretical
- Sirolimus is predicted to decrease the efficacy of mifamurtide. Avoid. **Severe** Theoretical
- Telotristat ethyl decreases the exposure to midazolam. **Moderate** Study
- Midodrine is predicted to decrease the exposure to midostaurin. **Moderate** Theoretical
- *Rifampicin* is predicted to decrease the exposure to midostaurin. Avoid. **Severe** Study
- *St John’s Wort* decreases the exposure to midostaurin. **Moderate** Study
- *Telotristat ethyl* decreases the exposure to midazolam. **Moderate** Study
Mifepristone
- Mifepristone is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. (Moderate)
- Theoretical

Minocycline → see tetracyclines

Minoxidil → see TABLE 8 p. 875 (Hypotension)

ROUTE-SPECIFIC INFORMATION: Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Mirabegron
- Mirabegron is predicted to increase the exposure to alisikiren. (Mild) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- Mirabegron is predicted to increase the exposure to anthistamines, non-sedating (fexofenadine). (Mild) Theoretical
- Mirabegron is predicted to increase the exposure to beta blockers, selective (metoprolol). (Moderate) Study
- Cobicistat is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- Mirabegron is predicted to increase the exposure to colchicine. (Mild) Theoretical
- Mirabegron is predicted to increase the exposure to dabigatran. (Severe) Theoretical
- Mirabegron slightly increases the exposure to digoxin. Monitor concentration and adjust dose. (Severe) Study
- Mirabegron is predicted to increase the exposure to edoxaban. (Mild) Theoretical
- Mirabegron is predicted to increase the exposure to elaglutstat. Avoid or adjust dose—consult product literature. (Severe) Study
- Mirabegron is predicted to increase the exposure to everolimus. (Mild) Theoretical
- HIV- protease inhibitors are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- Idelalisib is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- Mirabegron is predicted to increase the exposure to loperamide. (Mild) Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- Mirabegron is predicted to increase the exposure to sirolimus. (Mild) Theoretical
- Mirabegron is predicted to increase the exposure to taxanes (paclitaxel). (Mild) Theoretical
- Mirabegron is predicted to increase the exposure to topotecan. (Mild) Theoretical

Mirtazapine → see TABLE 13 p. 877 (Serotonin Syndrome), TABLE 11 p. 876 (CNS depressant effects)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study → Also see TABLE 11 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirtazapine. (Moderate) Study
- Cobicistat is predicted to increase the exposure to mirtazapine. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to mirtazapine. Use with caution and adjust dose. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to mirtazapine. (Moderate) Study
- Idelalisib is predicted to increase the exposure to mirtazapine. (Moderate) Study
- Macrolides (clarithromycin) are predicted to increase the exposure to mirtazapine. (Moderate) Study
- Mifepristone is predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study
- Mirtazapine is predicted to decrease the efficacy of pitolisant. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study
- Mitomycin → see TABLE 15 p. 877 (Myelosuppression), TABLE 5 p. 874 (Thromboembolism)

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mitomycin. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

Mitotane → see TABLE 15 p. 877 (Myelosuppression)
- Mitotane is predicted to markedly decrease the exposure to abemaciclib. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study
- Aldosterone antagonists (spironolactone) are predicted to decrease the effects of mitotane. Avoid. (Severe) Anecdotal
- Mitotane is predicted to decrease the exposure to aldosterone antagonists (eplerenone). Avoid. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to antiaarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to antiepileptics (propafenone). Avoid. (Moderate) Study
- Mitotane is predicted to decrease the exposure to antihistamines, non-sedating (fexofenadine). Avoid or adjust dose—consult product literature. (Severe) Study
- Mitotane is predicted to decrease the exposure to antituberculosis, centrally acting (donepezil). Avoid. (Mild) Study
- Mitotane is predicted to decrease the exposure to antituberculosis agents (perampanel). Monitor and adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to antimalarials (artemether) (with lumarfantrine). Avoid. (Severe) Study
- Mitotane is predicted to decrease the concentration of antimalarials (piperaquine). Avoid. (Moderate) Theoretical
- Mitotane is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study
- Mitotane is predicted to moderately decrease the exposure to apremilast. Avoid. (Severe) Study
- Mitotane is predicted to markedly decrease the exposure to aripiprazole. Avoid. (Moderate) Study
- Mitotane is predicted to decrease the exposure to artemether (with lumarfantrine). Avoid. (Severe) Study
- Mitotane decreases the exposure to bedaquiline. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Study
- Mitotane decreases the exposure to bosentan. Avoid. (Severe) Study → Also see TABLE 15 p. 877
- Mitotane affects the exposure to bosentan. Avoid. (Severe) Study
- Mitotane is predicted to very markedly decrease the exposure to bosutinib. Avoid. (Severe) Study → Also see TABLE 15 p. 877
- Mitotane is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. (Severe) Study
- Mitotane moderately decreases the exposure to cabozantinib. Avoid. (Moderate) Study → Also see TABLE 15 p. 877
- Mitotane is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the exposure to cannabis extract. Avoid. (Severe) Theoretical
- Mitotane is predicted to decrease the exposure to cariprazine. Avoid. (Severe) Theoretical
- Mitotane is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study → Also see TABLE 15 p. 877
- Mitotane decreases the concentration of ciclosporin. (Severe) Study
Mitotane is predicted to decrease the effects of cilostazol. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study

Mitotane decreases the exposure to clofibrate. Monitor and adjust dose. [Moderate] Study

Mitotane is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

Mitotane is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study

Mitotane is predicted to decrease the exposure to corticosteroids (fluticasone). Unknown Theoretical

Mitotane is predicted to markedly decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to darifenacin. Avoid. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Study → Also see TABLE 15 p. 877

Mitotane is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study

Mitotane decreases the exposure to dolasetro. Adjust dose. [Severe] Study

Mitotane is predicted to decrease the exposure to doravirine. Avoid. [Severe] Study

Mitotane is predicted to decrease the concentration of eltelatro. Avoid. [Severe] Theoretical

Mitotane is predicted to decrease the exposure to enzalutamid. [Severe] Theoretical

Mitotane is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. [Severe] Study

Mitotane is predicted to decrease the exposure to esteridom. Adjust dose. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical

Mitotane is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 877

Mitotane moderately decreases the exposure to exemestane. [Moderate] Study

Mitotane is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study

Mitotane is predicted to decrease the exposure to fosphatid. Avoid. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study → Also see TABLE 15 p. 877

Mitotane is predicted to greatly decrease the concentration of glecaprevir. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

Mitotane is predicted to decrease the concentration of guanafacine. Adjust guanafacine dose, p. 227. [Moderate] Study

Mitotane decreases the concentration of haloperidol. Adjust dose. [Moderate] Study

Mitotane is predicted to decrease the exposure to ibritinib. Avoid or adjust ibritinib dose. [Severe] Study → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

Mitotane is predicted to moderately markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to ivazobin. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study

Mitotane is predicted to increase the exposure to lomitapide. Monitor and adjust dose. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study

Mitotane is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study

Mitotane is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study

Mitotane is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study

Mitotane is predicted to decrease the exposure to montelukast. [Mild] Study

Mitotane is predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study

Mitotane is predicted to slightly decrease the exposure to nategliide. [Mild] Study

Mitotane is predicted to decrease the exposure to netupitant. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to nevirapine. [Severe] Theoretical

Mitotane is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to nitrosine. Adjust dose. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to ondasertron. [Moderate] Study

Mitotane is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study

Mitotane is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical

Mitotane decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study

Mitotane is predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study

Mitotane is predicted to moderately decrease the exposure to osmepinef. [Moderate] Study

Mitotane is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study

Mitotane is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 877
Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). (Moderate) Theoretical

Mitotane is predicted to moderately to markedly decrease the exposure to pibrentasvir. Avoid. (Severe) Study

Mitotane is predicted to moderately decrease the exposure to pitolisant. (Moderate) Study

Mitotane is predicted to decrease the exposure to ponatinib. Avoid. (Moderate) Theoretical

Mitotane is predicted to markedly decrease the exposure to praziquantel. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to quetiapine. (Moderate) Study

Mitotane is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to reboxetine. (Moderate) Aacdotal

Mitotane is predicted to decrease the exposure to regorafenib. Avoid. (Moderate) Study → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. (Moderate) Study

Mitotane is predicted to markedly decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study

Mitotane is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study

Mitotane is predicted to markedly decrease the exposure to rolipram. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study

Mitotane is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study

Mitotane is predicted to decrease the exposure to saxagliptin. (Moderate) Study

Mitotane is predicted to decrease the concentration of sirolimus. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical

Mitotane is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to statins (simvastatin). (Severe) Study

Mitotane is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study → Also see TABLE 15 p. 877

Mitotane decreases the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

Mitotane is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. (Severe) Study → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to taxanes (docetaxel). (Severe) Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Study → Also see TABLE 15 p. 877

Mitotane decreases the exposure to tetracyclines (doxycycline). Monitor and adjust dose. (Moderate) Study

Mitotane is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical

Mitotane is predicted to markedly decrease the exposure to tigecycline. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to tofacitinib. Use with caution or avoid depending on indication. (Severe) Study

Mitotane is predicted to decrease the exposure to toremifene. Adjust dose. (Moderate) Study

Mitotane is predicted to decrease the exposure to trabectedin. Avoid. (Severe) Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

Mitotane is predicted to moderately to markedly decrease the exposure to velpatasvir. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to vemurafenib. Avoid. (Severe) Theoretical

Mitotane is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vinorelbine). (Severe) Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. (Severe) Theoretical → Also see TABLE 15 p. 877

Mitotane is predicted to decrease the exposure to vismodegib. Monitor and adjust dose. (Moderate) Study

Mitotane is predicted to decrease the exposure to voriconazole. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to zopiclone. Adjust dose. (Moderate) Study

Mitocromone → see anticoagulants

Mivacurium → see neuromuscular blocking drugs, non-depolarising

Mizolastine → see antihistamines, non-sedating

Moclobemide → see TABLE 13 p. 877 (serotonin syndrome)

**FOOD AND LIFESTYLE** Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

Moclobemide is predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 877

Apalutamide is predicted to decrease the exposure to moclobemide. Avoid or monitor. (Mild) Study

Moclobemide is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 877

Moclobemide is predicted to increase the exposure to cilostazol. (Moderate) Theoretical

Moclobemide potentially increases the exposure to clobazam. Adjust dose. (Moderate) Theoretical

Moclobemide is predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study

Moclobemide is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Theoretical

H₂ receptor antagonists (cimetidine) increase the exposure to moclobemide. Adjust moclobemide dose. (Mild) Study

Levodopa increases the risk of side-effects when given with moclobemide. (Moderate) Study

Moclobemide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. (Severe) Theoretical → Also see TABLE 13 p. 877

Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with moclobemide. (Severe) Theoretical

Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid and for 1 week after stopping mianserin. (Severe) Theoretical → Also see TABLE 13 p. 877

Moclobemide is predicted to increase the effects of monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. (Severe) Theoretical → Also see TABLE 13 p. 877
Moclobemide – Monoamine-oxidase A and B inhibitors, irreversible

Moclobemide (continued)

- Moclobemide is predicted to increase the risk of side-effects when given with monoamine-oxidase B inhibitors (safinamide). Avoid and for 1 week after stopping safinamide. [Severe] Study

  Also see TABLE 13 p. 877

- Opiocapone is predicted to increase the risk of elevated blood pressure when given with moclobemide. Avoid. [Severe] Study

- Moclobemide increases the risk of side-effects when given with phenothiazines (leomepromazine). [Moderate] Study

- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with moclobemide. Avoid. [Severe] Theoretical

- Moclobemide moderately increases the exposure to rizatRIPTAN. Avoid. [Moderate] Study  Also see TABLE 13 p. 877

- Moclobemide slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Study  Also see TABLE 13 p. 877

Modafinil

- Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the exposure to modafinil. [Mild] Theoretical

- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to modafinil. [Mild] Theoretical

- Modafinil is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

- Cobicistat is predicted to increase the exposure to modafinil. [Mild] Theoretical

- Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study

- Modafinil is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical

- Modafinil is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. [Severe] Theoretical

- Modafinil is predicted to decrease the exposure to elbasvir. Avoid. [Unknown] Theoretical

- Modafinil is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical

- Modafinil is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Theoretical

- HIV-protease inhibitors are predicted to increase the exposure to modafinil. [Mild] Theoretical

- Modafinil is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal

- idelalisib is predicted to increase the exposure to modafinil. [Mild] Theoretical

- Modafinil is predicted to decrease the concentration of intermenvir. [Moderate] Theoretical

- Modafinil is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical

- Macrolides (clarithromycin) are predicted to increase the exposure to modafinil. [Mild] Theoretical

- Modafinil is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

- Rifampicin is predicted to decrease the exposure to modafinil. [Moderate] Theoretical

- Modafinil is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Theoretical

- Modafinil decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

- Modafinil is predicted to decrease the exposure to velpatasvir. Avoid. [Severe] Theoretical

- Modafinil is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical

Mometasone → see corticosteroids

TABLE 13 p. 877

FOOD AND LIFESTYLE

Potential life-threatening hypertensive crisis can develop in those taking MAOIs who eat tyramine-rich food (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or foods containing dopa (such as broad bean pods). Avoid tyramine-rich or dopa-rich food or drinks with, or for 2 to 3 weeks after stopping, the MAOI.

- Moclobemide and B inhibitors, irreversible are predicted to increase the effects of alpha blockers (indoramin). Avoid. [Severe] Theoretical  Also see TABLE 8 p. 875

- Moclobemide and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid and for 14 days after stopping the MAOI. [Severe] Anecdotal  Also see TABLE 13 p. 877

- Antiepileptics (carbamazepine) are predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical

- Antiepileptics (phenobarbital, primidone) are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. [Severe] Theoretical

- Moclobemide and B inhibitors, irreversible are predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, non-sedating. Avoid. [Severe] Theoretical

- Moclobemide and B inhibitors, irreversible are predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, sedating. Avoid. [Severe] Theoretical

- Moclobemide and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with atomoxetine. Avoid and for 2 weeks after stopping the MAOI. [Severe] Theoretical

- Moclobemide and B inhibitors, irreversible are predicted to increase the risk of cardiovascular side-effects when given with beta agonists. [Moderate] Anecdotal

- Moclobemide and B inhibitors, irreversible are predicted to increase the risk of severe hypertension when given with bupropion. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical  Also see TABLE 13 p. 877

- Buspirone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Anecdotal  Also see TABLE 13 p. 877

- Moclobemide and B inhibitors, irreversible are predicted to increase the effects of doxapram. [Moderate] Theoretical

- Entacapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

- Moclobemide and B inhibitors, irreversible are predicted to increase the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical  Also see TABLE 8 p. 875

- Levodopa increases the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Study  Also see TABLE 8 p. 875

- Moclobemide and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with...
Monoamine-oxidase A and B inhibitors – Monoamine-oxidase B inhibitors

**Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to **zolmitriptan**. (Severe)

Monoamine-oxidase B inhibitors — Monoamine-oxidase B inhibitors

- **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. (Severe)
- **Tryptophan** increases the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. (Severe)
- **Mianserin** is predicted to increase the risk of CNS toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. (Severe)
- **Tolcapone** increases the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. (Severe)
- **Tetrabenazine** is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. (Severe)
- **Monoamine-oxidase B inhibitors** are predicted to increase the risk of severe hypertension when given with **rasagiline**, **selegiline**. (Severe)
- **Moclobemide** is predicted to increase the effects of monoamine-oxidase B inhibitors (rasagiline, selegiline). (Severe)
- **Mexiletine** slightly increases the exposure to rasagiline. (Moderate)
- **Safinamide** is predicted to increase the risk of severe hypertension when given with **beta, agonists**. (Severe)
- **Monoamine-oxidase B inhibitors** are predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. (Moderate)
- **Combined hormonal contraceptives** slightly increase the exposure to rasagiline. (Moderate)
- **Monoamine-oxidase B inhibitors** are predicted to increase the effects of **levodopa**. Adjust dose. (Hild)
- **Hormone replacement therapy** is predicted to increase the exposure to selegiline. (Moderate)
- **Moclobemide** is predicted to increase the risks of monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. (Severe)
- **Safinamide** is predicted to increase the risk of severe side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. (Severe)
- **Monoamine-oxidase B inhibitors** (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. (Severe)
- **Monoamine-oxidase B inhibitors** (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. (Severe)
Monoamine-oxidase B inhibitors (continued)

- **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase B inhibitors (rasagline, selegiline). Avoid.  
- **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid.  
- **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasocostric tors. Avoid.  
- **Blinatumomab** is predicted to transiently increase the exposure to **antifungals, azoles**. Monitor and adjust dose.  
- **Tocilizumab** is predicted to decrease the exposure to **antiepileptics**. Monitor and adjust dose.  
- **Antifungals, azoles** are predicted to increase the exposure to **anthracyclines**. Monitor and adjust dose.  
- **Anakinra** is predicted to transiently increase the exposure to **antiarrhythmics**. Monitor and adjust dose.  
- **Antiarrhythmics** (dronedarone) increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose.  
- **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid.  
- **Antiepileptics** (carbamazepine) are predicted to decrease the exposure to **brentuximab vedotin**. Avoid.  
- **Blinatumomab** is predicted to decrease the exposure to **brentuximab vedotin**. Avoid.  
- **Tocilizumab** is predicted to decrease the exposure to **brentuximab vedotin**. Avoid.  
- **Blinatumomab** potentially affects the exposure to **brentuximab vedotin**. Avoid.  
- **Brentuximab vedotin** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **brentuximab vedotin**. Avoid.  
- **Antiepileptics** (lorazepam, valproate) are predicted to increase the exposure to **brentuximab vedotin**. Avoid.  
- **Antiepileptics** (midazolam) are predicted to increase the exposure to **brentuximab vedotin**. Avoid.  
- **Monoamine-oxidase B inhibitors** are predicted to increase the exposure to **brentuximab vedotin**. Avoid.  
- **Antiepileptics** (phenytoin) are predicted to increase the exposure to **brentuximab vedotin**. Avoid.  
- **Antiepileptics** (phenobarbital) are predicted to increase the exposure to **brentuximab vedotin**. Avoid.  
- **Antiepileptics** (phenytoin, phenobarbital) are predicted to increase the exposure to **brentuximab vedotin**. Avoid.  
- **Brentuximab vedotin** increases the risk of pulmonary toxicity when given with **brentuximab vedotin**. Monitor and adjust dose.  
- **Brentuximab vedotin** is predicted to decrease the exposure to **calcium channel blockers**. Monitor and adjust dose.  
- **Blinatumomab** is predicted to transiently increase the exposure to **cisplatin**. Monitor and adjust dose.  
- **Sarilumab** potentially affects the exposure to **cisplatin**. Monitor and adjust dose.  
- **Cisplatin** is predicted to decrease the exposure to **cisplatin**. Monitor and adjust dose.  
- **Cobimetinib** is predicted to transiently increase the exposure to **cisplatin**. Monitor and adjust dose.  
- **Sarilumab** potentially decreases the exposure to **combined hormonal contraceptives**. Avoid.  
- **Corticosteroids** are predicted to decrease the exposure to **cisplatin**. Monitor and adjust dose.  
- **Corticosteroids** (betamethasone, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone) are predicted to decrease the efficacy of monoclonal antibodies (atezolizumab, ipilimumab, nivolumab, pembrolizumab). Use with caution or avoid.  
- **Tocilizumab** is predicted to decrease the exposure to **coumarins** (dexamethasone, methylprednisolone). Monitor and adjust dose.  
- **Blinatumomab** is predicted to transiently increase the exposure to **coumarins** (warfarin). Monitor and adjust dose.  
- **Tocilizumab** is predicted to decrease the exposure to **coumarins** (warfarin). Monitor and adjust dose.  
- **HIV-protease inhibitors** (lopinavir, ritonavir, saquinavir) are predicted to increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose.  
- **HIV-protease inhibitors** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid.  
- **Immunoglobulins** are predicted to alter the effects of **dinutuximab**. Avoid.  
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **macrolides** (clarithromycin, azithromycin). Public Health England advises avoid (refer to Green Book).  
- **Macrolides** (clarithromycin) increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose.  
- **Macrolides** (clarithromycin) are predicted to increase the exposure to **trastuzumab emtansine**. Avoid.  
- **Tocilizumab** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose.  
- **Ribavirin** decreases the effects of **brentuximab vedotin**. Avoid.  
- **Sarilumab** potentially affects the exposure to **sirolimus**. Monitor and adjust dose.  
- **Sarilumab** is predicted to increase the exposure to **statins** (atorvastatin, simvastatin). Monitor and adjust dose.  
- **Tocilizumab** is predicted to decrease the exposure to **statins** (atorvastatin, simvastatin). Monitor and adjust dose.  
- **Sarilumab** potentially affects the exposure to **tacrolimus**. Monitor and adjust dose.  
- **Blinatumomab** is predicted to transiently increase the exposure to **theophylline**. Monitor and adjust dose.  
- **Tocilizumab** is predicted to decrease the exposure to **theophylline**. Monitor and adjust dose.  
- **Sarilumab** potentially affects the exposure to **theophylline**. Monitor and adjust dose.  
- **Tocilizumab** is predicted to decrease the exposure to **theophylline**. Monitor and adjust dose.  
- **Montelukast** is predicted to decrease the exposure to **theophylline**. Monitor and adjust dose.  
- **Antiepileptics** (carbamazepine, phenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **montelukast**.  
- **Clopidogrel** is predicted to moderately increase the exposure to **montelukast**.  
- **Enalapril** is predicted to increase the exposure to **montelukast**.  
- **Fibrates (gemfibrozil)** are predicted to moderately increase the exposure to **montelukast**.  
- **Mitotane** is predicted to decrease the exposure to **montelukast**.  
- **Opicapone** is predicted to increase the exposure to **montelukast**. Avoid.
Crizotinib is predicted to decrease the exposure to montelukast. [Mild] Study
Teriflunomide is predicted to increase the exposure to montelukast. [Moderate] Theoretical
Morphine → see opioids
Moxifloxacin → see quinolones
Moxisylyte → see TABLE 8 p. 875 (hypotension)
Moxonidine → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)
Tricyclic antidepressants are predicted to decrease the effects of moxonidine. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 875
Mycofenolate → see TABLE 15 p. 877 (myelosuppression)
Mycofenolate is predicted to increase the risk of haematological toxicity when given with aciclovir. [Moderate] Theoretical
Antacids decrease the exposure to mycofenolate. [Moderate] Study
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to mycofenolate. [Moderate] Study
Mycofenolate is predicted to increase the risk of haematological toxicity when given with ganciclovir. [Moderate] Theoretical → Also see TABLE 8 p. 877
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mycofenolate. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
Rifampicin decreases the concentration of mycofenolate. Monitor and adjust dose. [Severe] Study
Mycofenolate is predicted to increase the risk of haematological toxicity when given with valganciclovir. [Moderate] Theoretical
Mycofenolate is predicted to increase the risk of haematological toxicity when given with ganciclovir. [Moderate] Theoretical → Also see TABLE 8 p. 877
Nabilone → see TABLE 11 p. 876 (CNS depressant effects)
Nabilone is predicted to increase the risk of cardiovascular side-effects when given with amfetamines. [Severe] Theoretical
Nadolol → see NSAIDs
Nadolol is predicted to decrease the effects of amfetamines. [Severe] Study
Naloxegol is predicted to markedly decrease the exposure to naloxegol. Avoid. [Severe] Study
Idelalisib is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
Imatinib is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
Macrolides (clarithromycin) are predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
Macrolides (erythromycin) are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
Mitotane is predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
Netupitant is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
Nilotinib is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
Rifampicin is predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
Naltrexone
GENERAL INFORMATION Avoid concurrent use of opioids.
Nandrolone
Nandrolone is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Theoretical
Nandrolone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Severe] Study
Naproxen → see NSAIDs
Naratipran → see TABLE 13 p. 877 (serotonin syndrome)
Naratipran is predicted to increase the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. [Severe] Theoretical
Natalizumab → see monoclonal antibodies
Nateglinide → see TABLE 14 p. 877 (antidiabetic drugs)
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to nateglinide. [Mild] Study
Enalaprilat is predicted to slightly decrease the exposure to nateglinide. [Mild] Study
Enalaprilat is predicted to decrease the exposure to nateglinide. [Mild] Study
Enalaprilat is predicted to slightly decrease the exposure to nateglinide. [Mild] Study
Teriflunomide is predicted to increase the exposure to nateglinide. [Moderate] Theoretical
Mitotane is predicted to slightly decrease the exposure to nateglinide. [Mild] Study
Rifampicin is predicted to slightly decrease the exposure to nateglinide. [Mild] Study
Nebivolol → see beta blockers, selective
Necitumumab → see monoclonal antibodies
Nefopam → see TABLE 10 p. 876 (antimuscarinics)
Nefopam is predicted to increase the risk of serious elevations in blood pressure when given with monoamine oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical
Nelarabine → see TABLE 15 p. 877 (myelosuppression)
Neomycin → see TABLE 2 p. 874 (nephrotoxicity), TABLE 19 p. 878 (otoxicity), TABLE 20 p. 878 (neuromuscular blocking effects)
Neomycin decreases the absorption of digoxin. [Moderate] Study
Neomycin moderately decreases the exposure to sorafenib. [Moderate] Study
Neostigmine → see TABLE 6 p. 875 (bradycardia)
Aminoglycosides are predicted to decrease the effects of neostigmine. [Moderate] Theoretical
Nepafenac → see NSAIDs
Netupitant
Netupitant is predicted to increase the exposure to abemaciclib. [Moderate] Study
Netupitant is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study
Netupitant very slightly increases the exposure to alkylating agents (cyclophosphamide). [Moderate] Study
Nefopam
Netupitant (continued)

- **Netupitant** is predicted to increase the exposure to alkylating agents (ifosfamide). ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to alpha blockers (tamsulosin). ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to alprazolam. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to antarrhythmic (propafenone). Monitor and adjust dose. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to netupitant. Avoid. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to netupitant. ([Moderate] Study)
- **Netupitant** is predicted to decrease the exposure to antifungals, azoles (isavuconazole). ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to antihistamines, non-sedating (miolastine). ([Severe] Theoretical)
- **Netupitant** is predicted to increase the exposure to antimalarias (piriperaquine). ([Severe] Theoretical)
- **Netupitant** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. ([Matt] Theoretical)
- **Netupitant** is predicted to increase the exposure to beta agonists (salmeterol). ([Moderate] Study)
- **Netupitant** is predicted to decrease the exposure to netupitant. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to bosutinib. Avoid or adjust dose. ([Severe] Theoretical)
- **Netupitant** is predicted to increase the exposure to bupirone. Use with caution and adjust dose. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to cabozantinib. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to cariprazine. Avoid. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to ceritinib. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the concentration of ciclosporin. ([Severe] Study)
- **Cobicistat** is predicted to increase the exposure to netupitant. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to cabomininib. ([Severe] Theoretical)
- **Netupitant** is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to oral corticosteroids (budesonide). ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to corticosteroids (dexamethasone). Adjust dose. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to corticosteroids (fluticasone). ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. ([Moderate] Study)
- **Netupitant** is predicted to slightly increase the exposure to dasatinib. ([Moderate] Study)
- **Netupitant** increases the risk of QT-prolongation when given with domperidone. Avoid. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). ([Severe] Theoretical)
- **Netupitant** is predicted to increase the concentration of dopamine receptor agonists (cabergoline). ([Moderate] Anecdotal

- **Netupitant** is predicted to moderately increase the exposure to dutasteride. ([Mild] Study)
- **Efavirenz** is predicted to decrease the exposure to netupitant. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to eletriptan. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. ([Severe] Study)
- **Netupitant** is predicted to moderately increase the exposure to encorafenib. ([Moderate] Study)
- **Enzalutamide** is predicted to decrease the exposure to netupitant. Avoid. ([Severe] Study)
- **Netupitant** is predicted to increase the risk of ergotism when given with ergotamine. ([Severe] Theoretical)
- **Netupitant** is predicted to increase the risk of ergotism when given with ergotone. ([Severe] Theoretical)
- **Netupitant** is predicted to increase the exposure to erlotinib. ([Moderate] Theoretical)
- **Netupitant** slightly increases the exposure to etoposide. ([Moderate] Study)
- **Netupitant** is predicted to increase the concentration of everolimus. Avoid or adjust dose. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to gefitinib. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 237. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to HIV-protease inhibitors are predicted to increase the exposure to netupitant. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to ibritinib. Adjust ibritinib dose with moderate inhibitors of CYP3A4. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to Idelalisib is predicted to increase the exposure to netupitant. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to imatinib. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to irinotecan. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. ([Severe] Theoretical)
- **Netupitant** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to lapatinib. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to lomiptapide. Avoid. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose. ([Moderate] Study)
- **Macrolides (clarithromycin) are predicted to increase the exposure to netupitant. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to maraviroc. ([Moderate] Study)
- **Netupitant** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to midostaurin. ([Moderate] Theoretical)
- **Mitotane** is predicted to decrease the exposure to netupitant. Avoid. ([Severe] Study)
- **Netupitant** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. ([Moderate] Study)
- **Nevirapine** is predicted to decrease the exposure to netupitant. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to nilotinib. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. ([Moderate] Theoretical)
- **Netupitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. ([Moderate] Study)
Netupitant is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical

Netupitant is predicted to increase the exposure to oxycodone. (High) Theoretical

Netupitant is predicted to increase the exposure to pazopanib. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4. (Moderate) Study

Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical

Netupitant is predicted to increase the exposure to pimozide. Avoid. (Severe) Theoretical

Netupitant is predicted to increase the exposure to ranolazine. (Moderate) Study

Netupitant is predicted to increase the exposure to ribociclib. (Moderate) Study

Rifampin is predicted to decrease the exposure to netupitant. Avoid. (Severe) Study

Netupitant is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to saxagliptin. (High) Theoretical

Netupitant increases the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study

Netupitant is predicted to increase the exposure to simvastatin (dапoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to sunitinib. (Moderate) Theoretical

Netupitant is predicted to increase the concentration of tacrolimus. (Severe) Study

Netupitant is predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical

Netupitant slightly increases the exposure to taxanes (docetaxel). (Moderate) Study

Netupitant is predicted to increase the exposure to taxanes (paclitaxel). (Moderate) Study

Netupitant is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study

Netupitant is predicted to increase the exposure to tefacitinib. Adjust tefacitinib dose. (Moderate) Study

Netupitant is predicted to increase the exposure to tolerodine. (High) Theoretical

Netupitant is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study

Netupitant is predicted to increase the exposure to trazodone. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

Netupitant is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study

Netupitant is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical

Netupitant is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Study

Neuromuscular blocking drugs, non-depolarising. See also TABLE 6 p. 875 (bradycardia), TABLE 20 p. 878 (neuromuscular blocking effects)

- atracurium - cisatracurium - mivacurium - pancuronium - rocuronium

Anticholinesterases, centrally acting are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Theoretical

Antiepileptics (carbamazepine) are predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). Monitor and adjust dose. (Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). (Moderate) Study

Corticosteroids are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Severe) Anecdotal

Pancuronium is predicted to increase the risk of cardiovascular side-effects when given with digoxin. (Severe) Anecdotal

Trinitro is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Severe) Theoretical

Intravenous magnesium increases the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Study

Metoclopramide is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Theoretical

Neuromuscular blocking drugs, non-depolarising. (Severe) Anecdotal

Potentially increase the risk of prolonged neuromuscular blockade when given with mivacurium. (Unknown) Theoretical

Nevirapine

Nevirapine is predicted to decrease the exposure to antiarrhythmics (dronedarone). (Severe) Theoretical

Nevirapine is predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of nevirapine. (Severe) Study

Antifungals, azoles (fluconazole) slightly to moderately increase the exposure to nevirapine. (Moderate) Study

Nevirapine is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. (Severe) Theoretical

Nevirapine moderately decreases the exposure to antifungals, azoles (itraconazole). Avoid and for 14 days after stopping nevirapine. (Moderate) Study

Nevirapine moderately decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to nevirapine. Monitor and adjust dose. (Moderate) Study

Nevirapine is predicted to decrease the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole). Avoid. (Severe) Study

Nevirapine is predicted to decrease the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole). Avoid. (Severe) Study

Nevirapine is predicted to decrease the exposure to aprepitant. (Moderate) Study

Nevirapine is predicted to decrease the exposure to axitinib. (Moderate) Theoretical

Nevirapine is predicted to decrease the exposure to bedaquiline. Avoid. (Severe) Study

Boverant is predicted to decrease the exposure to nevirapine. (Severe) Theoretical

Nevirapine is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical

Nevirapine is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study

Nevirapine is predicted to decrease the exposure to cabozantinib. (Moderate) Theoretical
Nevirapine (continued)

- Nevirapine is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the concentration of caspofungin. Adjust dose. [Moderate] Theoretical
- Nevirapine is predicted to decrease the concentration of ciclosporin. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to cobiimetinib. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study
- Nevirapine potentially alters the anticoagulant effect of coumarins. [Severe] Anecdotal
- Nevirapine is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to dasatinib. [Severe] Study
- Nevirapine is predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- Nevirapine is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. [Severe] Theoretical
- Nevirapine decreases the concentration of efavirenz. Avoid. [Severe] Study
- Nevirapine is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to eliglustat. [Moderate] Theoretical
- Nevirapine is predicted to decrease the concentration of elvitegravir. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to nevirapine. [Severe] Theoretical
- Nevirapine is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- Nevirapine is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- Nevirapine is predicted to decrease the exposure to fosaprepitant. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- Nevirapine is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- Nevirapine decreases the exposure to HIV-2 protease inhibitors. Refer to specialist literature. [Moderate] Study
- Nevirapine is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- Nevirapine is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to imatinib. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to ivacaftor. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical
- Nevirapine decreases the exposure to macrolides (clarithromycin). [Moderate] Study
- Nevirapine decreases the concentration of midazolam. Monitor and adjust dose. [Moderate] Study
- Mitotane is predicted to decrease the exposure to nevirapine. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to netupitant. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- Nevirapine is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to omacetaxine. Avoid. [Severe] Theoretical
- Nevirapine decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study
- Nevirapine is predicted to decrease the exposure to ospemifene. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to paritaprevir (with ritonavir and omacetaxine). Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to piracetam. [Severe] Study
- Nevirapine is predicted to decrease the exposure to quetiapine. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to ribociclib. [Moderate] Study
- Rifampicin decreases the concentration of nevirapine. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to rolapitant. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the concentration of nevirapine. Avoid. [Severe] Theoretical
- Nevirapine slightly decreases the exposure to statins (atorvastatin). [Mild] Study
- Nevirapine moderately decreases the exposure to statins (simvastatin). [Moderate] Study
- Nevirapine decreases the concentration of tacrolimus. Monitor and adjust dose. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study
- Nevirapine is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to tofacitinib. [Moderate] Study
- Nevirapine decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- Nevirapine is predicted to decrease the exposure to velpatavir. Avoid. [Moderate] Theoretical
Nevirapine – Nilotinib 1001

- Nevirapine is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study
- Nevirapine is predicted to decrease the concentration of voxtaprevir. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the concentration of zidovudine. Refer to specialist literature. (Severe) Theoretical
- Nicardipine → see calcium channel blockers
- Nisoldipine → see calcium channel blockers
- Nicorandil → see TABLE 8 p. 875 (hypotension)
- Aspirin is predicted to increase the risk of gastrointestinal perforation when given with nicardipine. (Severe) Theoretical
- Corticosteroids increase the risk of gastrointestinal perforation when given with nicardipine. (Severe) Aneodal
- Nicorandil is predicted to increase the risk of gastrointestinal perforation when given with NSAIIS. (Severe) Theoretical
- Nisoldipine is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. (Severe) Theoretical → Also see TABLE 8 p. 875
- Nicotinic acid → see TABLE 3 p. 874 (anticoagulant effects)
- Nicotinic acid is predicted to increase the risk of rhabdomyolysis when given with statins. (Severe) Theoretical
- Nifedipine → see calcium channel blockers
- Nilotinib → see TABLE 15 p. 877 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)
- Nilotinib is predicted to increase the exposure to abemaciclib. (Moderate) Study
- Nilotinib is predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate) Theoretical
- Nilotinib is predicted to increase the exposure to alprostadil. (Moderate) Study
- Antacids are predicted to decrease the absorption of nilotinib. Separate administration by at least 2 hours. (Moderate) Theoretical
- Nilotinib is predicted to increase the exposure to antarrhythmys (propafenone). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to nilotinib. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to nilotinib. (Moderate) Theoretical → Also see TABLE 9 p. 876
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study → Also see TABLE 9 p. 876
- Nilotinib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). (Severe) Theoretical
- Nilotinib is predicted to increase the exposure to antihistamines, non-sedating (tripatadine). Avoid. (Moderate) Study
- Nilotinib is predicted to increase the concentration of antimalarias (piperaquine). (Severe) Theoretical
- Aprepitant is predicted to increase the exposure to nilotinib. (Moderate) Theoretical
- Nilotinib is predicted to increase the exposure to axitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Nilotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Moderate) Theoretical → Also see TABLE 9 p. 876
- Bosentan is predicted to decrease the exposure to nilotinib. Avoid. (Severe) Theoretical
- Nilotinib is predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- Nilotinib is predicted to increase the exposure to buspirone. Use with caution and adjust dose. (Moderate) Study
- Nilotinib is predicted to increase the exposure to cabozantinib. (Moderate) Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to nilotinib. (Moderate) Theoretical
- Nilotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Nilotinib is predicted to increase the exposure to cariprazine. Avoid. (Severe) Study
- Nilotinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- Nilotinib is predicted to increase the concentration of ciclosporin. (Severe) Study
- Cobastic is predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study
- Nilotinib is predicted to increase the exposure to cobimetinib. (Severe) Theoretical
- Nilotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4. (Severe) Study
- Nilotinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Nilotinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- Nilotinib is predicted to slightly increase the exposure to darifenacin. (Moderate) Study
- Nilotinib is predicted to increase the exposure to dasatinib. (Severe) Study → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- Nilotinib increases the risk of QT-prolongation when given with domerparedone. Avoid. (Severe) Study
- Nilotinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). (Severe) Theoretical
- Nilotinib is predicted to moderately increase the concentration of dopamine receptor agonists (cabergoline). (Moderate) Aneodal
- Nilotinib is predicted to moderately increase the exposure to dutasteride. (Moderate) Study
- Everolimus is predicted to decrease the exposure to nilotinib. Avoid. (Severe) Theoretical
- Nilotinib is predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical
- Nilotinib is predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical
- Nilotinib is predicted to increase the exposure to erlotinib. (Moderate) Theoretical
- Nilotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study → Also see TABLE 15 p. 877
- Nilotinib is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. (Moderate) Study
- Nilotinib is predicted to increase the exposure to gefitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Grapefruit juice is predicted to increase the exposure to nilotinib. Avoid. (Severe) Theoretical
- Nilotinib is predicted to increase the concentration of guanosine. Adjust guanosine dose, p. 237. (Moderate) Theoretical
- H\textsubscript{2} receptor antagonists are predicted to decrease the absorption of nilotinib. H\textsubscript{2} receptor antagonists should be taken 10 hours before or 2 hours after nilotinib. (Moderate) Theoretical
- HIV- protease inhibitors are predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study → Also see TABLE 9 p. 876
- Nilotinib is predicted to increase the exposure to ibritinib. Adjust ibritinib dose with moderate inhibitors of CYP3A4. (Severe) Study → Also see TABLE 15 p. 877
- Idelalisib is predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study → Also see TABLE 15 p. 877
- Nilotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. (Severe) Theoretical
- Nilotinib is predicted to increase the exposure to irinotecan. Adjust irinotecan dose with moderate inhibitors of CYP3A4. (Severe) Study
- Idelalisib is predicted to moderately increase the exposure to ivacaftor. Adjust ivacaftor p. 189 or tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. (Severe) Study
- Nilotinib is predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 876
Nilotinib (continued)

- **Nilotinib** is predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Macrolides (erythromycin) are predicted to increase the exposure to nilotinib. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Nitotane is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 15 p. 877
- **Nilotinib** is predicted to increase the exposure to naxogeol. Adjust naxogeol dose and monitor side effects. [Moderate] Study
- Neurotamine is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the exposure to oxabutrol. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to oxabutrol (avanafil). Adjust avanafil dose. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. [Moderate] Study → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the exposure to pimozone. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Pitolisant** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- **Pitolisant** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 876
- **Rifampicin** is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical → Also see TABLE 15 p. 877
- **Nilotinib** is predicted to increase the exposure to saxagliptin. [Mild] Study
- **Nilotinib** increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- **St. John’s Wort** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical

**Nilotinib** is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the concentration of tacrolimus. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical → Also see TABLE 15 p. 877
- **Nilotinib** is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical → Also see TABLE 15 p. 877
- **Nilotinib** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 196 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Nilotinib** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to tolterodine. [Mild] Theoretical → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to trazodone. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to urapidil. Avoid if used for uterine fibroids. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- **Nilotinib** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Nimodipine** → see calcium channel blockers

**Nintedanib**
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to nintedanib. [Moderate] Study
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to nintedanib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nintedanib. [Moderate] Study
- Calcium channel blockers are predicted to increase the exposure to nintedanib. [Moderate] Study
- Ciclosporin is predicted to increase the exposure to nintedanib. [Moderate] Study
- HIV- protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to nintedanib. [Moderate] Study
- **Lapatinib** is predicted to increase the exposure to nintedanib. [Moderate] Study
- **Macrolides** are predicted to increase the exposure to nintedanib. [Moderate] Study
- **Ranolazine** is predicted to increase the exposure to nintedanib. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to nintedanib. [Moderate] Study
- **St. John’s Wort** is predicted to decrease the exposure to nintedanib. [Moderate] Study
- **Vemurafenib** is predicted to increase the exposure to nintedanib. [Moderate] Study

**Nitisinone**
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nitisinone. Adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitisinone. Adjust dose. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to nitisinone. Adjust dose. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to nitisinone. Adjust dose. [Moderate] Theoretical

**Table 9**

| BNFC 2019–2020 | 1002 | Nilotinib – Nitisinone | A1 | Interactions Appendix 1 |
Nitrisone – NSAIDs 1003

- **HIV-protease inhibitors** are predicted to increase the exposure to nitrisone. Adjust dose. [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to nitrisone. Adjust dose. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to nitrisone. Adjust dose. [Moderate] Theoretical
- **Mitotane** is predicted to decrease the exposure to nitrisone. Adjust dose. [Moderate] Theoretical
- **Rifampin** is predicted to decrease the exposure to nitrisone. Adjust dose. [Moderate] Theoretical

**Nitrates → see TABLE 7 p. 875 (first-dose hypotension), TABLE 8 p. 875** (hypotension)

**glyceryl trinitrate** - isosorbide dinitrate - isosorbide mononitrate

**PHARMACOLOGY** Drugs with antimucociliar effects can cause dry mouth, which can reduce the effectiveness of sublingual glyceryl trinitrate tablets.

- **Nitrates** are predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (pilocaine). Avoid. [Severe] Theoretical
- **Nitrates are predicted to increase the risk of methaemoglobinaemia when given with dapsone.** [Severe] Theoretical
- **Nitrates potentially increase the risk of hypotension when given with phosphodiesterase type 5 inhibitors.** Avoid. [Severe] Study → Also see TABLE 8 p. 875

**Nitrazepam → see TABLE 11 p. 876 (CNS depressant effects)**

**rifampin** increases the clearance of nitrazepam. [Moderate] Study

**Nitrofurantoin → see TABLE 12 p. 877 (peripheral neuropathy)**

**Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (pilocaine). Use with caution or avoid. [Severe] Theoretical

Antacids (magnesium trisilicate) decrease the absorption of nitrofurantoin. [Moderate] Study

**Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with dapsone. [Severe] Theoretical

- **Nitrous oxide** → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)
- **Nitrous oxide potentially increases the risk of methotrexate toxicity when given with methotrexate.** Avoid. [Severe] Study

**Nivolumab → see monoclonal antibodies**

**Nizatidine** → see H₂ receptor antagonists

**Noradrenaline/norepinephrine** → see sympathomimetics, vasoconstrictor

**Norwegian**

**Noroxistine**

- **Antiepilepsics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Aprepitant** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Bosantan** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Efavirenz** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Fosaprepitant** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Glide steps to decrease the efficacy of norethisterone.** For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Nevirapine** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Rifabutin** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Rifampin** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **St John’s Wort** is predicted to decrease the efficacy of norethisterone. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal
- **Sugammadex** is predicted to decrease the exposure to norethisterone. Use additional contraceptive precautions. [Severe] Theoretical
- **Ulipristal** is predicted to decrease the efficacy of norethisterone. Avoid. [Severe] Theoretical

**Normal immunoglobulin** → see immunoglobulins

**Nortriptyline** → see tricyclic antidepressants

**NSAIDs → see TABLE 18 p. 878 (hypnotolamia), TABLE 2 p. 874 (nephrotoxicity), TABLE 16 p. 878 (increased serum potassium), TABLE 4 p. 874 (antiplatelet effects)**

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- **Celecoxib** is predicted to increase the exposure to antiarrhythmics (flecainide, propafenone). Monitor and adjust dose. [Moderate] Theoretical
- **Antifungals, azoles (fluconazole)** moderately increase the exposure to celecoxib. Adjust celecoxib dose. [Moderate] Study
- **Antifungals, azoles (fluconazole)** increase the exposure to parecoxib. Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles (voriconazole)** slightly increase the exposure to diclofenac. Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles (voriconazole)** moderately increase the exposure to ibuprofen. Adjust dose. [Moderate] Study
- **NSAIDs are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid).** [Moderate] Study
- **NSAIDs are predicted to increase the risk of renal impairment when given with bisphosphonates (sodium clodronate).** [Severe] Theoretical
- **Ceritinib** is predicted to increase the exposure to NSAI(Ds (celecoxib, diclofenac). Adjust dose. [Moderate] Theoretical
- **Ciclosporin** increases the concentration of diclofenac. [Severe] Study → Also see TABLE 2 p. 874 → Also see TABLE 16 p. 878
- **Etoricoxib** slightly increases the exposure to combined hormonal contraceptives. [Moderate] Study
- **NSAIDs increase the risk of gastrointestinal bleeding when given with corticosteroids.** [Severe] Study
- **NSAIDs increase the risk of renal impairment when given with daptomycin.** [Moderate] Theoretical
- **Indometacin increases the concentration of digoxin.** [Severe] Study
- **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. [Severe] Theoretical
- **Etoricoxib** slightly increases the exposure to hormone replacement therapy. [Moderate] Study
- **NSAIDs are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox).** [Severe] Theoretical
- **Leflunomide** is predicted to increase the exposure to NSAI(Ds (indometacin, ketoprofen). [Moderate] Theoretical
- **NSAIDs increase the concentration of lithium.** Monitor and adjust dose. [Severe] Study
- **NSAIDs are predicted to increase the risk of toxicity when given with methotrexate.** [Severe] Study → Also see TABLE 2 p. 874
NSAIDs (continued)

- NSAIDs (high-dose) are predicted to decrease the efficacy of mifamurtide. Avoid. (Severe) Theoretical
- Nicorandil is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. (Severe) Theoretical
- NSAIDs are predicted to increase the exposure to penretrexed. Use with caution or avoid. (Severe) Theoretical → Also see TABLE 2 p. 874
- NSAIDs potentially increase the risk of seizures when given with quinolones. (Severe) Theoretical
- Regorafenib is predicted to increase the exposure to mefenamic acid. Avoid. (Moderate) Theoretical → Also see TABLE 4 p. 874
- Rifampicin moderately decreases the exposure to NSAIDs (celecoxib, diclofenac, etoricoxib). (Moderate) Study
- Teriflunomide is predicted to increase the exposure to NSAIDs (indometacin, ketoprofen). (Moderate) Theoretical
- NSAIDs increase the risk of acute renal failure when given with thiazide diuretics. (Severe) Theoretical → Also see TABLE 1B p. 878
- Exposure increases the risk of haematological toxicity when given with NSAIDs. (Severe) Study → Also see TABLE 2 p. 874

Obeticholic acid
- Obeticholic acid decreases the anticoagulant effect of coumarins (warfarin). (Severe) Study
- Obeticholic acid is predicted to increase the exposure to theophylline. (Severe) Theoretical
- Obeticholic acid is predicted to increase the exposure to tizanidine. (Severe) Theoretical

Olanzapine → see monocolonic antibodies
Ocrelizumab → see monocolonic antibodies
Octreotide
- Octreotide decreases the absorption of oral ciclosporin. Adjust ciclosporin dose, p. 537. (Severe) Anecdotal
- Octreotide (short-acting) decreases the exposure to telotristat ethyl. Telotristat ethyl should be taken at least 30 minutes before octreotide. (Moderate) Study

Olfaxcin → see quinolones
Olanzapine → see TABLE 8 p. 875 (hypotension), TABLE 15 p. 877 (myelosuppression), TABLE 11 p. 876 (CNS depressant effects)

FOOD AND LIFESTYLE  Dose adjustment might be necessary if smoking started or stopped during treatment.

- Antiepileptics (carbamazepine) potentially decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (phenytoin) are predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Olanzapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 875
- HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Leflunomide is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study → Also see TABLE 15 p. 877
- Olanzapine decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. (Severe) Anecdotal → Also see TABLE 8 p. 875
- Mexiletine is predicted to increase the exposure to olanzapine. Adjust dose. (Moderate) Anecdotal
- Quinolones (ciprofloxacin) are predicted to increase the exposure to olanzapine. Adjust dose. (Moderate) Anecdotal
- Rifampicin is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- SSRIs (fluvoxamine) moderately increase the exposure to olanzapine. Adjust dose. (Severe) Anecdotal
- Teriflunomide is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study

Olaparib → see TABLE 15 p. 877 (myelosuppression)

FOOD AND LIFESTYLE  Bitter (Seville) orange is predicted to increase the exposure to olaparib.

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Aprepitant is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Bosentan is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical
- Cobicistat is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Crizotinib is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Efavirenz is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Grapefruit juice is predicted to increase the exposure to olaparib. Avoid. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Idelalisib is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study → Also see TABLE 15 p. 877
- Macrolides (clarithromycin) are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Study
- Macrolides (erythromycin) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Nitoufin is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. (Moderate) Theoretical
- Ombitasvir
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin) are predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
- Efavirenz is predicted to increase the exposure to ombitasvir. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

Ombitasvir
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin) are predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
- Efavirenz is predicted to increase the exposure to ombitasvir. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
Etravirine is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

Ombitasvir (in fixed-dose combination with dasabuvir) decreases the concentration of HIV-protease inhibitors (darunavir). Avoid or adjust dose. (Moderate) Study

Mitotane is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

Nevirapine is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

St John’s Wort is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

Omega-3 acid ethyl esters → see TABLE 3 p. 874 (anticoagulant effects)

Omeprazole → see proton pump inhibitors

Ondansetron → see TABLE 3 p. 877 (serotonin syndrome), TABLE 9 p. 876 (QT-interval prolongation)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ombitasvir. (Moderate) Study

Dopamine receptor agonists (apomorphine) increase the risk of severe hypotension when given with ondansetron. Avoid. (Severe) Study → Also see TABLE 9 p. 876

Enzalutamide is predicted to decrease the exposure to ombitasvir. (Moderate) Study

Mitotane is predicted to decrease the exposure to ondansetron. (Moderate) Study

Opicapone

Opicapone increases the exposure to levodopa. Adjust dose. (Moderate) Study

Opicapone is predicted to increase the exposure to loperamide. Avoid. (Moderate) Study

Opicapone is predicted to increase the risk of elevated blood pressure when given with moclobemide. Avoid. (Severe) Theoretical

Opicapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. (Severe) Theoretical

Opicapone is predicted to increase the exposure to montelukast. Avoid. (Moderate) Study

Opicapone is predicted to increase the exposure to pioglitazone. Avoid. (Moderate) Study

Opicapone is predicted to increase the exposure to repaglinide. Avoid. (Moderate) Study

Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. (Severe) Theoretical

Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Severe) Theoretical

Opioids → see TABLE 6 p. 875 (bradycardia), TABLE 13 p. 877 (serotonin syndrome), TABLE 9 p. 876 (QT-interval prolongation), TABLE 11 p. 876 (CNS depressant effects)

Alcohol (beverage) causes rapid release of opioids (hydromorphone, morphine) (from extended-release preparations). Avoid. (Severe) Study → Also see TABLE 11 p. 876

Antiarrhythmics (amiodarone) are predicted to increase the concentration of fentanyl. (Moderate) Theoretical → Also see TABLE 6 p. 875

Antiarrhythmics (dronedarone) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study

Antiarrhythmics (dronedarone) are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 9 p. 876

Antiepileptics (carbamazepine) decrease the concentration of tramadol. Adjust dose. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. (Moderate) Theoretical → Also see TABLE 11 p. 876

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to methadone. Monitor and adjust dose. (Severe) Study → Also see TABLE 11 p. 876

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to oxycodone. Monitor and adjust dose. (Moderate) Study → Also see TABLE 11 p. 876

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study → Also see TABLE 11 p. 876

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). (Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to methadone. Adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 876

Antifungals, azoles (miconazole) are predicted to increase the exposure to alfentanil. Use with caution and adjust dose. (Moderate) Study

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Moderate) Study

Aprepitant is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study

Aprepitant is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical

Bictegravir is predicted to increase the exposure to methadone. (Moderate) Theoretical

Bosentan decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study

Brigatinib potentially decreases the concentration of opioids (alfentanil, fentanyl). Avoid. (Moderate) Theoretical

Buproprion is predicted to decrease the efficacy of codeine. (Moderate) Theoretical

Buproprion is predicted to decrease the efficacy of tramadol. (Severe) Study → Also see TABLE 13 p. 877

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study → Also see TABLE 6 p. 875

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical

Certinib is predicted to increase the exposure to fentanyl. Avoid. (Severe) Theoretical

Cinacalcet is predicted to decrease the efficacy of codeine. (Moderate) Theoretical

Cinacalcet is predicted to decrease the efficacy of tramadol. (Severe) Study

Cobicistat is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study

Crizotinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Moderate) Study → Also see TABLE 6 p. 875

Crizotinib is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 6 p. 875

Efavirenz decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study → Also see TABLE 9 p. 876
Opioids (continued)

- **Enalaprilat** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. (Moderate) Theoretical
- **Enalaprilat** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Enalaprilat** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study
- **Enalaprilat** is predicted to decrease the exposure to oxycodeone. Monitor and adjust dose. (Severe) Study
- **H₂ receptor antagonists** (cimetidine) increase the concentration of alfentanil. Use with caution and adjust dose. (Severe) Study
- **H₂ receptor antagonists** (cimetidine) increase the exposure to fentanyl. (Moderate) Study
- **HIV-protease inhibitors** (boosted with ritonavir) are predicted to decrease the exposure to methadone. (Moderate) Study
  - Also see TABLE 9 p. 876
- **HIV-protease inhibitors** (ritonavir) are predicted to decrease the concentration of morphine. (Moderate) Theoretical
- **HIV-protease inhibitors** (ritonavir) increase the risk of CNS toxicity when given with pethidine. Avoid. (Severe) Study
- **HIV-protease inhibitors** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone, sufentanil). Monitor and adjust dose. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to methadone. Also see TABLE 9 p. 876
- **Idelalisib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone, sufentanil). Monitor and adjust dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone, sufentanil). Monitor and adjust dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical
- **Letermovir** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Monitor and adjust dose. (Moderate) Study
- **Macrolides (clarithromycin)** are predicted to increase the concentration of methadone. (Severe) Theoretical Also see TABLE 9 p. 876
- **Macrolides (erythromycin)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone). Monitor and adjust dose. (Moderate) Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone, sufentanil). Monitor and adjust dose. (Severe) Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical
- **Opioids potentially decrease the absorption of oral mexiletine. (Moderate) Study
- **Mitotane** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. (Moderate) Theoretical
- **Mitotane** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Mitotane** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study
- **Mitotane** is predicted to decrease the exposure to oxycodeone. Monitor and adjust dose. (Moderate) Study
- **Opioids** are predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. (Severe) Study Also see TABLE 13 p. 877
- **Monoamine-oxidase B inhibitors (rasagiline)** are predicted to increase the risk of side-effects when given with pethidine. Avoid and for 14 days after stopping rasagiline. (Severe) Theoretical Also see TABLE 13 p. 877
- **Monoamine-oxidase B inhibitors (selegiline)** are predicted to increase the risk of side-effects when given with pethidine. Avoid and for 1 week after stopping selegiline. (Severe) Theoretical Also see TABLE 13 p. 877
- **Nalmefene** is predicted to decrease the efficacy of opioids. Avoid. (Severe) Theoretical
- **Netupitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone). Monitor and adjust dose. (Moderate) Study
- **Netupitant** is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical
- **Neurontin** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Nilotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone). Monitor and adjust dose. (Moderate) Study
- **Nilotinib** is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical Also see TABLE 9 p. 876
- **Opioids (buprenorphine)** are predicted to increase the risk of opiate withdrawal when given with opioids (alfentanil). (Severe) Theoretical Also see TABLE 11 p. 876
- **Opioids (buprenorphine)** are predicted to increase the risk of opiate withdrawal when given with opioids (codeine, diamorphine, dihydrocodeine, dipipanone, fentanyl, hydromorphone, meptazinol, methadone, morphine, oxycodone, papaveretum). (Severe) Theoretical Also see TABLE 11 p. 876
- **Opioids (buprenorphine)** are predicted to increase the risk of opiate withdrawal when given with opioids (codeine, diamorphine, dihydrocodeine, dipipanone, fentanyl, hydromorphone, meptazinol, methadone, morphine, oxycodone, papaveretum, pentazocine, pethidine, remifentanil, sufentanil, tapentadol, tramadol). (Severe) Theoretical Also see TABLE 11 p. 876
- **Opioids (pentazocine)** are predicted to increase the risk of opiate withdrawal when given with opioids (sufentanil). (Severe) Also see TABLE 11 p. 876
- **Palbociclib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Adjust dose. (Moderate) Theoretical
- **Pitolisant** is predicted to decrease the exposure to morphine. (similar to pemoline) (Moderate) Theoretical
- **Ribocebin** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Use with caution and adjust dose. (Moderate) Study
- **Rifampicin** is predicted to decrease the exposure to buprenorphine. (similar to rifampicin) (Moderate) Theoretical
- **Rifampicin** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. (Moderate) Theoretical
- **Rifampicin** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Rifampicin** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study
- **Rifampicin** decreases the exposure to methadone. (Moderate) Study
- **Rifampicin** is predicted to decrease the exposure to oxycodone. Monitor and adjust dose. (Moderate) Study
- **Rucaparib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Monitor and adjust dose. (Moderate) Study
- **SSRI Is (fluoxetine, paroxetine) are predicted to decrease the efficacy of codeine. (Moderate) Theoretical
- **SSRI Is (fluoxetine, paroxetine) are predicted to decrease the efficacy of tramadol. (Severe) Study Also see TABLE 13 p. 877
- **St John’s Wort** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study Also see TABLE 13 p. 877
- **St John’s Wort** moderately decreases the exposure to oxycodone. Adjust dose. (Moderate) Study
- **Terbinafine** is predicted to decrease the efficacy of codeine. (Moderate) Theoretical
- **Terbinafine** is predicted to decrease the efficacy of tramadol. (Severe) Study

Orlistat

**SEPARATION OF ADMINISTRATION** Orlistat might affect the absorption of concurrently administered drugs—consider separating administration. Particular care should be taken with antiepileptics, antiretrovirals, and drugs that have a narrow therapeutic index.

**Orphenadrine** → see TABLE 10 p. 876 (antimuscarinic)
Paliperidone — Paritaprevir

Paliperidone — see TABLE 8 p. 875 (hypotension), TABLE 9 p. 876 (QT-interval prolongation), TABLE 11 p. 876 (CNS depressant effects)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study Also see TABLE 9 p. 876

Antiepileptics (valproate) slightly increase the exposure to paliperidone. Adjust dose. [Moderate] Study

Paliperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical Also see TABLE 8 p. 875 Also see TABLE 9 p. 876

Enzalutamide is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study

Paliperidone is predicted to decrease the effects of levodopa. [Severe] Theoretical Also see TABLE 8 p. 875

Methylphenidate increases the risk of dyskinasias when given with paliperidone. [Severe] Theoretical

Mitotane is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study

St John's Wort is predicted to decrease the exposure to paliperidone. [Severe] Theoretical

Palonosetron — see TABLE 9 p. 876 (QT-interval prolongation), TABLE 13 p. 877 (serotonin syndrome)

Dopamine receptor agonists (apomorphine) are predicted to increase the risk of severe hypotension when given with palonosetron. [Severe] Theoretical

Pamidronate — see bisphosphonates

Pancreatin

Pancreatin is predicted to decrease the effects of acarbose. Avoid. [Moderate] Theoretical

Pancuronium — see neuromuscular blocking drugs, non-depolarising

Panumumab — see monoclonal antibodies

Panobinostat — see TABLE 15 p. 876 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)

FOOD AND LIFESTYLE

Avoid pomegranate, pomegranate juice, and star fruit as they are predicted to increase panobinostat exposure.

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical Also see TABLE 9 p. 876

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study Also see TABLE 9 p. 876

Antifungals, azoles (posaconazole) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Panobinostat is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical Also see TABLE 9 p. 876

Panobinostat is predicted to decrease the exposure to beta blockers, selective (metoprolol). Monitor and adjust dose. [Moderate] Theoretical

Panobinostat is predicted to increase the exposure to beta blockers, selective (nebivolol). Monitor and adjust dose. [High] Theoretical

Calcium channel blockers (verapamil) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Ciclosporin is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study Also see TABLE 15 p. 876

Idelalisib is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study Also see TABLE 15 p. 876

Lapatinib is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical Also see TABLE 9 p. 876

Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical Also see TABLE 9 p. 876

Macrolides (clarithromycin) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study Also see TABLE 9 p. 876

Mitotane is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical Also see TABLE 15 p. 877

Panobinostat is predicted to increase the exposure to pimozone. Avoid. [Severe] Theoretical Also see TABLE 9 p. 876

Ranolazine is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical Also see TABLE 9 p. 876

Rifampicin is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical

Vemurafenib is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical Also see TABLE 9 p. 876

Pantoprazole — see proton pump inhibitors

Parpaveretum — see opioids

Paracetamol — see TABLE 1 p. 874 (hepatotoxicity)

Alcohol (beverages) (in those who drink heavily) causes severe liver damage when given with paracetamol. [Severe] Study Also see TABLE 1 p. 874

Paracetamol is predicted to decrease the clearance of alkylation agents (busulfan). [Moderate] Theoretical

Paracetamol is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to paracetamol. [Moderate] Study Also see TABLE 1 p. 874

Paracetamol increases the anticoagulant effect of coumarins. [Moderate] Study

Paracetamol is predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical

Imatinib increases the risk of hepatotoxicity when given with paracetamol. [Severe] Anecdotal

Paracetamol potentially increases the risk of high anion gap metabolic acidosis when given with penicillins (fluocoxacillin). [Severe] Theoretical Also see TABLE 1 p. 874

Paracetamol is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical

Pitolisant is predicted to decrease the exposure to paracetamol. [High] Theoretical

Pitolisant decreases the exposure to paracetamol. [Moderate] Study

Paraldehyde — see antiepileptics

Parathyroid hormone

Bisphosphonates are predicted to decrease the effects of parathyroid hormone. Avoid. [Moderate] Study

Paroxetine — see NSAIDs

Paricalcitol — see vitamin D substances

Paritaprevir

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to aliskiren. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir) and paritaprevir (with ritonavir and ombitasvir) is predicted to
increase the exposure to antifungals, azoles (posaconazole). Avoid. [Moderate Study]

- Bosentan is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe Study]
- Cobicistat is predicted to increase the exposure to paritaprevir. Avoid. [Severe Study]
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe Study]
- Paritaprevir (in fixed-dose combination with daalabuvir) decreases the anticoagulant effect of coumarins (acenocoumarol). Monitor INR and adjust dose. [Severe Anecdotal]
- Paritaprevir (in fixed-dose combination) decreases the anticoagulant effect of coumarins (warfarin). Monitor INR and adjust dose. [Severe Anecdotal]
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to dabigatran. [Severe Study]
- Paritaprevir (with ritonavir and ombitasvir) increases the exposure to digoxin. Monitor and adjust digoxin dose, p. 82. [Moderate Study]
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to edoxaban. Avoid. [Severe Study]
- Efalizumab is predicted to decrease the exposure to paritaprevir. Avoid. [Severe Study]
- HIV-protease inhibitors (atazanavir) boosted with ritonavir markedly increase the exposure to paritaprevir. Avoid or give unboosted. [Moderate Study]
- HIV-protease inhibitors (darunavir boosted with ritonavir) slightly decrease the exposure to paritaprevir. Avoid or give unboosted. [Moderate Study]
- HIV-protease inhibitors ( fosamprenavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to paritaprevir. Avoid. [Severe Study]
- HIV-protease inhibitors (saquinavir) are predicted to increase the exposure to paritaprevir (in fixed-dose combination). Avoid. [Severe Study]
- Paritaprevir is predicted to increase the exposure to idelalisib. Avoid. [Severe Study]
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to loperamide. [Moderate Study]
- Macrolides (clarithromycin) are predicted to increase the exposure to paritaprevir. Avoid. [Severe Study]
- Mitotane is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe Study]
- Neoral is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe Study]
- Rifampicin is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe Study]
- St John’s Wort is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe Study]
- Paritaprevir (in fixed-dose combination) is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). Avoid. [Severe Theoretical]
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to statins (fluvastatin). Avoid. [Moderate Theoretical]
- Paritaprevir (with ritonavir and ombitasvir) increases the exposure to taxanes (paclitaxel). [Moderate Study]
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to thyroid hormones (levothyroxine). Monitor and adjust dose. [Moderate Theoretical]
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to topectan. [Moderate Study]
- Paroxetine is predicted to increase the exposure to paritaprevir. Avoid. [Severe Theoretical]
- Pasireotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. [Severe Theoretical]

Paritaprevir is predicted to decrease the absorption of ciclosporin. Adjust dose. [Severe Theoretical]

### Patiromer

#### SEPARATION OF ADMINISTRATION

Manufacturer advises take 3 hours before, or after, other drugs.

### Pazopanib

- see TABLE 15 p. 877 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)
- Antacids are predicted to decrease the absorption of pazopanib. Pazopanib should be taken 1 hour before or 2 hours after antacids. [Moderate Theoretical]
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to pazopanib. [Moderate Theoretical] → Also see TABLE 9 p. 876
- Antidepressants (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pazopanib. Avoid. [Severe Theoretical]
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pazopanib. [Moderate Theoretical]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate Study] → Also see TABLE 9 p. 876
- Aprepitant is predicted to increase the exposure to pazopanib. [Moderate Theoretical]
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pazopanib. [Moderate Theoretical]
- Cobasistat is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate Study]
- Pazopanib is predicted to increase the risk of bleeding events when given with coumarins. [Severe Theoretical]
- Crizotinib is predicted to increase the exposure to pazopanib. [Moderate Theoretical] → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- Enalapril is predicted to decrease the exposure to pazopanib. Avoid. [Severe Theoretical]
- Grapefruit juice is predicted to increase the exposure to pazopanib. Avoid. [Severe Theoretical]
- H1 Receptor antagonists are predicted to decrease the exposure to pazopanib. H1 receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. [Moderate Theoretical]
- HIV-protease inhibitors are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate Study] → Also see TABLE 9 p. 876
- Idealalisib is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate Study] → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to pazopanib. [Moderate Theoretical] → Also see TABLE 15 p. 877
- Pazopanib is predicted to increase the exposure to sorafenib. [Moderate Theoretical] Separate administration by 12 hours. [Moderate Theoretical]
- Macrolides (clarithromycin) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate Study] → Also see TABLE 9 p. 876
- Macrolides (erythromycin) are predicted to increase the exposure to pazopanib. [Moderate Theoretical] → Also see TABLE 9 p. 876
Pazopanib – Phenindione

**Pazopanib (continued)**

- **Mitotane** is predicted to decrease the exposure to pazopanib. Avoid. **Severe** Theoretical → Also see TABLE 15 p. 877
- **Netupitant** is predicted to increase the exposure to pazopanib. **Moderate** Theoretical
- **Nilotinib** is predicted to increase the exposure to pazopanib. **Moderate** Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- **Pazopanib** is predicted to increase the risk of bleeding events when given with phenindione. **Severe** Theoretical
- **Proton pump inhibitors** are predicted to decrease the exposure to pazopanib. Avoid or administer concurrently without food. **Moderate** Study
- **Rifampicin** is predicted to decrease the exposure to pazopanib. Avoid. **Severe** Theoretical
- **Pazopanib** is predicted to affect the exposure to statins (atorvastatin). **Moderate** Anecdotal
- **Pazopanib** is predicted to affect the exposure to statins (pravastatin, rosuvastatin, simvastatin). **Moderate** Theoretical
- **Pegasparagase** → see TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression)
- **Pegasparagase** is predicted to increase the risk of hepatotoxicity when given with imatinib. **Severe** Theoretical → Also see TABLE 15 p. 877
- **Pegasparagase** affects the efficacy of methotrexate. **Severe** Anecdotal → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877
- **Pegasparagase** potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before pegasparagase. **Severe** Anecdotal → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877
- **Peginterferon alfa** → see interferons
- **Peginterferon beta-1a** → see TABLE 15 p. 877 (myelosuppression)
- **Pembrolizumab** → see monoclonal antibodies
- **Pemetrexed** → see TABLE 15 p. 877 (myelosuppression), TABLE 2 p. 874 (nephrotoxicity)
- **Antimalarials** (pyrimethamine) are predicted to increase the risk of side-effects when given with pemetrexed. **Severe** Theoretical → Also see TABLE 15 p. 877
- **Aspirin** (high-dose) potentially increases the exposure to pemetrexed. Use with caution or avoid. **Severe** Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with pemetrexed. Public Health England advises avoid (refer to Green Book). **Severe** Theoretical
- **NSAID**s are predicted to increase the exposure to pemetrexed. Use with caution or avoid. **Severe** Theoretical → Also see TABLE 2 p. 874
- **Penicillamine** → see TABLE 2 p. 874 (nephrotoxicity)
- **Antacids** decrease the absorption of penicillamine. Separate administration by 2 hours. **High** Study
- **Antimalarials** (chloroquine) are predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. **Severe** Theoretical
- **Iron** (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. **High** Study
- **Sodium aurothiomalate** potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. **Severe** Study
- **Zinc** is predicted to decrease the absorption of penicillamine. **High** Theoretical
- **Penicillins** → see TABLE 1 p. 874 (hepatotoxicity)
- **amoxicillin** - **ampicillin** - **benzypenicillin** - **flucloxacinil** - **phenoxymethylpenicillin** - **piperacillin** - **pivmecillinam** - **temocillin** - **ticarcillin**
- **Alliopirinol** increases the risk of skin rash when given with penicillins (amoxicillin, ampicillin). **Moderate** Study
- **Antiepileptics** (valproate) increase the risk of side-effects when given with pivmecillinam. Avoid. **Severe** Anecdotal
- **Penicillins** potentially alter the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. **Severe** Anecdotal
- **Leflunomide** is predicted to increase the exposure to benzypenicillin. **Moderate** Theoretical
- **Penicillins** are predicted to increase the risk of toxicity when given with methotrexate. **Severe** Anecdotal → Also see TABLE 1 p. 874
- **Piperacillin** increases the effects of **neuromuscular blocking drugs**, **non-depolarising**. **Moderate** Study
- **Paracetamol** potentially increases the risk of high anion gap metabolic acidosis when given with fluocoxidin. **Severe** Theoretical → Also see TABLE 1 p. 874
- **Penicillins** are predicted to increase the risk of bleeding events when given with **phenindione**. **Severe** Theoretical
- **Piperacillin** increases the effects of **suxamethonium**. **Moderate** Study
- **Teriflunomide** is predicted to increase the exposure to benzypenicillin. **Moderate** Study
- **Pentamidine** → see TABLE 9 p. 876 (CFI-interval prolongation), TABLE 15 p. 877 (myelosuppression), TABLE 2 p. 874 (nephrotoxicity)
- **Didanosine** is predicted to increase the risk of pancreatitis when given with pentamidine. Avoid. **Severe** Study
- **Foscarnet** increases the risk of hypocalcaemia when given with pentamidine. **Severe** Anecdotal → Also see TABLE 2 p. 874
- **Pentazocine** → see opioids
- **Pentostatin** → see TABLE 15 p. 877 (myelosuppression), TABLE 5 p. 874 (thromboembolism)
- **Alkylating agents** (cyclophosphamide) (high-dose) increase the risk of toxicity when given with pentostatin. Avoid. **Severe** Anecdotal → Also see TABLE 15 p. 877 → Also see TABLE 5 p. 874
- **Fludarabine** increases the risk of pulmonary toxicity when given with pentostatin. Avoid. **Severe** Study → Also see TABLE 15 p. 877
- **Pentoxifylline**
- **Pentoxifylline** is predicted to increase the concentration of **aminophylline**. Use with caution or avoid. **Severe** Theoretical
- **Quinolones** (ciprofloxacin) very slightly increase the exposure to pentoxifylline. **Moderate** Study
- **SSRIs** (fluvoxamine) are predicted to increase the exposure to pentoxifylline. **Moderate** Theoretical
- **Pentoxifylline** increases the concentration of **theophylline**. Monitor and adjust dose. **Severe** Study
- **Peppermint oil**
- **Peppermint oil** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Moderate** Theoretical
- **Perampanel** → see antiepileptics
- **Pergolide** → see dopamine receptor agonists
- **Pericyazine** → see phenothiazines
- **Perindopril** → see ACE inhibitors
- **Pertuzumab** → see monoclonal antibodies
- **Pethidine** → see opioids
- **Phenelzine** → see monoamine-oxidase A and B inhibitors, irreversible
- **Phenindione** → see TABLE 3 p. 874 (anticoagulant effects)

**FOOD AND LIFESTYLE** The effects of phenindione can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control.

- **Antirhythmic**s (propafenone) are predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. **Moderate** Theoretical
- **Antifungals**, azoles (miconazole) greatly increase the anticoagulant effect of phenindione. **Severe** Theoretical
- **Axitinib** is predicted to increase the risk of bleeding events when given with phenindione. **Severe** Theoretical
- **Bosutinib** is predicted to increase the risk of bleeding events when given with phenindione. **Severe** Theoretical
- **Cabozzatinib** is predicted to increase the risk of bleeding events when given with phenindione. **Severe** Theoretical
- **Cephalosporins** (ceftriaxone) potentially increase the risk of bleeding events when given with phenindione. **Severe** Anecdotal
- **Corticosteroids** are predicted to increase the effects of phenindione. **Moderate** Anecdotal
> Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Dasetubin is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Disulfiram is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical
> Enteral feeds (vitamin-K containing) potentially decrease the effects of phenindione. [Severe] Theoretical
> Erlotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Study
> Gefitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> H₂ receptor antagonists (cimetidine) increase the exposure to phenindione. [Severe] Theoretical
> Imatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Lapatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Nandrolone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Severe] Theoretical
> Nitrofurantoin is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Oxymetholone increases the anticoagulant effect of phenindione. [Severe] Theoretical
> Paracetamol is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical
> Pazopanib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Penicillins are predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Ponatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Ranibizumab is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Regorafenib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Ruxolitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Sotalol is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Statins (rosuvastatin) are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Theoretical
> Sunisib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Vandetanib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
> Phosphodiesterase type-5 inhibitors → see antiepileptics

**Phenothiazines** → see antiepileptics

**Phenothiazines are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] Theoretical** → Also see TABLE 8 p. 875
> Phenothiazines decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Study → Also see TABLE 8 p. 875
> Phenothiazines potentially increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 876
> Chlorpromazine decreases the effects of metyrapone. Avoid. [Moderate] Theoretical
> Moclobemide increases the risk of side-effects when given with levomepromazine. [Moderate] Study
> Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of neuroleptic malignant syndrome when given with phenothiazines. [Severe] Theoretical → Also see TABLE 8 p. 875

**Phenoxymethylpenicillin → see penicillins**
> Phenytoin → see antiepileptics
> Pholcodine is predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical

**Phosphodiesterase type-5 inhibitors** → see TABLE 8 p. 875 (hypotension). TABLE 9 p. 876 (QT-interval prolongation)avanafil - sildenafil - tadalafil - vardenafil

**Alpha blockers cause significant hypotensive effects when given with phosphodiesterase type-5 inhibitors. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. [Severe] Study** → Also see TABLE 8 p. 875
> Antiarhythmics (dronedarone) are predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical
> Antiarhythmics (dronedarone) are predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. [Moderate] Study → Also see TABLE 9 p. 876
> Antiarhythmics (dronedarone) are predicted to increase the exposure to tadalafil. [Severe] Theoretical
> Antiarhythmics (dronedarone) are predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 876
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil, vardenafil). Avoid. [Severe] Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). [Moderate] Theoretical
> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical
> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. [Moderate] Study → Also see TABLE 9 p. 876
> Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 876
> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. [Severe] Study → Also see TABLE 9 p. 876
> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tadalafil. Use with caution or avoid. [Severe] Study
> Antifungals, azoles (miconazole) are predicted to increase the exposure to sildenafil. Use with caution and adjust dose. [Severe] Theoretical
Phosphodiesterase type-5 inhibitors (continued)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 8 p. 876
- Apalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, sildenafil, vardenafil). Avoid or monitor. [Moderate] Study → Also see TABLE 9 p. 876
- Aprepitant is predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical
- Aprepitant is predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4. [Moderate] Study
- Aprepitant is predicted to increase the exposure to tadalafil. [Severe] Theoretical
- Aprepitant is predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical
- Bosentan decreases the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4. [Moderate] Study → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tadalafil. [Severe] Theoretical → Also see TABLE 8 p. 875
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical → Also see TABLE 8 p. 875
- Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. [Severe] Study → Also see TABLE 9 p. 876
- Cobicistat is predicted to increase the exposure to tadalafil. Use with caution or avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to vardenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. [Moderate] Study → Also see TABLE 9 p. 876
- Macrolides (clarithromycin) are predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 122. [Severe] Study → Also see TABLE 9 p. 876
- Macrolides (erythromycin) are predicted to increase the exposure to sildenafil. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study
- Mitotane is predicted to decrease the exposure to sildenafil. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Mitotane is predicted to decrease the exposure to vardenafil. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Theoretical
- Nicorandil is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 875
- Nitroglycerin is predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 122. [Moderate] Study → Also see TABLE 9 p. 876
- Nilotinib is predicted to increase the exposure to vardenafil. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Nitrates potentially increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Study → Also see TABLE 8 p. 875
- Rifampicin is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study
Pibrentasvir
- Rifampicin (with glecaprevir) is predicted to decrease the exposure to pibrentasvir. (Moderate) Study
- St John's Wort is predicted to decrease the exposure to pibrentasvir. Avoid. (Severe) Study

Phosphodiesterase type-5 inhibitors
- Tadalafil (with glecaprevir) is predicted to increase the exposure to pibrentasvir. Avoid. (Moderate) Study
- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to tadalafil. (Moderate) Study

Calcium channel blockers
- Diltiazem (with glecaprevir) is predicted to increase the exposure to pibrentasvir. Avoid. (Severe) Study

Antiepileptics
- Phenytoin (with glecaprevir) is predicted to increase the exposure to pibrentasvir. Avoid. (Severe) Study
- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to carbamazepine, oxcarbazepine, phenobarbital, phenytoin, primidone. Avoid. (Severe) Study

Pilocarpine
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pibrentasvir. (Moderate) Study

A1
Pimozide (continued)

- Pimozide decreases the effects of levodopa. [Severe] Theoretical → Also see TABLE 8 p. 875
- Macrolides (clarithromycin) are predicted to increase the exposure to pimozide. Avoid. [Severe] Study → Also see TABLE 9 p. 876
- Macrolides (erythromycin) are predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- Netupitant is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical
- Nitelidipine is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- Palbociclib is predicted to increase the exposure to pimozide. Adjust dose. [Moderate] Theoretical
- Panobinostat is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- Pitolisant is predicted to decrease the exposure to pimozide. Avoid. [Severe] Theoretical
- Rifabutin is predicted to decrease the exposure to pimozide. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- Rolapitant is predicted to decrease the exposure to pimozide. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical
- Voriconazole is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical

Food and Lifestyle

- Smoking increases pirenidone clearance; patients should be encouraged to stop smoking before and during treatment with pirenidone.
- Antiepileptics ( fosphenytoin, phenytoin) are predicted to decrease the exposure to pirenidone. [Moderate] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to pirenidone. Use with caution and adjust dose. [Moderate] Study
- HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to pirenidone. [Moderate] Theoretical
- Jeflumidine is predicted to decrease the exposure to pirenidone. [Moderate] Theoretical
- Mexiletine is predicted to increase the exposure to pirenidone. Use with caution and adjust dose. [Moderate] Study
- Quinolones (ciprofloxacin) are predicted to increase the exposure to pirenidone. Use with caution and adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to pirenidone. Avoid. [Moderate] Theoretical
- SSRIs ( fluvoxamine) are predicted to moderately increase the exposure to pirenidone. Avoid. [Moderate] Theoretical
- Teriflunomide is predicted to decrease the exposure to pirenidone. [Moderate] Theoretical

Piroxicam → see NSAIDs

Pitolisant

- Pitolisant is predicted to decrease the exposure to aliskiren. [Moderate] Theoretical
- Antiepileptics ( carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to antihistamines, non-sedating ( fexofenadine). [Mild] Theoretical
- Antihistamines, sedating are predicted to decrease the efficacy of pitolisant. [Moderate] Theoretical
- Pitolisant is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Bupropion is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to ciclosporin. Avoid. [Severe] Theoretical
- Cinacalcet is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to colchicine. [Mild] Theoretical
- Pitolisant is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to corticosteroids (dexamethasone). [Mild] Theoretical
- Pitolisant is predicted to decrease the exposure to efavirenz. [Mild] Theoretical
- Enzalutamide is predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to irinotecan. [Mild] Theoretical
- Pitolisant is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to loperamide. [Mild] Theoretical
- Pitolisant is predicted to increase the exposure to metformin. [Mild] Theoretical
- Mianserin is predicted to decrease the efficacy of pitolisant. [Moderate] Theoretical
- Mirtazapine is predicted to decrease the efficacy of pitolisant. [Moderate] Theoretical
- Mitotane is predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to opioids (morphine). [Mild] Theoretical
- Pitolisant is predicted to decrease the exposure to paracetamol. [Mild] Theoretical
- Pitolisant is predicted to decrease the exposure to pimozide. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to repaglinide. [Mild] Theoretical
- Rifampicin is predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to pitolisant. Monitor and adjust dose. [Moderate] Theoretical
- Pitolisant is predicted to decrease the exposure to tacrolimus. Avoid. [Severe] Theoretical
Pitolisant is predicted to slightly increase the exposure to taxanes (docetaxel). Avoid. [Severe] Theoretical

Pitolisant is predicted to decrease the exposure to taxanes (paclitaxel). [Mild] Theoretical

Pitolisant is predicted to decrease the exposure to temsirolimus. Avoid. [Severe] Theoretical

Terbinafine is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study

Pitolisant is predicted to decrease the exposure to topotecan. [Mild] Theoretical

Tricyclic antidepressants are predicted to decrease the efficacy of pitolisant. [Severe] Theoretical

Venlafaxine is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. [Mild] Theoretical

Pimecrolimus → see pencillins

Pizotifen → see antihistamines, sedating

Platinum compounds → see TABLE 15 p. 877 (myelosuppression), TABLE 2 p. 874 (nephrotoxicity), TABLE 19 p. 878 (ototoxicity), TABLE 12 p. 877 (peripheral neuropathy)

carbo platinum - cisplatin - oxaliplatin

• Cisplatin increases the risk of pulmonary toxicity when given with bleomycin. [Severe] Study → Also see TABLE 15 p. 877

• Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with platinum compounds. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Polymyxins → see TABLE 2 p. 874 (nephrotoxicity), TABLE 20 p. 878 (neuromuscular blocking effects)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Polystyrene sulfonate

SEPARATION OF ADMINISTRATION Manufacturers advise take other drugs at least 3 hours before or after calcium– or sodium-polystyrene sulfonate; a 6-hour separation should be considered in gastroparesis.

• Antacids increase the risk of metabolic alkalosis when given with polystyrene sulfonate. [Severe] Anecdotal

Pomalidomide → see TABLE 15 p. 877 (myelosuppression), TABLE 5 p. 874 (thromboembolism)

• Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with pomalidomide. Avoid. [Severe] Theoretical

• Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with pomalidomide. [Severe] Theoretical

• Quinolones (ciprofloxacin) are predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose. [Moderate] Theoretical

• SSRI (fluvoxamine) moderately increase the exposure to pomalidomide. Adjust pomalidomide dose. [Moderate] Study

Ponatinib

• Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

• Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

• Cobicistat is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

• Ponatinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

• Enzalutamide is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

• Grapefruit juice is predicted to increase the exposure to ponatinib. [Moderate] Theoretical

• HIV-protease inhibitors are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

• Idelalisib is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

• Macrolides (clarithromycin) are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

• Mitotane is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

• Ponatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

• Rifampicin is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

• St John’s Wort is predicted to decrease the exposure to ponatinib. Avoid. [Severe] Theoretical

Ponatinib

• Active metabolites (pomalidomide, piperacillin, topotecan) are predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

• Combined hormonal contraceptives are predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

• Statins (lovastatin, simvastatin) are predicted to decrease the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

• Temsirolimus is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

• Carboplatin is predicted to increase the risk of pulmonary toxicity when given with bleomycin. [Severe] Study

• Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with platinum compounds. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Potassium aminobenzoate → see TABLE 16 p. 878 (increased serum potassium)

• Potassium aminobenzoate increases the concentration of methotrexate. [Moderate] Theoretical

• Potassium aminobenzoate is predicted to affect the efficacy of sulfonamides. Avoid. [Severe] Theoretical

Potassium canrenoate → see TABLE 16 p. 878 (increased serum potassium)

• Potassium chloride → see TABLE 16 p. 878 (increased serum potassium)

Potassium citrate

• Potassium citrate is predicted to decrease the efficacy of methotrexate. Avoid. [Moderate] Theoretical

• Potassium citrate increases the risk of side-effects when given with sulphradine. Avoid. [Moderate] Theoretical

Potassium-sparring diuretics → see TABLE 18 p. 878 (hypopotassemia), TABLE 16 p. 878 (increased serum potassium)

• Amlodipine - triamterene

• Triamterene potentially increases the clearance of lithium. [Moderate] Study

Pramipexole → see dopamine receptor agonist antipsychotics

Prasugrel → see TABLE 4 p. 874 (antiplatelet effects)

Pravastatin → see statins

Praziquantel

• Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study

• Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to praziquantel. [Mild] Study

• Antimalarials (chloroquine) moderately decrease the exposure to praziquantel. Use with caution and adjust dose. [Moderate] Study

• Corticosteroids (dexamethasone) decrease the exposure to praziquantel. [Moderate] Study

• Enzalutamide is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study

• Grapefruit juice is predicted to increase the exposure to praziquantel. [Moderate] Study

• H₂ receptor antagonists (cimetidine) moderately increase the exposure to praziquantel. [Moderate] Study

• HIV-protease inhibitors are predicted to markedly increase the exposure to praziquantel. [Mild] Study

• Idelalisib is predicted to markedly increase the exposure to praziquantel. [Mild] Study

• Macrolides (clarithromycin) are predicted to moderately increase the exposure to praziquantel. [Mild] Study

• Mitotane is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study

• Rifampicin is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study

• Prazosin → see alpha blockers

Prednisolone → see corticosteroids

Pregabalin → see antiepileptics

Pramipexole → see dopamine receptor agonist antipsychotics

Primane → see antimalarials

Primidone → see antiepileptics

Procarnosoline → see TABLE 15 p. 877 (myelosuppression), TABLE 13 p. 877 (serotonin syndrome)
Propanolol → see beta blockers, non-selective
Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) are predicted to increase the risk of hypersensitivity reactions when given with procarbazine. (Severe) Anecdotal
Antiepileptics (fosphenytoin) are predicted to increase the risk of hypersensitivity when given with procarbazine. (Severe) Anecdotal
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with procarbazine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
Prochlorperazine → see phenothiazines
Propofol → see TABLE 10 p. 876 (antimuscarinics)
Propylthiouracil → see antithyroidism, iodides
Propafenone → see antiarrhythmics
Promazine → see antipsychotics
Promethazine → see antiarrhythmics
Promazine → see antipsychotics
Procyclidine is predicted to decrease the effects of metyrapone. Avoid. (Moderate) Theoretical
Proxymetacaine → see anaesthetics, local
Pyrazinamide → see antimycobacterial agents
Pyridostigmine → see anticholinesterase agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyridostigmine → see anticholinesterase agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Pyrimethamine → see antifalciparum (Ehrlichia species) agents
Quetiapine → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. (Moderate) Study
Quetiapine is predicted to decrease to moderately increase the exposure to velpatasvir. Avoid adjust dose, see sofosbuvir with velpatasvir and voxilaprevi...
Cobicistat is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Crizotinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical Also see TABLE 8 p. 875

Efavirenz is predicted to decrease the exposure to quetiapine. (Moderate) Study

Enalaprilat is predicted to decrease the exposure to quetiapine. (Moderate) Study

Grapefruit juice is predicted to increase the exposure to quetiapine. Avoid. (Severe) Theoretical

HIV- protease inhibitors are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Idelalisib is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Imatinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Quetiapine decreases the effects of levodopa. (Severe) Anecdotal Also see TABLE 8 p. 875

Quetiapine potentially increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal

Macrolides (clarithromycin) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Mitotane is predicted to decrease the exposure to quetiapine. (Moderate) Study

Netupitant is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Nevirapine is predicted to decrease the exposure to quetiapine. (Moderate) Study

Nilotinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Rilrobicitil (high-dose) is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Theoretical

Rifampicin is predicted to decrease the exposure to quetiapine. (Moderate) Study

St John’s Wort is predicted to decrease the exposure to quetiapine. (Moderate) Study

Quinagolide see dopamine receptor agonists

Quinapril see ACE inhibitors

Quinine see antimalarials

Quinolones see TABLE 9 p. 876 (QT-interval prolongation)

ciprofloxacin - levofloxacin - moxifloxacin - ofloxacin

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Interactions do not generally apply to topical use of moxifloxacin unless specified.

Ciprofloxacin is predicted to increase the exposure to quetiapine. (Severe) Study

Ciprofloxacin is predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

Ciprofloxacin is predicted to increase the exposure to anagrelide. (Moderate) Theoretical

Antacids decrease the absorption of quinolones. Quinolones should be taken 2 hours before or 4 hours after antacids. (Moderate) Study

Ciprofloxacin slightly increases the exposure to antithrythmics (lidocaine). (High) Study

Ciprofloxacin affects the concentration of antiepileptics (fosphenytoin, phenytoin) to predict increase the concentration and adjust dose. (Severe) Study

Calcium salts (calcium carbonate) decrease the absorption of ciprofloxacin. Separate administration by 2 hours. (Moderate) Study

Ciprofloxacin increases the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study

Quinolones increase the anticoagulant effect of coumarins. (Severe) Anecdotal

Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to duloxetine. Avoid. (Moderate) Theoretical

Ciprofloxacin is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Theoretical

Enteral feeds decrease the exposure to ciprofloxacin. (Moderate) Study

Ciprofloxacin slightly increases the exposure to erlotinib. Monitor side effects and adjust dose. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose. (Severe) Theoretical

Iron (oral) decreases the exposure to quinolones. Separate administration by at least 2 hours. (Moderate) Study

Lanthanum moderately decreases the exposure to quinolones. Quinolones should be taken 2 hours before or 4 hours after lanthanum. (Moderate) Study

Lenalidomide is predicted to increase the exposure to ciprofloxacin. (Moderate) Theoretical

Ciprofloxacin is predicted to increase the exposure to lodoxapine. Avoid. (Unknown) Theoretical

Ciprofloxacin is predicted to increase the exposure to melatonin. (Moderate) Theoretical

Ciprofloxacin potentially increases the risk of toxicity when given with methotrexate. (Severe) Anecdotal

Ciprofloxacin slightly increases the exposure to monoamine-oxidase B inhibitors (rasagiline). (Moderate) Study

NSAIDs potentially increase the risk of seizures when given with quinolones. (Severe) Theoretical

Ciprofloxacin is predicted to increase the exposure to olanzapine. Adjust dose. (Moderate) Anecdotal

Ciprofloxacin very slightly increases the exposure to pentoxyfylline. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to pirofendone. Use with caution and adjust dose. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose. (Moderate) Theoretical

Ciprofloxacin is predicted to increase the exposure to riluzole. (Moderate) Theoretical

Ciprofloxacin is predicted to increase the exposure to roflumilast. (Moderate) Theoretical

Sucralfate decreases the exposure to quinolones. Separate administration by 2 hours. (Moderate) Study

Teriflunomide is predicted to increase the exposure to ciprofloxacin. (Moderate) Theoretical

Ciprofloxacin is predicted to increase the exposure to theophylline. Monitor and adjust dose. (Moderate) Theoretical

Ciprofloxacin increases the exposure to tizanidine. Avoid. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to tolvaptan. Use with caution and adjust tolvaptan dose. (Moderate) Theoretical

Zinc is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. (Moderate) Study

Ciprofloxacin is predicted to decrease the exposure to zolmitriptan. Adjust zolmitriptan dose. p. 300. (Moderate) Theoretical

Rabeprazole see proton pump inhibitors

Rabies immunoglobulin see immunoglobulins

Rabies vaccine

Antimalarials (chloroquine) decrease the efficacy of rabies vaccine. Avoid. (Moderate) Study

Hydroxychloroquine is predicted to decrease efficacy of rabies vaccine. (Moderate) Theoretical

Ralofoxifene see TABLE 5 p. 874 (thromboembolism)

Combined hormonal contraceptives potentially oppose the effects of ralofoxifene. Avoid. (Severe) Theoretical

Hormone replacement therapy potentially opposes the effects of ralofoxifene. Avoid. (Severe) Theoretical

Raltegravir

Antacids slightly decrease the exposure to raltegravir. Avoid. (Moderate) Study

Antiepileptics (carbamazepine) are predicted to affect the exposure to raltegravir. (Moderate) Theoretical
Raltegravir (continued)

- **Antiepileptics** (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to affect the exposure to raltegravir. Use with caution or avoid. (Moderate) Theoretical
  - Phenobarbital (calcium carbonate) greatly decrease the exposure to raltegravir. (high-dose). Avoid. (Severe) Study
  - *Enoralfen* is predicted to increase the exposure to raltegravir. (Moderate) Theoretical
  - HIV-protease inhibitors (atazanavir) increase the exposure to raltegravir. (high-dose). Avoid. (Moderate) Study
  - HIV-protease inhibitors (darunavir) increase the risk of rash when given with raltegravir. (Moderate) Study

- **Ranolazine** (boosted with ritonavir) decrease the exposure to raltegravir and raltegravir decreases the exposure to HIV-protease inhibitors (fosamprenavir) (boosted with ritonavir). Avoid. (Severe) Study

- **Ranolazine** (tipranavir) boosted with ritonavir are predicted to decrease the exposure to raltegravir (high-dose). Avoid. (Moderate) Study

- **Rifampin** slightly decreases the exposure to raltegravir. Avoid or adjust dose—consult product literature. (Moderate) Study

**Raltrexed** → see TABLE 15 p. 877 (myelosuppression)

- **Folates** are predicted to alter the effects of raltrexed. Avoid. (Moderate) Study

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with raltrexed. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

- **Ramipril** → see ACE inhibitors

- **Ramucirumab** → see monoclonal antibodies

- **Ranibumab**
  - Ranibumab is predicted to increase the risk of bleeding events when given with argatroban. (Severe) Theoretical
  - Ranibumab is predicted to increase the risk of bleeding events when given with bivalirudin. (Moderate) Theoretical
  - **Ranibumab** increases the risk of bleeding events when given with coumarins. (Severe) Theoretical
  - **Ranibumab** is predicted to increase the risk of bleeding events when given with heparin (unfractionated). (Severe) Theoretical
  - **Ranibumab** increases the risk of bleeding events when given with low molecular-weight heparins. (Severe) Theoretical
  - **Ranibumab** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

- **Ranitidine** → see H$_2$ receptor antagonists

- **Ranolazine** → see TABLE 9 p. 876 (QT-interval prolongation)
  - **Ranolazine** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. (Moderate) Study
  - **Ranolazine** is predicted to increase the exposure to aliskiren. (Moderate) Theoretical
  - **Antiarrhythmics** (dronedarone) are predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 876
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study

- **Antifungals** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study → Also see TABLE 9 p. 876

- **Antifungals** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study → Also see TABLE 9 p. 876

- **Aprepitant** is predicted to increase the exposure to ranolazine. (Severe) Study

- **Ranolazine** is predicted to increase the exposure to beta blockers, non-selective (nadolol). (Moderate) Study

- **Ranolazine** is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to ranolazine. (Severe) Study

- **Ranolazine** is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 9 p. 876

- **Ciclosporin** is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the concentration of ciclosporin. (Moderate) Theoretical

- **Cobicistat** is predicted to increase the exposure to ranolazine. Avoid. (Severe) Study

- **Ranolazine** is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. (Severe) Theoretical

- **Crizotinib** is predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 876

- **Ranolazine** is predicted to increase the exposure to dabigatran. (Severe) Theoretical

- **Ranolazine** increases the concentration of digoxin. (Moderate) Study

- **Ranolazine** is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. (Moderate) Study

- **Ranolazine** is predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical

- **Enalapril** is predicted to decrease the exposure to ranolazine. (Severe) Study

- **Ranolazine** is predicted to increase the exposure to erlotinib. (Moderate) Theoretical

- **Ranolazine** is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

- **Grapefruit juice** is predicted to increase the concentration of ranolazine. Avoid. (Severe) Theoretical

- **HIV-protease inhibitors** are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study → Also see TABLE 9 p. 876

- **Idelalisib** is predicted to increase the exposure to ranolazine. Avoid. (Severe) Study

- **Imatinib** is predicted to increase the exposure to ranolazine. (Severe) Study

- **Ranolazine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

- **Macrolides** (clarithromycin) are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study → Also see TABLE 9 p. 876

- **Macrolides** (erythromycin) are predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 876

- **Mitotane** is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study

- **Netupitant** is predicted to increase the exposure to ranolazine. (Severe) Study

- **Nilotinib** is predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 876

- **Ranolazine** is predicted to increase the exposure to nintedanib. (Moderate) Study

- **Ranolazine** is predicted to increase the exposure to panobinostat. Adjust dose. (Moderate) Theoretical → Also see TABLE 9 p. 876

- **Ranolazine** is predicted to increase the exposure to pibrantavir. (Moderate) Theoretical

- **Rifampicin** is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study

- **St John’s Wort** is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study

- **Ranolazine** is predicted to increase the exposure to statins (atorvastatin). (Moderate) Theoretical

- **Ranolazine** slightly increases the exposure to statins (simvastatin). Adjust simvastatin dose. p.13e (Moderate) Study

- **Ranolazine** increases the concentration of tacrolimus. Adjust dose. (Severe) Anecdotal

- **Ranolazine** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. (Severe) Study

- **Ranolazine** is predicted to increase the exposure to topotecan. (Severe) Study

- **Ranolazine** is predicted to increase the concentration of trame tinib. (Moderate) Theoretical

- **Ranolazine** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical

- **Rasagiline** → see monoamine-oxidase B inhibitors

- **Reboxetine**
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to reboxetine. (Moderate) Anecdotal
### Interactions

| Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. Avoid.  
| (Moderate) Study |
| Antifungals, azoles (miconazole) are predicted to increase the concentration of repaglinide. Use with caution and adjust dose.  
| (Moderate) Theoretical |
| Cobicistat is predicted to increase the exposure to repaglinide.  
| Avoid.  
| (Moderate) Study |
| Enzalutamide is predicted to decrease the exposure to repaglinide.  
| (Moderate) Anecdotal |
| HIV-protease inhibitors are predicted to increase the exposure to repaglinide. Avoid.  
| (Moderate) Study |
| Idealalisib is predicted to increase the exposure to repaglinide.  
| Avoid.  
| (Moderate) Study |
| Repaglinide is predicted to increase the risk of a hypertensive crisis when given with linezolid. Avoid.  
| (Severe) Theoretical |
| Repaglinide is predicted to increase the risk of hypokalaemia when given with loop diuretics.  
| (Moderate) Theoretical |
| Macrolides (clarithromycin) are predicted to increase the exposure to repaglinide. Avoid.  
| (Moderate) Study |
| Mitotane is predicted to decrease the exposure to repaglinide.  
| (Moderate) Anecdotal |
| Repaglinide is predicted to increase the risk of a hypertensive crisis when given with moclобемид. Avoid.  
| (Severe) Theoretical |
| Repaglinide is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid.  
| (Severe) Theoretical |
| Repaglinide is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid.  
| (Severe) Theoretical |
| Repaglinide is predicted to decrease the exposure to repaglinide.  
| (Moderate) Anecdotal |
| Repaglinide is predicted to increase the risk of hypokalaemia when given with thiazide diuretics.  
| (Moderate) Anecdotal |
| Regorafenib → see TABLE 15 p. 877 (myelosuppression), TABLE 4 p. 874 (antidiabetic drugs) |
| Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose.  
| (Moderate) Study |
| Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide.  
| (Moderate) Study |
| Ciclosporin moderately increases the exposure to repaglinide.  
| (Moderate) Study |
| Clopidogrel increases the exposure to repaglinide. Avoid.  
| (Severe) Study |
| Cobicistat is predicted to increase the exposure to repaglinide.  
| (Moderate) Study |
| Enzalutamide is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose.  
| (Moderate) Study |
| HIV-protease inhibitors are predicted to increase the exposure to repaglinide.  
| (Moderate) Study |
| Iron chelators (deferasirox) moderately increase the exposure to repaglinide. Avoid.  
| (Moderate) Study |
| Leflunomide is predicted to increase the exposure to repaglinide.  
| (Moderate) Study |
| Letemovir is predicted to increase the concentration of repaglinide. Avoid.  
| (Moderate) Theoretical |
| Macrolides (clarithromycin) are predicted to increase the exposure to repaglinide.  
| (Moderate) Study |
| Mitotane is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose.  
| (Moderate) Study |
| Opicapone is predicted to increase the exposure to repaglinide. Avoid.  
| (Moderate) Study |
| Pitavastatin is predicted to decrease the exposure to repaglinide.  
| (Moderate) Study |
| Verapamil is predicted to increase the exposure to repaglinide.  
| (Moderate) Study |
| Trimethoprim slightly increases the exposure to repaglinide. Avoid or monitor blood glucose.  
| (Moderate) Study |
| Venetoclax is predicted to increase the exposure to repaglinide.  
| (Moderate) Theoretical |
| Retigabine → see antiepileptics |

### Retinoids

- Acitretin - adapalene - alitretinoin - bexarotene - isotretinoin - tazarotene - tretinoin

- Acitretin and isotretinoin. Since systemic absorption can follow topical application of isotretinoin and tretinoin, the possibility of interactions should be borne in mind.

- Avoid concomitant use of keratolytics in patients taking acitretin and isotretinoin.

### Alcohol (beverage)

- Alcohol (beverage) potentially increases the concentration of acitretin. Avoid and for 2 months after stopping acitretin. Avoid.  
| (Moderate) Study |

- Antiarrhythmics (amiodarone) are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose.  
| (Moderate) Theoretical |

- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole) are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose.  
| (Moderate) Theoretical |

- Ciclosporin moderately increases the exposure to alitretinoin. Adjust alitretinoin dose.  
| (Moderate) Theoretical |

- Clopidogrel is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose.  
| (Moderate) Theoretical |

- Fibrates (gemfibrozil) are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose.  
| (Moderate) Theoretical |

- Studies indicate that alitretinoin is well absorbed following oral administration. It is relatively extensively metabolized by the liver and extensively secreted into human milk. Dosage adjustments are not necessary for patients with reduced renal function.
Retinoids (continued)

- **Fibrates (gemfibrozil)** increase the concentration of bexarotene. Avoid. [Severe] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical
- **Aprepitant** is predicted to increase the concentration of methotrexate. Avoid. [Moderate] Anecdotal
- **Ribociclib (acitretin, altretinoin, isoretinoin, tretonin)** increase the risk of benign intracranial hypertension when given with macrolines. Avoid. [Severe] Anecdotal
- **Bexarotene** is predicted to increase the risk of toxicity when given with vitamin A. Adjust dose. [Moderate] Theoretical
- **Retinoids (acitretin, altretinoin, isoretinoin, tretonin)** are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Study
- **Tretinoin** is predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Study

**Ribavirin**

- **Ribavirin** is predicted to increase the exposure to didanosine. Avoid. [Severe] Study
- **Ribavirin** increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study
- **Ribavirin** increases the risk of anaemia and/or leucopenia when given with zidovudine. Avoid. [Severe] Study

**Ribociclib** → See Table 9 p. 876 (Q7-interval prolongation)

**FOOD AND LIFESTYLE**

- Avoid concomitant use of pomegranate or pomegranate juice as it is predicted to increase ribociclib exposure.
- **Ribociclib** (high-dose) is predicted to increase the exposure to alpha blockers (alfuzosin). Avoid. [Moderate] Theoretical
- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to ribociclib. [Moderate] Study → Also see Table 9 p. 876
- **Ribociclib** (high-dose) is predicted to increase the exposure to antiarhythmics (amiodarone). Avoid. [Moderate] Theoretical → Also see Table 9 p. 876
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to ribociclib. Avoid. [Severe] Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to ribociclib. [Moderate] Study → Also see Table 9 p. 876
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study → Also see Table 9 p. 876
- **Aprepitant** is predicted to increase the exposure to ribociclib. [Moderate] Study
- **Bosantan** is predicted to decrease the exposure to ribociclib. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to ribociclib. [Moderate] Study
- **Ribociclib** is predicted to increase the exposure to ciclosporin. Use with caution and adjust dose. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to ribociclib. [Moderate] Study → Also see Table 9 p. 876
- **Ribociclib** is predicted to increase the exposure to digoxin. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the exposure to ribociclib. [Moderate] Study → Also see Table 9 p. 876
- **Enzalutamide** is predicted to markedly decrease the exposure to ribociclib. Avoid. [Severe] Study
- **Ribociclib** (high-dose) is predicted to increase the exposure to ergotamine. Avoid. [Moderate] Theoretical
- **Ribociclib** is predicted to increase the exposure to everolimus. Use with caution and adjust dose. [Moderate] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to ribociclib. Avoid. [Moderate] Theoretical

**HIV-protease inhibitors** are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study → Also see Table 9 p. 876

- **Idelalisib** is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study
- **Imatinib** is predicted to increase the exposure to ribociclib. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study → Also see Table 9 p. 876
- **Macrolides (erythromycin)** are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose. [Moderate] Study

**Ribociclib** is predicted to increase the exposure to **metformin**. [Moderate] Theoretical

- **Ribociclib** moderately increases the exposure to **midazolam**. Avoid. [Moderate] Study
- **Mirtazapine** is predicted to markedly decrease the exposure to ribociclib. Avoid. [Severe] Study
- **Netupitant** is predicted to increase the exposure to ribociclib. [Moderate] Study
- **Nevirapine** is predicted to decrease the exposure to ribociclib. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to ribociclib. [Moderate] Study → Also see Table 9 p. 876
- **Ribociclib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Use with caution and adjust dose. [Moderate] Theoretical
- **Ribociclib** is predicted to increase the exposure to phosphodiesterase type 5 inhibitors (sildenafil). Avoid. [Moderate] Theoretical → Also see Table 9 p. 876
- **Ribociclib** (high-dose) is predicted to increase the exposure to pimozide. Avoid. [Moderate] Theoretical → Also see Table 9 p. 876
- **Ribociclib** (high-dose) is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Theoretical
- **Rifampicin** is predicted to markedly decrease the exposure to ribociclib. Avoid. [Severe] Study
- **Ribociclib** is predicted to increase the exposure to sirolimus. Use with caution and adjust dose. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to ribociclib. Avoid. [Severe] Study
- **Ribociclib** is predicted to increase the exposure to statins (pravastatin, rosuvastatin). [Moderate] Theoretical
- **Ribociclib** (high-dose) is predicted to increase the exposure to statins (simvastatin). Avoid. [Moderate] Theoretical
- **Ribociclib** is predicted to increase the exposure to tacrolimus. Use with caution and adjust dose. [Moderate] Theoretical

**Rifabutin**

**GENERAL INFORMATION** Although some manufacturers class rifabutin as a potent inducer of CYP3A4, clinical data suggests it is potentially a weak inducer, and therefore the BNF does not extrapolate the interactions of potent CYP3A4 inducers to rifabutin. For those who wish to err on the side of caution, see the interactions of rifampicin but bear in mind other mechanisms might be involved.

- **Antifungals, azoles (fluconazole)** increase the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Study
- **Antifungals, azoles (itraconazole, posaconazole)** increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. [Severe] Study
- **Antifungals, azoles (ketoconazole)** are predicted to increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (ketoconazole). Avoid. [Severe] Theoretical
- **Antifungals, azoles (miconazole)** are predicted to increase the concentration of rifabutin. Use with caution and adjust dose. [Moderate] Theoretical
- **Rifabutin** is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical
- **Rifabutin** decreases the concentration of antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the concentration of rifabutin. Avoid or adjust voriconazole dose, p. 392. [Severe] Study
- **Rifabutin** slightly decreases the exposure to antimalarials (atovaquone). Avoid. [Moderate] Study
Rifabutin — Rifampicin 1021

- Rifabutin slightly decreases the exposure to bicitravir. Avoid. (Moderate) Study
- Rifabutin is predicted to decrease the exposure to brigitamine. Avoid. (Moderate) Theoretical
- Rifabutin decreases the concentration of cobicitstat and cobicitstat increases the exposure to rifabutin. Avoid or adjust dose. (Severe) Study
- Rifabutin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Study
- Rifabutin decreases the exposure to dapsone. (Moderate) Study
- Rifabutin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Study
- Rifabutin moderately decreases the exposure to doravirine. Adjust doravirine dose. (Severe) Study
- Efavirenz slightly decreases the exposure to rifabutin. Adjust dose. (Severe) Study
- Rifabutin is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- Rifabutin decreases the exposure to etravirine. (Moderate) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) (boosted with ritonavir) increase the exposure to rifabutin. Monitor and adjust dose. (Severe) Study
- HIV-protease inhibitors (ritonavir) markedly increase the exposure to rifabutin. Avoid or adjust dose. (Severe) Study
- Rifabutin is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal
- Rifabutin is predicted to decrease the exposure to ledipasvir. Avoid. (Severe) Theoretical
- Rifabutin is predicted to decrease the concentration of lettermenor. (Moderate) Theoretical
- Rifabutin is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- Lumacaftor is predicted to decrease the exposure to rifabutin. Adjust dose. (Moderate) Theoretical
- Macrolides (azithromycin) increase the risk of neutropenia when given with rifabutin. Avoid. (Severe) Study
- Macrolides (clarithromycin) increase the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Theoretical
- Rifabutin is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal
- Rifabutin slightly decreases the exposure to ripivirine. Adjust dose. (Severe) Study
- Rifabutin is predicted to decrease the exposure to rolapitant. Avoid. (Moderate) Theoretical
- Rifabutin is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Rifabutin is predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical
- Rifabutin is predicted to decrease the exposure to tezacafator. Avoid. (Severe) Theoretical
- Rifabutin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal
- Rifabutin is predicted to decrease the concentration of vonlapirovir. Avoid. (Severe) Theoretical

Rifampicin

- Rifampicin is predicted to markedly decrease the exposure to abemacilch. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to afatinib. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to agomelatine. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to aldosterone antagonists (eplerenone). Avoid. (Moderate) Theoretical
- Rifampicin decreases the exposure to aliskiren. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Theoretical
- Rifampicin transiently increases the exposure to ambrisentan. (Moderate) Study
- Rifampicin decreases the exposure to aminophylline. Adjust dose. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to anaesthetics, local (ropivacaine). (Moderate) Theoretical
- Antacids decrease the absorption of rifampicin. Rifampicin should be taken 1 hour before antacids. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to antiarhythymics (disopyramide, dronedarone). Avoid. (Severe) Study
- Rifampicin is predicted to decrease the efficacy of antiarhythymics (propafenone). (Moderate) Study
- Rifampicin is predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). (Severe) Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to rifampicin and rifampicin is predicted to decrease the exposure to antiepileptics (phenobarbital, primidone). Use with caution and adjust dose. (Moderate) Study
- Rifampicin slightly decreases the exposure to antiepileptics (brivaracetam). Adjust dose. (Moderate) Study
- Rifampicin decreases the concentration of antiepileptics (topiramate, phenytoin, phenytoin). Use with caution and adjust dose. (Moderate) Study
- Rifampicin markedly increases the clearance of antiepileptics (lamotrigine). Adjust lamotrigine dose, p. 207. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. (Moderate) Study
- Rifampicin slightly decreases the exposure to antifungals, azoles (fluconazole). Adjust dose. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to antifungals, azoles (itraconazole). Avoid. (Severe) Study
- Rifampicin markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid and for 14 days after stopping rifampicin. (Moderate) Study
- Rifampicin markedly decreases the exposure to antifungals, azoles (ketoconazole). Avoid. (Moderate) Study
- Rifampicin markedly decreases the exposure to antifungals, azoles (ketoconazole) and antifungals, azoles (ketoconazole) potentially decrease the exposure to rifampicin. Avoid. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to antifungals, azoles (miconazole). Avoid. (Moderate) Anecdotal
- Rifampicin very markedly decreases the exposure to antifungals, azoles (voriconazole). Avoid. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to antihistamines, non-sedating (bilastine). (Moderate) Theoretical
- Rifampicin increases the clearance of antihistamines, non-sedating (fexofenadine). (Moderate) Study
- Rifampicin is predicted to decrease the exposure to antimalarias (artemether) (with lumefantrine). Avoid. (Severe) Study
- Rifampicin moderately decreases the exposure to antimalarias (atovaquone) and antimalarias (atovaquone) slightly increase the exposure to rifampicin. Avoid. (Moderate) Study
- Rifampicin moderately decreases the exposure to antimalarias (mefloquine). (Severe) Study
- Rifampicin is predicted to decrease the concentration of antimalarias (piperaquine). Avoid. (Moderate) Theoretical
- Rifampicin decreases the exposure to antimalarias (quinine). (Severe) Study
- Rifampicin is predicted to moderately decrease the exposure to aripiprazole. Use with caution or avoid. (Severe) Study
- Rifampicin moderately decreases the exposure to aripiprazole. Avoid. (Severe) Study
- Rifampicin is predicted to markedly decrease the exposure to aprepitant. Avoid. (Moderate) Study
- Rifampicin is predicted to moderately decrease the exposure to aprepitant. Adjust aripiprazole dose, p. 255. (Moderate) Study
- Rifampicin decreases the exposure to ataluren. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to axitinib. Avoid or adjust dose. (Moderate) Study
Rifampicin (continued)

- Rifampicin is predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
- Rifampicin decreases the exposure to bedaquiline. Avoid. [Severe] Study

Rifampicin moderately decreases the exposure to beta blockers, non-selective (carvedilol). [Moderate] Study

Rifampicin decreases the exposure to beta blockers, non-selective (propranolol). Monitor and adjust dose. [Moderate] Study

Rifampicin slightly decreases the exposure to beta blockers, selective (bisoprolol, metoprolol). [BL] Study

Rifampicin moderately decreases the exposure to beta blockers, selective (celiprolol). [Moderate] Study

Rifampicin is predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Study

- Rifampicin affects the exposure to bosentan. Avoid. [Severe] Study

Rifampicin is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to bupropion. [Moderate] Study

Rifampicin is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. [Severe] Study

Rifampicin moderately decreases the exposure to cabazitaxel. [Moderate] Study

Rifampicin moderately decreases the exposure to canagliflozin. Adjust canagliflozin dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to cariprazine. Avoid. [Severe] Study

Rifampicin decreases the concentration of caspofungin. Adjust caspofungin dose, p. 386. [Moderate] Study

Rifampicin is predicted to decrease the exposure to certitibib. Avoid. [Severe] Study

- Rifampicin decreases the concentration of chloramphenicol. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to chlor Diazepoxide. [Moderate] Theoretical

Rifampicin decreases the concentration of ciclesonide. [Severe] Study

- Rifampicin is predicted to alter the effects of ciclosporin. [Severe] Study

Rifampicin is predicted to increase the exposure to ciclosporin. [Moderate] Theoretical

- Rifampicin is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study

Rifampicin decreases the exposure to clomethiazole. Monitor and adjust dose. [Moderate] Study

- Rifampicin decreases the exposure to clozapine. [Severe] Anecdotal

- Rifampicin is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

- Rifampicin is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Study

Rifampicin is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to corticosteroids (fluticasone). [Unknown] Theoretical

- Rifampicin decreases the anticoagulant effect of coumarins. [Severe] Study

Rifampicin is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study

- Rifampicin is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical

- Rifampicin decreases the exposure to dapsone. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

- Rifampicin is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

- Rifampicin is predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study

- Rifampicin is predicted to slightly decrease the exposure to deathmanid. Avoid. [Moderate] Study

- Rifampicin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical

- Rifampicin moderately decreases the exposure to diazepam. Avoid. [Moderate] Study

- Rifampicin decreases the concentration of digoxin. [Moderate] Study

Rifampicin decreases the exposure to dolutegravir. Adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to doravirine. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to dolutegravir. [Moderate] Theoretical

- Rifampicin is predicted to decrease the exposure to edoxaban. [Moderate] Study

Rifampicin slightly decreases the exposure to efavirenz. Adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to eltorbogap and eltorbogap is predicted to increase the concentration of rifampicin. [Moderate] Theoretical

Rifampicin is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to encorafenib. [Severe] Theoretical

Rifampicin is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to esomeprazole. Adjust dose. [Moderate] Theoretical

Rifampicin is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study

Rifampicin moderately decreases the exposure to exemestane. [Moderate] Study

Rifampicin is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study

Rifampicin is predicted to decrease the exposure to fingolimod. [Moderate] Study

Rifampicin is predicted to decrease the exposure to fosaprepitant. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study

Rifampicin markedly affects the exposure to glecaprevir. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
Rifampicin is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose. [Moderate] Study

Rifampicin decreases the concentration of haloperidol. Adjust dose. [Moderate] Study

Rifampicin is predicted to moderately to markedly decrease the exposure to HIV-1 protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir). Avoid. [Severe] Study

Rifampicin slightly decreases the exposure to HIV-1 protease inhibitors (ritonavir). [Severe] Study

Rifampicin is predicted to decrease the exposure to HIV-1 protease inhibitors (tipranavir). Avoid. [Severe] Study

Rifampicin is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal

Rifampicin is predicted to decrease the exposure to ilbutramine. Avoid. [Moderate] Study

Rifampicin is predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study

Leflunomide is predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

Rifampicin is predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

Rifampicin is predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to ketoconazole. Avoid. [Severe] Study

Rifampicin is predicted to increase the clearance of lapatinib. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to lepadipasir. Avoid. [Severe] Study

Leflunomide is predicted to increase the exposure to rifampicin. [Moderate] Theoretical

Rifampicin is predicted to affect the concentration of letermovir. [Severe] Theoretical

Rifampicin is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to linagliptin. [Moderate] Study

Rifampicin slightly decreases the exposure to lincosamide. Monitor and adjust dose. [Moderate] Theoretical

Rifampicin increases the clearance of lorazepam. [Moderate] Study

Rifampicin is predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study

Rifampicin is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

Rifampicin decreases the concentration of macrolides (clarithromycin). [Severe] Study

Rifampicin is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to melatoninin. [Moderate] Theoretical

Rifampicin is predicted to increase the clearance of mexiteline. Monitor and adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to modafinil. [Moderate] Theoretical

Rifampicin decreases the effects of monoclonal antibodies (brentuximab vedotin). [Severe] Study

Rifampicin is predicted to decrease the exposure to montelukast. [Mild] Study

Rifampicin decreases the concentration of mycophenolate. Monitor and adjust dose. [Severe] Study

Rifampicin is predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study

Rifampicin is predicted to slightly decrease the exposure to nateglinide. [Mild] Study

Rifampicin is predicted to decrease the exposure to netupitant. Avoid. [Severe] Study

Rifampicin decreases the concentration of nevirapine. Avoid. [Severe] Study

Rifampicin is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to nintedanib. [Moderate] Study

Rifampicin is predicted to decrease the exposure to nitisine. Avoid. [Moderate] Theoretical

Rifampicin increases the clearance of nitrazepam. [Moderate] Study

Rifampicin is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Rifampicin decreases the exposure to NSAI: Ds (celecoxib, diclofenac, etoricoxib). [Moderate] Study

Rifampicin is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to ondansetron. [Moderate] Study

Rifampicin is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study

Rifampicin is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical

Rifampicin decreases the exposure to opioids (codeine, morphine). [Moderate] Study

Rifampicin decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to oxycodone. Monitor and adjust dose. [Moderate] Study

Rifampicin is predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study

Rifampicin is predicted to moderately decrease the exposure to ospemifene. [Moderate] Study

Rifampicin is predicted to decrease the exposure to paclitaxel. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to palbociclib. [Severe] Study

Rifampicin is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical

Rifampicin decreases the exposure to paracetamol. [Moderate] Study

Rifampicin is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to pioglitazone. Monitor and adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to pirenzepine. Avoid. [Moderate] Theoretical

Rifampicin is predicted to moderately to markedly decrease the exposure to piritondasvir. Avoid. [Severe] Study

Rifampicin is predicted to moderately decrease the exposure to piritonab. Avoid. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

Rifampicin is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study
Rifampicin — Rilpivirine

Rifampicin (continued)
- Rifampicin is predicted to decrease the exposure to quetiapine. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to rilpivirine.
- Rifampicin slightly decreases the exposure to raltegravir.
  Avoid or adjust dose—consult product literature. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to reboxetine. (Anecdotal) Study
- Rifampicin is predicted to decrease the exposure to regorafenib. Avoid. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. (Moderate) Study
- Rifampicin is predicted to markedly decrease the exposure to ribociclib. Avoid. (Severe) Study
- Rifampicin markedly decreases the exposure to rilpivirine. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study
- Rifampicin is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study
- Rifampicin is predicted to decrease the exposure to roflumilast. (Anecdotal) Study
- Rifampicin is predicted to markedly decrease the exposure to rolapitant. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to ruoxolitinib. Monitor and adjust dose. (Moderate) Study
- Rifampicin is predicted to moderately decrease the exposure to saxagliptin. (Moderate) Study
- Rifampicin moderately decreases the exposure to the active metabolite of selexipag. Adjust dose. (Moderate) Study
- Rifampicin is predicted to decrease the concentration of sirolimus. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- Rifampicin markedly decreases the exposure to statins (atorvastatin). Atorvastatin should be taken at the same time as rifampicin. (Moderate) Study
- Rifampicin moderately decreases the exposure to statins (fluvasatin). Monitor and adjust dose. (Moderate) Study
- Rifampicin very markedly decreases the exposure to statins (simvastatin). (Moderate) Study
- Rifampicin is predicted to decrease the exposure to sulfonylurea. Monitor and adjust dose. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study
- Rifampicin decreases the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study
- Rifampicin markedly decreases the exposure to tamoxifen. (Unknown) Study
- Rifampicin is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to taxanes (docetaxel). Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical
- Rifampicin decreases the exposure to terbinafine. Adjust dose. (Moderate) Study
- Teriflunomide is predicted to increase the exposure to rifampicin. (Moderate) Theoretical
- Rifampicin decreases the exposure to tetracyclines (doxycycline). Monitor and adjust dose. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to theophylline. Adjust dose. (Moderate) Study
- Rifampicin is predicted to markedly decrease the exposure to ticagrelor. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to tivozanib. (Severe) Study
- Rifampicin moderately decreases the exposure to tizanidine. (Anecdotal) Study
- Rifampicin is predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. (Severe) Study
- Rifampicin is predicted to decrease the exposure to toremifene. Adjust dose. (Moderate) Study
- Rifampicin decreases the exposure to trimethoprim. (Anecdotal) Study
- Rifampicin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 56. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study
- Rifampicin is predicted to markedly decrease the exposure to velpatasvir. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to vemurafenib. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). Avoid. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical
- Rifampicin potentially increases the risk of nephrotoxicity when given with volatile halogenated anaesthetics (methoxyflurane). Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. (Moderate) Study
- Rifampicin is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Study
- Rifampicin moderately decreases the exposure to zolpidem. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to zopiclone. Adjust dose. (Moderate) Study

Rilpivirine
- Ciclosporin very markedly increases the exposure to rilpivirine. (Severe) Study

Antacids are predicted to decrease the exposure to rilpivirine. Antacids should be taken 2 hours before or 4 hours after rilpivirine. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- Bosentan is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- Calcium salts (calcium carbonate) are predicted to slightly decrease the exposure to rilpivirine. Calcium carbonate should be taken 2 hours before or 4 hours after rilpivirine. (Severe) Theoretical
- Corticosteroids (dexamethasone) are predicted to decrease the concentration of rilpivirine. Avoid multiple-dose dexamethasone. (Severe) Theoretical
- Efavirenz is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- Enzalutamide markedly decreases the exposure to rilpivirine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
Risperidone is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate Study)

Rifampicin is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate Study)

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to risperidone. Adjust dose. (Moderate Study)

Terbinafine is predicted to increase the exposure to risperidone. Adjust dose. (Moderate Study)

Ritonavir → see HIV-protease inhibitors

Rifaximin → see monocolonal antibodies

Rivaroxaban → see TABLE 3 p. 874 (anticoagulant effects)

Antiarrhythmics (dronedarone) are predicted to increase the exposure to rivaroxaban. Avoid. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole) are predicted to moderately increase the exposure to rivaroxaban. Avoid. (Severe) Study

Ciclosporin is predicted to decrease the exposure to rivaroxaban. Avoid. (Moderate) Study

Cobicistat is predicted to increase the exposure to rivaroxaban. Avoid. (Severe) Theoretical

Moclobemide moderately increases the exposure to rivaroxaban. Avoid. (Moderate) Study

RizatRIPTAN → see TABLE 13 p. 877 (serotonin syndrome)

Beta blockers, non-selective (propranolol) slightly to moderately increase the exposure to rizatRIPTAN. Adjust rizatRIPTAN dose and separate administration by at least 2 hours. (Moderate) Study

RizatRIPTAN is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after rizatRIPTAN. (Severe) Theoretical

Rivastigmine → see anticholinesterases, centrally acting

 ASA and clopidogrel are predicted to increase the exposure to roflumilast. Adjust roflumilast dose and separate administration by at least 24 hours. Avoid. (Severe) Study

Combination of ASA and roflumilast increases the risk of bleeding. (Severe) Study

Clobenpropit is predicted to increase the exposure to roflumilast. Adjust dose. (Moderate) Study

Aminophylline is predicted to slightly increase the exposure to roflumilast. Avoid. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study

Combined hormonal contraceptives are predicted to increase the exposure to roflumilast. (Moderate) Study

Mexiteline is predicted to increase the exposure to roflumilast. (Moderate) Theoretical

Mitotane is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Adjust dose. (Moderate) Study

Rivacoxiban is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study

Mexiteline is predicted to increase the exposure to roflumilast. (Moderate) Theoretical

Rifampicin is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study

Rifampicin is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Adjust dose. (Moderate) Study

Theophylline is predicted to slightly increase the exposure to roflumilast. Avoid. (Moderate) Theoretical
Rolapitant
- Rolapitant is predicted to increase the exposure to alkylating agents (bendamustine). Avoid or monitor. (Moderate) Study
- Rolapitant is predicted to increase the exposure to antineoplastics (doxorubicin, mitoxantrone). Avoid or monitor. (Moderate) Study
- Rolapitant is predicted to increase the exposure to antituberculous (rifampicin). Monitor and adjust dose. (Moderate) Study
- Rolapitant is predicted to increase the exposure to antiarrhythmics (propafenone). (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to rolapitant. Avoid. (Severe) Study
- Rolapitant is predicted to moderately increase the exposure to beta blockers, selective (metoprolol). (Severe) Study
- Bosantan is predicted to decrease the exposure to colchicine. (Moderate) Study
- Rolapitant is predicted to increase the exposure to colchicine. (Moderate) Study
- Rolapitant is predicted to increase the exposure to dabigatran. (Moderate) Study
- Rolapitant is predicted to increase the exposure to efavirenz. Avoid. (Severe) Study
- Enzalutamide is predicted to markedly decrease the exposure to efavirenz. Avoid. (Severe) Study
- Rolapitant is predicted to increase the exposure to methotrexate. Avoid or monitor. (Moderate) Study
- Rolapitant is predicted to increase the exposure to mitotane. Avoid. (Severe) Study
- Nevirapine is predicted to decrease the exposure to rolapitant. Avoid. (Severe) Study
- Rolapitant is predicted to increase the exposure to pimozide. (Severe) Study
- Rifabutin is predicted to decrease the exposure to rolapitant. (Moderate) Study
- Riftimpicin is predicted to markedly decrease the exposure to rolapitant. Avoid. (Severe) Study
- St John's Wort is predicted to decrease the exposure to rolapitant. Avoid. (Severe) Study
- Rolapitant is predicted to increase the exposure to statins (rosuvastatin). Monitor and adjust dose. (Severe) Study
- Rolapitant increases the exposure to sulfasalazine. (Severe) Study
- Rolapitant is predicted to increase the exposure to tamoxifen. (Severe) Study
- Rolapitant is predicted to increase the exposure to topotecan. Avoid or monitor. (Moderate) Study
- Ropinirole → see dopamine receptor agonists
- ropivacaine → see anaesthetics, local
- Rosuvastatin → see statins
- Rotavirus vaccine → see live vaccines
- Ropivacaine → see anaesthetics, local
- Ruxolitinib is predicted to increase the exposure to theophylline. Monitor and adjust dose. (Moderate) Study
- Rucaparib is predicted to increase the exposure to tizzandine. Monitor and adjust dose. (Moderate) Study
- Rifinamide → see antiepileptics
- Rupatadine → see antihistamines, non-sedating
- Ruxolitinib → see TABLE 15 p. 877 (myelosuppression)
- Antiarhythmics (dronedaron) are predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. (Moderate) Study
- Aprepitant is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical
- Bosantan is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical
- Cobicistat is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. (Moderate) Study
- Ruxolitinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- Crizotinib is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Efavirenz is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to ruxolitinib. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. (Moderate) Study
- Idelalisib is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. (Moderate) Study → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Macrolides (clarithromycin) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. (Moderate) Study
- Macrolides (erythromycin) are predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to ruxolitinib. (Moderate) Theoretical
- Nitazoxanide is predicted to increase the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Study → Also see TABLE 15 p. 877
- Netupitant is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical
- Nevirapine is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical
- Nilotinib is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical → Also see TABLE 15 p. 877
- Ruxolitinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Rifampicin is predicted to increase the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Study
- St John's Wort is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Study
- Sacubitril → see TABLE 8 p. 875 (hypotension)
- Salsalate is predicted to increase the exposure to statins. (Severe) Study
- Sapropterin → see TABLE 8 p. 875 (hypotension)
- Methotrexate is predicted to decrease the efficacy of sapropterin. (Moderate) Theoretical
Phosphodiesterase type-5 inhibitors are predicted to increase the risk of hypotension when given with sapropterin. [Moderate]

Trimethoprim is predicted to decrease the efficacy of sapropterin. [Moderate] Theoretical → Also see Table 8 on p. 875

Saquinavir is predicted to increase the exposure to saxagliptin. [High] Study

Sarilumab → see monoclonal antibodies

Saxagliptin → see Table 14 on p. 877 (antidiabetic drugs)

Antiarrhythmics (dronedaron) are predicted to increase the concentration of saxagliptin. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. [High] Study

Aprepitant is predicted to increase the exposure to saxagliptin. [High] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to saxagliptin. [High] Study

Cobicistat is predicted to increase the exposure to saxagliptin. [Moderate] Study

Crizotinib is predicted to increase the exposure to saxagliptin. [High] Study

Enalaprilat is predicted to moderately decreases the exposure to saxagliptin. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to saxagliptin. [High] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to saxagliptin. [High] Study

Idelalisib is predicted to increase the exposure to saxagliptin. [Moderate] Study

Imatinib is predicted to increase the exposure to saxagliptin. [High] Study

Macrolides (clarithromycin) are predicted to increase the exposure to saxagliptin. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to saxagliptin. [High] Study

Mitotane is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study

Netupitant is predicted to increase the exposure to saxagliptin. [High] Study

Nilotinib is predicted to increase the exposure to saxagliptin. [High] Study

Rifampicin is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study

Secukinumab → see monoclonal antibodies

Selegiline → see monoamine-oxidase B inhibitors

Selenium

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use unless specified.

Oral selenium is predicted to decrease the absorption of etorfrabopag. Etorfrabopag should be taken 2 hours before or 4 hours after selenium. [Severe] Theoretical

Selexipag

Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to the active metabolite of selexipag. Adjust dose. [Moderate] Study

Antiepileptics (valproate) are predicted to increase the exposure to selexipag. [Unknown] Theoretical

Antifungals, azoles (fluconazole) are predicted to increase the exposure to selexipag. [Unknown] Theoretical

Clopidogrel is predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Study

Fibrates (gemfibrozil) increase the exposure to selexipag. Avoid. [Severe] Study

Iron chelators (deferasirox) are predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Study

Leflunomide is predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Theoretical

Rifampicin moderately decreases the exposure to the active metabolite of selexipag. Adjust dose. [Moderate] Study

Teriflunomide is predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Theoretical

Semaclutide → see Table 14 p. 877 (antidiabetic drugs)

Sertraline → see SSRIs

Sevoflurane → see volatile halogenated anaesthetics

Sildenafil → see phosphodiesterase type-5 inhibitors

Siltuximab → see monoclonal antibodies

Silver sulfadiazine

PHARMACOLOGY Silver might inactivate enzymatic debridging agents—concurrent use might not be appropriate.

Simvastatin → see statins

Sirolius

Antiarrhythmics (amiodarone) are predicted to increase the concentration of sirolimus. [Severe] Anecdotal

Antiarrhythmics (dronedaron) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Aprepitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Bosentan is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical

Brigatinib potentially decreases the concentration of sirolimus. Avoid. [Moderate] Theoretical

Ciclosporin is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. [Moderate] Theoretical

Ciclosporin moderately increases the exposure to sirolimus. Separate administration by 4 hours. [Severe] Study

Cobicistat is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Doravirine is predicted to decrease the exposure to sirolimus. Monitor sirolimus concentration and adjust dose, p. 529. [Moderate] Theoretical

Efavirenz is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Eliglustat is predicted to increase the exposure to sirolimus. Adjust dose. [Moderate] Study

Flavopiridol increases the concentration of sirolimus. Avoid. [Severe] Study

Grapefruit juice increases the concentration of sirolimus. Avoid. [Moderate] Study

HIV-protease inhibitors are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Idelalisib is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Imatinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Lapatinib is predicted to increase the exposure to sirolimus. [Moderate] Theoretical

Letemovir moderately increases the exposure to sirolimus. Monitor and adjust dose. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with sirolimus. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Silver sulfadiazine

PHARMACOLOGY Silver might inactivate enzymatic debridging agents—concurrent use might not be appropriate.

Simvastatin → see statins

Sirolius

Antiarrhythmics (amiodarone) are predicted to increase the concentration of sirolimus. [Severe] Anecdotal

Antiarrhythmics (dronedaron) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Aprepitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Bosentan is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical

Brigatinib potentially decreases the concentration of sirolimus. Avoid. [Moderate] Theoretical

Ciclosporin is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. [Moderate] Theoretical

Ciclosporin moderately increases the exposure to sirolimus. Separate administration by 4 hours. [Severe] Study

Cobicistat is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Doravirine is predicted to decrease the exposure to sirolimus. Monitor sirolimus concentration and adjust dose, p. 529. [Moderate] Theoretical

Efavirenz is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Eliglustat is predicted to increase the exposure to sirolimus. Adjust dose. [Moderate] Study

Flavopiridol increases the concentration of sirolimus. Avoid. [Severe] Study

Grapefruit juice increases the concentration of sirolimus. Avoid. [Moderate] Study

HIV-protease inhibitors are predicted to increase the concentration of sirolimus. Avoid. [Moderate] Study

Idelalisib is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Imatinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Lapatinib is predicted to increase the exposure to sirolimus. [Moderate] Theoretical

Letemovir moderately increases the exposure to sirolimus. Monitor and adjust dose. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with sirolimus. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
**Sirolimus** (continued)

- **Lumacafor** is predicted to decrease the exposure to sirolimus. **Avoid.** **Severe** Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the concentration of sirolimus. **Avert.** **Severe** Study
- **Macrolides (erythromycin)** increase the concentration of sirolimus. Monitor and adjust dose. **Moderate** Study
- **Sirolimus** is predicted to decrease the efficacy of **mifamurtide**. **Avert.** **Severe** Theoretical
- **Mirabegron** is predicted to increase the exposure to sirolimus. **Avert.** **Severe** Theoretical
- **Mitotane** is predicted to decrease the concentration of sirolimus. **Avert.** **Severe** Study
- **Monoclonal antibodies (sarilumab)** potentially affect the exposure to sirolimus. **Monitor and adjust dose.** **Moderate** Theoretical
- **Neticatant** increases the concentration of sirolimus. **Monitor and adjust dose.** **Moderate** Study
- **Nevirapine** is predicted to decrease the concentration of sirolimus. **Monitor and adjust dose.** **Moderate** Theoretical
- **Nilotinib** increases the concentration of sirolimus. **Monitor and adjust dose.** **Moderate** Study
- **Palbociclib** is predicted to increase the exposure to sirolimus. **Adjust dose.** **Moderate** Theoretical
- **Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to sirolimus. **Avert.** **Severe** Theoretical
- **Pitolisant** is predicted to decrease the exposure to sirolimus. **Avert.** **Severe** Theoretical
- **Ribociclib** is predicted to increase the exposure to sirolimus. **Use with caution and adjust dose.** **Moderate** Theoretical
- **Rifampicin** is predicted to decrease the concentration of sirolimus. **Avert.** **Severe** Study
- **Rucaparib** is predicted to increase the exposure to sirolimus. **Monitor and adjust dose.** **Moderate** Study
- **St John’s Wort** is predicted to decrease the concentration of sirolimus. **Monitor and adjust dose.** **Severe** Theoretical
- **Sirolimus** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** increases the exposure to sirolimus. **Severe** Study
- **Velpatasvir** is predicted to increase the exposure to sirolimus. **Severe** Study
- **Venetoclax** is predicted to increase the exposure to sirolimus. **Avoid or adjust dose.** **Severe** Study

**Sodium aurothiomalate**

- **ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with **sodium aurothiomalate**. **Severe** Anecdotal
- **Sodium aurothiomalate** potentially increases the risk of side-effects when given with **penicillins** (in those who have had previous adverse reactions to gold). **Avoid.** **Severe** Study

**Sodium bicarbonate**

**Route-specific information** Interactions do not generally apply to topical use unless specified.

- **Oral sodium bicarbonate** decreases the absorption of **antifungals, azoles (ketoconazole)**. **Moderate** Study
- **Sodium bicarbonate** decreases the concentration of **lithium**. **Severe** Anecdotal
- **Sodium bicarbonate** is predicted to decrease the efficacy of **methenamine**. **Avert.** **Moderate** Theoretical

**Sodium citrate**

- **Sodium citrate** is predicted to decrease the efficacy of **methenamine**. **Avert.** **Moderate** Theoretical
- **Sodium citrate** is predicted to increase the risk of side-effects when given with **sucralfate**. **Avoid.** **Moderate** Theoretical

**Sodium clofibrate** → see bisphosphonates

**Sodium feredolate** → see iron (oral)

**Sodium nitroprusside** → see TABLE 8 p. 875 (hypotension)

- **Sodium nitroprusside** is predicted to increase the risk of methaemoglobinaemia when given with topical **anaesthetics, local (prilocaine)**. **Use with caution or avoid.** **Severe** Theoretical
- **Sodium nitroprusside** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. **Severe** Theoretical

**Sodium oxybate** → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)

- **Antiepileptics (valproate)** increase the exposure to **sodium oxybate**. **Adjust sodium oxybate dose.** **Moderate** Study
- **Antiepileptics (valproate)** potentially decrease the effects of **sodium phenylbutyrate**. **Moderate** Anecdotal
- **Corticosteroids** potentially decrease the effects of **sodium phenylbutyrate**. **Moderate** Anecdotal
- **Haloperidol potentially decreases the effects of sodium phenylbutyrate.** **Moderate** Anecdotal

**Sodium picosulfate** → see TABLE 18 p. 878 (hypotension)

**Sodium stibogluconate**

- **Sodium stibogluconate** increases the risk of cardiovascular side-effects when given with **amphotericin**. Separate administration by 14 days. **Severe** Study

**Sofosbuvir**

- **Sofosbuvir** is predicted to increase the risk of severe bradycardia or heart block when given with **antiarrhythmics** (amiodarone). Refer to specialist literature. **Severe** Anecdotal
- **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to sofosbuvir. **Avert.** **Severe** Study
- **Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to sofosbuvir. **Avert.** **Severe** Study
- **H₂ receptor antagonists potentially decrease the exposure to sofosbuvir.** **Adjust dose, see lepidapsir with sofosbuvir p. 416, sofosbuvir with velpatasvir, and sofosbuvir with velpatasvir and voxilaprevir.** **Moderate** Study
- **HIV-rotease inhibitors (tipranavir)** are predicted to decrease the exposure to sofosbuvir. **Avert.** **Severe** Theoretical
- **Modafinil** is predicted to decrease the exposure to sofosbuvir. **Avert.** **Severe** Theoretical
- **Proton pump inhibitors** potentially decrease the exposure to sofosbuvir. **Avert.** **Severe** Theoretical
- **Rifampicin** is predicted to decrease the exposure to sofosbuvir. **Avert.** **Severe** Study
- **Rifabutin** is predicted to decrease the exposure to sofosbuvir. **Avert.** **Severe** Study
- **St John’s Wort** is predicted to decrease the exposure to sofosbuvir. **Avert.** **Severe** Study

**Solifenacin** → see TABLE 10 p. 876 (antimuscarinic)

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to solifenacin. **Moderate** Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study
- **Cobicistat** is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study
- **Enalapril** is predicted to decrease the exposure to solifenacin. **Moderate** Theoretical
- **HIV-rotease inhibitors** are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study
- **Mirabegron** is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study
- **Mitotane** is predicted to decrease the exposure to solifenacin. **Moderate** Theoretical
- **Rifampicin** is predicted to decrease the exposure to solifenacin. **Moderate** Theoretical

**Somatropin**

- **Corticosteroids** are predicted to decrease the effects of somatropin. **Moderate** Theoretical
Sorafenib → see TABLE 15 p. 877 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- Sorafenib increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- Enalaprilat is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- Fluvoxamine is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- Neomycin moderately decreases the exposure to sorafenib. (Moderate) Study
- Sorafenib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Fluoxetine is predicted to decrease the exposure to sorafenib. (Severe) Theoretical
- Sotalol → see beta blockers, non-selective
- Spironolactone → see aldosterone antagonists

SSRIs → see TABLE 18 p. 878 (hyponatraemia), TABLE 13 p. 877 (serotonin syndrome), TABLE 9 p. 876 (QT-interval prolongation), TABLE 4 p. 874 (antiplatelet effects)

- Citalopram, dapoxetine, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline

  ▶ Fluvoxamine very markedly increases the exposure to agomelatine. Avoid. (Severe) Study
  ▶ Fluvoxamine moderately increases the exposure to alprazolam. Adjust dose. (Moderate) Study
  ▶ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to amfetamines. (Severe) Theoretical → Also see TABLE 13 p. 877
  ▶ Fluvoxamine moderately to markedly increases the exposure to aminophylline. Avoid. (Severe) Study
  ▶ Fluvoxamine decreases the clearance of anaesthetics, local (ropivacaine). Avoid prolonged use. (Moderate) Study
  ▶ Fluvoxamine is predicted to increase the exposure to anagrelide. (Moderate) Theoretical → Also see TABLE 4 p. 874
  ▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical
  ▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline). (Severe) Theoretical → Also see TABLE 9 p. 876
  ▶ Fluvoxamine is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Moderate) Study
  ▶ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study
  ▶ Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of paroxetine. (Moderate) Study
  ▶ Sertraline potentially increases the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Anecdotal
  ▶ SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. (Severe) Anecdotal
  ▶ Antiepileptics (azoles) are predicted to moderately increase the exposure to paroxetine. Avoid potential inhibitors of CYP3A4 or adjust dapoxetine dose. (Severe) Study
  ▶ Antiepileptics, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. (Severe) Study
  ▶ Antihistamines, sedating (cyproheptadine) potentially decrease the effects of SSRIs. (Moderate) Anecdotal
  ▶ Aplaviroc is predicted to decrease the exposure to citalopram. Avoid or monitor. (R1D) Study → Also see TABLE 9 p. 876

Aprepitant is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 255. (Moderate) Study
- Fluvoxamine increases the exposure to asenapine. (Moderate) Study
- Paroxetine moderately increases the exposure to asenapine. (Moderate) Study
- SSRIs (fluoxetine, paroxetine) are predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study
- Fluvoxamine moderately increases the concentration of beta blockers, non-selective (propranolol). (Moderate) Study
- SSRIs (fluoxetine, fluvoxamine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Bupropion is predicted to increase the exposure to dapoxetine. (Moderate) Theoretical → Also see TABLE 13 p. 877
- Fluvoxamine markedly decreases the clearance of caffeine citrate. Monitor and adjust dose. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical
- SSRIs (fluoxetine, fluvoxamine) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Theoretical → Also see TABLE 4 p. 874
- Cinacalcet is predicted to increase the exposure to dapoxetine. (Moderate) Theoretical
- Fluvoxamine is predicted to increase the exposure to cinacalcet. Adjust dose. (Moderate) Theoretical
- SSRIs (fluoxetine, fluvoxamine) potentially increase the exposure to clozapam. Adjust dose. (Moderate) Theoretical
- SSRIs (fluoxetine, fluvoxamine) are predicted to decrease the efficacy of clopidogrel. Avoid. (Severe) Theoretical → Also see TABLE 4 p. 874
- Fluvoxamine increases the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study
- Cobicistat is predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. (Severe) Study
- Crizotinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to slightly increase the exposure to darifenacin. (R1D) Study
- Fluvoxamine moderately increases the exposure to diazepam. (Moderate) Study
- Fluvoxamine is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. (Moderate) Study
- Fluvoxamine markedly increases the exposure to duloxetine. Avoid. (Severe) Study → Also see TABLE 18 p. 878 → Also see TABLE 13 p. 877 → Also see TABLE 4 p. 874
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to elgilustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Fluvoxamine is predicted to increase the exposure to etoromopogat. (Moderate) Theoretical
- Fluvoxamine is predicted to increase the exposure to erlotinib. Monitor side effects and adjust dose. (Moderate) Theoretical
- Fluvoxamine increases the concentration of frovatriptan. (Severe) Study → Also see TABLE 13 p. 877
- Grapefruit juice moderately increases the exposure to sertraline. Avoid. (Moderate) Study
- H3 receptor antagonists (cimetidine) potentially increase the exposure to SSRIs (citalopram, escitalopram). Adjust dose. (Moderate) Study
- H3 receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (paroxetine, sertraline). (Moderate) Study
- Fluvoxamine increases the concentration of haloperidol. Adjust dose. (Moderate) Study
- Fluvoxamine increases the concentration of haloperidol. Adjust dose. (Moderate) Study

Sorafenib – SSRIs 1029

BNFC 2019–2020
SSRIs (continued)

- **HIV-protease inhibitors** are predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. (Severe) Study

- **Itraconazole** is predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. (Severe) Study

- **Imatinib** is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical

- **Fluvoxamine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical

- **Fluvoxamine** is predicted to increase the exposure to loxapine. Avoid. (Unknown) Theoretical

- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. (Severe) Study

- **Macrolides (erythromycin)** are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical

- **Fluvoxamine** very markedly increases the exposure to melatonin. Avoid. (Severe) Study

- **SSRIs (fluoxetine, paroxetine, paxil)** are predicted to increase the exposure to mexitelinate. (Moderate) Study

- **Netupitant** is predicted to increase the exposure to mexitelinate. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical

- **SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising (miavacurium).** (Unknown) Theoretical

- **Nilotinib** is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. (Moderate) Theoretical

- **Fluvoxamine** moderately increases the exposure to olanzapine. Adjust dose. (Severe) Aneotal

- **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of opioids (codeine). (Moderate) Theoretical

- **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of opioids (tramadol). (Severe) Study → Also see TABLE 13 p. 877

- **Citalopram** is predicted to increase the exposure to pentoxifylline. (Moderate) Theoretical

- **Fluvoxamine** is predicted to moderately increase the exposure to pirenidone. Avoid. (Moderate) Study

- **SSRIs (fluoxetine, paroxetine)** are predicted to moderately increase the exposure to piriton. Use with caution and adjust dose. (Moderate) Study

- **Fluvoxamine** moderately increases the exposure to pomalidomide. Adjust pomalidomide dose. (Moderate) Study

- **Paroxetine** slightly increases the exposure to procyclidine. Monitor and adjust dose. (Moderate) Study

- **SSRIs (fluoxetine, paroxetine)** are predicted to slightly to moderately increase the exposure to riluzole. Adjust dose. (Moderate) Study

- **Fluvoxamine** is predicted to increase the exposure to rifampicin. (Moderate) Theoretical

- **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study

- **Fluvoxamine** is predicted to increase the exposure to roflumilast. (Moderate) Study

- **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to SSRIs (dapoxetine). (Moderate) Theoretical → Also see TABLE 18 p. 878 → Also see TABLE 13 p. 877 → Also see TABLE 4 p. 874

- **SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with suxamethonium.** (Unknown) Theoretical

- **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study

- **Terbinafine** is predicted to increase the exposure to fluoxetine. Adjust dose. (Moderate) Theoretical

- **Terbinafine** moderately increases the exposure to paroxetine. (Moderate) Study

- **Terbinafine** is predicted to increase the exposure to SSRIs (citalopram, dapoxetine, escitalopram, fluvoxamine, sertraline). (Moderate) Theoretical

- **Fluvoxamine** moderately to markedly increases the exposure to theophylline. Avoid. (Severe) Study

- **Fluvoxamine** very markedly increases the exposure to tizanidine. Avoid. (Severe) Study

- **SSRIs (fluoxetine, fluvoxamine)** given with a moderate CYP3A4 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. (Moderate) Study

- **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to tricyclic antidepressants. Adjust dose. (Severe) Study → Also see TABLE 18 p. 878 → Also see TABLE 13 p. 877

- **Fluvoxamine** markedly increases the exposure to tricyclic antidepressants (clopimarin). Adjust dose. (Severe) Study → Also see TABLE 13 p. 877 → Also see TABLE 4 p. 874

- **Fluvoxamine** is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose. p. 300. (Severe) Theoretical → Also see TABLE 13 p. 877

| **St John’s Wort** | see also | TABLE 13 p. 877 (serotonin syndrome) |

| **St John’s Wort** | predicted to decrease the exposure to abemacilb. | Avoid. | (Severe) Study |

| **St John’s Wort** | is predicted to decrease the exposure to atafinib. | (Moderate) Study |

| **St John’s Wort** | is predicted to slightly decrease the exposure to aldostrone antagonists (epilunenone). Avoid. | (Moderate) Study |

| **St John’s Wort** | decreases the exposure to atalclinen. | (Moderate) Study |

| **St John’s Wort** | moderately decreases the exposure to alprazolam. | (Moderate) Study |

| **St John’s Wort** | is predicted to decrease the concentration of aminophylline. | (Severe) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to antiarrhythmics (dronedaron). Avoid. | (Severe) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to antipileptics (brivracetam). | (Moderate) Theoretical |

| **St John’s Wort** | is predicted to decrease the concentration of antipileptics (carbamazepine). Monitor and adjust dose. | (Moderate) Theoretical |

| **St John’s Wort** | is predicted to decrease the concentration of antipileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. | (Severe) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to antipileptics (perampanel). Monitor and adjust dose. | (Moderate) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to antipileptics (tiagabine). Avoid. | (Mild) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. | (Severe) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to aliskiren. | (Moderate) Study |

| **St John’s Wort** | is predicted to decrease the exposure to apixablan. Use with caution or avoid. | (Moderate) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to apremilast. Avoid. | (Severe) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to aprepitant. Avoid. | (Moderate) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to azithinib. | (Moderate) Theoretical |

| **St John’s Wort** | is predicted to decrease the exposure to bedaquiline. Avoid. | (Severe) Study |
- St John’s Wort is predicted to decrease the exposure to **bitergravir**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **bocsantrinib**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **bosutinib**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **brigitinib**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **caripazine**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **cobicistat**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **cimetobinib**. Avoid. (Severe) Theoretical
- St John’s Wort decreases the efficacy of **combined hormonal contraceptives**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal
- St John’s Wort decreases the concentration of **clofazimine**. Avoid. (Severe) Study
- St John’s Wort is predicted to alter the effects of **clofazimine**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **dabigatran**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **darifenacin**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **dasabuvir**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **dasatinib**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **dansazolin**. Avoid. (Severe) Study
- St John’s Wort decreases the concentration of **doxycycline**. Avoid. (Severe) Study
- St John’s Wort increases the exposure to **dolutegravir**. Adjust dose. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **edoxaban**. (Moderate) Study
- St John’s Wort is predicted to decrease the concentration of **efavirenz**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to moderately decrease the exposure to **elbasvir**. Avoid. (Severe) Study
- St John’s Wort is predicted to increase the exposure to **elagabalol**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of **elvitegravir**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **enocafenib**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the effects of **ergotamine**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **erlotinib**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the efficacy of **etanercept**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **etravirine**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **exemestane**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **fesoterodine**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **fingolimod**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **fosaprepitant**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **gatifloxacin**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **glecaprevir**. Avoid. (Severe) Study
- St John’s Wort is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of **guanfacine**. Adjust dose. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **HIV-protease inhibitors**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the efficacy of **hormone replacement therapy**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **ibrutinib**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **idelalisib**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **imidapsinib**. Avoid. (Moderate) Study
- St John’s Wort slightly decreases the exposure to **irmotecan**. Avoid. (Severe) Study
- St John’s Wort decreases the exposure to **ivarabradine**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **ixazomib**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **lapatinib**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **ledipasvir**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of **lertumimib**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the efficacy of **levnorgestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal
- St John’s Wort is predicted to decrease the exposure to **libraxone**. Avoid. (Severe) Study
- St John’s Wort moderately decreases the exposure to **midazolam**. Monitor and adjust dose. (Moderate) Study
- St John’s Wort is predicted to decrease the exposure to **midostaurin**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **maraviroc**. Avoid. (Severe) Theoretical
- St John’s Wort moderately decreases the exposure to **minagelvin**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of **mirvatinib**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of **nivipavride**. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to **nitinetinib**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to **nobiletine**. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of **noretetronone**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal
- St John’s Wort is predicted to decrease the exposure to **olaparib**. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to **omipavrinib**. Avoid. (Severe) Theoretical
- St John’s Wort decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. (Severe) Study Also see TABLE 13 p. 877
- St John’s Wort moderately decreases the exposure to **opioids (oxycodeone)**. Adjust dose. (Moderate) Study
St John’s Wort (continued)

- St John’s Wort is predicted to decrease the exposure to osimertinib. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to temel Essence. (Moderate) Study
- St John’s Wort is predicted to decrease the exposure to palbociclib. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to paliperidone. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to panobinostat. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to pibrentasvir. Avoid. (Severe) Study
- St John’s Wort slightly decreases the exposure to pioiltizone. (MILD) Study
- St John’s Wort is predicted to decrease the exposure to pitolisant. Monitor and adjust dose. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to ponatinib. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to pot. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to ripilivirine. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to roliprant. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. (Severe) Theoretical
- St John’s Wort is predicted to decrease the exposure to simvastatin. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of tacrolimus. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to tensofur falaenamide. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to tezalcator. Avoid. (Severe) Theoretical
- St John’s Wort potentially decreases the exposure to thapsiglylone. (Severe) Aneotodal
- St John’s Wort is predicted to decrease the exposure to ticagrelor. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to tofacitinib. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to tolvaptan. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to ospemifene. (Severe) Theoretical
- St John’s Wort decreases the efficacy of ulipristal. For FSHR guidance, see Contraceptives, interactions p. 51A. (Severe) Aneotodal
- St John’s Wort is predicted to decrease the exposure to velpatasvir. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to venoclay. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical

**Statin** → see TABLE 1 p. 874 (hepatotoxicity)

- atorvastatin - fluvastatin - pravastatin - rosuvastatin - simvastatin
- Atorvastatin slightly to moderately increases the exposure to aliskiren. (Moderate) Study
- Antacids moderately decrease the absorption of rosuvastatin. Separate administration by 2 hours. (Moderate) Study
- Antiarrhythmics (amiodarone) are predicted to increase the risk of rhabdomyolysis when given with atorvastatin. Monitor and adjust dose. (Moderate) Theoretical
- Antiarhythmics (amiodarone) are predicted to increase the exposure to fluvasatin. (Severe) Theoretical
- Antiarrhythmics (amiodarone) increase the risk of rhabdomyolysis when given with simvastatin. Adjust simvastatin dose, p. 136. (Severe) Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (MILD) Study
- Antiarrhythmics (dronedarone) slightly increase the exposure to rosuvastatin. Adjust dose. (Severe) Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. (Severe) Study
- Antiepileptics (carbamazepine) moderately decrease the exposure to simvastatin. Monitor and adjust dose. (Severe) Study → Also see TABLE 1 p. 874
- Antiepileptics (carbamazepine, eslicarbazepine) are predicted to decrease the exposure to atorvastatin. Monitor and adjust dose. (Moderate) Theoretical → Also see TABLE 1 p. 874
- Antiepileptics (eslicarbazepine) moderately decrease the exposure to simvastatin. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (fosphenytin, phenytoin) potentially decrease the exposure to statins (atorvastatin, simvastatin). (Moderate) Aneotodal
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. Also see TABLE 1 p. 874
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. (Severe) Study → Also see TABLE 1 p. 874
- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to fluvastatin. (Severe) Theoretical → Also see TABLE 1 p. 874
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study → Also see TABLE 1 p. 874
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to simvastatin. Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to simvastatin. (Moderate) Theoretical
- Apalutamide slightly decreases the exposure to rosuvastatin. (MILD) Study
- Apalutamide is predicted to decrease the exposure to simvastatin. Avoid or monitor. (Moderate) Study
- Aprepitant is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe) Study
- Aprepitant is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. (Severe) Study
- Bosentan slightly decreases the exposure to atorvastatin. (MILD) Study
- Bosentan moderately decreases the exposure to simvastatin. (Moderate) Study
- Calcium channel blockers (amlodipine) slightly increase the exposure to simvastatin. Adjust simvastatin dose, p. 136. [MID] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
- Cephalosporins (ceftobiprole) are predicted to increase the concentration of statins. [Moderate] Theoretical
- Ciclosporin very markedly increases the exposure to atorvastatin. Avoid or adjust atorvastatin dose, p. 134. [Severe] Study
- Ciclosporin moderately increases the exposure to fluvastatin. [Severe] Study
- Ciclosporin markedly to very markedly increases the exposure to pravastatin. Adjust dose. [Severe] Study
- Ciclosporin markedly increases the exposure to statins (rosuvastatin, simvastatin). Avoid. [Severe] Study
- Clopidogrel increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 135. [Moderate] Study
- Cobimetinib is predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- Cobimetinib is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
- Colchicine increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal
- Statins (fluvastatin, rosuvastatin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- Crizotinib is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- Crizotinib is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
- Danazol is predicted to increase the risk of rhabdomyolysis when given with atorvastatin. [Severe] Theoretical
- Danazol increases the risk of rhabdomyolysis when given with simvastatin. Avoid. [Severe] Anecdotal
- Statins (fluvastatin, rosuvastatin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- Dasabuvir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 135. [Moderate] Study
- Dasatinib is predicted to increase the exposure to simvastatin. [Moderate] Theoretical
- Efavirenz slightly decreases the exposure to atorvastatin. [MID] Study
- Efavirenz moderately decreases the exposure to simvastatin. [Moderate] Study
- Elbasvir increases the exposure to atorvastatin. Adjust atorvastatin dose, p. 134. [Moderate] Study
- Elbasvir is predicted to increase the exposure to fluvastatin. Adjust fluvastatin dose, p. 134. [Unknown] Theoretical
- Elbasvir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 135. [Moderate] Study
- Elbasvir is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 136. [Unknown] Theoretical
- Eltrombopag is predicted to increase the exposure to statins. Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to simvastatin. [Severe] Study
- Ezetimibe potentially increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal
- Fibrates (bezafibrate, clofibric acid) increase the risk of rhabdomyolysis when given with pravastatin. Avoid. [Severe] Study
- Fibrates (bezafibrate, clofibric acid) increase the risk of rhabdomyolysis when given with rosuvastatin. Adjust rosuvastatin dose, p. 135. [Severe] Study
- Fibrates (bezafibrate, clofibric acid) increase the risk of rhabdomyolysis when given with simvastatin. Adjust simvastatin dose, p. 136. [Severe] Study
- Fibrates (clofibrate, fenofibrate) increase the risk of rhabdomyolysis when given with atorvastatin. Avoid or adjust dose. [Severe] Study
- Fibrates (clofibrate, fenofibrate) increase the risk of rhabdomyolysis when given with fluvastatin. [Severe] Study
- Fibrates (fenofibrate) are predicted to increase the risk of rhabdomyolysis when given with fluvastatin. Adjust fenofibrate dose, p. 133. [Severe] Theoretical
- Fibrates (fenofibrate) are predicted to increase the risk of rhabdomyolysis when given with pravastatin. Avoid. [Severe] Theoretical
- Fibrates (fenofibrate) increase the risk of rhabdomyolysis when given with rosvastatin. Adjust fenofibrate and rosvastatin doses, p. 131, 135. [Severe] Anecdotal
- Fibrates (gemfibrozil) increase the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal
- Fibrates (bezafibrate) increase the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). [Severe] Study
- Fibrates (fenofibrate) increase the risk of rhabdomyolysis when given with statins (atorvastatin, simvastatin). Adjust fenofibrate dose, p. 133. [Severe] Anecdotal
- Fusidic acid increases the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal
- Glecaprevir (with pibrentasvir) markedly increases the exposure to atorvastatin. Avoid. [Severe] Study
- Glecaprevir (with pibrentasvir) is predicted to increase the exposure to fluvastatin. [Moderate] Theoretical
- Glecaprevir (with pibrentasvir) increases the exposure to pravastatin. Use with caution and adjust pravastatin dose, p. 135. [Moderate] Study
- Glecaprevir (with pibrentasvir) increases the exposure to rosuvastatin. Use with caution and adjust rosuvastatin dose, p. 135. [Moderate] Study
- Glecaprevir (with pibrentasvir) increases the exposure to simvastatin. Avoid. [Moderate] Study
- Grapefruit juice increases the exposure to atorvastatin. [MID] Study
- Grapefruit juice increases the exposure to simvastatin. Avoid. [Severe] Study
- Grazoprevir increases the exposure to atorvastatin. Adjust atorvastatin dose, p. 134. [Moderate] Study
- Grazoprevir is predicted to increase the exposure to fluvastatin. Adjust fluvastatin dose, p. 134. [Unknown] Theoretical
- Grazoprevir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 135. [Moderate] Study
- Grazoprevir is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 136. [Unknown] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- HIV-protease inhibitors slightly to moderately increase the exposure to rosuvastatin. Avoid or adjust dose. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- Idelalisib is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
- Imatinib is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- Imatinib is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Avoid. [Severe] Theoretical
- Ledipasvir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Adjust dose. [Moderate] Study
- Ledipasvir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Adjust dose. [Moderate] Study
- Ledipasvir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Adjust dose. [Moderate] Study
- Ledipasvir is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- Ledipasvir is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
- Ledipasvir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Adjust dose. [Moderate] Study
- Ledipasvir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Adjust dose. [Moderate] Study
- Ledipasvir is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- Ledipasvir is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
- Ledipasvir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Adjust dose. [Moderate] Study
- Ledipasvir is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- Ledipasvir is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
- Ledipasvir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- Ledipasvir is predicted to increase the exposure to rosuvastatin. Adjust dose. [Moderate] Study
- Ledipasvir is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- Ledipasvir is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
Statins

- **Letrozomiv** moderately increases the exposure to atorvastatin. Avoid or adjust atorvastatin dose, p. 134. [Severe] Study
- **Letrozomiv** is predicted to increase the exposure to fluuvastatin. Monitor and adjust dose. [Moderate] Theoretical
- **Letrozomiv** is predicted to increase the exposure to pravastatin. Avoid or adjust dose. [Moderate] Theoretical
- **Letrozomiv** is predicted to increase the exposure to statins (rosuvastatin, simvastatin). Avoid. [Severe] Study
- **Letrozomiv** increases the exposure to atorvastatin. Adjust lomitapide dose or separate administration by 12 hours. [Mild] Study → Also see TABLE 1, p. 874
- **Lomitapide** increases the exposure to simvastatin. Monitor and adjust simvastatin dose, p. 136. [Moderate] Study → Also see TABLE 1, p. 874
- **Macrolides** (clarithromycin) are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- **Macrolides** (clarithromycin) moderately increase the exposure to pravastatin. [Severe] Study
- **Macrolides** (clarithromycin) are predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to pravastatin. [Severe] Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
- **Mitotane** is predicted to decrease the exposure to simvastatin. [Severe] Study
- **Monoclonal antibodies** (sarilumab) are predicted to decrease the exposure to statins (atorvastatin, simvastatin). [Moderate] Study
- **Monoclonal antibodies** (tocilizumab) are predicted to decrease the exposure to statins (atorvastatin, simvastatin, rosuvastatin). Monitor and adjust dose. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study
- **Netupitant** is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
- **Nevirapine** slightly decreases the exposure to atorvastatin. [Mild] Study
- **Nevirapine** moderately decreases the exposure to simvastatin. [Moderate] Study
- **Nicotinic acid** is predicted to increase the risk of rhabdomyolysis when given with statins. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to atorvastatin. Avoid or adjust dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 136. [Severe] Study
- **Osimertinib** slightly increases the exposure to rosuvastatin. [Mild] Study
- **Paritaprevr** (in fixed-dose combination) is predicted to increase the risk of rhabdomyolysis when given with atorvastatin. Avoid. [Severe] Theoretical
- **Paritaprevr** (with ritonavir and ombitasvir) is predicted to increase the exposure to fluuvastatin. Avoid. [Moderate] Theoretical
- **Paritaprevr** (with ritonavir and ombitasvir) increases the exposure to pravastatin. Adjust pravastatin dose, p. 135. [Moderate] Study
- **Paritaprevr** (with ritonavir and ombitasvir) slightly to moderately increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 135. [Moderate] Study
- **Paritaprevr** (in fixed-dose combination) is predicted to increase the risk of rhabdomyolysis when given with atorvastatin. [Severe] Theoretical
- **Pazopanib** is predicted to affect the exposure to atorvastatin. [Moderate] Aneodal
- **Pazopanib** is predicted to affect the exposure to statins (pravastatin, rosuvastatin, simvastatin). [Moderate] Theoretical
- **Rosuvastatin** is predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Theoretical
- **Pibrentasvir** (with glecaprevir) markedly increases the exposure to atorvastatin. Avoid. [Severe] Study
- **Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to fluuvastatin. [Moderate] Theoretical
- **Pibrentasvir** (with glecaprevir) increases the exposure to pravastatin. Use with caution and adjust pravastatin dose, p. 135. [Moderate] Study
- **Pibrentasvir** (with glecaprevir) increases the exposure to rosuvastatin. Use with caution and adjust rosuvastatin dose, p. 135. [Moderate] Study
- **Pibrentasvir** (with glecaprevir) increases the exposure to simvastatin. Avoid. [Moderate] Study
- **Ranolazine** is predicted to increase the exposure to atorvastatin. [Moderate] Theoretical
- **Ranolazine** slightly increases the exposure to simvastatin. Adjust simvastatin dose, p. 136. [Moderate] Study
- **Regorafenib** is predicted to increase the exposure to statins (atorvastatin, fluuvastatin, rosuvastatin). [Moderate] Study
- **Ribociclib** (high-dose) is predicted to increase the exposure to siavastatin. Avoid. [Moderate] Theoretical
- **Ribociclib** is predicted to increase the exposure to statins (pravastatin, rosuvastatin). [Moderate] Theoretical
- **Rifampicin** markedly decreases the exposure to atorvastatin. Monitor and adjust dose. [Moderate] Study
- **Rifampicin** very markedly decreases the exposure to simvastatin. [Moderate] Study
- **Rolapitant** is predicted to increase the exposure to rosvastatin. Monitor and adjust dose. [Severe] Study
- **St John’s Wort** slightly decreases the exposure to atorvastatin. [Mild] Study
- **St John’s Wort** moderately decreases the exposure to simvastatin. [Moderate] Study
- **Fluvastatin** slightly increases the exposure to sulfonlureas (glibenclamide). [Mild] Study
- **Tedizolid** is predicted to increase the exposure to statins (atorvastatin, fluuvastatin, rosuvastatin). Avoid. [Moderate] Study
- **Teriflunomide** moderately increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 135. [Moderate] Study
- **Teriflunomide** is predicted to increase the exposure to statins (atorvastatin, fluuvastatin, pravastatin, simvastatin). [Moderate] Study
- **Ticagrelor** slightly increases the exposure to simvastatin. [Moderate] Study
- **Tivozanib** is predicted to decrease the exposure to rosuvastatin. [Moderate] Theoretical
- **Velpatasvir** is predicted to increase the exposure to atorvastatin. Avoid. [Severe] Study
- **Velpatasvir** increases the exposure to rosuvastatin. Monitor and adjust side effects, p. 135. [Severe] Study
- **Velpatasvir** is predicted to increase the exposure to simvastatin. Monitor side effects and adjust dose. [Severe] Theoretical
- **Venetoclax** is predicted to increase the exposure to atorvastatin. [Moderate] Study
- **Venetoclax** is predicted to increase the exposure to statins (fluvastatin, pravastatin, rosuvastatin, simvastatin). [Moderate] Theoretical
- **Voxilaprevir** is predicted to increase the exposure to atorvastatin. Avoid. [Moderate] Theoretical
- **Voxilaprevir** (with sofosbuvir and velpatasvir) moderately increases the exposure to pravastatin. Monitor and adjust pravastatin dose, p. 135. [Moderate] Study
- **Voxilaprevir** (with sofosbuvir and velpatasvir) markedly increases the exposure to rosuvastatin. Avoid. [Severe] Study
- **Voxilaprevir** (with sofosbuvir and velpatasvir) is predicted to increase the exposure to statins (fluvastatin, simvastatin). Avoid. [Moderate] Theoretical

**Stavudine** → see TABLE 12, p. 877 (peripheral neuropathy)
**Didanosine** increases the risk of toxicity when given with stavudine. Avoid. (Severe) Study → Also see TABLE 12 p. 877

**Hydroxyurea** increases the risk of toxicity when given with stavudine. Avoid. (Severe) Study

**Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with stavudine. (Severe) Theoretical → Also see TABLE 12 p. 877

**Ribavirin** increases the risk of toxicity when given with stavudine. Avoid. (Severe) Study

**Zidovudine** is predicted to decrease the efficacy of stavudine. Avoid. (Severe) Theoretical

**Stiripentol** → see antiepileptics

**Streptokinase** → see TABLE 3 p. 874 (anticoagulant effects)

**Streptomyacin** → see aminoglycosides

**Streptozocin** → see TABLE 1 p. 874 (hepatotoxicity), TABLE 2 p. 874 (nephrotoxicity)

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with streptozocin. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

**Sucralfate**

- **Sucralfate** is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Theoretical

- **Sucralfate** potentially decreases the effects of coumarins (warfarin). Separate administration by 2 hours. (Moderate) Anecdotal

- **Sucralfate** decreases the absorption of digoxin. Separate administration by 2 hours. (Moderate) Study

- **Sucralfate** decreases the absorption of dolutegravir. (Moderate) Study

- **Sucralfate** increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Separate administration by 1 hour. (Moderate) Study

- **Potassium citrate** increases the risk of side-effects when given with sucrafate. Avoid. (Moderate) Theoretical

- **Sucralfate** decreases the exposure to quinolones. Separate administration by 2 hours. (Moderate) Study

- **Sodium citrate** is predicted to increase the risk of side-effects when given with sucrafate. Avoid. (Moderate) Theoretical

- **Sucralfate** decreases the absorption of sulpiride. Separate administration by 2 hours. (Moderate) Study

- **Sucralfate** potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. (Moderate) Study

- **Sucralfate** decreases the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours. (Moderate) Study

- **Sucralfate** is predicted to decrease the absorption of tricyclic antidepressants. (Moderate) Study

**Sulfentanil** → see opioids

**Sugammadex**

- **Sugammadex** is predicted to decrease the exposure to oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. (Severe) Theoretical

- **Sugammadex** is predicted to decrease the exposure to desogestrel. Refer to patient information leaflet for missed pill advice. (Severe) Theoretical

- **Sugammadex** is predicted to decrease the efficacy of etonogestrel. Use additional contraceptive precautions. (Severe) Theoretical

- **Sugammadex** is predicted to decrease the exposure to levonorgestrel. Use additional contraceptive precautions. (Severe) Theoretical

- **Sugammadex** is predicted to decrease the exposure to medroxyprogesterone. Use additional contraceptive precautions. (Severe) Theoretical

- **Sugammadex** is predicted to decrease the exposure to norethisterone. Use additional contraceptive precautions. (Severe) Theoretical

**Sulfadiazine** → see sulfonamides

**Sulfadoxine** → see sulfonamides

**Sulfamethoxazole** → see sulfonamides

**Sulfasalazine** → see sulfonamides

**Sulfadiazine** → see TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression)

**Antifungals, azoles (isavuconazole)** are predicted to increase the exposure to sulfasalazine. (Moderate) Theoretical

**Sulfasalazine** decreases the concentration of digoxin. (Moderate) Study

**Sulfasalazine** is predicted to decrease the absorption of folates. (Moderate) Study

**Leflunomide** is predicted to increase the exposure to sulfasalazine. (Moderate) Study → Also see TABLE 1 p. 874 → Also see TABLE 15 p. 877

**Regorafenib** is predicted to increase the exposure to sulfasalazine. (Moderate) Study → Also see TABLE 15 p. 877

**Rolapitant** increases the exposure to sulfasalazine. (Severe) Study

**Tedizolid** is predicted to increase the exposure to sulfasalazine. (Moderate) Study

**Velpatasvir** is predicted to increase the exposure to sulfasalazine. (Moderate) Theoretical

**Voxilaprevir** is predicted to increase the concentration of sulfasalazine. Avoid. (Severe) Theoretical

**Sulfonamides** → see TABLE 15 p. 877 (myelosuppression)

**Sulfadiazine** - sulfadoxine - sulfamethoxazole

**Sulfonamides** potentially increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. (Severe) Anecdotal

**Sulfadiazine** is predicted to increase the concentration of antiepileptics (phenytoin). Monitor and adjust dose. (Moderate) Study

**Sulfadiazine** increases the concentration of antiepileptics (phenytoin). Monitor and adjust dose. (Moderate) Study

**Antimalarials (pyrimethamine) increase the risk of side-effects when given with sulfonamides. (Severe) Study → Also see TABLE 15 p. 877

**Sulfadiazine** is predicted to increase the anticoagulant effect of coumarins. (Severe) Theoretical

**Sulfamethoxazole** increases the anticoagulant effect of coumarins. (Severe) Study

**Sulfonamides** are predicted to increase the risk of methaemoglobinemia when given with dapson. (Severe) Theoretical

**Sulfonamides** are predicted to increase the exposure to methotrexate. Use with caution or avoid. (Severe) Theoretical → Also see TABLE 15 p. 877

**Potassium aminobenzoate** is predicted to affect the efficacy of sulfonamides. Avoid. (Severe) Theoretical

**Sulfonamides** are predicted to increase the exposure to sulfonylureas. (Moderate) Study

**Sulfonamides** are predicted to increase the effects of thiopental. (Moderate) Theoretical

**Sulfonylureas** → see TABLE 14 p. 877 (antidiabetic drugs)

**glibenclamide** - gliclazide - glimepiride - glipizide - tolbutamide

**Antiarrhythmics (amiodarone)** are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. (Moderate) Study

**Antifungals, azoles (flucanazole, micronazole)** are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. (Moderate) Study

**Antifungals, azoles (voriconazole)** are predicted to increase the concentration of sulfonylureas. Use with caution and adjust dose. (Moderate) Study

**Bosantan** increases the risk of hepatotoxicity when given with glibenclamide. Avoid. (Severe) Study

**Cephalosporins (cefotibiprole)** are predicted to increase the concentration of glibenclamide. (Moderate) Theoretical

**Certinib** is predicted to increase the exposure to glimepiride. Adjust dose. (Moderate) Theoretical

**Chloramphenicol** is predicted to increase the exposure to sulfonylureas. (Severe) Study

**Fibrates** are predicted to increase the risk of hypoglycaemia when given with sulfonylureas. (Moderate) Theoretical

**Leflunomide** is predicted to increase the exposure to glibenclamide. (Moderate) Study
Sulfonylureas (continued)

- **Letrozomir** is predicted to increase the concentration of glibenclamide. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to sulfonylureas. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to sulfonylureas. [Moderate] Study
- **Statins (fluvastatin)** slightly increase the exposure to glibenclamide. [Mild] Study
- **Sulfonylamides** are predicted to increase the exposure to sulfonylureas. [Moderate] Study
- **Teriflumodine** is predicted to increase the exposure to glibenclamide. [Moderate] Study
- **Venetoclax** is predicted to increase the exposure to glibenclamide. [Moderate] Theoretical

Sulindac → see NSAIDs.

Sulpiride → see TABLE 8 p. 875 (hypotension), TABLE 9 p. 876 (QT-interval prolongation), TABLE 11 p. 876 (CNS depressant effects)

- **Antacids** decrease the absorption of sulpiride. Separate administration by 2 hours. [Moderate] Study
- **Sulpiride** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 9 p. 876
- **Sulpiride** is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 875
- **Sulpiride** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Amodata → Also see TABLE 9 p. 876
- **Sucralfate** decreases the absorption of sulpiride. Separate administration by 2 hours. [Moderate] Study

Sumatriptan → see TABLE 13 p. 877 (serotonin syndrome)

- **Sumatriptan** increases the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. [Severe] Study
- **Moclobemide** moderately increases the exposure to sumatriptan. Avoid. [Moderate] Study → Also see TABLE 13 p. 877
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to sumatriptan. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 877

Sunitinib → see TABLE 15 p. 877 (myelosuppression), TABLE 9 p. 876 (QT-interval prolongation)

- **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study
- **Antifungals, azoles (fluconazole, itraconazole, ketoconazole) and posaconazole** are predicted to increase the exposure to sunitinib. Avoid. [Moderate] Study
- **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 9 p. 876
- **Aprepitant** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- **Cobicistat** is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study
- **Sunitinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Crisotibin** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- **Evelauro** is predicted to increase the concentration of sunitinib. Use with caution and adjust dose. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study
- **Grapefruit juice** is predicted to increase the exposure to sunitinib. Avoid. [Moderate] Theoretical
- **Grazoprevir** is predicted to increase the concentration of sunitinib. Use with caution and adjust dose. [Moderate] Theoretical
- **HIV-protease inhibitors** are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 9 p. 876
- **Ildalibis** is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 15 p. 877
- **Imatinib** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 877
- **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 9 p. 876
- **Macrolides (erythromycin)** are predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Mitotane** is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 15 p. 877
- **Netapitant** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 877 → Also see TABLE 9 p. 876
- **Sunitinib** is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study
- **Suxamethonium** → see TABLE 20 p. 878 (neuromuscular blocking effects)
- **Alkalizing agents (cyclophosphamide)** increase the risk of prolonged neuromuscular blockade when given with saximumethion. [Moderate] Study
- **Antiarrhythmics (lidocaine)** are predicted to increase the effects of saximumethion. [Moderate] Study
- **Anticholinesterases, centrally acting** increase the effects of saximumethion. [Moderate] Theoretical
- **Antiepileptics (carbamazepine)** increase the risk of prolonged neuromuscular blockade when given with saximumethion. [Moderate] Study
- **Antiepileptics (fosphenytoin, phenytoin)** increase the effects of saximumethion. [Moderate] Study
- **Clindamycin** increases the effects of saximumethion. [Severe] Amodata
- **Corticosteroids** are predicted to decrease the effects of saximumethion. [Severe] Amodata
- **Saximumethion** is predicted to increase the risk of cardiovascular side-effects when given with digoxin. [Severe] Amodata
- **Irinotecan** is predicted to increase the risk of prolonged neuromuscular blockade when given with saximumethion. [Moderate] Theoretical → Also see TABLE 9 p. 876
- **Intravenous magnesium** is predicted to increase the effects of saximumethion. [Moderate] Study
- **Metoclopramide** increases the effects of saximumethion. [Moderate] Study
- **Penicillins (piperacillin)** increase the effects of saximumethion. [Moderate] Study
- **SSRIs** potentially increase the risk of prolonged neuromuscular blockade when given with saximumethion. [Unknown] Theoretical

**Symphathomimetics, inotropic**

- **Dobutamine • dopamine**
  - **Symphathomimetics, inotropic** are predicted to decrease the effects of apraclonidine. Avoid. [Severe] Theoretical
  - **Beta blockers, non-selective** increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. [Theoretical]
  - **Ergometrine** potentially increases the risk of peripheral vasoconstriction when given with dopamine. Avoid. [Severe] Amodata
Sympathomimetics, inotropic – Tacrolimus 1037

- Guanethidine is predicted to increase the effects of dopamine.
  
  
- Sympathomimetics, inotropic are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Moderate Theoretical
  
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid. Severe Theoretical
  
- Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Moderate Theoretical
  
- Ephedrine increases the risk of side-effects when given with linezolid.

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Ephedrine increases the risk of side-effects when given with aminophylline. Avoid in children. Moderate Study
  
- Sympathomimetics, vasoconstrictor are predicted to decrease the effects of apraclonidine. Avoid. Severe Theoretical
  
- Atropine increases the risk of severe hypertension when given with phenylephrine. Severe Study
  
- Beta blockers, non-selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Severe Study
  
- Beta blockers, selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Moderate Study
  
- Isometheptene potentially increases the risk of side-effects when given with dopamine receptor agonists (bromocriptine). Avoid. Severe Anecdotal
  
- Entacapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Moderate Study
  
- Ergometrine is predicted to increase the risk of peripheral vasoconstriction when given with noradrenaline/norepinephrine. Anecdotal Study
  
- Guanethidine increases the effects of metaraminol. Anecdotal Study
  
- Guanethidine increases the effects of phenylephrine. Severe Study

† Guanethidine is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Moderate Study

† Pseudoephedrine increases the risk of elevated blood pressure when given with linezolid. Avoid. Severe Study

† Sympathomimetics, vasoconstrictor (adrenaline/epinephrine, epinephrine, isometheptene, noradrenaline/norepinephrine, phenylephrine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical

† Mianserin decreases the effects of ephedrine. Severe Anecdotal

† Moclobemide is predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor (epinephrine, isometheptene, phenylephrine, pseudoephedrine). Avoid. Severe Study

† Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid and for 14 days after stopping the MAOI. Severe Study

† Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid. Severe Theoretical

† Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Moderate Theoretical

† Ephedrine increases the risk of side-effects when given with theophylline. Avoid in children. Moderate Study

† Tolcapone is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Moderate Theoretical

† Tricyclic antidepressants are predicted to decrease the effects of ephedrine. Avoid. Severe Study

† Tricyclic antidepressants increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine, phenylephrine). Avoid. Severe Study

Tacalcitol → see vitamin B substances

Tacrolimus → see TABLE 2 p. 874 (nephrotoxicity), TABLE 16 p. 878 (increased serum potassium)

- Pomelo and pomegranate juices might greatly increase the concentration of tacrolimus.

- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Alcohol (beverage) increases the risk of facial flushing and skin irritation when given with topical tacrolimus. Moderate Study

- Antiarhythmics (amiodarone) are predicted to increase the concentration of tacrolimus. Severe Anecdotal

- Antiarhythmics (dronedarone) are predicted to increase the concentration of tacrolimus. Severe Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. Moderate Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. Severe Study

- Antifungals, azoles (miconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. Severe Theoretical

- Aprapant is predicted to increase the concentration of tacrolimus. Severe Study

- Bosentan is predicted to decrease the concentration of tacrolimus and tacrolimus potentially increases the concentration of bosentan. Avoid. Severe Theoretical

- Brigitinib potentially decreases the concentration of tacrolimus. Avoid. Moderate Theoretical

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. Severe Study

- Calcium channel blockers (nicardipine) potentially increase the concentration of tacrolimus. Monitor concentration and adjust dose. Severe Anecdotal

- Ceritinib is predicted to increase the exposure to tacrolimus. Avoid. Severe Theoretical

- Chloramphenicol increases the concentration of tacrolimus. Severe Study

- Ciclosporin increases the concentration of tacrolimus. Avoid. Severe Study – Also see TABLE 2 p. 874 → Also see TABLE 16 p. 878

- Cobicistat is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. Severe Study

- Crizotinib is predicted to increase the concentration of tacrolimus. Severe Study

- Tacrolimus is predicted to increase the exposure to dabigatran. Avoid. Severe Theoretical

- Danazol potentially increases the concentration of tacrolimus. Severe Anecdotal

- Doravirine is predicted to decrease the exposure to tacrolimus. Monitor tacrolimus concentration and adjust dose, p. 540. Moderate Theoretical

- Efavirenz is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. Moderate Theoretical
Tacroliomus (continued)
- Enalaprilamide decreases the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Glucaprevir (with ribavirin) slightly increases the exposure to tacrolimus. Monitor and adjust dose. *Moderate* Study
- Grapefruit juice greatly increases the concentration of tacrolimus. Avoid. *Severe* Study
- Grazoprevir increases the exposure to tacrolimus. *Moderate* Study
- HIV-protease inhibitors are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Idealisib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Imatinib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Letermovir moderately increases the exposure to tacrolimus. Separate administration by 12 hours. *Moderate* Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tacrolimus. Public Health England advises avoid (refer to Green Book). *Severe* Theoretical
- Tacrolimus is predicted to increase the exposure to lonidamine. Separate administration by 12 hours. *Moderate* Theoretical
- Lumacaftor is predicted to decrease the concentration of tacrolimus. Avoid. *Severe* Theoretical
- Macrolides (clarithromycin) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Macrolides (erythromycin) are predicted to increase the concentration of tacrolimus. *Severe* Study
- Tacrolimus is predicted to affect the efficacy of mifepristone. Avoid. *Severe* Theoretical
- Mitotane decreases the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Monoclonal antibodies (sarilumab) potentially affect the exposure to tacrolimus. Monitor and adjust dose. *Moderate* Theoretical
- Netupitant is predicted to increase the concentration of tacrolimus. *Severe* Study
- Nevirapine is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. *Moderate* Theoretical
- Nilotinib is predicted to increase the concentration of tacrolimus. *Severe* Study
- Palbociclib is predicted to increase the exposure to tacrolimus. Adjust dose. *Moderate* Theoretical
- Pibrentasvir (with glucaprevir) slightly increases the exposure to tacrolimus. Monitor and adjust dose. *Mild* Study
- Piritramide is predicted to decrease the exposure to tacrolimus. Avoid. *Severe* Study
- Ranolazine increases the concentration of tacrolimus. Adjust dose. *Severe* Anecdotal
- Ribociclib is predicted to increase the exposure to tacrolimus. Use with caution and adjust dose. *Moderate* Theoretical
- Rifampicin decreases the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Rucaparib is predicted to increase the exposure to tacrolimus. Monitor and adjust dose. *Moderate* Study
- Sirolimus is predicted to decrease the concentration of tacrolimus and tacrolimus increases the exposure to sirolimus. *Severe* Study
- St John’s Wort decreases the concentration of tacrolimus. Avoid. *Severe* Study
- Tacrolimus increases the exposure to tofacitinib. Avoid. *Severe* Study
- Tacrolimus potentially increases the risk of serotonin syndrome when given with venlafaxine. *Severe* Anecdotal
- Tadalafil → see phosphodiesterase type-5 inhibitors
- Tamoxifen → see TABLE 5 p. 874 (thromboembolism)
- Bupropion is predicted to decrease the efficacy of tamoxifen. Avoid. *Severe* Study
- Cinacalcet is predicted to decrease the efficacy of tamoxifen. Avoid. *Severe* Study
- Tamoxifen increases the anticoagulant effect of coumarins. *Severe* Study
- Rifampicin markedly decreases the exposure to tamoxifen. Unknown Study
- Rolapitant is predicted to increase the exposure to tamoxifen. *Severe* Study
- SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of tamoxifen. Avoid. *Severe* Study
- Terbinafine is predicted to decrease the efficacy of tamoxifen. Avoid. *Severe* Study
- Tamulosin → see alpha blockers
- Tapentadol → see opioids
- Taxanes → see TABLE 15 p. 877 (myelosuppression), TABLE 12 p. 877 (peripheral neuropathy)
- Cabazitaxel - docetaxel - paclitaxel
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to cabazitaxel. *Moderate* Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to paclitaxel. *Severe* Theoretical
- Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to docetaxel. *Severe* Theoretical → Also see TABLE 12 p. 877
- Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. *Severe* Study → Also see TABLE 12 p. 877
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cabazitaxel. *Moderate* Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cabazitaxel. Avoid. *Severe* Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to docetaxel. Avoid or adjust dose. *Severe* Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paclitaxel. *Severe* Study
- Antifungals, azoles (miconazole) are predicted to increase the concentration of docetaxel. Use with caution and adjust dose. *Moderate* Theoretical
- Aprepitant is predicted to increase the exposure to cabazitaxel. *Moderate* Theoretical
- Bosentan is predicted to decrease the exposure to cabazitaxel. Avoid. *Severe* Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cabazitaxel. *Moderate* Theoretical
- Ceritinib is predicted to increase the exposure to paclitaxel. *Moderate* Theoretical → Also see TABLE 15 p. 877
- Clopidogrel is predicted to increase the concentration of paclitaxel. *Severe* Anecdotal
- Cobimetinib is predicted to increase the exposure to cabazitaxel. Avoid. *Severe* Study
- Cobimetinib is predicted to moderately increase the exposure to docetaxel. Avoid or adjust dose. *Severe* Study
- Cobimetinib is predicted to increase the exposure to paclitaxel. *Severe* Theoretical
- Crizotinib is predicted to increase the exposure to cabazitaxel. *Moderate* Theoretical → Also see TABLE 15 p. 877
- Elaf dolphin is predicted to decrease the exposure to cabazitaxel. Avoid. *Severe* Study
- Eliglustat is predicted to increase the exposure to paclitaxel. Adjust dose. *Moderate* Study
- Enzalutamide is predicted to decrease the exposure to docetaxel. *Severe* Theoretical
- Enzalutamide is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. *Severe* Study
- Fibrates (gemfibrozil) are predicted to increase the concentration of paclitaxel. *Severe* Anecdotal
- HIV-protease inhibitors are predicted to increase the exposure to cabazitaxel. Avoid. *Severe* Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to docetaxel. Avoid or adjust dose. *Severe* Study
- HIV-protease inhibitors are predicted to increase the exposure to paclitaxel. *Severe* Theoretical
- Idelalisib is predicted to increase the exposure to cabazitaxel. Avoid. *Severe* Study → Also see TABLE 15 p. 877
Tedizolid

- Tedizolid is predicted to increase the exposure to imatinib. Avoid. [Moderate] Theoretical
- Tedizolid is predicted to increase the exposure to lopinavir. Avoid. [Moderate] Theoretical
- Tedizolid is predicted to increase the exposure to methotrexate. Avoid. [Moderate] Theoretical
- Tedizolid is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). Avoid. [Moderate] Study
- Tedizolid is predicted to increase the exposure to topotecan. Avoid. [Moderate] Study

Tedizolid is predicted to increase the exposure to docetaxel. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 877

Tedizolid is predicted to increase the exposure to paclitaxel. [Severe] Theoretical → Also see TABLE 15 p. 877

Lapatinib is predicted to increase the exposure to cabazitaxel. [Moderate] Theoretical → Also see TABLE 15 p. 877

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with taxanes (docetaxel, paclitaxel). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to cabazitaxel. Avoid. [Severe] Study

Macrolides (clarithromycin) are predicted to increase the exposure to paclitaxel. [Severe] Theoretical

Macrolides (erythromycin) are predicted to increase the exposure to cabazitaxel. [Moderate] Theoretical

Mirabegron is predicted to increase the exposure to paclitaxel. [Mild] Theoretical

Mitotane is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study → Also see TABLE 15 p. 877

Netupitant is predicted to increase the exposure to cabazitaxel. [Moderate] Theoretical

Netupitant slightly increases the exposure to docetaxel. [Moderate] Study

Netupitant is predicted to increase the exposure to paclitaxel. [Moderate] Study

Nevirapine is predicted to decrease the exposure to cabazitaxel. Avoid. [Severe] Study

Nilotinib is predicted to increase the exposure to cabazitaxel. [Moderate] Theoretical → Also see TABLE 15 p. 877

Paritaprevir (with ritonavir andombitasvir) is predicted to increase the exposure to paclitaxel. [Moderate] Study

Pibrentasvir (with glecaprevir) is predicted to increase the exposure to paclitaxel. [Moderate] Study

Pitolisant is predicted to decrease the exposure to docetaxel. Avoid. [Severe] Theoretical

Pitolisant is predicted to decrease the exposure to paclitaxel. [Mild] Theoretical

Rifampicin is predicted to decrease the exposure to docetaxel. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to cabazitaxel. Avoid. [Severe] Study

Teriflunomide is predicted to increase the concentration of paclitaxel. [Severe] Anecdotal

Velpatasvir is predicted to increase the exposure to paclitaxel. [Severe] Theoretical

Tazarotene → see retinoids

Tedizolid potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal

Tedizolid increases the anticoagulant effect of coumarins. [Moderate] Theoretical

Folates are predicted to increase the risk of toxicity when given with teagafur. [Severe] Theoretical

H₂ receptor antagonists (cimetidine) are predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tegafur. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Methotrexate is predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical

Teicoplanin

GENERAL INFORMATION If other nephrotoxic or neurotoxic drugs are given, monitor renal and auditory function on prolonged administration.

Telavancin → see TABLE 2 p. 874 (nephrotoxicity), TABLE 19 p. 878 (ototoxicity), TABLE 9 p. 876 (QT-interval prolongation)

Telbivudine

- Interferons (interferon alfa) are predicted to increase the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Theoretical

- Interferons (peginterferon alfa) increase the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Study

Telmisartan → see angiotensin-II receptor antagonists

Telotristat ethyl

- Telotristat ethyl is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. [Severe] Theoretical

- Telotristat ethyl decreases the exposure to midazolam. [Moderate] Study

- Octreotide (short-acting) decreases the exposure to telotristat ethyl. Telotristat ethyl should be taken at least 30 minutes before octreotide. [Moderate] Study

Temazepam → see TABLE 11 p. 876 (CNS depressant effects)

Temocilin → see penicillins

Temozolomide → see alkylating agents

Temozolomide is predicted to increase the concentration of temsirolimus. [Severe] Study

- Antiarhythmics (dronedarone) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

- Anticoagulants (warfarin, phenprocoumon) are predicted to increase the concentration of temsirolimus. [Severe] Theoretical

- Antiarrhythmics (dronedarone) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

- Apalutamide is predicted to decrease the exposure to temsirolimus. Avoid or monitor. [Moderate] Study

- Aprepitant is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

- Bosentan is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

- Cobicistat is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

- Crizotinib is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical → Also see TABLE 15 p. 877

- Efavirenz is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical

- Enzalutamide is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study

- Grapefruit juice is predicted to increase the concentration of temsirolimus. Use with caution or avoid. [Moderate] Theoretical

- HIV-protease inhibitors are predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

- Idelalisib is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 877

Netupitant is predicted to increase the exposure to taxanes (docetaxel, paclitaxel). Avoid. [Severe] Study
Temsirolimus (continued)

- **Irinotecan** is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical → Also see TABLE 15 p. 877

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with temsirolimus. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

- **Lumacaftor** is predicted to decrease the exposure to temsirolimus. Avoid. (Severe) Theoretical

- Macrolides (clarithromycin) are predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical

- **Macrolides** (erythromycin) are predicted to increase the concentration of temsirolimus. (Moderate) Theoretical

- **Mitotane** is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Study

- **Nevirapine** is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical

- **Nilotinib** is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical

- Also see TABLE 15 p. 877

- **Pitolisant** is predicted to decrease the exposure to temsirolimus. Avoid. (Severe) Theoretical

- **Rifampicin** is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical

- **St John’s Wort** is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical

**Tenofovir alafenamide**

- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

- **Ciclosporin** is predicted to increase the exposure to tenofovir alafenamide. (Moderate) Theoretical

- **Eltorbopag** is predicted to increase the exposure to tenofovir alafenamide. (Moderate) Theoretical

- **HIV-protease inhibitors** (atazanavir, darunavir, lopinavir) increase the exposure to tenofovir alafenamide. Avoid or adjust dose. (Moderate) Study

- **HIV-protease inhibitors** (tipranavir) are predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

- **Leflunomide** is predicted to increase the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

- **Rifabutin** is predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

- **Rifampicin** is predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

- **Teriflunomide** is predicted to increase the exposure to tenofovir alafenamide. Avoid or adjust dose. (Moderate) Study

**Tenofovir disoproxil**

- **Ciclosporin** is predicted to increase the exposure to tenofovir disoproxil. (Moderate) Theoretical → Also see TABLE 2 p. 874 (nephrotoxicity)

- **Eltorbopag** is predicted to increase the exposure to tenofovir disoproxil. (Moderate) Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, lopinavir) are predicted to increase the risk of renal impairment when given with tenofovir disoproxil. (Severe) Anecdotal

- **Ledipasvir** (with sofosbuvir) slightly increases the exposure to tenofovir disoproxil. (Moderate) Study

- **Leflunomide** is predicted to increase the exposure to tenofovir disoproxil. (Moderate) Theoretical

- **Teriflunomide** is predicted to increase the exposure to tenofovir disoproxil. (Moderate) Theoretical

- **Velpatasvir** is predicted to increase the exposure to tenofovir disoproxil. (Severe) Study

- **Voxilaprevir** (with sofosbuvir and velpatasvir) potentially increases the concentration of tenofovir disoproxil. (Severe) Study

**Terbinafine**

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- **Terbinafine** is predicted to increase the exposure to anticholinesterases, centrally acting (gallantamine). Monitor and adjust dose. (Moderate) Study

- **Terbinafine** is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose. p. 255. (Moderate) Study

- **Terbinafine** is predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study

- **Terbinafine** is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study

- **Terbinafine** is predicted to slightly increase the exposure to darifenacin. (Mild) Study

- **Terbinafine** is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study

- **Terbinafine** is predicted to increase the exposure to mexiletine. (Moderate) Study

- **Terbinafine** is predicted to decrease the efficacy of opioids (codeine). (Moderate) Theoretical

- **Terbinafine** is predicted to decrease the efficacy of opioids (triametadol). (Severe) Study

- **Terbinafine** is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. (Moderate) Study

- **Rifampicin** decreases the exposure to terbinafine. Adjust dose. (Moderate) Study

- **Terbinafine** is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study

- **Terbinafine** is predicted to increase the exposure to SSRIs (citalopram, dapoxetine, escitalopram, fluvoxamine, sertraline). (Moderate) Theoretical

- **Terbinafine** is predicted to increase the exposure to SSRIs (paroxetine). (Moderate) Study

- **Terbinafine** is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study

- **Terbinafine** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study

- **Terbinafine** is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. (Moderate) Study

**Terbutaline** → see beta agonists

**Teriflunomide**

- **Teriflunomide** is predicted to increase the exposure to adefovir. (Moderate) Study

- **Teriflunomide** is predicted to decrease the exposure to agomelatine. (Moderate) Theoretical

- **Teriflunomide** decreases the exposure to aminophylline. Adjust dose. (Moderate) Study

- **Teriflunomide** is predicted to decrease the exposure to anesthetics, local (ropivacaine). (Moderate) Theoretical

- **Teriflunomide** is predicted to increase the exposure to anthracyclines (daunorubicin, doxorubicin, mitoxantrone). (Moderate) Theoretical

- **Teriflunomide** is predicted to increase the exposure to baricitinib. (Moderate) Theoretical

- **Teriflunomide** is predicted to increase the exposure to bosentan. (Moderate) Study

- **Teriflunomide** is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. (Moderate) Study

- **Teriflunomide** is predicted to increase the exposure to cephalosporins (cefator). (Moderate) Study

- **Teriflunomide** is predicted to decrease the exposure to clozapine. (Moderate) Theoretical

- **Teriflunomide** affects the anticoagulant effect of coumarins. (Severe) Study

- **Teriflunomide** is predicted to decrease the exposure to duloxetine. (Moderate) Theoretical

- **Teriflunomide** is predicted to increase the exposure to ganciclovir. (Moderate) Study
Teriflunomide – Tezacaftor 1041

- Teriflunomide is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). [Moderate] Study
- Teriflunomide is predicted to increase the concentration of lertemovir. [Moderate] Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with teriflunomide. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Teriflunomide is predicted to increase the exposure to loop diuretics (furosemide). [Moderate] Study
- Teriflunomide is predicted to increase the exposure to melatonin. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to methotrexate. [Moderate] Study
- Teriflunomide is predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study
- Teriflunomide is predicted to increase the exposure to montelukast. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to nateglinide. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to NSAIDs. (indometacin, ketoprofen). [Moderate] Theoretical
- Teriflunomide is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. [Moderate] Study
- Teriflunomide is predicted to increase the exposure to oxalamivir. [Moderate] Study
- Teriflunomide is predicted to increase the exposure to penicillins (benzylpenicillin). [Moderate] Study
- Teriflunomide is predicted to increase the exposure to piperacillin. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to quinolones (ciprofloxacin). [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to repaglinide. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to rifampicin. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). [Moderate] Study
- Teriflunomide moderately increases the exposure to statins (rosuvastatin). Adjust rosvastatin dose. p. 125. [Moderate] Study
- Teriflunomide is predicted to increase the exposure to suflasalazine. [Moderate] Study
- Teriflunomide is predicted to increase the exposure to sulfonylureas (glibenclamide). [Moderate] Study
- Teriflunomide is predicted to decrease the concentration of taxanes (paclitaxel). [Severe] Anecdotal
- Teriflunomide is predicted to increase the exposure to tenofovir alafenamide. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to tenofovir disoproxil. [Moderate] Theoretical
- Teriflunomide is predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Study
- Teriflunomide moderately decreases the exposure to tizanidine. [High] Study
- Teriflunomide is predicted to increase the exposure to topotecan. [Moderate] Study
- Teriflunomide is predicted to increase the exposure to zidovudine. [Moderate] Theoretical

Tetanus immunoglobulin → see immunoglobulins
Tetrabenzazine → see TABLE 9 p. 876 (QT-interval prolongation)
Tetragenazine is predicted to decrease the effects of levodopa. Use with caution or avoid. [Moderate] Theoretical
Tetragenazine is predicted to increase the risk of CNS toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
Tetracaine → see anaesthetics, local
Tetracycline → see tetracyclines
Tetracyclines → see TABLE 1 p. 874 (hepatotoxicity)

demeclocycline • doxycycline • lymecycline • minocycline • oxytetracycline • tetracycline • tigecycline

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use of oxytetracycline unless specified.

- ACE inhibitors (quinapril) (tablet) decrease the absorption of oral tetracycline. Avoid. [Moderate] Study
- Antacids decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study Also see TABLE 1 p. 874
- Tetracycline decreases the concentration of antimarialars (atovaquone). [Moderate] Study
- Calcium salts (calcium carbonate) are predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- Tetracyclines increase the risk of bleeding events when given with coumarins. [Moderate] Anecdotal
- Dairy products decrease the absorption to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid. [Moderate] Study
- Enalapril decreases the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study
- Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral). [Moderate] Study
- Ketoconazole decreases the absorption of tetracyclines. [Moderate] Theoretical
- Lansoprazole decreases the exposure to tetracyclines. Separate administration by 2 hours. [Moderate] Theoretical
- Mitotane decreases the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study
- Retinoids (acitretin, altretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid. [Severe] Anecdotal
- Rifampicin decreases the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical

Tezacaftor

FOOD AND LIFESTYLE Avoid bitter (Seville) oranges as they are predicted to increase the exposure to tezacaftor.

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tezacaftor. Avoid. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- Antibacterials are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study
- Aprepitant is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- Antihypertensives (angiotensin receptor antagonists, dihydropyridine calcium channel blockers, (diltiazem, verapamil)) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- Crizotinib is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study
- Enalapril decreases the exposure to tezacaftor. Avoid. [Severe] Theoretical
**Tezacaftor** (continued)

- **Grapefruit juice** is predicted to increase the exposure to tezacaftor. Avoid. [Severe] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study
- **Idelalisib** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study
- **Irinotecan** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with potent inhibitors of CYP3A4. [Severe] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Mitotane** is predicted to decrease the exposure to tezacaftor. Avoid. [Severe] Theoretical
- **Netupitant** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 190 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Rifabutin** is predicted to decrease the exposure to tezacaftor. Avoid. [Severe] Theoretical
- **Rifampin** is predicted to decrease the exposure to tezacaftor. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to tezacaftor. Avoid. [Severe] Theoretical
- **Thalidomide** see TABLE 6 p. 875 (bradycardia), TABLE 15 p. 877 (myelosuppression), TABLE 12 p. 877 (peripheral neuropathy), TABLE 5 p. 874 (thromboembolism), TABLE 11 p. 876 (CNS depressant effects)
- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. [Severe] Study
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. [Severe] Study
- **Theophylline** see TABLE 17 p. 878 (reduced serum potassium)

**FOOD AND LIFESTYLE** Smoking can increase theophylline clearance and increased doses of theophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

- **Aciclovir** is predicted to increase the exposure to theophylline. Adjust dose with moderate and high doses. [Severe] Theoretical
- **Theophylline** decreases the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. [Mid] Study
- **Antiepileptics (carbamazepine)** potentially increase the clearance of theophylline and theophylline decreases the exposure to antiepileptics (carbamazepine). Adjust dose. [Moderate] Anecdotal
- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- **Antiepileptics (phenobarbital, primidone)** are predicted to increase the clearance of theophylline. Adjust dose. [Moderate] Theoretical
- **Antiepileptics (stiripentol)** are predicted to increase the exposure to theophylline. Avoid. [Moderate] Theoretical
- **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. [Severe] Theoretical
- **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. [Severe] Theoretical
- **Caffeine citrate** decreases the clearance of theophylline. [Moderate] Study
- **Combined hormonal contraceptives** are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **Theophylline** increases the risk of agitation when given with doxapram. [Moderate] Study
- **Enteral feeds** decrease the exposure to theophylline. [Moderate] Study
- **Esketamine** is predicted to increase the risk of seizures when given with theophylline. Avoid. [Severe] Theoretical
- **H. receptor antagonists (cimetidine)** increase the concentration of theophylline. Adjust dose. [Severe] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- **Interferons** slightly increase the exposure to theophylline. Adjust dose. [Moderate] Study
- **Iron chelators (deferasirox)** increase the exposure to theophylline. Avoid. [Moderate] Study
- **Isoniazid** is predicted to affect the clearance of theophylline. Avoid. [Severe] Anecdotal
- **Leflunomide** is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- **Theophylline** is predicted to decrease the concentration of lithium. Monitor concentration and adjust dose. [Moderate] Anecdotal
- **Macrolides (azithromycin, clarithromycin)** are predicted to increase the exposure to theophylline. Avoid. [Moderate] Anecdotal
- **Macrolides (erythromycin)** decrease the clearance of theophylline and theophylline potentially decreases the clearance of macrolides (erythromycin). Adjust dose. [Severe] Study
- **Methotrexate** decreases the clearance of theophylline. [Moderate] Study
- **Mesxetine** is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **Monoclonal antibodies (bentolimumab)** are predicted to transiently increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **Obeticholic acid** is predicted to increase the exposure to theophylline. [Severe] Theoretical
- **Pentoxifylline** increases the concentration of theophylline. Monitor and adjust dose. [Severe] Study
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **Rifaximin** is predicted to decrease the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **Rifampin** is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- **Theophylline** is predicted to slightly increase the exposure to rifamycin. Avoid. [Moderate] Theoretical
- **Rucaparib** is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** moderately to markedly increase the exposure to theophylline. Avoid. [Severe] Study
- **St John’s Wort** potentially decreases the exposure to theophylline. [Severe] Anecdotal
- **Sucralfate** potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. [Moderate] Study
- **Symptomptomimetics, vasconstrictor (ephedrine)** increase the risk of side-effects when given with theophylline. Avoid in children. [Moderate] Study
- **Teriflunomide** is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- **Valaciclovir** is predicted to increase the exposure to theophylline. [Severe] Theoretical

**Thiazide diuretics** see TABLE 18 p. 878 (hyponatraemia), TABLE 8 p. 875 (hypotension), TABLE 17 p. 878 (reduced serum potassium)

- **Benzoato de hidroclorotiazida - chlorothiazida - chlorotidina - hidroclorotiazida - hidroflumethiazida - indapamina - metolazona - xipamide**
- **Thiazide diuretics** are predicted to increase the risk of hypersensitivity reactions when given with allopurinol. [Severe] Theoretical
Thiazide diuretics — Tizanidine 1043

- Aspirin (high-dose) increases the risk of acute renal failure when given with thiazide diuretics. [Severe] Theoretical
- Thiazide diuretics increase the risk of hypercalcaemia when given with calcium salts. [Severe] Anecdotal
- Thiazide diuretics increase the concentration of lithium. Avoid or adjust dose and monitor concentration. [Severe] Study
- NSAIDs increase the risk of acute renal failure when given with thiazide diuretics. [Severe] Theoretical → Also see TABLE 18 p. 878
- Reboxetine is predicted to increase the risk of hypokalaemia when given with thiazide diuretics. [Moderate] Anecdotal
- Thiazide diuretics are predicted to increase the risk of hypercalcaemia when given with toremifene. [Severe] Theoretical
- Thiazide diuretics increase the risk of hypercalcaemia when given with vitamin D substances. [Moderate] Theoretical

Thiopental → see TABLE 8 p. 875 (hypotension), TABLE 11 p. 876 (CNS depressant effects)
- Sulfonamides are predicted to increase the effects of thiopental. [Moderate] Theoretical
- Tricyclic antidepressants increase the risk of cardiac arrhythmias and hypotension when given with thiopental. [Moderate] Study → Also see TABLE 8 p. 875

Thiotepa → see alkylating agents

Thyroid hormones
- Levothyroxine - liothyronine
- Antacids are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Anecdotal
- Antiarhythmics (amiodarone) are predicted to increase the risk of thyroid dysfunction when given with thyroid hormones. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with thyroid hormones. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical
- Apalutamide potentially decreases the exposure to levothyroxine. [Mild] Theoretical
- Oral calcium salts are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Anecdotal
- Thyroid hormones are predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- HIV-protease inhibitors (ritonavir) decrease the concentration of levothyroxine. MHRA advises monitor TSH for at least one month after starting or stopping ritonavir. [Moderate] Anecdotal
- Oral hormone replacement therapy is predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical
- Iron (oral) decreases the absorption of levothyroxine. Separate administration by at least 4 hours. [Severe] Study
- Lanthanum decreases the absorption of thyroid hormones. Separate administration by 2 hours. [Moderate] Study
- Paritaprevir (with ritonavir andombitasvir) is predicted to increase the absorption of levothyroxine. Monitor and adjust dose. [Moderate] Theoretical
- Sucralfate decreases the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Study

Tiagabine → see antiepileptics

Tiapronenic acid → see NSAIDs

Tilolone → see TABLE 8 p. 874 (thromboembolism)

Ticagrelor → see TABLE 4 p. 874 (antiplatelet effects)
- Antiarrhythmics (amiodarone) are predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- Bosentan is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- Ciclosporin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- Cobicistat is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- Ticagrelor increases the concentration of digoxin. [Moderate] Study
- Eravirenz is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- Enalapril is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Ticagrelor is predicted to increase the exposure to ergotamine. Avoid. [Severe] Anecdotal
- Grapefruit juice moderately increases the exposure to ticagrelor. [Moderate] Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- Idelalisib is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Ticagrelor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Macrolides (azithromycin) are predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- Mitotane is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to ticagrelor. [Severe] Study
- Ranolazine is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- Rifampicin is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to ticagrelor. [Severe] Theoretical
- Ticarclidin → see penicillins
- Tigecycline → see tetracyclines
- Tildrazikumab → see monoclonal antibodies
- Timolol → see beta blockers, non-selective

Tinzaparin
- Alcohol (beverage) potentially causes a disulfiram-like reaction when given with tizanidine. Avoid for 72 hours stopping treatment. [Moderate] Theoretical
- Tiazidizole is predicted to increase the antiangiostatic effect of coumarins. Monitor INR and adjust dose. [Severe] Theoretical
- Tizzanapin → see low molecular-weight heparins
- Tioguanine → see TABLE 15 p. 877 (myelosuppression)
- Tispropan is predicted to increase the risk of generalised infection (possibly life-threatening) when given with tioguanine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Tiopropium → see TABLE 10 p. 876 (antimuscarinics)
- Tirofiban → see HIV-protease inhibitors
- Tivozanib
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tivozanib. [Severe] Study
- Enalapril is predicted to decrease the exposure to tivozanib. [Severe] Study
- Mitotane is predicted to decrease the exposure to tivozanib. [Severe] Study
- Tivozanib is predicted to decrease the exposure to statins (rosuvastatin). [Moderate] Theoretical

Tizanidine → see TABLE 6 p. 875 (bradycardia), TABLE 8 p. 875 (hypotension), TABLE 9 p. 876 (Q-interval prolongation), TABLE 11 p. 876 (CNS depressant effects)
- Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to tizanidine. [Mild] Study
Tizanidine (continued)
» Combined hormonal contraceptives increase the exposure to tizanidine. Avoid. [Moderate] Study
» HIV-protease inhibitors (ritonavir) moderately decrease the exposure to tizanidine. [Mild] Study
» Iron chelators (deferasirox) are predicted to increase the exposure to tizanidine. [Mild] Study
» Leflunomide moderately decreases the exposure to tizanidine. [Mild] Study
» Mesalazine increases the exposure to tizanidine. Avoid. [Moderate] Study
» Obeticholic acid is predicted to increase the exposure to tizanidine. [Severe] Theoretical
» Quinolones (ciprofloxacin) increase the exposure to tizanidine. Avoid. [Moderate] Study
» Rifampicin moderately decreases the exposure to tizanidine. [Mild] Study
» Rucaparib is predicted to increase the exposure to tizanidine. Monitor and adjust dose. [Moderate] Study
» SSRI (fluvoxamine) very markedly increase the exposure to tizanidine. Avoid. [Severe] Study
» Teriflunomide moderately decreases the exposure to tizanidine. [Mild] Study

Tizanidine → see aminoglycosides
Tolcizumab → see monoclonal antibodies

Tofacitinib
» Antiarrhythmics (dronedarone) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tofacitinib. Avoid. [Severe] Study
» Antifungals (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Aprepitant given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Bosantan is decreased to predict the exposure to tofacitinib. [Moderate] Study
» Calcium channel blockers (diltiazem, verapamil) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Ciclosporin increases the exposure to tofacitinib. Avoid. [Severe] Study
» Cobicistat is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Crizotinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Efavirenz is predicted to decrease the exposure to tofacitinib. [Mild] Study
» Enalapril is predicted to decrease the exposure to tofacitinib. [Mild] Study
» HIV-protease inhibitors are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Idealisib is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Immunosuppressant (mycophenolate mofetil) is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Live vaccines potentially increase the risk of generalised infection (possibly life-threatening) when given with tofacitinib. Avoid. [Severe] Theoretical
» Macrolides (clarithromycin) are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Macrolides (erythromycin) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Mitotane is predicted to decrease the exposure to tofacitinib. Avoid. [Severe] Study
» Netupitant given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Mild] Study
» Nevirapine is predicted to decrease the exposure to tofacitinib. [Moderate] Study
» Nilotinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» Rifampicin is predicted to decrease the exposure to tofacitinib. Avoid. [Severe] Study
» SSRI (fluoxetine, fluvoxamine) given with a moderate CYP3A4 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. [Moderate] Study
» St John’s Wort is predicted to decrease the exposure to tofacitinib. [Moderate] Study
» Tacrolimus increases the exposure to tofacitinib. Avoid. [Severe] Study

Tolbutamide → see sulphonylureas

Tolcapone
» Tolcapone increases the exposure to levodopa. Monitor and adjust dose. [Moderate] Study
» Tolcapone is predicted to increase the effects of monoamine oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical
» Tolcapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. [Theoretical] Theoretical
» Tolcapone is predicted to increase the effects of sympathomimetics, vasconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Theoretical

Tolfenamic acid → see NSAIDs

Tolterodine → see TABLE 9 p. 878 (OT-interval prolongation), TABLE 10 p. 876 (antimuscarinics)
» Antiarrhythmics (dronedarone) are predicted to increase the exposure to tolterodine. [Mild] Theoretical → Also see TABLE 9 p. 876
» Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to tolterodine. [Mild] Theoretical → Also see TABLE 9 p. 876
» Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolterodine. Avoid. [Severe] Study → Also see TABLE 9 p. 876
» Aprepitant is predicted to increase the exposure to tolterodine. [Mild] Theoretical
» Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolterodine. [Mild] Theoretical
» Cobicistat is predicted to increase the exposure to tolterodine. [Mild] Theoretical
» Crizotinib is predicted to increase the exposure to tolterodine. [Mild] Theoretical → Also see TABLE 9 p. 876
» Eliglustat is predicted to increase the exposure to tolterodine. Adjust dose. [Moderate] Theoretical
» HIV-protease inhibitors are predicted to increase the exposure to tolterodine. Avoid. [Severe] Study → Also see TABLE 9 p. 876
» Idealisib is predicted to increase the exposure to tolterodine. Avoid. [Severe] Study
» Immunosuppressant (mycophenolate mofetil) is predicted to increase the exposure to tolterodine. Adjust tofacitinib dose. [Moderate] Study
» Macrolides (clarithromycin) are predicted to increase the exposure to tolterodine. [Mild] Theoretical → Also see TABLE 9 p. 876
» Macrolides (erythromycin) are predicted to increase the exposure to tolterodine. [Mild] Theoretical
» Netupitant is predicted to increase the exposure to tolterodine. [Mild] Theoretical → Also see TABLE 9 p. 876

Tolvaptan → see TABLE 10 p. 878 (increased serum potassium)

GENERAL INFORMATION
Avoid concurrent use of drugs that increase serum-sodium concentrations.
» Antiarrhythmics (dronedarone) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. [Moderate] Study
» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure
to tolvaptan. Use with caution or avoid depending on indication. (Severe) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. (Severe) Study

- Apalutamide is predicted to decrease the exposure to tolvaptan. Avoid or monitor. (Moderate) Study

- Aprepitant is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study

- Cobimetinib is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. (Severe) Study

- Crizotinib is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. (Severe) Study

- Tolvaptan increases the concentration of digoxin. (Mild) Study

- Enalaprilat is predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. (Severe) Study

- Grapefruit juice increases the exposure to tolvaptan. Avoid. (Moderate) Study

- HIV-protease inhibitors are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. (Severe) Study

- Imatinib is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study

- Macrolides (clarithromycin) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. (Severe) Study

- Mitotane is predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. (Severe) Study

- Netupitant is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Moderate) Study

- Topiramate is predicted to increase the exposure to tolvaptan. Use with caution and adjust tolvaptan dose. (Moderate) Theoretical

- Rifampicin is predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. (Severe) Study

- St John’s Wort is predicted to decrease the exposure to tolvaptan. Avoid. (Moderate) Theoretical

- Topiramate + see antiepileptics

- Topotecan + see table 15 p. 877 (myelosuppression)

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to topotecan. (Severe) Study

- Antiepileptics (fosphenytoin, phenytoin) increase the clearance of topotecan. (Moderate) Study

- Antifungals, azoles (isavuconazole) are predicted to increase the exposure to topotecan. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to topotecan. (Severe) Study

- Calcium channel blockers (verapamil) are predicted to increase the exposure to topotecan. (Severe) Study

- Ceritinib is predicted to increase the exposure to topotecan. (Moderate) Theoretical + see table 15 p. 877

- Ciclosporin is predicted to increase the exposure to topotecan. (Severe) Study

- Eliglustat is predicted to increase the exposure to topotecan. Adjust dose. (Moderate) Study

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to topotecan. (Severe) Study

- Lapatinib is predicted to increase the exposure to topotecan. (Severe) Study

- Leflunomide is predicted to increase the exposure to topotecan. (Moderate) Study + see table 15 p. 877

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

- Macrolides are predicted to increase the exposure to tolvaptan. (Severe) Study

- Mirabegron is predicted to increase the exposure to tolvaptan. (Mild) Theoretical

- Partaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to tolvaptan. (Moderate) Study

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to topotecan. (Moderate) Study

- Pitolisant is predicted to decrease the exposure to tolvaptan. (Mild) Study

- Ranolazine is predicted to increase the exposure to topotecan. (Severe) Study

- Regorafenib is predicted to increase the exposure to topotecan. (Moderate) Study + see table 15 p. 877

- Rilpamid is predicted to increase the exposure to topotecan. Avoid or monitor. (Moderate) Study

- St John’s Wort is predicted to decrease the exposure to topotecan. (Severe) Theoretical

- Tedizolid is predicted to increase the exposure to topotecan. Avoid. (Moderate) Study

- Velpatasvir is predicted to increase the exposure to topotecan. (Severe) Theoretical

- Vemurafenib is predicted to increase the exposure to topotecan. (Severe) Study

- Venetoclax is predicted to increase the exposure to topotecan. (Mild) Theoretical

- Voxelaprevir is predicted to increase the concentration of topotecan. Avoid. (Severe) Theoretical

- Torasemide + see loop diuretics

- Toremifene + see table 5 p. 874 (thromboembolism), table 9 p. 876 (QT-interval prolongation)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to toremifene. Adjust dose. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to toremifene. (Moderate) Theoretical + see table 9 p. 876

- Cobicistat is predicted to increase the exposure to toremifene. (Moderate) Theoretical

- Toremifene is predicted to increase the anticoagulant effect of coumarins. (Severe) Theoretical

- Enalaprilat is predicted to decrease the exposure to toremifene. Adjust dose. (Moderate) Study

- HIV-protease inhibitors are predicted to increase the exposure to toremifene. (Moderate) Theoretical + see table 9 p. 876

- Idelalisib is predicted to increase the exposure to toremifene. (Moderate) Theoretical + see table 9 p. 876

- Macrolides (clarithromycin) are predicted to increase the exposure to toremifene. (Moderate) Theoretical + see table 9 p. 876

- Mitotane is predicted to decrease the exposure to toremifene. Adjust dose. (Moderate) Study
Toremifene (continued)

- **Rifampicin** is predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study
- **Thiazide diuretics** are predicted to increase the risk of hypercalcaemia when given with toremifene. [Severe] Theoretical
- **Trabectedin** → See TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 887 (myelosuppression)
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to toremifene. Avoid. [Severe] Theoretical → Also see TABLE 1 p. 874
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 1 p. 874
- **Cobicistat** is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical
- **Enalaprilamide** is predicted to decrease the exposure to trabectedin. Avoid. [Severe] Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical
- **Idelalisib** is predicted to increase the exposure to trabectedin. Avoid. [Severe] Theoretical
- **Trazodone** → See TABLE 1 p. 874
- **Trastuzumab emtansine** → See TABLE 1 p. 874
- **Tranexamic acid**
- **Trandolapril** → See TABLE 1 p. 874
- **Vemurafenib** → See TABLE 1 p. 874
- **Lapatinib** → See TABLE 1 p. 874
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to trametinib. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to trameitinb. Avoid or adjust dose. [Moderate] Theoretical
- **Netupitant** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Rifampicin** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Trametinib** → See TABLE 1 p. 874
- **Trametinib** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Toremifene** (continued)
- **Antihistamines (clomipramine, imipramine)** are predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Cyproheptadine** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Tramadol** → See opioids
- **Tramadol** → See opioids
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to trametinib. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to trametinb. Avoid or adjust dose. [Moderate] Theoretical
- **Netupitant** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Tobramycin** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Toremifene** (continued)
- **Antihistamines (clomipramine, imipramine)** are predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Cyproheptadine** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Tramadol** → See opioids
- **Tramadol** → See opioids
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to trametinib. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to trametinb. Avoid or adjust dose. [Moderate] Theoretical
- **Netupitant** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Tobramycin** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Toremifene** (continued)
- **Antihistamines (clomipramine, imipramine)** are predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Cyproheptadine** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Tramadol** → See opioids
- **Tramadol** → See opioids
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to trametinib. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to trametinb. Avoid or adjust dose. [Moderate] Theoretical
- **Netupitant** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Tobramycin** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Toremifene** (continued)
- **Antihistamines (clomipramine, imipramine)** are predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Cyproheptadine** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study
- **Tramadol** → See opioids
- **Tramadol** → See opioids
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to trametinib. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to trametinb. Avoid or adjust dose. [Moderate] Theoretical
- **Netupitant** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to oxapitinb. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to trametinib. [Moderate] Theoretical
- **Tobramycin** is predicted to increase the exposure to oxapitinb. Avoid or adjust dose. [Moderate] Study

**GENERAL INFORMATION**

Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

**Tresoluran** → See alkylating agents

**Tretinoin** → See retinoids

**Triamcinolone** → See corticosteroids

**Triameterene** → See potassium-sparing diuretics

**Tricyclic antidepressants** → See TABLE 18 p. 873 (hypotension), TABLE 13 p. 877 (serotonin syndrome), TABLE 9 p. 876 (QT-interval prolongation), TABLE 10 p. 876 (antimuscarinics)

- **antidepressants** → See corticosteroids

- **Tricyclic antidepressants** (clomipramine, doxepin, imipramine, nortriptyline, trimipramine)

**ROUTE-SPECIFIC INFORMATION**

Since systemic absorption can follow topical application, the possibility of interactions of topical doxepin should be borne in mind.

**Toremifene** (continued)

- **Antiarhythmic drugs (dronedarone)** are predicted to increase the exposure to tricyclic antidepressants. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 876
- **Antiarhythmic drugs (propafenone)** are predicted to increase the concentration of tricyclic antidepressants. [Moderate] Theoretical → Also see TABLE 10 p. 876
- **Antiepileptics (carbamazepine)** decrease the exposure to tricyclic antidepressants. Adjust dose. [Moderate] Study → Also see TABLE 18 p. 878
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to tricyclic antidepressants. [Moderate] Study
- **Tricyclic antidepressants (clomipramine, imipramine)** potentially increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- **Bupropion** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 877
- **Cinacalcet** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study
- **Tricyclic antidepressants** decrease the antihypertensive effects of clonidine. Monitor and adjust dose. [Moderate] Anecdotal → Also see TABLE 8 p. 875
- **Darifenacin** is predicted to slightly increase the exposure to tricyclic antidepressants. [Mild] Study
- **Eliquisat** is predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical
- **Tricyclic antidepressants** are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] Study → Also see TABLE 8 p. 875
H1 receptor antagonists (cimetidine) increase the exposure to tricyclic antidepressants. [Moderate] Study

HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical

Tricyclic antidepressants potentially increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 13 p. 877. Also see TABLE 9 p. 876

Amtripryline decreases the effects of metyrapone. Avoid. [Moderate] Theoretical

Tricyclic antidepressants are predicted to increase the risk of severe toxic reaction when given with moclobemide. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 877

Tricyclic antidepressants are predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 875 → Also see TABLE 13 p. 877

Tricyclic antidepressants are predicted to decrease the effects of moxonidine. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 875

Tricyclic antidepressants are predicted to decrease the efficacy of pitolisant. [HLD] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 18 p. 878 → Also see TABLE 13 p. 877

SSRIs (fluvoxamine) markedly increase the exposure to clomipramine. Adjust dose. [Severe] Study → Also see TABLE 18 p. 878 → Also see TABLE 13 p. 877

SSRIs (fluvoxamine) increase the exposure to tricyclic antidepressants (amitriptyline, imipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 878 → Also see TABLE 13 p. 877

Sucralfate is predicted to decrease the absorption of tricyclic antidepressants. [Moderate] Study

Tricyclic antidepressants increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, norepinephrine/norepinephrine, phenylephrine). Avoid. [Severe] Study

Tricyclic antidepressants are predicted to decrease the effects of sympathomimetics, vasoconstrictor (ephedrine). Avoid. [Severe] Study

Terbutaline is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study

Tricyclic antidepressants increase the risk of cardiac arrhythmias and hypotension when given with thioridazine. [Moderate] Study → Also see TABLE 8 p. 875

Trimipramine

Trimipramine potentially decreases the absorption of iron (oral). [Moderate] Theoretical

Trimipramine potentially decreases the absorption of zinc. [Moderate] Theoretical

Trifluoperazine → see phenothiazines

Trimepr俘frolide → see TABLE 10 p. 876 (antimycosics)

Trimethoprim → see TABLE 18 p. 878 (amnucosics), TABLE 2 p. 874 (nephrotoxicity), TABLE 16 p. 878 (increased serum potassium)

Trimethoprim increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study

Antimalarials (pyrimethamine) increase the risk of side-effects when given with trimethoprim. [Severe] Study

Trimethoprim is predicted to increase the anticoagulant effect of coumarins. [Severe] Study

Dapsone increases the exposure to trimethoprim and trimethoprim increases the exposure to dapsone. [Severe] Study

Trimethoprim increases the concentration of digoxin. [Moderate] Study

Trimethoprim is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Theoretical

Trimethoprim is predicted to increase the exposure to l-DOPA. Trimethoprim slightly increases the exposure to levodopa. Avoid. [Moderate] Theoretical → Also see TABLE 2 p. 874

Trimethoprim slightly increases the exposure to repaglinide. Avoid or monitor blood glucose. [Moderate] Study

Rifampicin decreases the exposure to trimethoprim. [Moderate] Study

Trimethoprim is predicted to decrease the efficacy of saquinavir. [Moderate] Theoretical

Trimipramine → see tricyclic antidepressants

Tropicamide → see TABLE 10 p. 876 (antimycosics)

Trospleum → see TABLE 10 p. 876 (antimycosics)

Trvophanopan → see TABLE 13 p. 877 (serotonin syndrome)

Trvophanp greatly decreases the concentration of levodopa. [Moderate] Study

Trvophan greatly increases the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. [Severe] Anecdotal → Also see TABLE 13 p. 877

Trvophan, oral → see live vaccines

Ulipristal

Antiarrhythmics (dronedarone) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) decrease the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Aprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Bosentan decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Cobicistat is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

Ulipristal is predicted to decrease the efficacy of combined hormonal contraceptives. [Severe] Theoretical

Crisotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Ulipristal is predicted to decrease the efficacy of desogestrel. Avoid. [Severe] Theoretical

Efavirenz decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Enzalutamide is predicted to markedly decrease the exposure to ulipristal. Avoid and for 4 weeks after stopping ulipristal. [Severe] Theoretical

Ulipristal is predicted to decrease the efficacy of etonogestrel. Avoid. [Severe] Theoretical

Fosaprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Griseofulvin potentially decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

HIV-protease inhibitors (ritonavir) decrease the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Idelalisib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Imatinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Interactions | Appendix 1

TABLE 13

For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

Ulipristal

TABLE 2

For FSRH guidance, see Contraceptives, interactions p. 516. [Severe] Anecdotal

TABLE 8

Ulipristal

TABLE 16

TABLE 10

TABLE 18

TABLE 2

TABLE 13

TABLE 8
Ulipristal – Velpatasvir

Ulipristal (continued)

> Ulipristal is predicted to decrease the efficacy of levonorgestrel. Avoid. (Severe) Theoretical

> Lumacaftor is predicted to decrease the efficacy of ulipristal. Use additional contraceptive precautions. (Severe) Theoretical

> Macrolides (clarithromycin) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

> Macrolides (erythromycin) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

> Modafinil decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal

> Netupitant is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

> Ulipristal is predicted to decrease the efficacy of norethisterone. Avoid. (Severe) Theoretical

> Rifabutin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal

> Rifampicin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal

> St John’s Wort decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 516. (Severe) Anecdotal

Umeclidinium → see TABLE 10 p. 876 (antimuscarinic)

Urokinase → see TABLE 3 p. 874 (anticoagulant effects)

Ursodeoxycholic acid

> Antacids are predicted to decrease the absorption of ursodeoxycholic acid. Separate administration by 2 hours. (Moderate) Theoretical

> ursodeoxycholic acid affects the concentration of ciclosporin. Use with caution and adjust dose. (Severe) Anecdotal

> Fibrates are predicted to decrease the efficacy of ursodeoxycholic acid. Avoid. (Severe) Theoretical

Ustekinumab → see monoclonal antibodies

Valaciclovir → see TABLE 2 p. 874 (nephrotoxicity)

Valdarclovir is predicted to increase the exposure to aminophylline. (Severe) Anecdotal

> Mycophenolate is predicted to increase the risk of haematological toxicity when given with valaciclovir. (Moderate) Theoretical

> Valaciclovir is predicted to increase the exposure to theophylline. (Severe) Theoretical

Valganciclovir → see TABLE 15 p. 877 (myelosuppression), TABLE 2 p. 874 (nephrotoxicity)

> Valganciclovir is predicted to increase the risk of seizures when given with carbapenems (imipenem). Avoid. (Severe) Anecdotal

> Valganciclovir is predicted to increase the exposure to didanosine. (Moderate) Study

> Mycophenolate is predicted to increase the risk of haematological toxicity when given with valganciclovir. (Moderate) Theoretical → Also see TABLE 15 p. 877

Valproate → see antiepileptics

Valstarin → see angiotensin-II receptor antagonists

Vancomycin → see TABLE 2 p. 874 (nephrotoxicity), TABLE 19 p. 878 (ototoxicity)

Vandetanib → see TABLE 9 p. 876 (QT-interval prolongation)

> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

> Vandetanib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical

> Vandetanib slightly increases the exposure to digoxin. Monitor ECG and adjust dose. (Moderate) Study

> Vandetanib is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. (Moderate) Study

> Enzalutamide is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

> Vandetanib increases the exposure to metformin. Monitor and adjust dose. (Moderate) Study

> Mitotane is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

> Vandetanib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

> Rifampicin is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

Vardenafil → see phosphodiesterase type-5 inhibitors

Varicella-zoster immunoglobulin → see immunoglobulins

Varicella-zoster vaccine → see live vaccines

Vedolizumab → see monoclonal antibodies

Velpatasvir

> Velpatasvir is predicted to increase the exposure to aliskiren. (Severe) Theoretical

> Antacids are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. (Moderate) Theoretical

> Antiarrhythmics (amiodarone) are predicted to increase the concentration of velpatasvir. Avoid or monitor. (Moderate) Theoretical

> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to velpatasvir. Avoid. (Severe) Anecdotal

> Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to velpatasvir. Avoid. (Severe) Theoretical

> Velpatasvir is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). (Severe) Theoretical

> Bosentan is predicted to decrease the exposure to velpatasvir. Avoid. (Moderate) Theoretical

> Calcium salts (calcium carbonate) are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. (Moderate) Anecdotal

> Velpatasvir is predicted to increase the exposure to colchicine. (Severe) Theoretical

> Velpatasvir increases the exposure to dabigatran. Avoid. (Severe) Study

> Velpatasvir is predicted to increase the exposure to digoxin. (Severe) Study

> Velpatasvir is predicted to increase the exposure to edoxaban. (Severe) Theoretical

> Velpatasvir is predicted to increase the exposure to everolimus. (Severe) Theoretical

> H+, receptor antagonists are predicted to decrease the concentration of velpatasvir. Adjust dose. (Moderate) Study

> HIV-protase inhibitors (tipranavir) are predicted to increase the exposure to velpatasvir. (Severe) Theoretical

> Velpatasvir is predicted to increase the exposure to loperamide. (Severe) Theoretical

> Velpatasvir is predicted to moderately decrease the exposure to velpatasvir. Avoid. (Severe) Study

> Velpatasvir is predicted to increase the exposure to voriconazole. (Severe) Theoretical

> Velpatasvir is predicted to increase the exposure to voriconazole. (Severe) Theoretical

> Velpatasvir is predicted to increase the exposure to statins (atorvastatin). Avoid. (Severe) Study

> Velpatasvir is predicted to increase the exposure to statins (rosuvastatin). Adjust rosuvastatin dose and monitor side effects, p. 135. (Severe) Study
Velpatasvir – Venetoclax 1049

- **Velpatasvir** is predicted to increase the exposure to **statins** *(simvastatin)*. Monitor side effects and adjust dose. *Severe* Theoretical
- **Velpatasvir** is predicted to increase the exposure to **sulfasalazine**. *Moderate* Theoretical
- **Velpatasvir** is predicted to increase the exposure to **taxanes** *(paclitaxel)*. *Severe* Theoretical
- **Velpatasvir** is predicted to increase the exposure to **tenofovir disoproxil**. *Severe* Study
- **Velpatasvir** is predicted to increase the exposure to **topotecan**. *Severe* Theoretical

**Vemurafenib** → see TABLE 9 p. 876 (QT-interval prolongation)

**Vemurafenib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. *Moderate* Study

**Vemurafenib** is predicted to increase the exposure to **alkisiren**. Use with caution and adjust dose. *Moderate* Theoretical

**Antiepileptics** *(carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)* are predicted to decrease the exposure to **vemurafenib**. Avoid. *Severe* Theoretical

**Vemurafenib** is predicted to increase the exposure to **calcium channel blockers**, non-selective *(nadolol)*. *Moderate* Study

**Vemurafenib** is predicted to increase the exposure to **bictegravir**. *Theoretical*

**Cobicistat** is predicted to increase the exposure to **colchicine**. Avoid or adjust colchicine dose. *Severe* Theoretical

**Enzalutamide** is predicted to increase the exposure to **doxorubicin**. Use with caution and adjust dose. *Severe* Theoretical

**Mitotane** is predicted to decrease the exposure to **nintedanib**. *Moderate* Study

**Vemurafenib** is predicted to increase the exposure to **panobinostat**. Adjust dose. *Moderate* Theoretical → Also see TABLE 9 p. 876

**Idelalisib** is predicted to increase the exposure to **venuramifenib**. *Severe* Theoretical

**Macrolides** *(clarithromycin)* are predicted to increase the exposure to **venuramifenib**. *Severe* Theoretical → Also see TABLE 9 p. 876

**Mitotane** is predicted to decrease the exposure to **venuramifenib**. Avoid. *Severe* Theoretical

**Vemurafenib** is predicted to increase the exposure to **panobinostat**. Adjust dose. *Moderate* Theoretical → Also see TABLE 9 p. 876

**Vemurafenib** is predicted to increase the exposure to **piperentasim**. *Moderate* Theoretical

**Rifaximin** is predicted to decrease the exposure to **venuramifenib**. Avoid. *Severe* Theoretical

**Vemurafenib** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. *Severe* Study

**Vemurafenib** is predicted to increase the exposure to **topotecan**. *Severe* Study

**Vemurafenib** is predicted to increase the concentration of **trametinib**. *Moderate* Theoretical

**Vemurafenib** is predicted to increase the exposure to **venuramifenib**. Avoid or monitor for toxicity. *Severe* Theoretical

**Venetoclax**

**FOOD AND LIFESTYLE** Avoid Seville (bitter orange) and star fruit as they might increase the exposure to venetoclax.

**Antiarrhythmics** *(amiodarone)* are predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. *Severe* Theoretical

**Antiarrhythmics** *(dronedarone)* are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Antiepileptics** *(carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)* are predicted to decrease the exposure to venetoclax. Avoid. *Severe* Study

**Antifungal, azoles** *(fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole)* are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Venetoclax** is predicted to increase the exposure to **antithiastamines**, non-sedating *(fexofenadine)*. *Moderate* Theoretical

**Aprepitant** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. *Severe* Study

**Venetoclax** is predicted to increase the exposure to **bosentan**. *Moderate* Theoretical

**Calcium channel blockers** *(diltiazem, verapamil)* are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Ciclosporin** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. *Severe* Theoretical

**Dobutamine** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. *Severe* Study

**Enzalutamide** is predicted to decrease the exposure to **everolimus**. Avoid. *Severe* Study

**Grapefruit juice** is predicted to increase the exposure to **venetoclax**. Avoid. *Severe* Theoretical

**HIV-PROTEASE INHIBITORS** are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Idelalisib** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Imatinib** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Lapatinib** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. *Severe* Theoretical

**Venetoclax** potentially decreases the efficacy of **live vaccines**. Avoid. *Severe* Theoretical

**Macrolides** *(clarithromycin, erythromycin)* are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Mitotane** is predicted to decrease the exposure to venetoclax. Avoid. *Severe* Study

**Netupitant** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Nevirapine** is predicted to decrease the exposure to venetoclax. Avoid. *Severe* Study

**Nilotinib** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Dabigatran** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. *Severe* Study

**Ranolazine** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. *Severe* Theoretical

**Venetoclax** is predicted to increase the exposure to **repaglinide**. *Moderate* Theoretical

**Rifampicin** is predicted to decrease the exposure to venetoclax. *Severe* Study

**Simvastatin** *(atorvastatin)*. *Moderate* Study

**Venetoclax** is predicted to increase the exposure to **sirolimus**. Avoid or adjust dose. *Severe* Study

**St John’s Wort** is predicted to decrease the exposure to **venetoclax**. Avoid. *Severe* Study

**Venetoclax** is predicted to increase the exposure to **statins** *(atorvastatin)*. *Moderate* Study

**Venetoclax** is predicted to increase the exposure to **statins** *(fluvastatin, pravastatin, rosuvastatin, simvastatin)*. *Moderate* Theoretical
Venotecax (Venoclat) (continued)

- Venotecax is predicted to increase the exposure to sulfasalazine. Moderate Theoretical
- Venotecax is predicted to increase the exposure to sulfisoxazole (glitazone). Moderate Theoretical
- Venotecax is predicted to increase the exposure to topotecan. Moderate Theoretical
- Vemurafenib is predicted to increase the exposure to venotecax. Avoid or monitor for toxicity. Severe Theoretical
- Venlafaxine is predicted to increase the exposure to venotecax. See TABLE 13 p. 877 (serotonin syndrome), TABLE 9 p. 876 (QT-interval prolongation), TABLE 11 p. 876 (CNS depressant effects), TABLE 4 p. 876 (antiplatelet effects)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to venlafaxine. Moderate Study → Also see TABLE 9 p. 876
- Cobimetap is predicted to increase the exposure to venlafaxine. Moderate Study
- H2 receptor antagonists (cimetidine) slightly increase the exposure to venlafaxine. Mild Study
- Venlafaxine slightly increases the exposure to haloperidol. Severe Study → Also see TABLE 9 p. 876. Also see TABLE 11 p. 876
- H1-antihistamines are predicted to increase the exposure to venlafaxine. (Moderate) Study → Also see TABLE 9 p. 876
- Macrolides (clarithromycin) are predicted to increase the exposure to venlafaxine. Moderate Study → Also see TABLE 9 p. 876
- Venlafaxine is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. Mild Theoretical
- Tacrolimus potentially increases the risk of serotonin syndrome when given with venlafaxine. Severe Anecdotal
- Verapamil → see calcium channel blockers

Verotep

GENERAL INFORMATION Caution on concurrent use with other photosensitising drugs.

Vigabatrin → see antiepileptics
- Vilanterol → see beta, agonists
Vildagliptin → see TABLE 14 p. 877 (antidiabetic drugs)
- Vinblastine → see vinca alkaloids
- Vinca alkaloids → see TABLE 1 p. 874 (hepatotoxicity), TABLE 15 p. 877 (myelosuppression), TABLE 19 p. 878 (ototoxicity), TABLE 12 p. 877 (peripheral neuropathy), TABLE 5 p. 877 (thromboembolism), TABLE 9 p. 876 (QT-interval prolongation)
- Vinblastine, vincristine, vindesine, vinflunine, vinorelbine
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 9 p. 876
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 12 p. 877
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vincristine, vindesine. Severe Theoretical → Also see TABLE 12 p. 877
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinorelbine. Use with caution or avoid. Severe Theoretical → Also see TABLE 12 p. 877
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 1 p. 874. Also see TABLE 12 p. 877
- Antifungals, azoles (miconazole) are predicted to increase the concentration of vinca alkaloids. Use with caution and adjust dose. Moderate Theoretical
- Aprepitant is predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- Asparaginase potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before asparaginase. Severe Anecdotal → Also see TABLE 1 p. 874. Also see TABLE 15 p. 877
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- Cobicistat is predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- Crisantaspase potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before crisantaspase. Severe Anecdotal → Also see TABLE 1 p. 874. Also see TABLE 15 p. 877
- Crizotinib is predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 15 p. 877. Also see TABLE 9 p. 876
- Enzalutamide is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). Severe Theoretical
- Enzalutamide is predicted to decrease the exposure to vinflunine. Avoid. Severe Theoretical
- Enzalutamide is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. Severe Theoretical
- Fosaprepitant is predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 9 p. 876
- Idenalisib is predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 15 p. 877
- Imatinib is predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 15 p. 877
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with vinca alkaloids. Public Health England advises avoid (refer to Green Book). Severe Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 9 p. 876
- Mitotane is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). Severe Theoretical → Also see TABLE 15 p. 877
- Mitotane is predicted to decrease the exposure to vinflunine. Avoid. Severe Theoretical
- Mitotane is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. Severe Theoretical → Also see TABLE 15 p. 877
- Netupitant is predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- Nilotinib is predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 15 p. 877. Also see TABLE 9 p. 876
- Pegaspargase potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before pegaspargase. Severe Anecdotal → Also see TABLE 1 p. 874. Also see TABLE 15 p. 877
- Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). Severe Theoretical
- Rifampicin is predicted to decrease the exposure to vinflunine. Avoid. Severe Theoretical
- Rifampicin is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. Severe Theoretical

Vincristine → see vinca alkaloids
- Vinflunine → see vinca alkaloids
- Vinorelbine → see vinca alkaloids

Vismodegib → see TABLE 15 p. 877 (myelosuppression)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical

Vitamin A
- Retinoids (acitretin, alitretinoin, isotretinoin) are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. Severe Theoretical
Vitamin A - Yellow fever vaccine, live

Voxilaprevir
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Study
- Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Bosentan is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Ciclosporin increases the concentration of voxilaprevir. Avoid. (Severe) Study
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with voxilaprevir (with sofosbuvir and velpatasvir). Avoid. (Severe) Study
- Voxilaprevir (with sofosbuvir and velpatasvir) increases the concentration of dabigatran. Avoid. (Severe) Study
- Voxilaprevir (with sofosbuvir and velpatasvir) is predicted to increase the exposure to digoxin. Monitor and adjust dose. (Severe) Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) is predicted to increase the concentration of edoxaban. Avoid. (Severe) Theoretical
- Efavirenz is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Study
- HIV-protease inhibitors (atazanavir boosted with ritonavir) increase the concentration of voxilaprevir. Avoid. (Severe) Study
- HIV-protease inhibitors (lopinavir boosted with ritonavir) are predicted to increase the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- HIV-protease inhibitors (tipranavir boosted with ritonavir) are predicted to increase the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Mitotane is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Study
- Modafinil is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to voxilaprevir. Adjust dose. (Moderate) Study
- Rifabutin is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to voxilaprevir. Adjust dose. (Moderate) Study
- Rifabutin is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Voxilaprevir is predicted to increase the exposure to statins (atorvastatin). Avoid. (Moderate) Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) is predicted to increase the exposure to statins (fluvastatin, simvastatin). Avoid. (Moderate) Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) moderately increases the exposure to statins (pravastatin). Monitor and adjust pravastatin dose. (Moderate) Study
- Voxilaprevir (with sofosbuvir and velpatasvir) markedly increases the exposure to statins (rosuvastatin). Avoid. (Severe) Study
- Voxilaprevir is predicted to increase the concentration of sulfasalazine. Avoid. (Severe) Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) potentially increases the concentration of tenofovir disoproxil. (Severe) Study
- Voxilaprevir is predicted to increase the concentration of topotecan. Avoid. (Severe) Theoretical
- Warfarin → see coumarins

Wasp venom extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).
Zidovudine → see TABLE 15 p. 877 (myelosuppression), TABLE 2 p. 874 (nephrotoxicity)
- Anti-epileptics (valproate) slightly increase the exposure to zidovudine. [Moderate] Study
- Antifungals, azoles (fluconazole) slightly increase the exposure to zidovudine. [Moderate] Study
- Antimalarials (pyrimethamine) are predicted to increase the risk of side-effects when given with zidovudine. [Severe] Theoretical → Also see TABLE 15 p. 877
- Zidovudine increases the risk of haematological toxicity when given with asparin (high-dose). [Severe] Study
- Zidovudine increases the risk of haematological toxicity when given with fluycostine. Monitor and adjust dose. [Severe] Theoretical

Zinc
ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use unless specified.
- Oral zinc decreases the absorption of oral bisphosphonates (alendronic acid). Zinc should be taken at least 50 minutes before alendronic acid. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid zinc for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral zinc decreases the absorption of oral bisphosphonates (risedronate). Separate administration by at least 2 hours. [Moderate] Study
- Oral zinc decreases the absorption of oral bisphosphonates (sodium clodronate). Avoid zinc for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- Oral calcium salts decrease the absorption of zinc. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of etrombopag. Etrombopag should be taken 2 hours before or 4 hours after zinc. [Severe] Theoretical
- Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) is predicted to decrease the efficacy of zinc. [Moderate] Study
- Zinc is predicted to decrease the absorption of penicillamine. [Mild] Theoretical
- Zinc is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- Trientine potentially decreases the absorption of zinc. [Moderate] Theoretical
- Zoledronic acid → see bisphosphonates
- Zolmitriptan → see TABLE 13 p. 877 (serotonin syndrome)
- Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Theoretical
- H<sub>1</sub> receptor antagonists (cimetidine) slightly increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Mild] Study
- Mexiletine is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Theoretical
- Moroebemide slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Study → Also see TABLE 13 p. 877
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to zolmitriptan. [Severe] Theoretical → Also see TABLE 13 p. 877
- Quinolones (ciprofloxacin) are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Theoretical
- SSRI (fluvoxamine) are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Severe] Theoretical → Also see TABLE 13 p. 877
- Zolpidem → see TABLE 11 p. 876 (CNS depressant effects)
- Antiepileptics (carbamazepine) moderately decrease the exposure to zolpidem. [Moderate] Study
- Rifampicin moderately decreases the exposure to zolpidem. [Moderate] Study
- Zonisamide → see antiepileptics
- Zopiclone → see TABLE 11 p. 876 (CNS depressant effects)
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 876
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- Aprapentin is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Cobicistat is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- Crizotinib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Enalaprilate is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study
- HIV-protease inhibitors (tipranavir) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Idelalisib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- Milotane is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study
- Mexiletine is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Nilotinib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Zuclopenthixol is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Zuclopenthixol is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Zidovudine decreases the efficacy of stavudine. Avoid. [Severe] Theoretical
- Teriflunomide is predicted to increase the exposure to zidovudine. [Moderate] Theoretical
- Ribavirin increases the risk of anaemia and/or leucopenia when given with zidovudine. Avoid. [Severe] Study

Leflunomide is predicted to increase the exposure to stavudine. Avoid. [Severe] Theoretical
- Teriflunomide is predicted to increase the exposure to stavudine. [Moderate] Theoretical
- Macrolides (clarithromycin) decrease the absorption of zidovudine. Separate administration by at least 2 hours. [Moderate] Study
- Nevirapine is predicted to decrease the concentration of zidovudine. Refer to specialist literature. [Severe] Theoretical
- Zidovudine increases the risk of haematological toxicity when given with lamivudine. [Severe] Aneotald.
- Macrolides (clarithromycin) decrease the absorption of zidovudine. Separate administration by at least 2 hours. [Moderate] Study
- Oral zinc decreases the absorption of oral bisphosphonates (ibandronic acid). Avoid zinc for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral zinc decreases the absorption of oral bisphosphonates (risedronate). Separate administration by at least 2 hours. [Moderate] Study
- Oral zinc decreases the absorption of oral bisphosphonates (sodium clodronate). Avoid zinc for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- Oral calcium salts decrease the absorption of zinc. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of etrombopag. Etrombopag should be taken 2 hours before or 4 hours after zinc. [Severe] Theoretical
- Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) is predicted to decrease the efficacy of zinc. [Moderate] Study
- Zinc is predicted to decrease the absorption of penicillamine. [Mild] Theoretical
- Zinc is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- Trientine potentially decreases the absorption of zinc. [Moderate] Theoretical
- Zoledronic acid → see bisphosphonates
- Zolmitriptan → see TABLE 13 p. 877 (serotonin syndrome)
- Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Moderate] Theoretical
- H<sub>1</sub> receptor antagonists (cimetidine) slightly increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 300. [Mild] Study

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

Information
General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)
All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note
Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements
For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see Interactions: Appendix 1: enteral feeds.

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note
Feeds containing more than 5 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values
Nutritional values of products vary with flavour and pack size—consult product literature.

Paediatric ACBS indications: Disease-related malnutrition, intractable malabsorption, growth failure, pre-operative preparation of malnourished patients, dysphagia, short-bowel syndrome, bowel fistula
Standard ACBS indications: Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Other conditions for which ACBS products can be prescribed
This is a list of clinical conditions for which the ACBS has approved toilet preparations.

Dermatitis, Eczema and Pruritus
Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)
Covermark® classic foundation and finishing powder; Dermacolor® Camouflage cream and fixing powder; Keromask® finishing powder and masking cream; Veil®
Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).

**Disinfectants (antiseptics)**

May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not if ordered for general hygienic purposes.

**Dry mouth (xerostomia)**

For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

*AS Saliva Orthana®*, *Biotène Oralbalance®*, *Glandosane®*, *Saliveze®*

**Photodermatoses (skin protection in)**

*LA Roche-Posay Anthelios®* XL SPF 50+ cream; *Sunsense®* Ultra (Ego) SPF 50+; *Uvistat®* Lipscreen SPF 50, *Uvistat®* Suncream SPF 30 and 50

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in BNFC.
### Table 1 Enteral feeds (non-disease specific)

**Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL**

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

Powder provides: protein 13 g, carbohydrate 48.3 g, fat 26.7 g, fibre 5.2 g, energy 2030 kJ (485 kcal)/100 g.
### AMINO ACID FORMULA (ESSENTIAL AND NON-ESSENTIAL AMINO ACIDS)

**Product**

- **Emsogen®**
  - **(Nutricia Ltd)**
  - **Standard dilution**
    - (20%) of powder (sip or tube feed) per 100 mL
    - **Energy**: 368 kJ (88 kcal)
    - **Protein**: 2.5 g protein equivalent (essential and non-essential amino acids)
    - **Carbohydrate**: 12 g (sugars 1.6 g)
    - **Fat**: 3.3 g (MCT 83%)
    - **Fibre**: Nil
    - **Special Characteristics**: Lactose-free
    - **ACBS Indications**: Short-bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula
    - **Presentation & Flavour**: Not suitable for child under 1 year or as sole source of nutrition in child 1-5 years

**Powder provides:** protein equivalent 12.5 g, carbohydrate 60 g, fat 16.4 g, energy 1839 kJ (438 kcal)/100 g. Additional source of alpha linolenic acid needed if used as sole source of nutrition. To flavour unflavoured products, see Modjul® Flavour System p. 1082.

Feed additives
Special additives for conditions of intolerance

**Colief ®**
- Transient Lactase Deficiency. For dosage and administration details, consult product literature.
- LIQUID, lactase 50 000 units/g

**Colief 50,000 units/g infant drops** (Forum Health Products Ltd)
- 7 ml (ACBS) - NHS indicative price = £6.40

**Fructose**
- (Laevulose) For proven glucose/galactose intolerance
- Transient Lactase Deficiency. For dosage and administration details, consult product literature.

**Dietade dietary foods fruit sugar** (Margetts)
- 250 gram - No NHS indicative price available

**Glucose**
- (Dextrose monohydrate) For use as an energy supplement in sucrose-isomaltase deficiency

Feed thickeners and pre-thickened drinks

**Carobel, Instant ®**
- For thickening feeds in the treatment of vomiting. POWDER, carob seed flour.
- Instant Carobel powder (Cow & Gate Ltd)
  - 135 gram (ACBS) - NHS indicative price = £2.91

**Multi-thick ®**
- For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive. POWDER, modified maize starch, gluten- and lactose-free.

**Nutilis® Clear**
- For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years. POWDER, dried glucose syrup, xanthan gum, guar gum, gluten- and lactose-free.

**Nutilis Clear powder** (Nutricia Ltd)
- 175 gram (ACBS) - NHS indicative price = £8.46

**Nutilis® Powder**
- For thickening of food and fluid in dysphagia. Not suitable for child under 3 years. POWDER, carbohydrate 87.5 g, energy 1545 kJ (363 kcal)/100 g, contains modified starch. Gluten-free and lactose-free.

**Nutilis powder** (Nutricia Ltd)
- 300 gram (ACBS) - NHS indicative price = £5.50

**Resource Thickened Drink**
- For dysphagia. Not suitable for children under 3 years. POWDER, carob seed flour.
- Resource Thickened Drink custard apple (Nestle Health Science)
  - 114 ml (ACBS) - NHS indicative price = £0.78
- Resource Thickened Drink custard orange (Nestle Health Science)
  - 114 ml (ACBS) - NHS indicative price = £0.78
- Resource Thickened Drink syrup apple (Nestle Health Science)
  - 114 ml (ACBS) - NHS indicative price = £0.78
- Resource Thickened Drink syrup orange (Nestle Health Science)
  - 114 ml (ACBS) - NHS indicative price = £0.78

**Resource® ThickenedUp Clear**
- For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years. POWDER, maltodextrin, xanthum gum, gluten- and lactose-free.
- Resource ThickenedUp Clear powder (Nestle Health Science)
  - 28.8 gram (ACBS) - NHS indicative price = £5.28 | 127 gram (ACBS) - NHS indicative price = £8.46

**Resource® ThickenedUp**
- For thickening of foods in dysphagia. Suitable for children above 3 years of age. POWDER, modified maize starch. Gluten-free.
- Resource ThickenedUp powder (Nestle Health Science)
  - 227 gram (ACBS) - NHS indicative price = £4.66

**SLO Drinks ®**
- Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years. POWDER, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature.
- SLO Drink Stage 1: IDDSI 2 Mildly Thick oral powder blackcurrant (SLO Drinks Ltd)
  - 25 cup (ACBS) - NHS indicative price = £7.50
- SLO Drink Stage 1: IDDSI 2 Mildly Thick oral powder orange (SLO Drinks Ltd)
  - 25 cup (ACBS) - NHS indicative price = £7.50

**SLO Drink Stage 2: IDDSI 3 Moderately Thick oral powder blackcurrant** (SLO Drinks Ltd)
- 25 cup (ACBS) - NHS indicative price = £7.50

**SLO Drink Stage 2: IDDSI 3 Moderately Thick oral powder orange** (SLO Drinks Ltd)
- 25 cup (ACBS) - NHS indicative price = £7.50

**SLO Milkshakes®**
- Nutritional supplement in the dietary management of dysphagia. Not suitable for children under 3 years. POWDER, carbohydrate content varies with flavour and chosen consistency (2 consistencies available), see product literature.
- SLO Milkshake+ Stage 1 oral powder chocolate (SLO Drinks Ltd)
  - 7 x 50 gram (ACBS) - NHS indicative price = £5.88
- SLO Milkshake+ Stage 1 oral powder strawberry (SLO Drinks Ltd)
  - 7 x 50 gram (ACBS) - NHS indicative price = £5.05
- SLO Milkshake+ Stage 2 oral powder chocolate (SLO Drinks Ltd)
  - 7 x 50 gram (ACBS) - NHS indicative price = £5.88
- SLO Milkshake+ Stage 2 oral powder strawberry (SLO Drinks Ltd)
  - 7 x 50 gram (ACBS) - NHS indicative price = £5.88

**Thick and Easy®**
- For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive. POWDER/MODIFIED MAIZE STARCH
- Thick & Easy powder (Fresenius Kabi Ltd)
  - 225 gram (ACBS) - NHS indicative price = £5.41 | 4540 gram (ACBS) - NHS indicative price = £94.02
- Thick & Easy powder 9g sachets (Fresenius Kabi Ltd)
  - 100 sachet (ACBS) - NHS indicative price = £34.25

**Thicken Aid®**
- For thickening of foods in dysphagia. Not suitable for children under 1 year. POWDER, modified maize starch, maltodextrin, gluten- and lactose-free.
- Thicken Aid powder (M & A Pharmachem Ltd)
  - 35 gram (ACBS) - NHS indicative price = £3.71
- Thicken Aid powder 9g sachets (M & A Pharmachem Ltd)
  - 100 sachet (ACBS) - NHS indicative price = £22.40

**Thixo-D®**
- For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive. POWDER, modified maize starch, glucan-free.
- Thixo-D powder (Sutherland Health Ltd)
  - 375 gram (ACBS) - NHS indicative price = £8.10
- Thixo-D Cal-Free powder (Sutherland Health Ltd)
  - 50 gram - NHS indicative price = £3.00

Flavouring preparations

**FlavourPac®**
- For use with Vitaﬂo’s range of unflavoured protein substitutes for metabolic diseases; not suitable for child under 3 years. POWDER
- FlavourPac oral powder 4g sachets blackcurrant (Vitaﬂo International Ltd)
  - 30 sachet (ACBS) - NHS indicative price = £15.14
- FlavourPac oral powder 4g sachets lemon (Vitaﬂo International Ltd)
  - 30 sachet (ACBS) - NHS indicative price = £15.14
Foods for special diets

Gluten-free foods

ACBS indications: established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

- Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements. POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (352 kcal)/100 g. To flavour unflavoured products, see Modjul Flavour System p. 1082.

XLYS TRY Glutaridon powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £201.74

Glycogen storage disease

Corn flour and corn starch
- For glycogen storage disease

Glycosade®
- A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years. POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 20.0 mg, energy 803 kJ (192 kcal)/60 g.

Glycosade oral powder 60g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £122.64

Homocystinuria or hypermethioninaemia

HCU Anamix® Infant
- Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides...
HCU Anaxim Infant powder (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £42.17

HCU cooler® 15
- A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria.
LIQUID, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 593 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.

HCU orange cooler 15 liquid (Vitaflo International Ltd) 150 ml (ACBS) - NHS indicative price = £12.31

HCU Express® 15
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 5.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

HCU express 15 oral powder 25g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £362.37

HCU Express® 20
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/54 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

HCU express 20 oral powder 34g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £468.17

HCU gel®
- A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria.
POWDER, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.5 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

HCU gel oral powder 24g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £233.29

HCU Lophex® LQ 20
- Nutritional supplement for the dietary management of homocystinuria in children over 5 years.
LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 6.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

HCU Lophex® LQ 20 liquid (Nutricia Ltd) 125 ml (ACBS) - NHS indicative price = £17.39

HCU LV®
- Nutritional supplement for the dietary management of hypermethioninemia or vitamin B6 non-responsive homocystinuria in children over 8 years.
POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements. To flavour unflavoured products, see Modjul Flavour System p. 1082.

HCU-LV oral powder 27.8g sachets tropical (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £534.80

HCU-LV oral powder 27.8g sachets unflavoured (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £534.80

XMET Homidon®
- Nutritional supplement for the dietary management of hypermethioninemia or homocystinuria in children and adults.
POWDER, protein equivalent (essential and non-essential amino acids, except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour unflavoured products, see Modjul Flavour System p. 1082.

Hyperlysinaemia

HYPER LYS Anamix® Infant
- Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

HYPER LYS Anamix Infant powder (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £42.17

Isovaleric acidemia

IVA Anamix® Infant
- Nutritional supplement for the dietary management of proven isovaleric acidemia or other proven disorders of leucine metabolism in children from birth to 5 years.
POWDER, protein equivalent (essential and non-essential amino acids except leucine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

IVA Anamix Infant powder (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £42.17

Maple syrup urine disease

MSUD Aid III®
- Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids.
POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour unflavoured products, see Modjul Flavour System p. 1082.

MSUD Aid III powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £201.74

MSUD Anamix® Infant
- Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
Nutritional supplements for metabolic diseases

**MSUD Anamix Infant powder** (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £42.17

**MSUD Anamix** Junior
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.
  - POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 11.5 g, fat 4.5 g, energy 566 kJ (135 kcal)/35 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see Modulj Flavour System p. 1082.

**MSUD Anamix Junior oral powder** 36g sachets (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £225.52

**MSUD Anamix** Junior LQ
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.
  - LIQUID, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 15 g, carbohydrate 8.8 g, fat 4.8 g, fibre 510 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

**MSUD Anamix Junior LQ liquid** (Nutricia Ltd)
125 mL (ACBS) - NHS indicative price = £9.78

**MSUD Anamix** Junior LQ 15
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults.
  - LIQUID, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 395 kJ (92 kcal)/150 mL pouch, with vitamins, minerals, and trace elements.

**MSUD orange cooler** 15 liquid (Vitaflor International Ltd)
150 mL (ACBS) - NHS indicative price = £12.31

**MSUD red cooler** 15 liquid (Vitaflor International Ltd)
150 mL (ACBS) - NHS indicative price = £12.31

**MSUD express** 15
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.
  - POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

**MSUD express 15 oral powder** 25g sachets (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £62.37

**MSUD express 20**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.
  - POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/54 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

**MSUD express 20 oral powder** 34g sachets (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £46.17

**MSUD Gel**
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.
  - POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 10 g, carbohydrate 10.5 g, fat less than 100 mg, energy 337 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

**MSUD gel 24g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £236.03

**MSUD Lophlex** LQ 20
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 5 years.
  - LIQUID, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

**MSUD Lophlex LQ 20 liquid** (Nutricia Ltd)
125 ml (ACBS) - NHS indicative price = £17.39

**MSUD Maxamum**
- Nutritional supplement for the dietary management of maple syrup urine disease.
  - POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see Modulj Flavour System p. 1082.

Maxamum products are generally intended for use in children over 5 years.

**MSUD Maxamum powder orange** (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £170.70

**MSUD Maxamum powder unflavoured** (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £170.70

**Methylmalonic or propionic acidaemia**

**MMA/PA Anamix** Infant
- Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 5 years.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**MMA / PA Anamix infant powder** (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £42.17

**XMTVI Asadon**
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1586 kJ (326 kcal)/100 g. To flavour unflavoured products, see Modulj Flavour System p. 1082.

**XMTVI Asadon powder** (Nutricia Ltd)
200 gram (ACBS) - NHS indicative price = £80.69

**MMA/PA Maxamum**
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see Modulj Flavour System p. 1082. Maxamum products are generally intended for use in children over 8 years.

**MMA / PA Maxamum powder** (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £170.70

**Other inborn errors of metabolism**

**Cystine500**
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from 3 years.
  - POWDER, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 64 kJ (15 kcal)/4 g.

**Cystine500 oral powder sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £9.28

**DocOmega**
- Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.
  - POWDER, protein (cows' milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals.
DocOmega oral powder 4g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £42.90

EAA® Supplement
- Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders in children over 5 years.
  POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.

EAA Supplement oral powder 12.5g sachets (Vitaflo International Ltd)
50 sachet (ACBS) - NHS indicative price = £23.68

Isoleucine50®
- Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
  POWDER, isoleucine 50 mg, carbohydrate 5.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Isoleucine50 oral powder 4g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £9.28

KeyOmega®
- Nutritional supplement for the dietary management of inborn errors of metabolism.
  POWDER, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kcal (19 kcal)/4 g

KeyOmega oral powder 4g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £43.87

Leucine100®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
  POWDER, leucine 100 mg, carbohydrate 5.7 g, fat nil, energy 63.5 kJ (15 kcal)/4 g

Leucine100 oral powder sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £9.28

Low protein drink
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.
  POWDER, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose.
  Termed Milupa® lp-drink by manufacturer.

Milupa LP drink (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £10.00

Phenylalanine50®
- Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.
  POWDER, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63.5 kJ (15 kcal)/4 g

Phenylalanine50 oral powder sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £57.56

ProZero®
- A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.
  LIQUID, carbohydrate 8.1 g (of which sugars 3.5 g, fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

ProZero liquid (Vitaflo International Ltd)
250 ml (ACBS) - NHS indicative price = £1.58 | 1000 ml (ACBS) - NHS indicative price = £6.31

Tyrosine100®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
  POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4 g sachet.

Tyrosine100 oral powder 4g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £5.42

Valine50®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
  POWDER, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Valine50 oral powder 4g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £59.28

Phenylketonuria

Easiphen®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years.
  LIQUID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

Easiphen liquid (Nutricia Ltd)
250 ml (ACBS) - NHS indicative price = £10.46

L-Tyrosine
- Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations.
  POWDER, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g

L-Tyrosine powder (Nutricia Ltd)
100 gram (ACBS) - NHS indicative price = £23.76

Lophlex®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements.

Lophlex powder 27.8g sachets berry (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £314.10

Lophlex powder 27.8g sachets orange (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £314.10

Lophlex powder 27.8g sachets unflavoured (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £314.10

Loprofin® PKU Drink
- Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults.
  LIQUID, protein (cows’ milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 1650 kJ (40 kcal)/100 mL

Loprofin PKU drink (Nutricia Ltd)
200 ml (ACBS) - NHS indicative price = £0.81

Loprofin® Sno-Pro
- Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism.
  POWDER, protein (cows’ milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose.

Loprofin Sno-PRO drink (Nutricia Ltd)
200 ml (ACBS) - NHS indicative price = £1.35

Phlexy-10® Exchange System
- Nutritional supplement for the dietary management of phenylketonuria.
  CAPSULES, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule.

Phlexy-10® 500mg capsules (Nutricia Ltd)
200 capsule (ACBS) - NHS indicative price = £47.03

TABLETS, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet.

Phlexy-10 tablets (Nutricia Ltd)
75 tablet (ACBS) - NHS indicative price = £30.24
Nutritional supplement for the dietary supplement of proven phenylketonuria (PKU) in children over 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 18 g, carbohydrate 8.2 g, energy 1307 kJ (311 kcal)/130 mL pouch, with vitamins, minerals, and trace elements.

PKU Anamix Junior QO liquid berry (Nutricia Ltd) 125 ml (ACBS) - NHS indicative price = £6.08
PKU Anamix Junior QO liquid orange (Nutricia Ltd) 125 ml (ACBS) - NHS indicative price = £6.08
PKU cooler10
- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.9 g, energy 386 kJ (92 kcal)/130 mL pouch, with vitamins, minerals, and trace elements.

PKU orange cooler 10 liquid (Vitaflo International Ltd) 87 ml (ACBS) - NHS indicative price = £5.01
PKU purple cooler 10 liquid (Vitaflo International Ltd) 87 ml (ACBS) - NHS indicative price = £5.01

500 gram (ACBS) - NHS indicative price = £97.44

Tyrosinaemia
Methionine-free TYR Anamix ™ Infant
Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

TYR Anamix Infant methionine free powder (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £42.17

TYR Anamix ™ Infant
Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
Nutritional supplements for the dietary management of tyrosinaemia in children 1–10 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (115 kcal)/29-g sachet, with vitamins, minerals, and trace elements.

TYR Anamix Junior oral powder 20 g sachets (Nutricia Ltd)
15 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour unflavoured products, see FlavourPac p. 1081.

TYR Lophlex ® LQ 20
» Nutritional supplement for the dietary management of tyrosinaemia in children over 4 years and adults, including pregnant women (in conjunction with standard folic acid supplementation).
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

TYR Lophlex LQ 20 liquid (Nutricia Ltd)
125 ml (ACBS) - NHS indicative price = £17.39

XPHEN TYR Tyrosidon ®
» Nutritional supplement for the management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour unflavoured products, see Modjul Flavour System p. 1082.

XPHEN TYR Tyrosidon Free AA Mix powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £201.74

XPTM Tyrosidon ®
» Nutritional supplement for the dietary management of tyrosinaemia type I in children and adults where plasma-methionine concentrations are above normal.
POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour unflavoured products, see Modjul Flavour System p. 1082.

XPTM Tyrosidon powder (Nutricia Ltd)
500 gram - NHS indicative price = £91.31

TYR Anamix Infant methionine free powder (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £42.17

TYR Anamix Infant powder (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £42.17

TYR Anamix ® Junior
» Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 510 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals, and trace elements.

TYR Anamix Junior oral powder 20 g sachets (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £206.40

TYR Anamix ® Junior LQ
» Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults.
LIQUID, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 593 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.

TYR Anamix Junior LQ liquid (Nutricia Ltd)
125 ml (ACBS) - NHS indicative price = £9.78

TYR cooler ® 15
» Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years.
LIQUID, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 353 kJ (86 kcal)/92 mL, with vitamins, minerals, and trace elements.

TYR orange cooler 15 liquid (Vitaflo International Ltd)
130 ml (ACBS) - NHS indicative price = £12.31

TYR red cooler 10 liquid (Vitaflo International Ltd)
87 ml (ACBS) - NHS indicative price = £7.80

TYR red cooler 15 liquid (Vitaflo International Ltd)
130 ml (ACBS) - NHS indicative price = £12.31

TYR red cooler 20 liquid (Vitaflo International Ltd)
174 ml (ACBS) - NHS indicative price = £15.89

TYR express ®
» Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

TYR express 15 oral powder 25 g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £362.37

TYR express 20 ®
» Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

TYR express 20 oral powder 34 g sachets (Vitaflo International Ltd)
50 sachet (ACBS) - NHS indicative price = £468.17

TYR Gel ®
» Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.
GEL, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1081.

TYR gel oral powder 24 g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £233.29
Appendix 3
Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels

Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary. Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discoloration of urine or stools by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs

Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. The advice in patient information leaflets may be less appropriate when the medicine is for a child, particularly for unlicensed medicines or indications. Pharmacists should explain discrepancies to carers, if necessary. The patient information leaflet should only be withheld in exceptional circumstances because it contains other information that should be provided. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown. Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under ‘Dose’ should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed ‘NCL’ (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wording in addition to those directions specified on the prescription. Such labels include ‘Shake the bottle’, ‘For external use only’, and ‘Store in a cool place’, as well as ‘Discard... days after opening’ and ‘Do not use after...’, which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although absent in the BNF for Children these labels should continue to be used when appropriate; indeed, ‘For external use only’ is a legal requirement on external liquid preparations, while ‘Keep out of the reach of children’ is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF for Children apply to medicines dispensed against a prescription. Children and carers should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF for Children does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF for Children will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF for Children 2011–2012, a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 35 no longer apply to any medicines in the BNF for Children and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels

Comprehensive Welsh translations are available for each cautionary and advisory label.

Labels

1 Warning: This medicine may make you sleepy
Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysglyd
To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy, if this happens, do not drive or use tools or machines. Do not drink alcohol
Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysglyd. Peidiwch â gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd. Peidiwch ag yfed alcohol
To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.
In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness. Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor. Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

Rhybudd: Gall y feddygniäeth hon eich gwneud yn gysglyd. Peidiwch â gyrri; defnyddio offer iflaw neu biirianau os wy hyn yn digwedd To be used on preparations containing monoamine oxidase inhibitors; the warning to avoid alcohol and deacoholised (low alcohol) drink is covered by the patient information leaflet. Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol

Rhybudd: Peidiwch ag yfed alcohol To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary. Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

Peidiwch â chymryd meddygniäethau camdureiàd 2 awr cyn neu ar ôl y federdygniäeth hon To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Peidiwch â chymryd meddygniäethau camdureiàd neu federdygniäethau sy’n cynnws haearn neu sinc, 2 awr cyn neu ar ôl y federdygniäeth hon To be used on preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelaite calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Peidiwch â chymryd laeth, meddygniäethau camdureiàd, neu federdygniäeth sy’n cynnws haearn neu sinc, 2 awr cyn neu ar ôl cymryd y federdygniäeth hon

To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelaite calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop this medicine unless your doctor tells you to stop

Rhybudd: Peidiwch â stopio cymryd y federdygniäeth hon, oni bai fod eich meddyg yn dweud wrthych am stopio To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberoulous drugs). Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop

Gadewch yr un fiant o amser rhwng pob dôs yn ystod y dydd. Parhewch i gymryd eich wythnos ar ôl yr ymweliad ychwanegol gyda’r federdygniäeth hon To be used particularly on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

Rhybudd: Darllenwch y wybodaeth ychwanegol gyda’r federdygniäeth hon

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds

Diogelwch eich croen rhag golau’r haul, hyd y byddai o ddiwrnod hyd yn oed ar ddiwrnod— magician. Peidiwch â defnyddio gweñlwyd os yw hi os hyd hwyl i orffen, oni bai eich bod yn cael cynnar i stopio To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

12 Do not take anything containing aspirin while taking this medicine

Peidiwch â chymryd unrhwyth beth sy’n cynnws aspirin gyda’r federdygniäeth hon

To be used on preparations containing sulfapyrazone whose activity is reduced by aspirin.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking

Gadewch i doddi mewn dwr yn ôl ei gymryd

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders,
granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless
Gal y fedydgiaeth hon liwio eich dŵr. Nid yw hyn yn arwydd o ddŵr
To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames
Rhybudd: Fflamadwy. Ar ôl rôi'r fedydgiaeth ymlaen, cadwch yng nglir o dân neu ffîfmau
To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
Rhowch y dabled i dodi dan eich tafod - peidiwch â i’i lyncu. Cadwch y tablidi yng n’hotel yma gyda’r caead wedi’i gau yng dynn. Gofynnwch am dabledi newydd 8 wythnos ar ôl ei hagor
To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

17 Do not take more than... in 24 hours
Peidiwch â chymryd mwy na... mewn 24 awr
To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.

18 Do not take more than... in 24 hours. Also, do not take more than... in any one week
Peidiwch â chymryd mwy na... mewn 24 awr. Hefyd, peidiwch â chymryd mwy na... mewn wythnos
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
Rhybudd: Bydd y fedydgiaeth hon yn eich gwneud yn gysglyd. Os ydych yn dal i deimlo’n gysglyd dramoeth, peidiwch â gyrru, defnyddio oll llaw neu beiriannau. Peidiwch ag yfed alcohol
To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night.

It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’.

21 Take with or just after food, or a meal
Cymerwch gyda neu ar ôl bwyd
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.
Patients should be advised that a small amount of food is sufficient.

22 Take 30 to 60 minutes before food
Cymerwch 30 i 60 munud cyn bwyd
To be used on some preparations whose absorption is thereby improved.
Most oral antibacterials require label 25 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
Cymerwch y fedydgiaeth hon ar stumog wag. Mae hyn yn goglygu awr cyn, neu 2 awr ar ôl bwyd
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
Bydd angen cnoi neu sugno’r fedydgiaeth hon
To be used on preparations that should be sucked or chewed. The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or crush
Llynchych yn gyfan. Peidiwch â chnoi neu falfu’n fân
To be used on preparations that are enteric-coated or designed for modified-release.
Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue
Gadewch i’r fedydgiaeth hon doddi o dan y tafod
To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.

27 Take with a full glass of water
Cymerwch gyda llond gwydr o ddŵr
To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylocellulose). The patient should be advised that ‘a full glass’ means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
Taenwch yn denau ar y croen sydd wedi’i effeithio yn unig
To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
Peidiwch â chymryd mwy na 2 ar unrhyw un adeg. Peidiwch â chymryd mwy nag 8 mewn 24 awr
To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an ‘as required’ basis. The dose form should be specified, e.g. tablets or capsules.

This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
Yn cynnwys paracetamol. Peidiwch â chymryd unrhyw arall sy’n cynnwys paracetamol tra’n chymryd y fedydgiaeth hon. Siaradwch gyda’r meddyg ar unwaith os ydych yn cymryd gormod, hyd yn oed os ydych yn teimlo’n iawn
To be used on all containers of dispensed preparations containing paracetamol.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Yn cynnwys aspirin. Peidiwch â chymryd unrhyw arall sy’n cynnwys aspirin tra’n chymryd y fedydgiaeth hon
To be used on containers of dispensed preparations containing aspirin when the name on the label does not include the word ‘aspirin’.
Dental Practitioners’ Formulary

List of Dental Preparations
The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).
Licensed sugar-free versions, where available, are preferred. Licensed alcohol-free mouthwashes, where available, are preferred.
Aciclovir Oral Suspension, BP
Aciclovir Tablets, BP
Aciclovir Tablets, 200 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Oral Suspension, BP
Artificial Saliva Gel, DPF
Artificial Saliva Oral Spray, DPF
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF
Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):
BioXtra® Gel Mouthspray
BioXtra® Moisturising Gel
Glandosane®
Sialoex®
Artificial Saliva Substitute Spray, DPF
Aspirin Tablets, Dispersible, BP
Azithromycin Capsules, 250 mg, DPF
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Azithromycin Tablets, 250 mg, DPF
Azithromycin Tablets, 500 mg, DPF
Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:
Clenil Modulite®
Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazepine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Tablets, BP, 5 mg/5 mL
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorphenamene Oral Solution, BP
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Oral Solution, BP, 2 mg/5 mL
Diazepam Tablets, BP
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydromephene Tablets, BP, 30 mg
Doxycycline Tablets, Dispersible, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, Gastro-resistant, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP, 5%
Lidocaine Spray 10%, DPF
Loratadine Syrup, 5 mg/5 mL, DPF
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxytetracycline Tablets, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Phenoxybenzepinellenin Oral Solution, BP
Phenoxybenzepinellenin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF

Temazepam Tablets, BP
Tetracycline Tablets, BP
Nurse Prescribers’ Formulary (NPF)

Nurse Prescribers’ Formulary for Community Practitioners

List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP1UCN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations.

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
Aspirin Tablets, Dispersible, 300 mg, BP (max. 96 tablets; max. pack size 32 tablets)
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, ‘Solution G’, NPF
Catheter Maintenance Solution, ‘Solution R’, NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazol Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthramer Capsules, BP
Co-danthramer Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10% Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP
Emollients as listed below: Aquadrate® 10% w/w Cream
Arachis Oil, BP
Balneum® Plus Cream
Cetabren® Emollient Cream
Dermamist®
Diprobase® Cream
Diprobase® Ointment
Doublebase®
Doublebase® Dayleve Gel
E45® Cream
E45® Itch Relief Cream
Emulsifying Ointment, BP
Eucerin® Intensive 10% w/w Urea Treatment Cream
Eucerin® Intensive 10% w/w Urea Treatment Lotion
Hydromol® Cream
Hydromol® Intensive
Hydrous Ointment, BP
Lipobase®
Liquid and White Soft Paraffin Ointment, NPF
Neutrogena® Norwegian Formula Dermatological Cream
Nutraplus® Cream
Oilatum® Cream
Oilatum® junior Cream
Paraffin, White Soft, BP
Paraffin, Yellow Soft, BP
Ultrabase®
Unguentum M®
Emollient Bath and Shower Preparations as listed below: Aqueous Cream, BP
Balneum® (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Balneum Plus® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Cetabren® Emollient Bath Additive
Dermalo® Bath Emollient
Doublebase® Emollient Bath Additive
Doublebase® Emollient Shower Gel
Doublebase® Emollient Wash Gel
Hydromol® Bath and Shower Emollient
Oilatum® Emollient
Oilatum® Gel
Oilatum® Junior Bath Additive
Zerolatum® Emollient Medicinal Bath Oil
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
Ibuprofen Oral Suspension, BP (except for indications and doses that are prescription-only)
Ibuprofen Tablets, BP (except for indications and doses that are prescription-only)
Ispaghula Husk Granules, BP
Ispaghula Husk Granules, Effervescent, BP
Ispaghula Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaïne Ointment, BP
Lidocaïne and Chlorhexidine Gel, BP
Macrograd Oral Liquid, Compound, NPF
Macrograd Oral Powder, Compound, NPF
Macrograd Oral Powder, Compound, Half-strength, NPF
Magnesium Hydroxide Mixture, BP
Magnesium Sulfate Paste, BP
Malathion aqueous lotions containing at least 0.5%
Mebendazole Oral Suspension, BP
Mebendazole Tablets, BP
Methylcellulose Tablets, BP
Miconazole Cream 2%, BP
Miconazole Oromucosal Gel, BP
Mouthwash Solution-tablets, NPF
Nicotine Inhalation Cartridge for Oromucosal Use, NPF
Nicotine Lozenge, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Nasal Spray, NPF
Nicotine Oral Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nystatin Oral Suspension, BP
Olive Oil Ear Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Nurse Prescribers’ Formulary (NPF) 1099

Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tablets)
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets; max. 96 tablets; max. pack size 32 tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Potassium–Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulphate Capsules, NPF
Sodium Picosulphate Elixir, NPF
Spermicidal contraceptives as listed below:
   Gygel © Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Ichtammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Ns.

Appliances (including Contraceptive Devices) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff). (Where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic.)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

Details of NPF preparations

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema
   arachis oil 100%

Catheter Maintenance Solution, Sodium Chloride (proprietary products: OptiFlo S; Uro–Tainer Sodium Chloride; Uniflex–S), sodium chloride 0.9%

Catheter Maintenance Solution, ’Solution G’ (proprietary products: OptiFlo G; Uro–Tainer Suby G; Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, ’Solution R’ (proprietary products: OptiFlo R; Uro–Tainer Solution R; Uriflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions (proprietary products: Chloraprep; Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions (proprietary product: Unisept), chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules (Pom) co-danthramer 25/200 (dantram 25 mg, poloxamer ‘188’ 200 mg)

Co-danthramer Capsules, Strong (Pom) co-danthramer 37.5/500 (dantram 37.5 mg, poloxamer ‘188’ 500 mg)

Co-danthramer Oral Suspension (Pom) (proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantram 25 mg, poloxamer ‘188’ 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong (Pom) (proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantram 75 mg, poloxamer ‘188’ 1 g/5 mL)

Co-danthrusate Oral Suspension (Pom) (proprietary product: Normax), co-danthrusate 50/60 (dantram 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams (proprietary products Contonat Cream, dimeticone ‘350’ 22%; Sigel Barrier Cream, dimeticone ‘1000’ 10%), dimeticone 10–22% Dimeticone Lotion
   (proprietary product: Hedrin), dimeticone 4%

Docusate Enema
   (proprietary product: Norgalax Micro-enna), docusate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment
   liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound
   (proprietary product: Movicol Liquid), macrogol ’3350’ (polyethylene glycol ’3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound
   (proprietary products: Laxido Orange, Molaxole, Movicol), macrogol ’3350’ (polyethylene glycol ’3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet; (amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre)

Macrogol Oral Powder, Compound, Half-strength
   (proprietary product: Movicol-Half), macrogol ’3350’ (polyethylene glycol ’3350’) 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions
   (proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension (Pom) (proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets (Pom) (proprietary products: Ovep, Vermox), mebendazole 100 mg (can be supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or
package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg)

**Mouthwash Solution-tablets**
Consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash.

**Nicotine Inhalation Cartridge for Oromucosal Use**
(Proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 15 mg (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device) or refill pack (42 cartridges with inhalator device))

**Nicotine Lozenges**
Nicotine (as bitartrate) 1 mg or 2 mg (Proprietary products: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (Proprietary products: NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

**Nicotine Medicated Chewing Gum**
(Proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

**Nicotine Nasal Spray**
(Proprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

**Nicotine Oral Spray**
(Proprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

**Nicotine Sublingual Tablets**
(Proprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg (to be prescribed as either a starter pack (2 × 15-tablet discs with dispenser) or refill pack (7 × 15-tablet discs))

**Nicotine Transdermal Patches**
Releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (Proprietary products: Boots NicAssist Patch, Nicorette Patch), or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (Proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (Proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear) (Prescriber should specify the brand to be dispensed)

**Permethrin Cream**
(Proprietary product: Lyclear Dermal Cream), permethrin 5%

**Senna Oral Solution**
(Proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

**Senna and Ispaghula Granules**
(Proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

**Sodium Citrate Compound Enema**
(Proprietary products: Micolette Micro-enema; Micralax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

**Sodium Picosulfate Capsules**
(Proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg

**Sodium Picosulfate Elixir**
(Proprietary product: Dulcolax Liquid), sodium picosulfate 5 mg/5 mL

**Sterculia Granules**
(Proprietary product: Normacol Granules), sterculia 62%

**Sterculia and Frangula Granules**
(Proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

**Zinc Oxide and Dimeticone Spray**
(Proprietary product: Sprilon), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

**Zinc Oxide Impregnated Medicated Bandage**
(Proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

**Zinc Oxide Impregnated Medicated Stocking**
(Proprietary product: Zipzac), sterile rayon stocking impregnated with ointment containing zinc oxide 20%
Non-medical prescribing

Overview
A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

In order to protect patient safety, the initial prescribing and supply of medicines prescribed should normally remain separate functions performed by separate healthcare professionals.

Nurses
Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition. Unlicensed medicines are excluded from the Nurse Prescribing Formulary in Scotland.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to dihydrocodeine tartrate p. 285, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers’ Formulary (NPF) p. 1098 for Community Practitioners provides information on prescribing.

Physiotherapists
Physiotherapist Independent Prescribers can prescribe any medicine for any medical condition. This includes “off-label” medicines subject to accepted clinical good practice. They are also allowed to prescribe the following Controlled Drugs: oral or injectable morphine p. 299, transdermal fentanyl p. 286 and oral diazepam p. 226, dihydrocodeine tartrate p. 285, lorazepam p. 228, oxycodone hydrochloride p. 292 or temazepam p. 847.

Physiotherapist Independent Prescribers must work within their own level of professional competence and expertise.

Therapeutic radiographers
Therapeutic Radiographer Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Therapeutic Radiographer Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists
Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Podiatrists
Podiatrist Independent Prescribers can prescribe any medicine for any medical condition. This includes “off-label” medicines subject to accepted clinical good practice. They are also allowed to prescribe the following Controlled Drugs for oral administration: diazepam p. 226, dihydrocodeine tartrate p. 285, lorazepam p. 228 and temazepam p. 847.

Podiatrist Independent Prescribers must work within their own level of professional competence and expertise.

Further Information
For further details about the different types of prescribers, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).
## Index of manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on ‘special-order’ manufacturers and specialist importing companies see ‘Special-order manufacturers’.

Special-order manufacturers

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdsike.

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

REPORT OF SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNFC or www.mhra.gov.uk/yellowcard for guidance. Do not be put off reporting because some details are not known.

**PATIENT DETAILS**
Patient Initials: ___________  Sex: M / F  Is the patient pregnant? Y / N  Ethnicity: ___________
Age (at time of reaction): ___________  Weight (kg): ___________  Identification number (e.g. Practice or Hospital Ref): ___________

**SUSPECTED DRUG(S)/VACCINE(S)**
<table>
<thead>
<tr>

Date reaction(s) started: ___________  Date reaction(s) stopped: ___________

Do you consider the reactions to be serious?  Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- [ ] Patient died due to reaction
- [ ] Involved or prolonged inpatient hospitalisation
- [ ] Life threatening
- [ ] Involved persistent or significant disability or incapacity
- [ ] Congenital abnormality
- [ ] Medically significant; please give details: ___________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- [ ] Mild
- [ ] Unpleasant, but did not affect everyday activities
- [ ] Bad enough to affect everyday activities
It’s easy to report online: www.mhra.gov.uk/yellowcard

OTHER DRUG(S) (including self-medication and complementary remedies)
Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

<table>

Newborn Life Support

(Antenatal counselling)
Team briefing and equipment check

Birth

Dry the baby
Maintain normal temperature
Start the clock or note the time

Assess (tone), breathing, heart rate

If gasping or not breathing:
Open the airway
Give 5 inflation breaths
Consider SpO₂ ± ECG monitoring

Re-assess
If no increase in heart rate look for chest movement
during inflation

If chest not moving:
Re-check head position
Consider 2-person airway control and other
airway manoeuvres
Repeat inflation breaths
SpO₂ ± ECG monitoring
Look for a response

If no increase in heart rate look for chest
movement

When the chest is moving:
If heart rate is not detectable or very slow
(< 60 min⁻¹) start chest compressions:
coordinate with ventilation breaths (ratio 3:1)

Re-assess heart rate every 30 seconds
If heart rate is not detectable or very slow
(< 60 min⁻¹) consider venous access and drugs

Update parents and debrief team

Acceptable pre-ductal SpO₂
2 min 60%
3 min 70%
4 min 80%
5 min 85%
10 min 90%

Increase oxygen
guided by current if available

AT
ALL
TIMES
ASK:
DO
YOU
NEED
HELP?

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015
Paediatric Basic Life Support
(Healthcare professionals with a duty to respond)

Unresponsive

Shout for help

Open airway

Not breathing normally

5 Rescue breaths

No signs of life

15 Chest compressions

2 Rescue breaths
15 Chest compressions

Call resuscitation team
(1 min CPR first, if alone)

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015
Paediatric Advanced Life Support

Resuscitation Council (UK) 2015

Unresponsive
Not breathing or only occasional gasps

Call resuscitation team
(1 min CPR first, if alone)

CPR
(5 initial breaths then 15:2)
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Return of spontaneous circulation

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Controlled oxygenation and ventilation
- Investigations
- Treat precipitating cause
- Temperature control

Non-shockable (PEA/Asystole)

Immediately resume CPR for 2 min
Minimise interruptions

Shockable (VF/Pulseless VT)

1 Shock
4 J kg⁻¹

Immediately resume CPR for 2 min
Minimise interruptions

During CPR
- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Vascular access (intravenous, intracessous)
- Give adrenaline every 3-6 min
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Correct reversible causes
- Consider amiodarone after 3 and 5 shocks

Reversible Causes
- Hypoxia
- Hypovolaemia
- Hyper/hypokalaemia, metabolic
- Hypothermia
- Thrombosis (coronary or pulmonary)
- Tension pneumothorax
- Tamponade (cardiac)
- Toxic/therapeutic disturbances

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015

**Note**: Height is not required to estimate body surface using these tables

Medical emergencies in the community

Overview
Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the child’s condition requires investigation and further treatment, the child should be transferred to hospital promptly.

Asthma: acute

ECL PLUS

OR

Either

Saltbutamol aerosol inhaler p. 158

(100 micrograms/metered inhalation)

By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)

» Child: 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary

Salbutamol nebuliser solution (1 mg/ml, 2 mg/ml)

By inhalation of nebulised solution (via oxygen-driven nebuliser if available)

» Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary

» Child 5–11 years: 2.5–5 mg every 20–30 minutes or as necessary

» Child 12–17 years: 5 mg every 20–30 minutes or as necessary

Or

Terbutaline sulfate nebuliser solution p. 160 (2.5 mg/ml)

By inhalation of nebulised solution (via oxygen-driven nebuliser if available)

» Child 4 years and below: 5 mg every 20–30 minutes or as necessary

» Child 5–11 years: 5–10 mg every 20–30 minutes or as necessary

» Child 12–17 years: 10 mg every 20–30 minutes or as necessary

Plus (in all cases)

Either

Prednisolone tablets p. 458 (or prednisolone soluble tablets) (5 mg)

By mouth

» Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily

» Child 12–17 years: 40–50 mg once daily for at least 5 days

Or

Hydrocortisone p. 456 (preferably as sodium succinate)

By intravenous injection

» Child 17 years and below: 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:

» Child 1 year and below: 25 mg

» Child 2–4 years: 50 mg

» Child 5–17 years: 100 mg

High-flow oxygen should be given if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat nebulised beta2 agonist (as above) and give with

Ipratropium bromide nebuliser solution p. 155

(250 micrograms/ml)

By inhalation of nebulised solution (via oxygen-driven nebuliser if available)

» Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary

» Child 12–17 years: 500 micrograms every 4–6 hours as necessary

Or

Dexamethasone oral solution p. 455 (2 mg/5 ml)

By mouth

» Child 1 month–2 years: 150 micrograms/kg as a single dose

Anaphylaxis

Anaphylaxis

Adrenaline/epinephrine injection p. 138 (1 mg/ml (1 in 1000))

By intramuscular injection

» Child 5 years and below: 150 micrograms (0.15 ml), repeated every 5 minutes if necessary

» Child 6–11 years: 300 micrograms (0.3 ml), repeated every 5 minutes if necessary

» Child 12–17 years: 500 micrograms (0.5 ml), repeated every 5 minutes if necessary; 300 micrograms (0.3 ml) should be given if child is small or prepubertal

High-flow oxygen and intravenous fluids should be given as soon as available.

Chlorphenamine maleate injection p. 180

By intramuscular or intravenous injection

May help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate)

By intravenous injection

Has delayed action but should be given to severely affected patients to prevent further deterioration.

Bacterial disease

Meningococcal disease

Benzylenicillin sodium injection p. 349 (600 mg, 1.2 g)

By intravenous injection (or by intramuscular injection if venous access not available)

» Neonate: 300 mg

» Child 1 month–11 months: 300 mg

» Child 1–9 years: 600 mg

» Child 10–17 years: 1.2 g

Note A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

Or

If history of allergy to penicillin

Cefotaxime injection p. 330 (1 g)

By intravenous injection (or by intramuscular injection if venous access not available)

» Neonate: 50 mg/kg

» Child 1 month–11 years: 50 mg/kg (max. 1 g)

» Child 12–17 years: 1 g

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
OR if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

Chloramphenicol injection p. 368 (1 g)
BY INTRAVENOUS INJECTION
» Child 1 month-17 years: 12.5–25 mg/kg
NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer. See also Central nervous system infections, antibacterial therapy p. 314.

Hypoglycaemia

DIABETIC HYPOGLYCAEMIA
Glucose or sucrose
BY MOUTH
» Child over 2 years: approx. 10–20 g (110–220 mL)
  Lucozade® Energy Original or 100–200 mL
  Coca-Cola® — both non-diet versions or
  2–4 teaspoonfuls of sugar or 3–6 sugar lumps
  repeated after 10–15 minutes if necessary

OR if hypoglycaemia unresponsive or if oral route cannot be used

Glucagon injection p. 482 (1 mg/mL)
BY SUBCUTANEOUS OR INTRAMUSCULAR INJECTION
» Child body-weight up to 25 kg: 500 micrograms (0.5 mL)
» Child body-weight 25 kg and over: 1 mg (1 mL)

OR if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

Glucose intravenous infusion p. 611 (10%)
BY INTRAVENOUS INJECTION INTO LARGE VEIN
» Child 1 month-17 years: 5 mL/kg (glucose 500 mg/kg)

Seizures

CONVULSIVE (INCLUDING FEBRILE) SEIZURES last longer than 5 minutes

EITHER Diazepam rectal solution p. 226 (2 mg/mL, 4 mg/mL)
BY RECTUM
» Neonate: 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
» Child 1 month-1 year: 5 mg, repeated once after 10–15 minutes if necessary
» Child 2–11 years: 5–10 mg, repeated once after 10–15 minutes if necessary
» Child 12–17 years: 10–20 mg, repeated once after 10–15 minutes if necessary

OR Midazolam oromucosal solution p. 229
BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY
» Neonate: 300 micrograms/kg [unlicensed]
» Child 1–2 months: 300 micrograms/kg (max. 2.5 mg)
  [unlicensed]
» Child 3 months–11 months: 2.5 mg
» Child 1–4 years: 5 mg
» Child 5–9 years: 7.5 mg
» Child 10–17 years: 10 mg
### Approximate Conversions and Units

</tbody>
</table>

#### Length

- 1 metre (m) = 1000 millimetres (mm)
- 1 centimetre (cm) = 10 mm
- 1 inch (in) = 25.4 mm
- 1 foot (ft) = 12 inches
- 12 inches = 304.8 mm

#### Mass

- 1 kilogram (kg) = 1000 grams (g)
- 1 gram (g) = 1000 milligrams (mg)
- 1 milligram (mg) = 1000 micrograms
- 1 microgram = 1000 nanograms
- 1 nanogram = 1000 picograms

#### Volume

- 1 litre = 1000 millilitres (mL)
- 1 millilitre (1 mL) = 1000 microlitres
- 1 pint = 568 mL

#### Other units

- 1 kilocalorie (kcal) = 4186.8 joules (J)
- 1000 kilocalories (kcal) = 1.1668 megajoules (MJ)
- 1 megajoule (MJ) = 238.8 kilocalories (kcal)
- 1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)

#### Plasma-drug concentrations

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

#### Prescribing for children: weight, height, and gender

The table below shows the mean values for weight, height and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of actual measurements. However, the child’s actual weight and height might vary considerably from the values in the table and it is important to see the child to ensure that the value chosen is appropriate. In most cases the child’s actual measurement should be obtained as soon as possible and the dose recalculated.

Recommended wording of cautionary and advisory labels

For details including Welsh language translation, please see Appendix 3.

1. Warning: This medicine may make you sleepy.
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol.
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines.
4. Warning: Do not drink alcohol.
5. Do not take indigestion remedies 2 hours before or after you take this medicine.
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop.
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop.
10. Warning: Read the additional information given with this medicine.
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds.
12. Do not take anything containing aspirin while taking this medicine.
13. Dissolve or mix with water before taking.
14. This medicine may colour your urine. This is harmless.
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine.
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening.
17. Do not take more than... in 24 hours.
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week.
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol.
20. Take with or just after food, or a meal.
21. Take 30 to 60 minutes before food.
22. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food.
23. Suck or chew this medicine.
24. Swallow this medicine whole. Do not chew or crush.
25. Dissolve this medicine under your tongue.
26. Take with a full glass of water.
27. Spread thinly on the affected skin only.
28. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours.
29. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well.
30. Contains aspirin. Do not take anything else containing aspirin while taking this medicine.

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c. = ante cibum (before food)
b. d. = bis die (twice-daily)
o. d. = omni die (every day)
o. m. = omni mane (every morning)
o. n. = omni nocte (every night)
p. c. = post cibum (after food)
p. r. n. = pro re nata (when required)
q. d. s. = quater die sumendum (to be taken four times daily)
q. q. h. = quarta quaque hora (every four hours)
stat = immediately
i. d. = ter die sumendum (to be taken three times daily)

t.i.d. = ter in die (three daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102 Tartrazine
E104 Quinoline Yellow
E110 Sunset Yellow FCF
E123 Amaranth
E124 Ponceau 4R
E127 Erythrosine BS
E132 Indigo Carmine
E142 Green S
E171 Titanium Dioxide
E172 Iron oxides, iron hydroxides
E200 Sorbic Acid
E211 Sodium Benzoate
E223 Sodium Metabisulphite
E320 Butylated Hydroxyanisole
E321 Butylated Hydroxytoluene
E322 Lecithins
E420 Sorbitol
E421 Mannitol
E422 Glycerol
E901 Beeswax (white and yellow)
E1520 Propylene Glycol
