*If symptoms continue to persist or worsen after antibiotic treatment, patients should be assessed for possible alternative causes, re-infection with Lyme disease, treatment failure or non-adherence to previous antibiotic treatment, or progression to organ damage caused by Lyme disease (such as nerve palsy).*

A second course of antibiotic treatment should be given to patients presenting with signs and symptoms of re-infection. In patients presenting with ongoing symptoms due to possible treatment failure, treatment with an alternative antibacterial drug should be considered. A third course of antibacterial treatment is not recommended, and
further management should be discussed with a national reference laboratory or suitable specialist depending on symptoms (for example, a rheumatologist or neurologist).

Useful Resources

1.3 Methicillin-resistant staphylococcus aureus

MRSA

Management
Infection from Staphylococcus aureus strains resistant to methicillin [now discontinued] (methicillin-resistant Staph. aureus, MRSA) and to flucloxacillin p. 357 can be difficult to manage. Treatment is guided by the sensitivity of the infected strain.

Rifampicin p. 379 or fusidic acid p. 371 should not be used alone because resistance may develop rapidly. Clindamycin p. 337 alone or a combination of rifampicin and fusidic acid can be used for skin and soft-tissue infections caused by MRSA; a tetracycline is an alternative in children over 12 years of age. A glycopeptide (e.g. vancomycin p. 335) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Linezolid p. 372 should be reserved for skin and soft-tissue infections that have not responded to other antibiotics or for children who cannot tolerate other antibiotics.

A glycopeptide can be used for pneumonia associated with MRSA. Linezolid should be reserved for hospital-acquired pneumonia that has not responded to other antibiotics or for children who cannot tolerate other antibiotics.

Trimethoprim p. 373 or nitrofurantoin p. 384 can be used for urinary-tract infections caused by MRSA; a tetracycline is an alternative in children over 12 years of age. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibiotics.

A glycopeptide can be used for septicaemia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 334 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. See eradication of nasal carriage of MRSA in Nose p. 748.

1.4 Tuberculosis

Tuberculosis

Treatment phases, overview
Active tuberculosis is treated in two phases—an initial phase using four drugs and a continuation phase using two drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success. Treatment needs to be carefully monitored in families in whom concordance may be problematic.

Initial phase
The concurrent use of four drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as fixed dose combination preparations unless the child is unable to swallow the tablets or one of the components cannot be given because of resistance, intolerance or an inappropriate dose combination. The treatment of choice for the initial phase is the daily use of rifampicin p. 379, ethambutol hydrochloride p. 381, pyrazinamide p. 383 and isoniazid p. 382 (with pyridoxine hydrochloride p. 650 for prophylaxis of isoniazid-induced neuropathy); modified according to drug susceptibility testing. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for two months. Where a positive culture for M. tuberculosis has been obtained, but susceptibility results are not available after two months, treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) should be continued until full susceptibility is confirmed, even if this is for longer than two months. Streptomycin p. 323 is rarely used in the UK although it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced and ethambutol hydrochloride is contra-indicated, or when patients cannot tolerate standard treatment.

Continuation phase
After the initial phase, daily treatment is continued for a further 4 months with rifampicin and isoniazid (preferably given as a combination preparation) with pyridoxine hydrochloride. Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment
The unsupervised treatment regimen should be used for children who are likely to take antituberculosis drugs reliably without supervision by a healthcare worker. Children and families who are unable or unlikely to comply with daily administration of therapy should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding
The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.
### Recommended dosage for standard unsupervised 6-month treatment

<table>
<thead>
<tr>
<th>Medicine</th>
<th>Child:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Isoniazid</td>
<td>10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)</td>
</tr>
<tr>
<td>Rifampicin</td>
<td></td>
</tr>
<tr>
<td>50 kg and above 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day; 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day</td>
<td></td>
</tr>
<tr>
<td>Pyrazinamide</td>
<td></td>
</tr>
<tr>
<td>50 kg and above 15 mg/kg once daily for 6 months (initial phase); maximum 1.5 g per day; 15 mg/kg once daily for 6 months (initial phase); maximum 2 g per day</td>
<td></td>
</tr>
<tr>
<td>Ethambutol hydrochloride</td>
<td>20 mg/kg once daily for 2 months (initial phase)</td>
</tr>
</tbody>
</table>

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (Rifater®, Rifinah®) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

### Recommended dosage for intermittent supervised 6-month treatment

<table>
<thead>
<tr>
<th>Medicine</th>
<th>Child:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Isoniazid</td>
<td>15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</td>

<td></td>
</tr>
<tr>
<td>50 kg and above 15 mg/kg once daily for 6 months (initial phase); maximum 1.5 g per day; 15 mg/kg once daily for 6 months (initial phase); maximum 2 g per day</td>
<td></td>
</tr>
<tr>
<td>Ethambutol hydrochloride</td>
<td>30 mg/kg 3 times a week for 2 months (initial phase)</td>
</tr>
</tbody>
</table>

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (Rifater®, Rifinah®) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

**Neonates**

Congenital tuberculosis is acquired from maternal extrapulmonary sites at birth, particularly the genital tract; if infection is suspected, the baby will require treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride). This regimen is used for 2 months during the initial phase of treatment. After the initial phase, rifampicin and isoniazid with pyridoxine hydrochloride is continued for a further 4 months.

**Supervised treatment**

Drug administration should be fully supervised by a healthcare worker (directly observed therapy, DOT) in children or families who cannot comply reliably with the treatment regimen. If daily directly observed therapy is not possible, a supervised dosing schedule of three times a week should be considered. Regimens with a dosing schedule of fewer than three times a week should not be used.

Directly observed therapy should be offered to children or to children whose carers:
- have a history of non-adherence;
- have previously been treated for tuberculosis;
- are in denial of the tuberculosis diagnosis;
- have multidrug-resistant tuberculosis;
- have a major psychiatric or cognitive disorder;
- have a history of homelessness, drug or alcohol misuse;
- are in prison, or have been in the past 5 years;
- are too ill to self-administer treatment;
- request directly observed therapy.

Advice and support should be offered to these children and their carers to assist with treatment completion.

**Immunocompromised patients**

Multi-resistant Mycobacterium tuberculosis may be present in immunocompromised children. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed M. tuberculosis infection sensitive to first-line drugs should be treated with a standard six-month regimen; after completing treatment, children should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a child who is HIV-positive (see also Latent tuberculosis below); care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first two months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Treatment for tuberculosis should not routinely extend beyond 12 months. Infection may also be caused by other mycobacteria e.g. M. avium complex, in which case specialist advice on management is needed.

**Extrapulmonary tuberculosis**

**Central nervous system tuberculosis**

Children with central nervous system tuberculosis should be offered rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) for two months. After completion of the initial treatment phase, rifampicin and isoniazid (with pyridoxine hydrochloride) should be continued for a further 10 months. Treatment for tuberculosis meningitis should be offered if clinical signs and laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.
An initial high dose dexamethasone p. 455 or prednisolone p. 458 should be started at the same time as antituberculosis therapy and then slowly withdrawn over 4–8 weeks.

Referral for surgery should be considered only in children who have raised intracranial pressure.

**Pericardial tuberculosis**
An initial high dose of oral prednisolone should be offered to children with active pericardial tuberculosis at the same time as initiation of antituberculosis therapy; it should then be slowly withdrawn over 2–3 weeks.

**Latent tuberculosis**
Clinicians should be aware that some groups of children with latent tuberculosis are at increased risk of developing active tuberculosis (such as children who are HIV-positive, diabetic or receiving treatment with a tumour necrosis factor alpha inhibitor). These children and their carers should be advised of the risks and symptoms of active tuberculosis.

**Close contacts**
All children who are a close contact (prolonged, frequent or intense contact, e.g. household contacts or relations) of a person with confirmed pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Children under 2 years should be assessed by a specialist.

**Immunocompromised**
Children in whom latent tuberculosis is suspected and who are anticipated to be, or who are currently immunocompromised (for example, if they are from a high incidence country or have been in close contact with people with suspected infectious or confirmed pulmonary or laryngeal tuberculosis), should be referred to a tuberculosis specialist.

**Chemoprophylaxis for latent tuberculosis**
Neonates who have been in close contact with a person with tuberculosis which has not yet been treated for at least two weeks, should be treated with isoniazid p. 382 (with pyridoxine hydrochloride p. 650) followed by a Mantoux test after six weeks of treatment. If the test is positive (and active tuberculosis is not present) treatment should be continued for six months; if negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given.

Children aged 4 weeks to 2 years who have been in close contact with a person with tuberculosis which has not been treated for at least two weeks, should be treated with either isoniazid (with pyridoxine hydrochloride) alone for six months (preferred regimen if interactions with rifamycins are a concern) or rifampicin p. 379 and isoniazid (with pyridoxine hydrochloride) for three months (recommended when hepatotoxicity is a concern); and then have a Mantoux test. If the test is positive (and active tuberculosis is not present), the treatment course should be completed. If the test is negative, treatment should be continued and reassessed after 6 weeks. If the results are then negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given (if the child has not already had one). If the result is positive (and active tuberculosis is not present), the course of treatment should be continued.

Children aged over 2 years should be offered a Mantoux test, and if positive (active tuberculosis is not present), then treated as above for children aged 4 weeks to 2 years. If the test is negative, reassess after 6 weeks.

Testing for hepatitis B and hepatitis C should be considered before starting treatment for tuberculosis as this may affect the choice of therapy. Children with severe liver disease should be treated under the care of a specialist team; careful monitoring of liver function is necessary in children with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs.

See advice on immunisation against tuberculosis and tuberculin testing in BCG vaccine p. 802.

**Treatment failure**
Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the child or their carer. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be specialised by a specialist paediatrician.

**Treatment interruptions**
A break in antituberculosis treatment of at least two weeks (during the initial phase), or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly.

**Treatment interruptions due to drug-induced hepatotoxicity**
Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once hepatic function has recovered, antituberculosis therapy should be sequentially reintroduced at previous full doses over a period of no more than ten days, initially with ethambutol hydrochloride p. 381 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In children with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least two drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 323 (with or without a quinolone, such as levofloxacin p. 700 or moxifloxacin p. 700), and with ongoing monitoring by a liver specialist.

**Treatment interruptions due to cutaneous reactions**
If a child with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least two drugs with a low risk of causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin with monitoring by a dermatologist.

**Antituberculosis drugs**
Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculosis regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculosis regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months (“initial phase”) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20–30% of patients.

Rifabutin p. 378 is licensed in adults for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. There is limited experience in children.

Pyrazinamide p. 383 is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*. 

See advice on immunisation against tuberculosis and tuberculin testing in BCG vaccine p. 802.
Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis

Drug-resistant tuberculosis should be treated by a specialist paediatrician with experience in such cases, and where appropriate facilities for infection-control exist. Multidrug-resistant tuberculosis (resistance to isoniazid and rifampicin, with or without any other resistance) requires treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin and streptomycin, capreomycin, cycloserine (marketed in the UK as Pyrophos), ethionamide (marketed in the UK as Mycomycin), ethambutol (marketed in the UK as Mycobutin), ofloxacin (marketed in the UK as Oxilat, and in the USA as CuragraT), and moxifloxacin (marketed in the USA as vibramycin), etc. Availability of suitable formulations may limit choice in children.

Single drug-resistant tuberculosis

For single drug-resistance the following treatment regimen is recommended:

**Resistance to isoniazid p. 382:**
- First two months (initial phase): rifampicin p. 379, pyrazinamide p. 383 and ethambutol hydrochloride p. 381
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for seven months (up to ten months for extensive disease)

**Resistance to pyrazinamide:**
- First two months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride p. 650)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for seven months

**Resistance to ethambutol hydrochloride:**
- First two months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for four months

**Resistance to rifampicin:**
- Offer treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive.

**ANTIMYCOBACTERIALS > RIFAMYCINS**

**Rifabutin**

- **INDICATIONS AND DOSE**
  
  Prophylaxis of Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count
  - BY MOUTH
    - Child 1 month–11 years: 5 mg/kg once daily (max. per dose 300 mg), also consult product literature
    - Child 12–17 years: 300 mg once daily, also consult product literature

  Treatment of non-tuberculous mycobacterial disease, in combination with other drugs
  - BY MOUTH
    - Child 1 month–11 years: 5 mg/kg once daily for up to 6 months after cultures negative

- **Treatment of pulmonary tuberculosis, in combination with other drugs**
  - BY MOUTH
  - Child 12–17 years: 150–450 mg once daily for at least 6 months

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 624 - discosolurs soft contact lenses
- **INTERACTIONS** > Appendix 1: rifabutin
- **SIDE-EFFECTS** Agranulocytosis - anaemia - arthralgia - bronchospasm - chest pain - corneal deposits - decreased leucocytes - dyspnoea - eosinophilia - fever - haemolysis - hepatic disorders - influenza like illness - myalgia - nausea - neutropenia - pancytopenia - skin reactions - thrombocytopenia - urine discoloration - uveitis (more common following high doses or concomitant use with drugs that increase plasma concentration) - vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifampycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid - no information available.
- **BREAST FEEDING** Manufacturer advises avoid - no information available.
- **HEPATIC IMPAIRMENT**
  
  Dose adjustments Reduce dose in severe impairment.
  Monitoring In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

- **RENAL IMPAIRMENT**
  
  Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  
  Renal function should be checked before treatment.
  Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.

- **BLOOD COUNTS**
  
  Blood counts should be monitored on prolonged therapy.

- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

- **PATIENT AND CARER ADVICE**
  
  Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.
  Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  
  **Capsule**

  CAUTIONARY AND ADVISORY LABELS B, 14
  - **Mycobutin** (Pfizer Ltd)
  - **Rifabutin** 150 mg Mycobutin 150mg capsules | 30 capsule £90.38
Tuberculosis 379

Rifampicin

**INDICATIONS AND DOSE**

- Brucellosis in combination with other antibiotics
- Legionnaires disease in combination with other antibiotics
- Serious staphylococcal infections in combination with other antibiotics
  - BY MOUTH, OR BY INTRAVENOUS INFUSION

  - Neonate: 5–10 mg/kg twice daily.
  - Child 1-11 months: 5–10 mg/kg twice daily
  - Child 1-17 years: 10 mg/kg twice daily (max. per dose 600 mg)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

  - BY MOUTH
  - Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases).

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

  - BY MOUTH
  - Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
  - Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

**Congenital tuberculosis**

  - BY MOUTH

  - Neonate: 15 mg/kg once daily for 6 months (initial and continuation phases).

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid**

  - BY MOUTH
  - Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
  - Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
  - Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 3 months
  - Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 3 months

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant**

  - BY MOUTH
  - Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
  - Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
  - Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 6 months
  - Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 6 months

**Prevention of secondary case of Haemophilus influenzae type b disease**

  - BY MOUTH
  - Neonate: 5 mg/kg every 12 hours for 2 days.
  - Child 1-11 months: 5 mg/kg every 12 hours for 2 days

**Prevention of secondary case of meningococcal meningitis**

  - BY MOUTH

  - Neonate: 5 mg/kg every 12 hours for 2 days.
  - Child 1-11 months: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
  - Child 12-17 years: 600 mg every 12 hours for 2 days

**Pruritus due to cholestasis**

  - BY MOUTH

  - Child: 5–10 mg/kg once daily (max. per dose 600 mg)

**UNLICENSED USE**

- Not licensed for use in children for pruritus due to cholestasis.

**CONTRA-INDICATIONS**

- Acute porphyria p. 624. jaundice
- **CAUTIONS**
  - Discolours soft contact lenses

**INTERACTIONS**

- Appendix 1: rifampicin

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **With intravenous use** Bone pain - gastrointestinal disorder - hyperbilirubinaemia - psychotic disorder
- **With oral use** Psychosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenia purpura, and acute renal failure.
  - Discontinue if serious side-effects develop.

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated in patients with rifampicin hypersensitivity.

**CONCEPTION AND CONTRACEPTION**

- Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

**PREGNANCY**

- Manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

**BREAST FEEDING**

- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution—monitor liver function weekly for two weeks, then every two weeks for the next six weeks.

**Dose adjustments**

- Manufacturer advises maximum 8 mg/kg per day.

**RENAL IMPAIRMENT**

- Use with caution if doses above 10 mg/kg daily.

**MONITORING REQUIREMENTS**

- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- Blood counts should be monitored in patients on prolonged therapy.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Displacement value may be significant, consult local reconstitution guidelines; reconstitute with

**Antimycobacterials** > Other

### Cycloserine

**Indications and Dose**

- **Tuberculosis resistant to first-line drugs, in combination with other drugs**
  - **By mouth**
    - Child 2-11 years: Initially 5 mg/kg twice daily (max. per dose 250 mg), then increased if necessary up to 10 mg/kg twice daily (max. per dose 500 mg), dose to be increased according to blood concentration and response.
    - Child 12-17 years: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response.

**Pharmacokinetics**

- Cycloserine penetrates the CNS.
- **Unlicensed use** Licensed for use in children (age range not specified by manufacturer).
- **Contra-Indications** Alcohol dependence • depression • epilepsy • psychotic states • severe anxiety
- **Interactions** Appendix 1: cycloserine
- **Side-Effects** Behaviour abnormal • coma • confusion • congestive heart failure • drowsiness • dysarthria • headache • hyperirritability • megaloblastic anaemia • memory loss • neurological effects • paraesthesia • paresis • psychosis • rash • reflexes increased • seizures • suicidal ideation • tremor • vertigo

**Side-Effects, Further Information**

- CNS toxicity
  - Discontinue or reduce dose if symptoms of CNS toxicity occur.
- Rashes or allergic dermatitis
  - Discontinue or reduce dose if rashes or allergic dermatitis develop.
- **Pregnancy** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **Breast Feeding** Present in milk—amount too small to be harmful.
- **Renal Impairment**
  - Dose adjustments Increase interval between doses if creatinine clearance less than 50 mL/minute/1.73 m².
  - Monitoring Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute/1.73 m².
- **Monitoring Requirements**
  - Blood concentration should not exceed a peak concentration of 30 mg/litre (measured 3–4 hours after the dose).
  - Monitor haematological, renal, and hepatic function.
- **Medicinal Forms** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Cautionary and Advisory Labels** 2, 8
- Cycloserine (Non-proprietary)
- Cycloserine 250 mg
- 100 capsule pod £442.89 DT = £442.89

### Ethambutol hydrochloride

**Indications and Dose**

- **Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**
  - **By mouth**
  - Child: 30 mg/kg 3 times a week for 2 months (initial phase)

**Prescribing and Dispensing Information**

- The RCPCH and NPPG recommend that, when a liquid special of ethambutol is required, the following strength is used: 400 mg/5 mL.

**Patient and Carer Advice**

- Ocular toxicity: The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.
Isoniazid

INDICATIONS AND DOSE
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)
- By mouth, or by intramuscular injection, or by intravenous injection

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)
- By mouth, or by intramuscular injection, or by intravenous injection

Congenital tuberculosis, in combination with other drugs
- By mouth, or by intramuscular injection, or by intravenous injection

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive
- Initially by mouth, or by intramuscular injection, or by intravenous injection

Neonate: 10 mg/kg daily for 6 months (initial and continuation phases).

Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months (initial and continuation phases) to be taken in combination with rifampicin.

Child 12–17 years: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin.

CONTRA-INDICATIONS
- Drug-induced liver disease
- Caution: Acute porphyrias p. 624; alcohol dependence; diabetes mellitus; epilepsy; history of psychosis; HIV infection; malnutrition; slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION
- Neuralgia Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 650 should be given prophylactically from the start of treatment.

INTERACTIONS
- Appendix 1: isoniazid

SIDE-EFFECTS
- Uncommon Hepatic disorders
- Rare or very rare Severe cutaneous adverse reactions (SCARs)

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS
- Ethambutol hydrochloride (Non-proprietary)
  - Ethambutol hydrochloride 100 mg Ethambutol 100mg tablets
  - 56 tablet £17.00 ST £11.51
  - Ethambutol hydrochloride 400 mg Ethambutol 400mg tablets
  - 56 tablet £42.74 ST £42.74

- Ethambutol 10 mg/kg daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

- Ethambutol 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

- Ethambutol 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

- Ethambutol 30 mg/kg daily for 6 months, alternatively (by mouth) 30 mg/kg daily for 3 months, to be taken in combination with rifampicin

- Ethambutol 361 mg for 6 months.

- Ethambutol 50 mg/ampoule

PRESCRIBING AND DISPENSING INFORMATION
- With oral use in general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The RCPCH and NHG recommend that, when a liquid special of isoniazid is required, the following strength is used: 50 mg/mL.

- Doses may need to be recalculated to allow for weight gain in younger children.

PATIENT AND CARER ADVICE
- Hepatic disorders
- Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

  - 30 tablet £54.99

COMBINATIONS AVAILABLE
- Rifampicin with isoniazid, p. 380
  - Rifampicin with isoniazid and pyrazinamide, p. 380
Pyrazinamide

**INDICATIONS AND DOSE**

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
  - Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
  - Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

- **BY MOUTH**
  - Neonate: 35 mg/kg once daily for 2 months (initial phase).

**CAUTIONS**

- Diabetes

**INTERACTIONS**

- Appendix 1: pyrazinamide

**SIDE-EFFECTS**

- Appetite decreased, arthralgia, dysuria, flushing, gout aggravated, hepatic disorders, malaise, nausea, peptic ulcer aggravated, photosensitivity reaction, sideroblastic anaemia, skin reactions, splenomegaly, vomiting

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST-FEEDING**

Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment, acute hepatic disease and for up to 6 months after occurrence of hepatitis (risk of increased exposure).

**REnal IMPAIRMENT**

Dose adjustments

If estimated glomerular filtration rate less than 30 ml/min/1.73 m², use 25–30 mg/kg 3 times a week.

**MONITORING REQUIREMENTS**

- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

**PREScribing AND DISPensing INFORMATION**

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

The RCPCH and NPG recommend that, when a liquid special of pyrazinamide is required, the following strength is used: 500 mg/5 ml.

**PATIENT AND CARER ADVICE**

Hepatic disorders

Patients or their carers should be told how to recognise signs of liver disorder, and advised to continue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### 1.5 Urinary tract infections

**Urinary-tract infections**

**Description of condition**

Urinary-tract infections are common bacterial infections usually caused by *Escherichia coli*, *Proteus mirabilis*, or *Staphylococcus saprophyticus*. Occasionally, urinary-tract infections can also be caused by *Citrobacter species*, *Serratia marcescens*, *Pseudomonas species*, *Klebsiella aerogenes*, or *Staphylococcus epidermidis*.

The most common urinary-tract infection symptoms in children younger than 3 months are fever, vomiting, lethargy, and irritability. Children older than 3 months usually present with fever with urinary frequency or dysuria.

Lower urinary-tract infections are associated with inflammation of the bladder (cystitis) and urethra (urethritis), whereas upper urinary-tract infections are associated with inflammation of the renal pelvis and the kidneys (pyelonephritis). Urinary-tract infections are considered recurrent after at least two episodes of acute pyelonephritis, three episodes of cystitis or one episode of acute pyelonephritis plus one or more episodes of cystitis.

Urinary-tract infections are more common in girls than boys. The risk of contracting a urinary-tract infection is greater in children with functional and structural abnormalities that may cause urinary retention (e.g. vesicoureteric reflux, genital malformation, dysfunctional elimination syndrome, or constipation). Acute pyelonephritis, especially in children with vesicoureteric reflux, may lead to renal scarring and hypertension.

**Aims of treatment**

The aim of treatment is to relieve symptoms, prevent systemic infection, and to reduce the risk of complications.

**Treatment**

Urinary-tract infections require prompt antibacterial treatment to minimise the risk of complications including renal scarring, hypertension and renal failure.

**Initial treatment for symptomatic bacteriuria should not be delayed while waiting for urine culture results and the antibacterial used should reflect local bacterial sensitivity.**

Urine culture results will determine the subsequent choice of antibacterial therapy.

Children under 3 months of age with a suspected urinary-tract infection and all children with a high risk of serious illness should be referred urgently to paediatric specialist care.

Parenteral antibacterials should be used to treat urinary-tract infections in children under 1 month old who present with a fever or, children 1–3 months old who appear unwell or present with abnormal white blood cell counts. A third-generation cephalosporin (such as cefotaxime p. 330 or ceftriaxone p. 332) should be given in combination with an
antibacterial active against listeria (such as ampicillin p. 353 or amoxicillin p. 351).

Children over 3 months of age with cystitis should receive a 3-day course of oral antibacterial in line with the local formulary which may include trimethoprim p. 373, nitrofurantoin below, a cephalosporin or amoxicillin as options. Children should be reassessed if they are still feeling unwell 24–48 hours after starting treatment.

Children over 3 months of age with acute pyelonephritis should be treated with an oral antibacterial with low resistance patterns such as a cephalosporin or co-amoxiclav p. 354 for 7–10 days and referral to a paediatric specialist should be considered. Alternatively, a broad-spectrum antibacterial such as cefotaxime or ceftriaxone can be administered intravenously for the first 2–4 days followed by an oral antibacterial for a total duration of 10 days. Once-daily dosing is recommended when intravenous aminoglycosides (e.g. gentamicin p. 322, amikacin p. 321) are used in children with urinary-tract infections. If intravenous treatment is indicated but not possible, intramuscular treatment should be considered.

Prevention of recurrence

Children who have had a urinary-tract infection should be encouraged to drink plenty of fluids. Dysfunctional elimination syndromes and constipation should also be addressed. Antibacterial prophylaxis may be considered in children with recurrent symptomatic urinary-tract infections (see Prevention of urinary-tract infection in Antibacterials, use for prophylaxis p. 311). When children develop a urinary-tract infection whilst taking antibacterial prophylaxis, a different antibacterial should be chosen to treat the infection rather than increasing the dose of the antibacterial used for prophylaxis.

ANTIBACTERIALS > OTHER

Nitrofurantoin

- INDICATIONS AND DOSE
  - Acute uncomplicated urinary-tract infections
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
      - Child 12–17 years: 50 mg 4 times a day for 3–7 days
    - BY MOUTH USING MODIFIED-RELEASE MEDICINES
      - Child 12–17 years: 100 mg twice daily, dose to be taken with food
  - Severe chronic recurrent urinary-tract infections
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 12–17 years: 100 mg 4 times a day for 3–7 days
    - Propphylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)
      - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
        - Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
        - Child 12–17 years: 50–100 mg once daily, dose to be taken at night
    - Genito-urinary surgical prophylaxis
      - BY MOUTH USING MODIFIED-RELEASE MEDICINES
        - Child 12–17 years: 100 mg twice daily on day of procedure and for 3 days after surgery.

- CONTRA-INDICATIONS
  - Acute porphyrias p. 624 - G6PD deficiency
  - Infants less than 3 months old

- CAUTIONS
  - Anemia - diabetes mellitus - electrolyte imbalance - folate deficiency - pulmonary disease - susceptibility to peripheral neuropathy - urine may be coloured yellow or brown - vitamin B deficiency

- INTERACTIONS
  - Appendix 1: nitrofurantoin

- SIDE-EFFECTS

- PREGNANCY
  - Avoid at term — may produce neonatal haemolysis.

- BREAST FEEDING
  - Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution.

- RENAL IMPAIRMENT
  - Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract. Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

- MONITORING REQUIREMENTS
  - On long-term therapy, monitor liver function and monitor for pulmonary symptoms (discontinue if deterioration in lung function).

- EFFECT ON LABORATORY TESTS
  - False positive urinary glucose (if tested for reducing substances).

- PATIENT AND CARER ADVICE

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Fungal infection

Antifungals, systemic use

Fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 392 is the treatment of choice for aspergillosis; liposomal amphotericin p. 387 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 386 or itraconazole p. 390 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections, including infections of the skin, are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated with locally acting antifungals; alternatively, fluconazole p. 389 can be given by mouth. Oropharyngeal candidiasis generally responds to topical therapy. Fluconazole is given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, either amphotericin by intravenous infusion or an echinocandin can be used. Fluconazole is an alternative for Candida albicans infection in clinically stable children who have not received an azole antifungal recently. Amphotericin should be considered for the initial treatment of CNS candidiasis.

Voriconazole can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in children intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 393 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 750 are used more frequently than griseofulvin p. 394 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by Trichophyton tonsurans and Microsporum spp. Terbinafine is used for tinea capitis caused by T. tonsurans [unlicensed indication]. The role of terbinafine in the management of Microsporum infections is uncertain. Fluconazole or itraconazole are alternatives in the treatment of tinea capitis caused by T. tonsurans or Microsporum spp. [both unlicensed indications].

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; they should be used under specialist advice in children. Although terbinafine is not licensed for use in children, it is considered to be the drug of choice for onychomycosis. Itraconazole can be administered as intermittent ‘pulse’ therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised children

Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against Aspergillus spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Micafungin p. 387 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole or itraconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections in immunocompromised children; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver
Infection

amphotericin is inadequate; lipid formulations are more recommended when the conventional formulation of 
Flucytosine p.

Other antifungals

The polyene antifungals include amphotericin and nystatin. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 734 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin and nystatin. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include caspofungin below Echinocandin antifungals p. 734. Neither drug is absorbed when given by mouth. Nystatin p. 734 is used for oral, opharyngitis, and perioral infections by local application in the mouth. Nystatin is also used for Candida albicans infection of the skin.

Amphotericin p. 387 by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is a highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include caspofungin below and micafungin p. 387. They are only active against Aspergillus spp. and Candida spp.; however, micafungin is not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. Echinocandin antifungals have a role in the prevention and systemic treatment of fungal infections.

Other antifungals

Flucytosine p. 393 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal menigitis.

Griseofulvin p. 394 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for trichophytin infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 750 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

386 Fungal infection

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Caspofungin

- INDICATIONS AND DOSE

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

- BY INTRAVENOUS INFUSION

- Neonate: 25 mg/m² once daily.
- Child 1-2 months: 25 mg/m² once daily
- Child 3-11 months: 50 mg/m² once daily
- Child 1-17 years: 70 mg/m² once daily (max. per dose 70 mg) for 1 day, then 50 mg/m² once daily (max. per dose 70 mg); increased to 70 mg/m² once daily (max. per dose 70 mg), dose may be increased if lower dose tolerated but inadequate response

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises increase dose to 70 mg/m² daily (max. 70 mg daily) with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin).

- INTERACTIONS → Appendix 1: caspofungin

- SIDE-EFFECTS

- Common or very common Arthralgia · arthralgia · diarrhea · dyspnoea · electrolyte imbalance · fever · flushing · headache · hyperhidrosis · hypotension · nausea · skin reactions · vomiting
- Uncommon Anaemia · anxiety · appetite decreased · ascites · chest discomfort · coagulation disorder · congestive heart failure · constipation · cough · disorientation · dizziness · drowsiness · dry mouth · dysphagia · excessive tearing · eyelid oedema · fatigue · flatulence · fluid overload · gastrointestinal discomfort · haematuria · hepatic disorders · hyperbilirubinemia · hyperglycaemia · hypertension · hypoxia · induration · insomnia · laryngeal pain · leucopenia · malaise · metabolic acidosis · muscle weakness · myalgia · nasal congestion · oedema · pain · palpitations · renal impairment · respiratory disorders · sensation abnormal · taste altered · thrombocytopenia · thrombophlebitis · tremor · vision blurred
- Frequency not known Severe cutaneous adverse reactions (SCARs)

- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies.

- BREAST FEEDING Present in milk in animal studies—manufacturer advises avoid.

- HEPATIC IMPAIRMENT No information available for severe impairment.

Dose adjustments Usual initial dose, then use 70% of normal maintenance dose in moderate impairment.

- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Cancidas®), allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding 500 micrograms/mL; store at room temperature; discard if solution is not clear or becomes cloudy.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- Caspofungin (Non-proprietary) Caspofungin (as Caspofungin acetate) 50 mg Caspofungin 50mg powder for concentrate for solution for infusion vials | 1 vial £69.77–£327.67
Micafungin

**INDICATIONS AND DOSE**

**Invasive candidiasis**
- BY INTRAVENOUS INFUSION
  - Neonate (administered on expert advice): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate.

- Child (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate

- Child (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

**Oesophageal candidiasis**
- BY INTRAVENOUS INFUSION
  - Child 16-17 years (body-weight up to 40 kg): 3 mg/kg once daily
  - Child 16-17 years (body-weight 40 kg and above): 150 mg once daily

**Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days**
- BY INTRAVENOUS INFUSION
  - Neonate: 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range.

- Child (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range

- Child (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

**INTERACTIONS** → Appendix 1: micafungin

**SIDE-EFFECTS**
- Anaemia, anxiety, appetite decreased, arrhythmias, confusion, constipation, diarrhoea, disseminated intravascular coagulation, dizziness, drowsiness, dyspnoea, electrolyte imbalance, eosinophilia, flushing, gastrointestinal discomfort, haemolysis, haemolytic anaemia, headache, hepatic disorders, hepatic failure (potentially life-threatening), hyperbilirubinaemia, hyperhidrosis, hypersensitivity, hypertension, hypalbuminaemia, hypotension, insomnia, leucopenia, nausea, neutropenia, palpitations, pancytopenia, peripheral oedema, renal impairment, severe cutaneous adverse reactions (SCARs), shock, skin reactions, taste altered, thrombocytopenia, tremor, vomiting

**PREGNANCY**

**BREAST FEEDING**

**HEPATIC IMPAIRMENT**

**RENAI IMPAIRMENT**

Use with caution; renal function may deteriorate.

**MONITORING REQUIREMENTS**
- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to dissolve; dilute requisite dose to a concentration of 0.5–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect infusion from light; give over 60 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **Mycamine (Astellas Pharma Ltd)**
    - Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial | £341.00
  - Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial | £196.08

**ANTIFUNGALS**

**Amphotericin**

(Amphotericin B)

**INDICATIONS AND DOSE**

**ABELCET ®**

- **Severe invasive candidiasis**: Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptoccosis in HIV patients
  - BY INTRAVENOUS INFUSION
    - **Child**: Test dose 100 micrograms/kg (max. per dose 1 mg), then 5 mg/kg once daily

  **AMBISOME ®**

- **Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin**: Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials
  - BY INTRAVENOUS INFUSION
    - **Child**: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day.

- **Visceral leishmaniasis (unresponsive to the antimonial alone)**
  - BY INTRAVENOUS INFUSION
    - **Child**: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**FUNIGZONE ®**

**Systemic fungal infections**
- BY INTRAVENOUS INFUSION
  - **Neonate**: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day.

  **Child**: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day.

**FUNIGZONE ®**

**Systemic fungal infections**
- BY INTRAVENOUS INFUSION
  - **Neonate**: 1 mg/kg once daily, increased if necessary to 1.5 mg/kg daily for 7 days, then reduced to 1–1.5 mg/kg once daily on alternate days if required.

  **Child**: Test dose 100 micrograms/kg (max. per dose 1 mg), included as part of first dose of 250 micrograms/kg daily, then increased if tolerated to 1 mg/kg daily, dose is gradually increased over 2–4 days; in severe infection max. 1.5 mg/kg daily or on alternate days. Prolonged treatment usually continued →
necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

- **UNLICENSED USE**
  - **AMBISOME**® Ambrisome® not licensed for use in children under 1 month.
  - **FUNGIZONE**® Intravenous conventional formulation amphotericin (Fungizone®) is licensed for use in children (age range not specified by manufacturer).

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: PARENTERAL AMPHOTERICIN B: REMINDER OF RISK OF POTENTIALLY FATAL ADVERSE REACTION IF FORMULATIONS CONFUSED (JULY 2018)**

The MHRA is aware of three fatal overdoses which were caused by medication error in which Fungizone® was administered (a non-lipid-based formulation of amphotericin B) instead of a lipid-based formulation. Healthcare professionals are advised:
- when prescribing and dispensing amphotericin products, both the complete generic name and the proprietary name should be used;
- the product name and dose should be verified before administration, especially if the dose prescribed exceeds the maximum recommended dose for Fungizone®.

- **Cautions** Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

- **Cautions, further information**
  - Anaphylaxis Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion in children over 1 month of age; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **Interactions** → Appendix 1: amphotericin

- **Side-effects**
  - Common or very common Anaemia - appetite decreased - azotaemia - chillis - diarrhoea - dyspepsia - electrolyte imbalance - fever - headache - hepatitis should be considered.
  - Uncommon Anaglycosuria - arthralgia - flushing - gastrointestinal discomfort - hepatic disorders - leucopenia - myalgia - peripheral neuropathy - respiratory disorders - thrombocytopenia
  - Rare or very rare Arthralgia - cardiac arrest - coagulation disorder - deafness - encephalopathy - eosinophilia - haemorrhage - heart failure - hypersensitivity - hypertension - malaise - nephrogenic diabetes insipidus - pain - pulmonary oedema non-cardiogenic - seizure - severe cutaneous adverse reactions (SCARs) - shock - tinnitus - vertigo - vision disorders - weight decreased

- **Pregnancy** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

- **Breast Feeding** No information available.

- **Renal Impairment** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **Monitoring Requirements** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

- **Directions for Administration**
  - **Abelcet**® Amphotericin (lipid complex)
    - For intravenous infusion, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-ml syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line.
  - **Ambisome**® Amphotericin (liposomal)
    - For intravenous infusion, reconstitute each vial with 12 ml. Water for Injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5-micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose given over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or 10%, or use separate line.
  - **Fungizone**® Amphotericin (as sodium deoxycylcholate complex)
    - For intravenous infusion, reconstitute each vial with 10 ml. Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL (in fluid-restricted children, up to 400 micrograms/mL, given via a central line); pH of glucose solution must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 4–6 hours, or if tolerated over a minimum of 2 hours (initial test dose given over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with Sodium Chloride solutions—flush existing intravenous line with Glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

- **Prescribing and dispensing information** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for infusion**

**Electrolytes**: May contain Sodium

- **Abelcet** (Tevis UK Ltd)
  - Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 ml
  - Abelcet 100mg/20ml concentrate for suspension for infusion vials | 10 vial | £77.50 (Hospital only)

**Powder for solution for infusion**

**Excipients**: May contain Sucrose

- **Electrolytes**: May contain Sodium

- **Ambisome** (Gilead Sciences International Ltd)
  - Amphotericin B liposomal 50 mg
  - Ambisome 50mg powder for solution for infusion vials | 10 vial | £82.87

- **Fungizone** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Amphotericin B 50 mg
  - Fungizone Intravenous 50mg powder for solution for infusion vials | 1 vial | £3.88
# Fluconazole

### CONTRA-INDICATIONS
- Acute porphyrias p. 624

### CAUTIONS
- Susceptibility to QT interval prolongation

### INTERACTIONS
- Appendix 1: antifungals, azoles

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS
- Common or very common
- Diarrhoea, gastrointestinal discomfort, headache, nausea, skin reactions, vomiting
- Uncommon
- Dizziness, flattulence, hepatic disorders, seizure, taste altered
- Rare or very rare
- Agranulocytosis, alopecia, dyslipidaemia, hypokalaemia, leucopenia, neutropenia, QT interval prolongation, severe cutaneous adverse reactions (SCARs), thrombocytopenia, torsade de pointes

#### SPECIFIC SIDE-EFFECTS
- Uncommon
- With parental use
- Angioedema, face oedema, tremor
- Frequency not known
- With oral use
- Cardio-respiratory distress, oedema

#### SIDE-EFFECTS, FURTHER INFORMATION
- If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.
- Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- Manufacturer advises caution—limited information available.
- Dose adjustments
- Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
Itraconazole

**INDICATIONS AND DOSE**

**Oropharyngeal candidiasis**
- **BY MOUTH**
  - Child 1 month-11 years: 3–5 mg/kg once daily for 15 days; maximum 100 mg per day
  - Child 12-17 years: 100 mg once daily for 15 days

**Oropharyngeal candidiasis in patients with AIDS or neutropenia**
- **BY MOUTH**
  - Child 1 month-11 years: 3–5 mg/kg once daily for 15 days; maximum 200 mg per day
  - Child 12-17 years: 200 mg once daily for 15 days

**Systemic candidiasis where other antifungal drugs inappropriate or ineffective**
- **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
- **BY INTRAVENOUS INJECTION**
  - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

**Pityriasis versicolor**
- **BY MOUTH**
  - Child 1 month-11 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 7 days
  - Child 12-17 years: 200 mg once daily for 7 days

**Tinea pedis / Tinea manuum**
- **BY MOUTH**
  - Child 1 month-11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 30 days
  - Child 12-17 years: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

**Tinea corporis / Tinea cruris**
- **BY MOUTH**
  - Child 1 month-11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 15 days
  - Child 12-17 years: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

**Tinea capitis**
- **BY MOUTH**
  - Child 1-7 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 2–6 weeks

**Onychomycosis**
- **BY MOUTH**
  - Child 1-11 years: 5 mg/kg daily (max. per dose 200 mg) for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses
  - Child 12-17 years: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

**Systemic aspergillosis where other antifungal drugs inappropriate or ineffective**
- **BY INTRAVENOUS INJECTION**
  - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days
  - **BY MOUTH**
    - Child: 5 mg/kg once daily (max. per dose 200 mg), increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis

**Histoplasmosis**
- **BY MOUTH**
  - Child: 5 mg/kg 1–2 times a day (max. per dose 200 mg)
**Fungal infection 391**

**Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective**

- **BY MOUTH**
  - **Child:** 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
  - **BY INTRAVENOUS INFUSION**
  - **Child:** 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate**

- **BY MOUTH**
  - **Child:** 5 mg/kg once daily (max. per dose 200 mg), then increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased only if low plasma-itraconazole concentration

**Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic**

- **BY MOUTH USING ORAL SOLUTION**
  - **Child:** 2.5 mg/kg twice daily, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - **With intravenous use** Chest pain, confusion, cough, dizziness, drowsiness, electrolyte imbalance, fatigue, gastrointestinal disorder, granulocytopenia, hyperglycaemia, hyperhidrosis, hypersensitivity, hypertension, myalgia, pain, renal impairment, tachycardia, tremor, urinary incontinence
  - **Uncommon**
    - With intravenous use Dysphonia, numbness, thrombocytopenia
    - With oral use Flatulence, increased risk of infection, menstrual disorder
  - **Rare or very rare**
    - **With oral use** Erectile dysfunction, leucopenia, neuralgia, peripheral oedema, taste altered, unusual taste

**SIDE-EFFECTS, FURTHER INFORMATION**

- Potentially life-threatening hepatotoxicity reportedly very rarely — discontinue if signs of hepatitis develop.

**CONCEPTION AND CONTRACEPTION**

- Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

**PREGNANCY**

- Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

**BREAST FEEDING**

- Small amounts present in milk — may accumulate; manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- Use only if potential benefit outweighs risk of hepatotoxicity.

**Dose adjustments**

- Dose reduction may be necessary.

**RENAL IMPAIRMENT**

- Risk of congestive heart failure.

- **With oral use** Bioavailability of oral formulations possibly reduced.

- **With intravenous use** Use intravenous infusion with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).

- **Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.**

**DIRECTIONS FOR ADMINISTRATION**

- **With intravenous use** For intravenous infusion, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes.

- **With oral use** For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include cherry.

**PATIENT AND CARER ADVICE**

- Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

**IMPORTANT SAFETY INFORMATION**

**HEART FAILURE**

- Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:
  - patients receiving high doses and longer treatment courses;
  - older adults and those with cardiac disease;
  - patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
  - patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers. Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 624

**CAUTIONS**

- Active liver disease, history of hepatotoxicity with other drugs, susceptibility to congestive heart failure

**INTERACTIONS**

- Appendix 1: antifungals, azoles

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Alopecia, constipation, diarrhoea, dysphonia, gastrointestinal discomfort, headache, heart failure, hepatic disorders, hyperbilirubinaemia, hypotension, nausea, oedema, pulmonary oedema, skin reactions, vision disorders, vomiting

- **Uncommon** Hearing loss, taste altered

- **Rare or very rare** Angioedema, hypersensitivity vasculitis, hypertrichy, uraemia, pancreatitis, photosensitivity reaction, severe cutaneous adverse reactions (SCARs)

- **Frequency not known** Peripheral neuropathy (discontinue)

**UNLICENSED USE**

- Not licensed for use in children (age range not specified by manufacturer).
Infection solution from special-order manufacturers include: oral suspension, oral solution

Solution for infusion
EXCIPIENTS: May contain Propylene glycol
- **Sporanox** (Janssen-Cilag Ltd)
  - Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar-free sugar-free | 150 ml $58.34-$59.25 DT = $59.25
  - Sporanox (Janssen-Cilag Ltd)
  - Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar-free | 150 ml $58.34 DT = $59.25

**Oral solution**
CAUTIONARY AND ADVISORY LABELS 9, 23
- **Itraconazole** (Non-proprietary)
  - Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar-free sugar-free | 150 ml $58.34-$59.25 DT = $59.25
  - Sporanox (Janssen-Cilag Ltd)
  - Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar-free | 150 ml $58.34 DT = $59.25

**Capsule**
CAUTIONARY AND ADVISORY LABELS 5, 9, 21, 25
- **Itraconazole** (Non-proprietary)
  - Itraconazole 100 mg Itraconazole 100mg capsules | 15 capsule $13.77 DT = $13.74 | 60 capsule $12.96-$15.10
  - Sporanox (Janssen-Cilag Ltd)
  - Itraconazole 100 mg Sporanox-Pulse 100mg capsules | 28 capsule $25.72
  - Sporanox 100mg capsules | 4 capsule $3.67 | 15 capsule $13.77 DT = $13.24 | 60 capsule $15.10

**Voriconazole**

**INDICATIONS AND DOSE**
**Invasive aspergillosis** | Serious infections caused by *Scedosporium spp., Fusarium spp.,* or invasive fluconazole-resistant *Candida spp.* (including *C. krusei*)

- **By mouth**
  - Child 2-11 years: Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
  - Child 12-14 years (body-weight up to 50 kg): Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
  - Child 12-14 years (body-weight 50 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
  - Child 15-17 years (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
  - Child 15-17 years (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

- **By intravenous infusion**
  - Child 2-11 years: Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
  - Child 12-14 years (body-weight up to 50 kg): Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
  - Child 12-14 years (body-weight 50 kg and above): Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises increasing the maintenance dose with concurrent use of fosphenytoin, phenytoin, or rifabutin—no specific recommendations made for children.

- **CONTRA-INDICATIONS**
  - Acidic porphyrias p. 624

- **CAUTIONS**
  - Avoid exposure to sunlight, bradycardia, cardiomyopathy, electrolyte disturbances, history of QT interval prolongation, patients at risk of pancreatitis, symptomatic arrhythmias

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**

  - **GENERAL SIDE-EFFECTS**
    - Common or very common  
      - Acute kidney injury
      - agranulocytosis, alopecia, anaemia, anxiety, arrhythmias
      - asthenia, bone marrow disorders, chest pain, chills
      - confusion, constipation, depression, diarrhea, dizziness, drowsiness, dyspnoea, electrolyte imbalance, eye disorders, eye inflammation, fever, gastrointestinal discomfort, haemorrhage, hallucination, headache, hepatic disorders, hypoglycaemia, hypotension
      - increased risk of infection, insomnia, leucopenia, muscle tone increased, nausea, neutropenia, oedema, oral disorders, pain, pulmonary oedema, respiratory disorders, seizure, sensation abnormal, skin reactions, syncope, tetany, thrombocytopenia, tremor, vision disorders, vomiting
    - Uncommon  
      - Adrenal insufficiency, arthritis, brain oedema, duodenitis, encephalopathy, eosinophilia, gallbladder disorders, hearing impairment, hypothyroidism, influenza like illness, lymphadenopathy, lymphangitis, movement disorders, nephritis, nerve disorders, pancreatitis, parkinsonism, photoxicity, proteinuria, pseudomembranous enterocolitis, QT interval prolongation, renal tubular necrosis, severe cutaneous adverse reactions (SCARs), taste altered, thrombophlebitis, tinnitus, vertigo
    - Rare or very rare  
      - Angioedema, cardiac conduction disorders, disseminated intravascular coagulation, hyperthyroidism
    - Frequency not known  
      - Cutaneous lupus erythematosus, peristitis (more common in transplant patients), squamous cell carcinoma (more common in presence of phototoxicity)

  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use  
      - Infusion related reaction

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - **Hepatotoxicity**
    - Hepatitis, cholestasis, and acute hepatic failure have been reported; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

  - **Phototoxicity** Phototoxicity occurs uncommonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
Fungal infection 393

ANTIFUNGALS  OTHER

Flucytosine

INDICATIONS AND DOSE
Systemic fungal infections | Adjunct to amphotericin B in severe systemic candidiasis and in other severe or long-standing infections

By intravenous infusion, or by mouth

Neonate: 50 mg/kg every 12 hours.

Child: Usual dose 50 mg/kg every 6 hours usually for not more than 7 days, alternatively 25–37.5 mg/kg every 6 hours usually for not more than 7 days, lower dose may be sufficient for sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin B)

By intravenous infusion, or by mouth

Neonate: 50 mg/kg every 12 hours.

Child: 25 mg/kg every 6 hours for 2 weeks

UNLICENSED USE

With oral use Tablets not licensed.

CAUTIONS
Blood disorders

INTERACTIONS

Appendix 1: flucytosine

SIDE EFFECTS
Agranulocytosis • aplastic anaemia • blood disorder • cardiotoxicity • confusion • diarrhoea • hallucination • headache • hepatic disorders • leucopenia • nausea • rash • sedation • seizure • thrombocytopenia • toxic epidermal necrolysis • ventricular dysfunction • vertigo • vomiting

PREGNANCY
Teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING
Manufacturer advises avoid.

RENAL IMPAIRMENT
Dose adjustments Use normal dose every 12 hours if creatinine clearance 20–40 mL/minute; use normal dose every 24 hours if creatinine clearance 10–20 mL/minute; use initial normal dose if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. Monitoring In renal impairment liver- and kidney-function tests and blood counts required weekly.

MONITORING REQUIREMENTS
For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).

Liver and kidney function tests and blood counts required (weekly in blood disorders).

DIRECTIONS FOR ADMINISTRATION For intravenous infusion, give over 20–40 minutes.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Voriconazole (Non-proprietary)

Voriconazole 200 mg Voriconazole 200 mg powder for solution for infusion via | 1 vial | £51.43–£77.14 (Hospital only)

VFEND (Pfizer Ltd)

BNFC 2019–2020 INFECTION

Hepatic impairment

Manufacturer advises caution, particularly in severe impairment (no information available).

Dose adjustments

Child 12–17 years Manufacturer advises use usual initial loading dose then halve maintenance doses in mild to moderate cirrhosis.

Renal impairment

Child 2–12 years No information available.

Child 12–17 years Intravenous vehicle may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

Monitoring requirements

Monitor renal function.

Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

DIRECTIONS FOR ADMINISTRATION

With intravenous use For intravenous infusion, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

Monitoring

In renal impairment liver- and kidney-function tests and blood counts required weekly.

Caution

Children and neonates should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunblock with high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

Patients and their carers should be advised to keep the alert card with them at all times.

Excipients: May contain Sulfobutylether beta cyclodextrin sodium

Flavours of oral liquid formulations may include orange.

Patient and carer advice

Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunblock with high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

Patients and their carers should be advised to keep the alert card with them at all times.

Griseofulvin

**INDICATIONS AND DOSE**

Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

- **BY MOUTH**
  - Child 1 month–11 years: Usual dose 10 mg/kg daily (max. per dose 500 mg), increased if necessary to 20 mg/kg daily (max. per dose 1 g), for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
  - Child 12–17 years: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

**SIDE-EFFECTS**

- Common or very common: Appetite decreased, dizziness, drowsiness, incoordination, irritable, peripheral neuropathy, photosensitivity reaction, skin reactions, taste alteration, toxic epidermal necrolysis

- Rare or very rare: Anaemia, hepatic disorders, leucopenia, neutropenia, systemic lupus erythematosus (SLE)

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during and for at least 6 months after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child while taking the drug and for at least 6 months after administration.

**PREGNANCY**

Avoid (fetotoxicity and teratogenicity in animals).

**BREAST FEEDING**

Avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild to moderate impairment (risk of deterioration); avoid in severe impairment.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Griseofulvin for fungal infections
- www.medicinesforchildren.org.uk/griseofulvin-fungal-infections

Driving and skilled tasks: May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**CONTRA-INDICATIONS**

Acute porphyrias p. 624 - systemic lupus erythematosus (risk of exacerbation)

**INTERACTIONS**

- Appendix 1: griseofulvin

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

### 2.1 Pneumocystis pneumonia

**Pneumocystis pneumonia**

**Overview**

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

**Treatment**

The recommended duration of treatment is generally 14–21 days.

**Mild to moderate disease**

Co-trimoxazole p. 362 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 395 or a combination of dapsone p. 395 with trimethoprim p. 373 is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of clindamycin p. 337 and primaquine p. 412 may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

**Severe disease**

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 395 given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. If there is clinical improvement after 7–10 days of intravenous therapy with pentamidine isetionate, patients can be switched to oral treatment (e.g. atovaquone) to complete 21 days treatment.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

**Adjunctive therapy**

In moderate to severe pneumocystis infections associated with HIV infection, prednisolone p. 458 is given by mouth for 5 days (alternatively, hydrocortisone p. 456 may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

**Prophylaxis**

Prophylaxis against pneumocystis pneumonia should be given to all children with a history of this infection, and to all HIV-infected infants aged 1 month–1 year. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised children. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Prophylaxis should also be given to infants aged 1 month–1 year who are suspected to be HIV-positive, or whose mothers had a viral load greater than 1000 HIV RNA copies/mL between 36 weeks’ gestation and delivery; prophylaxis should be continued until HIV infection is excluded or until immunity recovers.
Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, dapsone can be used.

**ANTIPROTOZOALS**

### Atovaquone

**INDICATIONS AND DOSE**

**Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients intolerant of co-trimoxazole**

- **BY MOUTH**
  - Child 1-2 months: 15–20 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
  - Child 3 months-1 year: 22.5 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
  - Child 2-17 years: 15–20 mg/kg twice daily (max. per dose 750 mg) for 14–21 days, dose to be taken with food, particularly high fat food

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Other causes of pulmonary disease should be sought and treated - initial diarrhoea and difficulty in taking food may reduce absorption (and require alternative therapy)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
  - *Common or very common* Anaemia - angioedema - bronchospasm - diarrhoea - headache - hypersensitivity - hyponatraemia - insomnia - nausea - neutropenia - skin reactions - throat tightness - vomiting
  - *Frequency not known* Stevens-Johnson syndrome
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in significant impairment and monitor closely — no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - **CAUTIONARY AND ADVISORY LABELS** 21
    - **Wellvone** (GlaxoSmithKline UK Ltd)
      - Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml [POD] £486.37 DT = £486.37

### Dapsone

**INDICATIONS AND DOSE**

**Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (in combination with trimethoprim)**

- **BY MOUTH**
  - Child 1 month-11 years: 2 mg/kg once daily (max. per dose 100 mg)
  - Child 12-17 years: 100 mg once daily

**Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia**

- **BY MOUTH**
  - Child: 2 mg/kg once daily (max. per dose 100 mg)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (P. jirovecii) pneumonia. Monotherapy not licensed for children for prophylaxis of P. jirovecii pneumonia.
- **CAUTIONS** Anaemia (treat severe anaemia before starting)
- **INTERACTIONS** → Appendix 1: dapsone
- **SIDE-EFFECTS** Agranulocytosis - appetite decreased - haemolysis - haemolytic anaemia - headache - hepatic disorders - hypoalbuminaemia - insomnia - lepra reaction - methaemoglobinemia - motor loss - nausea - peripheral neuropathy - photosensitivity reaction - psychosis - severe cutaneous adverse reactions (SCARs) - skin reactions - tachycardia - vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects are dose-related. If dapsone syndrome occurs ( rash with fever and eosinophilia )—discontinue immediately ( may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).
- **PREGNANCY** Folic acid p. 594 ( higher dose ) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**
  - Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 8

- **Dapsone (Non-proprietary)**
  - **Dapsone 50 mg** Dapsone 50mg tablets | 28 tablet [POD] £36.22 DT = £18.62
  - **Dapsone 100 mg** Dapsone 100mg tablets | 28 tablet [POD] £97.39 DT = £89.29

### Pentamidine isetionate

**INDICATIONS AND DOSE**

**Treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Child: 4 mg/kg once daily for at least 7–10 days

continued →
**396 Helminth infection**

**Helminth infections**

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

- **Birmingham** (0121) 424 0357
- **Scotland** Contact local Infectious Diseases Unit
- **Liverpool** (0151) 705 3100
- **London** 0845 155 5000 (treatment)

**Threadworms**

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment. Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 398 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

**Ascaricides (common roundworm infections)**

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 398 [unlicensed] (available from ‘special-order’ manufacturers or special importer companies) is

---

**Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (specialist use only)**

- **By inhalation of nebulised solution**
  - Child 5–17 years: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

**Visceral leishmaniasis (specialist use only)**

- **By deep intramuscular injection**
  - Child 1–7 years: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

**Cutaneous leishmaniasis (specialist use only)**

- **By deep intramuscular injection**
  - Child 1–7 years: 3–4 mg/kg 1–2 times a week until condition resolves

**Trypanosomiasis (specialist use only)**

- **By deep intramuscular injection, or by intravenous infusion**
  - Child 1–7 years: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Common or very common Dizziness, hypoglycaemia
  - Rare or very rare QT interval prolongation

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - When used by inhalation: Cough, dyspnoea, respiratory disorders
  - With parenteral use: Acute kidney injury, anaemia, azotaemia, electrolyte imbalance, flushing, haematuria, hyperglycaemia, induration, leucopenia, local pain, myopathy, syncope, thrombocytopenia, vomiting
  - Rare or very rare
    - With parenteral use: Arrhythmia (can be severe and sometimes fatal), pancreatitis (can be severe and sometimes fatal)
  - Frequency not known
    - When used by inhalation: Angioedema, appetite decreased, bradycardia, fatigue, renal failure
    - With parenteral use: Arrhythmias, perioral hypoaesthesia, sensation abnormal—Stevens-Johnson syndrome

**PREGNANCY**

Manufacturer advises avoid unless essential.

**BREAST FEEDING**

Manufacturer advises avoid unless essential—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution.

**RENAL IMPAIRMENT**

Dose adjustments Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in less severe infection, use 4 mg/kg on alternate days for at least 14 doses.

**MONITORING REQUIREMENTS**

- Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- Carry out laboratory monitoring according to product literature.

**DIRECTIONS FOR ADMINISTRATION**

Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL. Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL. Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.

Powder for injection (dissolved in water for injection) may be used for nebulisation.

**HANDLING AND STORAGE**

Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

**UNLICENSED USE**

Not licensed for prevention of pneumocystis pneumonia in children.

**CAUTIONS**

Anaemia, bradycardia, coronary heart disease, history of ventricular arrhythmias, hyperglycaemia, hypotension, hypoglycaemia, hypokalaemia, hypomagnesaemia, hypotension, leucopenia, risk of severe hypotension following administration, thrombocytopenia

**INTERACTIONS**

Appendix 1: pentamidine

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Pentacarinat (Sanofi) Pentamidine isetionate 300 mg Pentacarinat 300 mg powder for solution for injection vials | 5 vial (pack) £158.86
an alternative when mebendazole cannot be used. It is very well tolerated.

**Tapeworm infections**

**Taenicides**

**Niclosamide** [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cystercerosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 399 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is as effective as niclosamide.

**Hydatid disease**

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole below [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

**Hookworms**

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

**Schistosomicides (bilharziasis)**

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide *) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

**Filaricides**

*Diethylcarbamazine* [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 398 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in onchocerciasis and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

**Cutaneous larva migrans (creeping eruption)**

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical thiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or thiabendazole (thiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

**Strongyloidiasis**

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

### ANTHELMINTICS

#### Albendazole

- **INDICATIONS AND DOSE**
  - **Chronic Strongyloides infection**
    - **BY MOUTH**
      - Child 2-17 years: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary
  - **Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases**
    - **BY MOUTH**
      - Child 2-17 years: 7.5 mg/kg twice daily (max. per dose 400 mg twice daily) for 28 days followed by 14-day break, repeated for up to 2–3 cycles
  - **Hookworm infections**
    - **BY MOUTH**
      - Child 2-17 years: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1: albendazole

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

**Tablet**

Medicines for Children leaflet: Levamisole for nephrotic syndrome
www.medicinesforchildren.org.uk/levamisole-nephrotic-syndrome

**Nephrotic syndrome (initiated under specialist supervision)**
- **BY MOUTH**
  - Child: 2.5 mg/kg once daily on alternate days (max. per dose 150 mg)

**UNLICENSED USE** Not licensed.
**CONTRA-INDICATIONS** Blood disorders
**CAUTIONS** Epilepsy - juvenile idiopathic arthritis - Sjögren’s syndrome
**INTERACTIONS** → Appendix 1: levamisole
**SIDE-EFFECTS** Arthralgia (long term use) - blood disorder (long term use) - diarrhoea - dizziness - headache - influenza like illness (long term use) - insomnia (long term use) - myalgia (long term use) - nausea - rash (long term use) - seizure (long term use) - taste altered (long term use) - vasculitis (long term use) - vomiting
**PREGNANCY** Embryotoxic in animal studies, avoid if possible.
**BREAST FEEDING** No information available.
**HEPATIC IMPAIRMENT** Dose adjustments Use with caution—dose adjustment may be necessary.

**DIETARY ADVICE**
- Use with caution
- Dose adjustments
- Use with caution—dose adjustment may be necessary.

**INTERACTIONS** → Appendix 1: mebendazole

**SIDE-EFFECTS**
- Common or very common Gastrointestinal discomfort
- Uncommon Diarrhoea - flatulence
- Rare or very rare Alopecia - atulence - dizziness - hepatitis - neutropenia - seizure - severe cutaneous adverse reactions (SCARs) - skin reactions
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.
4 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 344 is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers. Tinidazole p. 346 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver.

Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment. For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated.

Aspiration aids penetration of metronidazole and, for abscesses with large volumes of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Triclofenamides

Metronidazole is the treatment of choice for Trichomonas vaginalis infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for Giardia lamblia infections. Tinidazole may be used as an alternative to metronidazole.

Leishmaniadies

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate p. 400, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin p. 387 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (AmBisome®). Abelcet® is a lipid formulation of amphotericin, is also likely to be effective but less information is available.

Pentamidine isethionate p. 395 (pentamidine isethionate) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).
Trypanocides
The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Toxoplasmosis
Most infections caused by Toxoplasma gondii are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 412 and sulfadiazine p. 363, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 337 or clarithromycin p. 340 or azithromycin p. 339. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) may reduce the risk of infection if pharyngeal or tracheal involvement (may be life-threatening inflammation around the lesions (may be life-threatening pneumonia)).

Other neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folinic acid.

4.1 Leishmaniasis

Other drugs used for Leishmaniasis Amphotericin, p. 387 • Pentamidine isetionate, p. 395

ANTIPROTOZOALS
Sodium stibogluconate

- INDICATIONS AND DOSE
  Visceral leishmaniasis (specialist use only)
  - BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
    - Child: 20 mg/kg daily for at least 20 days

- UNLICENSED USE
  - With intravenous use Licensed for use in children (age range not specified by manufacturer).

- CAUTIONS
  Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia)

- CAUTIONS, FURTHER INFORMATION
  Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

- INTERACTIONS • Appendix 1: sodium stibogluconate

- SIDE-EFFECTS
  - Common or very common Abdominal pain • appetite decreased • arthralgia • diarrhoea • headache • lethargy • malaise • myalgia • nausea • vomiting
  - Rare or very rare Chest pain • chills • fever • flushing • haemorrhage • hyperhidrosis • jaundice • skin reactions • vertigo

- Frequency not known Arrhythmias • cough • pain • pancreatitis • pneumonia • QT interval prolongation • thrombosis

- PREGNANCY
  - Manufacturer advises use only if potential benefit outweighs risk.

- BREAST FEEDING
  - Amount probably too small to be harmful.

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution (limited information available; abnormalities in hepatic function may be expected in visceral leishmaniasis).

- RENAL IMPAIRMENT
  - Avoid in significant impairment.

- MONITORING REQUIREMENTS
  - Monitor ECG before and during treatment.

- DIRECTIONS FOR ADMINISTRATION
  - Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occurs. Injection should be filtered immediately before administration using a filter of 5 microns or less.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Pentostam (GlaxoSmithKline UK Ltd) Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial (Price £66.43)

4.2 Malaria

Antimalarials

Artemether with lumefantrine
Artemether with lumefantrine p. 408 is licensed for the treatment of acute uncomplicated falciparum malaria.

Arteminol with piperaquine
Arteminol with piperaquine phosphate p. 408 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Atovaquone with proguanil
Atovaquone with proguanil hydrochloride p. 409 is licensed for the prophylaxis of falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 402) and for the treatment of acute, uncomplicated falciparum malaria.

Chloroquine
Chloroquine p. 410 is usually used with proguanil hydrochloride p. 412 for the prophylaxis of malaria in areas of the world where there is little chloroquine resistance, but this regimen may not give optimal protection (for details, see Recommended regimens for prophylaxis against malaria P. 402).

Guidelines for malaria prevention in travellers from the United Kingdom (2018) published by Public Health England state that patients already taking hydroxychloroquine sulfate p. 662 for another indication, and for whom
chloroquine would be an appropriate antimalarial, can remain on hydroxychloroquine sulfate.

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine p. 413, atovaquone with proguanil hydrochloride p. 409, or arteether with lumefantrine. It is still recommended for the treatment of non-falciparum malaria.

**Doxycycline**

Doxycycline p. 364 is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine p. 411 or atovaquone with proguanil hydrochloride p. 409 (for details, see Recommended regimens for prophylaxis against malaria p. 402).

**Mefloquine**

Mefloquine is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine resistant falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 402). Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

**Primaquine**

Primaquine p. 412 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

**Proguanil**

Proguanil hydrochloride is usually used in combination with chloroquine or atovaquone for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 402).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however atovaquone with proguanil hydrochloride p. 409 is licensed for the treatment of acute uncomplicated falciparum malaria. Atovaquone with proguanil hydrochloride is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Atovaquone with proguanil hydrochloride is also used as an alternative to mefloquine or doxycycline. Atovaquone with proguanil hydrochloride is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

**Pyrimethamine**

Pyrimethamine p. 412 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

**Quinine**

Quinine is not suitable for the prophylaxis of malaria. Quinine is used for the treatment of falciparum malaria, if the infective species is not known, or if the infection is mixed (for details see Malaria, treatment p. 407).

**Useful resources**

All recommendations on prophylaxis against malaria reflect guidelines agreed by UK malaria specialists, published in the Public Health England Guidelines for malaria prevention in travellers from the United Kingdom, 2018. The advice is aimed at residents of the UK who travel to endemic areas.

up to 3 years). Doxycycline can be used for up to 2 years, and atovaquone with proguanil hydrochloride for up to 1 year. Prophylaxis with mefloquine, doxycycline, or Malarone™ may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to consider that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should see a doctor immediately and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In these patients, doxycycline (children aged 12 years and over) or atovaquone with proguanil hydrochloride may be used. However doxycycline may interact with some antiepileptics and its dose may need to be adjusted, see interactions information for doxycycline.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined; in the case of proguanil hydrochloride, folic acid p. 594 (dosed as a pregnancy at ‘high-risk’ of neural tube defects) should be given for at least the first trimester. If travelling to high risk areas or there is resistance to other drugs, mefloquine may be considered during the second or third trimester of pregnancy.

Mefloquine can be used in the first trimester with caution if the benefits outweigh the risks. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Atovaquone with proguanil hydrochloride should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative. Folic acid (dosed as a pregnancy at ‘high-risk’ of neural tube defects) should be given if atovaquone with proguanil hydrochloride is used during pregnancy.

Breast-feeding

Some antimalarials should be avoided when breast feeding, see individual drugs for details.

Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 99 should begin chemoprophylaxis 2–3 weeks before departure and the INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Other medical conditions

For additional information on malaria prophylaxis in patients with other medical conditions, see Public Health England Guidelines for malaria prevention in travellers from the UK.

Standby treatment

Children and their parents or carers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area.
and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas, expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

**Malaria prophylaxis, specific recommendations**

Travellers planning journeys across continents can travel into areas that have different malaria prophylaxis recommendations. The choice of prophylaxis medication must reflect overall risk to ensure protection in all areas; it may be possible to change from one regimen to another. Those travelling to remote or little-visited areas may require expert advice. For further information see Recommended regimens for prophylaxis against malaria, and Public Health England Guidelines for malaria prevention in travellers from the United Kingdom.

**Important**

Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

- National Travel Health Network and Centre (NaTHNaC) www.travelhealthpro.org.uk/

**Treatment**

Recommends on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child. If the infective species is not known, or if the infection is mixed, initial treatment should be as for *falciparum malaria* with quinine p. 413, *Malarone*® (atovaquone with proguanil hydrochloride p. 409), or *Riamet*® (artemether with lumefantrine) can be given by mouth if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the child is seriously ill or unable to take tablets. Mefloquine p. 411 is now rarely used for treatment because of concerns about resistance.

Oral quinine is well tolerated by children although the salts are bitter. Quinine is given by mouth together with or followed by clindamycin p. 337 [unlicensed indication] or, in children over 12 doxycycline p. 364.

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*® or *Riamet*® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*® or *Riamet*® treatment.

If the child is seriously ill or unable to swallow tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline in children over 12 years, or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

**Pregnancy**

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, *Malarone*®, and *Riamet*® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named patient’ use.

**Non-falciparum malaria (treatment)**

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region.

Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*® [unlicensed indication], quinine, or *Riamet*® [unlicensed indication] can be used; as with chloroquine, primaquine p. 412 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine.
For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age.

**Parenteral**
If the child is unable to take oral therapy, quinine can be given by intravenous infusion, changed to oral chloroquine as soon as the patient’s condition permits.

**Pregnancy**
Treatment doses of chloroquine can be given for non-falciparum malaria. In the case of P. vivax or P. ovale, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued, given weekly, during the pregnancy.

---

**ANTIPROTOZOALS ▶ ANTIMALARIALS**

**Artemether with lumefantrine**

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

- **BY MOUTH**
  - Child (body-weight 5-14 kg): Initially 1 tablet, followed by 1 tablet for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)
  - Child (body-weight 15-24 kg): Initially 2 tablets, followed by 2 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)
  - Child (body-weight 25-34 kg): Initially 3 tablets, followed by 3 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)
  - Child 12-17 years (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.

- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation - family history of sudden death - history of arrhythmias - history of clinically relevant bradycardia - history of congestive heart failure accompanied by reduced left ventricular ejection fraction

- **CAUTIONS** Avoid in Acute porphyrias p. 624 - electrolyte disturbances

- **INTERACTIONS** ▶ Appendix 1: antimalarials

- **SIDE-EFFECTS** ▶ Common or very common Abdominal pain - appetite decreased - arthralgia - asthma - cough - diarrhoea - dizziness - headache - myalgia - nausea - palpitations - QT interval prolongation - skin reactions - sleep disorders - vomiting
  - Uncommon Clonus - drowsiness
  - Frequency not known Angioedema

- **PREGNANCY** Toxicity in animal studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available)—monitor ECG and plasma potassium concentration.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
  - Monitoring In severe renal impairment monitor ECG and plasma potassium concentration.
  - MONITORING REQUIREMENTS Monitor patients unable to take food (greater risk of recrudescence).

---

**Artrenimol with piperaquine phosphate**

(Piperaquine tetraphosphate with dihydroartemisinin)

**INDICATIONS AND DOSE**
Treatment of uncomplicated falciparum malaria

- **BY MOUTH**
  - Child 6-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6-17 years (body-weight 13-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6-17 years (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

- **CONTRA-INDICATIONS** Acute myocardial infarction - bradycardia - congenital long QT syndrome - electrolyte disturbances - family history of sudden death - heart failure with reduced left ventricular ejection fraction - history of symptomatic arrhythmias - left ventricular hypertrophy - risk factors for QT interval prolongation - severe hypertension

- **INTERACTIONS** ▶ Appendix 1: antimalarials

- **SIDE-EFFECTS** ▶ Common or very common Abdominal pain - anaemia - appetite decreased - asthenia - conjunctivitis - cough - diarrhoea - eosinophilia - fever - increased risk of infection - leucocytosis - leucopenia - increased risk of infection - QT interval prolongation - skin reactions - thrombocytopenia - vomiting
  - Uncommon Arthralgia - cardiac conduction disorder - epistaxis - headache - hepatic disorders - hypochromia - lymphadenopathy - nausea - rhinorrhoea - seizure - splenomegaly - stomatitis - thrombocytosis

- **PREGNANCY** Teratogenic in animal studies—manufacturer advises use only if other antimalarials cannot be used.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in jaundice or in moderate to severe failure (no information available)—monitor ECG and plasma potassium concentration.
  - Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.
Atovaquone with proguanil hydrochloride

**INDICATIONS AND DOSE**

**MALARONE® 250MG/100MG**

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

- **BY MOUTH**
  - Child (body-weight 40 kg and above): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 5–11 kg): 0.5 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria

- **BY MOUTH**
  - Child (body-weight 20–29 kg): 2 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 30–39 kg): 3 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 40 kg and above): Use Malarone® (standard) tablets.

**DOSE EQUIVALENCE AND CONVERSION**

- Each tablet of Malarone® contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride.

**MALARONE® PEDIATRIC**

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

- **BY MOUTH**
  - Child (body-weight 5–7 kg): 0.5 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 8–9 kg): 0.75 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 10–19 kg): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

**UNLICENSED USE**

**CAUTIONS**

Diarrhoea or vomiting (reduced absorption of atovaquone), efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

**INTERACTIONS**

- See also Pregnancy in Malaria, prophylaxis p. 401.

- Breastfeeding
  - Use only if no suitable alternative available.

**RENAL IMPAIRMENT**

Avoid for malaria prophylaxis and, if possible, for treatment if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- Tablets may be crushed and mixed with food or milky drink just before administration.

**PATIENT AND CARER ADVICE**

- Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

- Medicines for Children leaflet: Malarone for prevention of malaria www.medicinesforchildren.org.uk/malarone-prevention-malaria

**NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.
410 Protozoal infection

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Prophylaxis of malaria**

- **INITIALLY BY MOUTH USING SYRUP**
  - Child: 4-5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child: 6 weeks–5 months (body-weight 4.5-7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child: 6-11 months (body-weight 8-10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child: 1-2 years (body-weight 11-14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child: 3-4 years (body-weight 15-16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child: 5-7 years (body-weight 16.5-24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child: 8-13 years (body-weight 25-44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child: 14-17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

- **BY MOUTH**
  - Child: 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

- **P. vivax or P. ovale infection during pregnancy while radical cure is postponed**
  - **BY MOUTH**
  - Child: 10 mg/kg once weekly (max. per dose 310 mg)

**DOSE EQUIVALENCE AND CONVERSION**

- **Doses expressed as chloroquine base**.
  - Each tablet contains 155 mg of chloroquine base (equivalent to 250 mg of chloroquine phosphate).
  - Syrup contains 50 mg/5 mL of chloroquine base (equivalent to 80 mg/5 mL of chloroquine phosphate).

**SIDE-EFFECTS**

- **Rare or very rare** Cardiomyopathy • hallucination • hepatitis
- **Frequency not known** Abdominal pain • agranulocytosis • alopecia • anxiety • atrioventricular block • bone marrow disorders • confusion • corneal deposits • depression • diarrhoea • eye disorders • gastrointestinal disorder • headache • hearing impairment • hypoglycaemia • hypotension • insomnia • interstitial lung disease • movement disorders • myopathy • nausea • neuromyopathy • neutropenia • personality change • photosensitivity reaction • psychotic disorder • QT interval prolongation • seizure • severe cutaneous adverse reactions (SCARs) • skin reactions • thrombocytopenia • tinnitus • tongue protrusion • vision disorders • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.

- **Overdose** Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

- **BREASTFEEDING** Present in breast milk and breastfeeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in cirrhosis.

- **RENAI IMPAIRMENT** Manufacturers advise caution.

- **Dose adjustments** Only partially excreted by the kidneys particularly in cirrhosis.

- **INTERACTIONS**

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 5

- **Malarivon** (Wallace Manufacturing Chemists Ltd) Chloroquine phosphate 16 mg per 1 ml Malarivon 80mg/5ml syrup | 75 ml (PO) £30.00 DT + £30.00

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 5

Malaria 411

Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 410, proguanil hydrochloride p. 412.

● INDICATIONS AND DOSE
Prophylaxis of malaria
▶ BY MOUTH
▶ Child: (consult product literature)

● INTERACTIONS → Appendix 1: antimalarials
● EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
Tablet
▶ Paludrine/Avloclor (Alliance Pharmaceuticals Ltd)
Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet £13.50

Mefloquine

● INDICATIONS AND DOSE
Treatment of malaria
▶ BY MOUTH
▶ Child: (consult product literature)
Prophylaxis of malaria
▶ BY MOUTH
▶ Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
▶ Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
▶ Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
▶ Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

● UNLICENSED USE Mefloquine doses in BNF Publications may differ from those in product literature.
Not licensed for use in children under 5 kg body-weight and under 3 months.
● CONTRA-INDICATIONS Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions - avoid for standby treatment if history of convulsions - history of blackwater fever
● CAUTIONS Cardiac conduction disorders - epilepsy (avoid for prophylaxis) - not recommended in infants under 5 months (5 kg) - traumatic brain injury

CAUTIONS, FURTHER INFORMATION
Neuropsychiatric reactions. Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Neuropsychiatric symptoms such as insomnia, nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the Guide for Healthcare Professionals provided by the manufacturer.

● INTERACTIONS → Appendix 1: antimalarials
● SIDE-EFFECTS
▶ Common or very common Anxiety · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vision disorders · vomiting
▶ Frequency not known Acute kidney injury · agranulocytosis · alopecia · aplastic anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · behaviour abnormal · cardiac conduction disorders · cataract · chest pain · chills · concentration impaired · confusion · cranial nerve paralysis · delusional disorder · depersonalisation · drowsiness · dyspnoea · encephalopathy · eye disorder · fever · flushing · gait abnormal · hallucination · hearing impairment · hepatic disorders · hyperacausis · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · memory loss · mood altered · movement disorders · muscle complaints · muscle weakness · nephritis · nerve disorders · oedema · palpatitations · pancreatitis · paranaesthesia · pneumonia · pneumonitis · psychosis · seizure · self-endangering behaviour · speech disorder · Stevens-Johnson syndrome · suicidal tendencies · syncope · thrombocytopenia · tinnitus · tremor · vertigo

● ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with hypersensitivity to quinine.

● CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies).
● PREGNANCY Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

● BREAST FEEDING Present in milk but risk to infant minimal.
● HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—elimination may be prolonged.

● RENAL IMPAIRMENT Manufacturer advises caution.
● DIRECTIONS FOR ADMINISTRATION Tablet may be crushed and mixed with food such as jam or honey just before administration.

● PATIENT AND CARER ADVICE Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

A patient alert card should be provided.
Driving and skilled tasks Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

● NATIONAL FUNDING/ACCESS DECISIONS
NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
Tablet
CAUTIONARY AND ADVISORY LABELS 10, 21, 27
▶ Lariam (Cheplapharm Arzneimittel GmbH)
Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet (PO) £14.53 DT + £14.53
Primaquine

**INDICATIONS AND DOSE**

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection
- **BY MOUTH**
  - Child: 750 micrograms/kg once weekly for 8 weeks; maximum 45 mg per week

Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection
- **BY MOUTH**
  - Child: 250 micrograms/kg daily (max. per dose 30 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. falciparum* infection
- **BY MOUTH**
  - Child: This combination is associated with considerable toxicity (consult product literature)

**SIDE-EFFECTS**

- Alopecia
- Abdominal pain
- Nausea
- Vomiting
- Diarrhoea
- Gastric disorder
- Skin reactions
- Gastric haemorrhage
- Urticaria
- Megaloblastic anaemia
- Leucopenia
- Megaloblastic anaemia
- Methaemoglobinaemia

**INTERACTIONS** → Appendix 1: antimalarials

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Proguanil doses in BNF Publications may differ from those in product literature.

**INDICATIONS AND DOSE**

Proguanil hydrochloride

**INDICATIONS AND DOSE**

Prophylaxis of malaria
- **BY MOUTH**
  - Child 4-11 years (body-weight up to 6 kg): 25 mg once daily
  - Child 3-6 months (body-weight 6-9 kg): 50 mg once daily

Pregnancy
- Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.

Breast feeding
- Amount in milk probably too small to be harmful when used for malaria prophylaxis.

**SIDE-EFFECTS**

- Bowel disorders
- Gastric disorder
- Abdominal pain
- Nausea
- Vomiting
- Diarrhoea
- Skin reactions
- Megaloblastic anaemia
- Leucopenia

**INTERACTIONS** → Appendix 1: antimalarials

**CAUTIONARY AND ADVISORY LABELS**

- Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are used.

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**RENAI IMPAIRMENT**

- Glomerular filtration rate less than 20 mL/minute/1.73 m²:
  - Use one-quarter normal dose on alternate days if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity in severe impairment.
**Quinine**

**INDICATIONS AND DOSE**

Non-falciparum malaria

- Child: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient’s condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.

Falciparum malaria

- Child: Loading dose 20 mg/kg, infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by doxycycline (in children over 12 years), or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.

- Neonate: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.

Falciparum malaria (in intensive care unit)

- Child: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.

**DOSE EQUIVALENCE AND CONVERSION**

- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.

- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg.

Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

**UNLICENSED USE**

Injection not licensed.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: REMINDER OF DOSE-DEPENDENT QT-PROLONGING EFFECTS (NOVEMBER 2017)

Quinine has been associated with dose-dependent QT-interval-prolonging effects and should be used with caution in patients with risk factors for QT prolongation or in those with ativoventricular block—see Cautions for further information.

**CONTRA-INDICATIONS**

- Haemoglobinuria
- Myasthenia gravis
- Optic neuritis
- Tinnitus

**CAUTIONS**

- Atrial fibrillation (monitor ECG during parenteral treatment)
- Cardiac disease (monitor ECG during parenteral treatment)
- Conduction defects (monitor ECG during parenteral treatment)
- Electrolyte disturbance
- G6PD deficiency
- Heart block (monitor ECG during parenteral treatment)

**INTERACTIONS**

- Appendix 1: antimalarials

**SIDE-EFFECTS**

- Abdominal pain
- Agitation
- Agranulocytosis
- Angioedema
- Asthma
- Ativoventricular conduction changes
- Bronchospasm
- Cardiotoxicity
- Cerebral impairment
- Coagulation disorders
- Coma
- Confusion

**DOSE**

- **BY MOUTH**
  - Child: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient’s condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.
  - Neonate: Loading dose 20 mg/kg, infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.

4.3 Toxoplasmosis

Other drugs used for Toxoplasmosis Pyrimethamine, p. 412

4.3.1 Antimicrobials - Macrolides

**Spiramycin**

- **INDICATIONS AND DOSE**
  - **Toxoplasmosis in pregnancy**
    - Child 12–17 years: 1.5 g twice daily until delivery
  - **Chemoprophylaxis of congenital toxoplasmosis**
    - *By mouth*
  - Neonate: 50 mg/kg twice daily.

- **DOSE EQUIVALENCE AND CONVERSION**
  - 3000 units ≡ 1 mg spiramycin.

4.3.2 Other antimicrobials

- **ANTIBACTERIALS**
  - **MACROLIDES**
    - **Spiramycin**
      - **INDICATIONS AND DOSE**
        - **Toxoplasmosis in pregnancy**
          - Child 12–17 years: 1.5 g twice daily until delivery
        - **Chemoprophylaxis of congenital toxoplasmosis**
          - *By mouth*
        - Neonate: 50 mg/kg twice daily.

- **DOSE EQUIVALENCE AND CONVERSION**
  - 3000 units ≡ 1 mg spiramycin.
5.2 Hepatitis infections

5.2a Chronic hepatitis B

Other drugs used for Chronic hepatitis B Interferon alfa, p. 577 • Lamivudine, p. 436 • Tenoforv disoproxil, p. 437

**ANTIVIRALS > NUUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS**

<table>
<thead>
<tr>
<th>Tenofovir alafenamide</th>

<tbody>
<tr>
<td>26-Feb-2018</td>
</tr>
</tbody>
</table>

- **INDICATIONS AND DOSE**
  - Chronic hepatitis B (initiated by a specialist)
    - **BY MOUTH**
      - Child 12-17 years (body-weight 35 kg and above): 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS**
  - Decompensated liver disease • HIV co-infection

- **INTERACTIONS**
  - Appendix 1: tenofovir alafenamide

- **SIDE-EFFECTS**
  - Common or very common: Abdominal distension
  - Frequency not known: Hepatitis aggravated (during or following treatment)

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in decompensated hepatic disease (no information available).

- **PRE-TREATMENT SCREENING**
  - Manufacturer advises HIV antibody testing should be offered to those with unknown HIV-1 status before initiation of treatment.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor liver function tests at repeated intervals during treatment and for at least 6 months after last dose—recurrent hepatitis may occur on discontinuation.

- **PATIENT AND CARER ADVICE**
  - Missed doses
    - Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

    - **BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION**
      - Child 1-23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

  - Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children

    - **BY INTRAVENOUS INFUSION**
      - Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

  - **REBETOL ® CAPSULES**
    - Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation
      - **BY MOUTH**
        - Child 3-17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
        - Child 3-17 years (body-weight 47-49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
        - Child 3-17 years (body-weight 50-64 kg): 400 mg twice daily
        - Child 3-17 years (body-weight 65-80 kg): 600 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
        - Child 3-17 years (body-weight 81-104 kg): 600 mg twice daily
        - Child 3-17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

  - **REBETOL ® ORAL SOLUTION**
    - Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation
      - **BY MOUTH**
        - Child 3-17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
        - Child 3-17 years (body-weight 47-49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
        - Child 3-17 years (body-weight 50-64 kg): 400 mg twice daily
        - Child 3-17 years (body-weight 65-80 kg): 600 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
        - Child 3-17 years (body-weight 81-104 kg): 600 mg twice daily
        - Child 3-17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

- **UNLICENSED USE**
  - When used by inhalation
    - Inhalation licensed for use in children (age range not specified by manufacturer).
  - With intravenous use
    - Intravenous preparation not licensed.

- **CONTRA-INDICATIONS**
  - With systemic use
    - Active severe psychiatric condition • autoimmune disease • autoimmune hepatitis • haemoglobinopathies • history of severe psychiatric condition • severe debilitating medical conditions • severe, uncontrolled cardiac disease in children with chronic hepatitis C

- **CAUTIONS**
  - When used by inhalation
    - Maintain standard supportive respiratory and fluid management therapy
  - With systemic use
    - Cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration)

  - Consult product literature for specific precautions when ribavirin used in combination with other medicinal products—patients with a
transplant—risk of rejection - risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

- **INTERACTIONS** ➔ Appendix 1: ribavirin
- **SIDE-EFFECTS**
  - Uncommon Dehydration - diabetes mellitus - hallucination - hearing loss - hepatic disorders - hypertension - nerve disorders - sarcoidosis - suicidal tendencies - thyroiditis
  - Rare or very rare Angina pectoris - angiodema - bone marrow disorders - cardiac inflammation - cerebral ischaemia - cholangitis - coma - congestive heart failure - facial paralysis - hepatic failure (discontinue) - hypersensitivity - intracranial haemorrhage - myocardial infarction - myopathy - pancreatitis - psychotic disorder - pulmonary embolism - retinopathy - seizure - severe cutaneous adverse reactions (SCARs) - systemic lupus erythematosus (SLE) - vasculitis
  - Frequency not known Haemolytic anaemia - homicidal ideation - nephrotic syndrome - pure red cell aplasia - renal failure - solid organ transplant rejection - tongue discolouration - ulcerative colitis

**SIDE-EFFECTS, FURTHER INFORMATION** Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

- **CONCEPTION AND CONTRACEPTION**
  - With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
  - When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

- **PREGNANCY** Avoid; teratogenicity in animal studies.
  - When used by inhalation Pregnant women should avoid exposure to aerosol.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.

- **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased. Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
  - Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
  - With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature). Test thyroid function before treatment and then every 3 months.
  - With oral use Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013) NICE TA300
  - Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children. www.nice.org.uk/TA300

- **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.

- **ANTIVIRALS** ➔ NUCLEOTIDE ANALOGUES

**Ledipasvir with sofosbuvir**

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 417.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

**INDICATIONS AND DOSE** Chronic hepatitis C infection (initiated by a specialist)
- **BY MOUTH**
  - Child 12-17 years: 90/400 mg once daily, for duration of treatment consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to
**SOFOSVURIR**

**Chronic hepatitis C infection**

- By mouth
- Child 12-17 years: 400 mg once daily, for duration of treatment consult product literature

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:
- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

**CAUTIONS**

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1343/18

The Scottish Medicines Consortium has advised (June 2018) that ledipasvir with sofosbuvir (Harvoni®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 and 4 only in patients aged 12 years up to 18 years.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS

- Harvoni (Gilead Sciences International Ltd)

Ledipasvir 90 mg, Sofosbuvir 400 mg | Harvoni 90mg/400mg tablets | 28 tablet blister | £12,993.33

**PRESCRIBING AND DISPENSING INFORMATION**

Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

Vomiting. If vomiting occurs within 5 hours of administration, an additional dose should be taken.

Missed doses. If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**SIDE-EFFECTS**

- Common or very common: Fatigue, headache, rash
- Frequency not known: Angioedema, arrhythmia

**INTERACTIONS**

- Appendix 1: ledipasvir, sofosbuvir

**CAUTIONS**

**FURTHER INFORMATION**

Manufacturer advises—in limited information available.

**PREGNANCY**

Manufacturer advises avoid.

**RENAI IMPAIRMENT**

Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

**BREAST FEEDING**

Manufacturer advises avoid.

**NICE decisions**

- Sofosbuvir for treating chronic hepatitis C (February 2015)

NICE TA320

Sofosbuvir (Sovaldi®) in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
- of genotype 3 with cirrhosis (treatment naïve patients)
- of genotype 3 that has not adequately responded to interferon–based treatment
- of genotype 4, 5, or 6 with cirrhosis.

Sofosbuvir (Sovaldi®) in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 2 who are intolerant to or ineligible for interferon (treatment naïve patients)
- of genotype 2 that has not adequately responded to interferon–based treatment
- of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naïve patients)
Infection

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Glecaprevir-pibrentasvir for treating chronic hepatitis C (January 2018) NICE TA499

Glecaprevir with pibrentasvir is recommended, within its marketing authorisation, as an option for treating chronic hepatitis C in adults, only if the manufacturer provides the drug at the same price or lower than that agreed with the Commercial Medicines Unit.

www.nice.org.uk/guidance/ta499

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (November 2017) that glecaprevir with pibrentasvir (Maviret®) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDIcular SAFETY INFORMATION

Hepatitis B infection

Cases of hepatitis B reactivation, sometimes fatal, have been reported in patients co-infected with hepatitis B and C viruses; manufacturer advises to assess patients for hepatitis B prior to initiation of therapy and manage according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

▶ to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;

▶ to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;

▶ to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

renal SAFETY INFORMATION

Hepatitis B infection

Hepatitis C infection of genotypes 2, or 3, is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

### Herpesvirus infections

#### 5.3 Herpesvirus infections

**Herpes simplex infections**

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

**Herpes simplex infections**

Infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. After completing parental treatment of neonatal herpes simplex encephalitis, oral suppression therapy with aciclovir p. 420 for 6 months can be considered on specialist advice. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

**Varicella–zoster infections**

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe
Infection supervision.

Cytomegalovirus infection

Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital herpes; there is limited information available on use in children.

Valaciclovir is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed in children over 12 years for preventing cytomegalovirus disease following solid organ transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision.

Cytomegalovirus infection

Ganciclovir p. 423 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 438; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet sodium p. 424 is also active against cytomegalovirus; it is toxic and can cause renal impairment. It is deposited in teeth, bone and cartilage, and animal studies have shown that deposition is greater in young animals. Its effect on skeletal development in children is not known. Foscarnet sodium should be prescribed under specialist supervision.

Aciclovir (Aciclovir)

- **INDICATIONS AND DOSE**
  - **Herpes simplex, suppression**
    - **BY MOUTH**
      - Child 12-17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
  - **Herpes simplex, prophylaxis in the immunocompromised**
    - **BY MOUTH**
      - Child 1-23 months: 100–200 mg 4 times a day
      - Child 2-17 years: 200–400 mg 4 times a day
  - **Herpes simplex, treatment**
    - **BY MOUTH**
      - Child 1-23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
      - Child 2-17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment).

  - **Herpes simplex, treatment, in immunocompromised or if absorption impaired**
    - **BY MOUTH**
      - Child 1-23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
    - **BY INTRAVENOUS INFUSION**
      - Child 3 months-11 years: 250 mg/m² every 8 hours usually for 5 days
      - Child 12-17 years: 5 mg/kg every 8 hours usually for 5 days
  - **Herpes simplex, treatment, in immunocompromised or in simplex encephalitis**
    - **BY INTRAVENOUS INFUSION**
      - Child 3 months-11 years: 500 mg/m² every 8 hours usually for 5 days (given for at least 21 days in encephalitis—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

  - **Varicella zoster (chickenpox), treatment**
    - **BY MOUTH**
      - Child 1-23 months: 200 mg 4 times a day for 5 days
      - Child 2-5 years: 400 mg 4 times a day for 5 days
      - Child 6-11 years: 800 mg 4 times a day for 5 days
      - Child 12-17 years: 800 mg 5 times a day for 7 days
Herpesvirus infections 421

- **INTERACTIONS** ➔ Appendix 1: aciclovir
- **SIDE-EFFECTS**
  - Common or very common
    - With intravenous use Nausea, photosensitivity reaction, skin reactions, vomiting
    - With oral use Abdominal pain, diarrhoea, dizziness, fatigue, fever, headache, nausea, photosensitivity reaction, skin reactions, vomiting
  - Uncommon
    - With intravenous use Anaemia, leucopenia, thrombocytopenia
  - Rare or very rare
    - With intravenous use Abdominal pain, agitation, angioedema, ataxia, coma, confusion, diarrhoea, dizziness, drowsiness, dysarthria, dysphonia, encephalopathy, fatigue, fever, hallucination, headache, hepatic disorders, inflammation, localised, psychosis, renal impairment, renal pain, seizure, tremor
    - With oral use Agitation, anaemia, angioedema, ataxia, coma, confusion, drowsiness, dysarthria, dysphonia, encephalopathy, hallucination, hepatic disorders, leucopenia, psychosis, renal impairment, renal pain, seizure, thrombocytopenia, tremor
  - Frequency not known
    - With intravenous use Crystalluria
    - With oral use Alopecia, crystalluria
  - **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
  - **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
  - **RENAL IMPAIRMENT** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).
  - **Dose adjustments**
    - With intravenous use Use normal intravenous dose every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m². Consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
    - With oral use For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
  - **DIRECTIONS FOR ADMINISTRATION**
    - With intravenous use For intravenous infusion, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - With oral use Flavours of oral liquid preparations may include banana, or orange.
  - **PATIENT AND CARER ADVICE**
    - Medicines for Children leaflet: Aciclovir (oral) for viral infections
    - With oral use www.medicinesforchildren.org.uk/aciclovir-oral-viral-infections-0
  - **PROFESSION SPECIFIC INFORMATION**
    - Dental practitioners’ formulary
      - With oral use Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

**VARICELLA ZOSTER (CHICKENPOX), TREATMENT IN IMMUNOCOMPROMISED | HERPES ZOSTER (SHINGLES), TREATMENT IN IMMUNOCOMPROMISED**

- **BY INTRAVENOUS INFUSION**
  - Neonate: 10–20 mg/kg every 8 hours for at least 7 days.
  - Child 1–2 months: 10–20 mg/kg every 8 hours for at least 7 days.
  - Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days.
  - Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days.
  - **Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised**
    - **BY INTRAVENOUS INFUSION**
      - Child 1–2 months: 200 mg 4 times a day continued for 2 days after crusting of lesions.
      - Child 2–5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions.
      - Child 6–11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions.
      - Child 12–17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions.
  - **Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
      - Child 1–2 months: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
      - Child 3 months–11 years: 500 mg/m² every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
      - Child 12–17 years: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
  - **Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated**
    - **BY MOUTH**
      - Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure.
  - **Varicella zoster (chickenpox), prophylaxis after delivery**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 10 mg/kg every 8 hours continued until serological tests confirm absence of virus.

**DOSES AT EXTREMES OF BODY-WEIGHT**

- With intravenous use To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.
- **UNLICENSED USE**
  - With intravenous use Intravenous infusion not licensed for herpes zoster in children under 18 years.
  - With oral use Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer).
  - Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.
- **CAUTIONS** Maintain adequate hydration (especially with infusion or high doses).
Infection

Infection

l MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

l Aciclovir (Non-proprietary)

Aciclovir 200 mg Aciclovir 200mg tablets | 25 tablet (PO) £1.25 DT = £1.03
Aciclovir 400 mg Aciclovir 400mg tablets | 56 tablet (PO) £3.30 DT = £2.42
Aciclovir 800 mg Aciclovir 800mg tablets | 35 tablet (PO) £4.35 DT = £3.25

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS

l Aciclovir (Non-proprietary)

Aciclovir 200 mg Aciclovir 200mg dispersible tablets | 25 tablet (PO) £1.05 DT = £1.01
Aciclovir 400 mg Aciclovir 400mg dispersible tablets | 56 tablet (PO) £1.98 DT = £1.96
Aciclovir 800 mg Aciclovir 800mg dispersible tablets | 35 tablet (PO) £1.90 DT = £1.98

v Zovirax (GlaxoSmithKline UK Ltd)

Aciclovir 200 mg Zovirax 200mg dispersible tablets | 25 tablet (PO) £2.85 DT = £1.01
Aciclovir 800 mg Zovirax 800mg dispersible tablets | 35 tablet (PO) £1.50 DT = £1.08

Oral suspension

CAUTIONARY AND ADVISORY LABELS

l Aciclovir (Non-proprietary)

Aciclovir 40 mg per 1 ml Aciclovir 200mg/5ml oral suspension sugar free sugar-free | 125 ml (PO) £35.76 DT = £35.76
Aciclovir 80 mg per 1 ml Aciclovir 400mg/5ml oral suspension sugar free sugar-free | 100 ml (PO) £39.47 DT = £39.47

v Zovirax (GlaxoSmithKline UK Ltd)

Aciclovir 40 mg per 1 ml Zovirax 200mg/5ml oral suspension sugar-free | 125 ml (PO) £29.56 DT = £29.56
Aciclovir 80 mg per 1 ml Zovirax Double Strength 400mg/5ml oral suspension sugar-free | 100 ml (PO) £33.02 DT = £33.02

Solution for infusion

ELECTROLYTES: May contain Sodium

l Aciclovir (Non-proprietary)

Aciclovir (as Aciclovir sodium) 25 mg per 1 ml Aciclovir 1g/40ml solution for infusion vials | 1 vial (PO) £40.00 (Hospital only)
Aciclovir 250mg/10ml concentrate for solution for infusion vials | 5 vial (PO) £50.00 (Hospital only) | 5 vial (PO) £30.00–£40.00
Aciclovir 500mg/20ml solution for infusion vials | 5 vial (PO) £100.00 (Hospital only) | 5 vial (PO) £50.00
Aciclovir 500mg/20ml concentrate for solution for infusion vials | 5 vial (PO) £40.00 (Hospital only)

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

l Aciclovir (Non-proprietary)

Aciclovir (as Aciclovir sodium) 250 mg Aciclovir 250mg powder for solution for infusion vials | 5 vial (PO) £116.50 (Hospital only)
Aciclovir 250mg powder for solution for infusion vials | 5 vial (PO) £49.30 | 10 vial (PO) £91.30 (Hospital only)
Aciclovir (as Aciclovir sodium) 500 mg Aciclovir 500mg powder for solution for infusion vials | 5 vial (PO) £182.00 (Hospital only)

v Zovirax IV. (GlaxoSmithKline UK Ltd)

Aciclovir (as Aciclovir sodium) 250 mg Zovirax IV. 250mg powder for solution for infusion vials | 5 vial (PO) £116.70
Aciclovir (as Aciclovir sodium) 500 mg Zovirax IV. 500mg powder for solution for infusion vials | 5 vial (PO) £170.00

l UNLICENSED USE Not licensed for treatment of herpes zoster in children. Not licensed for treatment or suppression of herpes simplex infection in immunocompromised or HIV-positive children.

l CAUTIONS Maintain adequate hydration (especially with high doses).

l INTERACTIONS → Appendix 1: valaciclovir

l SIDE-EFFECTS

Common or very common Diarrhoea, dizziness, headache, nausea, photosensitivity reaction, skin reactions, vomiting

Uncommon Abdominal discomfort, agitation, confusion, dysphoria, hallucination, leucopenia, level of consciousness decreased, renal pain, thrombocytopenia, tremor

Rare or very rare Angioedema, ataxia, coma, delirium, dysarthria, encephalopathy, neuphotaxis, psychosis, renal impairment, seizure

Frequency not known Microangiopathic haemolytic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Neurological reactions more frequent with higher doses.

l PREGNANCY Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

l BREAST FEEDING Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

l HEPATIC IMPAIRMENT Manufacturer advises caution with doses of 4 g or more per day (no information available).

l RENAL IMPAIRMENT Maintain adequate hydration.

## Valaciclovir

l INDICATIONS AND DOSE

Herpes zoster infection, treatment in immunocompromised patients

BY MOUTH

Child 12–17 years: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

Herspes simplex, treatment of first infective episode

BY MOUTH

Child 12–17 years: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herspes simplex infections treatment of first episode in immunocompromised or HIV-positive patients

BY MOUTH

Child 12–17 years: 1 g twice daily for 10 days

Herspes simplex, treatment of recurrent infections

BY MOUTH

Child 12–17 years: 1 g twice daily for 3–5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients

BY MOUTH

Child 12–17 years: 1 g twice daily for 5–10 days

Herspes labialis treatment

BY MOUTH

Child 12–17 years: Initially 2 g, then 2 g after 12 hours

Herspes simplex, suppression of infections

BY MOUTH

Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herspes simplex, suppression of infections in immunocompromised or HIV-positive patients

BY MOUTH

Child 12–17 years: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

BY MOUTH

Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

Herspes labialis treatment

BY MOUTH

Child 12–17 years: Initially 2 g, then 2 g after 12 hours

Herspes simplex, suppression of infections

BY MOUTH

Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

BY MOUTH

Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

**HERPES SIMPLEX, TREATMENT OF FIRST INFECTIVE EPISODE**

- **BY MOUTH**
  - Child 12–17 years: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

**HERPES SIMPLEX INFECTIONS TREATMENT OF FIRST EPISODE IN IMMUNOCOMPROMISED OR HIV-POSITIVE PATIENTS**

- **BY MOUTH**
  - Child 12–17 years: 1 g twice daily for 10 days

**HERPES SIMPLEX TREATMENT OF RECURRENT INFECTIONS**

- **BY MOUTH**
  - Child 12–17 years: 1 g twice daily for 3–5 days

**TREATMENT OF RECURRENT HERPES SIMPLEX INFECTIONS IN IMMUNOCOMPROMISED OR HIV-POSITIVE PATIENTS**

- **BY MOUTH**
  - Child 12–17 years: 1 g twice daily for 5–10 days

**HERPES LABIALS TREATMENT**

- **BY MOUTH**
  - Child 12–17 years: Initially 2 g, then 2 g after 12 hours

**HERPES SIMPLEX, SUPPRESSION OF INFECTIONS**

- **BY MOUTH**
  - Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**PREVENTION OF CYTOMEGALOVIRUS DISEASE FOLLOWING SOLID ORGAN TRANSPLANTATION WHEN VALGANCICLOVIR OR GANCICLOVIR CANNOT BE USED**

- **BY MOUTH**
  - Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation
Dose adjustments For herpes zoster, 1 g every 12 hours if estimated glomerular filtration rate 30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

For treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

For treatment of herpes labialis, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).

For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Reduce dose according to estimated glomerular filtration rate for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature).

Prescribing and dispensing information Valaciclovir is a pro-drug of aciclovir.

Medicinal forms There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Cautions and Advisory Labels 9

Valaciclovir (Non-proprietary)

Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valaciclovir

500 mg tablets | 10 tablet | £20.59 OT = £2.47 | 42 tablet | £8.99-£8.30

Valtrex (GlaxoSmithKline UK Ltd)

Valaciclovir (as Valaciclovir hydrochloride) 250 mg Valtrex 250 mg tablets | 60 tablet | £123.28 OT = £212.28

Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valtrex

500 mg tablets | 10 tablet | £20.59 OT = £2.47 | 42 tablet | £8.30

5.3a Cytomegalovirus infections

Antivirals Nucleoside Analogues

Ganciclovir

Indications and dose Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

By intravenous infusion

Child 12-17 years: Initially 5 mg/kg every 12 hours for 7–14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

By intravenous infusion

Neonate: (consult product literature).

Child 1 month-16 years: (consult product literature)

Child 17 years: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

Treatment of cytomegalovirus disease [in immunocompromised patients]

By intravenous infusion

Child: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated

Congenital cytomegalovirus infection of the CNS

By intravenous infusion

Neonate: 6 mg/kg every 12 hours for 6 weeks.

Unlicensed use Not licensed for use in children under 12 years for the treatment of cytomegalovirus disease in immunocompromised patients.

In neonates Not licensed for congenital cytomegalovirus infection of the CNS.

Contra-indications Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)

Caution History of cytopenia - potential carcinogen (including long-term carcinogenicity) - potential teratogen (including long-term teratogenicity) - radiotherapy

Interactions Appendix 1: Ganciclovir

Side-effects

Uncommon Alopecia - arthralgia - deafness - haematuria - hypotension - infertility male - oral ulceration - pancreatitis - psychotic disorder - tremor - visual impairment

Rare or very rare Agranulocytosis - hallucination

Allergy and cross-sensitivity Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

Conception and contraception Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis — impaired fertility observed in animal studies.

Pregnancy Manufacturer advises avoid unless potential benefit outweighs risk — teratogenicity in animal studies.

Breast feeding Manufacturer advises avoid — present in milk in animal studies.

Renal impairment Dose adjustments Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute — consult product literature.

Monitoring requirements Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

Directions for administration Manufacturer advises, for intravenous infusion, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for

Cytomegalovirus infections 423

5
Infections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.

**CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)

**CAUTIONS** History of cytopenia - potential carcinogen (including long-term carcinogenicity) - potential teratogen (including long-term teratogenicity) - radiotherapy

**INTERACTIONS** → Appendix 1: valganciclovir

**SIDE-EFFECTS**
- **Common or very common** Anaemia - anxiety - appetite decreased - arthralgia - asthenia - bone marrow disorders - chest pain - confusion - constipation - cough - depression - diarrhoea - dizziness - dysphagia - dyspnoea - ear pain - eye disorders - eye inflammation - eye pain - flatulence - gastrointestinal discomfort - headache - hepatic function abnormal - increased risk of infection - insomnia - leucopenia - malaise - muscle complaints - nausea - neutropenia - night sweats - pain - peripheral neuropathy - renal impairment - seizure - sensation abnormal - sepsis - skin reactions - taste altered - thinking abnormal - thrombocytopenia - vomiting - weight decreased
- **Uncommon** Alopecia - arrhythmia - deafness - haematuria - hallucination - hypotension - infertility male - oral ulceration - pancreatitis - psychotic disorder - tremor - visual impairment

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in animal studies.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with ganciclovir in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—ganciclovir present in milk in animal studies.

**MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

**PRESCRIBING AND DISPENSING INFORMATION**
Valganciclovir is a pro-drug of ganciclovir. Flavours of oral liquid formulations may include tutti-frutti.

**HANDLING AND STORAGE** Manufacturer advises reconstituted powder for oral solution should be stored in a refrigerator (2–8°C) for up to 49 days. Caution in handling Valganciclovir is a potential teratogen and carcinogen. Manufacturer advises caution when handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

---

**Valganciclovir**

**INDICATIONS AND DOSE**
Prevention of cytomegalovirus disease (following solid organ transplantation from a cytomegalovirus positive donor)

**BY MOUTH**
- Neonate: (consult product literature).
- Child: (consult product literature)

**DOSE EQUIVALENCE AND CONVERSION**
- Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

**CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)

**CAUTIONS** History of cytopenia - potential carcinogen (including long-term carcinogenicity) - potential teratogen (including long-term teratogenicity) - radiotherapy

**INTERACTIONS** → Appendix 1: valganciclovir

**SIDE-EFFECTS**
- **Common or very common** Anaemia - anxiety - appetite decreased - arthralgia - asthenia - bone marrow disorders - chest pain - confusion - constipation - cough - depression - diarrhoea - dizziness - dysphagia - dyspnoea - ear pain - eye disorders - eye inflammation - eye pain - flatulence - gastrointestinal discomfort - headache - hepatic function abnormal - increased risk of infection - insomnia - leucopenia - malaise - muscle complaints - nausea - neutropenia - night sweats - pain - peripheral neuropathy - renal impairment - seizure - sensation abnormal - sepsis - skin reactions - taste altered - thinking abnormal - thrombocytopenia - vomiting - weight decreased
- **Uncommon** Alopecia - arrhythmia - deafness - haematuria - hallucination - hypotension - infertility male - oral ulceration - pancreatitis - psychotic disorder - tremor - visual impairment

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 90 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with ganciclovir in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—ganciclovir present in milk in animal studies.

**MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

**PRESCRIBING AND DISPENSING INFORMATION**
Valganciclovir is a pro-drug of ganciclovir. Flavours of oral liquid formulations may include tutti-frutti.

**HANDLING AND STORAGE** Manufacturer advises reconstituted powder for oral solution should be stored in a refrigerator (2–8°C) for up to 49 days. Caution in handling Valganciclovir is a potential teratogen and carcinogen. Manufacturer advises caution when handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

---

**Foscarnet sodium**

**INDICATIONS AND DOSE**
Cytomegalovirus disease

**BY INTRAVENOUS INFUSION**
- Child (under expert supervision): Initially 60 mg/kg every 8 hours 2–3 weeks, then maintenance 60 mg/kg daily, increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

**Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients**

**BY INTRAVENOUS INFUSION**
- Child (under expert supervision): 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Ensure adequate hydration

**INTERACTIONS** → Appendix 1: foscarnet

**SIDE-EFFECTS**
- **Common or very common** Aggression - anaemia - anxiety - appetite decreased - arthralgia - asthenia - chest pain - chills - confusion - constipation - coordination abnormal - dehydration - depression - diarrhoea - dizziness - electrolyte imbalance - fever - gastrointestinal discomfort - genital
discomfort (due to high concentrations excreted in urine), genital ulceration (due to high concentrations excreted in urine), haemorrhage, headache, hepatic function abnormal, hypertension, hypotension, leucopenia, malaise, muscle contractions involuntary, myalgia, nausea, reduced infusion rate, neutropenia, numbness, oedema, palpatations, pancreatitis, paraesthesia (reduced infusion rate), peripheral neuropathy, proteinuria, renal impairment, seizure, sepsis, skin reactions, thrombocytopenia, thrombophlebitis, tremor, urinary disorders, vomiting.

- **Uncommon** Acidosis, angioedema, glomerulonephritis, nephropathy, pancytopenia
- **Frequency not known** Anaphylactoid reaction, diabetes insipidus, muscle weakness, myopathy, oesophageal ulcer, QT interval prolongation, renal pain, renal tubular acidosis, severe cutaneous adverse reactions (SCARs)

**CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**RENAL IMPAIRMENT** Dose adjustments: Reduce dose; consult product literature.

**MONITORING REQUIREMENTS**
- Monitor electrolytes, particularly calcium and magnesium.
- Monitor serum creatinine every second day during induction and every week during maintenance.

**DIRECTIONS FOR ADMINISTRATION** Avoid rapid infusion. For *intravenous infusion*, give undiluted solution via a central venous catheter; alternatively dilute to a concentration of 12 mg/ml with glucose 5% or Sodium Chloride 0.9% for administration via a peripheral vein; give over at least 1 hour (give doses greater than 60 mg/kg over 2 hours).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium
- Foscavir (Clinigen Healthcare Ltd)
- Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles 1 bottle £119.85 (Hospital only)

### 5.4 HIV infection

**HIV infection**

**Overview**

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals.

The natural progression of HIV disease is different in children compared to adults; drug treatment should only be undertaken by specialists within a formal paediatric HIV clinical network. Guidelines and dose regimens are under constant review and for this reason some dose recommendations have not been included in BNF for Children.

Further information on the management of children with HIV can be obtained from the Children’s HIV Association (CHIVA) www.chiva.org.uk; and further information on antiretroviral use and toxicity can be obtained from the Paediatric European Network for Treatment of AIDS (PENTA) website penta-id.org/.

**Aims of treatment**

Treatment is aimed at suppressing viral replication for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and the child’s tolerance of treatment. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

**Initiation of treatment**

Treatment is started in all HIV infected children under 1 year of age regardless of clinical and immunological parameters. In children over 1 year of age, treatment is based on the child’s age, CD4 cell count, viral load, and symptoms. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Initiating treatment with a combination of drugs (‘highly active antiretroviral therapy’ which includes 2 nucleoside reverse transcriptase inhibitors with *either* a non-nucleoside reverse transcriptase inhibitor or a boosted protease inhibitor) is recommended. Abacavir p. 431 and lamivudine p. 436 are the nucleoside reverse transcriptase inhibitors of choice for initial therapy; however, zidovudine p. 438 and lamivudine are used in children who are positive for the HLA-B*5701 allele. Nevirapine p. 430 is the preferred non-nucleoside reverse transcriptase inhibitor in children under 3 years of age, but efavirenz p. 429 is preferred in older children. Lopinavir with ritonavir p. 441 is the preferred boosted protease inhibitor for initial therapy. The metabolism of many antiretrovirals varies in young children; it may therefore be necessary to adjust the dose according to the plasma-drug concentration. Children who require treatment for both HIV and chronic hepatitis B should receive antivirals that are active against both diseases.

**HIV infection, switching therapy**

Deterioration of the condition (including clinical, virological changes, and CD4 cell changes) may require a complete change of therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance, and the possibility of cross-resistance.

**HIV infection and pregnancy**

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. *All treatment options require careful assessment by a specialist.* Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Local protocols and national guidelines (www.bhiva.org) should be consulted for recommendations on treatment during pregnancy and the perinatal period. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childbirth at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.
**HIV infection and breast-feeding**

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

**HIV infection, post-exposure prophylaxis**

Children exposed to HIV infection through needlestick injury or by another route should be taken immediately to an accident and emergency department for post-exposure prophylaxis [unlicensed indication]. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Recommendations have been developed by the Children’s HIV Association, www.chiva.org.uk.

**Drug treatment**

Zidovudine, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 433, emtricitabine p. 434, lamivudine, stavudine p. 437, and tenofovir disoproxil p. 437. There are concerns about renal toxicity and effects on bone mineralisation when tenofovir disoproxil is used in prepubertal children.

The protease inhibitors include atazanavir p. 439, darunavir p. 439, fosamprenavir p. 441 (a pro-drug of amprenavir), lopinavir (available as lopinavir with ritonavir), ritonavir p. 442, and tipranavir p. 442. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 429, nevirapine and rilpivirine p. 431 are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and rarely fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs.

Enfuvirtide below should be combined with other potentially active antiretroviral drugs; it is given by subcutaneous injection.

Maraviroc p. 443 is an antagonist of the CCR5 chemokine receptor. It is used in patients exclusively infected with CCR5–tropic HIV.

Dolutegravir p. 427 and raltegravir p. 427 are inhibitors of HIV integrase. They are used for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

**Immune reconstitution syndrome**

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

**Osteonecrosis**

Osteonecrosis has been reported in children with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**HIV infection in neonates**

In order to prevent transmission of infection, neonates born to HIV-positive mothers should be given post-exposure prophylaxis as soon as possible after birth, but starting no later than 72 hours after birth. Zidovudine p. 438 alone should be given to neonates whose mothers had a viral load less than 50 HIV RNA copies/mL between 36 weeks’ gestation and delivery, or whose mothers underwent caesarean section while taking zidovudine monotherapy. Combination antiretroviral therapy should be given to neonates whose mothers had a viral load over 50 HIV RNA copies/mL at delivery or whose mothers are found to be HIV positive after delivery. Prophylaxis is continued for 4 weeks.

**ANTIVIRALS)**

**HIV-FUSION INHIBITORS**

**Enfuvirtide**

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

- **INDICATIONS AND DOSE**

  HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

  - **BY SUBCUTANEOUS INJECTION**
    - Child 6–15 years: 2 mg/kg twice daily (max. per dose 90 mg)
    - Child 16–17 years: 90 mg twice daily

- **SIDE-EFFECTS**

  - Common or very common Anxiety - appetite decreased - asthenia - concentration impaired - conjunctivitis - diabetes mellitus - gastrooesophageal reflux disease - haematuria - hyperglycaemia - increased risk of infection - influenza like illness - iritability - lymphadenopathy - myalgia - nasal congestion - nephrolithiasis - night mare - numbness - pancreatitis - peripheral neuropathy - skin papilloma - skin reactions - tremor - vertigo - weight decreased

  - Frequency not known Diarrhoea - hypersensitivity - immune reconstitution inflammatory syndrome - nausea - osteonecrosis

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - Hypersensitivity

    Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).

- **DIRECTIONS FOR ADMINISTRATION** For subcutaneous injection, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.
HIV infection 427

**PATIENT AND CARER ADVICE**

Hypersensitivity reactions. Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

**MEDICINAL FORMS**

There can be a variation in the licensing of different medicines containing the same drug.

**SIDE-EFFECTS**

**Common or very common** Depression, diarrhoea, dizziness, fatigue, flatsulence, gastrointestinal discomfort, headache, nausea, skin reactions, sleep disorders, vomiting

**Uncommon** Arthralgia, hepatitis, hypersensitivity, immune reconstitution inflammatory syndrome, myalgia, suicidal tendencies

---

**COMMON DRUGS**

**Dolutegravir**

**INDICATIONS AND DOSE**

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs**

- By mouth
  - Child 12-17 years (body-weight 40 kg and above): 50 mg once daily

**HIV infection in combination with other antiretroviral drugs**

- With concomitant carboamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John’s wort, rifampicin, or tipranavir
  - By mouth
    - Child 12-17 years (body-weight 40 kg and above): 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

---

**COMMUNICATION WITH PATIENTS**

**PREGNANCY**

Manufacturer advises avoid, see **Important Safety Information**.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

The **Scottish Medicines Consortium (SMC)** has advised (October 2017) that dolutegravir (Tivicay®) is recommended as an option for use within NHS Scotland when used in combination with other anti-retroviral medicinal products for the treatment of HIV infected children aged 6 to 12 years of age. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected children aged 6 to 12 years of age. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The **Scottish Medicines Consortium (SMC)** has advised (July 2017) that dolutegravir (Tivicay®) is recommended for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected children aged 6 to 12 years of age. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**All Wales Medicines Strategy Group (AWMSG) decisions**

The **All Wales Medicines Strategy Group (AWMSG)** has advised (October 2017) that dolutegravir (Tivicay®) is recommended as an option for use within NHS Wales in combination with other anti-retroviral medicinal products for the treatment of HIV infected patients above 6 years of age. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

**MEDICINAL FORMS**

There can be a variation in the licensing of different medicines containing the same drug.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypersensitivity**

Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

**Osteonecrosis**

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**PREGNANCY**

Manufacturer advises avoid, see **Important Safety Information**.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment—no information available.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer dolutegravir tablets.

**Missed doses**

If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

**INTERACTIONS**

Appendix 1: dolutegravir

**Important Safety Information**

**MHRA/CHM ADVICE: Dolutegravir (Tivicay®, Triumeq®, Juluca®): Signal of Increased Risk of Neural Tube Defects; Do Not Prescribe to Women Seeking to Become Pregnant; Exclude Pregnancy Before Initiation and Advise Use of Effective Contraception (June 2018)**

New safety recommendations have been issued whilst an EU review evaluates cases of neural tube defects in babies born to mothers who became pregnant while taking dolutegravir. The MHRA advises:

- Dolutegravir should not be prescribed to women who are trying to become pregnant.
- Pregnancy should be excluded in women of childbearing potential with pregnancy testing before starting dolutegravir.
- Women of childbearing potential should be advised to use effective contraception throughout treatment with dolutegravir.
- If pregnancy is confirmed in the first trimester while a woman is taking dolutegravir, switch to an alternative treatment unless there is no suitable alternative.
- Women taking dolutegravir for HIV should be advised not to stop taking their medicine without first consulting their doctor.

**Interactions**

Appendix 1: dolutegravir

**SIDE-EFFECTS**

**Common or very common** Depression, diarrhoea, dizziness, fatigue, flatsulence, gastrointestinal discomfort, headache, nausea, skin reactions, sleep disorders, vomiting

**Uncommon** Arthralgia, hepatitis, hypersensitivity, immune reconstitution inflammatory syndrome, myalgia, suicidal tendencies

**INDICATIONS AND DOSE**

**HIV infection (initiated by a specialist)**

- By mouth using tablets
  - Child (body-weight 25 kg and above): 400 mg twice daily
  - Child (body-weight 40 kg and above): 1200 mg once daily, once daily dosing for use in patients who are not started on a twice daily regimen

---

**Raltegravir**

**DRUG ACTION**

Raltegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**

**HIV-1 infection (initiated by a specialist)**

- By mouth using tablets
  - Child (body-weight 25 kg and above): 10 mg twice daily
  - Child (body-weight 40 kg and above): 20 mg twice daily

**SIDE-EFFECTS**

**Common or very common** Depression, diarrhoea, dizziness, fatigue, flatsulence, gastrointestinal discomfort, headache, nausea, skin reactions, sleep disorders, vomiting

**Uncommon** Arthralgia, hepatitis, hypersensitivity, immune reconstitution inflammatory syndrome, myalgia, suicidal tendencies
treatment naïve or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only

- **BY MOUTH USING CHEWABLE TABLETS**
  - Child (body-weight 11-13 kg): 75 mg twice daily
  - Child (body-weight 14-19 kg): 100 mg twice daily
  - Child (body-weight 20-27 kg): 150 mg twice daily
  - Child (body-weight 28-39 kg): 200 mg twice daily
  - Child (body-weight 40 kg and above): 300 mg twice daily
- **BY MOUTH USING ORAL SUSPENSION**
  - Neonate up to 7 days (body-weight 2-2.5 kg): 4 mg once daily.
  - Neonate up to 7 days (body-weight 3-3.5 kg): 5 mg once daily.
  - Neonate 7 days to 28 days (body-weight 2.5-4 kg): 7 mg once daily.
  - Neonate 7 days to 28 days (body-weight 4-4.5 kg): 8 mg twice daily.
  - Neonate 7 days to 28 days (body-weight 4-4.5 kg): 10 mg twice daily.
  - Child (body-weight 3-3.5 kg): 25 mg twice daily
  - Child (body-weight 4-5 kg): 30 mg twice daily
  - Child (body-weight 6-7.5 kg): 40 mg twice daily
  - Child (body-weight 8-10 kg): 60 mg twice daily
  - Child (body-weight 11-13 kg): 80 mg twice daily
  - Child (body-weight 14-19 kg): 100 mg twice daily

- **DOSE EQUIVALENCE AND CONVERSION**
  - Raltegravir granules for oral suspension and chewable tablets are not bioequivalent or interchangeable with the 400 mg and 600 mg standard tablets.

- **CONTRA-INDICATIONS**
  - Pre-term neonates—no information available

- **CAUTIONS**
  - Psychiatric illness (may exacerbate underlying illness including depression) - risk factors for myopathy - risk factors for rhabdomyolysis

- **INTERACTIONS**

- **SIDE-EFFECTS**
  - **Common or very common**
    - Akathisia
    - Appetite abnormal
    - Asthenia
    - Behaviour abnormal
    - Depression
    - Diarrhoea
    - Dizziness
    - Fever
    - Gastrointestinal discomfort
    - Gastrointestinal disorders
    - Headaches
    - Nausea
    - Skin reactions
    - Sleep disorders
    - Vertigo
    - Vomiting
  - **Uncommon**
    - Alopecia
    - Anaemia
    - Anxiety
    - Arrhythmias
    - Arthralgia
    - Arthritis
    - Body fat disorder
    - Burping
    - Cachexia
    - Chest discomfort
    - Chills
    - Cognitive disorder
    - Concentration impaired
    - Confusion
    - Constipation
    - Diabetes mellitus
    - Drowsiness
    - Dry mouth
    - Dyslipidaemia
    - Dysphonia
    - Erectile dysfunction
    - Feeling jittery
    - Glossitis
    - Gynaecomastia
    - Haemorrhage
    - Hepatic disorders
    - Hot flush
    - Hyperglycaemia
    - Hypersensitivity
    - Hypertension
    - Immune reconstitution inflammatory syndrome
    - Increased risk of infection
    - Lipodystrophy
    - Lymph node abscess
    - Lymphatic abnormalities
    - Malaise
    - Memory loss
    - Menopausal symptoms
    - Mood altered
    - Myalgia
    - Myopathy
    - Nasal congestion
    - Nephritis
    - Nephrolithiasis
    - Nerve disorders
    - Neutropenia
    - Nocturia
    - Odynophagia
    - Oedema
    - Osteopenia
    - Pain
    - Palpitations
    - Pancreatitis acute
    - Polydipsia
    - Psychiatric disorder
    - Renal cyst
    - Renal impairment
    - Sensation abnormal
    - Severe cutaneous adverse reactions (SCARs)
    - Skin papilloma
    - Submandibular mass
    - Suicidal tendencies
    - Sweat changes
    - Taste altered
    - Tendinitis
    - Thrombocytopenia
    - Timidity
    - Tremor
    - Visual impairment
    - Weight increased
  - **Frequency not known**
    - Osteonecrosis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

  - For further information regarding lipodystrophy and osteonecrosis see HIV infection p. 425

- **PREGNANCY**
  - Manufacturer advises avoid—toxicity in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

- **DIRECTIONS FOR ADMINISTRATION**
  - Manufacturer advises for chewable tablets, the 100 mg strength can be divided into equal 50 mg doses.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dispense raltegravir chewable tablets in original container (contains desiccant).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) decisions**

  SMC No. 902/13
  - The Scottish Medicines Consortium has advised (September 2013) that raltegravir (Isentress®) is accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adolescents and children aged 2 to 17 years when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir should be prescribed under the supervision of specialists in paediatric HIV.

  SMC No. 1102/15
  - The Scottish Medicines Consortium has advised (November 2015) that raltegravir granules for oral suspension (Isentress®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults, adolescents, children, toddlers and infants from the age of 4 weeks when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir granules should be prescribed under the supervision of specialists in paediatric HIV.

  SMC No. 3113/17
  - The Scottish Medicines Consortium has advised (November 2015) that raltegravir chewable tablets (Isentress®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in children from the age of 4 weeks to <2 years when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir chewable tablets should be prescribed under the supervision of specialists in paediatric HIV.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Granules**
  - **EXCIPIENTS:** May contain Sorbitol
  - Isentress (Merck Sharp & Dohme Ltd)
  - Raltegravir 100 mg (Isentress 100mg granules sachets)
  - 60 sachet pack £213.02 DT = £213.02

Efavirenz

● INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs

▶ BY MOUTH USING CAPSULES
Child 3 months-17 years (body-weight 3.5-4 kg): 100 mg once daily
Child 3 months-17 years (body-weight 5-7.4 kg): 150 mg once daily
Child 3 months-17 years (body-weight 7.5-14 kg): 200 mg once daily
Child 3 months-17 years (body-weight 15-19 kg): 250 mg once daily
Child 3 months-17 years (body-weight 20-24 kg): 300 mg once daily
Child 3 months-17 years (body-weight 25-32.4 kg): 350 mg once daily
Child 3 months-17 years (body-weight 32.5-39 kg): 400 mg once daily
Child 3 months-17 years (body-weight 40 kg and above): 600 mg once daily
▶ BY MOUTH USING TABLETS
Child (body-weight 40 kg and above): 600 mg once daily

● CAUTIONS
Acute porphyrinas p. 624 · history of psychiatric disorders · history of seizures

● INTERACTIONS ▶ Appendix 1: efavirenz

● SIDE-EFFECTS
Common or very common Abdominal pain · anxiety · concentration impaired · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · fatigue · headache · movement disorders · nausea · skin reactions · sleep disorders · vomiting

Uncommon Behaviour abnormal · confusion · flushing · gynaecomastia · hallucination · hepatic disorders · memory loss · mood altered · pancreatitis · psychosis · seizure · Stevens-Johnson syndrome · suicidal tendencies · thinking abnormal · tinnitus · tremor · vertigo · vision blurred

Rare or very rare Delusions · photosensitivity reaction

Frequency not known Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding osteonecrosis, immune reconstitution syndrome and lipodystrophy, see HIV infection p. 425

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

● PREGNANCY
Reports of neural tube defects when used in first trimester.

● HEPATIC IMPAIRMENT
Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in severe impairment.

Monitoring In mild to moderate liver disease, monitor for dose-related side-effects (e.g. CNS effects) and liver function.

● RENAL IMPAIRMENT
Manufacturer advises caution in severe renal failure—no information available.

● MONITORING REQUIREMENTS
Monitor liver function if receiving other hepatotoxic drugs.

● DIRECTIONS FOR ADMINISTRATION
For patients who cannot swallow capsules, the capsule may be opened and contents added to a small amount of food—consult product literature. No additional food should be consumed for up to 2 hours after administration of efavirenz.

● PATIENT AND CARER ADVICE
Psychiatric disorders. Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

PRESCRIBING AND DISPENSING INFORMATION

DIRECTIONS FOR ADMINISTRATION

HEPATIC IMPAIRMENT

Frequency not known

Haemorrhagic stroke - osteonecrosis - weight increased

SIDE-EFFECTS, FURTHER INFORMATION

For further information regarding osteonecrosis, immune reconstitution syndrome and lipodystrophy, see HIV infection p. 425

Hypersensitivity reactions

Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

Hepatic impairment

Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).

DIRECTIONS FOR ADMINISTRATION

Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

PRESCRIBING AND DISPENSING INFORMATION

Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE

Hypersensitivity reactions

Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses

If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nevirapine

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child: Initially 150–200 mg/m² once daily (max. per dose 200 mg) for first 14 days, initial dose titration using ‘immediate-release’ preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the ‘immediate-release’ preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1-month-2 years: 150–200 mg/m² twice daily (max. per dose 200 mg), alternatively 300–400 mg/m² once daily (max. per dose 400 mg)

Child 3-17 years: 150–200 mg/m² twice daily (max. per dose 200 mg)

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 3-17 years (body surface area 0.58–0.83 m²): 200 mg once daily

Child 3-17 years (body surface area 0.84–1.17 m²): 300 mg once daily

Child 3-17 years (body surface area 1.18 m² and above): 400 mg once daily

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Child 3-17 years (body surface area 0.58–0.83 m²): 200 mg once daily

Child 3-17 years (body surface area 0.84–1.17 m²): 300 mg once daily

Child 3-17 years (body surface area 1.18 m² and above): 400 mg once daily

UNLICENSED USE

‘Immediate-release’ tablets not licensed for use in children weighing less than 50 kg or with body surface area less than 1.25 m²; ‘immediate-release’ tablets and suspension not licensed for once daily dose after the initial dose titration.

CONTRA-INDICATIONS

Acute porphyrias p. 624. - post-exposure prophylaxis

CAUTIONS

Females (at greater risk of hepatic side effects) - high CD4 cell count (at greater risk of hepatic side effects)

INTERACTIONS

Appendix 1: nevirapine

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects

Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash

Usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Hepatic impairment

Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).

RENAL IMPAIRMENT

Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).
**Rilpivirine**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100,000 copies/mL

- **BY MOUTH**
  - Child 12-17 years: 25 mg once daily

- **CAUTIONS**
  - Acute porphyrias p. 264

- **INTERACTIONS** → Appendix 1: rilpivirine

- **SIDE-EFFECTS**
  - Common or very common
    - Appetite decreased
    - Depression
    - Dizziness
    - Drowsiness
    - Dry mouth
    - Fatigue
    - Gastrointestinal discomfort
    - Headache
    - Myalgia
    - Nausea
    - Rash
    - Sleep disorders
    - Vomiting
  - Uncommon
    - Immune reconstitution inflammatory syndrome

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - For further information regarding lipodystrophy, see HIV infection p. 265

**PRENANCY**

Monitoring Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

**HEPATIC IMPAIRMENT**

In general, manufacturers advise caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

**Abacavir**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH**
  - Child 3 months-11 years: 8 mg/kg twice daily (max. per dose 300 mg), alternatively 16 mg/kg once daily (max. per dose 600 mg)
  - Child 3 months-11 years (body-weight 14-20 kg): 150 mg twice daily, alternatively 300 mg once daily
  - Child 3 months-11 years (body-weight 21-29 kg): 150 mg, taken in the morning and 300 mg, taken in the evening, alternatively 450 mg once daily
  - Child 3 months-11 years (body-weight 30 kg and above): 300 mg twice daily, alternatively 600 mg once daily
  - Child 12-17 years: 300 mg twice daily, alternatively 600 mg once daily

- **INTERACTIONS** → Appendix 1: abacavir
Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 431, lamivudine p. 436, dolutegravir p. 427.

**INDICATIONS AND DOSE**

**HIV infection**

- Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

**INTERACTIONS** → Appendix 1: abacavir - dolutegravir - lamivudine

**RENAL IMPAIRMENT** Avoid Triumeq® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Triumeq (ViiV Healthcare UK Ltd) ▼
  - Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg Triumeq® 50mg/600mg/300mg tablets | 30 tablet [PBP] £71.18

Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 431, lamivudine p. 436.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretrovirals**

- Child 12-17 years (body-weight 40 kg and above): 1 tablet once daily

**INTERACTIONS** → Appendix 1: abacavir - lamivudine

**RENAL IMPAIRMENT** Avoid Kivexa® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Abacavir with lamivudine (Non-proprietary)
  - Lamivudine 300 mg, Abacavir 600 mg Abacavir 600mg | Lamivudine 300mg tablets | 30 tablet [PBP] £190.00–£229.41 | 30 tablet [PBP] £224.56 (Hospital only)
- Kivexa® (ViiV Healthcare UK Ltd) Lamivudine 300 mg, Abacavir 600 mg Kivexa® 300mg tablets | 30 tablet [PBP] £152.25

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 431, lamivudine p. 436, zidovudine p. 438.

**INDICATIONS AND DOSE**

**HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)**

- Child (body-weight 30 kg and above): 1 tablet twice daily
Didanosine (ddI; DDI)

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**
- **BY MOUTH**
  - Child 1-7 months: 50–100 mg/m² twice daily
  - Child 8 months-17 years: 180–240 mg/m² once daily; usual dose 200 mg/m² once daily; maximum 400 mg per day

**SIDE-EFFECTS**
- **Common or very common** Arthralgia • chills • dry mouth • fever • flatulence • gynaecomastia • hepatic disorders • pain • peripheral neuropathy
- **Uncommon** Acute kidney injury • alopecia • diabetes mellitus • dry eye • haemodialysis • hyperglycaemia • hypoglycaemia • leucopenia • myopathy • optic neuritis • retinal discolouration • sialadenitis
- **Rare or very rare** Parotid gland enlargement
- **Frequency not known** Lipoatrophy

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Pancreatitis** Suspend treatment if serum lipase raised or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatitis toxicity; monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

**Lipoatrophy syndrome** Metabolic effects may occur with didanosine: these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipoatrophy syndrome. Manufacturer advises monitoring of plasma lipids and blood-glucose.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.

**UNLICENSED USE** Tablets not licensed for use in children under 3 months. EC capsules not licensed for use in children under 6 years.

**CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) • hyperuricaemia • lactic acidosis • peripheral neuropathy

**CAUTIONS, FURTHER INFORMATION**
- **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

**INTERACTIONS**
- **Appendix 1: didanosine**
- **By MOUTH**
  - Avoid Trizivir if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
  - There can be variation in the licensing of different medicines containing the same drug.

**MEDICINAL FORMS**
- Trizivir (ViiV Healthcare UK Ltd)
  - Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg

**INTERACTIONS**
- **Appendix 1: abacavir • lamivudine • zidovudine**
- **RENAL IMPAIRMENT** Avoid Trizivir if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- **Ophthalmological examination** (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

**DIRECTIONS FOR ADMINISTRATION**
- Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

**PATIENT AND CARER ADVICE**
- Patients or carers should be given advice on how to administer didanosine capsules.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**
- **CAUTIONARY AND ADVISORY LABELS 25**
  - **Videx EC** (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Didanosine 125 mg Capsule VIDEX 125 mg 30 capsule
      - £48.18 (Hospital only)
    - Didanosine 250 mg Capsule VIDEX 250 mg 30 capsule
      - £96.37 (Hospital only)
    - Didanosine 400 mg Capsule VIDEX 400 mg 30 capsule
      - £154.19 (Hospital only)

**Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 434, elvitegravir, cobicistat, tenofovir alafenamide p. 415.

**INDICATIONS AND DOSE**
- **HIV-1 infection (specialist use only)**
  - **BY MOUTH**
    - Child 6–11 years (body-weight 25 kg and above): 1 tablet once daily
    - Child 12–17 years (body-weight 35 kg and above): 1 tablet once daily

**IMPORTANT SAFETY INFORMATION**
- **MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019)**
- Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in Genvoya® and Stribild®) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see Pregnancy.

**INTERACTIONS**
- **Appendix 1: cobicistat • elvitegravir • tenofovir alafenamide**
- **SIDE-EFFECTS**
  - **Common or very common** Abnormal dreams • diarrhoea • dizziness • fatigue • flatulence • gastrointestinal discomfort • headache • nausea • skin reactions • vomiting
  - **Uncommon** Anaemia • angioedema • depression
  - **Frequency not known** Nephrotoxicity • osteonecrosis • weight increased

**CONCEPTION AND CONTRACEPTION**
- Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must...
Emtricitabine

**Viral infection**

**Emtricitabine**

- **INDICATIONS AND DOSE**
  - HIV infection in combination with other antiretroviral drugs
  - By mouth using capsules
  - Child (body-weight 33 kg and above): 200 mg once daily

**Emtricitabine with rilpivirine and tenofovir alafenamide**

- **INDICATIONS AND DOSE**
  - HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)
    - By mouth
    - Child 12-17 years (body-weight 35 kg and above): 1 tablet once daily

- **SIDE-EFFECTS**
  - Common or very common
    - Appetite decreased, depression, diarrhoea, dizziness, drowsiness, dry mouth, fatigue, flatulence, gastrointestinal discomfort, headache, nausea, skin reactions, sleep disorders, vomiting
  - Uncommon
    - Anaemia, angioedema, arthralgia, immune reconstitution inflammatory syndrome
  - Frequency not known
    - Conjunctivitis, drug reaction with eosinophilia and systemic symptoms (DRESS)
eosinophilia - fever - osteonecrosis - QT interval prolongation - weight increased

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (increased risk of hepatic side-effects); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available.
- **PATIENT AND CARER ADVICE**
  - Vomiting: Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.
  - Driving and skilled tasks: Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (October 2016) that emtricitabine with tenofovir alafenamide (Odefsey®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

**All Wales Medicines Strategy Group (AWMSG) decisions**
The All Wales Medicines Strategy Group has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (Odefsey®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 3, 21

- Odefsey (Gilead Sciences International Ltd) ▼
- Rilpivirine (as Rilpivirine hydrochloride) 25 mg, Tenofovir alafenamide (as Tenofovir alafenamide fumarate) 25 mg, Emtricitabine 200 mg Odefsey 200mg/25mg/25mg tablets 30 tablet £525.95

Emtricitabine with tenofovir alafenamide 05-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 415, tenofovir alafenamide p. 415.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs (specialist use only)**

- **BY MOUTH**
  - Child 12–17 years (body-weight 35 kg and above): 200/10–200/25 mg once daily, dose is dependent on drug regimen—consult product literature

**DOSE EQUIVALENCE AND CONVERSION**

- Dose expressed as x/y mg emtricitabine/tenofovir alafenamide.

**INTERACTIONS** → Appendix 1: tenofovir alafenamide

**SIDE-EFFECTS**

- Common or very common Abnormal dreams - diarrhoea - dizziness - fatigue - flatulence - gastrointestinal discomfort - headache - nausea - skin reactions - vomiting
- Uncommon Anaemia - arthralgia
- Frequency not known Angioedema - osteonecrosis

**HEPATIC IMPAIRMENT** Manufacturer advises use with caution (greater risk of hepatic side-effects).

**RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks: Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (August 2016) that emtricitabine with tenofovir alafenamide (Descovy®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 in combination with other antiretroviral agents.

All Wales Medicines Strategy Group (AWMSG) decisions
The All Wales Medicines Strategy Group has advised (September 2016) that emtricitabine with tenofovir alafenamide (Descovy®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 in combination with other antiretroviral agents.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Descovy (Gilead Sciences International Ltd) ▼
  - Tenofovir alafenamide (as Tenofovir alafenamide fumarate) 25 mg, Emtricitabine 200 mg Descovy 200mg/25mg tablets

Emtricitabine with tenofovir disoproxil 15-Nov-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 437, emtricitabine p. 434.

**INDICATIONS AND DOSE**

**HIV-1 infection (initiated by a specialist)**

- **BY MOUTH**
  - Child 12–17 years (body-weight 35 kg and above): 200/245 mg once daily

**Pre-exposure prophylaxis of HIV-1 infection (initiated by a specialist)**

- **BY MOUTH**
  - Child 12–17 years (body-weight 35 kg and above): 200/245 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**

- Dose expressed as x/y mg emtricitabine/tenofovir disoproxil.

**INTERACTIONS** → Appendix 1: tenofovir disoproxil

**RENA lMPAIRMENT**

Manufacturer advises avoid.

**DIRECTIONS FOR ADMINISTRATION**

Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste).
PATIENT AND CARER ADVICE  Patients or carers should be given advice on how to administer emtricitabine with tenofovir tablets.

Missed doses  If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE  EPIVIR ® ORAL SOLUTION

HIV infection in combination with other antiretroviral drugs  

> BY MOUTH
  - Child 1-2 months: 4 mg/kg twice daily
  - Child 3 months–11 years (body-weight up to 14 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg)
  - Child 3 months–11 years (body-weight 14-20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
  - Child 3 months–11 years (body-weight 21-29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily
  - Child 3 months–11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
  - Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily

EPIVIR ® TABLETS

HIV infection in combination with other antiretroviral drugs  

> BY MOUTH
  - Child 1-2 months: 4 mg/kg twice daily
  - Child 3 months–11 years (body-weight up to 14 kg): 4 mg/kg twice daily, alternatively 8 mg/kg once daily
  - Child 3 months–11 years (body-weight 14-20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
  - Child 3 months–11 years (body-weight 21-29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily
  - Child 3 months–11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily

ZEFFIX ®

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease  

> BY MOUTH
  - Child 2-11 years: 3 mg/kg once daily (max. per dose 100 mg), children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection
  - Child 12-17 years: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

UNLICENSED USE

EPIVIR ® ORAL SOLUTION  Not licensed for use in children under 3 months.

EPIVIR ® TABLETS  Not licensed for use in children under 3 months.

ZEFFIX ®  Not licensed for use in children.

CAUTIONS  Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine.

INTERACTIONS  → Appendix 1: lamivudine

SIDE-EFFECTS

> Common or very common  Hepatitis aggravated - muscle cramps - myopathy
> Rare or very rare  Angioedema
> Frequency not known  Abdominal discomfort - malaise - respiratory tract infection - throat complaints

BREAST FEEDING

Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

RENAI IMPAIRMENT

Dose adjustments  Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.

MONITORING REQUIREMENTS  When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include banana and strawberry.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCipients:  May contain Sucrose

Epigiv (VIIV Healthcare UK Ltd)

Lamivudine 10 mg per 1 ml  Epigiv 50mg/5ml oral solution  240 ml (P) £39.01

Tablet

Epigiv (VIIV Healthcare UK Ltd)

Lamivudine 150 mg  Epigiv 150mg tablets  60 tablet (P) £143.32 DT + £143.32
Stavudine (d4T)

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible**

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 1 mg/kg twice daily, to be taken preferably at least 1 hour before food
  - Child (body-weight 30-59 kg): 30 mg twice daily, to be taken preferably at least 1 hour before food
  - Child (body-weight 60 kg and above): 40 mg twice daily, to be taken preferably at least 1 hour before food

**SIDE-EFFECTS**

- **Common or very common** Depression - drowsiness - dyspepsia - hyperlactacidaemia - lipoatrophy - nerve disorders - paraesthesia - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) - sleep disorders - thinking abnormal
- **Uncommon** Anxiety - arthralgia - emotional lability - gynaecomastia - hepatic disorders
- **Rare or very rare** Diabetes mellitus - hyperglycaemia - muscle weakness - neutropenia

**SIDE-EFFECTS, FURTHER INFORMATION** Metabolic effects may occur with stavudine; plasma lipids and blood glucose concentrations should be measured routinely.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**RENAAL IMPAIRMENT** Risk of peripheral neuropathy.

- **Dose adjustments** Reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

**LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipoatrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

**INTERACTIONS** → Appendix 1: stavudine

**INTERACTIONS** → Appendix 1: tenofovir disoproxil

**SIDE-EFFECTS**

- **Common or very common** Abdominal distension - flatulence
- **Uncommon** Proximal renal tubulopathy
- **Rare or very rare** Acute tubular necrosis - angioedema - hepatitis - nephritis - nephrogenic diabetes insipidus - renal impairment

**HEPATIC IMPAIRMENT** Manufacturer advises caution in decompensated hepatic disease (limited information available).

**RENAAL IMPAIRMENT** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

- Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

**DIRECTIONS FOR ADMINISTRATION** Granules: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules.

**Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
Infection

Lactic acidosis

CAUTIONS

CONTRA-INDICATIONS

Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine.

INTERACTIONS → Appendix 1: zidovudine

SIDE-EFFECTS

Common or very common Leucopenia, malaise, neutropenia

Uncommon Bone marrow disorders, dyspnoea, fever, flatulence, generalised pain, myopathy

Rare or very rare Alertness decreased, anxiety, cardiomyopathy, chest pain, chills, cough, depression, drowsiness, dyspepsia, gynaecomastia, hepatic disorders, hyperhidrosis, influenza-like illness, insomnia, nail discoulouration, oral discolouration, paraesthesia, pure red cell aplasia, seizure, taste altered, urinary frequency increased

Frequency not known Lipoatrophy

SIDE-EFFECTS, FURTHER INFORMATION Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (increased risk of accumulation).

Dose adjustments Manufacturer advises consider dose reduction in moderate to severe impairment—consult product literature.

RENAL IMPAIRMENT

Dose adjustments Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.

MONITORING REQUIREMENTS Monitor full blood count after 4 weeks of treatment, then every 3 months.

DIRECTIONS FOR ADMINISTRATION

With intravenous use For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give 1 hour.

PRESCRIBING AND DISPENSING INFORMATION The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

PATIENT AND CARER ADVICE

MEDITINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Granules

CAUTIONARY AND ADVISORY LABELS 21

Viread (GlaxoSmithKline International Ltd)

Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 33 mg per 1 gram Viread 33mg/6 granules | 60 gram (P) £54.50

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Tenofovir disoproxil (Non-proprietary) 245 mg Tenofovir 245mg tablets | 30 tablet (P) £16.84 | 240.39 DT = £30.25 | 168 tablet (P) £15.48

Viread (GlaxoSmithKline International Ltd)

Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 123 mg Viread 123mg tablets | 30 tablet (P) £102.60 DT = £102.60

Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 163 mg Viread 163mg tablets | 30 tablet (P) £135.98 DT = £135.98

Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 204 mg Viread 204mg tablets | 30 tablet (P) £170.19 DT = £170.19

Tenofovir disoproxil 245 mg Viread 245mg tablets | 30 tablet (P) £204.39 DT = £30.25

Zidovudine

(Azidothymidine; AZT)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

Child: 180 mg/m² twice daily (max. per dose 300 mg)

Child (body-weight 8–13 kg): 100 mg twice daily

Child (body-weight 14–20 kg): 100 mg, to be taken in the morning and 200 mg, to be taken in the evening

Child (body-weight 21–27 kg): 200 mg twice daily

Child (body-weight 28–29 kg): 200–250 mg twice daily

Child (body-weight 30 kg and above): 250–300 mg twice daily

HIV infection in combination with other antiretroviral drugs (dose expressed in mg/kg)

BY MOUTH

Child (body-weight 4–8 kg): 12 mg/kg twice daily

Child (body-weight 9–29 kg): 9 mg/kg twice daily

Prevention of maternal-fetal HIV transmission

BY MOUTH, OR BY INTRAVENOUS INFUSION

Child: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

BY INTRAVENOUS INFUSION

Child 3 months–11 years: 60–80 mg/m² every 6 hours usually for not more than 2 weeks, dose approximating to 9–12 mg/kg twice daily by mouth

Child 12–17 years: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

CONTRA-INDICATIONS

Abnormally low haemoglobin concentration (consult product literature) - abnormally low neutrophil counts (consult product literature) - neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature)

CAUTIONS

Lactic acidosis - risk of haematological toxicity particularly with high dose and advanced disease - vitamin B₁₂ deficiency (increased risk of neutropenia)

CAUTIONS, FURTHER INFORMATION

Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine.

Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

INTERACTIONS → Appendix 1: zidovudine

SIDE-EFFECTS

Common or very common Leucopenia, malaise, neutropenia

Uncommon Bone marrow disorders, dyspnoea, fever, flatulence, generalised pain, myopathy

Rare or very rare Alertness decreased, anxiety, cardiomyopathy, chest pain, chills, cough, depression, drowsiness, dyspepsia, gynaecomastia, hepatic disorders, hyperhidrosis, influenza-like illness, insomnia, nail discoulouration, oral discolouration, paraesthesia, pure red cell aplasia, seizure, taste altered, urinary frequency increased

Frequency not known Lipoatrophy

SIDE-EFFECTS, FURTHER INFORMATION Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (increased risk of accumulation).

Dose adjustments Manufacturer advises consider dose reduction in moderate to severe impairment—consult product literature.

RENAL IMPAIRMENT

Dose adjustments Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.

MONITORING REQUIREMENTS Monitor full blood count after 4 weeks of treatment, then every 3 months.

DIRECTIONS FOR ADMINISTRATION

With intravenous use For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give 1 hour.

PRESCRIBING AND DISPENSING INFORMATION The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

01-Sep-2016
Zidovudine with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 438, lamivudine p. 436.

† INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs

▶ BY MOUTH
- Child (body-weight 14–20 kg): 0.5 tablet twice daily
- Child (body-weight 21–29 kg): 0.5 tablet, to be given in the morning and 1 tablet, to be given in the evening
- Child (body-weight 30 kg and above): 1 tablet twice daily

† INTERACTIONS ➔ Appendix 1: lamivudine - zidovudine
† RENAL IMPAIRMENT Avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
† DIRECTIONS FOR ADMINISTRATION
COMBIVIR™ TABLETS Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

† MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
Tablet
- Zidovudine with lamivudine (Non-proprietary)
  Lamivudine 150 mg, Zidovudine 300 mg
- Lamivudine 150 mg tablets | 60 tablet PDTD £24.01–£255.10
- Combivir (ViiV Healthcare UK Ltd)
  Lamivudine 150 mg, Zidovudine 300 mg
  Combivir 150mg/300mg tablets | 60 tablet PDTD £30.11

ANTIVIRALS ➔ PROTEASE INHIBITORS, HIV

Protease inhibitors

† CONTRA-INDICATIONS Acute porphyrias p. 624
† CAUTIONS Haemophilia (increased risk of bleeding)
† SIDE-EFFECTS Common or very common Alopopenia - anaemia - angioedema - anxiety - appetite abnormal - arthralgia - asthma - diabetes mellitus - diarrhoea - dizziness - dry mouth - dyslipidaemia - dyspepsia - fever - gastrointestinal discomfort - gastrointestinal disorders - headache - hepatic disorders - hypersensitivity - hypertension - malaise - muscle complaints - nausea - neutropenia - oral ulceration - pancreatitis - peripheral neuropathy - seizure - skin reactions - sleep disorders - taste altered - vomiting
† Uncommon Drowsiness - immune reconstitution inflammatory syndrome - osteonecrosis - Stevens-Johnson syndrome - weight increased
† HEPATIC IMPAIRMENT In general, manufacturers advise use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Atazanavir

† INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs— with low-dose ritonavir

▶ BY MOUTH
- Child 6–17 years (body-weight 15–29 kg): 150 mg once daily
- Child 6–17 years (body-weight 20–39 kg): 200 mg once daily
- Child 6–17 years (body-weight 40 kg and above): 300 mg once daily

† CAUTIONS Cardiac conduction disorders - electrolyte disturbances - predisposition to QT interval prolongation

† INTERACTIONS ➔ Appendix 1: HIV–protease inhibitors
† SIDE-EFFECTS
thoracic: · thrombocytopenia · urinary disorders · urinary abnormalities · vertigo

- Rare or very rare: Arthritis, chills, feeling abnormal, joint stiffness, musculoskeletal stiffness, palpitations, rhinorrhoea, severe cutaneous adverse reactions (SCARs), syncope, visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION.** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

- **ALLERGY AND CROSS-SENSITIVITY.** Use with caution in patients with sulfonamide sensitivity.

- **PREGNANCY.** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

- **HEPATIC IMPAIRMENT.** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

- **MONITORING REQUIREMENTS.** Monitor liver function before and during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION.** Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE.**
  - Missed doses: If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS.** There can be variation in the licensing of different medicines containing the same drug.

**Darunavir with cobicistat, emtricitabine and tenofovir alafenamide**

**25-Jul-2018**

The properties listed below are those particular to the combination only. For the properties of the components please consider, darunavir p. 439, cobicistat, emtricitabine p. 434, tenofovir alafenamide p. 415.

- **INDICATIONS AND DOSE.**
  - **HIV infection (initiated by a specialist).**
    - **BY MOUTH.**
      - Child 12-17 years (body-weight 40 kg and above): 1 tablet once daily

**IMPORTANT SAFETY INFORMATION.**

**MHRA/CHM ADVICE: DARUNAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (JULY 2018)**

Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in Rezolsta® and Symtuza®) to be lower during the second and third trimesters of pregnancy than during 6–12 weeks postpartum. Low darunavir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see Pregnancy.

- **INTERACTIONS.**
  - Appendix 1: cobicistat - HIV-protease inhibitors - tenofovir alafenamide

- **PREGNANCY.** Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen.

- **RENAL IMPAIRMENT.** Manufacturer advises avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—no information available.

- **PATIENT AND CARER ADVICE.**
  - Driving and skilled tasks: Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS.**

  **Scottish Medicines Consortium (SMC) decisions**

  SMC No. 1290/18

  The Scottish Medicines Consortium has advised (January 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (Symtuza®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

  **All Wales Medicines Strategy Group (AWMSG) decisions**

  AWMSG No. 2418

  The All Wales Medicines Strategy Group has advised (March 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (Symtuza®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

- **MEDICINAL FORMS.** There can be variation in the licensing of different medicines containing the same drug.

Fosamprenavir

**DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

- **BY MOUTH**
  - Child 14 days (body-weight 5–14 kg): 25 mg/kg twice daily.
  - Child 2–17 years (body-weight up to 40 kg and above): 200 mg twice daily.
  - Child 2–17 years (body-weight 40 kg and above): 300 mg twice daily.

**DOSE EQUIVALENCE AND CONVERSION**

- 700 mg of fosamprenavir is equivalent to 500 mg amprenavir.

**SIDE-EFFECTS**

- Rash may occur, usually the second week of therapy; may continue without interruption—usually resolves and may respond to antihistamines.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Oral suspension**
  - EXCIPIENTS: May contain Propylene glycol, peppermint.
  - Telzir (ViiV Healthcare UK Ltd)
    - Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 mL Telzir 50 mg/ml oral suspension
    - 225 mL (PO) £69.06
  - Tablet
    - Telzir (ViiV Healthcare UK Ltd)
      - Fosamprenavir (as Fosamprenavir calcium) 700 mg Telzir 700 mg tablets
      - 60 tablet (PO) £258.97

Lopinavir with ritonavir

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH USING TABLETS**
  - Child 2–17 years (body-weight up to 40 kg and body surface area 0.5–0.7 m²): 200/50 mg twice daily.
  - Child 2–17 years (body-weight up to 40 kg and body surface area 0.8–1.1 m²): 300/75 mg twice daily.
  - Child 2–17 years (body-weight 40 kg and above and body surface area 1.2 m² and above): 400/100 mg twice daily.

- **BY MOUTH USING ORAL SOLUTION**
  - Child 14 days–5 months: 3.75 mL/m² twice daily.
  - Child 6 months–17 years: 2.9 mL/m² twice daily (max. per dose 5 mL).

**DOSE EQUIVALENCE AND CONVERSION**

- Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).

**SIDE-EFFECTS**

- Rash may occur, usually in the second week of therapy; may continue without interruption—usually resolves and may respond to antihistamines.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

**PREGNANCY** Avoid oral solution due to high alcohol and propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).

**HEPATIC IMPAIRMENT** For oral solution, manufacturer advises avoid due to propylene glycol content (risk of toxicity). For tablets, manufacturer advises avoid in severe impairment (no information available).

**RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content.

**MONITORING REQUIREMENTS**

- Monitor liver function before and during treatment.

- With oral solution, monitor for signs of alcohol and propylene glycol toxicity (particularly in infants).

**PRESCRIBING AND DISPENSING INFORMATION**

- With oral solution, manufacturer advises high alcohol (42 % v/v) and propylene glycol content—consider total amounts from all medicines that are to be given to infants in order to avoid toxicity; caution in patients for which consumption may be harmful.

**PATIENT AND CARER ADVICE** Oral solution tastes bitter.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1302/18
The Scottish Medicines Consortium has advised (February 2018) that lopinavir with ritonavir oral solution (Kaletra®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV–1 infected children aged from 14 days to less than 2 years.

SMC No. 326/06
The Scottish Medicines Consortium has advised (November 2006) that lopinavir with ritonavir tablet (Kaletra®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV–1 infected adults and children above the age of 2 years.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3557
The All Wales Medicines Strategy Group has advised (March 2018) that lopinavir with ritonavir oral solution (Kaletra®) is recommended as an option for use within NHS Wales in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus (HIV–1) infected children aged from 14 days to less than 2 years old.
Viral infection

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 21**

**EXCIPIENTS:** May contain Alcohol, propylene glycol

- Kaletra (AbbVie Ltd)

Ritonavir 20 mg per 1 mL, Lopinavir 80 mg per 1 mL

Kaletra 80 mg/20 mg/1 mL oral solution | 120 mL (PO) £122.96

300 mL (PO) £307.39

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

- Kaletra (AbbVie Ltd)

Ritonavir 25 mg, Lopinavir 100 mg | 60 tablet (PO) £76.85

Ritonavir 50 mg, Lopinavir 200 mg | 120 tablet (PO) £285.41

**Ritonavir**

18-Apr-2019

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

- **BY MOUTH**
  - Child 2-17 years: Initially 250 mg/m² twice daily, increased in steps of 50 mg/m² every 2-3 days; increased to 350 mg/m² twice daily (max. per dose 600 mg twice daily), tolerability of this regimen is poor

**Low-dose ritonavir to increase the effect of atazanavir**

- **BY MOUTH**
  - Child 6-17 years (body-weight 15-19 kg): 80–100 mg once daily
  - Child 6-17 years (body-weight 20 kg and above): 100 mg once daily

**Low-dose ritonavir to increase the effect of darunavir**

- **BY MOUTH**
  - Child 3-17 years (body-weight 15-29 kg): 50 mg twice daily
  - Child 3-17 years (body-weight 30-39 kg): 60 mg twice daily
  - Child 3-17 years (body-weight 40 kg and above): 100 mg twice daily
  - Child 12-17 years (body-weight 40 kg and above): 100 mg once daily for use in patients taking darunavir once daily

**Low-dose ritonavir to increase the effect of fosamprenavir**

- **BY MOUTH**
  - Child 6-17 years (body-weight 25-32 kg): 3 mg/kg twice daily
  - Child 6-17 years (body-weight 33 kg and above): 100 mg twice daily

**Low-dose ritonavir to increase the effect of tipranavir**

- **BY MOUTH**
  - Child 2-11 years: 150 mg/m² twice daily (max. per dose 200 mg)
  - Child 12-17 years: 200 mg twice daily

**SIDE-EFFECTS, FURTHER INFORMATION**

**SIGNS AND SYMPTOMS** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated — discontinue if pancreatitis diagnosed.

**PREGNANCY**

Dose adjustments

- Only use low-dose booster to increase the effect of other protease inhibitors.

**HEPATIC IMPAIRMENT**

When used as a low-dose booster, manufacturer advises caution in severe impairment; avoid in decompensated liver disease. When used in high-doses, manufacturer advises avoid in severe impairment.

Dose adjustments

Manufacturer advises consult product literature of co-administered protease inhibitor.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 21, 25**

- Ritonavir (Non-proprietary)
  - Ritonavir 100 mg Ritonavir 100 mg tablets | 30 tablet (PO) £16.52-£19.40
  - Norvir (AbbVie Ltd)
  - Ritonavir 100 mg Norvir 100 mg tablets | 30 tablet (PO) £19.44

**Tipranavir**

**INDICATIONS AND DOSE**

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

- **BY MOUTH USING CAPSULES**
  - Child 12-17 years: 500 mg twice daily

- **BY MOUTH USING ORAL SOLUTION**
  - Child 2-11 years: 375 mg/m² twice daily (max. per dose 500 mg)

**DOSE EQUIVALENCE AND CONVERSION**

The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

**CAUTIONS**

Abnormal liver function tests and/or signs of symptoms of liver injury (consider delaying treatment if serum transaminases are greater than 5 times the upper limit of normal—consult product literature) — patients at risk of increased bleeding from trauma, surgery or other pathological conditions

**INTERACTIONS**

- Appendix 1: HIV-protease inhibitors

**SIDE-EFFECTS**

- Uncommon Hyperamylasaemia · hyperglycaemia · influenza like illness · renal failure · thrombocytopenia

- Rare or very rare Dehydration · hyperbilirubinaemia · intracranial haemorrhage

- Frequency not known Bleeding tendency

**SIDE-EFFECTS, FURTHER INFORMATION**

Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild impairment (risk of increased exposure)—monitor liver function before treatment, then every two weeks for 3 months, then monthly until 48 weeks, then every 8 to 12 weeks thereafter, and discontinue if liver function worsens; avoid in moderate to severe impairment.

**MONITORING REQUIREMENTS**

Monitor liver function before treatment, then every 2 weeks for 1 month, then...
Influenza

5.5 Influenza

Management

Oseltamivir p. 444 and zanamivir p. 445 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 48 hours of the first symptoms while zanamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in children with severe influenza or in those who are immuno compromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised children.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed use].

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amantadine hydrochloride is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended.
Oseltamivir

**DRUG ACTION**
Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

**INDICATIONS AND DOSE**

**Prevention of influenza**
- **BY MOUTH**
  - Neonate: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
  - Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
  - Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.
  - Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.
  - Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.
  - Child 1-12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.
  - Child 13-17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.

**Treatment of influenza**
- **BY MOUTH**
  - Neonate: 3 mg/kg twice daily for 5 days.
  - Child 1-11 months: 3 mg/kg twice daily for 5 days.
  - Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days.
  - Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days.
  - Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days.
  - Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days.
  - Child 13-17 years: 75 mg twice daily for 5 days.

**UNLICENSED USE**
Not licensed for use in premature infants.

**INTERACTIONS**
Appendix 1: oseltamivir

**SIDE-EFFECTS**
- **Common or very common**
  - Dizziness.
  - Gastrointestinal discomfort.
  - Herpes simplex.
  - Nausea.
  - Sleep disorders.
  - Vertigo.
  - Vomiting.

- **Uncommon**
  - Arrhythmia.
  - Seizure.
  - Skin reactions.

- **Rare or very rare**
  - Angioedema.
  - Anxiety.
  - Behaviour abnormal.
  - Confusion.
  - Delirium.
  - Delusions.
  - Gastrointestinal haemorrhage.
  - Hallucination.
  - Hepatic disorders.
  - Self-injurious behaviour.
  - Severe cutaneous adverse reactions (SCARs).
  - Thrombocytopenia.
  - Visual impairment.

**PREGNANCY**
Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic).

**BREAST FEEDING**
Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.

**RENAL IMPAIRMENT**
Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**Dose adjustments**
For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

**DIRECTIONS FOR ADMINISTRATION**
If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include tutti-frutti.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Oseltamivir for influenza (flu)
www.medicinesforchildren.org.uk/oseltamivir-influenza-flu

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
  - Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Oseltamivir is not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.
- At risk patients include those aged 65 years or older or those who have one or more of the following conditions:
  - Chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
  - Chronic heart disease;
  - Chronic renal disease;
  - Chronic liver disease;
  - Chronic neurological disease;
  - Immunosuppression;
  - Diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta158

Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168
  - Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes. At risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza (treatment only) or women who are pregnant.

When in the community.

Zanamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

- **INDICATIONS AND DOSE**

  - **Post-exposure prophylaxis of influenza**
    - **BY INHALATION OF POWDER**
    - Child 5-17 years: 10 mg once daily for 10 days
  
  - **Prevention of influenza during an epidemic**
    - **BY INHALATION OF POWDER**
    - Child 5-17 years: 10 mg once daily for up to 28 days

- **TREATMENT OF INFLUENZA**
  - **BY INHALATION OF POWDER**
  - Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

- **CAUTIONS** Asthma, chronic pulmonary disease, uncontrolled chronic illness

  - **CAUTIONS, FURTHER INFORMATION**
    - Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

- **SIDE-EFFECTS**

  - **Common or very common** Skin reactions
  
  - **Uncommon** Bronchospasm, dehydration, dyspnoea, oropharyngeal oedema, presyncope, severe cutaneous adverse reactions (SCARs), throat tightness

  - **Rare or very rare** Face oedema

  - **Frequency not known** Behaviour abnormal, delirium, hallucination, level of consciousness decreased, psychiatric disorder, seizure

- **SIDE-EFFECTS, FURTHER INFORMATION** Neurological and psychiatric disorders occur more commonly in children and adolescents.

- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE decisions**
    - Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158

  - **Zanamivir** is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

  - **Zanamivir** is not recommended for seasonal prophylaxis against influenza.

  - When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza.

  - When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza.

  - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.
At risk patients include those aged over 65 years or those who have one or more of the following conditions:

5.6 Respiratory syncytial virus

Respiratory syncytial virus

Management
Ribavirin p. 415 inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is effective in Lassa fever and has also been used parenterally in the treatment of life-threatening RSV, para-influenza virus, and adenovirus infections in immunocompromised children [unlicensed indications].

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:
- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:
- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES

MONOCLONAL ANTIBODIES

Palivizumab

- INDICATIONS AND DOSE
  Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)
    - BY INTRAMUSCULAR INJECTION
      - Neonate: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.
      - Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.
    - BY INTRAMUSCULAR INJECTION
      - Child 1–23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder
- Relenza (GlaxoSmithKline UK Ltd)
  Zanamivir 5 mg Relenza 5mg inhalation powder blisters with Diskhaler 20 blister £16.36
to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

- **CAUTIONS** Moderate to severe acute infection • moderate to severe febrile illness • serum-palivizumab concentration may be reduced after cardiac surgery • thrombocytopenia

- **SIDE-EFFECTS**
  - **Common or very common** Apnoea
  - **Uncommon** Seizure • thrombocytopenia • urticaria
  - **Frequency not known** Hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Synagis** (AbbVie Ltd)
  - Palivizumab 100 mg per 1 mL Synagis 100mg/1ml solution for injection vials | 1 vial £563.64
  - Synagis 50mg/0.5ml solution for injection vials | 1 vial £306.34
**Chapter 6**

**Endocrine system**

---

**1 Antidiuretic hormone disorders**

**Posterior pituitary hormones and antagonists**

**Posterior pituitary hormones**

**Diabetes insipidus**

Diabetes insipidus is caused by either a deficiency of antidiuretic hormone (ADH, vasopressin p. 69) secretion (cranial, neurogenic, or pituitary diabetes insipidus) or by failure of the renal tubules to react to secreted antidiuretic hormone (nephrogenic diabetes insipidus).

Vasopressin (antidiuretic hormone, ADH) is used in the treatment of *pituitary diabetes insipidus* as is its analogue desmopressin below. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication.

Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients.

Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides.

**Other uses**

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. Desmopressin also has a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

---

**1.1 Diabetes insipidus**

**Other drugs used for Diabetes insipidus** Chlorothiazide, p. 113 · Chlortalidone, p. 144

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES › VASOPRESSIN AND ANALOGUES**

**Desmopressin**

**Drug action**

Desmopressin is an analogue of vasopressin.

**Indications and dose**

**Diabetes insipidus, treatment**

**By mouth**

- Neonate: Initially 1–4 micrograms 2–3 times a day, adjusted according to response.
- Child 1–2 years: Initially 5 micrograms 2–3 times a day, adjusted according to response; usual dose 60–180 micrograms daily
- Child 2–4 years: Initially 20 micrograms 2–3 times a day, adjusted according to response; usual dose 100–300 micrograms daily
- Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
Child 15–17 years: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1-11 months: 400 nanograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 days to avoid fluid overload
  - Child 1-17 years: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**Mild to moderate haemophilia and von Willebrand’s disease**

- **BY INTRANASAL ADMINISTRATION**
  - Child 1-17 years: 4 micrograms/kg for 1 dose, for pre-operative use give 2 hours before procedure
  - **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - Child: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

**Fibrinolytic response testing**

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 2-17 years: 300 nanograms/kg for 1 dose to be sampled after 20 minutes for fibrinolytic activity

**Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)**

- **BY INTRANASAL ADMINISTRATION**
  - Child 1-23 months: Initially 100–500 nanograms for 1 dose

**Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)**

- **BY INTRANASAL ADMINISTRATION**
  - Child 1-23 months: 1–5 micrograms for 1 dose

---

**Diabetes insipidus, diagnosis (water deprivation test)**

- **BY INTRANASAL ADMINISTRATION**
  - Child 1-23 months: 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
  - Child 2-11 years: 10–20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
  - Child 12-17 years: 20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia

- **BY SUBLINGUAL ADMINISTRATION**
  - Child 5-7 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1-23 months: 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended

- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 2-11 years: 0.5–1 microgram for 1 dose, manage fluid input carefully to avoid hyponatraemia
  - Child 12-17 years: 1–2 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia

**Renal function testing**

- **BY INTRANASAL ADMINISTRATION**
  - Child 1-11 months: 10 micrograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
  - Child 1-14 years: 20 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**Frequency not known**

- Child 1-11 months: 400 nanograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
  - Child 1-17 years: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**INTERACTIONS**

- Appendix 1: desmopressin

**SIDE-EFFECTS**

- **Common or very common** Hyponatraemia (on administration without restricting fluid intake) - nausea
  - **Frequency not known** Abdominal pain - aggression - allergic dermatitis - emotional disorder - fluid retention - headache - hyponatraemic seizure - vomiting - weight increased

**SPECIFIC SIDE-EFFECTS**

- With intranasal use Epistaxis - nasal congestion - rhinitis
  - With intravenous use Vasodilation

**SIDE-EFFECTS, FURTHER INFORMATION**

Manufacturer advises avoiding concomitant use of drugs which increase
secretion of vasopressin (e.g. tricyclic antidepressants)—increases risk of hyponatraemia.
- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST Feeding** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS** In nocturia, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION** DDAVP® and Desmotsabs® tablets may be crushed. DDAVP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL. DDAVP® injection may be administered orally. Desmopressin oral hyaluronicates are for sublingual administration.
- **With intravenous use** Higher doses of DDAVP® by intravenous infusion, used in mild to moderate haemophilia and von Willebrand’s disease, may be diluted with 30–50 mL Sodium Chloride 0.9% intravenous infusion. For intravenous infusion (Octim®), dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.
- **Children** requiring an intranasal dose of less than 10 micrograms should be given DDAVP® intranasal solution.
- **PATIENT AND CARER ADVICE** Hyponatraemic convulsions. Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops.

**Tablet**

**2 Corticosteroid responsive conditions**

**CORTICOSTEROIDS**

**Overview**
Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 456 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose hydrocortisone p. 456 can be used in septic shock that is
resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency. The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of dexamethasone p. 455 at night is sufficient to inhibit cortisol secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone p. 454 and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 22); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 138. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma.

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia and thrombocytopenic purpura.

High doses of a corticosteroid (usually prednisolone p. 455) are used in the treatment of glomerular kidney disease, including nephrotic syndrome. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole p. 398, cyclophosphamide p. 555, chlorambucil p. 554, and ciclosporin p. 537. Congenital nephrotic syndrome may be resistant to corticosteroids and immunosuppressants; indomethacin p. 581 and an ACE inhibitor such as captopril p. 114 have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polymyalitis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

Side-effects
MHRA/CHM advice: Corticosteroids: rare risk of central serous chorioretinopathy with local as well as systemic administration (August 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intrarticularal, topical dermal, and periorcular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects
- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone acetate, but are significant with hydrocortisone, corticotropin, and tetracosactide p. 491. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone p. 458, prednisolone, and triamcinolone.

Glucocorticoid side effects
- diabetes
- osteoporosis
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

Managing side-effects
Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses
are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

**Corticosteroids, replacement therapy**

**Overview**
The adrenal cortex normally secretes hydrocortisone p. 456 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 456; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2-3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 610.

In hypopituitarism, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 503 and sex hormones should be given as indicated by the pattern of hormone deficiency.

In congenital adrenal hyperplasia, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone. Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

**Glucocorticoid therapy**

**Glucocorticoid and mineralocorticoid activity**

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 456 is so high that its anti-inflammatory activity is of no clinical relevance.

The relatively high mineralocorticoid activity of hydrocortisone p. 456, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 458 has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 454 and dexamethasone p. 455 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion.

Some esters of betamethasone and of beclometasone dipropionate p. 162 (beclometasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 454 has a high glucocorticoid activity; it is derived from prednisolone.

**Corticosteroids (systemic)**

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHIORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periorcular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

**CONTRA-INDICATIONS**

Avoid injections containing benzyl alcohol in neonates (in neonates): - avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) - systemic infection (unless specific therapy given)
CONTRA-INDICATIONS, FURTHER INFORMATION

- With intra-articular use or intradermal use or intralional use For further information on contra-indications associated with intra-articular, intradermal and intralional preparations, consult product literature.

- CAUTIONS Congestive heart failure - diabetes mellitus (including a family history of) - diverticulitis - epilepsy - glaucoma (including a family history of or susceptibility to) - history of steroid myopathy - history of tuberculosis or X-ray changes (frequent monitoring required) - hypertension - hypothyroidism - infection (particularly untreated) - myasthenia gravis - oculer herpes simplex (risk of corneal perforation) - osteoporosis - peptic ulcer - psychiatric reactions - recent intestinal anastomoses - recent myocardial infarction (rupture reported) - severe affective disorders (particularly if history of steroid-induced psychosis) - should not be used long-term - thromboembolic disorders - ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- With intra-articular use or intradermal use or intralional use For further information on cautions associated with intra-articular, intradermal and intralional preparations, consult product literature.

SIDE-EFFECTS

- Common or very common Anxiety - behaviour abnormal - cataract subcapsular - cognitive impairment - Cushing's syndrome - electrolyte imbalance - fluid retention - gastrointestinal discomfort - growth retardation - headache - healing impaired - hirsutism - hypotension - increased risk of infection - menstrual cycle irregularities - mood altered - nausea - osteoporosis - peptic ulcer - psychotic disorder - skin reactions - sleep disorders - weight increased

- Rare or very rare Malaise - tendon rupture

- Frequency not known Chorioretinopathy - intracranial pressure increased with papilloedema (usually after withdrawal) - telangiectasia

SIDE-EFFECTS, FURTHER INFORMATION Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

- Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculous may reach an advanced stage before being recognised, and amebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

- Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella-zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 2 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

- Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

- Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

PREGNANCY The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.

- Monitoring Pregnancy women with fluid retention should be monitored closely when given systemic corticosteroids.

- Breast feeding The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.

- Hepatic impairment In general, manufacturers advise caution (risk of increased exposure).

- Renal impairment Use by oral and injectable routes should be undertaken with caution.

- Monitoring requirements The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

- Effect on laboratory tests May suppress skin test reactions.

- Treatment cessation The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
Corticosteroid responsive conditions

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
- been given repeat doses in the evening;
- received more than 3 weeks’ treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above. During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

**PATIENT AND CARER ADVICE**

Advice for patients

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment. A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe chickenpox and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting measles;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards

Steroid treatment cards should be issued where appropriate. Consider giving a ‘steroid card’ to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk.

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In Scotland, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dpPas@apsgroup.co.uk or by fax on 0131 629 9967.

**Betamethasone**

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

- **INDICATIONS AND DOSE**

  **Suppression of inflammatory and allergic disorders**

  - **Congenital adrenal hyperplasia**
    - BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
    - Child 1–11 months: Initially 1 mg, repeated up to 4 times in 24 hours according to response
    - Child 1–5 years: Initially 2 mg, repeated up to 4 times in 24 hours according to response
    - Child 6–11 years: Initially 4 mg, repeated up to 4 times in 24 hours according to response
    - Child 12–17 years: 4–20 mg, repeated up to 4 times in 24 hours according to response

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Hiccups, mycotic infarction (following recent myocardial infarction) - oedema - Stevens-Johnson syndrome

- **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**Deflazacort**

- **DRUG ACTION** Deflazacort is derived from prednisolone; it has predominantly glucocorticoid activity.

- **INDICATIONS AND DOSE**

  **Inflammatory and allergic disorders**

  - **BY MOUTH**
    - Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
    - Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

  **Nephrotic syndrome**

  - **BY MOUTH**
    - Child: Initially 1.5 mg/kg once daily (max. per dose 120 mg), reduced to the lowest effective dose for maintenance

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS**

  - Uncommon Oedema

- **HEPATIC IMPAIRMENT**

  **Dose adjustments** Manufacturer advises adjust to the minimum effective dose.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).
**Corticosteroid responsive conditions**

With oral use
For administration by mouth tablets may be dispersed in water or injection solution given by mouth.

With intravenous use
For intravenous infusion dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**
Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

**PREGNANCY**
Dexamethasone readily crosses the placenta.

---

**INDICATIONS AND DOSE**

- **Physiological replacement**
  - By mouth, or by slow intravenous injection
  - Child: 250–500 micrograms/m² every 12 hours, adjusted according to response

- **Suppression of inflammatory and allergic disorders**
  - By mouth
  - Child: 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations
  - By intramuscular injection, or by slow intravenous injection, or by intravenous infusion
  - Child 1 month–11 years: 83–333 micrograms/kg daily in 1–2 divided doses; maximum 20 mg per day
  - Child 12–17 years: Initially 0.4–20 mg daily

- **Mild croup**
  - By mouth
  - Child: 150 micrograms/kg for 1 dose

- **Severe croup (or mild croup that might cause complications)**
  - Initially by mouth
  - Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

- **Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)**
  - By slow intravenous injection
  - Child 3 months–17 years: 150 micrograms/kg every 6 hours (max per dose 10 mg) for 4 days

- **Life-threatening cerebral oedema**
  - By intravenous injection
  - Child (body weight up to 35 kg): Initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 6 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then reduced in steps of 0.8 mg daily
  - Child (body weight 35 kg and above): Initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then reduced in steps of 1.7 mg daily

**UNLICENSED USE**
- With intravenous use: Consult product literature; not licensed for use in bacterial meningitis.

**INTERACTIONS** Appendix 1: corticosteroids

**SIDE-EFFECTS**
- With oral use
  - Hiccups - hyperglycaemia - myocardial rupture (following recent myocardial infarction) - protein catabolism
- With parenteral use
  - Perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)

**Bronchodilator**
Dexamethasone readily crosses the placenta.

Fludrocortisone acetate

**DRUG ACTION** Fludrocortisone has very high mineralocorticoid activity and insignificant glucocorticoid activity.

- **INDICATIONS AND DOSE**
  - Mineralocorticoid replacement in adrenocortical insufficiency
    - **BY MOUTH**
      - Neonate: Initially 50 micrograms once daily, adjusted according to response; usual dose 50–200 micrograms once daily, higher doses may be required, dose adjustment may be required if salt supplements are administered.
    - Child: Initially 50–100 micrograms once daily; maintenance 50–300 micrograms once daily, adjusted according to response, dose adjustment may be required if salt supplements are administered.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Conjunctivitis; idiopathic intracranial hypertension; muscle weakness; thrombophlebitis
- **HEPATIC IMPAIRMENT**
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Fludrocortisone for hormone replacement [www.medicinesforchildren.org.uk/fludrocortisone-hormone-replacement]

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 10
  - Fludrocortisone acetate (Non-proprietary)
    - Fludrocortisone acetate 100 microgram Fludrocortisone 100microgram tablets | 30 tablet [POT] £13.60 DT = £13.60

Hydrocortisone

**DRUG ACTION** Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

- **INDICATIONS AND DOSE**
  - Acute adrenocortical insufficiency (Addisonian crisis)
    - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
    - Neonate: Initially 10 mg, then (by continuous intravenous infusion) 100 mg/m² daily, alternatively (by intravenous infusion) 100 mg/m² daily in divided doses, to be given every 6–8 hours; adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.

  - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child 1 month–11 years: Initially 2–4 mg/kg, then 2–4 mg/kg every 6 hours, adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.
    - Child 12–17 years: 100 mg every 6–8 hours

  - **CONGENITAL ADRENAL HYPERPLASIA**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Neonate: 9–15 mg/m² in 3 divided doses, adjusted according to response.
      - Child: 9–15 mg/m² in 3 divided doses, adjusted according to response.

  - **ADRENAL HYPOPLASIA** (Addison’s disease, chronic maintenance or replacement therapy)
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Neonate: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.
      - Child: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.

  - **INFLAmMATory BOWEL DISEASE—INDUCTION OF REMISSION**
    - **BY INTRAVENOUS INJECTION**
      - Child 2–17 years: 2.5 mg/kg every 6 hours (max. per dose 100 mg)
      - **BY CONTINUOUS INTRAVENOUS INFUSION**
        - Child 2–17 years: 10 mg/kg daily; maximum 400 mg per day

  - **ULCERATIVE COLITIS** | Proctitis | Proctosigmoiditis
    - **BY INTRAVENOUS INJECTION**
      - Child 2–17 years: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

  - **ACUTE HYPERSENSITIVITY REACTIONS** | Angioedema
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INJECTION**
      - Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response.
      - Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response.
      - Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response.
      - Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response.

  - **Hypotension resistant to inotropic treatment and volume replacement (limited evidence)**
    - **BY INTRAVENOUS INJECTION**
      - Neonate: Initially 2.5 mg/kg, then 2.5 mg/kg after 4 hours if required, followed by 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, dose to then be reduced gradually over at least 48 hours.

      - Child: 1 mg/kg every 6 hours (max. per dose 100 mg)

  - **Severe acute asthma** | Life-threatening acute asthma
    - **BY INTRAVENOUS INJECTION**
      - Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate.
      - Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until
conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

- Child 5-11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Child 12-17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

### CONTRA-INDICATIONS
- With rectal use Bowel perforation - extensive fistulas - intestinal obstruction - recent intestinal anastomoses
- With oral use Use of injection by mouth is unlicensed.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: HYDROCORTISONE MUCO-ADHESIVE BUCAL TABLETS - SHOULDN'T BE USED OFF-LABEL FOR ADRENAL INSUFFICIENCY IN CHILDREN DUE TO SERIOUS RISKS (DECEMBER 2018)**

The MHRA has received reports of off-label use of hydrocortisone muco-adhesive buccal tablets for adrenal insufficiency in children.

Healthcare professionals are advised that:
- hydrocortisone muco-adhesive buccal tablets are indicated only for local use in the mouth for aphthous ulceration and should not be used to treat adrenal insufficiency;
- substitution of licensed oral hydrocortisone formulations with muco-adhesive buccal tablets can result in insufficient cortisol absorption and, in stress situations, life-threatening adrenal crisis;
- only hydrocortisone products licensed for adrenal replacement therapy should be used.

### CAUTIONS
- With rectal use Systemic absorption may occur

### INTERACTIONS
- Appendix 1: corticosteroids

### SIDE-EFFECTS
- With oral use Dyslipidaemia - myocardial rupture (following recent myocardial infarction) - oedema
- With parenteral use Hiccups - Kaposi's sarcoma - lipomatosis - myocardial rupture (following recent myocardial infarction)

### DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
- With oral use For administration by mouth, injection solution may be swallowed [unlicensed use] but consider phosphate content. For Alkindi®, manufacturer advises capsule should be opened and granules either administered directly into the mouth and then followed immediately with a drink, or sprinkled onto a spoonful of soft food (such as yoghurt) and given immediately. Granules should not be chewed or added to liquid before administration due to the bitter taste, and they should not be given via a nasogastric tube.

### PRESCRIBING AND DISPENSING INFORMATION

The RCPCH and NPPG recommend that, when a liquid special of hydrocortisone is required, the following strength is used: 5 mg/5 mL.

### PATIENT AND CARER ADVICE
- With systemic use Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

### NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2088

- With oral use The Scottish Medicines Consortium (October 2018) has advised that hydrocortisone (Alkindi®) is accepted for restricted use within NHS Scotland for the first-line treatment of patients with adrenal insufficiency aged from birth to less than six years of age for whom hydrocortisone must otherwise be individually prepared by manipulation such as by compounding (or crushing) or by production of special solutions in order to produce age-appropriate doses, or hydrocortisone given as off-label buccal tablets. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

### EXCEPTIONS TO LEGAL CATEGORY
- With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Methylprednisolone

**DRUG ACTION** Methylprednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

**INDICATIONS AND DOSE**

**Inflammatory and allergic disorders**
- **By mouth, or by slow intravenous injection, or by intravenous infusion**
  - Child: 0.5–1.7 mg/kg daily in 2–4 divided doses, divide doses depending on condition and response

**Treatment of graft rejection reactions**
- **By intravenous injection**
  - Child: 10–20 mg/kg once daily for 3 days, alternatively 400–600 mg/m² once daily (max. per dose 1 g) for 3 days

**Severe erythema multiforme / Lupus nephritis / Systemic onset juvenile idiopathic arthritis**
- **By intravenous injection**
  - Child: 10–30 mg/kg once daily or on alternate days (max. per dose 1 g) for up to 3 doses

**DEPO-MEDRONE**

**Suppression of inflammatory and allergic disorders**
- **By deep intramuscular injection**
  - Child: Seek specialist advice, to be injected into the gluteal muscle

**INDICATIONS**

**Common or very common**
- Diarrhoea
- Severe erythema multiforme
- Lipomatosis

**Rare**
- Myocardial infarction
- Severe erythema multiforme
- Abrupt withdrawal syndrome
- Depression
- Delusions
- Suicidal thoughts

**MEDICATION FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, tablet, injection vials.

**SIDE-EFFECTS**
- Common: glucocorticoid effects with minimal mineralocorticoid effects
- Rare: mild croup, mild withdrawal syndrome, emotional lability

**INTERACTIONS**

**Important Safety Information**

**BNFC 2019–2020**
Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)

- **BY MOUTH**
  - Child: Initially 1–2 mg/kg once daily, to be reduced after a few days if appropriate; maximum 60 mg per day

Autoimmune hepatitis

- **BY MOUTH**
  - Child: Initially 2 mg/kg once daily, to then be reduced to minimum effective dose; maximum 40 mg per day

Corticosteroid replacement therapy

- **BY MOUTH**
  - Child 12–17 years: 2–2.5 mg/m<sup>2</sup> daily in 1–2 divided doses, adjusted according to response

Infantile spasms

- **BY MOUTH**
  - Child 1 month–1 year: Initially 10 mg 4 times a day for 14 days; increased to 20 mg 3 times a day for 7 days if seizures not controlled after initial 7 days, reduce dose gradually over 15 days until stopped

Infantile spasms (dose reduction in patient taking 40 mg daily)

- **BY MOUTH**
  - Child 1 month–1 year: Reduced in steps of 10 mg every 5 days, then stop

Infantile spasms (dose reduction in patient taking 60 mg daily)

- **BY MOUTH**
  - Child 1 month–1 year: Reduced to 40 mg daily for 5 days, then reduced to 20 mg daily for 5 days, then reduced to 10 mg daily for 5 days and then stop

Idiopathic thrombocytopenic purpura

- **BY MOUTH**
  - Child 1–9 years: 1–2 mg/kg daily for maximum of 14 days, alternatively 4 mg/kg daily for a maximum of 4 days

Nephrotic syndrome

- **BY MOUTH**
  - Child: Initially 60 mg/m<sup>2</sup> once daily for 4–6 weeks until proteinuria ceases, then reduced to 40 mg/m<sup>2</sup> once daily on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; maximum 80 mg per day

Nephrotic syndrome (prevention of relapse)

- **BY MOUTH**
  - Child: 0.5–1 mg/kg once daily or on alternate days for 3–6 months

Ulcerative colitis | Crohn’s disease

- **BY MOUTH**
  - Child 2–17 years: 2 mg/kg once daily (max. per dose 60 mg) until remission occurs, followed by reducing doses

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

- **BY MOUTH**
  - Child: 2 mg/kg daily for 5 days, the dose is then reduced over the next 16 days and then stopped, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards, the corticosteroid should be withdrawn before anti-pneumocystis treatment is complete; maximum 80 mg per day

Proctitis

- **BY RECTUM USING RECTAL FOAM**
  - Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

- **BY RECTUM USING SUPPOSITORIES**
  - Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis

- **BY RECTUM USING SUPPOSITORIES**
  - Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn’s disease

- **BY RECTUM USING SUPPOSITORIES**
  - Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

**UNLICENSED USE**

- With rectal use Prednisolone rectal foam not licensed for use in children (age range not specified by manufacturer).

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

**CONTRA-INDICATIONS**

- With rectal use Bowel perforation· extensive fistulas· intestinal obstruction· recent intestinal anastomoses

**CAUTIONS**

- With rectal use systemic absorption may occur with rectal preparations
- With systemic use Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)· systemic sclerosis (increased incidence of scleroderma renal crisis with a daily dose of 15 mg or more)

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

- With oral use Diarrhoea· dizziness· dyslipidaemia· lipomatosis· protein catabolism· scleroderma renal crisis

**PREGNANCY**

- As it crosses the placenta 88% of prednisolone is inactivated.
  - Monitoring: With systemic use Pregnant women with fluid retention should be monitored closely.

**BREAST FEEDING**

- Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.
  - Monitoring: With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

**MONITORING REQUIREMENTS**

- With systemic use Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

2.1 Cushing’s syndrome and disease

**Cushing’s Syndrome**

**Management**

Most types of Cushing’s syndrome are treated surgically. Metyrapone p. 461 may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotropic tumour cells in patients with Cushing’s disease. It is used under specialist supervision in children over 12 years for treatment of endogenous Cushing’s syndrome.

**ENZYME INHIBITORS**

**Ketoconazole**

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17α-hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing’s disease.

- **INDICATIONS AND DOSE**
  - **Endogenous Cushing’s syndrome (specialist use only)**
    - **BY MOUTH**
      - Child 12-17 years: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

- **CONTRA-INDICATIONS** Acquired QTc prolongation. Acute porphyrias p. 624 – avoid concomitant use of hepatotoxic drugs – congenital QTc prolongation

- **CAUTIONS** Pre-treatment liver enzymes should not exceed 2 times the normal upper limit - risk of adrenal insufficiency

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**
  - **Common or very common** Adrenal insufficiency - diarrhoea - gastrointestinal discomfort - nausea - skin reactions - vomiting
  - **Uncommon** Allergic conditions - alopecia - angioedema - asthenia - dizziness - drowsiness - headache - thrombocytopenia
  - **Rare or very rare** Fever - hepatic disorders - taste altered
  - **Frequency not known** Alcohol intolerance - appetite abnormal - arthralgia - azoospermia - dry mouth - epistaxis - flatulence -fontanelle bulging - glycaemostasis - hot flush - insomnia - intracranial pressure increased - malaise - menstrual disorder - myalgia - nervousness - papilloedema - paraesthesia - peripheral oedema - photosensitivity reaction - tongue discolouration

**SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported rarely with oral use.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **MONITORING REQUIREMENTS**
  - Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
  - Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose
established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hypoponatremia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

- Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

- PATIENT AND CARER ADVICE Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

- Driving and skilled tasks Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- Tablet
  - CAUTIONARY AND ADVISORY LABELS 2, 5, 21
  - Ketoconazole (non-proprietary)
  - Ketoconazole 200 mg
  - 60 tablet | £480.00 DT + £480.00

Metyrapone

- DRUG ACTION Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of adrenal function.

- INDICATIONS AND DOSE
  - Differential diagnosis of ACTH-dependent Cushings syndrome (specialist supervision in hospital)
    - BY MOUTH
    - Child: 15 mg/kg every 4 hours for 6 doses, alternatively 300 mg/m² every 4 hours for 6 doses; usual dose 250–750 mg every 4 hours
  - Management of Cushings syndrome (specialist supervision in hospital)
    - BY MOUTH
    - Child: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

- CONTRA-INDICATIONS Adrenocortical insufficiency

- CAUTIONS Avoid in Acute porphyria p. 624 - gross hypopituitarism (risk of precipitating acute adrenal failure) - hypotension on long-term administration - hypothryoidism (delayed response)

- INTERACTIONS → Appendix 1: metyrapone

- SIDE-EFFECTS
  - Common or very common Dizziness - headache - hypotension - nausea - sedation - vomiting
  - Rare or very rare Abdominal pain - adrenal insufficiency - allergic dermatitis - hirsutism

- FREQUENCY NOT KNOWN Alopeia - bone marrow failure - hypertension

- PREGNANCY Avoid (may impair biosynthesis of fetal-placental steroids).

- BREAST FEEDING Avoid—no information available.

- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of delayed response).

- PATIENT AND CARER ADVICE Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- Capsule
  - CAUTIONARY AND ADVISORY LABELS 21
  - Metyrapone (HRA Pharma UK Ltd)
  - Metyrapone 250 mg Metopirone 250mg capsules | 100 capsule [POD] £363.66 DT + £363.66

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat, and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes p. 462 mellitus and Type 2 diabetes p. 465 mellitus are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral or antipsychotic drugs may also cause secondary diabetes. In children, conditions such as cystic fibrosis can lead to diabetes; monogenic diabetes (previously known as maturity onset diabetes in the young) can also occur due to a single gene defect.

Driving

Information on the requirements for driving vehicles by young people receiving treatment for diabetes is available in the BNF or from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive.

Alcohol

Adolescents and their carers should be made aware that alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; (note: specialist sources recommend that adult patients with diabetes should drink alcohol only in moderation, and when accompanied by food).

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use of diabetes when severe symptoms of hyperglycaemia are present. In children who have less severe symptoms and blood-glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It may be useful for diagnosis of monogenic diabetes or cystic fibrosis related diabetes, and is used to establish the presence of gestational diabetes.
**Type 1 diabetes**

**Description of condition**

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood. Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, premature cardiovascular disease, and peripheral artery disease.

Typical features in children presenting with type 1 diabetes are hyperglycaemia, polyuria, polydipsia, weight loss, and excessive tiredness.

**Aims of treatment**

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications. Disability from complications can often be prevented by early detection and active management of the disease (Diabetic complications p. 466).

The target for glycaemic control should be individualised for each child, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, and history of hypoglycaemia. Tighter control of blood-glucose is now recommended for children with type 1 diabetes and treatment should attempt to reach near normal HbA1c and blood-glucose concentration. A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is recommended in children to minimise the risk of long-term complications. The optimal plasma glucose targets for children are:

- fasting blood-glucose concentration of 4–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre after meals;
- a blood-glucose concentration of at least 5 mmol/litre in young people when driving.

**Overview**

Type 1 diabetes requires insulin replacement, supported when necessary by active management of other associated cardiovascular risk factors such as hypertension. Tight glycaemic control may be achieved by intensive insulin management (multiple daily injections or insulin pump therapy) from diagnosis, accompanied by carbohydrate counting.

The effectiveness of metformin in combination with insulin is not yet known in children, and so should not be used; other oral antidiabetic drugs should not be used in combination with insulin as their use may increase the risk of hypoglycaemia.

Dietary control is important in both type 1 and type 2 diabetes and children (with their families) should be encouraged to develop good knowledge of nutrition and how it affects their diabetes and insulin requirements. Healthy eating, regular exercise, and control of body-weight can reduce cardiovascular risk and help improve glycaemic control.

Children with type 1 diabetes over the age of 6 months should receive immunisation against influenza and pneumococcal infection (in children treated with...
antidiabetic drugs)—see Influenza vaccine p. 806 and Pneumococcal vaccine p. 809.  

Insulin therapy in type 1 diabetes

All children with type 1 diabetes require insulin therapy (see also Insulin p. 464). Treatment should be initiated and managed by clinicians with relevant expertise; there are three basic types of insulin regimen, although each regimen should be individualised.

Children should also be offered carbohydrate-counting training as part of a structured education programme.  

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

Children should be offered multiple daily injection basal-bolus regimens initiated at diagnosis, considering personal and family circumstances, and personal preferences. Children and their carers should be encouraged to adjust the insulin dose as appropriate after each blood-glucose measurement, and to inject rapid-acting insulin analogues before eating (rather than after eating); this reduces blood-glucose concentrations after meals and helps to optimise blood-glucose control.

If a multiple daily injection basal-bolus insulin regimen is unsuitable, or the child does not have optimal blood-glucose control, it may be necessary to offer an alternative insulin regimen (either continuous subcutaneous insulin infusion or once-, twice- or three-times daily mixed injections) as well as additional support (such as increased contact with their specialist diabetes team).

Continuous subcutaneous insulin infusion (or insulin pump) therapy may be considered under the care of a specialist team. It should only be offered to children over 12 years who suffer disabling hypoglycaemia, or, who have high HbA1c concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Children under 12 years may be offered insulin pump therapy if a multiple daily injection regimen is impractical or inappropriate, but they should undergo a trial of a multiple dose injection regimen between the ages of 12 and 18 years.

If the chosen regimen is a twice daily injection regimen, the insulin dose should be adjusted according to the general trend in pre-meal, bedtime and occasional night-time blood-glucose concentration.  

Insulin requirements

The dosage of insulin must be determined individually for each child and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Prescribers and patients should be aware that initiation of insulin may be followed by a temporary partial remission phase or ‘honeymoon period’ when lower doses of insulin are required than are subsequently necessary to maintain glycaemic control with an HbA1c concentration of less than 48 mmol/mol (6.5%).  

Insulin doses should be reviewed after puberty (around 1 year after menarche or after the growth spurt in boys) as insulin resistance falls after puberty, and maintenance of pubertal doses may increase the risk for excessive weight gain.  

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet and exercise), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison’s disease or gastroparesis.  

A review of the child’s injection sites should be offered at each clinic visit.  

Infection, stress, accidental or surgical trauma, and puberty may all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, and in certain endocrine disorders, such as anterior pituitary or adrenocortical insufficiency and hypothyroidism.

Rapid-acting insulin analogues should be supplied for use during intercurrent illness and episodes of hypoglycaemia.  

Risks of hypoglycaemia with insulin

Hypoglycaemia is an inevitable adverse effect of insulin treatment, and children and their carers should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 482).  

Impaired awareness of hypoglycaemia can occur, when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present.  

AWARENESS of hypoglycaemia should be discussed and assessed with the child and their carer approximately every 3 months.  

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the child. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated children can be a serious hazard, especially for adolescents who are drivers, cyclists, or in dangerous occupations.

Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see Driving, under Diabetes p. 461).  

To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous glucose monitoring should be considered.

Children and their carers should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the child should be referred to a specialist centre.  

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hyodermic equipment

Children and their carers should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers.
Arrangements should be made for the suitable disposal of these containers.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Advanced Pharmacy Services

Patients with type 1 diabetes may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Useful Resources

Insulin

Overview

For recommended insulin regimens see Type 1 diabetes p. 462 and Type 2 diabetes p. 465.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered.

Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration.

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble insulin (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 472, insulin glulisine p. 473 and insulin lispro p. 473).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 466 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of post-meal injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia.

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 474) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of
Lifestyle interventions such as diet and exercise, from the achieving glycaemic control in children, therefore resulting in hyperglycaemia. Insulin production also occurs progressively over time, characterised by insulin resistance. Insufficient pancreatic insulin can be supplied (biphasic isophane insulin p. 474, biphasic insulin aspart p. 475 and biphasic insulin lispro p. 475).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

**Long-acting insulin**

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin p. 477, insulin zinc suspension p. 476, insulin detemir p. 476, insulin glargine p. 476, insulin degludec p. 475) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

### Type 2 diabetes

**Description of condition**

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia. Type 2 diabetes in children is associated with increased body-weight, increased risk of renal complications, hypertension, and dyslipidaemia; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

**Aims of treatment**

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA1c at or below the target value set for each individual child.

**Overview**

Lifestyle modifications (including weight loss, smoking cessation and regular exercise) can help to reduce both hyperglycaemia and cardiovascular risk and should be encouraged where appropriate. Children and their carers should also receive advice from a paediatric dietitian to help optimise body-weight and blood-glucose control.

Lifestyle modifications alone are often unsuccessful at achieving glycaemic control in children, therefore antidiabetic drugs should be offered and initiated alongside lifestyle interventions such as diet and exercise, from the time of diagnosis.

Children with type 2 diabetes should receive immunisation against influenza (over the age of 6 months) and pneumococcal infection—see Influenza vaccine p. 806 and Pneumococcal vaccine p. 809.

### Antidiabetic drugs

In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic drugs in children is limited. For recommended treatment regimens and the place in therapy of each drug, see *Treatment of type 2 diabetes*.

#### 05-Jun-2017

**Treatment with antidiabetic drugs should be initiated under specialist supervision only.**

Metformin hydrochloride p. 468 is the only oral antidiabetic drug licensed for use in children. It has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. Metformin hydrochloride does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia.

**The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side-effects.**

There is little experience of the use of other non-insulin antidiabetic drugs in children, with most evidence extrapolated from adult studies.

Several sulfonylureas (such as gliclazide p. 470, glibenclamide p. 469 and tolbutamide p. 470) are available but experience in children is limited; they are not the recommended choice of treatment in children; therefore treatment should be initiated by a specialist. The sulfonylureas may cause hypoglycaemia which may be more common in children than in adults. Hypoglycaemia is more likely with long-acting sulfonylureas such as glibenclamide, which has been associated with severe, prolonged and sometimes fatal cases—for this reason sulfonylureas are usually avoided in children.

**Treatment of type 2 diabetes**

A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is ideal to minimise the risk of long-term complications, however an individualised lowest achievable target should be agreed with each child and their carers taking into account factors such as daily activities, individual life goals, complications, and comorbidities. HbA1c concentrations should be monitored every 3 months.

**Note:** Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for children where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

Standard-release metformin hydrochloride is the first-line choice for initial treatment in children and should be offered from diagnosis, alongside nutrition and lifestyle advice.

If the combination of lifestyle changes and metformin hydrochloride fails to reduce HbA1c to the agreed target within 3 to 4 months of therapy, addition of a long-acting insulin or once-daily human isophane insulin p. 474 should be considered (see also, Insulin p. 464).

**Initiation of insulin should be under specialist care.**

**Metformin hydrochloride should be continued alongside insulin, to improve insulin sensitivity.**

The combination of metformin hydrochloride and once-daily insulin is usually an effective treatment for maintaining glycaemic control in the majority of children for extended periods of time.

If the combination of basal insulin and metformin does not achieve the HbA1c target (and postprandial hyperglycaemia persists) addition of prandial rapid- or short-acting insulin should be initiated and titrated until the target HbA1c is met.

**Weight gain may occur and can be particularly problematic in children with type 2 diabetes when insulin therapy is initiated, unless there is careful attention and...**
adherence to dietary measures. The importance of diet and exercise should be emphasised.

**Advanced Pharmacy Services**

Children with type 2 diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

**Useful Resources**

---

**Diabetic complications**

See also

Diabetes p. 461
  - Type 1 diabetes p. 462
  - Type 2 diabetes p. 465

**Diabetes and cardiovascular disease**

Diabetes is a strong risk factor for cardiovascular disease later in life. Other risk factors for cardiovascular disease that should also be addressed are: smoking, hypertension, obesity and dyslipidaemia. The use of an ACE inhibitor (or an angiotensin-II receptor antagonist) and lipid-regulating drugs can be beneficial in children with diabetes and a high cardiovascular disease risk. ACE inhibitors and angiotensin-II receptor antagonists may also have a role in the management of diabetic nephropathy. For guidance on stopping smoking, see Smoking cessation p. 304.

**Diabetic nephropathy**

In diabetic children with nephropathy, blood pressure should be reduced to the lowest achievable level to slow the rate of decline of glomerular filtration rate and reduce proteinuria. Microalbuminuria can occur transiently during puberty. Provided there are no contra-indications, all diabetic children with nephropathy causing proteinuria or with established microalbuminuria should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist, even if the blood pressure is normal. ACE inhibitors or angiotensin-II receptor antagonists should also be given as monotherapy, or combined therapy, in children with chronic kidney disease and proteinuria, to reduce the rate of progression of chronic kidney disease.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment. See also treatment of hypertension in diabetes in Hypertension p. 100.

**Diabetic neuropathy**

Clinical neuropathy is rare in children whose diabetes is well controlled.

**Visual impairment**

Optimal diabetic control (HbA1c ideally around 7% or 53 mmol/mol) and blood pressure control (<130/80 mmHg) should be maintained to prevent onset and progression of diabetic eye disease.

---

**Diabetic ketoacidosis**

**Management**

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes, (available at www.bsped.org.uk) should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in shock, give 10 mL/kg sodium chloride 0.9% as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
- Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over 48 hours; initially use sodium chloride 0.9%, changing to sodium chloride 0.45% and glucose 5% after 12 hours if response is adequate and plasma-sodium concentration is stable.
- Include potassium chloride in the fluids unless anuria is suspected, adjust according to plasma-potassium concentration.
- Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
- **Soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.**
- **Sodium bicarbonate** infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.
- Once blood glucose falls to 14 mmol/litre, **glucose intravenous infusion 5% or 10% should be added to the fluids.**
- The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started; it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
- The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long acting insulin, or 10 minutes after starting subcutaneous insulin aspart p. 472, or insulin glulisine p. 473, or insulin lispro p. 473.
- Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

---

**Diabetes, surgery and medical illness**

**Management of diabetes during surgery**

Children with diabetes should undergo surgery in centres with facilities and expertise for the care of children with diabetes. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these children. All surgery requiring general anaesthesia in children with type 1 and type 2 diabetes requires hospital admission.
Note: The following recommendations provide general guidance for the management of diabetes during surgery. Local protocols and guidelines should be referred to where they exist.

Use of insulin during surgery

**Elective surgery—minor procedures**

Minor procedures (procedures of less than 2 hours requiring either general anaesthesia or heavy sedation) in children who have type 1 or type 2 diabetes should ideally be performed when diabetes is under optimal control. If glycaemic control is poor, the procedure should be delayed if possible; otherwise it is advisable to admit the child well in advance of surgery for stabilisation of glycaemic control. Blood-glucose concentration should be maintained within the usual target range of 5–10 mmol/litre throughout the peri-operative period for all surgical procedures.

Children usually prescribed insulin for type 1 or type 2 diabetes require an intravenous insulin infusion p. 471 during surgery (even if fasting) to avoid ketoacidosis. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the **evening before surgery**, the usual insulin regimen should be given as usual; the usual bedtime snack should be given and hourly capillary blood-glucose monitoring should be initiated to detect hypoglycaemia or hyperglycaemia before the procedure. Ketones should also be checked if blood-glucose is above 14 mmol/litre, and an appropriate dose of short-acting insulin should be administered to restore blood-glucose to the target range;
- on the **morning of surgery** the usual insulin dose should be omitted;
- at least **2 hours before the procedure**, a maintenance fluid infusion of sodium chloride 0.45% and glucose 5% (sodium chloride with glucose) intravenous infusion should be started. A switch to sodium chloride 0.9% infusion p. 610 may be required if sodium concentration falls and there is risk of hypotension. After surgery, potassium chloride p. 623 should be added to the intravenous fluid, according to the child’s body weight and fluid requirements. Electrolytes must be measured frequently throughout, and adjustments to the infusion made as necessary;
- soluble human insulin 1 unit/mL in sodium chloride 0.9% intravenous infusion should be started with the maintenance fluids at an infusion rate appropriate to the blood-glucose concentration, to maintain a concentration between 5 and 10 mmol/litre, adjusted according to hourly blood-glucose monitoring;
- if the blood-glucose concentration falls below 6 mmol/litre the insulin infusion should not be stopped as this will cause rebound hyperglycaemia; instead the rate should be reduced; however, if blood-glucose concentration drops below 4 mmol/litre the insulin infusion can be stopped temporarily for 10–15 minutes.

After surgery, continue the glucose infusion, and the intravenous insulin infusion or additional short-acting insulin as necessary, until the child can eat and drink normally and their usual treatment regimen can resume. A short-acting insulin can also be given if required to reduce hyperglycaemia.

**Emergency surgery**

Children with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood-glucose, blood or urinary ketone concentration, and serum electrolytes checked before surgery. If ketones are high, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis p. 466 should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for major elective surgery (above).

**Use of antidiabetic drugs during surgery**

If elective minor surgical procedures only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

Children who usually take sulfonylureas should have their medication stopped on the day of surgery.

Sulfonylureas are associated with hypoglycaemia in the fasted state and therefore should not be recommenced until the child is eating and drinking normally.

Children undergoing minor procedures require hourly blood-glucose monitoring and, if blood-glucose concentration rises above 10 mmol/litre, should be treated with subcutaneous rapid-acting insulin no more frequently than every 3 hours.

Children undergoing a major surgical procedure expected to last at least 2 hours should be managed on an intravenous insulin infusion following the recommendations for Elective surgery (above).

Insulin is almost always required in medical and surgical emergencies.

Metformin hydrochloride p. 468 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. In children undergoing major surgery lasting more than 2 hours, metformin hydrochloride should be discontinued 24 hours before the procedure. Children having minor surgery lasting less than 2 hours may stop their metformin on the day of surgery. Metformin hydrochloride should not be restarted until at least 48 hours after surgery or after the child is eating again, and only once normal renal function has been established.

The manufacturer advises that metformin should also be omitted if contrast medium is administered during surgery to reduce the risk of contrast-induced nephropathy. It should be stopped prior to, or at the time of the test, and not to be restarted until 48 hours afterwards, and only once normal renal function has been established.

**Use of antidiabetic drugs during medical illness**

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

---

**Diabetes, pregnancy and breast-feeding**

**Description of condition**

Diabetes in pregnancy is associated with increased risks to the young woman (such as pre-eclampsia and rapidly worsening retinopathy), and to the developing fetus, compared with pregnancy in non-diabetic young women. Effective blood-glucose control before conception and throughout pregnancy reduces (but does not eliminate) the...
risk of adverse outcomes such as miscarriage, congenital malformation, stillbirth, and neonatal death.

**Management of pre-existing diabetes**

**CGG** Young women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA1c concentration below 48 mmol/mol (6.5%) if possible without causing problematic hyperglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Young women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for young women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 594.

**Overview**

**Oral antidiabetic drugs**

**CGG** All oral antidiabetic drugs, except metformin hydrochloride below, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Young women with diabetes may be treated with metformin hydrochloride below [unlicensed in pregnancy] as an adjunct or alternative to insulin in the preconception period and during pregnancy, when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride below can be continued immediately after birth and during breast-feeding for those with pre-existing Type 2 diabetes p. 465. All other antidiabetic drugs should be avoided while breast-feeding.

**Insulin**

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 472 and insulin lispro p. 473) can be associated with fewer episodes of hyperglycaemia, a reduction in postprandial glucose excursions, and an improvement in overall glycaemic control compared with regular human insulin.

**Isophane insulin** p. 474 is the first-choice for long-acting insulin during pregnancy, however in young women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 476 or insulin glargine p. 476), it may be appropriate to continue their use throughout pregnancy.

Continuous subcutaneous insulin infusion p. 471 (insulin pump therapy) may be appropriate for young women who have difficulty achieving glycaemic control with multiple daily injections of insulin p. 471 without significant disabling hypoglycaemia.

All young women treated with insulin p. 471 during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant young women with Type 1 diabetes p. 462 should also be prescribed glucagon p. 482 for use if needed.

Young women with pre-existing diabetes treated with insulin p. 471 during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose.

**Medication for diabetic complications**

**CGG** Angiotensin-converting enzyme inhibitors and angiotensin-II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed. Statins should not be prescribed during pregnancy and should be discontinued before a planned pregnancy.

---

**Gestational diabetes**

**CGG** Young women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride below may be prescribed [unlicensed use]. Insulin p. 471 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone.

Young women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin p. 471 immediately with or without metformin hydrochloride below, in addition to a change in diet and exercise.

Young women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications, such as macrosomia or hydramnios, should be considered for immediate insulin p. 471 treatment, with or without metformin hydrochloride below.

Young women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth.

www.nice.org.uk/guidance/ng3

**BLOOD GLUCOSE LOWERING DRUGS**

**Biguanides**

**Metformin hydrochloride**

- **Drug Action** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

- **Indications and Dose**
  - **Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]**
    - By mouth using immediate-release medicines
    - Child 6–9 years (specialist use only): Initially 200 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
    - Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

- **Unlicensed Use** Not licensed for use in children under 10 years.

- **Contra-Indications** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)

- **Caution** Risk factors for lactic acidosis

- **Caution, Further Information** Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

- **Interactions** → Appendix 1: metformin
Diabetes mellitus 469

Glibenclamide

- INDICATIONS AND DOSE
  - Type 2 diabetes mellitus
  - By mouth
  - Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

Maturity-onset diabetes of the young (specialist use only)

- By mouth
  - Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- UNLICENSED USE
  - Not licensed for use in children.

- CONTRA-INDICATIONS
  - Avoid where possible in Acute porphyrias p. 624

- INTERACTIONS
  - Appendix 1: sulfonylureas

- SIDE-EFFECTS
  - Appetite decreased - gastrointestinal discomfort - SIADH - taste metallic

- PREGNANCY
  - The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.

- BREAST FEEDING
  - Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Glibenclamide (Non-proprietary)

- Glipizide 2.5 mg
- Glibenclamide 5 mg

- MEASUREMENTS
  - 500 mg Metformin hydrochloride 500 mg per 1 ml
  - 1000 mg Metformin hydrochloride 1000 mg per 1 ml

- INDICATIONS
  - Type 2 diabetes mellitus
  - Maturity-onset diabetes of the young

- CONTRA-INDICATIONS
  - Presence of ketoacidosis

- CAUTIONS
  - Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) - G6PD deficiency

- SIDE-EFFECTS
  - Common or very common
  - Abdominal pain - diarrhea - hypoglycaemia - nausea
  - Uncommon
  - Hepatic disorders - vomiting
  - Rare or very rare
  - Agranulocytosis - erythromenia - granulocytopenia - haemolytic anaemia - leucopenia - pancytopenia - thrombocytopenia

- FREQUENCY
  - Not known

- MEDICATIONS
  - Glucophage (Merck Serono Ltd)

- PATIENT AND CARER ADVICE
  - Driving and skilled tasks
  - Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

BLOOD GLUCOSE LOWERING DRUGS 》 SULfonylureAS

Sulfonylureas

- DRUG ACTION
  - The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

- CONTRA-INDICATIONS
  - Presence of ketoacidosis

- CAUTIONS
  - Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) - G6PD deficiency

- SIDE-EFFECTS
  - Common or very common
  - Abdominal pain - diarrhea - hypoglycaemia - nausea
  - Uncommon
  - Hepatic disorders - vomiting
  - Rare or very rare
  - Agranulocytosis - erythromenia - granulocytopenia - haemolytic anaemia - leucopenia - pancytopenia - thrombocytopenia

- FREQUENCY
  - Not known

- MEDICATIONS
  - Glucophage (Merck Serono Ltd)

- PATIENT AND CARER ADVICE
  - Driving and skilled tasks
  - Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.
Gliclazide

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**
- By mouth using immediate-release medicines
- Child 12-17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

**Maturity-onset diabetes of the young (specialist use only)**
- By mouth using immediate-release medicines
- Child 12-17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 624

**INTERACTIONS** → Appendix 1: sulfonylureas

**SIDE-EFFECTS**
- Rare or very rare Aplastic anaemia - blood disorder
- Frequency not known Alcohol intolerance - appetite abnormal - erythema multiforme (usually in the first 6-8 weeks of therapy) - exfoliative dermatitis (usually in the first 6-8 weeks of therapy) - fever (usually in the first 6-8 weeks of therapy) - headache - hypersensitivity (usually in the first 6-8 weeks of therapy) - paraesthesia - photosensitivity reaction - tinnitus - weight increased

**PREGNANCY**
- The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

**BREAST FEEDING**
- The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

**RENAL IMPAIRMENT**
- If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Gliclazide for type 2 diabetes mellitus and maturity-onset diabetes of the young

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- Gliclazide 40 mg, 80 mg, 160 mg
- Tolbutamide 500 mg

**INSULINS**

**Insulins**

**IMPORTANT SAFETY INFORMATION**

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)**

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

**SIDE-EFFECTS**
- Common or very common Oedema
- Uncommon Lipodystrophy

**SIDE-EFFECTS, FURTHER INFORMATION**

**Overdose**
- Overdose causes hypoglycaemia.

**PREGNANCY**
- Dose adjustments During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.
- The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

**BREAST FEEDING**
- Dose adjustments During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

**HEPATIC IMPAIRMENT**
- Dose adjustments Insulin requirements may be decreased in patients with hepatic impairment.

**RENAL IMPAIRMENT**
- The compensatory response to hypoglycaemia is impaired in renal impairment.
- Dose adjustments Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary.
MONITORING REQUIREMENTS

- Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

DIRECTIONS FOR ADMINISTRATION

Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulin not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

PRESCRIBING AND DISPENSING INFORMATION

Show container to patient or carer and confirm the expected version is dispensed.

Units

The word ‘unit’ should not be abbreviated.

PATIENT AND CARER ADVICE

Hypoglycaemia

Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Insulin Passport

Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS > INSULINS, RAPID-ACTING

Insulin

(Inulin Injection; Neutral Insulin; Soluble Insulin—short acting)

INDICATIONS AND DOSE

Diabetes mellitus

- By subcutaneous injection
- Child: According to requirements

Hyperglycaemia during illness

- By intravenous infusion
- Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.
- Child: 0.025–0.1 unit/kg/hour, dose to be adjusted according to blood-glucose concentration

Neonatal hyperglycaemia | Neonatal diabetes

- By intravenous infusion
- Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

Diabetic ketoacidosis | Diabetes during surgery

- By intravenous infusion
- Child: (consult local protocol)

SIDE-EFFECTS

- Uncommon Skin reactions

RARE OR VERY RARE

- Refraction disorder

DIRECTIONS FOR ADMINISTRATION

Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

- With intravenous use For intravenous infusion, dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin. For intravenous infusion in neonatal intensive care, dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.

PRESCRIBING AND DISPENSING INFORMATION

A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**
- **Humulin R (Imported (United States))**
  - Insulin human 500 unit per 1 ml Humulin R 500units/ml solution for injection 20ml vials | 1 vial (PO) £15.68
  - Humulin R KnipPen 500units/ml solution for injection 3ml pre-filled pen | 2 pre-filled disposable injection (PO) £12.18
- **Actrapid (Novo Nordisk Ltd)**
  - Insulin human (as Insulin soluble human) 100 unit per
    - 1 ml Actrapid 100units/ml solution for injection 10ml vials | 1 vial (PO) £7.48 DT = £15.68
  - Humulin S (Eli Lilly and Company Ltd)
    - Insulin human (as Insulin soluble human) 100 unit per
      - 1 ml Humulin S 100units/ml solution for injection 10ml vials | 1 vial (PO) £15.68 DT = £31.30
    - Humulin S 100units/ml solution for injection 3ml cartridges | 5 cartridge (PO) £15.68 DT = £78.40
- **Hypurin Bovine Neutral (Wockhardt UK Ltd)**
  - Insulin bovine (as Insulin soluble bovine) 100 unit per
    - 1 ml Hypurin Bovine Neutral 100units/ml solution for injection 10ml vials | 1 vial (PO) £27.72 DT = £55.44
  - Hypurin Bovine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge (PO) £41.58 DT = £207.90
- **Hypurin Porcine Neutral (Wockhardt UK Ltd)**
  - Insulin porcine (as Insulin soluble porcine) 100 unit per
    - 1 ml Hypurin Porcine Neutral 100units/ml solution for injection 10ml vials | 1 vial (PO) £33.80 DT = £67.60
  - Hypurin Porcine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge (PO) £50.71 DT = £253.55
- **Insulan Infusat (Sanofi)**
  - Insulin human 100 unit per 1 ml Insulan Infusat 100units/ml solution for injection 3.15ml cartridges | 5 cartridge (PO) £250.00
  - Insulan Infusat 100units/ml solution for injection 10ml vials | 3 vial (PO) £250.00
- **Insuman Rapid (Sanofi)**
  - Insulin human (as Insulin soluble human) 100 unit per
    - 1 ml Insuman Rapid 100units/ml solution for injection 3ml cartridges | 5 cartridge (PO) £17.50 DT = £87.50

**Diabetes mellitus**
- **BY SUBCUTANEOUS INJECTION**
  - Child 1 month–1 year: Administer immediately before meals or when necessary shortly after meals, according to requirements
  - Child 2–17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements
- **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–1 year: According to requirements
  - Child 2–17 years: According to requirements

**PREGNANCY** Not known to be harmful—may be used during pregnancy.

**BREAST FEEDING** Not known to be harmful—may be used during lactation.

**DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

**With intravenous use** For *intravenous infusion*, dilute to a concentration of 0.05–1 unit/ml, with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151

- **BREAST FEEDING**
  - Not known to be harmful—may be used during lactation.

- **DIRECTIONS FOR ADMINISTRATION**
  - Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

  - **With intravenous use**
    - For intravenous infusion, dilute to a concentration of 0.1–1 unit/ml with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 ml of infusion fluid containing insulin.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Insulin lispro is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
    - Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
      - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
      - whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
    - Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on
insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Insulin lispro (non-proprietary)**

  Insulin lispro Sanofi 100units/ml solution for injection 3ml cartridges | 5 cartridge (£90) | £24.96 DT = £2.38

  Insulin lispro Sanofi 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£50) | £25.04 DT = £2.50

  Insulin lispro Sanofi 100units/ml solution for injection 10ml vials | 5 vial (£60) | £11.42 DT = £1.61

- **Humalog** (Eli Lilly and Company Ltd)

  Insulin lispro 100 unit per 1 ml Humalog 100units/ml solution for injection 10ml vials | 1 vial (£50) | £16.61 DT = £1.61

  Humalog 100units/ml solution for injection 3ml cartridges | 5 cartridge (£70) | £28.31 DT = £2.83

  Humalog Junior KwikPen (Eli Lilly and Company Ltd)

  Insulin lispro 100 unit per 1 ml Humalog Junior KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£70) | £29.46 DT = £2.95

  Humalog KwikPen (Eli Lilly and Company Ltd)

  Insulin lispro 100 unit per 1 ml Humalog KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£70) | £29.46 DT = £2.95

  Insulin lispro 200 unit per 1 ml Humalog KwikPen 200units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£70) | £58.92 DT = £5.89

**INSULINS** > INTERMEDIATE-ACTING

**Biphasic isophane insulin**

(Biphasic Isophane Insulin Injection—intermediate acting)

**INDICATIONS AND DOSE**

*Diabetes mellitus*

- **BY SUBCUTANEOUS INJECTION**

- Child: According to requirements

**INTERACTIONS** → Appendix 1: Insulins

**SIDE-EFFECTS**

- Rare or very rare Angioedema

- Frequency not known Hypokalaemia - weight increased

**PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Humulin M3** (Eli Lilly and Company Ltd)

  Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£90) | £19.08 DT = £1.91

  Humulin M3 100units/ml suspension for injection 10ml vials | 1 vial (£50) | £15.68 DT = £1.57

- **Humulin M3 KwikPen** (Eli Lilly and Company Ltd)

  Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£90) | £21.70 DT = £2.17

- **Hypurin Porcine 30/70 Mix** (Wockhardt UK Ltd)

  Insulin porcine (as Insulin soluble porcine) 30 unit per 1 ml, Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£90) | £50.71 DT = £5.07

  Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials | 1 vial (£30) | £33.80 DT = £3.38

- **Insuman Comb 15** (Sanofi)

  Insulin human (as Insulin soluble human) 15 unit per 1 ml, Insulin human (as Insulin isophane human) 85 unit per 1 ml Insuman Comb 15 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£90) | £17.50 DT = £1.75

- **Insuman Comb 25** (Sanofi)

  Insulin human (as Insulin soluble human) 25 unit per 1 ml, Insulin human (as Insulin isophane human) 75 unit per 1 ml Insuman Comb 25 100units/ml suspension for injection 3ml vials | 1 vial (£50) | £5.61

  Insuman Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (£50) | £19.80 DT = £1.98

  Insuman Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£90) | £17.50 DT = £1.75

- **Insuman Comb 50** (Sanofi)

  Insulin human (as Insulin soluble human) 50 unit per 1 ml, Insulin human (as Insulin soluble human) 50 unit per 1 ml Insuman Comb 50 100units/ml suspension for injection 3ml vials | 5 cartridge (£90) | £17.50 DT = £1.75

**Isophane insulin**

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

**INDICATIONS AND DOSE**

*Diabetes mellitus*

- **BY SUBCUTANEOUS INJECTION**

- Child: According to requirements

**INTERACTIONS** → Appendix 1: Insulins

**PREGNANCY** Recommended where longer-acting insulins are needed.

**PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Humulin I** (Eli Lilly and Company Ltd)

  Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial (£50) | £15.68 DT = £1.57

  Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£90) | £19.08 DT = £1.91

- **Humulin I KwikPen** (Eli Lilly and Company Ltd)

  Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£90) | £21.70 DT = £2.17

- **Hypurin Porcine Isophane** (Wockhardt UK Ltd)

  Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isophane 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£90) | £21.70 DT = £2.17

- **Insulatard** (Novo Nordisk Ltd)

  Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial (£30) | £7.48 DT = £0.75

- **Insulatard InnoLet** (Novo Nordisk Ltd)

  Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£90) | £20.40 DT = £2.04

- **Insulatard Penfill** (Novo Nordisk Ltd)

  Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£90) | £22.90 DT = £2.29
DIABETES MELLITUS

INSULINS > INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

Biphasic insulin aspart
(Intermediate-acting insulin)

INDICATIONS AND DOSE
Diabetes mellitus
- By subcutaneous injection
- Child: Administer up to 10 minutes before or soon after a meal, according to requirements

INTERACTIONS
- Appendix 1: insulins

SIDE-EFFECTS
- Uncommon: Skin reactions

PRESCRIBING AND DISPENSING INFORMATION
Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
- NovoMix 30 FlexPen (Novo Nordisk Ltd)
- Insulin aspart 30 unit per 1 ml, insulin aspart (as insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100 units/ml suspension for injection 3 ml pre-filled pen | 5 pre-filled disposable injection pens £13.90 DT = £21.70

Biphasic insulin lispro
(Intermediate-acting insulin)

INDICATIONS AND DOSE
Diabetes mellitus
- By subcutaneous injection
- Child: Administer up to 15 minutes before or soon after a meal, according to requirements

CAUTIONS
- Children under 12 years (use only if benefit likely compared to soluble insulin)

INTERACTIONS
- Appendix 1: insulins

PRESCRIBING AND DISPENSING INFORMATION
- Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
- Humalog Mix25 (Eli Lilly and Company Ltd)
- Insulin lispro 25 unit per 1 ml, insulin lispro (as insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100 units/ml suspension for injection 3 ml pre-filled pen | 5 pre-filled disposable injection pens £30.98 DT = £50.98

INSULINS > LONG-ACTING

Insulin degludec
(Recombinant human insulin analogue—long acting)

INDICATIONS AND DOSE
Diabetes mellitus
- By subcutaneous injection
- Child 1-17 years: Dose to be given according to requirements

INTERACTIONS
- Appendix 1: insulins

SIDE-EFFECTS
- Rare or very rare: Urticaria

PREGNANCY
- Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

PRESCRIBING AND DISPENSING INFORMATION
- Insulin degludec (Tresiba®) is available in strengths of 100 units/ml (allows 1-unit dose adjustment) and 200 units/ml (allows 2-unit dose adjustment)—ensure correct strength prescribed.

NATIONAL FUNDING/ACCESS DECISIONS
- All Wales Medicines Strategy Group (AWMSG) decisions
- AWMSG No. 3158
- The All Wales Medicines Strategy Group has advised (October 2016) that insulin degludec (Tresiba®) is not recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Tresiba FlexTouch (Novo Nordisk Ltd)
- Insulin human (as insulin degludec) 100 unit per 1 ml Tresiba FlexTouch 100 units/ml solution for injection 3 ml pre-filled pen | 5 pre-filled disposable injection pens £46.00 DT = £46.60
- Insulin human (as insulin degludec) 200 unit per 1 ml Tresiba FlexTouch 200 units/ml solution for injection 3 ml pre-filled pen | 3 pre-filled disposable injection pens £55.92 DT = £55.92
- Tresiba Penfill (Novo Nordisk Ltd)
- Insulin human (as insulin degludec) 100 unit per 1 ml Tresiba Penfill 100 units/ml solution for injection 3 ml cartridges | 5 cartridges £46.00 DT = £46.60
Insulin detemir  
(Recombinant human insulin analogue—long acting)

- **INDICATIONS AND DOSE**
  - Diabetes mellitus
    - By subcutaneous injection
      - Child 2-17 years: According to requirements
  - Interactions → Appendix 1: insulins
  - Side-effects
    - Rare or very rare
      - Myalgia - sodium retention - taste altered
  - Pregnancy
    - Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 474 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
- **Solution for injection**
  - Levemir FlexPen (Novo Nordisk Ltd)
    - Insulin human (as Insulin detemir) 100 unit per 1 ml
      - Levemir FlexPen 100 units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (POM) £42.00 DT = £42.00
    - Levemir InnoLet (Novo Nordisk Ltd)
      - Insulin human (as Insulin detemir) 100 unit per 1 ml
        - Levemir InnoLet 100 units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (POM) £44.85 DT = £42.00
    - Levemir Penfill (Novo Nordisk Ltd)
      - Insulin human (as Insulin detemir) 100 unit per 1 ml
        - Levemir Penfill 100 units/ml solution for injection 3ml cartridges | 5 cartridge (POM) £42.00 DT = £42.00

Insulin glargine  
(Recombinant human insulin analogue—long acting)

- **INDICATIONS AND DOSE**
  - Diabetes mellitus
    - By subcutaneous injection
      - Child 2-17 years: According to requirements
  - Interactions → Appendix 1: insulins
  - Side-effects
    - Rare or very rare
      - Myalgia - sodium retention - taste altered
  - Pregnancy
    - Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 474 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.
  - Prescribing and dispensing information
    - Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.
  - National funding/access decisions
    - Scottish Medicines Consortium (SMC) decisions
      - The Scottish Medicines Consortium has advised that Lantus® preparations (April 2013) and Toujeo® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:
        - In those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
        - As a once daily insulin therapy for patients who require a carer to administer their insulin

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Insulin zinc suspension**  
(Insulin zinc suspension (mixed)—long acting)

- **INDICATIONS AND DOSE**
  - Diabetes mellitus
    - By subcutaneous injection
      - Child: According to requirements
  - Interactions → Appendix 1: insulins
  - Side-effects
    - Hypokalaemia - weight increased
  - Pregnancy
    - Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 474 is recommended where longer-acting insulins are needed; insulin detemir above may also be considered.
  - Prescribing and dispensing information
    - A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).
  - Medicinal forms
    - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Hypurin Bovine Lente (Wockhardt UK Ltd)
  - Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml
  - Hypurin Bovine Lente 100 units/ml solution for injection 10ml vials | 1 vial (POM) £27.72
- Abasaglar (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Abasaglar 100 units/ml solution for injection 3ml cartridges | 5 cartridge (POM) £35.28 DT = £37.77
  - Abasaglar KwikPen (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Abasaglar KwikPen 100 units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (POM) £35.28 DT = £37.77
  - Lantus (Sanofi)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Lantus 100 units/ml solution for injection 3ml cartridges | 5 cartridge (POM) £37.77 DT = £37.77
  - Lantus 100 units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (POM) £37.77 DT = £37.77
  - Lantus 100 units/ml solution for injection 10ml vials | 1 vial (POM) £27.92 DT = £27.92
  - Semglee (Mylan)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Semglee 100 units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection (POM) £29.99 DT = £37.77
  - Toujeo (Sanofi)
  - Insulin human (as Insulin glargine) 300 unit per 1 ml
  - Toujeo 300 units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection (POM) £33.13 DT = £33.13
  - Toujeo DoubleStar (Sanofi)
  - Insulin human (as Insulin glargine) 300 unit per 1 ml
  - Toujeo 300 units/ml solution for injection 3ml pre-filled DoubleStar pen | 3 pre-filled disposable injection (POM) £66.26

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.
understanding of the normal blood glucose monitoring systems and the appropriate actions to take on the results obtained, including when to seek medical attention.

3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis: urinary glucose
Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring. Microalbuminuria can be detected with Microl-Test H® but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood glucose monitoring
Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hyperglycaemia as well as hypoglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood ketones should be measured according to local guidelines in order to detect diabetic ketoacidosis. Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- Hypurin Bovine Protamine Zinc (Wockhardt UK Ltd)
- Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 mL
- Hypurin Bovine Protamine Zinc 100 units/mL suspension for injection 10mL vials | 1 vial (55g) £27.72

Hypodermic insulin injection pens

Hypodermic insulin injection pens

AUTOPEN® 24

Autopen® 24 (for use with Sanofi® - Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen 24 hypodermic insulin pen reusable for 3 ml cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd) 1 device - NHS indicative price = £16.71 - Drug Tariff (Part IXa)

Autopen 24 hypodermic insulin pen reusable for 3 ml cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd) 1 device - NHS indicative price = £16.71 - Drug Tariff (Part IXa)

AUTOPEN® CLASSIC

Autopen® Classic (for use with Lilly and Woolhard 3-mL insulin cartridges), allowing 1-unit dosage adjustment,
3.2 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children. Initially glucose 10–20 g p. 611 is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.

Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for patients to keep on hand in case of hypoglycaemia. Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of Lucozade® Energy Original (also, see note below), 100 mL of Coca-Cola®, 19 mL of Ribena® Blackcurrant (to be diluted).

Note: the carbohydrate content of commercially available glucose-containing drinks is currently subject to change — individual product labels should be checked.

Patients should be aware that for a time, both old and new bottles and cans may be available — individual product labels should be checked.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an ‘if necessary’ basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 10% can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is not recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

Chronic hypoglycaemia

Diazoxide p. 483 is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis). Diazoxide has no place in the management of acute hypoglycaemia. Chlorothiazide p. 113 reduces diazoxide-induced sodium and water retention and has the added benefit of potentiating the glycaemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then octreotide p. 483 or nifedipine p. 111 can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

Neonatal hypoglycaemia

Neonatal hypoglycaemia at birth is treated with glucose intravenous infusion 10%. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of glucagon. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.

GLYCOGENOLYTIC HORMONES

Glucagon

- **INDICATIONS AND DOSE**
  - **Insulin-induced hypoglycaemia**
    - By subcutaneous injection, or by intramuscular injection
    - Neonate: 20 micrograms/kg.
    - Child 1 month–1 year: 500 micrograms
    - Child 2–7 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
    - Child 2–7 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
  - **Endogenous hyperinsulinism**
    - By intramuscular injection, or by intravenous injection
    - Neonate: 200 micrograms/kg (max. per dose 1 mg) for 1 dose.
    - Child 1 month–1 year: 1 mg for 1 dose
    - By continuous intravenous infusion
    - Neonate: 1–18 micrograms/kg/hour (max. per dose 50 micrograms/kg/hour), adjusted according to response.
    - Child 1 month–1 year: 1–10 micrograms/kg/hour, dose to be adjusted as necessary
  - **Diagnosis of growth hormone secretion (specialist use only)**
    - By intramuscular injection
    - Child: 100 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may vary, consult local guidelines
  - **Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)**
    - Initially by intravenous injection
    - Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

- **DOSE EQUIVALENCE AND CONVERSION**
  - 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

Unlicensed for growth hormone test and hyperinsulinism.

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Glucagonoma - ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency - insulinoma - when used in the diagnosis of growth
3.2a Chronic hypoglycaemia

Other drugs used for Chronic hypoglycaemia
Chlorothiazide, p. 113

GLYCOGENOLYTIC HORMONES

Diazoxide

- **INDICATIONS AND DOSE**
  - **Resistant hypertension**
    - **BY MOUTH**
      - Neonate: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.
      - Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.
  - **Chronic intractable hypoglycaemia**
    - **BY MOUTH**
      - Neonate: Initially 5 mg/kg twice daily, adjusted according to response, initial dose used to establish response; maintenance 1.5–3 mg/kg 2–3 times a day; increased if necessary up to 7 mg/kg 3 times a day, higher doses are unlikely to be beneficial, but may be required in some cases.
      - Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maintenance 1.5–3 mg/kg 2–3 times a day, increased if necessary up to 5 mg/kg 3 times a day, doses up to 5 mg/kg may be required in some cases, but higher doses are unlikely to be beneficial.

- **UNLICENSED USE**
  Not licensed for resistant hypertension.

- **CAUTIONS**
  - Aortic coarctation • aortic stenosis • arteriovenous shunt • heart failure • hyperuricaemia • impaired cardiac circulation • impaired cerebral circulation

- **INTERACTIONS**
  
  - **SIDE-EFFECTS**
    - Abdominal pain • albuminuria • appetite decreased (long term use) • arrhythmia • azotemia • cardiomegaly • cataract • constipation • diabetic hyperosmolar coma • diarrhoea • dizziness • dyspnoea • eosinophilia • extrapyramidal symptoms • face abnormal • fever • fluid retention • galactorrhoea • haemorrhage • headache • heart failure • hirsutism • hyperglycaemia • hyperuricaemia (long term use) • hypogammaglobulinaemia • hypotension • ileus • ketoacidosis • leucopenia • libido decreased • muscular skeletal pain • nausea • nephritic syndrome • oculogyric crisis • pancreatitis • parkinsonism • pulmonary hypertension • skin reactions • sodium retention • taste altered • thrombocytopenia • tinnitus • vision disorders • voice alteration (long term use) • vomiting

- **PREGNANCY**
  - Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**
  - Dose adjustments: Dose reduction may be required.

- **MONITORING REQUIREMENTS**
  - Monitor blood pressure.
  - Monitor white cell and platelet count during prolonged use.
  - Regularly assess growth, bone, and psychological development during prolonged use.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Powder and Solvent for solution for injection
    - GlucaGen Hypokit (Novo Nordisk Ltd)

  Glucagon hydrochloride 1 mg
  Glucagon powder for injection 1 vial £11.52 DT = £11.52

Chronic hypoglycaemia 483

Diazoxide 50 mg
(RPH Pharmaceuticals AB)
Diazoxide 25 mg
(RPH Pharmaceuticals AB)

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES

Somatostatin analogues

**CAUTIONS**
- Diabetes mellitus (antidiabetic requirements may be reduced) • insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)

**SIDE-EFFECTS**
- Common or very common • Alopecia • appetite decreased • asthenia • cholecystitis • cholelithiasis (following long term use) • cholesterol • constipation • diabetes mellitus • diarrhoea • dizziness • gastrointestinal discomfort • gastrointestinal disorders • glucose tolerance impaired (following long term use) • headache • hyperglycaemia (long term use) • hypoglycaemia • myalgia • nausea • pruritus • sinus bradycardia • vomiting

**DIRECTIONS FOR ADMINISTRATION**
- Injection sites should be rotated.

Octreotide

**INDICATIONS AND DOSE**

- **Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose**

  - **BY SUBCUTANEOUS INJECTION**

  - Neonate: Initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.
Disorders of bone metabolism

Bone metabolism

Disorders of bone metabolism

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets and hypophosphataemic rickets. See also calcium.

Osteoporosis

Osteoporosis in children may be primary (e.g. osteogenesis imperfecta and idiopathic juvenile osteoporosis), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

Bisphosphonates

A bisphosphonate such as pamidronate disodium p. 486 is used in the management of severe forms of osteogenesis imperfecta and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children has not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia. Treatment should be initiated under specialist advice only.

Other drugs used for Disorders of bone metabolism

Calcitriol, p. 653
Bisphosphonates

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

Important Safety Information

**Mhra/Cmh Advice: Bisphosphonates: Atypical Femoral Fractures (June 2013)**

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**Mhra/Cmh Advice: Bisphosphonates: Osteonecrosis of the Jaw (November 2009) and Intravenous Bisphosphonates: Osteonecrosis of the Jaw—Further Measures to Minimise Risk (July 2015)**

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronic), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

**Mhra/Cmh Advice: Bisphosphonates: Osteonecrosis of the External Auditory Canal (December 2015)**

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

**Side-effects**

- Common or very common Alopoeia - anaemia - arthralgia - asthenia - constipation - diarrhoea - dizziness - dysphagia - electrolyte imbalance - eye inflammation - fever - gastritis - gastrointestinal discomfort - headache - influenza like illness - malaise - myalgia - nausea - oesophageal ulcer (discontinue) - oesophagitis (discontinue) - pain - peripheral oedema - renal impairment - skin reactions - taste altered - vomiting

- uncommon Anaphylactic reaction - angioedema - bronchospasm - oesophageal stenosis (discontinue) - osteonecrosis

- Rare or very rare Atypical femur fracture - Stevens-Johnson syndrome

**Patient and Carer Advice**

Atypical femoral fractures: Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw: During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

Osteonecrosis of the external auditory canal: Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

Alendronic Acid

(Alendronate)

**Indications and Dose**

Osteoporosis (due to osteogenesis imperfecta and other causes) (initiated under specialist supervision)
- By mouth
- Child: (consult local protocol)

**Unlicensed Use**

Not licensed for use in children.

**Contra-Indications**

Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)

**Caution**

Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders

**Interactions**

- Appendix 1: bisphosphonates

**Side-effects**

- Common or very common Gastrointestinal disorders · joint swelling · vertigo
- Uncommon Haemorrhage
- Rare or very rare Femoral stress fracture · oropharyngeal ulceration · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)

**Side-effects, Further Information**

Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or
worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoidance—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

- **Alendronic acid (Non-proprietary)**
  - Alendronic acid 700 microgram per 1 mL Alendronic acid 700mg/100ml oral solution unit dose sugar-free (specialist use only) | 4 unit dose (P) £28.56 DT + £28.56

- **Effervescent tablet**
  - **Binosto (Interis Pharmaceuticals Ltd)**
    - Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet (P) £22.80 DT + £22.80

- **Tablet**
  - **Alendronic acid (Non-proprietary)**
    - Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet (P) £3.25 DT + £1.46
    - Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet (P) £22.80 DT + £0.86

- **Fosamax Once Weekly (Merck Sharp & Dohme Ltd)**
  - Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet (P) £22.80 DT + £0.86

### Pamidronate disodium

(Formerly called aminohydroxypropyldenediphosphonate disodium (APD))

- **INDICATIONS AND DOSE**
  - **Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only)** Hypercalcaemia (specialist use only)
    - **BY INTRAVENOUS INFUSION**
      - Child: (consult product literature)
  - **UNLICENSED USE** Not licensed for use in children.
  - **CAUTIONS** Atypical femoral fractures - cardiac disease - ensure adequate hydration - previous thyroid surgery (risk of hypocalcaemia)
  - **INTERACTIONS** → Appendix 1: bisphosphonates
  - **SIDE-EFFECTS**
    - Common or very common Appetite decreased - chills - decreased leucocytes - drowsiness - flushing - hypertension - insomnia - paraesthesia - tetany - thrombocytopenia
    - Uncommon Agitation - dyspnoea - hypotension - muscle cramps - seizure
    - Rare or very rare Confusion - glomerulonephritis - haematuria - heart failure - nephritis tubulointerstitial - nephrotic syndrome - oedema - pulmonary oedema - reactivation of infections - renal disorder exacerbated - renal tubular disorder - respiratory disorders - visual hallucinations - xanthopsia
    - Frequency not known Atrial fibrillation
  - **PREGNANCY** Avoid—toxicity in animal studies.
  - **BREAST FEEDING** Avoid.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment (no information available).
  - **RENAL IMPAIRMENT** Monitoring Monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia).
  - **DIRECTIONS FOR ADMINISTRATION** For slow intravenous infusion (Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in glucose 5% or sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Pamidronate disodium (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.
  - **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).
  - **Driving and skilled tasks** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

### Risedronate sodium

- **INDICATIONS AND DOSE**
  - **Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only)** Hypercalcaemia (specialist use only)
    - **BY MOUTH**
      - Child: (consult local protocol)
  - **UNLICENSED USE** Not licensed for use in children.
  - **CONTRA-INDICATIONS** Hypocalcaemia
  - **CAUTIONS** Atypical femoral fractures - oesophageal abnormalities - other factors which delay transit or emptying (e.g. stricture or achalasia)
  - **INTERACTIONS** → Appendix 1: bisphosphonates
Disorders of bone metabolism

Risedronate sodium 35 mg Tablet

> **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

> **Risedronate sodium (Non-proprietary)**
> Risedronate sodium 5 mg Risedronate sodium 5mg tablets | 28 tablet (Pos) £24.78 DT = £11.85

Endocrine system

DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION

MONOClonal antibodies

Denosumab

26-Sep-2018

Drug action

Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

Indications and dose

XGEVA

Giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in skeletally mature adolescents

By subcutaneous injection

Child: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present, to be administered into the thigh, abdomen or upper arm

Important safety information

MHRA/CHM advice: denosumab: minimising the risk of osteonecrosis of the jaw; monitoring for hypercalcaemia—updated recommendations (September 2014) and denosumab: osteonecrosis of the jaw—further measures to minimise risk (July 2015)

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypercalcaemia.

Osteonecrosis of the jaw

Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

Denosumab 120 mg (cancer indication)

A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients

Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery

All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypercalcaemia

Denosumab is associated with a risk of hypercalcaemia. This risk increases with the degree of renal impairment. Hypercalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

before the first dose

within two weeks after the initial dose

if suspected symptoms of hypercalcaemia occur

consider monitoring more frequently in patients with risk factors for hypercalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

All patients should be advised to report symptoms of hypercalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

MHRA/CHM advice: denosumab: reports of osteonecrosis of the external auditory canal (June 2017)

Osteonecrosis of the external auditory canal has been reported with denosumab and this should be considered in patients who present with ear symptoms including chronic ear infections or in those with suspected cholesteatoma. Possible risk factors include steroid use and chemotherapy, with or without local risk factors such as infection or trauma. The MHRA recommends advising patients to report any ear pain, discharge from the ear, or an ear infection during denosumab treatment.

MHRA/CHM advice: denosumab (XGEVA) for giant cell tumour of bone: risk of clinically significant hypercalcaemia following discontinuation (June 2018)

Cases of clinically significant hypercalcaemia (rebound hypercalcaemia) have been reported up to 5 months after discontinuation of denosumab treatment for giant cell tumour of bone. The MHRA recommends that prescribers should monitor patients for signs and symptoms of hypercalcaemia after discontinuation, consider periodic assessment of serum calcium, re-evaluate the patient’s calcium and vitamin D

RH

London

Page 488

Disorders of bone metabolism

BNFC 2019–2020
supplementation requirements, and advise patients to report symptoms of hypercalcaemia. Denosumab is not recommended in patients with growing skeletons.

- **CONTRA-INDICATIONS** Hypocalcaemia
  - Xgeva®: Unhealed lesions from dental or oral surgery

- **CAUTIONS** Atypical femoral fractures - hypocalcaemia - osteonecrosis of the jaw—consider temporary interruption of treatment if occurs

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort - cataract - constipation - hypocalcaemia (including fatal cases) - increased risk of infection - pain - sciatica - secondary primary malignancy - skin reactions
  - **Uncommon** Cellulitis (seek prompt medical attention) - hypercalcaemia (on discontinuation)
  - **Rare or very rare** Atypical femur fracture - osteonecrosis

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies; risk of toxicities increases with each trimester.

- **BREAST FEEDING** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Increased risk of hypocalcaemia if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.

- **PATIENT AND CARER ADVICE**
  - Atypical femoral fractures: Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.
  - Osteonecrosis of the jaw: All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist. Hypocalcaemia: All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

- **PATIENT REMINDER CARD** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - Xgeva (Amgen Ltd)
      - Denosumab 70 mg per 1 ml Xgeva 120mg/1.7ml solution for injection vials | 1 vial £309.86 DT = £309.86

- **INDICATIONS AND DOSE**
  - **ZOLADEX LA®**
    - Gonadotrophin-dependent precocious puberty
      - **BY SUBCUTANEOUS INJECTION**
        - Child: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases
        - **ZOLADEX®**
          - Gonadotrophin-dependent precocious puberty
            - **BY SUBCUTANEOUS INJECTION**
              - Child: 3.6 mg every 28 days, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding

- **CAUTIONS** Depression - patients with metabolic bone disease (decrease in bone mineral density can occur)

- **SIDE-EFFECTS** Asthma - body hair change - breast abnormalities - depression - headache - hypersensitivity - mood altered - ovarian cyst - paraesthesia - skin reactions - vaginal haemorrhage - visual impairment - weight change - withdrawal bleed

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Monitor bone mineral density.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Implant**
    - Zoladex (AstraZeneca UK Ltd)
      - Goserelin (as Goserelin acetate) 3.6 mg: Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection £70.00 DT = £70.00
      - Zoladex LA (AstraZeneca UK Ltd)
        - Goserelin (as Goserelin acetate) 10.8 mg: Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection £235.00 DT = £235.00
**Leuprolrelin acetate**

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**
  - **PROSTAP 3 DCS**
    - **Gonadotrophin-dependent precocious puberty**
      - By subcutaneous injection, or by intramuscular injection.
      - Child: 11.25 mg every 12 weeks, injections may be required more frequently in some cases.
  - **PROSTAP SR DCS**
    - **Gonadotrophin-dependent precocious puberty**
      - By subcutaneous injection, or by intramuscular injection.
      - Child: 3.75 mg every 4 weeks, half this dose is sometimes used in children with body-weight under 20 kg, injections may be required more frequently in some cases.

- **SIDE-EFFECTS**
  - Common or very common: Acne, emotional lability, gastrointestinal discomfort, haemorrhage, headache, metrorrhagia, nausea, vaginal discharge, vomiting.
  - Frequency not known: Seizure.
  - PREGNANCY: Avoid—teratogenic in animal studies.
  - BREAST FEEDING: Avoid.
  - MONITORING REQUIREMENTS: Monitor bone mineral density.
  - DIRECTIONS FOR ADMINISTRATION: Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS**
  - Powder and solvent for suspension for injection:
    - **Prostap 3 DCS** (Takeda UK Ltd)
      - Leuprolrelin acetate 11.25 mg: Prostap 3 DCS 11.25 mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection | £225.72 DT = £225.72.
    - **Prostap SR DCS** (Takeda UK Ltd)
      - Leuprolrelin acetate 3.75 mg: Prostap SR DCS 3.75 mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection | £75.24 DT = £75.24.

- **UNLICENSED USE**: Not licensed for use in children.
- **CONTRA-INDICATIONS**: Undiagnosed vaginal bleeding.
- **CAUTIONS**: Patients with metabolic bone disease (decrease in bone mineral density can occur).

**Triptorelin**

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**
  - **DecaPeptyl® SR 11.25MG**
    - **Gonadotrophin-dependent precocious puberty**
      - By intramuscular injection.
      - Child: 11.25 mg every 3 months, discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys.
  - **GonaPeptyl Depot®**
    - **Gonadotrophin-dependent precocious puberty**
      - By subcutaneous injection, or by deep intramuscular injection.
      - Child (body-weight up to 20 kg): Initially 1.875 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 1.875 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys.
      - Child (body-weight 20–30 kg): Initially 2.5 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 2.5 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys.
      - Child (body-weight 31 kg and above): Initially 3.75 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 3.75 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys.

- **SIDE-EFFECTS**
  - Common or very common: Depression, mood altered.
  - Uncommon: Anaphylactic reaction, haemorrhage, nausea, vaginal discharge, vomiting.
  - Frequency not known: Alopecia, angioedema, epiphysiolysis, gastrointestinal discomfort, headache, hot flush, malaise, myalgia, nervousness, pain, skin reactions, vision disorders, weight increased.

- **CONCEPTION AND CONTRACEPTION**: Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY**: Avoid.
- **BREAST FEEDING**: Avoid.
- **MONITORING REQUIREMENTS**: Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION**: Rotate injection site to prevent atrophy and nodule formation.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - **DecaPeptyl® SR 11.25MG**: Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - Powder and solvent for suspension for injection:
    - **Decapeptyl SR** (Ipsen Ltd)
      - Triptorelin 11.25 mg: Decapeptyl SR 11.25 mg powder and solvent for suspension for injection vials | 1 vial | £207.00 DT = £207.00.
6 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide below (tetracosactrin), an analogue of corticotropin (adrenocorticotropic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (Synacthen Depot®) is also used in the treatment of infantile spasms but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticolin p. 492, (also known as corticotropin-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner’s syndrome, growth disturbance in children born small for gestational age, chronic renal insufficiency, and short stature homeobox-containing gene (SHOX) deficiency. Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 492, produced using recombinant DNA technology.

Mecasermin p. 494, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 492 when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon p. 482, arginine p. 635, and clonidine hydrochloride p. 103 [all unlicensed uses]. The tests should be carried out in specialist centres.

6.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

- **INDICATIONS AND DOSE**
  - Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), standard-dose test
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Child: 145 micrograms/m² (max. per dose 250 micrograms) for 1 dose
  - Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), low-dose test
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Child: 0.3 microgram/m² for 1 dose
  - Infantile spasm
    - **BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
    - Child 1-23 months: Initially 500 micrograms once daily on alternate days, adjusted according to response

- **CONTRA-INDICATIONS** Acute psychosis - adrenogenital syndrome - allergic disorders - asthma - avoid injections containing benzyl alcohol in neonates - Cushing’s syndrome - infectious diseases - peptic ulcer - primary adrenocortical insufficiency - refractory heart failure

- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) - active systemic diseases (should not be used unless adequate disease-specific therapy is being given) - diabetes mellitus - diverticulitis - history of asthma - history of atopic allergy - history of eczema - history of hayfever - history of hypersensitivity - hypertension - latent amoebiasis (may become activated) - latent tuberculosis (may become activated) - myasthenia gravis - ocular herpes simplex - osteoporosis - predisposition to thromboembolic - psychological disturbances may be triggered - recent intestinal anastomosis - reduced immune response (should not be used unless adequate disease-specific therapy is being given) - ulcerative colitis

- **CAUTIONS, FURTHER INFORMATION**
  - Risk of anaphylaxis. Should only be administered under medical supervision. Consult product literature.
  - Hypertension. Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
  - Diabetes mellitus. Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.

- **SIDE-EFFECTS** Abdominal distension - abcess - adrenocortical unresponsiveness - angioedema - appetite increased - bone fractures - congestive heart failure - Cushing’s syndrome - diabetes mellitus exacerbated - dizziness - dysphoea - electrolyte imbalance - exophthalmos - fluid retention - flushing - gastrointestinal disorders - glaucoma - growth retardation - haemorrhage - headache - healing impaired - hirsutism - hyperglycaemia -
hyperhidrosis • hypersensitivity (may be more severe in patients susceptible to allergies, especially asthma) • hypertension • idiopathic intracranial hypertension exacerbated • increased risk of infection • leucocytosis • malaise • menstruation irregular • muscle weakness • myopathy • nausea • osteonecrosis • osteoporosis • pancreatitis • papilloedema • pituitary unresponsiveness • posterior subcapsular cataract • protein catabolism • psychiatric disorder • seizure • skin reactions • tendinopathy • thromboembolism • vasculitis necrotising • ventricular hypertrophy • vertigo • vomiting • weight increased

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** For depot injection, manufacturer advises caution in cirrhosis (may enhance effect of tetracosactide therapy).
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.
  
  Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.
- **DIRECTIONS FOR ADMINISTRATION** For intramuscular or intravenous injection, may be diluted in sodium chloride 0.9% to 250 nanograms/mL.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  
  **Solution for injection**
  
  Synacthen (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
  Tetracosactide acetate 250 microgram per 1 ml Synacthen 250 micrograms/1ml solution for injection ampoules ▶ 1 ampoule £38.00 DT + £38.00
  
  **Suspension for injection**
  
  EXCIPIENTS: May contain Benzyl alcohol ▶ Synacthen Depot (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
  Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules ▶ 1 ampoule £346.28 DT + £346.28

### 6.2 Assessment of pituitary function

#### DIAGNOSTIC AGENTS

- **Corticotelin**
  
  (Corticotrophin-releasing hormone; CRH)

- **INDICATIONS AND DOSE**
  
  Test of anterior pituitary function ▶ BY INTRAVENOUS INJECTION
  
  Child: 1 microgram/kg (max. per dose 100 micrograms) for 1 dose, to be administered over 30 seconds

- **UNLICENSED USE** Not licensed.
- **SIDE-EFFECTS** Altered smell sensation • flushing • hypotension • taste altered

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MEDICINAL FORMS** No licensed medicines listed.

### 6.3 Growth hormone disorders

#### PITUITY AND HYPOTHALAMIC HORMONES AND ANALOGUES

- **GONADOTROPIN-RELEASING HORMONES**
  
  **Gonadorelin**
  
  (Gonadotrophin-releasing hormone; GnRH; LH-RH)

- **INDICATIONS AND DOSE**
  
  Assessment of anterior pituitary function | Assessment of delayed puberty
  
  ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
  
  Child 1-17 years: 2.5 micrograms/kg (max. per dose 100 micrograms) for 1 dose

- **UNLICENSED USE** Not licensed for use in children under 1 year.
- **CAUTIONS** Pituitary adenoma
- **SIDE-EFFECTS**
  
  ▶ Uncommon
  
  Pain • skin reactions • swelling
  
  ▶ Rare or very rare
  
  Abdominal discomfort • bronchospasm • dizziness • eye erythema • flushing • headache • nausea • tachycardia
  
  ▶ Frequency not known
  
  Menorrhagia • sepsis • thrombophebitis
  
  **PREGNANCY** Avoid.
  
  **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS** No licensed medicines listed.
Chronic renal insufficiency (renal function decreased to less than 50%) ▶ By Subcutaneous Injection ▶ Child: 45–50 micrograms/kg daily, alternatively 1.4 mg/m² daily, higher doses may be needed, adjust if necessary after 6 months

SHOX deficiency ▶ By Subcutaneous Injection ▶ Child: 45–50 micrograms/kg daily

Dose equivalence and conversion ▶ Dose formerly expressed in units; somatropin 1 mg = 3 units.

● Unlicensed use Not licensed for use in Noonan syndrome.

● Contra-indications Avoid injections containing benzyl alcohol in neonates • evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) • not to be used after renal transplantation • not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) • severe obesity in Prader-Willi syndrome • severe respiratory impairment in Prader-Willi syndrome

● Cautions Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) • disorders of the epiphysis of the hip (monitor for limping) • history of malignant disease • hypoadrenalism (initiation or adjustment of glucocorticoid replacement therapy may be necessary) • hypothyroidism • manufacturers recommend periodic thyroid function tests but limited evidence of clinical value • initiation of treatment close to puberty not recommended in child born small for corrected gestational age • papilloedema • relative deficiencies of other pituitary hormones • resolved intracranial hypertension (monitor closely) • Silver-Russell syndrome

● Interactions ▶ Appendix 1: somatropin

● Side-effects ▶ Common or very common Headache • lipodystrophy

Uncommon Arthralgia • carpal tunnel syndrome • fluid retention • gynaecomastia • idiopathic intracranial hypertension • musculoskeletal stiffness • myalgia • oedema • paraesthesia

Rare or very rare Hyperglycaemia • hyperinsulinism • hypothyroidism • osteonecrosis of femur • pancreatitis • slipped capital femoral epiphysis

Frequency not known Leukaemia

Side-effects, further information Fundoscopy for papilloedema recommended if severe or recurrent headache, visual problems, nasea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

● Pregnancy Discontinue if pregnancy occurs—no information available.

● Breast feeding No information available. Absorption from milk unlikely.

● Directions for administration Rotate subcutaneous injection sites to prevent lipodystrophy.

Genotropin®, Norditropin®, Nutropin® A®, Omnitrope®, Saizen®, Zomacton® For use by subcutaneous injection.

Humatrope® Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.

● Prescribing and dispensing information Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

Saizen® Solution for injection For use with cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

Norditropin® Preparations Cartridges are for use with appropriate NordiPen® device (non-NHS but available free of charge from clinics).

Multidose disposable prefilled pens for use with NovoFine® or NovoTwist® needles.

Omnitrope® For use with Omnitrope Pen 5® and Omnitrope Pen 10® devices (non-NHS but available free of charge from clinics).

Nutropin® A For use with Nutropina® A Pen device (non-NHS but available free of charge from clinics).

Zomacton® 4 mg vial for use with ZomaJet 2® Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

10 mg vial for use with ZomaJet Vision X® needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

Saizen® Powder and solvent for solution for injection For use with one. click® autoinjector device or cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

Genotropin® Preparations Cartridges are for use with Genotropin® Pen device (non-NHS but available free of charge from clinics).

● National funding/access decisions

NICE decisions ▶ Somatropin for the treatment of growth failure in children (May 2010) NICE TA188

Somatropin is recommended for children with growth failure who:

• have growth-hormone deficiency

• have Turner syndrome

• have Prader-Willi syndrome

• have chronic renal insufficiency

• are born small for gestational age with subsequent growth failure at 4 years of age or later

• have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

● Medicinal forms There can be variation in the licensing of different medicines containing the same drug.

Solution for injection Excipients: May contain Benzyl alcohol

Norditropin NordiFlex (Novo Nordisk Ltd)

Somatropin (ep) 3.3 mg per 1 ml Norditropin NordiFlex 5mg/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection £115.90 DT + £115.90 (C04-2)

Somatropin (ep) 6.7 mg per 1 ml Norditropin NordiFlex 10mg/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection £231.80 DT + £231.80 (C04-2)

Somatropin (ep) 10 mg per 1 ml Norditropin NordiFlex 15mg/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection £347.70 DT + £347.70 (C04-2)

Norditropin Simplex (Novo Nordisk Ltd)

Somatropin (ep) 3.3 mg per 1 ml Norditropin SimplexX 5mg/1.5ml solution for injection cartridges | 1 cartridge £106.35 DT + £106.35 (C04-2)

Somatropin (ep) 6.7 mg per 1 ml Norditropin SimplexX 10mg/1.5ml solution for injection cartridges | 1 cartridge £212.70 DT + £212.70 (C04-2)

Somatropin (ep) 10 mg per 1 ml Norditropin SimplexX 15mg/1.5ml solution for injection cartridges | 1 cartridge £319.05 DT + £319.05 (C04-2)
6.3a Insulin-like growth factor-i deficiency

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOMEDINS

Mecasermin
(Recombinant human insulin-like growth factor-i, rhIGF-I)

- **DRUG ACTION** Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-i (rhIGF-I), is the principal mediator of the somatotropic effects of human growth hormone.

- **INDICATIONS AND DOSE** Treatment of growth failure in children with severe primary insulin-like growth factor-i deficiency
  - **BY SUBCUTANEOUS INJECTION**
    - Child 2-7 years: Initially 40 micrograms/kg twice daily for 1 week, increased, if tolerated, in steps of 40 micrograms/kg (max. per dose 120 micrograms/kg twice daily), discontinue if no response within 1 year, reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

- **CONTRA-INDICATIONS** Evidence of tumour activity (discontinue treatment)

- **CAUTIONS** Correct hypothyroidism before initiating treatment - diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - papillodema

- **SIDE-EFFECTS**
  - Common or very common Adenoidal hypertrophy - arthralgia - dizziness - ear discomfort - gastrointestinal discomfort - gynaecomastia - hair texture abnormal - headache - hearing impairment - hyperglycaemia - hypoglycaemia - melanocytic naevus - myalgia - otitis media - pain in extremity - papillodema - scoliosis - seizures - skin hypertrophy - sleep apnoea - snoring - tachycardia - thymus enlargement - tonsillar hypertrophy - tremor - vomiting
  - Uncommon Cardiac hypertrophy - cardiac valve disorders - depression - idiopathic intracranial hypertension - lipohypertrophy - nervousness - weight increased
  - Frequency not known Alopecia

SIDE-EFFECTS, FURTHER INFORMATION Funduscropy for papillodema recommended regularly during treatment and if severe or recurrent headache, visual problems, nausea and vomiting occur—if papillodema confirmed consider benign intracranial hypertension.

CONCEPTION AND CONTRACEPTION Contraception advised in women of child-bearing potential.

PREGNANCY Avoid unless essential.

BREAST FEEDING Avoid.
Sex hormone responsive conditions

Sex hormones

Hormone replacement therapy

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotrophic hypogonadism, hypergonadotrophic hypogonadism (Turner’s syndrome, Klinefelter’s syndrome), endocrine disorders (Cushing’s syndrome or hyperprolactinaemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development. Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

Female sex hormones

Oestrogens

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol p. 496 in increasing doses, guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment. Once the adult dosage of oestrogen has been reached, it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication]. There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under specialist supervision, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion. Topical oestrogen creams are used in the treatment of labial adhesions.

Progestogens

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxypregesterone acetate p. 531) and testosterone analogues (norethisterone p. 497 and norgestrel). The newer progestogens (desogestrel p. 526, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 527 is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy to establish a menstrual cycle. Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

Heavy menstrual bleeding

Description of condition

Heavy menstrual bleeding, also known as menorrhagia, is excessive menstrual blood loss of 80 mL or more, or for a duration of more than 7 days, which results in the need to change menstrual products every 1–2 hours. Heavy menstrual bleeding occurs regularly, every 24–35 days.

Drug treatment

The choice of treatment should be guided by the presence or absence of fibroids (including size, number and location), polyps, endometrial pathology or adenomyosis, other symptoms (such as pressure or pain), co-morbidities, and patient preference.

In females with heavy menstrual bleeding and unidentified pathology, fibroids less than 3 cm in diameter causing no distortion of the uterine cavity, or suspected or diagnosed adenomyosis, a levonorgestrel p. 527-releasing intra-uterine system is the first-line treatment option. Patients should be advised that irregular menstrual bleeding can occur particularly during the first months of use and that the full benefit of treatment may take at least 6 months.

If a levonorgestrel p. 527-releasing intra-uterine system is unsuitable, either tranexamic acid p. 83, an NSAID, a combined hormonal contraceptive, or a cyclical oral progestogen should be considered. Progestogen-only contraceptives may suppress menstruation and be beneficial to females with heavy menstrual bleeding. A non-hormonal treatment is recommended in patients actively trying to conceive.

If drug treatment is unsuccessful or declined by the patient, or if symptoms are severe, referral to a specialist for alternative drug treatment or surgery should be considered.

In females with fibroids of 3 cm or more in diameter, referral to a specialist should be considered. Treatment options include tranexamic acid, an NSAID, a levonorgestrel p. 527-releasing intra-uterine system, a combined hormonal contraceptive, a cyclical oral progestogen, uterine artery embolisation, or surgery. Treatment choice depends on the size, number and location of the fibroids, and severity of symptoms. If drug treatment is required while investigations and definitive treatment is being organised, either tranexamic acid, or an NSAID, or both, can be given.

The effectiveness of drug treatment for heavy menstrual bleeding may be limited in females with fibroids that are substantially greater than 3 cm in diameter. [Evi ]

Treatment
OESTROGENS

Ethinylestradiol (Ethinylestradiol)

- **INDICATIONS AND DOSE**
  - **Induction of sexual maturation in girls**
    - **BY MOUTH**
      - Child (female): Initially 2 micrograms daily for 6 months, then increased to 5 micrograms daily for 6 months, then increased to 10 micrograms daily for 6 months, then increased to 20 micrograms daily, after 12–18 months of treatment give progesterogen for 7 days of each 28-day cycle.
  - **Maintenance of sexual maturation in girls**
    - **BY MOUTH**
      - Child (female): 20 micrograms daily, to be given with cyclical progesterogen for 7 days of each 28-day cycle.
  - **Prevention of tall stature in girls**
    - **BY MOUTH**
      - Child 2–11 years (female): 20–50 micrograms daily.
  - **Pituitary priming before growth hormone secretion test in girls with bone age over 10 years**
    - **BY MOUTH**
      - Child (female): 100 micrograms daily for 3 days before test.

- **UNLICENSED USE**
  - Unlicensed for use in children.
- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 624.
  - Cardiovascular disease (sodium retention with oedema).
  - Family history of thromboembolism.
  - Gallstones.
  - Heart disease associated with pulmonary hypertension.
  - Heart disease associated with risk of embolus.
  - History during pregnancy of cholestatic jaundice.
  - Hypothyroidism.
  - History during pregnancy of pemphigoid gestationis.
  - History during pregnancy of pruritus.
  - History of breast cancer.
  - History of haemolytic uraemic syndrome.
  - Malignancy.
  - Migraine with aura.
  - Migraine with aura (focal symptoms).
  - Severe migraine frequently lasting over 72 hours despite treatment.
  - Migraine treated with ergot derivatives.
  - Pregnancy.
  - Severe or multiple risk factors for arterial disease.
  - Severe or multiple risk factors for venous thromboembolism.
  - Systemic lupus erythematosus.
  - Transient cerebral ischaemic attacks without headaches.
  - Undiagnosed vaginal bleeding.
  - Venous thromboembolism.
  - History of recurrent venous thromboembolism (unless already on anticoagulant treatment).

- **CAUTIONS**
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice.
  - Crohn’s disease.
  - Gene mutations associated with breast cancer (e.g. BRCA 1).
  - History of severe depression (especially if induced by hormonal contraceptive).
  - Hyperprolactinaemia (seek specialist advice).
  - Inflammatory bowel disease.
  - Migraine (migraine-like headaches).
  - Personal or family history of hypertriglyceridaemia.
  - Increased risk of pancreatitis.
  - Risk factors for arterial disease.
  - Risk factors for migraine.
  - Risk factors for venous thromboembolism.
  - Sickle-cell disease.
  - Undiagnosed breast mass.

- **USEFUL RESOURCES**
  - www.nice.org.uk/guidance/ng88

Other drugs used for Female sex hormone responsive conditions

- Clonidine hydrochloride, p. 103.
- Medroxyprogesterone acetate, p. 531.
- Ulipristal acetate, p. 525.

Risk of venous thromboembolism

- Use with caution if any of following factors present but avoid if two or more factors present:
  - Family history of venous thromboembolism: in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - Obesity—body mass index ≥30 kg/m² (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - Long-term immobilisation e.g. in wheelchair (avoid if confined to bed or leg in plaster cast);
  - History of superficial thrombophlebitis;
  - Age over 35 years (avoid if over 50 years);
  - Smoking.

- Risk factors for arterial disease
  - Use with caution if any one of following factors present but avoid if two or more factors present:
    - Family history of arterial disease: in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
    - Diabetes mellitus (avoid if diabetes complications present);
    - Hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, avoid if blood pressure very high);
    - Smoking (avoid if smoking 40 or more cigarettes daily);
    - Age over 35 years (avoid if over 50 years);
    - Obesity (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
    - Migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- Migraine
  - Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

- INTERACTIONS
  - Appendix 1: hormone replacement therapy.

- SIDE-EFFECTS
  - Breast abnormalities.
  - Cervical mucus increased.
  - Cholelithiasis.
  - Contact lens intolerance.
  - Depression.
  - Electrolyte imbalance.
  - Embolism and thrombosis.
  - Erthema nodosum.
  - Femur fracture.
  - Fluid retention.
  - Headache.
  - Hypertension.
  - Jaundice.
  - Metrorrhagia.
  - Mood altered.
  - Myocardial infarction.

- CAUTIONS
  - Use with caution if any of following factors present but avoid if two or more factors present:
    - Pregnancy.
    - Severe or multiple risk factors for arterial disease.
    - Severe or multiple risk factors for venous thromboembolism.
    - Sickle-cell disease.
    - Undiagnosed breast mass.

- FURTHER INFORMATION
  - Other conditions
    - The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, osteosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from treatment.

- Risk of venous thromboembolism:
  - Use with caution if any of the following factors present but avoid if two or more factors present:
    - Family history of venous thromboembolism: in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
    - Obesity—body mass index ≥30 kg/m² (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
    - Long-term immobilisation e.g. in wheelchair (avoid if confined to bed or leg in plaster cast);
    - History of superficial thrombophlebitis;
    - Age over 35 years (avoid if over 50 years);
    - Smoking.

- Risk factors for arterial disease
  - Use with caution if any one of the following factors present but avoid if two or more factors present:
    - Family history of arterial disease: in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
    - Diabetes mellitus (avoid if diabetes complications present);
    - Hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, avoid if blood pressure very high);
    - Smoking (avoid if smoking 40 or more cigarettes daily);
    - Age over 35 years (avoid if over 50 years);
    - Obesity (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
    - Migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- Migraine
  - Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

- INTERACTIONS
  - Appendix 1: hormone replacement therapy.

- SIDE-EFFECTS
  - Breast abnormalities.
  - Cervical mucus increased.
  - Cholelithiasis.
  - Contact lens intolerance.
  - Depression.
  - Electrolyte imbalance.
  - Embolism and thrombosis.
  - Erthema nodosum.
  - Femur fracture.
  - Fluid retention.
  - Headache.
  - Hypertension.
  - Jaundice.
  - Metrorrhagia.
  - Mood altered.
  - Myocardial infarction.
nausea · neoplasms · skin reactions · stroke · uterine disorders · vomiting · weight change

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

**HEPATIC IMPAIRMENT** Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson orRotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet
- Ethinylestradiol (Non-proprietary) Ethinylestradiol 2 microgram tablets | 100 tablet (PSt) £200.00
- Ethinylestradiol 10 microgram tablets | 21 tablet (PSt) £200.00 DT + £200.00
- Ethinylestradiol 50 microgram tablets | 21 tablet (PSt) £200.00 DT + £200.00
- Ethinylestradiol 1 mg Ethinylestradiol 1mg tablets | 28 tablet (PSt) £200.00 DT + £200.00

**PROGESTOGENS**

**Norethisterone**

- **INDICATIONS AND DOSE**
  - **Postponement of menstruation**
    - **BY MOUTH**
      - Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)
  - **Induction and maintenance of sexual maturation in females**
    - **(combined with an oestrogen after 12–18 months oestrogen therapy)**
      - **BY MOUTH**
        - Child: 5 mg once daily for the last 7 days of 28-day cycle
      - **Short-term contraception**
        - **BY DEEP INTRAMUSCULAR INJECTION**
          - Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required
  - **Contraception**
    - **BY MOUTH**
      - Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

- **UNLICENSED USE**
  - When used for Induction and maintenance of sexual maturation in females or Postponement of menstruation Not licensed for use in children
  - When used for Contraception Consult product literature for the licensing status of individual preparations.

- **CONTRA-INDICATIONS**
  - **GENERAL CONTRA-INDICATIONS**
    - Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pempigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)
    - **SPECIFIC CONTRA-INDICATIONS**
      - With oral use Acute porphyrias p. 624 · severe arterial disease · undiagnosed vaginal bleeding
  - **CAUTIONS**
    - **GENERAL CAUTIONS** Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)
    - **SPECIFIC CAUTIONS**
      - When used for contraception active trophoblastic disease (until return to normal of urine- and plasma-hCG concentration) · seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
      - With intramuscular use for contraception disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer
    - **CAUTIONS, FURTHER INFORMATION**
      - Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
      - Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.
      - **INTERACTIONS** Appendix 1: norethisterone

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Menstrual cycle irregularities
    - Uncommon Breast tenderness
    - Frequency not known Hepatic cancer · thromboembolism
  - **SPECIFIC SIDE-EFFECTS**
    - Common or very common
      - With intramuscular use Dizziness · haemorrhage · headache · hypersensitivity · nausea · skin reactions · weight increased
    - Uncommon
      - With intramuscular use Abdominal distension · depressed mood
      - Frequency not known
        - With oral use Appetite change · depression · fatigue · gastrointestinal disorder · headaches · hypertension · libido disorder · nervousness · rash · weight change
  - **PREGNANCY** Not known to be harmful in contraceptive doses. Avoid in other indications.
  - **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
    - With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.
  - **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Caution when used for
sexual maturation and to postpone menstruation; avoid if severe.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

- **PATIENT AND CARER ADVICE**
  
  Diarrhoea and vomiting with oral contraceptives. Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

  Starting routine for oral contraceptives: One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

  Changing from a combined oral contraceptive: Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

  After childbirth: Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

  Contraceptives by injection: Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

- **Missed oral contraceptive pill** The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

  The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Solution for injection**

  - **Noristerat** (Bayer Plc)
    - Norethisterone enantate 200 mg per 1 ml
    - Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule (POM) £9.05

  **Tablet**

  - Norethisterone (Non-proprietary)
    - Norethisterone 5 mg: Norethisterone 5mg tablets | 30 tablet (POM) £2.40 DT + £2.35
    - Noriday (Pfizer Ltd)
    - Norethisterone 350 microgram: Norethisterone 350mcg tablets | 84 tablet (POM) £2.10 DT + £2.10
    - Prinolut N (Bayer Plc)
    - Norethisterone 5 mg: Prinolut N 5mg tablets | 30 tablet (POM) £2.26 DT + £2.35
    - Utovlan (Pfizer Ltd)
    - Norethisterone 5 mg: Utovlan 5mg tablets | 30 tablet (POM) £1.40 DT + £2.35 | 90 tablet (POM) £4.21

### 7.2 Male sex hormone responsive conditions

#### Androgens, anti-androgens and anabolic steroids

**Androgens**

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate or propionate or alternatively Sustanon®, which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the doses increased every 6 to 12 months according to response. Single ester testosterone injections may need to be given more frequently.

**Oral testosterone undecanoate** is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone p. 499.

Testosterone topical gel is also available but experience of use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of microphallus; an extemporaneously prepared cream should be used because the alcohol in proprietary gel formulations causes irritation.

**Anti-androgens and precocious puberty**

The gonadorelin stimulation test is used to distinguish between gonadotrophin-independent (central) precocious puberty and gonadotrophin-dependent precocious puberty. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone p. 500 and cyproterone acetate p. 500 are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxiosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate-limiting step in oestrogen synthesis. Cyproterone acetate is a progestogen with anti-androgen properties.

Spironolactone p. 128 is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in girls. They are used in the treatment of some aplastic anaemias.

Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short
stature and in girls with Turner’s syndrome; specialist management is required.

**ANABOLIC STEROIDS** > ANDROSTAN DERIVATIVES

**Oxandrolone**

- **INDICATIONS AND DOSE**
  
  **Stimulation of late pre-pubertal growth in boys (of appropriate age) with short stature**
  
  - **BY MOUTH**
  - Child 10–17 years (male): 1.25–2.5 mg daily for 3–6 months.
  
  **Stimulation of late pre-pubertal growth in girls with Turner’s syndrome**
  
  - **BY MOUTH**
  - Child (female): 0.625–2.5 mg daily, to be taken in combination with growth hormone.

- **CONTRA-INDICATIONS**
  
  - History of primary liver tumours - hypercalcaemia - nephrosis
  
  - **CAUTIONS**
  
  - Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - skeletal metastases (risk of hypercalcaemia)
  
  - **SIDE-EFFECTS**
  
  - Common or very common Anorexia - alopecia - anorexia - anxiety - asthenia - bone formation increased - depression - electrolyte imbalance - epiphyses premature fusion (in pre-pubertal males) - gastrointestinal haemorrhage - gynaecomastia - headache - hirsutism - hypertension - jaundice - cholestatic - nausea - oedema - paraesthesia - polycythaemia - precocious puberty (in pre-pubertal males) - seborrhoea - sexual dysfunction - skin reactions - spermatogenesis reduced - virilism - weight increased
  
  - Rare or very rare Hepatic neoplasm
  
  - **PREGNANCY**
  
  - Avoid — causes masculinisation of female fetus.
  
  - **BREAST FEEDING**
  
  - Avoid; may cause masculinisation in the female infant or precocious development in the male infant. High doses suppress lactation.
  
  - **HEPATIC IMPAIRMENT**
  
  - Avoid if possible — fluid retention and dose-related toxicity.
  
  - **RENAL IMPAIRMENT**
  
  - Use with caution — potential for fluid retention.

- **MEDICINAL FORMS**
  
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  
  - **Tablet**
  
  - Oxandrolone (Imported (Australia))
  
  - Oxandrolone 2.5 mg
  
  - Oxandrin 2.5mg tablets | 100 tablet (£39.10) (£44.24)

**ANDROGENS**

**Androgens**

- **CONTRA-INDICATIONS**
  
  - Breast cancer in males - history of liver tumours - hypercalcaemia - prostate cancer
  
  - **CAUTIONS**
  
  - Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature) — statural growth and sexual development should be monitored - skeletal metastases — risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) - sleep apnoea - stop treatment or reduce dose if severe polycythaemia occurs - tumours — risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)

  - **SIDE-EFFECTS**
  
  - Common or very common Headache - hot flush - hypertension - polycythaemia - prostate abnormalities - skin reactions - weight increased
  
  - Uncommon Alopecia - asthenia - behaviour abnormal - depression - dizziness - dysphoria - dysuria - gynaecomastia - hyperhidrosis - insomnia - nausea - sexual dysfunction
  
  - Rare or very rare Pulmonary oil microembolism - sperm abnormalities
  
  - Frequency not known Anxiety - epiphyses premature fusion - fluid retention - jaundice - oedema - paraesthesia - precocious puberty - prostate cancer - seborrhoea - sleep apnoea - urinary tract obstruction
  
  - **SIDE-EFFECTS, FURTHER INFORMATION**
  
  - Stop treatment or reduce dose if severe polycythaemia occurs.
  
  - **PREGNANCY**
  
  - Avoid — causes masculinisation of female fetus.
  
  - **BREAST FEEDING**
  
  - Avoid.
  
  - **HEPATIC IMPAIRMENT**
  
  - Avoid if possible — fluid retention and dose-related toxicity.
  
  - **RENAL IMPAIRMENT**
  
  - Caution — potential for fluid retention.
  
  - **MONITORING REQUIREMENTS**
  
  - Monitor haematocrit and calcium concentration restored.

- **MEDICINAL FORMS**
  
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream

- **Testosterone enantate**
  
  - **INDICATIONS AND DOSE**
  
  - Induction and maintenance of sexual maturation in males (specialist use only)
  
  - **BY DEEP INTRAMUSCULAR INJECTION**
  
  - Child 12–17 years: 25–50 mg/m² every month, increase dose every 6–12 months according to response

  - **UNLICENSED USE**
  
  - Not licensed for use in children.

  - **CAUTIONS**
  
  - Thrombophilia — increased risk of thrombosis

  - **SIDE-EFFECTS**
  
  - Bone formation increased - circulatory system disorder - gastrointestinal disorder - gastrointestinal haemorrhage - hepatomegaly - hypercalcaemia - neoplasms

- **MEDICINAL FORMS**
  
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream

- **Testosterone propionate**
  
  - **INDICATIONS AND DOSE**
  
  - Delayed puberty in males
  
  - **BY INTRAMUSCULAR INJECTION**
  
  - Child: 50 mg once weekly

  - **TREATMENT OF MICROPHALLUS (SPECIALIST USE ONLY)**
  
  - **TO THE SKIN USING CREAM**
  
  - Child: Apply 3 times a day for 3 weeks

  - **CAUTIONS**
  
  - Thrombophilia — increased risk of thrombosis

  - **MEDICINAL FORMS**
  
  - Forms available from special-order manufacturers include: solution for injection, cream
7.2a Male sex hormone antagonism

<table>

<tr>
<th>ANTI-ANDROGENS</th>
</tr>
</thead>
</table>

**Cyproterone acetate**

- **INDICATIONS AND DOSE**
  - Gonadotrophin-independent precocious puberty (specialist use only)
  - **BY MOUTH**
  - Child: Initially 25 mg twice daily, adjusted according to response

- **Cautions**
  - Diabetes mellitus - in prostate cancer, severe depression - in prostate cancer, sickle-cell anaemia - ineffective for male hypersexuality in chronic alopecia
  - **Side-effects**
    - Common or very common: Depressed mood, dyspnoea, fatigue, gynaecomastia, hepatic disorders, hot flush, hyperhidrosis, nipple pain, restlessness, weight change
    - Uncommon: Skin reactions
    - Rare or very rare: Galactorrhoea, neoplasms
    - Frequency not known: Adrenocortical suppression, anaemia, azoospermia, hair changes, hypotrichosis, osteoporosis, sebaceous gland underactivity (may clear acne), thromboembolism

- **Medicinal forms**
  - Tablet (specialist use only)

- **Patient and carer advice**
  - Driving and skilled tasks: Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

- **Side-effects, further information**
  - Direct hepatic toxicity including jaundice, hepatisis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).
  - **Hepatic impairment**: Avoid.
  - **Pregnancy**: Avoid.
  - **Breast feeding**: No information available.

- **Patient and carer advice**
  - Unlicensed for use in children.
  - **Contra-indications**
    - Dubin–Johnson syndrome - history of thrombomembolic disorders - liver disorders - malignant diseases - meningoia or history of meningioma - previous or existing liver tumours - Rotor syndrome - severe depression - severe diabetes (with vascular changes) - sickle-cell anaemia - wasting diseases - youths under 18 years (may arrest bone maturation and testicular development)

- **Cautions**
  - Thrombophilia - increased risk of thrombosis
8 Thyroid disorders

8.1 Hyperthyroidism

Antithyroid drugs

Overview
Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole below is the most commonly used drug. Propylthiouracil p. 502 should be reserved for children who are intolerant of, or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones. Treatment in children should be undertaken by a specialist.

Carbimazole or propylthiouracil are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine sodium p. 503 replacement (blocking–replacement regimen); this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking–replacement regimen is not suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroideocytomectomy.

Propranolol hydrochloride p. 106 is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but atenolol p. 108 is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 456 as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Antithyroid drugs in pregnancy
Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking–replacement regimen is not suitable. Carbimazole is associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy). See also Important safety information in the carbimazole below drug monograph.

Advanced Pharmacy Services
Children with thyroid disorders may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Antithyroid drugs in neonates
Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 109

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

- INDICATIONS AND DOSE
Hyperthyroidism (blocking–replacement regimen) in combination with levothyroxine
  - BY MOUTH
  - Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

Hyperthyroidism (including Graves’ disease)
  - BY MOUTH
  - Neonate: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.
  - Child 1 month–11 years: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses; maximum 30 mg per day
  - Child 12–17 years: Initially 30 mg daily until euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses

DOSE EQUIVALENT AND CONVERSION
  - When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION
NEUTROPENIA AND AGRANULOCYTOSIS
Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.
  - Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
  - A white blood cell count should be performed if there is any clinical evidence of infection.
  - Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.
BREAST FEEDING

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

INTERACTIONS

→ Appendix 1: carbimazole

SIDE-EFFECTS

▶ Rare or very rare Bone marrow disorders - haemolytic anaemia - severe cutaneous adverse reactions (SCARs) - thrombocytopenia

CONCEPTION AND CONCEPTION

The MHRA advises that females of childbearing potential should use effective contraception during treatment.

PREGNANCY

The MHRA advises consider use only after a thorough benefit-risk assessment. See Important Safety Information and Antithyroid drugs p. 501 for further information.

BREAST FEEDING

Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

HEPATIC IMPAIRMENT

Manufacturer advises use with caution in mild to moderate insufficiency—half-life may be prolonged; avoid in severe insufficiency.

PATIENT AND CARER ADVICE

Warn patient or carers to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

Medicines for Children leaflet: Carbimazole for hyperthyroidism

www.medicinesforchildren.org.uk/carbimazole-hyperthyroidism

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

Carbimazole (Non-proprietary)

Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet £84.80 DT = £21.36
Carbimazole 10 mg Carbimazole 10mg tablets | 100 tablet £81.32 DT = £21.32
Carbimazole 15 mg Carbimazole 15mg tablets | 100 tablet £115.98-£127.50 DT = £32.75

ANTITHYROID DRUGS > THIOURACILS

Propylthiouracil

INDICATIONS AND DOSE

Hyperthyroidism (including Graves' disease)

▶ BY MOUTH

Neonate: Initially 2.5–5 mg/kg twice daily until euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.

Child 1-11 months: Initially 2.5 mg/kg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

Child 1-4 years: Initially 25 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

Child 5-11 years: Initially 50 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

DOSE EQUIVALENCE AND CONVERSION

▶ When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

UNLICENSED USE

Not licensed for use in children under 6 years of age.

INTERACTIONS

→ Appendix 1: propylthiouracil

SIDE-EFFECTS

▶ Rare or very rare Agranulocytosis - bone marrow disorders - glomerulonephritis acute - hearing impairment - leucopenia - thrombocytopenia - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

PREGNANCY

Propylthiouracil can be given but the blocking-replacement regimen is not suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

BREAST FEEDING

Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.
8.2 Hypothyroidism

Thyroid hormones

Overview
Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto’s thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

Levothyroxine sodium below (thyroxine sodium) is the treatment of choice for maintenance therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

Liothryronine sodium p. 504 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Liothyrionate sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 456, and treatment of infection; assisted ventilation is often required.

Advanced Pharmacy Services
Children with thyroid disorders may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

THYROID HORMONES

Levothyroxine sodium
(Thyroxine sodium)

INDICATIONS AND DOSE
Hypothyroidism
> BY MOUTH

- Neonate: Initially 10–15 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 5 micrograms/kg every 2 weeks, alternatively adjusted in steps of 5 micrograms/kg as required; maintenance 20–50 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.

- Child 1 month–1 year: Initially 5 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 10–25 micrograms every 2–4 weeks until metabolism normalised; maintenance 25–75 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.

- Child 2–11 years: Initially 50 micrograms once daily; adjusted in steps of 25 micrograms every 2–4 weeks until metabolism normalised; maintenance 75–100 micrograms daily, levothyroxine should be taken at the same time each day, preferably...
30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

- Child 12-17 years: Initially 50 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks until metabolism normalised; maintenance 100–200 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

**Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole**

- BY MOUTH
  - Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

**CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - long-standing hypothyroidism - panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) - predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

**INTERACTIONS** → Appendix 1: thyroid hormones

**PREGNANCY** Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

**Dose adjustments** Levothyroxine requirement may increase during pregnancy.

**Monitoring** Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

**BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION** Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Levothyroxine for hypothyroidism
- www.medicinesforchildren.org.uk/levothyroxine-hypothyroidism

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- **Tablet**
  - Levothyroxine sodium (Non-proprietary)
    - Levothyroxine sodium anhydrous 12.5 microgram | 28 tablet | £2.09
    - Levothyroxine sodium anhydrous 25 microgram | 28 tablet | £3.05
    - Levothyroxine sodium anhydrous 50 microgram | 100 tablet | £6.79

- **Injectable**
  - Levothyroxine sodium anhydrous 75 microgram
  - Levothyroxine sodium anhydrous 100 microgram
  - Levothyroxine sodium anhydrous 150 microgram
  - Levothyroxine sodium anhydrous 200 microgram

**SIDE-EFFECTS**

- Rare or very rare: Decreased appetite - angina pectoris - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) - severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

**INTERACTIONS** → Appendix 1: thyroid hormones

**INDICATIONS AND DOSE**

- **Hypothyroidism**
  - **BY MOUTH**
  - Child 12-17 years: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses

- **Hypothyroid coma**
  - **BY SLOW INTRAVENOUS INJECTION**
  - Child 12-17 years: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

- **Hypothyroidism (replacement for oral levothyroxine)**
  - **BY SLOW INTRAVENOUS INJECTION**
  - Child: Convert daily levothyroxine dose to liothyronine and give in 2–3 divided doses, adjusted according to response

- **DOSE EQUIVALENCE AND CONVERSION**
  - 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
  - Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

**CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) - severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

**GENERAL SIDE-EFFECTS**
Frequency not known  Agitation · fever · flushing · headache 
· hyperhidrosis · insomnia (more common at excessive dosage) · oedema · restlessness (more common at excessive dosage) · skin reactions · tremor (more common at excessive dosage) · weight decreased

SPECIFIC SIDE-EFFECTS

Rare or very rare

With intravenous use  Epiphyses premature fusion · idiopathic intracranial hypertension · menstruation irregular

PREGNANCY  Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Dose adjustments  Liothyronine requirement may increase during pregnancy.

Monitoring  Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

BREAST FEEDING  Amount too small to affect tests for neonatal hypothyroidism.

PRESCRIBING AND DISPENSING INFORMATION

Switching to a different brand  Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary incontinence
Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; oxybutynin hydrochloride p. 507 also has a direct relaxant effect on urinary smooth muscle. Oxybutynin hydrochloride can be considered first for children under 12 years. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin hydrochloride can be given by intravesical instillation. Tolterodine tartrate p. 508 is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin hydrochloride. Modified-release preparations of oxybutynin hydrochloride and tolterodine tartrate are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled.

See also Nocturnal enuresis in children below.

Nocturnal enuresis in children

23-May-2017

Description of condition
Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment
Children under 5 years
For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families.

Non Drug Treatment
Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child’s maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 448, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable.

Drug Treatment
Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn gradually at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 507 or tolterodine tartrate p. 508 [unlicensed indication]).
Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepresant imipramine hydrochloride p. 246 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

Useful Resources

ANTIMUSCARINICS

Antimuscarinics (systemic)

- CONTRA-INDICATIONS Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

- CAUTIONS Arrhythmias (may be worsened) - autonomic neuropathy - cardiac insufficiency (due to association with tachycardia) - cardiac surgery (due to association with tachycardia) - children (increased risk of side-effects) - conditions characterised by tachycardia - congestive heart failure (may be worsened) - coronary artery disease (may be worsened) - diarrhoea - gastro-oesophageal reflux disease - hiatus hernia with reflux oesophagitis - hypertension - hyperthyroidism (due to association with tachycardia) - individuals susceptible to angle-closure glaucoma - pyrexia - ulcerative colitis

- SIDE-EFFECTS Common or very common - Confusion - constipation - dizziness - drowsiness - dry mouth - dyspepsia - flushing - headache - nausea - palpitations - skin reactions - tachycardia - urinary disorders - vision disorders - vomiting

- Rare or very rare - Angioedema

- PATIENT AND CARER ADVICE Driving and skilled tasks - Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

ANTIMUSCARINICS > URINARY

Oxybutynin hydrochloride

- INDICATIONS AND DOSE Urinary frequency / Urinary urgency / Urinary incontinence | Neurogenic bladder instability

  - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
    - Child 2-4 years: 1.25–2.5 mg 2–3 times a day
    - Child 5-11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
    - Child 12-17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 10 mg 4 times a day

  - BY INTRAVESICAL INSTILLATION
    - Child 2–7 years: 5 mg 2–3 times a day
    - BY MOUTH USING MODIFIED-RELEASE TABLETS
    - Child 5-11 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

  - BY MOUTH USING MODIFIED-RELEASE TABLETS

- CONTRA-INDICATIONS Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

- CAUTIONS Arrhythmias (may be worsened) - autonomic neuropathy - cardiac insufficiency (due to association with tachycardia) - cardiac surgery (due to association with tachycardia) - children (increased risk of side-effects) - conditions characterised by tachycardia - congestive heart failure (may be worsened) - coronary artery disease (may be worsened) - diarrhoea - gastro-oesophageal reflux disease - hiatus hernia with reflux oesophagitis - hypertension - hyperthyroidism (due to association with tachycardia) - individuals susceptible to angle-closure glaucoma - pyrexia - ulcerative colitis

1.2 Urinary retention

Urinary retention

Description of condition

Urinary retention is the inability to voluntarily urinate. Causes in children can include severe voiding dysfunction, urethral blockage, drug treatment (such as opioids and antimuscarinic drugs), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, and neurogenic causes. Acute urinary retention is a medical emergency characterised by the abrupt (over a period of hours) development of the inability to pass urine, associated with increasing pain and the presence of a distended bladder, which can be palpated on examination. Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by difficulties with initiating and maintaining urinary stream, urinary overflow, no sensation for needing to void and a post-void residual.

Treatment

Treatment of urinary retention depends on the underlying condition. Catheterisation is used as an effective initial management strategy, which should be followed by diagnostic evaluation and appropriate treatment of the underlying cause. Clean intermittent catheterisation on a long-term basis is effective for children with idiopathic or neurogenic bladder dysfunction.

The selective alpha-adrenoceptor blockers, doxazosin below and tamsulosin hydrochloride p. 510, have been shown to be of use in primary bladder neck dysfunction and dysfunctional voiding; they reduce urethral sphincteric pressure, thereby improving bladder emptying in children. Treatment should be under specialist advice only.

ALPHA-ADRENOCEPTOR BLOCKERS

</table>

DOSAGE EQUIVALENT AND CONVERSION

- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** History of postural hypotension

- **CAUTIONS** Care with initial dose (postural hypotension) - cataract surgery (risk of intra-operative floppy iris syndrome) - heart failure - pulmonary oedema due to aortic or mitral stenosis

- **INTERACTIONS** ▶ Appendix 1: alpha blockers

- **SIDE-EFFECTS**
  - Common or very common Arrhythmias - asthenia - chest pain - cough - cystitis - dizziness - drowsiness - dry mouth - dyspnœa - gastrointestinal discomfort - headache - hypotension - increased risk of infection - influenza like illness - muscle complaints - nausea - oedema - pain - palpitations - skin reactions - urinary disorders - vertigo
  - Uncommon Angina pectoris - anxiety - appetite abnormal - arthralgia - constipation - depression - diarrhoea - gastrointestinal disorders - gout - haemorrhage - insomnia - myocardial infarction - sensation abnormal - sexual dysfunction - stroke - syncope - tinnitus - tremor - vomiting - weight increased
  - Rare or very rare Alopecia - bronchospasm - flushing - gynaecomastia - hepatic disorders - leucopenia - malaise - muscle weakness - thrombocytopenia - vision blurred
  - Frequency not known Floppy iris syndrome

- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Accumulates in milk in animal studies - manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).

- **PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).

- Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- **Modified-release tablet**

**13 Urolithiasis**

Renal and ureteric stones

**Description of condition**
Renal and ureteric stones are crystalline calculi that may form anywhere in the upper urinary tract. They are often asymptomatic but may cause pain when they move or obstruct the flow of urine. Most stones are composed of calcium salts (calcium oxalate, calcium phosphate or both). The rest are composed of struvite, uric acid, cystine and other substances. Patients are susceptible to stone formation when there is a decrease in urine volume and/or an excess of other substances. Patients are susceptible to stone formation when there is a decrease in urine volume and/or an excess of other substances.

The following are risk factors that have been associated with stone formation: dehydration, change in urine pH, positive family history, obesity, urinary anatomical abnormalities, and excessive dietary intake of oxalate, urate, sodium, and animal protein. Certain diseases which alter urinary volume, pH, and concentrations of certain ions (such as calcium, phosphate, oxalate, sodium, and uric acid) may also increase the risk of stone formation. Certain drugs such as calcium or vitamin D supplements, protease inhibitors, or diuretics may also increase the risk of stone formation.

Symptoms of acute renal or ureteric stones can include an abrupt onset of severe unilateral abdominal pain radiating to the groin (known as renal colic) that may be accompanied with nausea, vomiting, haematuria, increased urinary frequency, dysuria and fever (if concomitant urinary infection is present).

Stones can pass spontaneously and will depend on a number of factors, including the size of the stone (stones greater than 6 mm have a very low chance of spontaneous passage), the location (distal ureteral stones are more likely to pass than proximal ureteral stones), and the degree of obstruction.
Aims of treatment

The aim of treatment is to improve the detection, clearance and prevention of renal and ureteric stones thereby reducing pain and improving quality of life. 

Non-drug treatment

Consider watchful waiting for asymptomatic renal stones if they are less than 5 mm in diameter. If they are larger than this then the specialist will discuss the risk and benefit of this option with the patient or parents.

Options for surgical stone removal should be discussed by the specialist team in hospital depending on severity of obstruction, patient factors, size and site of stone. Options include shockwave lithotripsy, percutaneous nephrolithotomy and ureteroscopy.

For patients with recurrent calcium stones avoid excessive dietary intake of oxalate-rich products, such as rhubarb, spinach, cocoa, tea, nuts, soy products, strawberries, and wheat bran. For patients with recurrent uric acid stones, avoid excessive intake of urate rich products, such as liver, kidney, call thymus, poultry skin, and certain fish (herring with skin, sardines and anchovies).

Child aged under 16 years

Consider referring children and young patients with renal or ureteric stones to a paediatric nephrologist or urologist with expertise in this area for assessment and metabolic investigations.

Advise children to drink or carers to give their children 2.5–3 litres of water a day (depending on age) with the addition of fresh lemon juice and to avoid carbonated drinks. Advise children or carers to maintain a normal daily calcium intake of 350–1000 mg and daily salt intake of 2–6 g (depending on age).

Child aged 16 years and over

Consider stone analysis and measure serum calcium for children with recurring renal or ureteric stones.

Along with maintaining a healthy lifestyle, advise children to drink 2.5–3 litres of water a day with the addition of fresh lemon juice and to avoid carbonated drinks. Maintain a normal daily calcium intake of 700–1,200 mg and salt intake of no more than 6 g a day.

Pain Management

Offer NSAIDs as first line treatment for the management of pain associated with suspected renal colic or renal and ureteric stones. If NSAIDs are contra-indicated or not sufficiently controlling the pain, consider intravenous paracetamol. Subsequently, opioids can be used if both paracetamol and NSAIDs are contra-indicated or not sufficiently controlling the pain. Do not offer antispasmodics to patients with suspected renal colic.

Medical Expulsive Therapy

Consider alpha-adrenoceptor blockers for children with distal ureteric stones less than 10 mm in diameter.

Child aged 16 years and over

Alpha-adrenoceptor blockers may also be considered as adjunctive therapy for children having shockwave lithotripsy for ureteric stones less than 10 mm.

Prevention of recurrence of stones

Child aged under 16 years

Alongside lifestyle advice, consider potassium citrate [unlicensed] in children with recurrent stones composed of at least 50% calcium oxalate, and those with hypercalciuria and hypocitraturia.

Child aged 16 years and over

Alongside lifestyle advice, consider potassium citrate [unlicensed] in children with recurrent stones composed of at least 50% calcium oxalate. Thiazides [unlicensed] may be given if children also have hypercalciuria after restricting their sodium intake to no more than 6 g a day.

1.4 Urological pain

Urological pain

Treatment

Lidocaine hydrochloride gel is a useful topical application in urethral pain or to relieve the discomfort of catheterisation.

For information on the management of pain in renal and ureteric stones, see Renal and ureteric stones p. 510.

Alkalisation of urine

Alkalisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of cystitis caused by lower urinary tract infections.

ALKALISING DRUGS

Citric acid with potassium citrate

INDICATIONS AND DOSE

Relief of discomfort in mild urinary-tract infections

Alkalisation of urine

BY MOUTH USING ORAL SOLUTION

Child 1-5 years: 5 mL 3 times a day, diluted well with water

Child 6-17 years: 10 mL 3 times a day, diluted well with water

CAUTIONS

Cardiac disease

INTERACTIONS

Appendix 1: potassium citrate

SIDE-EFFECTS

Hyperkalaemia, nausea, vomiting

RENAL IMPAIRMENT

Avoid in severe impairment.

Monitoring

Close monitoring required in renal impairment—high risk of hyperkalaemia.

PRESCRIBING AND DISPENSING INFORMATION

When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaja tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K+/10 mL.

EXCEPTIONS TO LEGAL CATEGORY

Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS

200 mL £1.38 DT
2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection
Various solutions are available as irrigations or washouts.
Aqueous chlorhexidine p. 727 can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 610 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots
Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Maintenance of indwelling urinary catheters
The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

3 Contraception

Contraceptives, hormonal

Overview
The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives
Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

## Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 496 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 519, ethinylestradiol with drospirenone p. 520, and ethinylestradiol with gestodene p. 521 may be considered for...
women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drosiprene, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 519 is in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaRing®).

**Surgery**

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

**Reason to stop immediately**

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatic, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

**Progestogen-only contraceptives**

**Oral progestogen-only contraceptives**

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

**Parenteral progestogen-only contraceptives**

Medroxyprogesterone acetate p. 531 (Depo-Provera®, SAYANA PRESS®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased):

- in adolescents, medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

**Norethisterone enantate** (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

**An etonogestrel-releasing implant** (Nexplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etongestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

**Intra-uterine progestogen-only device**

The progestogen-only intra-uterine systems Mirena®, Jaydess® and Levovist® release levonorgestrel p. 527 directly into the uterine cavity. Mirena® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. Jaydess® and Levovist® are licensed for contraception, and Levovist® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive
effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery
All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

### Contraceptives, non-hormonal

#### Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol p. 532 9° has been associated with genital lesions, which may increase the risk of acquiring these infections.

#### Contraceptive devices

##### Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for young women irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

A frameless, copper-bearing intra-uterine device (Cyne Fix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

##### Caution with oil-based lubricants

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

---

### Emergency contraception

#### Overview

Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse. It does not replace effective regular contraception.

Women who do not wish to conceive should be offered emergency contraception after unprotected sexual intercourse that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after unprotected intercourse from day 21 after childbirth (unless the criteria for lactational amenorrhoea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to women if their regular contraception has been compromised or has been used incorrectly.

### Emergency contraceptive methods

#### Copper intra-uterine devices

Insertion of a copper intra-uterine device (see intra-uterine contraceptive devices (copper) p. 524) is the most effective form of emergency contraception and should be offered (if appropriate) to all women who have had unprotected sexual intercourse and do not want to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse or up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle. Antibacterial cover should be considered for copper intra-uterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs.

#### Hormonal methods

Hormonal emergency contraceptives (includes levonorgestrel p. 527 and ulipristal acetate p. 525) should be offered as soon as possible after unprotected intercourse if a copper intra-uterine device is not appropriate or is not acceptable to the patient; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy. Hormonal emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours (5 days) of unprotected intercourse. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception.

It is possible that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel, if BMI is greater than 25 kg/m² or body-weight is greater than 70 kg. It is recommended that either ulipristal acetate or a double dose of levonorgestrel [unlicensed indication] (see Emergency contraception under levonorgestrel) is given. It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line hormonal emergency contraceptive for a woman who has had unprotected intercourse 96–120 hours ago (even if she has also had unprotected intercourse within the last 96 hours). It should also be considered first line for a woman who has had unprotected sexual intercourse within the last
5 days if it is likely to have taken place during the 5 days before the estimated day of ovulation. ❧

**Hormonal emergency contraception interactions**
See Contraceptives, interactions below.

**Starting hormonal contraception after emergency hormonal contraception**
Emergency hormonal contraception methods do not provide ongoing contraception. ❧ After taking levonorgestrel, women should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Women should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception. Women must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective.

The copper intra-uterine device immediately provides effective ongoing contraception.

**Useful Resources**

---

### Contraceptives, interactions

#### Overview
The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 200, esicarbazine acetate, nevirapine p. 430, oxcarbazepine p. 209, phenoxytoin p. 211, phenobarbital p. 223, primidone p. 224, ritonavir p. 442, St John’s Wort, topiramate p. 218 and, above all, rifabutin p. 378 and rifampicin p. 379), and possibly also griseofulvin p. 394. A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

**Combined hormonal contraceptives interactions**
Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 531 and norethisterone p. 497) or intra-uterine devices (levonorgestrel p. 527; see also Contraceptives, non-hormonal p. 515). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate, changes should be discussed:

---

**Short course (2 months or less) of an enzyme-inducing drug**
Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

**Long-term course (over 2 months) of an enzyme-inducing drug**
Exiting the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping.

---

### Hormonal emergency contraception interactions
The effectiveness of levonorgestrel and ulipristal acetate p. 525 is reduced in women taking enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

**Antibacterials that do not induce liver enzymes**
It is recommended that no additional contraceptive precautions are required when combined oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman.

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 353, doxycycline p. 364) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

**Oral progestogen-only contraceptives interactions**
Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

**Parenteral progestogen-only contraceptives interactions**
Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 530 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

**Hormonal emergency contraception interactions**
The effectiveness of levonorgestrel and ulipristal acetate p. 525 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). ❧ A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See Dose adjustments due to interactions under levonorgestrel). There
is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers. ❍

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied. Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended.

Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. ❍ Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antilucogocorticoid effect of ulipristal acetate. ❍

- Risk factors for arterial disease. Use with caution if any one of following factors present but avoid if two or more factors present:
  - **family history of arterial disease** in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
Genito-urinary system

DIRECTIONS FOR ADMINISTRATION

HEPATIC IMPAIRMENT

BREAST FEEDING

SIDE-EFFECTS

Migraine

Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer

There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer

Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

Pregnancy

Not known to be harmful.

Breast feeding

Avoid until weaning or for 6 months after birth (adverse effects on lactation).

Hepatic impairment

Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), Infective hepatitis (until liver function returns to normal), liver tumours.

Directions for administration

With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Every day (ED) combined preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations. Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira®).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®). After abortion or miscarriage Start same day.

Patient and carer advice

Travel

Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery. Diarrhoea and vomiting Vomiting and severe diarrhoea can interfere with the absorption of combined oral contraceptives. The FSRH advises following the instructions for missed pills if vomiting occurs within 3 hours of taking a combined oral contraceptive or severe diarrhoea occurs for more than 24 hours. Use of non-oral contraception should be considered if diarrhoea or vomiting persist.

Missed doses

The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval). If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.
**Dienogest with estradiol valerate**

**INDICATIONS AND DOSE**

**Contraception with 28-day combined preparations**

**Menstrual symptoms with 28-day combined preparations**

- **BY MOUTH**
  - Females of childbearing potential: 1 active tablet daily for 26 days, followed by 1 inactive tablet daily for 2 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding may occur during the 2-day interval of inactive tablets); subsequent courses repeated without interval

**DIRECTIONS FOR ADMINISTRATION**

Changing to Zoely® Start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand.

**SIDE-EFFECTS**

- **Common or very common** Breast abnormalities - depression - menstrual cycle irregularities - mood altered - pelvic pain - sexual dysfunction
- **Uncommon** Abdominal distension - appetite abnormal - galactorrhoea - hot flush - hyperhidrosis - oedema - painful sexual intercourse - seborrhoea - sensation of pressure - skin reactions - uterine cramps - vulvovaginal disorders
- **Rare or very rare** Cerebrovascular insufficiency - concentration impaired - contact lens intolerance - dry eye - dry mouth - gallbladder disorders - hypertrichosis

**PREGNANCY**

Toxicity in animal studies.

**DIRECTIONS FOR ADMINISTRATION**

Zoely® (every day (ED) combined (monophasic) preparation), 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, starting on day 1 of cycle with first active tablet; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets are taken). Changing to Zoely® Start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand.

- **Yznell** (Lupin Healthcare (UK) Ltd)
  Ethinylestradiol 30 microgram, Drospirenone 3 mg
  0.03mg/3mg tablets | 63 tablet (PO) £8.30 DT = £14.70

**Ethinylestradiol with etonogestrel**

- **INDICATIONS AND DOSE**
  Contraception: Menstrual symptoms
  - By Vagina
  - Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

- **DIRECTIONS FOR ADMINISTRATION**
  Changing method of contraception to vaginal ring
  Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.
  Changing from progestogen-only method From an implant or intra-uterine progestogen–only device, insert ring on the day implant or intra-uterine progestogen–only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.
  - **PATIENT AND CARER ADVICE**
    Patients or carers should be given advice on how to administer vaginal ring.
    Counselling The presence of the ring should be checked regularly.

- **Missed doses**
  Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.
  If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:
  - If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
  - If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.
  If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

- **UNLICENSED USE**
  Consult product literature for the licensing status.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

- **SIDE-EFFECTS**
  - Common or very common Breast abnormalities - depressed mood - increased risk of infection - menstrual disorder - vaginal discharge
  - Uncommon Diarrhoea - hypotension - sexual dysfunction - skin reactions - vomiting - weight decreased
  - Rare or very rare Arterial thromboembolism - asthma - erythema nodosum - hearing impairment

- **PATIENT AND CARER ADVICE**
  Pill-free interval Withdrawal bleeding can occur during the 7-day tablet-free interval.

- **MEDICINAL FORMS**
  - Ethinylestradiol 30 microgram, Drospirenone 3 mg

      0.03mg/3mg tablets | 63 tablet (PO) £8.30 DT = £14.70

- **Ethinylestradiol with drospirenone**

  - **INDICATIONS AND DOSE**
    Contraception with 21-day combined preparations
    Menstrual symptoms with 21-day combined preparations
    - By Mouth
    - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval

  - **UNLICENSED USE**
    Consult product literature for the licensing status.

  - **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

  - **SIDE-EFFECTS**
    - Common or very common Breast abnormalities - depressed mood - increased risk of infection - menstrual disorder - vaginal discharge
    - Uncommon Diarrhoea - hypotension - sexual dysfunction - skin reactions - vomiting - weight decreased
    - Rare or very rare Arterial thromboembolism - asthma - erythema nodosum - hearing impairment

  - **MEDICINAL FORMS**
    There can be variation in the licensing of different medicines containing the same drug.

    **Tablet**
    - Dretine (Theramex HQ UK Ltd)
      Ethinylestradiol 30 microgram, Drospirenone 3 mg
      0.03mg/3mg tablets | 63 tablet (PO) £8.34 DT = £14.70
    - ELOINE (Bayer Plc)
      Ethinylestradiol 20 microgram, Drospirenone 3 mg
      0.02mg/3mg tablets | 84 tablet (PO) £14.70 DT = £14.70
    - Lucette (Consilent Health Ltd)
      Ethinylestradiol 30 microgram, Drospirenone 3 mg
      0.03mg/3mg tablets | 63 tablet (PO) £9.35 DT + £14.70
    - Yacella (Morningside Healthcare Ltd)
      Ethinylestradiol 30 microgram, Drospirenone 3 mg
      0.03mg/3mg tablets | 63 tablet (PO) £8.30 DT = £14.70
**Ethinyelstradiol with gestodene**

### INDICATIONS AND DOSE

**Contraception with 21-day combined preparations**

**Menstrual symptoms with 21-day combined preparations**

**BY MOUTH**

- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

**Contraception with 28-day combined preparations**

**Menstrual symptoms with 28-day combined preparations**

**BY MOUTH**

- Females of childbearing potential: 1 active tablet once daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval, withdrawal bleeding occurs during the 7-day interval of inactive tablets being taken, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

### UNLICENSED USE

Consult product literature for the licensing status.

### INTERACTIONS

Appendix 1: combined hormonal contraceptives

### SIDE-EFFECTS

- **Common or very common** Abdominal pain · breast abnormalities · depression · dizziness · increased risk of infection · menstrual cycle irregularities · mood swings · nervousness · vaginal discharge

- **Uncommon** Appetite abnormal · diarrhoea · hirsutism · hypertriglyceridaemia · sexual dysfunction · skin reactions · vomiting

- **Rare or very rare** Angioedema · chorea exacerbated · ear disorders · embolism and thrombosis · erythema nodosum · eye irritation · gallbladder disorders · gastrointestinal disorders · haemolytic uraemic syndrome · hepatic disorders · hypersensitivity · inflammatory bowel disease · neoplasms · optic neuritis · pancreatitis · systemic lupus erythematosus exacerbated · varicose veins exacerbated · weight decreased

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Ethinyelstradiol with gestodene (Non-proprietary)**
- **Ethinyelstradiol 30 microgram, Gestodene 50 microgram**

### Ethinyelstradiol with levonorgestrel

### INDICATIONS AND DOSE

**Contraception with 21-day combined preparations**

**Menstrual symptoms with 21-day combined preparations**

**BY MOUTH**

- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

### UNLICENSED USE

Consult product literature for the licensing status of individual preparations.

### INTERACTIONS

Appendix 1: combined hormonal contraceptives
Ethinylestradiol with norelgestromin

08-Feb-2019

**INDICATIONS AND DOSE**

**Contraception | Menstrual symptoms**

▷ **BY TRANSDERMAL APPLICATION**

- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

**UNLICENSED USE** Consult product literature for the licensing status of individual preparations.

**INTERACTIONS** → Appendix 1: combined hormonal contraceptives

**SIDE-EFFECTS**

- **Common or very common** Anxiety, breast abnormalities, diarrhea, dizziness, fatigue, gastrointestinal discomfort, increased risk of infection, malaise, menstrual cycle irregularities, mood altered, muscle spasms, skin reactions, uterine cramps, vaginal haemorrhage, vomiting, vulvovaginal disorders

- **Uncommon** Appetite increased, dyslipidaemia, insomnia, lactation disorders, oedema, photosensitivity reaction, sexual dysfunction

- **Rare or very rare** Embolism and thrombosis, gallbladder disorders, genital discharge, neoplasms, stroke, swelling

- **Frequency not known** Anger, angioedema, cervical dysplasia, colitis, contact lens intolerance, erythema nodosum, hepatic disorders, hyperglycaemia, intracranial haemorrhage, myocardial infarction, pulmonary artery thrombosis, taste altered

**DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive

**Changing from combined oral contraception** Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for 7 days.

**Changing from progestogen-only method**

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from a oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

**After childbirth (not breast-feeding)** Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

**After abortion or miscarriage** Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

**PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer patches.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

**Missed doses** Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle.

If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.
Ethinylestradiol with norgestimate

**INDICATIONS AND DOSE**
Contraception with 21-day combined preparations
Menstrual symptoms with 21-day combined preparations

**BY MOUTH**
- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

**SIDE-EFFECTS**
- Common or very common: Anxiety; asthenic conditions; breast abnormalities; chest pain; constipation; depression; diarrhea; dizziness; gastrointestinal discomfort; gastrointestinal disorders; genitourinary disorders; genital discharge; hypersensitivity; increased risk of infection; insomnia; menstrual cycle irregularities; mood altered; muscle complaints; oedema; pain; skin reactions; vomiting
- Uncommon: Appetite abnormal; cervical dysplasia; dry eye; dyspnoea; embolism and thrombosis; hirsutism; hot flush; libido disorder; ovarian cyst; palpitations; paraesthesia; syncope; visual impairment; vulvovaginal disorders; weight changes
- Rare or very rare: Hepatic disorders; pancreatitis; photosensitivity reaction; sweat changes; tachycardia; vertigo
- Frequency not known: Angioedema; contact lens intolerance; dyslipidaemia; erythema nodosum; neoplasms; seizure; suppressed lactation

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Ethinylestradiol with norgestimate (Non-proprietary)
  - Ethinylestradiol 35 microgram, Norgestimate

  - Ethinylestradiol 30 microgram, Norgestimate acetate
    - 1.5 mg Loestrin 30 tablets | 63 tablet 
  - Norimin (Pfizer Ltd)
  - Ethinylestradiol 35 microgram, Norgestimate 1 mg Norimin 1mg/35 microgram tablets | 63 tablet

**Norethisterone with mestranol**

**INDICATIONS AND DOSE**
Contraception | Menstrual symptoms

**BY MOUTH**
- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding can occur during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at the same time each day
CONTRACEPTIVE DEVICES

3.2 Contraception, devices

Other drugs used for Contraception, devices
Levonorgestrel, p. 527

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

INDICATIONS AND DOSE

Contraception
- BY INTRA-UTERINE ADMINISTRATION
- Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:
- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

CONTRA-INDICATIONS

Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diabetes · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson’s disease

CAUTIONS

Anemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age

CAUTIONS, FURTHER INFORMATION

The Faculty of Sexual and Reproductive Healthcare advises if removal is after day 3 of the menstrual cycle, intercourse should be avoided or another method of contraception used for at least 7 days before removal of device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed after day 3 of the menstrual cycle.

Risk of infection

The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
- they are under 25 years old or
- they are over 25 years old and
  - have a new partner or
  - have had more than one partner in the past year or
  - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

SIDE-EFFECTS

Device complications · epilepsy (on insertion) · haemorrhage (on insertion) · hypersensitivity · menstrual cycle irregularities · pain (on insertion—alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection exacerbated · premenstrual (on insertion) · uterine injuries

SIDE-EFFECTS, FURTHER INFORMATION

Advise the patient to seek medical attention promptly in case of significant symptoms—very small risk of uterine perforation, ectopic pregnancy and pelvic inflammatory disease.

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated if patient has a copper allergy.

PREGNANCY

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.

BRACE FEEDING

Not known to be harmful.

MONITORING REQUIREMENTS

Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.

DIRECTIONS FOR ADMINISTRATION

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

PRESCRIBING AND DISPENSING INFORMATION

TT380 ® SLIMLINE For uterine length 6.5–9 cm; replacement every 10 years.

LOAD ® 375 For uterine length over 7 cm; replacement every 5 years.
NOVAPLUS T 380 ® Ag · ‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years.

MULTILOAD ® CU375 For uterine length 6–9 cm; replacement every 5 years.

GYNEFIX ® Suitable for all uterine sizes; replacement every 5 years.

UT380 STANDARD ® For uterine length 6.5–9 cm; replacement every 5 years.

UT380 SHORT® For uterine length 5–7 cm; replacement every 5 years.

MULTI-SAFE ® 375 For uterine length 6–9 cm; replacement every 5 years.

ANCORA ® 375 CU For uterine length over 6.5 cm; replacement every 5 years.

T-SAFE ® 380A QL For uterine length 6.5–9 cm; replacement every 10 years.

NEO-SAFE ® T 380 For uterine length 6.5–9 cm; replacement every 5 years.

MINI TT380 ® SLIMLINE For minimum uterine length 5 cm; replacement every 5 years.

COOPER T380 ® A For uterine length 6.5–9 cm; replacement every 10 years.

NOVAPLUS T 380 ® cu · ‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years.

NOVA-T ® 380 For uterine length 6.5–9 cm; replacement every 5 years.

FLEXI-T ® 300 For uterine length over 6 cm; replacement every 5 years.

Silicone contraceptive pessaries

- **SILICONE CONTRACEPTIVE PESSARIES**
  - FemCap 22mm (Durbin Plc) | 1 device · NHS indicative price = £15.29 · Drug Tariff (Part Ixa)
  - FemCap 26mm (Durbin Plc) | 1 device · NHS indicative price = £15.29 · Drug Tariff (Part Ixa)

### 3.3 Contraception, emergency

#### Ulipristal acetate

**Drug action** Ulipristal acetate is a progestosterone receptor modulator with a partial progestosterone antagonist effect.

- **Indications and dose**
  - Emergency contraception
    - **By mouth**
      - Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours
    - **Common or very common** Back pain · breast tenderness · dizziness · fatigue · gastrointestinal discomfort · headaches · menstrual cycle irregularities · mood altered · myalgia · nausea · pelvic pain · vomiting
    - **Uncommon** Anxiety · appetite disorder · chills · concentration impaired · diarrhea · drowsiness · dry mouth · fever · flatulence · hot flush · increased risk of infection · insomnia · libido disorder · malaise · skin reactions · vision disorders · vulvovaginal disorders
    - **Rare or very rare** Abnormal sensation in eye · disorientation · dry throat · eye erythema · genital pruritus · ovarian cyst ruptured · painful sexual intercourse · syncope · taste altered · thirst · tremor · vertigo

- **Pregnancy**
  - When used for emergency contraception Limited information available—if pregnancy occurs, manufacturer advises report to the ellaOne® pregnancy registry.

- **Breast feeding**
  - When used for emergency contraception Manufacturer advises avoid for 1 week after administration—present in milk.

- **Hepatic impairment**
  - When used for emergency contraception Manufacturer advises avoid in severe impairment (no information available).

- **Prescribing and dispensing information** The manufacturer of Esmya® has provided a Physician’s Guide to Prescribing Esmya®.

- **Patient and carer advice**
  - When used for emergency contraception When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
    - If vomiting occurs within 3 hours of taking a dose, a replacement dose should be taken;
    - That their next period may be early or late;
    - To seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.

The Faculty of Sexual and Reproductive Healthcare also advises women should be told:

- That a barrier method of contraception needs to be used—see Emergency contraception p. 515 for further information;
- That a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is
lighter than usual, or is associated with abdominal pain that is not typical of the woman’s usual dysmenorrhoea; • that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
• Ellione (HRA Pharma UK Ltd)
  Ulipristal acetate 30 mg Ellione 30mg tablets 1 tablet £14.05 DT = £14.05
• Esmya (Gedeon Richter (UK) Ltd)
  Ulipristal acetate 5 mg Esmya 5mg tablets 28 tablet £114.13 DT = £114.13

3.4 Contraception, oral progestogen-only

Desogestrel

Other drugs used for Contraception, oral progestogen-only Norethisterone, p. 497

PROGESTOGENS

Desogestrel

19-Jul-2018

● INDICATIONS AND DOSE
Contraception

• BY MOUTH
  • Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a ‘missed pill’.

● LICENSED USE Consult product literature for the licensing status of individual preparations.

● CONTRA-INDICATIONS Acute porphyrias p. 624 - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

● CAUTIONS Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

CAUTIONS, FURTHER INFORMATION

Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

● INTERACTIONS • Appendix 1: desogestrel

● SIDE-EFFECTS
  • Common or very common Breast abnormalities - depressed mood - headache - libido decreased - menstrual cycle irregularities - mood altered - nausea - skin reactions - weight increased
  • Uncommon Alopecia - contact lens intolerance - fatigue - ovarian cyst - vomiting - vulvovaginal infection
  • Rare or very rare Erythema nodosum
  • Frequency not known Angioedema - embolism and thrombosis - neoplasms

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestogen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

● PREGNANCY Not known to be harmful.

● BREAST FEEDING Progestogen-only contraceptives do not affect lactation.

● HEPATIC IMPAIRMENT Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

● PATIENT AND CARER ADVICE
  Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.
Levonorgestrel

**INDICATIONS AND DOSE**

**Emergency contraception**

- **BY MOUTH**
  - Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time), alternatively 3 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time). Higher dose should be considered for patients with body-weight over 70 kg or BMI over 26 kg/m²

**Contraception**

- **BY MOUTH**
  - Females of childbearing potential: 30 micrograms daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a “missed pill”

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.
  - There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.
  - With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

**JAYDESS® 13.5MG INTRA-UTERINE DEVICE**

**Contraception**

- **BY INTRA-UTERINE ADMINISTRATION**
  - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 3 years

**KYLEENA® 19.5MG INTRA-UTERINE DEVICE**

**Contraception**

- **BY INTRA-UTERINE ADMINISTRATION**
  - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

**LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**

**Contraception | Menorrhagia**

- **BY INTRA-UTERINE ADMINISTRATION**
  - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 4 years

**MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**

**Contraception | Menorrhagia**

- **BY INTRA-UTERINE ADMINISTRATION**
  - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; continued →
postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy
- By intra-uterine administration
  - Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

Contraception

- With intra-uterine use
  - The Faculty of Sexual and Reproductive Healthcare (FSRH) advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
    - Insertion at any time if reasonably certain the woman is not pregnant or at risk of pregnancy;
    - Additional precautions (e.g. barrier methods) for at least 7 days before replacement even if immediate replacement is intended;
    - Insertion immediately following termination of pregnancy below 24 weeks' gestation;
    - Postpartum insertions 4 weeks after delivery.
- With oral use
  - The FSRH advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
    - Higher dose option for emergency contraception in patients with body-weight over 70 kg or BMI over 26 kg/m²;
    - Use for emergency contraception between 72–96 hours after coitus.
- With intra-uterine use or oral use
  - Consult product literature for licensing status of individual preparations.

- With oral use
  - Acute porphyrias p. 624
  - History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

Caution

General cautions
- Risk factors for ectopic pregnancy (including previous ectopic pregnancy, tubal surgery or pelvic infection)

Specific cautions
- Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression).
- Acute venous thromboembolism (consider removal).
- Anaemia - anticoagulant therapy (avoid if possible).
- Diabetes - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression).
- Endometriosis - epilepsy (risk of seizure at time of insertion).
- Fertility problems.
- History of pelvic inflammatory disease.
- Increased risk of expulsion if inserted before uterine involution - jaundice (consider removal).
- Marked increase of blood pressure (consider removal).
- Migraine (consider removal).
- Undiagnosed vaginal bleeding.
- Undiagnosed cervical intraepithelial neoplasia.
- Uterine or cervical malignancy.

Unlicensed use
- With intra-uterine use
  - The Faculty of Sexual and Reproductive Healthcare advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
    - Acute porphyrias p. 624
- With oral use
  - History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

Caution

General cautions
- Risk factors for ectopic pregnancy (including previous ectopic pregnancy, tubal surgery or pelvic infection)

Specific cautions
- Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression).
- Acute venous thromboembolism (consider removal).
- Anaemia - anticoagulant therapy (avoid if possible).
- Diabetes - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression).
- Endometriosis - epilepsy (risk of seizure at time of insertion).
- Fertility problems.
- History of pelvic inflammatory disease.
- Increased risk of expulsion if inserted before uterine involution - jaundice (consider removal).
- Marked increase of blood pressure (consider removal).
- Migraine (consider removal).
- Undiagnosed vaginal bleeding.
- Undiagnosed cervical intraepithelial neoplasia.
- Uterine or cervical malignancy.

Intra-uterine contraception
- Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) — seek specialist advice.
- Arterial disease.
- Functional ovarian cysts.
- History of jaundice in pregnancy.
- Malabsorption syndromes.
- Past ectopic pregnancy.
- Sex-steroid dependent cancer.
- Systemic lupus erythematosus.
- Antiphospholipid antibodies.

Use as a contraceptive
- Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) — seek specialist advice.
- Postpartum insertions should be delayed until at least 6 weeks after delivery.
- Postpartum insertions should be delayed until at least 5 weeks postpartum in patients who are breastfeeding.
- Insertion immediately following termination of pregnancy below 24 weeks' gestation.
- Postpartum insertions 4 weeks after delivery.
- With intra-uterine use
  - Insert during last days postpartum or in patients who experiences sustained pain during the next 20 days.
  - Use as a contraceptive in co-morbidities.
  - With oral use
    - The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

Important safety information
MHRA/CHM Advice (June 2015) Intra-uterine contraception

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:
- Severe pelvic pain after insertion (worse than period cramps);
- Pain or increased bleeding after insertion which continues for more than a few weeks;
- Sudden changes in periods;
- Pain during intercourse;
- Unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

Contra-indications
- With intra-uterine use
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration).
- Acute cervicitis.
- Distorted uterine cavity.
- History of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception.
- Increased risk factors for pelvic infections.
- Infected abortion during the previous three months.
- Not suitable for emergency contraception.
- Pelvic inflammatory disease.
- Postpartum endometritis.
- Unexplained uterine bleeding.
- Unresolved cervical intraepithelial neoplasia.
- Uterine or cervical malignancy.
Contraception, oral progestogen-only

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Advanced uterine atrophy

INTERACTIONS

Appendix 1: levonorgestrel

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common

Gastrointestinal discomfort - headaches - menstrual cycle irregularities - nausea - skin reactions

SPECIFIC SIDE-EFFECTS

Common or very common

With intra-uterine use: Back pain - breast abnormalities - depression - device expulsion - hirsutism - increased risk of infection - libido decreased - nervousness - ovarian cyst - pelvic disorders - uterine haemorrhage (on insertion) - vaginal haemorrhage (on insertion) - vulvovaginal disorders - weight increased

With oral use: Breast tenderness - diarrhoea - dizziness - fatigue - haemorrhage - vomiting

Uncommon

With intra-uterine use: Alopecia - endometritis - oedema - uterine rupture

Rare or very rare

With oral use: Face oedema - pelvic pain

Frequency not known

With oral use: Cerebrovascular insufficiency - depressed mood - diabetes mellitus - embolism and thrombosis - neoplasms - sexual dysfunction - weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer

There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

With intra-uterine use

There is no evidence of an association between the levonorgestrel intra-uterine system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of it’s use should be by a specialist in contraception and in consultation with the patients cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including referring them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3–6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

PREGNANCY

With oral use: Not known to be harmful.

With intra-uterine use: If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

BREAST FEEDING

Progestogen-only contraceptives do not affect lactation.

HEPATIC IMPAIRMENT

With oral use: For Contraception or Emergency contraception. Manufacturer advises avoid in severe impairment.

With intra-uterine use: Manufacturer advises avoid in severe impairment—no information available; avoid in acute hepatic disease.

MONITORING REQUIREMENTS

With intra-uterine use: Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

DIRECTIONS FOR ADMINISTRATION

With intra-uterine use: The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

PRESCRIBING AND DISPENSING INFORMATION

With intra-uterine use: Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

PATIENT AND CARER ADVICE

Diarrhoea and vomiting with use as an oral contraceptive. Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine

With oral use for Contraception: One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive. Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth: Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

With oral use for Emergency contraception: When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:

• that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman’s usual dysmenorrhoea;

• that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.

Missed doses: When used as an oral contraceptive, the following advice is recommended. If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue...
you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.\textsuperscript{1}

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

\textbf{NATIONAL FUNDING/ACCESS DECISIONS}

\textbf{Scottish Medicines Consortium (SMC) decisions}

SMC No. 1299/18

The Scottish Medicines Consortium has advised (February 2018) that levonorgestrel (Kyleena\textsuperscript{®}) is accepted for use within NHS Scotland as a contraceptive device for up to 5 years.

\textbf{All Wales Medicines Strategy Group (AWMSG) decisions}

AWMSG No. 3582

The All Wales Medicines Strategy Group has advised (September 2018) that levonorgestrel (Kyleena\textsuperscript{®}) is recommended as an option for use within NHS Wales for contraception for up to five years.

\textbf{EXCEPTIONS TO LEGAL CATEGORY}

Levonelle\textsuperscript{®} One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

\textbf{MEDICINAL FORMS}

There can be variation in the licensing of different medicines containing the same drug.

\textbf{Intra-uterine device}

\begin{itemize}
  \item Jaydess (Bayer Plc)\textsuperscript{↓}
    \begin{itemize}
      \item Jaydess 13.5 mg Jaydess 13.5 mg intra-uterine device 1 device \textsuperscript{POM} £69.22 DT = £69.22

                \end{itemize}
            \end{itemize}
        \end{itemize}
    \end{itemize}
\end{itemize}

\textbf{INDICATIONS AND DOSE}

\textbf{Contraception (no hormonal contraceptive use in previous month)}

\begin{itemize}
  \item BY SUBDERMAL IMPLANTATION
    \begin{itemize}
      \item Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion
    \end{itemize}
  \item Contraception (postpartum)
    \begin{itemize}
      \item Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion
    \end{itemize}
  \item Contraception following abortion or miscarriage in the second trimester
    \begin{itemize}
      \item BY SUBDERMAL IMPLANTATION
        \begin{itemize}
          \item Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion
        \end{itemize}
    \end{itemize}
  \item Contraception following abortion or miscarriage in the first trimester
    \begin{itemize}
      \item BY SUBDERMAL IMPLANTATION
        \begin{itemize}
          \item Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion
        \end{itemize}
    \end{itemize}
  \item Contraception (changing from other hormonal contraceptive)
    \begin{itemize}
      \item BY SUBDERMAL IMPLANTATION
        \begin{itemize}
          \item Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)
        \end{itemize}
    \end{itemize}
\end{itemize}

\textbf{UNLICENCED USE}

Nexplanon\textsuperscript{®} not licensed for use in females outside of the age range 18–40 years.

\section*{IMPORTANT SAFETY INFORMATION}

\textbf{MRHA/CHM ADVICE (JUNE 2016): NEXPLANON\textsuperscript{®} (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULARITY AND LUNG}

There have been rare reports of Nexplanon\textsuperscript{®} implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

\textbf{CONTRA-INDICATIONS}

Acute porphyrrias p. 624 – history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable – severe arterial disease – undiagnosed vaginal bleeding

\textbf{CAUTIONS}

malabsorption syndromes • possible risk of breast cancer • sex-steroid dependent cancer • systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- INTERACTIONS  ➔ Appendix 1: etonogestrel
- SIDE-EFFECTS
  - Common or very common Abdominal pain • alopecia • anxiety • appetite increased • breast abnormalities • depressed mood • dizziness • emotional lability • fatigue • flatulence • headaches • hot flush • increased risk of infection • influenza like illness • libido decreased • menstrual cycle irregularities • nausea • ovarian cyst • pain • skin reactions • weight changes
  - Uncommon Arthralgia • constipation • diarrhoea • drowsiness • dysuria • fever • galactorrhoea • genital abnormalities • hypertrichosis • insomnia • myalgia • oedema • vomiting • vulvovaginal discomfort
  - Frequency not known Abscess • angioedema • embolism and thrombosis • haemorrhage • insulin resistance • neoplasms • paraesthesia • seborrhoea

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progesterone-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- PREGNANCY Not known to be harmful, remove implant if pregnancy occurs.
- BREAST FEEDING Progestogen-only contraceptives do not affect lactation.
- DIRECTIONS FOR ADMINISTRATION The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- PATIENT AND CARER ADVICE Full counselling backed by patient information leaflet required before administration.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Implant
  - Nexplanon (Merck Sharp & Dohme Ltd)
  - Etonogestrel 68 mg  Nexplanon 68mg implant  | 1 device £83.43 £83.43

**Medroxyprogesterone acetate**

- INDICATIONS AND DOSE
  - Contraception
    - BY DEEP INTRAMUSCULAR INJECTION
      - Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
    - BY SUBCUTANEOUS INJECTION
      - Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

**Long-term contraception**

- BY DEEP INTRAMUSCULAR INJECTION
  - Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- BY SUBCUTANEOUS INJECTION
  - Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

**Contraception (when patient changing from other hormonal contraceptive)**

- BY SUBCUTANEOUS INJECTION
  - Females of childbearing potential: (consult product literature)

**SIDE-EFFECTS**

- Common or very common Abdominal pain • alopecia • anxiety • appetite increased • breast abnormalities • depressed mood • dizziness • emotional lability • fatigue • flatulence • headaches • hot flush • increased risk of infection • influenza like illness • libido decreased • menstrual cycle irregularities • nausea • ovarian cyst • pain • skin reactions • weight changes
- Uncommon Arthralgia • constipation • diarrhoea • drowsiness • dysuria • fever • galactorrhoea • genital abnormalities • hypertrichosis • insomnia • myalgia • oedema • vomiting • vulvovaginal discomfort

**SIDE-EFFECTS**

- Common or very common Abdominal pain • alopecia • anxiety • appetite increased • breast abnormalities • depressed mood • dizziness • emotional lability • fatigue • flatulence • headaches • hot flush • increased risk of infection • influenza like illness • libido decreased • menstrual cycle irregularities • mood altered • nausea • pain • sexual dysfunction • skin reactions • vulvovaginal infection • weight changes
- Uncommon Arthralgia • constipation • diarrhoea • drowsiness • fever • fluid retention • galactorrhoea • hirsutism • hot flush • hypertension • muscle spasms • ovarian cyst • painful sexual intercourse • tachycardia • under eye haemorrhage • varicose veins • vertigo • vulvovaginal disorders
- Rare or very rare Breast cancer • lipodystrophy
  - Frequency not known Embolism and thrombosis • hepatic disorders • osteoporosis • osteoporotic fractures • seizure

**SIDE-EFFECTS, FURTHER INFORMATION** Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

**CONCEPTION AND CONTRACEPTION**

- With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation. The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no
Genito-urinary system can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection or threadworm infestation. Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults.

Vaginal and vulval changes
Topical oestrogen creams containing estriol 0.01% (Gynest®) are used in the treatment of labial adhesions; treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

Vaginal and vulval infections
Effective specific treatments are available for the common vaginal infections.

Fungal infections
Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. Vaginal candidiasis, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs ( clotrimazole p. 533, econazole nitrate p. 534, fenticonazole nitrate p. 534, and miconazole) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 389 may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy
Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis
Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections
Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 344 or tinidazole p. 346. Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against

3.6 Contraception, spermicidal

Spermidicals

Nonoxinol

- INDICATIONS AND DOSE
  Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps
  • BY VAGINA
  • Females of childbearing potential: consult product literature

- SIDE-EFFECTS
  Genital erosion - increased risk of HIV infection - pain - paraesthesia - skin reactions - vaginal redness

SIDE-EFFECTS, FURTHER INFORMATION
High frequency use of the spermicide nonoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.

- CONCEPTION AND CONTRACEPTION
  No evidence of harm to latex condoms and diaphragms.

- PREGNANCY
  Toxicity in animal studies.

- BREAST FEEDING
  Present in milk in animal studies.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
- Depo-Provera (Pfizer Ltd)
- Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera 150mg/ml suspension for injection pre-filled syringes
- 1 pre-filled disposable injection (PSt) £6.01 DT = £6.01
- Sayana Press (Pfizer Ltd)
- Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices
- 1 pre-filled disposable injection (PSt) £6.90 DT = £6.90

4 Vaginal and vulval conditions

Vaginal and vulval conditions

Management
Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations applied after cleansing can be useful when the symptoms are due to non-specific...
certain Gram-negative organisms, especially Bacteroides spp. and can be used prophylactically in gynaecological surgery. Clindamycin cream below and metronidazole gel are indicated for bacterial vaginosis.

The antiviral drugs aciclovir p. 420 and valaciclovir p. 422 can be used in the treatment of genital infection due to herpes simplex virus, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

4.1 Vaginal and Vulval infections

4.1a Vaginal and Vulval Bacterial Infections

**Antibacterials > Lincosamides**

**Clindamycin**

- **Indications and Dose**
  - **Dalacin® 2% Cream**
  - **Bacterial vaginosis**
    - Child: 1 applicatorful daily for 3–7 nights, dose to be administered at night
    - **Dose equivalence and conversion**
      - 1 applicatorful delivers a 5 g dose of clindamycin 2%.  

- **Unlicensed Use** Not licensed for use in children.
- **Caution** Avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **Interactions** → Appendix 1: clindamycin
- **Side-effects**
  - **Common or very common** Skin reactions
  - **Frequency not known** Constipation, diarrhoea (discontinue), dizziness, gastrointestinal discomfort, headache, increased risk of infection, nausea, vertigo, vomiting, vulvovaginal irritation
- **Side-effects, further information** Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.
- **Conception and contraception** Damages latex condoms and diaphragms.
- **Patient and carer advice** Patients and their carers should be advised to discontinue and contact a doctor immediately if severe, prolonged or bloody diarrhoea develops.
- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - EXCipients: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol
    - Dalacin (Pfizer Ltd)
    - Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram | £6.86 DT | £10.86

4.1b Vaginal and Vulval Fungal Infections

**Antifungals > Imidazole**

**Clotrimazole**

- **Indications and Dose**
  - **Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)**
    - Child: Apply 2–3 times a day, to be applied to anogenital area
  - **Vaginal candidiasis (dose for 10% intravaginal cream)**
    - Child: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary
  - **Vaginal candidiasis**
    - Child: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary
  - **Recurrent vulvovaginal candidiasis**
    - Child: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

- **Unlicensed use** Consult product literature for individual preparations.
- **Caution** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **Interactions** → Appendix 1: antifungals, azoles
- **Side-effects** Abdominal pain, discomfort, genital peeling, oedema, paraesthesia, pelvic pain, skin reactions, syncope, vaginal haemorrhage
- **Conception and Contraception** Cream and pessaries may damage latex condoms and diaphragms.
- **Pregnancy**
  - **Dose adjustments** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
Econazole nitrate

- **INDICATIONS AND DOSE**
  
  **GYNO-PEVARYL® ONCE**
  
  **Vaginal and vulval candidiasis**
  
  ▶️ BY VAGINA
  
  - Child: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

  **GYNO-PEVARYL® PESSARY**
  
  **Vaginal and vulval candidiasis**
  
  ▶️ BY VAGINA
  
  - Child: 1 pessary daily for 3 days, pessary to be inserted at night, course can be repeated once if necessary

- **CAUTIONS**
  
  Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **SIDE-EFFECTS**
  
  ▶️ Common or very common Skin reactions
  
  ▶️ Uncommon Vaginal burning
  
  ▶️ Frequency not known Angioedema

- **CONCEPTION AND CONTRACEPTION**
  
  Cream and pessaries damage latex condoms and diaphragms.

- **PREGNANCY**
  
  Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Pessary**
  
  ▶️ Gyno-Pevaryl (Janssen-Cilag Ltd)

  Econazole nitrate 150 mg Gyno-Pevaryl Once 150mg vaginal pessary | 1 pessary £3.69
  
  Gyno-Pevaryl 150mg vaginal pessaries | 3 pessary £4.17

---

Fenticonazole nitrate

- **INDICATIONS AND DOSE**
  
  **Vaginal and vulva candidiasis**
  
  ▶️ BY VAGINA USING CAPSULES
  
  - Child: 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night

  ▶️ BY VAGINA USING CREAM
  
  - Child: 1 applicatorful twice daily for 3 days

  **DOSE EQUIVALENCE AND CONVERSION**
  
  ▶️ 1 applicatorful delivers a 5 g dose of fenticonazole 2%.

- **CAUTIONS**
  
  Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **SIDE-EFFECTS**
  
  Paraesthesia

- **CONCEPTION AND CONTRACEPTION**
  
  Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  
  EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol, woolfat and related substances (including lanolin).

  ▶️ Gynoxin (Recordati Pharmaceuticals Ltd)
  
  Fenticonazole nitrate 20 mg per 1 gram Gynoxin 2% vaginal cream | 30 gram £3.74

  **Capsule**
  
  EXCIPIENTS: May contain Hydroxybenzoates (parabens)

  ▶️ Gynoxin (Recordati Pharmaceuticals Ltd)
  
  Fenticonazole nitrate 200 mg Gynoxin 200mg vaginal capsules | 3 capsule £2.42
  
  Fenticonazole nitrate 600 mg Gynoxin 600mg vaginal capsules | 1 capsule £2.62

---

Oral antifungal treatment should be avoided during pregnancy.

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease
Azathioprine p. 536, mercaptopurine p. 562, or once weekly methotrexate p. 563 are used to induce remission in unresponsive or chronically active Crohn’s disease. Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn’s disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid p. 594 should be given to reduce the possibility of methotrexate toxicity. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Ciclosporin p. 537 (cyclosporin) is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, ciclosporin may reduce the need for urgent colorectal surgery.

Immunosuppressant therapy
Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mercaptopurine), calcineurin inhibitors (ciclosporin or tacrolimus p. 540), corticosteroids, or sirolimus p. 539. Choice is dependent on the type of organ, time after transplant, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness
Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as sepsicaemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine is also necessary during this period—important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants
Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced (to one quarter of the original dose in children) when allopurinol p. 576 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invading cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment.

Cyclophosphamide p. 555 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants
The corticosteroids prednisolone p. 458 and dexamethasone p. 455 are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin’s disease, non-Hodgkin’s lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure, or to help control emesis when combined with an appropriate anti-emetic.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-
myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone. Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

Other drugs used for Immune system disorders and transplantation
Anakinra, p. 662 • Chloroquine, p. 410 • Everolimus, p. 580 • Hydroxychloroquine sulfate, p. 662 • Rituximab, p. 550

IMMUNE SERA AND IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

28-Nov-2017

**INDICATIONS AND DOSE**

- **Prophylaxis of organ rejection in heart allograft recipients**
  - **By intravenous infusion**
    - Child: 1–2.5 mg/kg daily for 3–5 days, start treatment on day of transplantation, to be given over at least 6 hours
  - **Prophylaxis of organ rejection in renal allograft recipients**
    - **By intravenous infusion**
      - Child 1–7 years: 1–1.5 mg/kg daily for 3–9 days, start treatment on day of transplantation, to be given over at least 6 hours
  - **Treatment of corticosteroid-resistant allograft rejection in renal transplantation**
    - **By intravenous infusion**
      - Child 1–7 years: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

**DOSES AT EXTREMES OF BODY-WEIGHT**

- To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

**CONTRA-INDICATIONS**

- Infection

**INTERACTIONS**

- **Common or very common**
  - Chills • diarrhoea • dysphagia • dyspnoea • fever • hypotension • infection • lymphopenia • myalgia • nausea • leukopenia malignant • neutropenia • reactivation of infection • secondary malignancy • sepsis • skin reactions • thrombocytopenia • vomiting
- **Uncommon**
  - Cytokine release syndrome • hepatic disorders • hypersensitivity • infusion related reaction

**SIDE-EFFECTS, FURTHER INFORMATION**

- Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

**PREGNANCY**

- Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**

- Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

- Monitor blood count.

**DIRECTIONS FOR ADMINISTRATION**

- For continuous intravenous infusion reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482

- Antithymocyte immunoglobulin (rabbit) is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

**MEDITATIONAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- Powder and solvent for solution for infusion
  - Thymoglobulin (Sanofi)
  - Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobulin 25mg powder and solvent for solution for infusion vials | 1 vial £158.77 (Hospital only)

**IMMUNOSUPPRESSANTS**

Azathioprine

13-Jun-2018

**INDICATIONS AND DOSE**

- Severe ulcerative colitis • Severe Crohn’s disease
  - **By mouth**
    - Child 2–7 years: Initially 2 mg/kg once daily, then increased if necessary up to 2.5 mg/kg once daily
  - Systemic lupus erythematosus • Vasculitis • Autoimmune conditions usually when corticosteroid therapy alone has proved inadequate
  - **By mouth**
    - Child: Initially 1 mg/kg daily, then adjusted according to response to 3 mg/kg daily, consider withdrawal if no improvement within 3 months; maximum 3 mg/kg per day

- Suppression of transplant rejection
  - **By mouth, or by intravenous infusion**
    - Child: Maintenance 1–3 mg/kg daily, adjusted according to response, consult local treatment protocol for details, oral route preferred, but if oral route is not possible then can be given by intravenous infusion, the total daily dose may alternatively be given in 2 divided doses

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

**CAUTIONS**

- Reduced thiopurine methyltransferase activity

**INTERACTIONS**

- **Appendix 1: azathioprine**

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - **Common or very common**
    - Bone marrow depression (dose-related) • increased risk of infection • leucopenia • thrombocytopenia
  - **Uncommon**
    - Anaemia • hepatic disorders • hypersensitivity • pancreatitis
  - Rare or very rare
    - Agranulocytosis • alopecia • bone marrow disorders • diarrhoea • gastrointestinal disorders • neoplasms • photosensitivity reaction • pneumonitis • severe cutaneous adverse reactions (SCARS)
Frequency not known Nodular regenerative hyperplasia - sinusoidal obstruction syndrome

SPECIFIC SIDE-EFFECTS
With oral use Nausea

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may require drug withdrawal.

Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.

Neutropenia and thrombocytopenia Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in hypersensitivity to mercaptopurine.

PREGNANCY Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

BREAST FEEDING Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

HEPATIC IMPAIRMENT Manufacturer advises caution (impaired metabolism)—monitor liver function and complete blood count more frequently in those with severe impairment.

Dose adjustments Manufacturer advises use doses at lower end of the dose range in hepatic failure; reduce dose if hepatic or haematological toxicity occur.

RENAI IMPAIRMENT Dose adjustments Reduce dose.

PRE-TREATMENT SCREENING Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, thioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or thioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

MONITORING REQUIREMENTS
Monitor for toxicity throughout treatment.
Monitor full blood count weekly (more frequently with higher doses or if severe renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

DIRECTIONS FOR ADMINISTRATION
With intravenous use Consult local treatment protocol for details. For intravenous injection, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute. For intravenous infusion, reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritating. Intravenous route should therefore be used only if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid.

PRESCRIBING AND DISPENSING INFORMATION The RCPCH and NPPG recommend that, when a liquid special of azathioprine is required, the following strength is used: 50 mg/5 mL.

PATIENT AND CARER ADVICE Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

Medicines for Children leaflet: Azathioprine for severe atopic eczema www.medicinesforchildren.org.uk/azathioprine-severe-atopic-eczema-0

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin
(Cyclosporin)

DRUG ACTION Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

INDICATIONS AND DOSE
Refractory ulcerative colitis
| BY MOUTH |
| Child 2-17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg twice daily), dose adjusted according to blood-ciclosporin concentration and response |
| BY INTRAVENOUS INFUSION |
| Child 3-17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response |

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)
| BY MOUTH |
| Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not continued |

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin
(Cyclosporin)

DRUG ACTION Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

INDICATIONS AND DOSE
Refractory ulcerative colitis
| BY MOUTH |
| Child 2-17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg twice daily), dose adjusted according to blood-ciclosporin concentration and response |
| BY INTRAVENOUS INFUSION |
| Child 3-17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response |

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)
| BY MOUTH |
| Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not continued |
Immune system disorders and transplantation

achieved within 2 weeks, increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- **BY MOUTH**
  - Child: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

- **BY MOUTH**
  - Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation Prevention and treatment of graft-versus-host disease

- **BY MOUTH**
  - Child: 3 mg/kg twice daily, dose can be increased if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Common or very common
    - Headache
    - Nausea
    - Vomiting
    - Seizure
    - Tremor
    - Fatigue
    - Appetite decreased
    - Haemolytic anaemia
    - Muscle weakness
    - Gastrointestinal discomfort
    - Electrolyte imbalance
    - Renal impairment (renal structural changes — proteinuria, and renal function

- **SPECIFIC SIDE-EFFECTS**
  - Rare or very rare
    - Gynaecomastia
    - Anaphylactic shock
    - Idiopathic intracranial hypertension
    - Multifocal motor neuropathy
    - Muscle weakness
    - Pancreatitis
    - Gingival hyperplasia
    - Seizure
    - Tremor
    - Vomiting

- **CONTRA-INDICATIONS**
  - Abnormal baseline renal function (in non-transplant indications) - malignancy (in non-transplant indications) - uncontrolled hypertension (in non-transplant indications) - uncontrolled infections (in non-transplant indications)

- **CAUTIONS**
  - Hyperuricaemia - in atopic dermatitis, active herpes simplex infections — allow injection to clear before starting (if they occur during treatment withdraw if severe)
  - In atopic dermatitis, Staphylococcus aureus skin infections — not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) - in psoriasis; patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) - in uveitis, Behcet’s syndrome (monitor neurological status) - lymphoproliferative disorders (discontinue treatment) - malignancy

**MONITORING REQUIREMENTS**

- Monitor whole blood ciclosporin concentration (tough level dependent on indication — consult local treatment protocol for details)
- In long-term management of nephrotic syndrome, perform renal biopsies every 1–2 years

**DIRECTIONS FOR ADMINISTRATION**

- With oral use Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
With intravenous use For intermittent intravenous infusion, dilute to a concentration of 0.5–2.5 mg/ml with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

PRESCRIBING AND DISPENSING INFORMATION
Brand name prescribing. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). Sandimmun® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

PATIENT AND CARER ADVICE
Patients and carers should be counselled on the administration of different formulations of ciclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

Medicines for Children leaflet: Ciclosporin for nephrotic syndrome
With systemic use www.medicinesforchildren.org.uk/ciclosporin-nephrotic-syndrome-0

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
CAUTIONARY AND ADVISORY LABELS
EXCIPIENTS: May contain Alcohol, polyoxy castor oils

- Deximune (Dexcel-Pharma Ltd)
  - Ciclosporin 50 mg | 30 capsule (POM) £25.60 DT = £35.97
  - Ciclosporin 100 mg | 30 capsule (POM) £48.90 DT = £68.28

  - Ciclosporin 25 mg | 30 capsule (POM) £11.05 DT = £18.37

Sirolimus
16-Nov-2017

DRUG ACTION
Sirolimus is a non-calcineurin inhibiting immunosuppressant.

INDICATIONS AND DOSE
As a component of immunosuppressive therapy for renal transplantation in children and adolescents only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

BY MOUTH
Child: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION
The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

UNLICENSED USE
Not licensed for use in children.

CAUTIONS
Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

INTERACTIONS
Appendix 1: sirolimus

SIDE-EFFECTS
- Common or very common Abdominal pain · anaemia · arthralgia · ascites · constipation · diabetes mellitus · diarrhoea · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · fever · haemolytic uraemic syndrome · haemorrhage · headache · healing impaired · hyperglycaemia · hypertension · increased risk of infection · leucopenia · lymphatic vessel disorders · menstrual cycle irregularities · nausea · neoplasms · neutropenia · oedema · osteonecrosis · ovarian cyst · pain · pancreatitis · pericardial effusion · proteinuria · respiratory disorders · sepsis · skin reactions · stomatitis · tachycardia · thrombocytopenia
- Uncommon Antibiotic associated colitis · focal segmental glomerulosclerosis · hepatic failure · nephrotic syndrome · pancytopenia · post transplant lymphoproliferative disorder
- Frequency not known Posterior reversible encephalopathy syndrome (PRES)
CONCEPTION AND CONTRACEPTION  Effective contraception must be used during treatment and for 12 weeks after stopping.

PREGNANCY  Avoid unless essential—toxicity in animal studies.

BREAST FEEDING  Discontinue breast-feeding.

HEPATIC IMPAIRMENT  Manufacturer advises caution (risk of increased exposure). Dose adjustments  In adults, manufacturer advises maintenance dose reduction in severe impairment—consult product literature.

MONITORING REQUIREMENTS  Monitor whole blood-sirolimus trough concentration.

PATIENT AND CARER ADVICE  Patient or carers should be advised on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

NATIONAL FUNDING/ACCESS DECISIONS  NICE decisions

Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482

Sirolimus is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/TA482

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Oral solution EXCIPIENTS: May contain Ethanol

Rapamune (Pfizer Ltd)

Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution sugar-free 60 ml £162.41 DT = £162.41

Tablet

Rapamune (Pfizer Ltd)

Sirolimus 500 microgram Rapamune 0.5mg tablets 30 tablet £69.00 DT = £69.00

Sirolimus 1 mg Rapamune 1mg tablets 30 tablet £86.49 DT = £86.49

Sirolimus 2 mg Rapamune 2mg tablets 30 tablet £172.98 DT = £172.98

Tacrolimus 19-Mar-2018

DRUG ACTION  Tacrolimus is a calcineurin inhibitor.

INDICATIONS AND DOSE

ADOPORT

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

BY MOUTH

Neonate: Initially 150 micrograms/kg twice daily.

Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

Neonate: Initially 150 micrograms/kg twice daily.

Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high ‘tough’ concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

Neonate: Initially 50–150 micrograms/kg twice daily.

Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

Child: Seek specialist advice

MODIGRAF

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

BY MOUTH

Neonate: Initially 150 micrograms/kg twice daily.

Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

Neonate: Initially 150 micrograms/kg twice daily.

Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

Neonate: Initially 50–150 micrograms/kg twice daily.

Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)
Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- BY CONTINUOUS INTRAVENOUS INFUSION
- Neonate: Initially 30–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.
- Child: Initially 30–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.

Allograft rejection resistant to conventional immunosuppressive therapy
- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: Seek specialist advice (consult local protocol) **TACNI®**

Prophylaxis of graft rejection following liver transplantation, starting within 12 hours of transplantation
- BY MOUTH
- Neonate: Initially 150 micrograms/kg twice daily.
- Child: Initially 50–150 micrograms/kg twice daily.

Prophylaxis of graft rejection following kidney transplantation without antibody induction, starting within 5 days of transplantation
- BY MOUTH
- Neonate: Initially 50–150 micrograms/kg twice daily.
- Child: Initially 50–150 micrograms/kg twice daily.

Allograft rejection resistant to conventional immunosuppressive therapy
- BY MOUTH
- Child: Seek specialist advice **PROGRAF® CAPSULES**

Prophylaxis of graft rejection following liver transplantation, starting within 5 days of transplantation when oral route not appropriate
- BY CONTINUOUS INTRAVENOUS INFUSION
- Neonate: Initially 50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.
- Child: Initially 50–150 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate
- BY CONTINUOUS INTRAVENOUS INFUSION
- Neonate: Initially 75–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.
- Child: Initially 75–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.
Immune system disorders and transplantation

- **Adaprot®**, **Prograf®**, **Capzixon®** and **Tacni®** are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- **Modigraf®** granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- **Advagraf®** is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: **Envarsus®** is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections • lymphoproliferative disorders • malignancies • neurotoxicity • QT-interval prolongation • UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** → Appendix 1: tacrolimus
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Alopecia • anaemia • anxiety • appetite decreased • arthralgias • ascites • asthenic conditions • bile duct disorders • confusion • consciousness impaired • constipation • coronary artery disease • cough • depression • diabetes mellitus • diarrhoea • dizziness • dysgraphia • dyslipidaemia • dyspnoea • electrolyte imbalance • embolism and thrombosis • eye disorder • febrile disorders • fluid imbalance • gastrointestinal discomfort • gastrointestinal disorders • gastrointestinal inflammatory disorders • haemorrhage • hallucination • headache • hepatic disorders • hyperglycaemia • hyperhidrosis • hypertension • hyperuricaemia • hypotension • increased risk of infection • ischaemia • joint disorders • leucocytosis • leucopenia • metabolic acidosis • mood altered • muscle spasms • nasal complaints • nausea • nephropathy • nervous system disorder • oedema • oral disorders • pain • peripheral neuropathy • peripheral vascular disease • primary transplant dysfunction • psychiatric disorder • renal impairment • renal tubular necrosis • respiratory disorders • seizure • sensation abnormal • skin reactions • sleep disorders • temperature alteration • thrombocytopenia • tinnitus • tremor • urinary tract disorder • urine abnormal • visual disorders • vomiting • weight changes
  - Uncommon Asthma • cardiac arrest • cardiomyopathy • cataract • central nervous system haemorrhage • chest discomfort • coagulation disorders • coma • dysmenorrhoea • encephalopathy • feeling abnormal • haemolytic anaemia • hearing impairment • heart failure • hypoglycaemia • hypoproteinaemia • influenza like illness • memory loss • multi organ failure • neutropenia • palpitations • pancreatitis • pancytopenia • paralysis • paresis • photosensitivity reaction • psychotic disorder • shock • speech disorder • stroke • ventricular hypertrophy
  - Rare or very rare Fall • hirsutism • mobility decreased • muscle tone increased • muscle weakness • pancreatic pseudocyst • pericardial effusion • QT interval prolongation • severe cutaneous adverse reactions (SCARs) • sinusoidal obstruction syndrome • thirst • ulcer
  - Frequency not known Agranulocytosis • neoplasms malignancy • neoplasms • polyomavirus-associated nephropathy • progressive multifocal leukoencephalopathy (PML) • pure red cell aplasia

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Anaphylactoid reaction (due to excipient) • hypersensitivity

**SIDE-EFFECTS, FURTHER INFORMATION** Cardiomyopathy has been reported to occur primarily in children with tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONCEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **Dose adjustments** Manufacturer advises consider dose reduction in severe impairment.
- **MONITORING REQUIREMENTS**
  - After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
  - Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For continuous intravenous infusion over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500mL. Tacrolimus is incompatible with PVC.
- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of tacrolimus is required, the following strength is used: 5 mg/5 mL.
- **PROGRAF® INFUSION** Intravenous route should only be used if oral route is inappropriate.
- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight. Medicines for Children leaflet: Tacrolimus for prevention of transplant rejection www.medicinesforchildren.org.uk/tacrolimus-prevention-transplant-rejection
- **Driving and skilled tasks** With systemic use May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482
      Immediate-release tacrolimus, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in patients having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. Tacrolimus granules for oral suspension (Modigraf®) should be used only if the manufacturer provides it at the same price or lower than that agreed with the Commercial Medicines Unit. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/TA482
  - Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482
Prolonged-release tacrolimus is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (December 2010) that tacrolimus granules for suspension (Modigraf®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Granules

CAUTIONARY AND ADVISORY LABELS 13, 23
- **Modigraf (Astellas Pharma Ltd)**
  - Tacrolimus (as Tacrolimus monohydrate) 200 microgram Modigraf 0.2mg granules sachets sugar-free | 50 sachet [PDR] £71.30 DT + £71.30
  - Tacrolimus (as Tacrolimus monohydrate) 1 mg Modigraf 1mg granules sachets sugar-free | 50 sachet [PDR] £356.65 DT + £356.65

**Solution for infusion**
EXCIPIENTS: May contain Polyoxyl castor oils
- **Prograf (Astellas Pharma Ltd)**
  - Tacrolimus 5 mg per 1 ml Prograf 5mg/1ml solution for infusion ampoules | 10 ampoule [PDR] £584.51

  - Tacrolimus 5 mg Prograf 5mg capsules | 50 capsule [PDR] £296.58 DT + £296.58

#### IMMUNOSUPPRESSANTS > MONOClonal ANTIBODIES

### Canakinumab

26-Jun-2018

**DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

**INDICATIONS AND DOSE**

**Cryopyrin-associated periodic syndromes (specialist use only)**

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-3 years (body-weight 7.5-14 kg): 4 mg/kg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature
  - Child 4-17 years (body-weight 7.5-14 kg): 4 mg/kg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature
● **PATIENT AND CARER ADVICE**  Manufacturer advises patients and carers should be instructed to seek medical advice if signs or symptoms suggestive of tuberculosis (including persistent cough, weight loss and subfebrile temperature) occur.

**Driving and skilled tasks**  Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

● **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Ilaris (Novartis Pharmaceuticals UK Ltd)
  Canakinumab 150 mg per 1 ml Ilaris 150mg/1ml solution for injection vials | 1 vial (£39,927.80)

**IMMUNOSUPPRESSANTS**  > **MONOCLONAL ANTIBODIES**  > **ANTI-LYMPHOCYTE**

| Basiliximab |
| 16-Nov-2017 |

● **DRUG ACTION**  Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

● **INDICATIONS AND DOSE**  Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

  → BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - Child: 1-17 years (body-weight up to 35 kg): Initially 10 mg, dose to be administered within 2 hours before transplant surgery, followed by 10 mg after 4 days, dose administered after transplant surgery, withheld second dose if severe hypersensitivity or graft loss occurs
  - Child: 1-17 years (body-weight: 35 kg and above): Initially 20 mg administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withheld second dose if severe hypersensitivity or graft loss occurs

● **CAUTIONS**  Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects

● **INTERACTIONS**  → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**  Capillary leak syndrome · constipation · cytokine release syndrome · dyspnoea · fever · heart failure · hypersensitivity · hypertension · hypotrichosis · hypotension · increased risk of infection · myocardial infarction · pulmonary oedema · respiratory disorders · sepsis · skin reactions · sneezing · tachycardia

● **CONCESSION AND CONTRACEPTION**  Adequate contraception must be used during treatment and for 16 weeks after last dose.

● **PREGNANCY**  Manufacturer advises avoid—no information available.

● **BREAST FEEDING**  Manufacturer advises avoid—no information available.

● **DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

● **NATIONAL FUNDING/ACCESS DECISIONS**  

**NICE decisions**
- Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482
  Basiliximab, when used as part of an immunosuppressive regimen that includes a calcineurin inhibitor, is recomended as an initial option to prevent organ rejection in patients having a kidney transplant. The use of basiliximab with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision.

Informed consent should be obtained and documented.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

● **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Simulect (Novartis Pharmaceuticals UK Ltd)
  Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial (£104.28 Hospital only)

**IMMUNOSUPPRESSANTS**  > **PURINE SYNTHESIS INHIBITORS**

| Mycophenolate mofetil |
| 09-Mar-2018 |

● **INDICATIONS AND DOSE**  Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

  → BY MOUTH
  - Child: 600 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

**Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and tacrolimus) (under expert supervision)**

  → BY MOUTH
  - Child: 300 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

**Prophylaxis of acute rejection in hepatic transplantation (in combination with a corticosteroid and ciclosporin or tacrolimus) (under expert supervision)**

  → BY MOUTH
  - Child: 10 mg/kg twice daily, increased to 20 mg/kg twice daily, consult local protocol for details; maximum 2 g per day

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS**

(FEBRUARY 2018)

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see Conception and contraception and Patient and carer advice.

● **CAUTIONS**  Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants
PATIENT AND CARER ADVICE

**PRESCRIBING AND DISPENSING INFORMATION**

**MONITORING REQUIREMENTS**

- Renal impairment: Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

**PREScribing AND Dispensing INFORMATION**

- Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m².

**PATIENT AND CARER ADVICE**

Pregnancy prevention advice: The MHRA advises that prescribers should ensure that female patients understand the need to comply with the pregnancy prevention advice, and they should be informed to seek immediate medical attention if there is a possibility of pregnancy; male patients planning to conceive children should be informed of the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy.

Bone marrow suppression: Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inescapable bruising or bleeding.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482

Mycophenolate mofetil, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in patients having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. The use of mycophenolate mofetil with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

          - Mycophenolate mofetil 250 mg: Myfenax 250mg capsules | 100 capsule | £78.15 DT = £82.26

- | DT = |
Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Blinatumomab

DRUG ACTION The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

INDICATIONS AND DOSE
Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia (initiated by a specialist)
- BY CONTINUOUS INTRAVENOUS INFUSION
- Child 1-17 years: (consult product literature)

CAUTIONS Aphasias, brain injuries (severe), cerebellar disease, dementia, elderly—limited information available
- epilepsy, paraparesis, Parkinson’s disease—patients may need pre-medication to minimise adverse reactions
- psychosis, seizure, severe hepatic impairment, severe renal impairment—stroke

CAUTIONS, FURTHER INFORMATION
- Pre-medication Manufacturer advises pre-medication with a corticosteroid and an anti-pyretic—consult product literature.
- Neurological events There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology—manufacturer advises caution.

INTERACTIONS ➔ Appendix 1: monoclonal antibodies

SIDE-EFFECTS
- Common or very common Abdominal pain, anaemia, aphasia, appetite decreased, arthralgia, chest pain, chills, cognitive disorder, confusion, constipation, cough, decreased leucocytes, diarrhoea, dizziness, dysphonia, electrolyte imbalance, encephalopathy, facial swelling, fatigue, fever, flushing, headache, hyperglycaemia, hypersensitivity, hypotension, hypertension, hypoalbuminaemia, hypotension—immune disorder—increased risk of infection—infusion related reaction, insomnia, leucocytosis, memory loss, nausea, neutropenia, oedema, pain, paraesthesia, rash, respiratory disorders, seizure, sepsis, tachycardia, thrombocytopenia, tremor—tumour lysis syndrome—vomiting—weight increased
- Uncommon Capillary leak syndrome, cranial nerve disorder, pancreatitis
- Frequency not known Device related infection, hypoxia, multi organ failure

SIDE-EFFECTS, FURTHER INFORMATION Pancreatitis Life-threatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).

Cytokine release syndrome, infusion reactions and tumour lysis syndrome Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BRONCHOLOGY Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).

RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment—consult product literature.

HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after reconstitution and dilution.

PATIENT AND CARER ADVICE A patient alert card should be provided. Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2148

The Scottish Medicines Consortium has advised (April 2019) that blinatumomab (Blincyto®) is accepted for use within NHS Scotland as monotherapy for the treatment of paediatric patients aged 1 year or older with Philadelphia chromosome-negative CD19 positive B-cell precursor acute lymphoblastic leukaemia which is refractory or in relapse after receiving at least two prior therapies or in relapse after receiving prior allogeneic hematopoietic stem cell transplantation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions
AWMSG No. 3169

The All Wales Medicines Strategy Group has advised (April 2019) that blinatumomab (Blincyto®) is recommended as an option for use within NHS Wales as monotherapy for the treatment of paediatric patients aged 1 year or older with Philadelphia chromosome-negative CD19 positive B-cell precursor acute lymphoblastic leukaemia which is refractory or in relapse after receiving at least two prior therapies or in relapse after receiving prior allogeneic haematopoietic stem cell transplantation. This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.
Dinutuximab beta

**DRUG ACTION** Dinutuximab beta is a chimeric monoclonal antibody; it specifically targets the carbohydrate moiety of disialoganglioside 2, which is overexpressed on neuroblastoma cells.

**INDICATIONS AND DOSE**
- **High-risk neuroblastoma (specialist use only)**
  - By intravenous infusion
  - Child 1–17 years: consult product literature

**CONTRA-INDICATIONS** Acute grade 3 or 4, or severe chronic graft-versus-host disease

**CAUTIONS** Avoid vaccinations during and for at least 3 months after treatment and for 6 months after the last dose—no information available.

**INTERACTIONS** Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**
- Common or very common: Abdominal distension, anaemia, anxiety, appetite decreased, ascites, capillary leak syndrome, chills, cough, cytokine release syndrome, decreased leucocytes, device related infection, dizziness, dyspnoea, electrolyte imbalance, eye disorders, eye inflammation, fever, fluid imbalance, gastrointestinal disorders, haematuria, headache, heart failure, hyperhidrosis, hypersensitivity, hypertension, hypertiglycaemia, hypoalbuminaemia, hypotension, hypoxia, increased risk of infection, left ventricular dysfunction, muscle spasms, nausea, neutropenia, oedema, oral disorders, pain, paraesthesia, pericardial effusion, peripheral neuropathy, photosensitization reaction, pulmonary oedema, renal impairment, respiratory disorders, seizure, sepsis, skin reactions, tachycardia, thrombocytopenia, tremor, urinary retention, urine abnormalities, vision disorders, vomiting, weight changes
- Uncommon: Disseminated intravascular coagulation, eosinophilia, hepatocellular injury, hypovolaemic shock, intracranial pressure increased, peripheral vascular disease, posterior reversible encephalopathy syndrome (PRES)

**CONCEPTION AND CONTRACEPTION**
- Manufactuer advises women of childbearing potential should use contraception during and for 6 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**PREGNANCY**
- Manufactuer advises avoid—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**BREAST FEEDING**
- Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.

**MONITORING REQUIREMENTS**
- Manufacturer advises pre-treatment evaluation of pulse oximetry, bone marrow function, liver function and renal function—consult product literature for values required for treatment initiation.
- Manufacturer advises monitor circulatory and respiratory function—risk of capillary leak syndrome.
- Manufactuer advises monitor liver function and electrolytes regularly.

**HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks: Manufacturer advises patients should not use or drive machines during treatment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Dinutuximab beta for treating neuroblastoma (August 2018)

**Scottish Medicines Consortium (SMC) decisions**
- SMC No. SMC2105

The Scottish Medicines Consortium has advised (November 2018) that dinutuximab beta (Qarziba®) is recommended as an option for treating high-risk neuroblastoma in people aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplant, only if:
- they have not already had anti-GD2 immunotherapy, and
- the manufacturer provides dinutuximab beta according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta538

Scottish Medicines Consortium (SMC) decisions

**SMC No. SMC2105**

The Scottish Medicines Consortium has advised (November 2018) that dinutuximab beta (Qarziba®) is accepted for use within NHS Scotland for the treatment of high-risk neuroblastoma in patients aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplant, as well as patients with a history of relapsed or refractory neuroblastoma, with or without residual disease.

In patients with a history of relapsed or refractory disease and in patients who have not achieved a complete response after first line therapy, dinutuximab beta should be combined with interleukin-2.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- Excipients: May contain Polysorbates
  - Blinatumomab 38.5 microgram
  - Blinatumomab 38.5 microgram powder for concentrate and solution for infusion vials | 1 vial [Post] £2,017.00

**Antibody responsive malignancy**

547
Gemtuzumab ozogamicin

**Drug Action** Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

**Indications and Dose**

- **CD33-positive acute myeloid leukaemia (specialist use only)**
  - **By Intravenous Infusion**
  - Child 15–17 years: (consult product literature)

**Caution** Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) - haematopoietic stem cell transplantation (increased risk of hepatotoxicity) - pre-medication recommended to minimise adverse reactions

**Side-effects**

- Common or very common: Anaemia - appetite decreased - ascites - chills - constipation - decreased leucocytes - diarrhoea - dyspnoea - fatigue - fever - gastrointestinal discomfort - gastrointestinal disorders - haemorrhage - headache - hepatic disorders - hyperbilirubinaemia - hyperglycaemia - hypertension - hypotension - infection - infusion related reaction (including fatal cases) - multi organ failure - nausea - neutropenia - oedema - pancytopenia - sinusoidal obstruction syndrome - skin reactions - stomatitis - tachycardia - thrombocytopenia - tumour lysis syndrome (including fatal cases) - vomiting

- Frequency not known: Interstitial pneumonia

**Prescribing and Dispensing Information**

- **Gemtuzumab ozogamicin for untreated acute myeloid leukaemia (November 2018) NICE TAs545**
- Gemtuzumab ozogamicin (Mylotarg®) with daunorubicin and cytarabine, is recommended as an option for untreated de novo CD33-positive acute myeloid leukaemia (AML), except acute promyelocytic leukaemia, in people 15 years and over, only if:
  - they start induction therapy when either the cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (that is, because the test was unsuccessful) or when their cytogenetic test results are not yet available, and
  - they start consolidation therapy when their cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (because the test was unsuccessful), and
  - the manufacturer provides gemtuzumab ozogamicin according to the commercial arrangement.

**National Funding/Access Decisions**

**NICE decisions**

- **Gemtuzumab ozogamicin for untreated acute myeloid leukaemia (November 2018) NICE TAs545**

**Scottish Medicines Consortium (SMC) decisions**

- **SMC No. SMC2089**

  The Scottish Medicines Consortium has advised (October 2018) that gemtuzumab ozogamicin (Mylotarg®) is accepted for restricted use within NHS Scotland as combination therapy with daunorubicin and cytarabine for the treatment of previously untreated, de novo CD33-positive acute myeloid leukaemia in patients aged 15 years and above with a favourable, intermediate or unknown cytogenetic profile.

**Medicinal Forms** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Mylotarg (Pfizer Ltd)**
- Gemtuzumab ozogamicin 5 mg Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial [500] £6,300.00 (Hospital only)
**Ipilimumab**

**Drug Action** Ipilimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.

**Indications and Dosage**

- **Melanoma (as monotherapy) (specialist use only)**
- **By Intravenous Infusion**
  - Child 12-17 years: 3 mg/kg every 3 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature

**Cautions, Further Information**

- **Cautions, Further Information** For full details consult product literature.

- **Interactions** → Appendix 1: monoclonal antibodies

- **Side-Effects**
  - **Rare or very rare** Myasthenia gravis - proteinuria - thyroiditis
  - **Frequency not known** Cytomegalovirus infection reactivation

**Important Safety Information**

MHRA/CHM Advice: Ipilimumab (Yervoy®): Reports of Cytomegalovirus (CMV) Gastrointestinal Infection or Reactivation (January 2019)

There have been post-marketing cases of gastrointestinal CMV infection or reactivation in ipilimumab-treated patients reported to have corticosteroid-refractory immune-related colitis, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

**Side-Effects, Further Information** A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

- **Conception and Contraception** Use effective contraception.

- **Pregnancy** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

- **Breast Feeding** Manufacturer advises avoid—present in milk in animal studies.

- **Hepatic Impairment** Manufacturer advises caution if bilirubin greater than 3 times upper limit of normal range or if transaminases equal to or greater than 5 times upper limit of normal range (limited information available).

- **Monitoring Requirements**
  - Manufacturer advises monitor liver function tests and thyroid function prior to initiation of treatment and before each dose.
  - Manufacturer advises monitor for signs or symptoms of immune-related side-effects and gastrointestinal perforation—consult product literature.

- **Directions for Administration** Manufacturer advises for intravenous infusion, give undiluted or dilute to a concentration of 1–4 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 90 minutes.

- **Prescribing and Dispensing Information** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

- **Handling and Storage** Manufacturer advises store in a refrigerator (2–8 °C) and protect from light—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

**National Funding/Access Decisions**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2094

The Scottish Medicines Consortium has advised (October 2018) that ipilimumab (Yervoy®) is accepted for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adolescents 12 years of age and older. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3604

The All Wales Medicines Strategy Group has advised (November 2018) that ipilimumab (Yervoy®) is recommended as an option for use within NHS Wales as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adolescents 12 to 17 years of age. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

**Medicinal Forms** There can be variation in the licensing of different medicines containing the same drug.

**Solution for Infusion**

Electrolytes: May contain Sodium

- **Yervoy** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Ipilimumab 5 mg per 1 ml

Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial £3,750.00 (Hospital only)

Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial £15,000.00 (Hospital only)
Anti-lymphocyte monoclonal antibodies

**DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

**IMPORTANT SAFETY INFORMATION**
All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

**SIDE-EFFECTS**
- **Common or very common** Alopecia, anaemia, arthralgia, asthenia, back pain, constipation, depression, diarrhoea, fever, headache, hypersensitivity (discontinue permanently), hypertension, increased risk of infection, infusion related reaction, leukopenia, myocardial infarction, neutropenia, night sweats, thrombocytopenia, vomiting.
- **Uncommon** Progressive multifocal leukoencephalopathy (PML).
- **Frequency not known** Anaphylactic reaction.

**INFUSION-RELATED SIDE-EFFECTS** In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

**Cytokine release syndrome** Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

**PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

**CAUTIONS, FURTHER INFORMATION** For full details on cautions, consult product literature or local treatment protocol.

- Hepatitis B infection and reactivation. Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Angioedema, anxiety, appetite decreased, arthralgia, bone marrow disorders, bursitis, cancer pain, cardiac disorder, chest pain, chills, conjunctivitis, cough aggravated, dizziness, dysphagia, dyspnoea, ear pain, gastrointestinal discomfort, gastrintestinal disorders, hepatitis B, hypercholesterolaemia, hyperglycaemia, hyperhidrosis, hypocalcaemia, hypotension, insomnia, lamination disorder, malaise, migraine, multi organ failure, muscle tone increased, myalgia, nausea, nerve disorders, oedema, oral disorders, oropharyngeal pain, osteoarthritis, pain, respiratory disorders, sensation abnormal, sepsis, skin reactions, throat irritation, tinnitus, vasodilatation, weight decreased.
  - **Uncommon** Asthma, coagulation disorder, haemolytic anaemia, heart failure, hypoxia, ischaemic heart disease, lymphadenopathy, taste altered.
  - **Rare or very rare** Cytokine release syndrome, facial paralysis, hepatitis B reactivation, renal failure, Stevens-Johnson syndrome (discontinue), toxic epidermal necrolysis (discontinue), tumour lysis syndrome, vasculitis, vision disorders.
  - **Frequency not known** Hearing loss, hypogammaglobulinaemia, infective thrombosis, irritability, posterior reversible encephalopathy syndrome (PRES), psychiatric disorder, seizure, skin papilloma.

**INDICATIONS AND DOSE**
- Post-transplantation lymphoproliferative disease (under expert supervision).
- Non-Hodgkin’s lymphoma (under expert supervision).

**BY INTRAVENOUS INFUSION**
- Child: Patients should receive premedication before each dose (consult product literature for details) (consult local protocol).

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** History of cardiovascular disease; in adults exacerbation of angina, arthralgia, and heart failure have been reported; transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion).
Cytotoxic responsive malignancy

Cytotoxic drugs

Overview

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Cytotoxic drug handling guidelines

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Solution for infusion

EXCIPIENTS: May contain Polysorbates

MabThera (Roche Products Ltd)

Rituximab 10 mg per 1 ml MabThera 100mg/10ml concentrate for solution for infusion vials | 2 vial \( \text{POD} \) £346.25

MabThera 500mg/50ml concentrate for solution for infusion 1 vial \( \text{POD} \) £873.15

Rixathon (Sandoz Ltd)

Rituximab 10 mg per 1 ml Rixathon 100mg/10ml concentrate for solution for infusion vials | 2 vial \( \text{POD} \) £314.33 (Hospital only)

Rixathon 500mg/50ml concentrate for solution for infusion vials | 1 vial \( \text{POD} \) £785.84 (Hospital only) | 2 vial \( \text{POD} \) £1.571.67 (Hospital only)

Truxima (Napp Pharmaceuticals Ltd)

Rituximab 10 mg per 1 ml Truxima 100mg/10ml concentrate for solution for infusion vials | 2 vial \( \text{POD} \) £314.33

Truxima 500mg/50ml concentrate for solution for infusion vials | 1 vial \( \text{POD} \) £785.84

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from: Department of Health PO Box 777 London SE1 6XH Fax: 01623 724524 It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is co-ordinated by a multi-disciplinary team
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- Oral cytotoxic medicines should be dispensed with clear directions for use

Cytotoxic drugs: important safety information

Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Cytotoxic drug doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Cytotoxic drugs: effect on pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Alkylating drugs can have an adverse effect on gametogenesis, which may be reversible particularly in females. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy. Amenorrhoea may occur, which also may be reversible.

**Management of cytotoxic drug side-effects**

**Gastro-intestinal effects**
Management of gastrointestinal effects of cytotoxic drugs includes the use of antacids, H₂-receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

**Oral mucositis**
Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements can be used on the advice of the child’s dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia. Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole p. 389, is effective.

**Nausea and vomiting**
Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management. Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered, and to the individual’s susceptibility to emetogenic stimuli.

**Mildly emetogenic treatment**— fluorouracil, etoposide p. 569, low doses of methotrexate p. 563, the vinca alkaloids, and abdominal radiotherapy.

**Moderately emetogenic treatment**— carboplatin p. 567, doxorubicin hydrochloride p. 559, intermediate and low doses of cyclophosphamide p. 555, mitoxantrone p. 560, and high doses of methotrexate.

**Highly emetogenic treatment**— cisplatin p. 568, dacarbazine p. 556, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

**Prevention of acute symptoms**: For patients at low risk of emesis, pretreatment with a 5HT₁-receptor antagonist may be of benefit. For patients at high risk of emesis or when other treatment is inadequate, a 5HT₁-receptor antagonist is often highly effective. The addition of dexamethasone p. 455 and other anti-emetics may also be required.

**Prevention of delayed symptoms**: Dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide hydrochloride p. 269. Due to the risks of neurological side-effects, metoclopramide hydrochloride should only be used in children as a second-line option. The 5HT₁-receptor antagonists may have a role in preventing uncontrolled symptoms. Aprepitant p. 269 given in combination with a 5HT₁-receptor antagonist (with or without dexamethasone) is licensed for prevention of nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy.

**Prevention of anticipatory symptoms**: Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam p. 228 can be helpful for its amnesiac, sedative, and anxiolytic effects.

**Bone-marrow suppression**
All cytotoxic drugs except vincristine sulfate p. 570 and bleomycin p. 566 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan p. 557. Peripher al blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors; their use should be reserved for children who have previously experienced severe neutropenia.

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs. Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens. Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella-zoster immunoglobulin p. 796 is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella–zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin p. 796 should be given.

**Alopecia**
Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

**Long-term and delayed toxicity**
Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin hydrochloride or nephrotoxicity with cisplatin and ifosfamide p. 556). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.
Thromboembolism
Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Tumour lysis syndrome
Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non- Hodgkin’s lymphoma (especially if high grade and bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Treatment of cytotoxic drug side-effects
Hyperuricaemia
Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure.

Allopurinol p. 576 is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine p. 562 or azathioprine p. 536 should be reduced if allopurinol is given concomitantly.

Rasburicase p. 576 is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Methotrexate-induced mucositis and myelosuppression
Folinic acid p. 575 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’).

The calcium salt of levofoinic acid p. 575, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanogrammes/mL (100–200 nanomol/litre).

In the treatment of methotrexate p. 562 overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

Urothelial toxicity
Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 555 and ifosfamide p. 556; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna p. 574 reacts specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine.

Cytotoxic antibiotics
Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity.

Daunorubicin p. 558, doxorubicin hydrochloride p. 559, and epirubicin hydrochloride p. 560 are anthracycline antibiotics. Mitoxantrone p. 560 (mitozantrone) is an anthracycline derivative.

Epirubicin hydrochloride and mitoxantrone are considered less toxic than the other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

Vincadalkoids
The vincadalkoids, vindristine sulfate p. 569 and vincristine sulfate p. 570 are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

Antimetabolites
Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. Cytarabine p. 561, fludarabine phosphate p. 562, mercaptopurine p. 562, methotrexate, and tioguanine p. 566 are commonly used in paediatric chemotherapy.

Other antineoplastic drugs
Asparaginase
Asparaginase is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

### Busulfan

(Busulphan)

- **INDICATIONS AND DOSE**
  - Conditioning treatment before haematopoietic progenitor cell transplantation
    - By mouth, or by intravenous infusion
    - Child: (consult local protocol)
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
    - Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 551.

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 624: high dose (antiepileptic prophylaxis required) - history of seizures (antiepileptic prophylaxis required) - ineffective once in blast crisis phase - previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) - previous radiation therapy (increased risk of hepatic veno-occlusive disease) - risk of second malignancy - three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

- **INTERACTIONS**
  - Appendix 1: alkylating agents

- **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**

  > Common or very common
    - Alopecia - diarrhoea - hepatic disorders - nausea - respiratory disorders - sinusoidal obstruction syndrome - skin reactions - thrombocytopenia - vomiting
Monitor full blood count regularly throughout treatment.

**MEDICINAL FORMS**

- **Busulfan (Non-proprietary)**
  - Busulfan 2 mg | 25 tablet [PO] £69.02 DT + £69.02

**HEPATIC IMPAIRMENT**

- With intravenous use Anaemia • appetite decreased • arrhythmias • ascites • jaundice • cardiomegaly • chest pain • confusion • constipation • cough • depression • diziness • dyspnoea • dysuria • electrolyte imbalance • embolism and thrombosis • fever • gastrointestinal discomfort • haemorrhage • headache • hiccups • hyperglycaemia • hypokalaemia • hypertension • hypoalbuminaemia • hypotension • increased risk of infection • insomnia • mucositis • myalgia • nervous system disorder • neutropenia • oedema • pain • pancytopenia • pericardial effusion • pericarditis • reactivation of infections • renal disorder • renal impairment • stomatitis • vasodilatation • weight increased
- uncommon
- with oral use Amnorrhea (may be reversible) • bone marrow disorders • cardiovascular disorder • delayed puberty • hyperbilirubinaemia • infertility male • leucopenia • leukaemia • menopausal disorders • oral disorders • ovarian and fallopian tube disorders • testicular atrophy
- uncommon
- with intravenous use Capillary leak syndrome • delirium • encephalopathy • hallucination • hypoxia • intracranial haemorrhage
- rare or very rare
- with oral use Dry mouth • erythema nodosum • gynaecomastia • myasthenia gravis • radiation injury • Sjögren’s syndrome
- frequency not known
- with intravenous use Hypogonadism • ovarian failure • premature menopause • sepsis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Lung toxicity
  - Discontinue if lung toxicity develops.
- Secondary malignancy
  - Use of busulfan is associated with an increased incidence of secondary malignancy.
- Fluid retention
  - Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

**CONCEPTION AND CONTRACEPTION**

- Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.
- PREGNANCY
  - Avoid (teratogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.
- Lactation
  - Discontinue breast-feeding.
- Hepatic Impairment
  - Manufacturer advises caution.

**MEDITICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

- **Busulfan**
  - Busulfan 2 mg | 25 tablet [PO] £69.02 DT + £69.02

**Solution for infusion**

- **Busulfan (Non-proprietary)**
  - Busulfan 6 mg per 1 ml Busulfan 60mg/10ml concentrate for solution for infusion vials | 8 vial [PHS] £1.529.50–£2.054.80 (Hospital only)
  - Busilvex (Pierre Fabre Ltd)
  - Busulfan 6 mg per 1 ml Busulfan 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule [PHS] £1.610.00 (Hospital only)

**Chlorambucil**

- **INDICATIONS AND DOSE**
  - Hodgkin’s disease | Non-Hodgkin’s lymphoma
  - BY MOUTH
  - Child: (consult local protocol)

- **SIDE-EFFECTS**
  - Common or very common Anaemia • bone marrow disorders • diarrhoea • gastrointestinal disorder • leucopenia • neoplasms • neutropenia • oral ulceration • seizures • thrombocytopenia • vomiting
  - uncommon
  - rare or very rare Cystitis • fever • hepatic disorders • movement disorders • muscle twitching • peripheral neuropathy • respiratory disorders • severe cutaneous adverse reactions (SCARs) • tremor
  - frequency not known
  - SIDE-EFFECTS, FURTHER INFORMATION
    - Secondary malignancy
      - Use of chlorambucil is associated with an increased incidence of acute leukaemia, particularly with prolonged use.
    - Skin reactions
      - Manufacturer advises assessing continued use if rash occurs—has been reported to progress to Stevens-Johnson syndrome and toxic epidermal necrolysis.
    - Fluid retention
      - Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
  - CONCEPTION AND CONTRACEPTION
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.
  - PREGNANCY
    - Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.
  - Lactation
    - Discontinue breast-feeding.
  - Hepatic Impairment
    - Manufacturer advises caution—monitor for signs and symptoms of toxicity.
  - Dose adjustments
    - Manufacturer advises consider dose reduction in severe impairment—limited information available.
  - MONITORING REQUIREMENTS
    - Monitor full blood count regularly throughout treatment.
Cytotoxic responsive malignancy 555

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Chlorambucil for nephrotic syndrome www.medicinesforchildren.org.uk/chlorambucil-nephrotic-syndrome-0

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Chlorambucil (Non-proprietary)
  Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet PSt £42.87 DT = £42.87

INDICATIONS AND DOSE
Acute lymphoblastic leukaemia, non-Hodgkin’s lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis
- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

Stomatose-sensitive nephrotic syndrome
- BY MOUTH
- Child 3 months-17 years: 2–3 mg/kg daily for 8 weeks
- BY INTRAVENOUS INFUSION
- Child 3 months-17 years: 500 mg/m² once a month for 6 months

UNLICENSED USE
Not licensed for use in children.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 551.

CONTRA-INDICATIONS
Haemorrhagic cystitis

CAUTIONS
Avoid in Acute porphyrias p. 624, diabetes mellitus - previous or concurrent medistinal irradiation — risk of cardiotoxicity

INTERACTIONS
- Appendix 1: alkylating agents

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
Common or very common
- Agranulocytosis - alopecia - anaemia - asthenia - bone marrow disorders - cystitis - decreased leucocytes - fever - haemolytic uraemic syndrome - haemorrhage - hepatic disorders - immunosuppression - increased risk of infection - mucosal abnormalities - neutropenia - progressive multifocal leukoencephalopathy (PML) - reactivation of infections - sperm abnormalities - thrombocytopenia

Uncommon
- Appetite decreased - embolism and thrombosis - flushing - hypersensitivity - ovarian and fallopian tube disorders - sepsis

RARE or very rare

Frequency not known

SPECIFIC SIDE-EFFECTS
- With intravenous use: Infusion site necrosis - injection site necrosis

SIDE-EFFECTS, FURTHER INFORMATION
Haemorrhagic cystitis
- A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication that may be prevented by increasing fluid intake for 24–48 hours after intravenous injection. Mesna can also help prevent cystitis.

Secondary malignancy
- As with all cytotoxic therapy, treatment with cyclophosphamide is associated with an increased incidence of secondary malignancies.

Fluid retention
- Alkylating drugs can cause fluid retention with oedema and dilutional hyponaetraemia in younger children; the risk of this complication is higher in the first 2 days and also with concomitant vinca alkaloids.

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

PREGNANCY
Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING
Discontinue breast-feeding during and for 36 hours after stopping treatment.

HEPATIC IMPAIRMENT
Manufacturer advises caution (risk of decreased cyclophosphamide activation and increased risk of veno-occlusive liver disease).

Dose adjustments
Manufacturer advises consider dose adjustment in severe impairment—consult product literature.

RENAL IMPAIRMENT
Dose adjustments
Reduce dose—consult local treatment protocol for details.

DIRECTIONS FOR ADMINISTRATION
Consult local treatment protocol for details.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Cyclophosphamide for nephrotic syndrome www.medicinesforchildren.org.uk/cyclophosphamide-nephrotic-syndrome-0

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

Tablet
CAUTIONARY AND ADVISORY LABELS 25, 27
- Cyclophosphamide (Non-proprietary)
  Cyclophosphamide (as Cyclophosphamide monohydrate)
  50 mg Cyclophosphamide 50mg tablets | 100 tablet PSt £139.00 DT = £139.00
- Cytoxan (Imported (United States))
  Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet PSt £

Powder for solution for injection
- Cyclophosphamide (Non-proprietary)
  Cyclophosphamide (as Cyclophosphamide monohydrate)
  500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial PSt £9.66 (Hospital only) | 1 vial PSt £9.66
  1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial PSt £17.06 (Hospital only) | 1 vial PSt £17.06

Cytoxan (as Cyclophosphamide monohydrate)
  1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial PSt £34.12 (Hospital only)
Dacarbazine

- **INDICATIONS AND DOSE**
  - Hodgkin's disease | Paediatric solid tumours
  - By intravenous injection, or by intravenous infusion
  - Child: consult local protocol

- **CAUTIONS**
  - Caution in handling—irritant to tissues

- **INTERACTIONS**
  - Appendix 1: alkylating agents

- **SIDE-EFFECTS**
  - Common or very common
    - Anaemia
    - Appetite decreased
    - Leucopenia
    - Nausea
    - Photosensitivity reaction
  - Rare or very rare
    - Agranulocytosis
    - Confusion
    - Diarrhoea
    - Photosensitivity reaction
    - Seizure
    - Visual impairment

- **CONCEPTION AND CONTRAINDICATIONS**
  - Ensure effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **PREGNANCY**
  - Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Avoid in severe impairment.
  - Dose reduction may be required in combined renal and hepatic impairment.

- **RENAL IMPAIRMENT**
  - Avoid in severe impairment.
  - Dose reduction may be required in combined renal and hepatic impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dacarbazine is a component of a commonly used combination for Hodgkin’s disease (ABVD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - Dacarbazine (Non-proprietary)
    - Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial (POD) £37.50
    - Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial (POD) £70.00
  - **Powder for solution for injection**
    - Dacarbazine (Non-proprietary)
      - Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial (POD) £90.00
      - Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial (POD) £160.00

Ifosfamide

- **INDICATIONS AND DOSE**
  - Rhabdomyosarcoma | Soft-tissue sarcomas | Ewing tumour | Germ cell tumour | Osteogenic sarcoma
  - By intravenous infusion
  - Child: consult local protocol

- **CONTRA-INDICATIONS**
  - Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage

- **CAUTIONS**
  - Avoid in acute porphyrias p. 624

- **INTERACTIONS**
  - Appendix 1: alkylating agents

- **SIDE-EFFECTS**
  - Common or very common
    - Alopecia
    - Appetite decreased
    - Bone marrow disorders
    - Haemorrhage
    - Hepatic disorders
    - Infection
    - Leucopenia
    - Nausea
    - Reactivation of infection
    - Renal impairment
    - Thrombocytopenia
    - Vomiting
  - Uncommon
    - Cardiotoxicity
    - Diarrhoea
    - Hypotension
    - Oral disorders
  - Rare or very rare
    - Skin reactions

  - Sepsis
  - Severe cutaneous adverse reactions (SCARs)
  - SIADH
  - Sinusoidal obstruction syndrome
  - Sperm abnormalities
  - Stomatitis
  - Tumour lysis syndrome
  - Urinary disorders
  - Vascularitis
  - Vertigo
  - Visual impairment

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Urothelial toxicity
  - Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

  **Secondary malignancy**
  - Use of ifosfamide is associated with an increased incidence of acute leukaemia.

  **Fluid retention**
  - Alkylation drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRAINDICATIONS**
  - Manufacturer advises avoid adequate contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **PREGNANCY**
  - Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid.

- **RENAL IMPAIRMENT**
  - Avoid.

- **MONITORING REQUIREMENTS**
  - Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for injection**
  - Ifosfamide (Non-proprietary)
    - Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial (POD) £115.79–£119.27
    - Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial (POD) £228.09–£234.94
Melphalan

- **INDICATIONS AND DOSE**
  
  High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours
  
  - BY INTRAVENOUS INFUSION
  - Child: (consult local protocol)

- **UNLICENSED USE**
  
  Not licensed for use in embryonal tumours.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 551.

- **CAUTIONS**
  
  Consider use of prophylactic anti-infective agents - for high-dose intravenous administration establish adequate hydration - haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details)

- **INTERACTIONS**
  
  → Appendix 1: alkylating agents

- **SIDE-EFFECTS**

  - Common or very common
    

  - Rare or very rare
    
    Haemolytic anaemia - hepatic disorders - peripheral vascular disease - respiratory disorders - skin reactions

  **SIDE-EFFECTS, FURTHER INFORMATION**

  **Secondary malignancy** Use of melphalan is associated with an increased incidence of acute leukaemias.

  **Fluid retention** Alkylating drugs can cause fluid retention with oedema and dilutional hypovolaemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

  **CONCEPTION AND CONTRACEPTION**

  Manufacturer advises adequate contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

  **PREGNANCY**

  Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

  **BREAST FEEDING**

  Discontinue breast-feeding.

  **RENAL IMPAIRMENT**

  Dose adjustments Reduce dose initially (consult product literature).

  **MONITORING REQUIREMENTS**

  Monitor full blood count before and throughout treatment.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Powder and solvent for solution for injection**

  - Melphalan (Non-proprietary)
    
    Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial £137.37

---

Temozolomide

- **DRUG ACTION**

  Temozolomide is structurally related to dacarbazine.

- **INDICATIONS AND DOSE**

  Treatment of recurrent or progressive malignant glioma

  - BY MOUTH
    
    Child 3-17 years: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 551.

- **CAUTIONS**

  Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements

- **INTERACTIONS**

  → Appendix 1: alkylating agents

- **SIDE-EFFECTS**

  - Common or very common
    

  - Rare or very rare
    
    Neoplasms - respiratory disorders - secondary malignancy - severe cutaneous adverse reactions (SCARs), including Steven-Johnson syndrome and toxic epidermal necrolysis

  **CONCEPTION AND CONTRACEPTION**

  Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

  **PREGNANCY**

  Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

  **BREAST FEEDING**

  Discontinue breast-feeding.

  **HEPATIC IMPAIRMENT**

  Manufacturer advises caution in severe impairment (no information available).

  **RENAL IMPAIRMENT**

  Manufacturer advises caution — no information available.

- **MONITORING REQUIREMENTS**

  → Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles — consider the balance of benefits and risks of treatment if results are abnormal at any point (fetal liver injury reported).

  → Monitor for myelodysplastic syndrome.

  → Monitor for secondary malignancies.

### SIDE-EFFECTS, FURTHER INFORMATION
Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

### CONCEPTION AND CONCEPTION
Contraceptive advice required; see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

### PREGNANCY
Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

### ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

#### Daunorubicin

**31-Jul-2018**

### INDICATIONS AND DOSE
- Acute myelogenous leukaemia
- Acute lymphocytic leukaemia

### BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

### CONTRA-INDICATIONS
- Cardiotoxicity is potentially severe. Avoid in children.

### CAUTIONS
- Avoid in children.
- Avoid in severe heart failure.
- Avoid in severe arrhythmia.

### INTERACTIONS
- Appendix 1: anthracyclines
- Appendix 1: anthracyclines

### SIDE-EFFECTS
- Abdominal pain
- Alopecia
- Amnionrrhoea
- Anemia
- Arrhythmias
- Ascites
- Atroventricular block
- Azoospermia
- Bone marrow disorders
- Cardiac inflammation
- Cardiomyopathy
- Chills
- Congestive heart failure
- Cytosis
- Death
- Dehydration
- Diarrhoea
- Dysphoria
- Extravasation necrosis
- Fever
- Flushing
- Gastrointestinal disorders
- Haemorrhage
- Hepatomegaly
- Hyperpyrexia
- Hyperuricaemia
- Hypoxia
- Infection
- Ischaemic heart disease
- Leucopenia
- Mucositis
- Myocardial infarction
- Nail discoloration
- Nausea
- Nephropathy
- Neutropenia
- Oedema
- Pain
- Paraesthesia
- Pleural effusion
- Radiation injuries
- Shock
- Skin reactions
- Stomatitis
- Thrombocytopenia
- Thrombophlebitis
- Urine red
- Venous sclerosis
- Vomiting

### SIDE-EFFECTS, FURTHER INFORMATION
Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

### CONCEPTION AND CONCEPTION
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

### PREGNANCY
Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

### BREAST FEEDING
Discontinue breast-feeding.

### HEPATIC IMPAIRMENT
For solution for infusion manufacturer advises caution. For powder for solution for infusion manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
Dose adjustments  Manufacturer advises dose reduction according to serum bilirubin concentration—consult product literature.

**RENAL IMPAIRMENT**  Avoid in severe impairment.

Dose adjustments  Reduce dose—consult local treatment protocol for details.

**MONITORING REQUIREMENTS**
- Cardiac monitoring essential.
- Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

- **Daunoxome** (Galen Ltd)
  Daunorubicin (as Daunorubicin hydrochloride citrate liposomal pegylated) 2 mg per 1 ml Daunoxome 50mg/25ml concentrate for solution for infusion vials  |  1 vial  | £20.00

- **Powder for solution for infusion**
  Daunorubicin (Non-proprietary)
  Daunorubicin (as Daunorubicin hydrochloride) 20 mg Daunorubicin 20mg powder for solution for infusion vials  |  10 vial  | £17.50  (Hospital only)

### Doxorubicin hydrochloride

**INDICATIONS AND DOSE**
- Some paediatric malignancies  Ewing’s sarcoma  Osteogenic sarcoma  Wilm’s tumour  Neuroblastoma  Retinoblastoma  Some liver tumours  Acute lymphoblastic leukaemia  Hodgkin’s lymphoma  Non-Hodgkin’s lymphoma

**CONTRA-INDICATIONS**
- Acute inflammatory heart disease
- Consult product literature
- Increased haemorrhagic tendency
- Marked persisting myelosuppression induced by previous treatment
- Marked persisting stomatitis induced by previous treatment
- Previous myocardial infarction
- Previous treatment with maximum cumulative doses of doxorubicin
- Previous treatment with maximum cumulative doses of other anthracycline
- Severe arrhythmia
- Severe myocardial insufficiency

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

**CAUTIONS**
- Caution in handling—irritant to tissues—consult product literature

**INTERACTIONS**
- Appendix 1: anthracyclines

**SIDE-EFFECTS**
- **Common or very common**
  - Alopecia
  - Anaemia
  - Anxiety
  - Appetite decreased
  - Arthralgia
  - Asthenia
  - Bone marrow depression
  - Breast pain
  - Cachexia
  - Cardiovascular disorder
  - Chest discomfort
  - Chills
  - Constipation
  - Cough
  - Decreased leucocytes
  - Dehydration
  - Depression
  - Diarrhoea
  - Dizziness
  - Dry mouth
  - Dysphagia
  - Dyspnoea
  - Dysuria
  - Electrolyte imbalance
  - Epistaxis
  - Eye inflammation
  - Fever
  - Gastrointestinal discomfort
  - Gastrointestinal disorders
  - Headache
  - Hyperhidrosis
  - Hypersensitivity
  - Hypertension
  - Hyperthermia
  - Hypotension
  - Increased risk of infection
  - Influenza like illness
  - Infusion related reaction
  - Insomnia
  - Malaise
  - Mucosal abnormalities
  - Muscle complaints
  - Muscle tone increased
  - Muscle weakness
  - Nail disorder
  - Nausea
  - Nerve disorders
  - Neutropenia
  - Oedema
  - Oral disorders
  - Pain
  - Pruritus
  - Rashes
  - Recurrent infections
  - Renal failure
  - Reversal of radiation
  - Secondary malignancy
  - Sepsis
  - Skin complaints
  - Skin ulcer
  - Syncope
  - Taste altered
  - Thrombocytopenia
  - Vasodilation
  - Vision blurred
  - Vomiting
  - Weight decreased

- **Uncommon**
  - Confusion
  - Embolism
  - Thrombosis

- **Rare or very rare**
  - Secondary oral neoplasms
  - Secondary cutaneous adverse reactions (SCARs)

- **Frequency not known**
  - Asthma
  - Congestive heart failure
  - Secondary malignancy
  - Throat tightness

**SIDE-EFFECTS, FURTHER INFORMATION**
- Extravasation can cause tissue necrosis.

**Cardiotoxicity**
- All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

**CONCEPTION AND CONTRACEPTION**
- Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**
- Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- For solution for injection or infusion, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**Dose adjustments**
- Manufacturer advises dose reduction according to bilirubin concentration.

**RENAL IMPAIRMENT**
- Consult product literature in severe impairment.

**MONITORING REQUIREMENTS**
- Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Doxorubicin hydrochloride (Non-proprietary)**
  Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 10mg/5ml solution for injection vials  |  1 vial  | £18.54  (Hospital only)
  Doxorubicin 50mg/25ml solution for injection Cytosafe vials  |  1 vial  | £103.00  (Hospital only)
  Doxorubicin 50mg/25ml solution for infusion vials  |  1 vial  | £103.00  (Hospital only)
  Doxorubicin 10mg/5ml solution for injection Cytosafe vials  |  1 vial  | £20.60  (Hospital only)
  Doxorubicin 10mg/5ml concentrate for solution for infusion vials  |  1 vial  | £113.12  (Hospital only)  |  1 vial  | £113.57
  Doxorubicin 10mg/5ml concentrate for solution for infusion vials  |  1 vial  | £20.60  (Hospital only)  |  1 vial  | £20.60  (Hospital only)
  Doxorubicin 50mg/25ml solution for injection vials  |  1 vial  | £92.70  (Hospital only)
  Doxorubicin 50mg/25ml concentrate for solution for infusion vials  |  1 vial  | £61.41  (Hospital only)  |  1 vial  | £97.85

**Solution for infusion**

- **Doxorubicin hydrochloride (Non-proprietary)**
  Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 200mg/100ml solution for infusion vials  |  1 vial  | £412.00  (Hospital only)
  Doxorubicin 20mg/10ml concentrate for solution for infusion vials  |  1 vial  | £412.00  (Hospital only)
  Doxorubicin 100mg/50ml concentrate for solution for infusion vials  |  1 vial  | £412.00  (Hospital only)
  Doxorubicin 200mg/100ml solution for injection Cytosafe vials  |  1 vial  | £412.00  (Hospital only)
  Doxorubicin 200mg/100ml concentrate for solution for infusion vials  |  1 vial  | £360.23

**Powder and solvent for suspension for infusion**
- Electrolytes: May contain Sodium
- **Myocet** (Teva UK Ltd)
  Doxorubicin hydrochloride liposomal pegylated 50 mg Myocet 50mg powder and solvent for suspension for infusion vials  |  2 vial  | £912.26  (Hospital only)
Epirubicin hydrochloride

- **INDICATIONS AND DOSE**
  - Recurrent acute lymphoblastic leukaemia | Rhabdomyosarcoma | Other soft-tissue tumours of childhood
  - **BY INTRAVENOUS INFUSION**
    - Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS**
  - Bladder infection or contraction (when used as a bladder instillation), catheterisation difficulties (when used as a bladder instillation), haematuria (when used as a bladder instillation), invasive tumours penetrating the bladder (when used as a bladder instillation), myocardopathy, previous treatment with maximum cumulative doses of epirubicin or other anthracycline, recent myocardial infarction, severe arrhythmia, severe myocardial insufficiency, unstable angina, urinary tract infections (when used as a bladder instillation).
- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.
- **CAUTIONS**
  - Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
  - Common or very common
    - Alopecia, anaemia, appetite decreased, bone marrow depression, dehydration, diarrhoea, increased risk of infection, leucopenia, mucositis, nausea, neutropenia, oesophagitis, stomatitis, urea red, vasodilation, vomiting.
  - Uncommon
    - Embolism and thrombosis, thrombocytopenia.
  - Rare or very rare
    - Anaemia, arthralgias, ascites, anemia, azoospermia, cardiac conduction disorders, cardiomypathy, cardiotoxicity, chills, congestive heart failure, dizziness, dyspnoea, fever, hepatitis, hyperuricaemia, malaise, neuropsychia, oedema, pleural effusion, pulmonary oedema, skin reactions.
  - Frequency not known
    - Eye inflammation, haemorrhage, hypoxia, nail discoulouration, paraphysaemia, photosensitivity reaction, radiation injuries, shock, urinary frequency increased.
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Cardiotoxicity: All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
  - Cumulative doses of other anthracyline: Epirubicin is considered less toxic than other anthracyline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.
- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.
- **PREGNANCY**
  - Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.
- **BREAST FEEDING**
  - Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  - Dose adjustments
    - In adults, manufacturer advises dose reduction according to bilirubin level.
- **RENAL IMPAIRMENT**
  - Dose adjustments
    - Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
  - Cardiac toxicity: Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion
- **Solution for injection**
  - Epirubicin hydrochloride (Non-proprietary)
    - Pharmorubicin (Pfizer Ltd)
      - Epirubicin hydrochloride 2 mg per 1 ml
        - Solution for injection vials | 1 vial £106.19 (Hospital only)
        - Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial £21.24 (Hospital only)
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Pharmorubicin 200mg/100ml solution for infusion vials | 1 vial £366.85
    - Pharmorubicin 100mg/50ml solution for infusion vials | 1 vial £201.76
    - Pharmorubicin (Pfizer Ltd)
      - Epirubicin hydrochloride 2 mg per 1 ml
        - Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial £386.16 (Hospital only)

Mitoxantrone

- **INDICATIONS AND DOSE**
  - Acute myeloid leukaemia | Recurrent acute lymphoblastic leukaemia
  - **BY INTRAVENOUS INFUSION**
    - Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS**
- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
  - Abdominal pain, acute leukaemia, alopecia, amenorrhoea, anxiety, appetite decreased, arthralgia, ascites, anemia, azoospermia, bone marrow depression, cancer, confusion, constipation, cough, dizziness, dyspnoea, fever, gastrointestinal haemorrhage, heart attack, mucositis, nail discoulouration, nail dystrophy, nausea, neurological effects, paraesthesia, scleral discoulouration, skin discoulouration, stomatitis, thrombocytopenia, uric acid, vomiting.
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY**
  - Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.
- **BREAST FEEDING**
  - Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (limited information available).
  - Dose adjustments
    - Manufacturer advises consider dose reduction.
- **MONITORING REQUIREMENTS**
  - Cardiac toxicity: Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.
Cytotoxic responsive malignancy  561

Cytarabine

• **DRUG ACTION**  Cytarabine acts by interfering with pyrimidine synthesis.

• **INDICATIONS AND DOSE**  
  - Acute lymphoblastic leukaemia  
  - Acute myeloid leukaemia  
  - Non-Hodgkin’s lymphoma
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - Child: (consult local protocol)

• **UNLICENSED USE**  DepoCyt® intrathecal injection not licensed for use in children.

— **IMPORTANT SAFETY INFORMATION**  Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

• **INTERACTIONS**  → Appendix 1: cytarabine

• **SIDE-EFFECTS**
  - **Common or very common**  Alopecia - anaemia - appetite decreased - consciousness impaired - diarrhoea - dysphagia - eye disorders - eye inflammation - eye stinging - fever - gastrointestinal discomfort - gastrointestinal disorders - haemorrhagic conjunctivitis (consider prophylactic corticosteroid eye drops) - hyperuricaemia - leucopenia - nausea - oral disorders - renal impairment - skin reactions - thrombocytopenia - urinary retention - vasculitis - vision disorders - vomiting
  - **Uncommon**  Arthralgia - dyspnoea - headache - increased risk of infection - myalgia - nerve disorders - pain - paranoid disorders - periarteritis nodosa - peripheral neuropathy - psychiatric disorder - renal impairment - respiratory disorders - sepsis - sinusoidal obstruction syndrome - skin reactions - systemic inflammatory response syndrome - tachycardia - tremor - tumour lysis syndrome - vomiting - weight decreased
  - **Frequency not known**  Antibiotic associated colitis - gastrointestinal disorders - hypomagnesaemia - pancreatitis - severe cutaneous adverse reactions (SCARs)

• **CONCEPTION AND CONTRACEPTION**  Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

• **PREGNANCY**  Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

• **BREAST FEEDING**  Discontinue breast-feeding.

• **HEPATIC IMPAIRMENT**  Dose adjustments  Reduce dose—consult product literature.

• **RENAL IMPAIRMENT**  Consult local treatment protocols.

• **MONITORING REQUIREMENTS**  Haematological monitoring  Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

• **PRESCRIBING AND DISPENSING INFORMATION**  Dose is based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults.

• **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyte®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.
Fludarabine phosphate

**INDICATIONS AND DOSE**

- Poor prognosis or relapsed acute myeloid leukaemia
- Relapsed acute lymphoblastic leukaemia | Conditioning before bone marrow transplantation
  - By mouth, or by intravenous injection, or by intravenous infusion
  - Child: (consult local protocol)

**UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 551.

**CONTRA-INDICATIONS** Haemolytic anaemia

**CAUTIONS** Increased susceptibility to skin cancer - worsening of existing skin cancer

**CAUTIONS, FURTHER INFORMATION**

- Immunosuppression: Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

**INTERACTIONS** Appendix 1: fludarabine

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common: Anaemia - appetite decreased - asthenia - bone marrow depression (may be cumulative) - chills - cough - diarrhoea - fever - increased risk of infection - malaise - mucositis - nausea - neutropenia - oedema - stomatitis - thrombocytopenia - vision disorders - vomiting

- Uncommon: Autoimmune disorder - confusion - haemorrhage - tumour lysis syndrome

**SPECIAL SIDE-EFFECTS**

- Rare or very rare: Agitation - arrhythmia - coma - heart failure - seizure - severe cutaneous adverse reactions (SCARs)

**CONCESSION AND CONTRAINDICATION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**BREAST FEEDING** Discontinue breast-feeding.

**RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute/1.73 m².

**Dose adjustments** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor for signs of haemolysis.
- Monitor for neurological toxicity.

**DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**SOLUTION FOR INJECTION**

- Cytarabine (Non-proprietary)
  - Fludarabine phosphate 20 mg per 1 ml: Cytarabine 100mg/5ml solution for injection Cytosafe vials | 5 vial (POD) £20.48 (Hospital only)
  - Cytarabine 500mg/25ml solution for injection vials | 1 vial (POD) £13.50
  - Cytarabine 100mg/5ml solution for injection vials | 5 vial (POD) £30.00 (Hospital only) | 5 vial (POD) £20.98
  - Cytarabine 500mg/25ml solution for injection Cytosafe vials | 1 vial (POD) £19.50 (Hospital only)

- Cytarabine 100 mg per 1 ml: Cytarabine 1g/10ml solution for injection Cytosafe vials | 1 vial (POD) £30.00 (Hospital only) | 1 vial (POD) £40.00–£49.78 (Hospital only) | 1 vial (POD) £37.05–£39.00
  - Cytarabine 1g/10ml solution for injection vials | 1 vial (POD) £40.00–£49.78 (Hospital only) | 1 vial (POD) £37.05–£39.00
  - Cytarabine 500mg/5ml solution for injection vials | 5 vial (POD) £100.00 (Hospital only) | 5 vial (POD) £83.78
  - Cytarabine 100mg/1ml solution for injection vials | 5 vial (POD) £26.93

- Cytarabine liposomal pegylated 10 mg per 1 ml: DepoCyte
  - 50mg/5ml suspension for injection vials | 1 vial (POD) £1,223.75 (Hospital only)

**MERCATORPURINE**

**INDICATIONS AND DOSE**

- Severe ulcerative colitis | Severe Crohn’s disease
  - By mouth
  - Child 2-17 years: Initially 1–1.5 mg/kg once daily (max. per dose 50 mg), then increased if necessary up to 75 mg once daily

**ACUTE LYMPHOBlastic LEUKAEMIA | LYMPHOMAS**

- By mouth
  - Child: (consult local protocol)
DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

DOSE EQUIVALENCE AND CONVERSION
- Mercaptopurine tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

UNLICENSED USE
- Not licensed for use in severe ulcerative colitis and Crohn’s disease.
- Not licensed for use in children for acute lymphoblastic lymphoma or T-cell non-Hodgkins lymphoma.

IMPORTANT SAFETY INFORMATION
SAFE PRACTICE
Mercaptopurine has been confused with mercaptamide; care must be taken to ensure the correct drug is prescribed and dispensed.

RISKS OF INCORRECT DOING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 551.

CONTRA-INDICATIONS
- Absent thiopurine methyltransferase activity

CAUTIONS
- Reduced thiopurine methyltransferase activity

CAUTIONS, FURTHER INFORMATION
- Thiopurine methyltransferase. The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

INTERACTIONS
- Appendix 1: mercaptopurine

SIDE-EFFECTS
- Common or very common: Anaemia; appetite decreased; bone marrow depression; diarrhoea; hepatic disorders; hepatotoxicity (more common at high doses); leucopenia; nausea; oral disorders; thrombocytopenia; vomiting
- Uncommon: Arthralgia; fever; increased risk of infection; neutropenia; pancreatitis; rash
- Rare or very rare: Alopecia - face oedema; intestinal ulcer; neoplasms; oligozoospermia
- Frequency not known: Hypoglycaemia; photosensitivity reaction

CONCEPTION AND CONTRACEPTION
- Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

PREGNANCY
- Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING
- Discontinue breast-feeding

HEPATIC IMPAIRMENT
- Dose adjustments: May need dose reduction.

RENAL IMPAIRMENT
- Dose adjustments: Manufacturer advises consider reducing dose.

PRE-TREATMENT SCREENING
- Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.

MONITORING REQUIREMENTS
- Monitor liver function—discontinue if jaundice develops.
- When used for severe ulcerative colitis or severe Crohn’s disease: Monitor for toxicity throughout treatment. Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

METHOTREXATE

01-Feb-2019

Drug Action
- Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

INDICATIONS AND DOSE
Severe Crohn’s disease
- By subcutaneous injection, or by intramuscular injection
- Child 7-17 years: 15 mg/m² once weekly (max. per dose 25 mg)

Maintenance of remission of severe Crohn’s disease
- By mouth, or by subcutaneous injection, or by intramuscular injection
- Child 7-17 years: 15 mg/m² once weekly (max. per dose 25 mg), dose reduced according to response to lowest effective dose

Juvenile idiopathic arthritis | Juvenile dermatomyositis | Vasculitis | Uveitis | Systemic lupus erythematosus | Localised scleroderma | Sarcoidosis
- By mouth, or by subcutaneous injection, or by intramuscular injection
- Child: Initially 10–15 mg/m² once weekly, then increased if necessary up to 25 mg/m² once weekly

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma
- By mouth
- Child: (consult local protocol)

Treatment of early stage Burkitt’s lymphoma, non-Hodgkin’s lymphoma, osteosarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia
- By intravenous injection, or by intravenous infusion
- Child: (consult local protocol)

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia
- By intrathecal injection
- Child: (consult local protocol)

Severe psoriasis unresponsive to conventional therapy (specialist use only)
- By mouth
- Child 2-17 years: Initially 200 micrograms/kg once weekly (max. per dose 10 mg), then increased if necessary to 400 micrograms/kg once weekly (max. per dose 25 mg), adjusted according to response, stop treatment if inadequate response after 3 months at the optimum dose

UNLICENSED USE
- Methotrexate is licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic
arthritis; other preparations not licensed for use in children for non-malignant conditions.

**IMPORTANT SAFETY INFORMATION**

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:
- the child or their carer is carefully advised of the **dose** and frequency and the reason for taking methotrexate and any other prescribed medication (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**CONTRA-INDICATIONS** Active infection (in non-malignant conditions), ascites, immunodeficiency syndromes (in non-malignant conditions), significant pleural effusion.

**CAUTIONS** Photosensitivity—porokeratosis lesions aggravated by UV radiation (skin ulcers). extreme caution in blood disorders (avoid if severe), peptic ulceration, risk of accumulation in pleural effusion or ascites—drain before treatment. ulcerative colitis.

**SIDE-EFFECTS** Pulmonary toxicity. Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough, or fever develops; discontinue if pneumonia is suspected.

**INTERACTIONS** → Appendix 1: methotrexate

**SIDE-EFFECTS**
- Common or very common
  - With intrathecal use. Necrotising demyelinating leukoencephalopathy.
  - With oral use. Anaemia, appetite decreased, diarrhoea, drowsiness, fatigue, gastrointestinal discomfort, headache, increased risk of infection, leucopenia, nausea, oral disorders, respiratory disorders, skin reactions, throat ulcer, thrombocytopenia, vomiting.
  - With parental use. Anaemia, appetite decreased, chest pain, cough, diarrhoea, drowsiness, dysphagia, fatigue, fever, gastrointestinal discomfort, headache, leucopenia, malaise, nausea, oral disorders, respiratory disorders, skin reactions, throat complaints, thrombocytopenia, vomiting.
- Uncommon
  - With oral use. Agranulocytosis, alopecia, arthralgia, bone marrow disorders, chill, confusion, cystitis, depression, diabetes mellitus, dysuria, fever, gastrointestinal disorders, haemorrhage, healing impaired, hepatic disorders, myalgia, neutropenia, nephropathy, osteoporosis, photosensitivity reaction, rheumatoid arthritis aggravated, seizure, severe cutaneous adverse reactions (SCARs), vasculitis, vertigo, vulvovaginal disorders.
  - With parenteral use. Agranulocytosis, alopecia, arthralgia, bone marrow disorders, confusion, cystitis, depression, diabetes mellitus, drug toxicity, dysuria, gastrointestinal disorders, haemorrhage, healing impaired, hepatic disorders, increased risk of infection, lipotrophy, local reaction, myalgia, neutropenia, osteoporosis, pain, paraesthesia, photosensitivity reaction, rheumatoid arthritis aggravated, seizure, severe cutaneous adverse reactions (SCARs), sterile abscess, vasculitis, vertigo, vulvovaginal disorders.
  - Rare or very rare
  - With oral use. Azotaemia, brain oedema, cognitive impairment, conjunctivitis, cough, dyspnoea, eosinophilia, gynaecomastia, hypotension, immune deficiency, infertility, insomnia, lymphadenopathy, meningitis, musculoskeletal disorder, mood altered, muscle weakness, nail discoloration, neutropenia, oligozoospermia, pain, pancreatitis, paresis, pericardial disorders, pericarditis, proteinuria, psychosis, radiation injuries, renal impairment, retinopathy, sensation abnormal, sepis, sexual dysfunction, speech impairment, stress fracture, taste metallic, telangiectasia, tinnitus, visual impairment.
  - With parenteral use. Aponoea, asthma-like conditions, azotaemia, conjunctivitis, embolism and thrombosis, eosinophilia, gynaecomastia, hypotension, immune deficiency, infertility, influenza like illness, insomnia, lymphadenopathy, meningitis, musculoskeletal disorder, mood altered, muscle weakness, nail discoloration, necrosis, neutropenia, paralysis, pericardial disorders, pericarditis, proteinuria, reactivation of infection, renal impairment, retinopathy, sepis, sexual dysfunction, sperm abnormalities, stress fracture, taste altered, telangiectasia, vision disorders.
  - Frequency not known
  - With oral use. Encephalopathy.
  - With parenteral use. Aphasia, chill, cognitive disorder, defective oogenesis, dizziness, hemiparesis, leukoencephalopathy, metabolic change, mucusitis, nephropathy, pancreatitis, pulmonary oedema, skin ulcer, sudden death, tinnitus.

**SIDE-EFFECTS, FURTHER INFORMATION**

Give folic acid to reduce side-effects. Folic acid decreases mucosal and gastrointestinal side-effects of methotrexate and may prevent hepatotoxicity; there is no evidence of a reduction in haematological side-effects.

Withdraw treatment if ulcerative stomatitis develops—may be first sign of gastro-intestinal toxicity.

**TREATMENT**

Treatment with folinic acid (as calcium folinate) may be required in acute toxicity.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during and for at least 6 months after treatment in men and women.

**PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).

**BREAST FEEDING** Discontinue breast-feeding—present in milk.

**HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.

**RENAL IMPAIRMENT** Risk of nephrotoxicity at high doses. Avoid in severe impairment.

**DOSE ADJUSTMENTS** Reduce dose.

**PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.
Check immunity to varicella-zoster and consider vaccination before initiating therapy.

- **Monitoring requirements** Full blood count and liver function tests repeated fortnightly for at least the first 4 weeks of treatment and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests should be performed regularly during treatment.

- **Prescribing and dispensing information** Folinic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

- **Patient and carer advice** Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen.

Children and their carers should be counselled on the dose and use of NSAIAs.

Medicines for Children leaflet: Methotrexate for skin conditions www.medicinesforchildren.org.uk/methotrexate-skin-conditions

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

**Tablet**

- Methotrexate (Non-proprietary) Methotrexate 2.5 mg | 24 tablet | £1.52–£1.75 | 28 tablet | £3.82 DT + £1.77 | 100 tablet | £5.75–£14.10
- Methotrexate 10 mg | 100 tablet | £55.74 DT + £46.66
- Maxtrex (Pfizer Ltd) Methotrexate 2.5 mg | 24 tablet | £2.39
- Methotrexate 10 mg | 100 tablet | £9.96

**Solution for injection**

- Methotrexate (Non-proprietary) Methotrexate (as Methotrexate sodium) 2.5 mg per 1 ml Methotrexate 5mg/2ml solution for injection vials | 5 vial | £36.00 (Hospital only)
- Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 1g/40ml solution for injection vials | 1 vial | £1.452.55 (Hospital only) | 1 vial | £44.57
- Methotrexate 500mg/20ml solution for injection vials | 1 vial | £48.00–£72.62 (Hospital only) | 1 vial | £25.07
- Methotrexate 50mg/2ml solution for injection vials | 1 vial | £2.62–£72.63 | 5 vial | £35.00 (Hospital only)
- Methotrexate 200mg/8ml solution for injection vials | 1 vial | £10.02
- Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 1g/10ml solution for injection vials | 1 vial | £85.00 (Hospital only)
- Methofill (Accord Healthcare Ltd) Methotrexate 50 mg per 1 ml Methofill 12.5mg/0.25ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £14.34 DT + £14.35
- Methofill 22.5mg/0.45ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £16.10 DT + £16.11
- Methofill 30mg/0.6ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £16.55 DT + £16.56
- Methofill 27.5mg/0.55ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £16.49 DT + £16.50
- Methofill 7.5mg/0.15ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £12.86 DT + £12.87
- Methofill 20mg/0.4ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £16.85 DT + £16.86
- Methofill 10mg/0.2ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £13.25 DT + £13.26

Methofill 15mg/0.3ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £14.40 DT + £14.41
- Methofill 17.5mg/0.35ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £15.24 DT + £15.25
- Methofill 25mg/0.5ml solution for injection pre-filled injector | 1 pre-filled disposable injection | £16.12 DT + £16.13
- Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Methotrexate 2mg/mL oral solution for suspension-sugar-free-sugar-free-solution | 35 ml | £35.00 | 65 ml | £65.00
- Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Methotrexate 2mg/mL oral solution for suspension-sugar-free-sugar-free-solution | 35 ml | £35.00 | 65 ml | £65.00
- Jylano (Intrapharm Laboratories Ltd) Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Jylano 2mg/mL oral solution sugar-free | 60 ml | £12.50

**Solution for infusion**

- Methotrexate (Non-proprietary) Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 5g/200ml solution for infusion vials | 1 vial | £200.57
- Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial | £400.00 (Hospital only)

**Oral solution**

- Methotrexate (Non-proprietary) Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Methotrexate 2mg/mL oral solution for suspension-sugar-free-sugar-free-solution | 35 ml | £35.00 | 65 ml | £65.00
- Jylano (Intrapharm Laboratories Ltd) Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Jylano 2mg/mL oral solution sugar-free | 60 ml | £12.50
**Nelarabine**

- **INDICATIONS AND DOSE**
  T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens
  - BY INTRAVENOUS INFUSION
  - Child: (consult local protocol)

- **CAUTIONS**
  - Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity)
  - Previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

- **INTERACTIONS** → Appendix 1: nelarabine

- **SIDE-EFFECTS**
  - Common or very common
    - Anaemia
    - Arthralgia
    - Asthenia
    - Ataxia
    - Confusion
    - Constipation
    - Diarrhoea
    - Drowsiness
    - Electrolyte imbalance
    - Fever
    - Headache
    - Hyperbilirubinaemia
    - Hypoglycaemia
    - Increased risk of infection
    - Leucopenia
    - Nausea
    - Neutropenia
    - Pain in extremity
    - Peripheral neuropathy
    - Seizures
    - Sensation abnormal
    - Stomatitis
    - Thrombocytopenia
    - Tremor
    - Vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - If neurotoxicity occurs, treatment should be discontinued.

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises effective contraception during for at least 3 months after treatment in men and women.

- **PREGNANCY**
  - Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **MONITORING REQUIREMENTS**
  - Neurotoxicity
    - Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for infusion
    - ELECTROLYTES: may contain Sodium
      - Atriance (Novartis Pharmaceuticals UK Ltd) ▼
    - Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials 6 vial £1.332.00

- **ANTINEOPLASTIC DRUGS** → CYTOTOXIC

**Tioguanine**

*(Thioguanine)*

- **INDICATIONS AND DOSE**
  - Infant acute lymphoblastic leukaemia
    - **BY MOUTH**
    - Child: Can be given at various stages of treatment in short-term cycles (consult local protocol)

- **CONTRA-INDICATIONS**
  - Absent thiopurine methyltransferase activity

- **CAUTIONS**
  - Thiopurine methyltransferase status

- **CAUTIONS, FURTHER INFORMATION**
  - Thiopurine methyltransferase: The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
  - Long-term therapy
    - Long-term therapy is no longer recommended because of the high risk of liver toxicity.

- **INTERACTIONS** → Appendix 1: tioguanine

- **SIDE-EFFECTS**
  - Common or very common
    - Bone marrow failure
    - Gastrointestinal disorders
    - Hepatic disorders
    - Hyperbilirubinaemia
    - Hyperuricaemia
    - Nodular regenerative hyperplasia
    - Oesophageal varices
    - Sinusoidal obstruction syndrome
    - Splenomegaly
    - Stomatitis
    - Thrombocytopenia
    - Uric acid nephropathy
    - Weight increased
  - Frequency not known
    - Photosensitivity reaction

- **CONCEPTION AND CONTRACEPTION**
  - Ensure effective contraception during treatment in men or women.

- **PREGNANCY**
  - Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.

- **Dose adjustments**
  - Manufacturer advises consider dose reduction.

- **RENAI IMPAIRMENT**
  - Dose adjustments
    - Reduce dose.

- **PRE-TREATMENT SCREENING**
  - Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

- **MONITORING REQUIREMENTS**
  - Monitor liver function weekly—discontinue if liver toxicity develops.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

  - **Tablet**
    - Tioguanine (Non-proprietary)
      - Tioguanine 40 mg Tioguanine 40mg tablets 25 tablet £0.97

**Bleomycin**

- **INDICATIONS AND DOSE**
  - Some germ cell tumours: Hodgkin’s lymphoma
    - **BY INTRAVENOUS INFUSION**
    - Child: (consult local protocol)

- **UNLICENSED USE**
  - Not licensed for use in children.

- **CONTRA-INDICATIONS**
  - Acute pulmonary infection

- **CAUTIONS**
  - Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: bleomycin

- **SIDE-EFFECTS**
  - Common or very common
    - Alopecia
    - Angular stomatitis
    - Appetite decreased
    - Chills
    - Fever (after administration)
    - Haemorrhage
    - Headache
    - Interstitial pneumonia
    - Leucopenia
    - Malaise
    - Nail discolouration
    - Nail disorder
    - Nausea
    - Pain
    - Pulmonary fibrosis (dose-related)
    - Scleroderma
    - Skin reactions
    - Stomatitis
    - Vomiting
    - Weight decreased

- **Uncommon**
  - Diarrhoea
  - Dizziness
  - Hepatocellular injury
  - Oliguria
  - Shock
  - Urinary disorders
  - Vein wall hypertrophy
  - Venous stenosis

**Important Safety Information**

**Risks of incorrect dosing of oral anti-cancer medicines**

See Cytotoxic drugs p. 551.
CONCEPTION AND CONTRACEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

PREGNANCY

Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING

Discontinue breast feeding.

RENAL IMPAIRMENT

Dose adjustments Reduce dose—consult local treatment protocol for details.

MONITORING REQUIREMENTS

Ensure monitoring of pulmonary function—investigate any shortness of breath before initiation.

PRESCRIBING AND DISPENSING INFORMATION

To conform to the European Pharmacopoeia vials previously labelled as containing 15 units of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Bleomycin (Non-proprietary)
  - Bleomycin (as Bleomycin sulfate) 5000 unit
  - Bleo-Kyowa
  - 15 000 unit powder for solution for injection vials | 10 vial
  - £170.00
  - £100.60

- Bleomycin (as Bleomycin sulfate) 5000 unit
  - Bleo-Kyowa (Kyowa Kirin Ltd)
  - 15 000 unit powder for solution for injection vials | 10 vial
  - £190

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

10-Jun-2016

- INDICATIONS AND DOSE
  - Stage 4 neuroblastoma | Germ cell tumours | Low-grade gliomas (including astrocytomas) | Neuroectodermal tumours (including medulloblastoma) | Rhabdomyosarcoma (metastatic and non-metastatic disease) | Soft-tissue sarcomas | Retinoblastoma | High risk Wilms’ tumour: Some liver tumours
  - By INTRAVENOUS INFUSION
  - Child: (consult local protocol)

- UNLICENSED USE
  - Not licensed for use in children.

- INTERACTIONS
  - Appendix 1: platinum compounds

- SIDE-EFFECTS
  - Common or very common Alopeia · anaemia · asthenia · cardiovascular disorder · constipation · diarrhoea · gastrointestinal discomfort · haemorrhage · hypersensitivity · increased risk of infection · leucopenia · mucosal abnormalities · musculoskeletal disorder · nausea · neutropenia · ototoxicity · peripheral neuropathy · reflexes decreased · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · urogenital disorder · vision disorders · vomiting
  - Rare or very rare Cardiac discomfort · dyspnoea
  - Frequency not known Appetite decreased · bone marrow failure · chills · dehydration · embolism · encephalopathy · extravasation necrosis · fever · haemolytic uraemic syndrome · heart failure · hypertension · hypotension · injection site necrosis · malaise · pancreatitis · stomatitis · stroke · treatment related secondary malignancy

- CONCEPTION AND CONTRACEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

PREGNANCY

Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING

Discontinue breast-feeding.

RENAL IMPAIRMENT

Avoid if creatinine clearance less than 20 mL/minute/1.73 m².

Dose adjustments Reduce dose.

Monitoring Monitor haematological parameters in renal impairment.

Monitor renal function in renal impairment.

Dactinomycin

(Actinomycin D)

- INDICATIONS AND DOSE
  - Wilms’ tumour | Childhood rhabdomyosarcoma and other soft-tissue sarcomas | Ewing’s sarcoma
  - By INTRAVENOUS INJECTION
  - Child: (consult local protocol)

- UNLICENSED USE
  - Not licensed for use in children under 12 years.

- CAUTIONS
  - Caution in handling—irritant to tissues

- INTERACTIONS
  - Appendix 1: dactinomycin

- SIDE-EFFECTS
  - Agranulocytosis · alopecia · anaemia · appetite decreased · ascites · bone marrow disorders · diarrhoea · dysphagia · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · growth retardation · healing impaired · hepatic disorders · hypocalcaemia · increased risk of infection · lethargy · leucopenia · leukaemia secondary · malaise · myalgia · nausea · neutropenia · oedema · oral disorders · pneumonitis · renal impairment · reticulocytopenia · secondary neoplasia · sepsis · severe cutaneous adverse reactions (SCARs) · sinusoidal obstruction syndrome · skin reactions · soft tissue damage · thrombocytopenia · tumour lysis syndrome · venous thrombosis · vomiting

- CONCEPTION AND CONTRACEPTION

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

- PREGNANCY

Avoid (teratogenic in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought

- BREAST FEEDING

Discontinue breast-feeding.

- HEPATIC IMPAIRMENT

Dose adjustments Consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Cosmegen (Recordati Rare Diseases UK Ltd)
  - Dactinomycin 500 microgram
  - Cosmegen Lyovac 500microgram powder for solution for injection vials | 1 vial
  - £52.58

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS
Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284
Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).
www.nice.org.uk/TA284

Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285
Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.
www.nice.org.uk/TA285

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Carboplatin (Non-proprietary)
  Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial (POM) £20.67–£22.04 (Hospital only) | 1 vial (POM) £20.20
  Carboplatin 15mg/15ml concentrate for solution for infusion vials | 1 vial (POM) £53.39–£56.92 (Hospital only) | 1 vial (POM) £60.59
  Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial (POM) £243.89–£264.53 (Hospital only) | 1 vial (POM) £232.64
  Carboplatin 600mg/60ml solution for infusion vials | 1 vial (POM) £260.00 (Hospital only) | 1 vial (POM) £260.00
  Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial (POM) £138.40–£168.85 (Hospital only) | 1 vial (POM) £131.77
  Carboplatin 450mg/45ml solution for infusion vials | 1 vial (POM) £197.48 (Hospital only) | 1 vial (POM) £197.48
  Carboplatin 150mg/15ml solution for infusion vials | 1 vial (POM) £65.83 (Hospital only) | 1 vial (POM) £65.83
  Carboplatin 50mg/5ml solution for infusion vials | 1 vial (POM) £22.86 (Hospital only) | 1 vial (POM) £22.86

Cisplatin

INDICATIONS AND DOSE
Osteogenic sarcoma | Stage 4 neuroblastoma | Some liver tumours | Brain tumours | Intra-cranial germ-cell tumours
- By intravenous infusion
- Child: (consult local protocol)

UNLICENSED USE
Not licensed for use in children.

CAUTIONS
CAUTIONS, FURTHER INFORMATION
Hydration: Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control.

INTERACTIONS
- Appendix 1: platinum compounds

SIDE-EFFECTS
- Common or very common Anaemia | arrhythmias | bone marrow failure | electrolyte imbalance | extravasation | necrosis | fever | leucopenia | nephrotoxicity (dose-related and potentially cumulative) | sepsis | thrombocytopenia
- Uncommon Anaphylactoid reaction | ototoxicity (dose-related and potentially cumulative) | spermatogenesis abnormal
- Rare or very rare Acute leukaemia | cardiac arrest | encephalopathy | myocardial infarction | nerve disorders | seizure | stomatitis
- Frequency not known Alopecia | appetite decreased | asthenia | autonomic dysfunction | cardiac disorder | cerebrovascular insufficiency | deafness | dehydration | diarrhoea | haemolytic anaemia | hiccups | hyperuricaemia | infection | Lhermitte’s sign | malaise | muscle spasms | myelopathy | nausea | papilloedema | pulmonary embolism | rash | Raynaud’s phenomenon | renal impairment | renal tubular disorder | retinal discolouration | SIADH | taste loss | tetany | thrombotic microangiopathy | tininitus | vision disorders | vomiting

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY
Avoid (teratogenic and toxic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING
Discontinue breast-feeding.

RENAL IMPAIRMENT
Avoid if possible—nephrotoxic.

Monitoring
Baseline testing of renal function is required; for children with pre-existing renal impairment, consideration should be given to withholding treatment or using another drug.

MONITORING REQUIREMENTS
- Monitor full blood count.
- Monitor audiology.
- Monitor plasma electrolytes.
- Baseline testing of hearing is required; for children with pre-existing hearing impairment, consideration should be given to withholding treatment or using another drug.
- For children with pre-existing marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.
- Monitor renal function.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Cisplatin (Non-proprietary)
  Cisplatin 1 mg per 1 ml Cisplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial (POM) £25.11–£28.11 DT = £26.51 (Hospital only)
  Cisplatin 100mg/100ml solution for infusion vials | 1 vial (POM) £50.22 DT = £50.88 | 1 vial (POM) £50.22 DT = £50.88 (Hospital only)
  Cisplatin 10mg/10ml solution for infusion vials | 1 vial (POM) £5.90
  Cisplatin 50mg/50ml solution for infusion vials | 1 vial (POM) £25.37–£28.11 DT = £26.51 | 1 vial (POM) £25.37 DT = £26.51 (Hospital only)
  Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial (POM) £5.36 (Hospital only)
  Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial (POM) £50.22–£55.64 DT = £50.88 (Hospital only)
**ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES**

**Etoposide**  
12-Jul-2018

- **INDICATIONS AND DOSE**
  - Stage 4 neuroblastoma | Germ-cell tumours | Intracranial germ-cell tumours | Rhabdomyosarcoma | Soft-tissue sarcomas | Neuroectodermal tumours (including medulloblastoma) | Relapsed Hodgkin's disease | Non-Hodgkin's lymphoma | Ewing tumour | Acute lymphoblastic leukaemia | Acute myeloid leukaemia
  - By mouth, or by intravenous infusion
  - Child: (consult local protocol)

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain · acute leukaemia · alopecia · anaemia · appetite decreased · arrhythmia · asthenia · bone marrow depression · constipation · diarrhoea · dizziness · hepatotoxicity · hypertension · leucopenia · malaise · mucositis · myocardial infarction · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
  - Uncommon: Nerve disorders
  - Rare or very rare: Dysphagia · neurotoxicity · radiation recall reaction · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · vision loss

- **SPECIFIC SIDE-EFFECTS**
  - Common or very common: With intravenous use · Anaphylactic reaction · hypotension · infection
  - With oral use: Oesophagitis · stomatitis · transient systolic hypotension
  - Uncommon: With intravenous use · Haemorrhage
  - Rare or very rare: With intravenous use · Fever
  - With oral use: Drowsiness
  - Frequency not known: With intravenous use · Angioedema · extravasation necrosis · infertility · tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice: required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (increased risk of accumulation).

- **RENAL IMPAIRMENT**
  - Dose adjustments: Consider dose reduction—consult local treatment protocol for details.

- **DIRECTIONS FOR ADMINISTRATION**
  - Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

- **UNLICENSED USE**
  - Not licensed for use in children.

- **IMPORTANT SAFETY INFORMATION**

- **INTERACTIONS**
  - Appendix 1: etoposide

- **SIDE-EFFECTS**
  - General side-effects:
    - Common or very common: Abdominal pain · acute leukaemia · alopecia · anaemia · appetite decreased · arrhythmia · asthenia · bone marrow depression · constipation · diarrhoea · dizziness · hepatotoxicity · hypertension · leucopenia · malaise · mucositis · myocardial infarction · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
    - Uncommon: Nerve disorders
    - Rare or very rare: Dysphagia · neurotoxicity · radiation recall reaction · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · vision loss

- **SPECIFIC SIDE-EFFECTS**
  - Common or very common: With intravenous use · Anaphylactic reaction · hypotension · infection
  - With oral use: Oesophagitis · stomatitis · transient systolic hypotension
  - Uncommon: With intravenous use · Haemorrhage
  - Rare or very rare: With intravenous use · Fever
  - With oral use: Drowsiness
  - Frequency not known: With intravenous use · Angioedema · extravasation necrosis · infertility · tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice: required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - Etoposide (Non-proprietary)
    - Etoposide 20 mg per 1 ml (etoposide 100mg/5ml concentrate for solution for infusion vials) 1 vial (£11.50–13.51) (Hospital only)
    - Etoposide 200 mg/10ml concentrate for solution for infusion vials 1 vial (£10.70–11.75) (Hospital only)
    - Etoposide 500 mg/25ml concentrate for solution for infusion vials 1 vial (£12.00–17.75) (Hospital only)

- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS
    - Vepesid (Bristol-Myers Squibb Pharmaceuticals Ltd)
      - Etoposide 50 mg Vepesid 50mg capsules 20 capsule (£99.82) (Hospital only)
      - Etoposide 100 mg Vepesid 100mg capsules 10 capsule (£115.00–119.88) (Hospital only)

- **Powder for solution for injection**
  - Etophos (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Etoposide (as Etoposide phosphate) 100 mg Etophos 100mg powder for solution for injection vials 10 vial (£261.68) (Hospital only)

**ANTINEOPLASTIC DRUGS > VINCA ALKALOIDS**

**Vinblastine sulfate**

- **INDICATIONS AND DOSE**
  - Hodgkin’s disease and other lymphomas
  - By intravenous injection
    - Child: (consult local protocol)

- **UNLICENSED USE**
  - Licensed for use in children (age range not specified by manufacturer).

- **IMPORTANT SAFETY INFORMATION**
  - Vinblastine is for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.
  - The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS**
  - Contra-indications, further information: Intrathecal injection contra-indicated.

- **CAUTIONS**
  - Caution in handling—irritant to tissues

- **INTERACTIONS**
  - Appendix 1: vinca alkaloids

- **SIDE-EFFECTS**
  - Rare or very rare: Hearing impairment · nerve disorders · vestibular damage
  - Frequency not known: Abdominal pain · acute respiratory distress syndrome (ARDS) · alopecia (reversible) · anaemia · appetite decreased · asthenia · balance impaired · cancer pain · constipation · depression · diarrhoea · dizziness · dyspnoea · haemorrhage · headache · hypertension · ileus · increased risk of infection · leucopenia (dose-limiting) · malaise · mediastinal disorder · myalgia · myocardial infarction · nausea · nyctagmus · oral blistering · pain · Raynaud’s phenomenon · refexes absent · seizure · sensation abnormal · SIADH · skin reactions · stroke · thrombocytopenia · vertigo · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Constipation
  - Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice: required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.
**PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in significantly impaired hepatic or biliary function.

**Dose adjustments** Manufacturer advises consider initial dose reduction in significantly impaired hepatic or biliary function.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**SOLUTION FOR INJECTION**
- **Vincristine sulfate (Non-proprietary)**
  - Vincristine sulfate 1 mg per 1 ml: Vinblastine 10mg/10ml solution for injection vials | 5 vial (Hospital only)

**VINCRISTINE SULFATE**

| **INDICATIONS AND DOSE** | **Acute leukaemias | Lymphomas | Paediatric solid tumours** |
|--------------------------|-------------------|
| **Child:** (consult local protocol) |

**UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

**IMPORTANT SAFETY INFORMATION**

Vincristine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 ml minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

**CAUTIONS** Caution in handling—irritant to tissues • ileus • neuromuscular disease

**INTERACTIONS** Appendix 1: vinca alkaloids

**SIDE-EFFECTS**

- Rare or very rare
  - Hypersensitivity • rash • SIAHD
- **Frequency not known**
  - Abdominal cramps • adrenal disorder • alopecia • anaemia • appetite decreased • azotemia • bladder atony • bronchospasm • connective tissue disorders • constipation • coronary artery disease • dehydration • diarrhoea • dizziness • dyspnoea • eighth cranial nerve damage • eye disorders • fever • gait abnormalities • gastrointestinal disorders • haemolytic anaemia • headache • hearing impairment • hypertension • hyponatraemia • hypotension • infection • leucopenia • movement disorders • muscle atrophy • myalgia • myocardial infarction • nausea • neuromuscular effects (dose-limiting) • neutropenia • oedema • oral disorders • pain • paralysis • paresis • reflexes absent • renal disorder • secondary malignancy • seizure • sensation abnormal • sepsis • throat pain • thrombocytopenia • urinary disorders • vertigo • vestibular damage • vision loss • vomiting • weight decreased

SIDE-EFFECTS, FURTHER INFORMATION

**Bromochaspm**

Severe bronchospasm following administration is more common when used in combination with mitomycin-C.

**Neurotoxicity** Sensory and motor neuropathies are common and are cumulative. Manufacturer advises monitoring patients for symptoms of neuropathy, such as hypoesthesia, hyperesthesia, paresthesia, hyperreflexia, areflexia, neuralgia, jaw pain, decreased vibratory sense, cranial neuropathy, ileus, burning sensation, arthralgia, myalgia, muscle spasm, or weakness, both before and during treatment—requires dose reduction, treatment interruption or treatment discontinuation, depending on severity.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

**Constipation** Prophylactic use of laxatives may be considered.

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction.

**Dose adjustments** Manufacturer advises dose reduction.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**SOLUTION FOR INJECTION**

- **Vincristine sulfate (Non-proprietary)**
  - Vinblastine sulfate 1 mg per 1 ml: Vinblastine 10mg/10ml solution for injection vials | 5 vial (Hospital only)

**ANTINEOPLASTIC DRUGS** OTHER

**Asparaginase**

**DRUG ACTION** Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

**INDICATIONS AND DOSE**

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- **BY INTRAVENOUS INJECTION**
  - Neonate: (consult product literature or local protocols).
  - Child 1-11 months: (consult product literature or local protocols)
  - Child 1-17 years: 5000 units/m² every 3 days

**CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy • history of serious haemorrhage related to asparaginase therapy • history of serious thrombosis related to asparaginase therapy • pancreatitis • pre-existing known coagulopathy

**CAUTIONS** Diabetes (may raise blood glucose) • hypersensitivity reactions • hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

**CONTRA-INDICATIONS, FURTHER INFORMATION**

History of pancreatitis related to asparaginase therapy • history of serious haemorrhage related to asparaginase therapy • history of serious thrombosis related to asparaginase therapy • pancreatitis • pre-existing known coagulopathy.

**CAUTIONS** Diabetes (may raise blood glucose) • hypersensitivity reactions • hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

**INTERACTIONS** Appendix 1: asparaginase
Cytotoxic responsive malignancy

SIDE-EFFECTS
- Common or very common: Abdominal pain, agitation, anaemia, angioedema, appetite decreased, arthralgia, back pain, bronchospasm, confusion, depression, diarrhoea, disseminated intravascular coagulation, dizziness, drowsiness, dyspnoea, embolism and thrombosis, fatigue, flushing, haemorrhage, hallucination, hyperglycaemia, hypersensitivity, hypoaalbuminaemia, hypoglycaemia, hypotension, increased risk of infection, leucopenia, nausea, neurological effects, oedema, pancreatitis, skin reactions, thrombocytopenia, vomiting, weight decreased
- Uncommon: Headache, hyperammonaemia, hyperuricaemia
- Rare or very rare: Coma, consciousness impaired, diabetic ketoacidosis, hepatic disorders, hyperparathyroidism, hypoparathyroidism, ischaemic stroke, necrotising pancreatitis, pancreatic pseudocyst, posterior reversible encephalopathy syndrome (PRES), seizure, tremor

SIDE-EFFECTS, FURTHER INFORMATION
There have been rare reports of cholesterol, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

PREGNANCY
Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING
Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises avoid in severe impairment—no information available.

MONITORING REQUIREMENTS
- Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
- Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.

HANDLING AND STORAGE
Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.

PATIENT AND CARER ADVICE
- Driving and skilled tasks: Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
SMC No. 1319/18
The Scottish Medicines Consortium has advised (April 2018) that asparaginase (Spectrila®) is accepted for use within NHS Scotland when used as a component of antineoplastic combination therapy for the treatment of acute lymphoblastic leukaemia in paediatric patients from birth to 18 years and adults.

DRUG ACTION
Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

INDICATIONS AND DOSE
- Acute lymphoblastic leukaemia
- Acute myeloid leukaemia
- Non-Hodgkin’s lymphoma

DIRECTIONS FOR ADMINISTRATION
BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
Child: (consult local protocol)

UNLICENSED USE
Preparations of asparaginase derived from Escherichia coli are available but they are not licensed, they include: Medac® asparaginase and Elspar® asparaginase.

CONTRA-INDICATIONS
History of pancreatitis related to asparaginase therapy

CAUTIONS
Diabetes (may raise blood glucose)

INTERACTIONS
- Appendix 1: crisantaspase

SIDE-EFFECTS
- Common or very common: Chills, coagulation disorders, confusion, diarrhoea, dizziness, drowsiness, dyspnoea, face oedema, fever, headache, hepatic disorders, hypersensitivity, limb swelling, lip swelling, neurotoxicity, pain, pallor, pancreatitis, seizures, skin reactions, thrombosis
- Uncommon: Hyperglycaemia, hyperlipidaemia, hypoxia, increased risk of infection, respiratory disorders
- Rare or very rare: Arthritis reactive, coma, diabetic ketoacidosis, dysphagia, dysphasia, encephalopathy, haemorrhage, level of consciousness decreased, myalgia, myocardial infarction, necrotising pancreatitis, neuropenia, paresis, sepsis, thrombocytopenia
- Frequency not known: Abdominal pain, flushing, hyperammonaemia, hypertension, hypotension, nausea, pseudocyst, vomiting

ALLERGY AND CROSS-SENSITIVITY
Children who are hypersensitive to asparaginase derived from one organism but cross-sensitivity occurs in about 20–30% of individuals.

CONCEPTION AND CONTRACEPTION
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

PREGNANCY
Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING
Discontinue breast-feeding.

DIRECTIONS FOR ADMINISTRATION
Facilities for the management of anaphylaxis should be available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Spectrila (medac UK) ▼
  Asparaginase 10000 unit Spectrila, 10,000 unit powder for concentrate for solution for infusion vials | 1 vial (p) £450.00 (Hospital only)

CRISANTASPASE

Drug Action
Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

Indications and Dose
- Acute lymphoblastic leukaemia | Acute myeloid leukaemia
- Non-Hodgkin’s lymphoma

DIRECTIONS FOR ADMINISTRATION
BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
Child: (consult local protocol)

Unlicensed Use
Preparations of asparaginase derived from Escherichia coli are available but they are not licensed, they include: Medac® asparaginase and Elspar® asparaginase.

Contra-indications
History of pancreatitis related to asparaginase therapy

Cautions
Diabetes (may raise blood glucose)

Interactions
- Appendix 1: crisantaspase

Side-effects
- Common or very common: Chills, coagulation disorders, confusion, diarrhoea, dizziness, drowsiness, dyspnoea, face oedema, fever, headache, hepatic disorders, hypersensitivity, limb swelling, lip swelling, neurotoxicity, pain, pallor, pancreatitis, seizures, skin reactions, thrombosis
- Uncommon: Hyperglycaemia, hyperlipidaemia, hypoxia, increased risk of infection, respiratory disorders
- Rare or very rare: Arthritis reactive, coma, diabetic ketoacidosis, dysphagia, dysphasia, encephalopathy, haemorrhage, level of consciousness decreased, myalgia, myocardial infarction, necrotising pancreatitis, neuropenia, paresis, sepsis, thrombocytopenia
- Frequency not known: Abdominal pain, flushing, hyperammonaemia, hypertension, hypotension, nausea, pseudocyst, vomiting

Allergy and Cross-sensitivity
Children who are hypersensitive to asparaginase derived from one organism but cross-sensitivity occurs in about 20–30% of individuals.

Conception and Contraception
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

Pregnancy
Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 551.

Breast Feeding
Discontinue breast-feeding.

Directions for Administration
Facilities for the management of anaphylaxis should be available.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
- Erwinase (Jazz Pharmaceuticals UK)
  Crisantaspase 10000 unit Erwinase, 10,000 unit powder for solution for injection vials | 1 vial (p) £13,065.00
Hydroxycarbamide
(Hydroxyurea)

22-Mar-2018

- **INDICATIONS AND DOSE**

  **SIKLOS®**
  Sickle-cell disease [prevention of recurrent vaso-occlusive crises] (initiated by a specialist)
  
  ▶ **BY MOUTH**
  
  - Child 2-17 years: Initially 10–15 mg/kg once daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

- **SIDE-EFFECTS**

  
  ▶ **Rare or very rare** Gangrene

- **CONCEPTION AND CONTRACEPTION**

  Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

- **PREGNANCY**

  Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING**

  Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**

  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (unless used for malignant conditions).

- **RENAL IMPAIRMENT**

  In sickle-cell disease, avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². 
  
  **Dose adjustments**
  
  In sickle-cell disease, reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**

  ▶ **Monitor renal and hepatic function before and during treatment.**
  
  ▶ **Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).**
  
  ▶ **Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.**

- **PATIENT AND CARER ADVICE**

  Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

  Medicines for Children leaflet: Hydroxycarbamide for sickle cell disease www.medicinesforchildren.org.uk/hydroxycarbamide-sickle-cell-disease

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  ▶ **SIKLOS (Nordic Pharma Ltd)**
  
  Hydroxycarbamide 100 mg SIKLOS 100mg tablets | 60 tablet POM £100.00 DT + £300.00
  
  Hydroxycarbamide 1 gram SIKLOS 1000mg tablets | 30 tablet POM £500.00 DT + £500.00

**Mitotane**

- **DRUG ACTION**

  Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

- **INDICATIONS AND DOSE**

  Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

  – **BY MOUTH**
  
  – Child: (consult local protocol)

- **UNLICENSED USE**

  Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 551.

- **CAUTIONS**

  Avoid in Acute porphyrias p. 524. risk of accumulation in overweight patients.

- **INTERACTIONS**

  **Appendix 1: mitotane**

- **SIDE-EFFECTS**

  ▶ **Common or very common** Adrenal insufficiency - anaemia - appetite decreased - asthenia - cognitive impairment - confusion - diarrhoea - dizziness - drowsiness - dyslipidaemia - gastrointestinal discomfort - gynaecomastia - headache - hepatic disorders - leucopenia - movement disorders - mucositis - muscle weakness - nausea - paraesthesia - polynuropathy - rash - thrombocytopenia - vertigo - vomiting
  
  ▶ **Rare or very rare** Encephalopathy - eye disorders - flushing - fungal infection - generalised pain - growth retardation - haemorrhage - hyperpyrexia - hypersalivation - hypertension - hypothyroidism - hypouricaemia - lens opacity - neuro-psychological retardation - ovarian cyst - postural hypotension - proteinuria - taste altered - thyroid disorder - vision disorders

- **CONCEPTION AND CONTRACEPTION**

  Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **PREGNANCY**

  Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING**

  Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**

  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (limited information available).

  Monitoring In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.

- **RENAL IMPAIRMENT**

  Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

  Monitoring In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.

**MONITORING REQUIREMENTS**

- **Monitor plasma-mitotane concentration—consult product literature.**

**PRESCRIBING AND DISPENSING INFORMATION**

Corticosteroid replacement therapy
Corticosteroid replacement therapy is necessary with treatment with
mito.

- **PATIENT AND CARER ADVICE** Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency). Driving and skilled tasks Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 2, 10, 21
  - Lysodren (HRA Pharma UK Ltd)
  - Mitotane 500 mg Lysodren 500mg tablets | 100 tablet (PO)
  - £550.97

### Pegasparase

- **DRUG ACTION** Pegasparase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

- **INDICATIONS AND DOSE** Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)
  - BY INTRAMUSCULAR INJECTION, OR BY INTRA VENOUS INFUSION
  - Neonate: 82.5 units/kg every 14 days.
  - Child (body surface area up to 0.6 m²): 82.5 units/kg every 14 days.
  - Child (body surface area 0.6 m² and above): 2500 units/m² every 14 days.

- **IMPORTANT SAFETY INFORMATION** Be aware that doses are calculated either using units/kg or units/m², depending on the size of the child.

- **CONTRA-INDICATIONS** History of pancreatitis - history of serious haemorrhagic event with previous L-asparaginase therapy - history of serious thrombosis with previous L-asparaginase therapy

- **CAUTIONS** Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function - diabetes (may raise blood glucose). Hypersensitivity reactions - marked decrease of leucocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy

- **CAUTIONS, FURTHER INFORMATION**
  - Hyposensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegasparagse should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

- **INTERACTIONS** → Appendix 1: pegasparase

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - bone marrow depression - diarrhea - hyperglycaemia - hyponatraemia - hypoxia - pain in extremity - pancreatitis (discontinue if suspected and do not restart if confirmed) - peripheral neuropathy - rash - sepsis - stomatitis - syncope - thrombosis (discontinue) - vomiting
  - Rare or very rare Acute kidney injury - posterior reversible encephalopathy syndrome (PRES) - tremor

- **Frequency not known** Confusion - diabetic ketoadiposis - drowsiness - hepatobiliary disorder - hyperammonaemia (monitor if symptoms present) - toxic epidermal necrolysis

- **SIDE-EFFECTS, FURTHER INFORMATION** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome in patients receiving pegasparagse.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegasparagse may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **PREGNANCY** Manufacturer advises avoid unless essential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegasparagse; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
  - Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intramuscular injection, volumes over 2 mL must be divided between more than one site.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator between 2–8°C.

- **PATIENT AND CARER ADVICE** Pancreatitis Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

  Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE decisions**
  - Pegasparagse for treating acute lymphoblastic leukaemia (September 2016) NICE TA408
  - Pegasparagse, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.
  - Patients whose treatment was started within the NHS before this guidance was published may continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/guidance/ta408

  **Scottish Medicines Consortium (SMC) decisions**
  - The Scottish Medicines Consortium has advised (October 2016) that pegasparagse (Onaspar) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.
574 Cytotoxic response to malignant disease

MEDICINAL FORMS There can be variation in the labeling of different medicines containing the same drug.

Solution for injection
- Oncaspar (Servier Laboratories Ltd)
- Pegaspargase 750 unit per ml (Servier Laboratories Ltd)

For injection vials | 1 vial | £1,296.19

Procarbazine

DRUG ACTION Procarbazine is a mild monoamine-oxidase inhibitor.

INDICATIONS AND DOSE Hodgkin’s lymphoma
- BY MOUTH
- Child: (consult local protocol)

SIDE-EFFECTS
- Common or very common Abdominal pain, alopecia, anxiety, appetite decreased, arthralgia, asthenia, bone pain, chills, chest pain, confusion, constipation, depression, diarrhea, dizziness, dry mouth, flushing, headache, hearing impairment, hyperhidrosis, idiopathic intracranial hypertension (children particularly susceptible - consider dose reduction if intractable headache in children), insomnia, intracranial pressure increased, malaise, nasal dryness, nausea, pancreatitis, paraesthesia, respiratory disorders, skin reactions, visual impairment, vomiting
- Frequency not known Embolism and thrombosis, erythema nodosum, genital ulceration, hepatotoxicity, hypercalcemia, increased leucocytes, myocardial infarction, myositis, necrotising fasciitis, QT interval prolongation, stroke, thrombocytopenia, vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Children are particularly susceptible to nervous system effects.

RETINOIC ACID SYNDROME Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment — consult product literature.

CONCEPTION AND CONTRACEPTION Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progesterone-only contraceptives not considered effective).

PREGNANCY Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING Avoid (discontinue breast-feeding).

HEPATIC IMPAIRMENT Manufacturer advises caution.
Dose adjustments Manufacturer advises dose reduction.

RENAL IMPAIRMENT
Dose adjustments Reduce dose — consult local treatment protocol for details.

MONITORING REQUIREMENTS Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

PRESCRIBING AND DISPENSING INFORMATION Tretinoin is the acid form of vitamin A.

MEDICINAL FORMS There can be variation in the labeling of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS
- 21, 25
- Tretinoin (Non-proprietary)
- Tretinoin 10 mg Tretinoin 10mg capsules | 100 capsule | £300.00–£315.00 DT = £300.00

2.1 Cytotoxic drug-induced side effects

DETOXIFYING DRUGS > UROPROTECTIVE DRUGS

Mesna

INDICATIONS AND DOSE
- Urothelial toxicity following oxazaphosphorine therapy
  - BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
  - Child: (consult local protocol)

Mucolytic in cystic fibrosis
- BY INHALATION OF NEBULISED SOLUTION
  - Child: 3–6 ml twice daily, use a 20% solution

UNLICENSED USE Not licensed for use in children.
VITAMINS AND TRACE ELEMENTS

Folinic acid

**INDICATIONS AND DOSE**

Reduction of methotrexate-induced toxicity

- By mouth, or by intravenous infusion, or by intravenous injection
- Child: (consult local protocol)

Methotrexate overdose

- By intravenous infusion, or by intravenous injection
- Child: (consult local protocol)

Megaloblastic anaemia due to folate deficiency

- By mouth
- Child 1 month-11 years: 250 micrograms/kg once daily
- Child 12-17 years: 15 mg once daily

Metabolic disorders leading to folate deficiency

- By mouth, or by intravenous infusion
- Child: 15 mg once daily, larger doses may be required in older children

Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

- By mouth

- Neonate: 5 mg 3 times a week; increased if necessary up to 20 mg 3 times a week, if the patient is neutropenic.

- Child 1-11 months: 10 mg 3 times a week

**SODIOFOLIN**

As an antidote to methotrexate

- By intravenous infusion, or by intravenous injection
- Child: (consult product literature)

**UNLICENSED USE** Consult product literature for licensing status of individual preparations.

**CONTRA-INDICATIONS** Intrathecal injection

**CAUTIONS** Avoid simultaneous administration of methotrexate • not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency

**INTERACTIONS** → Appendix 1: folates

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Uncommon** Fever
- **Rare or very rare** Agitation (with high doses) • depression (with high doses) • epilepsy exacerbated • gastrointestinal disorder (with high doses) • insomnia (with high doses) • urticaria

**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
- With intravenous use • Bone marrow failure • dehydration • diarrhoea (with high doses) • mucositis • nausea • oral disorders • skin reactions • vomiting
- **Rare or very rare**
- With intravenous use • Sensitisation
- **Fever not known**
- With intravenous use • Hyperammonaemia
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Mesna (Non-proprietary)**
  - Mesna 100 mg per ml Mesna 1g/10ml solution for injection ampoules | 1 ampoule (£39.40) Mesna 400mg/4ml solution for injection ampoules | 5 ampoule (£308)
  - £7.00 | 15 ampoule (£39.40) £201.15

**Megaloblastic anaemia due to folate deficiency**

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, tablet.

**Tablet**

- Folinic acid (Non-proprietary)
- Folinic acid (as Calcium folinate) 15 mg Calcium folinate 15mg tablets | 10 tablet (£49.00 DT + £43.55)
- Refolinon (Pfizer Ltd) Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet (£50) £85.74

**Solution for injection**

- Folinic acid (Non-proprietary)
- Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 15mg/2ml solution for injection ampoules | 5 ampoule (£39.00 DT + £39.00 (Hospital only))
- Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 350mg/35ml solution for injection vials | 1 vial (£120.00 | 10 vial (£1,216.80 Hospital only)) Calcium folinate 50mg/5ml solution for injection vials | 1 vial (£20.00 (Hospital only)) Calcium folinate 300mg/30ml solution for injection vials | 1 vial (£100.00 (Hospital only)) Calcium folinate 100mg/10ml solution for injection vials | 1 vial (£37.50 (Hospital only)) | 1 vial (£37.50 | 10 vial (£385.20 (Hospital only))
- Refolinon (Pfizer Ltd) Folinic acid (as Calcium folinate) 3 mg per 1 ml Refolinon 30mg/10ml solution for injection ampoules | 5 ampoule (£23.12 (Hospital only))
- Sodiofolin (medac UK) Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodiofolin 400mg/8ml solution for injection vials | 1 vial (£126.25 (Hospital only)) Sodiofolin 100mg/2ml solution for injection vials | 1 vial (£35.09 (Hospital only))

**Levofolinic acid**

**DRUG ACTION** Levofolinic acid is an isomer of folic acid.

**INDICATIONS AND DOSE**

Reduction of methotrexate-induced toxicity

- By intramuscular injection, or by intravenous injection, or by intravenous infusion
- Child: (consult local protocol)

**SODIOFOLIN**

As an antidote to methotrexate

- By intravenous infusion, or by intravenous injection
- Child: (consult product literature)
2.1a Hyperuricaemia associated with cytotoxic drugs

Other drugs used for Hyperuricaemia associated with cytotoxic drugs Allopurinol, below

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

- INDICATIONS AND DOSE
  Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy
    > BY INTRAVENOUS INFUSION
    > Child: (consult local protocol)

- UNLICENSED USE
  Not licensed for use in children.

- CONTRA-INDICATIONS
  G6PD deficiency

- CAUTIONS
  Atopic allergies

- SIDE-EFFECTS
  > Common or very common
    Diarrhoea • fever • headache • nausea • skin reactions • vomiting
  > Uncommon
    Bronchospasm • haemolysis • haemolytic anaemia • hypersensitivity • hypotension • methaemoglobinemia • seizure
  > Rare or very rare
    Rhinitis
  > Frequency not known
    Muscle contractions involuntary

- PREGNANCY
  Manufacturer advises avoid—no information available.

- MONITORING REQUIREMENTS
  Monitor closely for hypersensitivity.

- EFFECT ON LABORATORY TESTS
  May interfere with test for uric acid—consult product literature.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion
  > Fasturtec (Sanofi)
    Rasburicase 1.5 mg. Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial £208.89 (Hospital only)
    Rasburicase 7.5 mg. Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial £347.32 (Hospital only)

XANTHINE OXIDASE INHIBITORS

Allopurinol

- INDICATIONS AND DOSE
  Prophylaxis of hyperuricaemia associated with cancer chemotherapy / Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g. Lesch-Nyhan syndrome
    > BY MOUTH
  > Child 1 month-14 years: 10–20 mg/kg daily, dose to be taken preferably after food; maximum 400 mg per day
  > Child 15-17 years: Initially 100 mg daily, taken preferably after food; dose to be increased according to response, up to 900 mg daily in divided doses (max. per dose 300 mg)

- CAUTIONS
  Ensure adequate fluid intake • for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

- INTERACTIONS
  > Common or very common
    Rash (discontinue therapy; if rash mild re-introduce cautiously but discontinue immediately if recurrence)
  > Uncommon
    Hypersensitivity • nausea • vomiting
  > Rare or very rare
    Agranulocytosis • alopecia • angina pectoris • angioedema • angioimmunoblastic T-cell lymphoma • aplastic anaemia • asthma • ataxia • boil • bradycardia • cataract • coma • depression • diabetes mellitus • drowsiness • erectile dysfunction • fever • gastrointestinal disorders • gynaecomastia • haemorrhage • hair colour changes • headache • hepatic disorders • hyperlipidaemia • hypertension • infertility male • maculopathy • malaise • oedema • paraesthesia • paralysis • peripheral neuropathy • severe cutaneous adverse reactions (SCARs) • skin reactions • stomatitis • taste altered • thrombocytopenia • vertigo • visual impairment

- PREGNANCY
  Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.

- BREAST FEEDING
  Present in milk—not known to be harmful.

- HEPATIC IMPAIRMENT
  Manufacturer advises monitor liver function periodically during early stages of therapy.

- Dose adjustments
  Manufacturer advises reduce dose.

- RENAL IMPAIRMENT
  Dose adjustments
  Manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

- PATIENT AND CARER ADVICE

  www.medicinesforchildren.org.uk/allopurinol-hyperuricaemia
### Immunotherapy responsive malignancy

#### IMMUNOSTIMULANTS

**Interferon alfa**

**Drug Action**

Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

- **Indications and Dose**

  - **Induction of early regression of life-threatening corticosteroid resistant haemangiomata of infancy**
    - By subcutaneous injection
    - Child: (consult local protocol)

  - **IntronA® Pen**
    - Chronic active hepatitis B
      - By subcutaneous injection
      - Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week
    - Chronic active hepatitis C (in combination with oral ribavirin)
      - By subcutaneous injection
      - Child 3-17 years: 3 000 000 units/m² 3 times a week

  - **IntronA® IVials**
    - Chronic active hepatitis B
      - By subcutaneous injection
      - Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week
    - Chronic active hepatitis C (in combination with ribavirin)
      - By subcutaneous injection
      - Child 3-17 years: 3 000 000 units/m² 3 times a week

  - **Roferon-A®**
    - Chronic active hepatitis B
      - By subcutaneous injection
      - Child 2-17 years: 2 500 000–5 000 000 units/m² 3 times a week, up to 10 000 000 units/m² has been used 3 times a week

- **Unlicensed Use**

  Not licensed for use in children for chronic active hepatitis B.

- **Contraindications**

  Avoid injections containing benzyl alcohol in neonates - history of severe psychiatric illness

  For contra-indications consult product literature and local treatment protocol.

- **Medicinal Forms**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash

- **Tablet**

  **CAUTIONARY AND ADVISORY LABELS**

  - Alloquin (Non-proprietary)
    - Alloquin 100 mg Alloquin 100mg tablets | 28 tablet
      - Price £8.15 DT £1.72
    - Alloquin 300 mg Alloquin 300mg tablets | 28 tablet
      - Price £8.53 DT £6.35
  - Zyloric (Ennogen Pharma Ltd)
    - Zyloric 100 mg Zyloric 100mg tablets | 100 tablet
      - Price £30.19
    - Zyloric 300 mg Zyloric 300mg tablets | 28 tablet
      - Price £7.31

- **Medicines and pregnancy**

  Avoid injections containing benzyl alcohol in neonates

- **Medicines and breastfeeding**

  Unlikely to be harmful.

- **Hepatic impairment**

  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **Monitoring**

  Close monitoring required in mild to moderate hepatic impairment.

- **Renal impairment**

  Avoid in severe renal impairment.

- **Monitoring Requirements**

  Monitoring of lipid concentration is recommended.

- **Monitoring of hepatic function is recommended.**

- **Directions for Administration**

  **IntronA® IVials**

  Introna® injection vials for subcutaneous injection or intravenous infusion.

  **Roferon-A®**

  Roferon-A® injection for subcutaneous injection.

- **Medicinal Forms**

  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  - **Excipients**
    - May contain Benzyl alcohol
      - IntronaA (Merck Sharp & Dohme Ltd)
    - **IntronA alfa 2b 10 mega u per 1 ml Introna 10ml units/1ml solution for injection vials | 1 vial**
      - Introna 25ml units/2.5ml solution for injection multidose vials | 1 vial
        - Price £103.94
    - **IntronA alfa 2b 15 mega u per 1 ml Introna 18ml units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection**
      - Price £74.83

- **Caution**

  **Cautionary, Further Information**

  For cautions consult product literature and local treatment protocol.

  Interferon alfa should always be used under the close supervision of a specialist; the decision to treat should be made only after careful assessment of the expected benefits versus the potential risks, in particular the risk of growth inhibition caused by combination therapy.

  **Interactions**

  Appendix 1: interferons

  **Side-Effects**

  - Common or very common

  **Side-Effects, Further Information**

  Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

  **Conception and contraception**

  Effective contraception required during treatment—consult product literature.

  **Pregnancy**

  Avoid unless potential benefit outweighs risk (toxicity in animal studies).

  **Breastfeeding**

  Unlikely to be harmful.

  **Hepatic Impairment**

  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

  **Monitoring**

  Close monitoring required in mild to moderate hepatic impairment.

  **Renal Impairment**

  Avoid in severe renal impairment.

  **Monitoring**

  Close monitoring required in mild to moderate renal impairment.

  **Monitoring Requirements**

  Monitoring of lipid concentration is recommended.

  **Monitoring of hepatic function is recommended.**

  **Directions for Administration**

  **IntronA® IVials**

  Introna® injection vials for subcutaneous injection or intravenous infusion.

  **Roferon-A®**

  Roferon-A® injection for subcutaneous injection.

  **Medicinal Forms**

  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  **Excipients**

  - May contain Benzyl alcohol
    - **IntronA (Merck Sharp & Dohme Ltd)**
      - **IntronA alfa 2b 10 mega u per 1 ml Introna 10ml units/1ml solution for injection vials | 1 vial**
        - Introna 25ml units/2.5ml solution for injection multidose vials | 1 vial
          - Price £103.94
      - **IntronA alfa 2b 15 mega u per 1 ml Introna 18ml units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection**
        - Price £74.83

  **Caution**

  **Cautionary, Further Information**

        - Price £74.83
Interferon gamma-1b
(Immune interferon)

**INDICATIONS AND DOSE**
To reduce the frequency of serious infection in chronic granulomatous disease
- **BY SUBCUTANEOUS INJECTION**
  - Child 6 months-17 years (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
  - Child 6 months-17 years (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week
To reduce the frequency of serious infection in severe malignant osteosarcoma
- **BY SUBCUTANEOUS INJECTION**
  - Child (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
  - Child (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

**CONTRA-INDICATIONS**
Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response

**CAUTIONS**
Arrhythmias—cardiac disease; congestive heart failure—ischæmia; seizure disorders (including seizures associated with fever)

**SIDE-EFFECTS**
- Common or very common Abdominal pain—arthralgia—back pain—chills—depression—diarrhoea—fatigue—fever—headache—nausea—rash—vomiting

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during treatment—consult product literature.

**PREGNANCY**
Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**
Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment (increased risk of accumulation).

**RENAL IMPAIRMENT**
Manufacturer advises caution in severe impairment—risk of accumulation.

**MONITORING REQUIREMENTS**
Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Immukin** (Roche Products Ltd)
  - Interferon alfa-2b 50 mega u per 1 ml
  - Interferon alfa-2b 50 million units per 1 ml

**IMMUNOSTIMULANTS**

**Mifamurtide**

**INDICATIONS AND DOSE**
Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)
- **BY INTRAVENOUS INFUSION**
- Child 2-17 years: Infusion to be given over 1 hour (consult product literature or local protocols)

**UNLICENSED USE**
Not licensed for use in patients under 2 years of age at initial diagnosis.

**CAUTIONS**
- Asthma—consider prophylactic bronchodilator therapy—chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy—history of autoimmune disease—history of collagen disease—history of inflammatory disease

**INTERACTIONS**
Appendix 1: mifamurtide

**SIDE-EFFECTS**

**CONCEPTION AND CONTRACEPTION**
Effective contraception required.

**PREGNANCY**
Avoid.

**BREAST FEEDING**
Avoid—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in moderate impairment (risk of increased half-life and exposure); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**
Use with caution—no information available.

**MONITORING REQUIREMENTS**
Monitor renal function, hepatic function and clotting parameters.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235
Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed
4 Targeted therapy responsive malignancy

ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS

Dasatinib

30-Apr-2019

- DRUG ACTION Dasatinib is a tyrosine kinase inhibitor.

- INDICATIONS AND DOSE
  Chronic phase chronic myeloid leukaemia (initiated by a specialist) / Acute lymphoblastic leukaemia (in combination with chemotherapy) (initiated by a specialist)

  - BY MOUTH USING TABLETS
    Child 1-17 years (body-weight 10-19 kg): 40 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
    Child 1-17 years (body-weight 20-29 kg): 60 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
    Child 1-17 years (body-weight 30-44 kg): 70 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
    Child 1-17 years (body-weight 45 kg and above): 100 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature

- IMPORTANT SAFETY INFORMATION
  RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
  See Cytotoxic drugs p. 551.

  MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS
  An EU wide review has concluded that dasatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- CAUTIONS Hepatitis B infection - risk of cardiac dysfunction (monitor closely) - susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)

- CAUTIONS, FURTHER INFORMATION
  Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- INTERACTIONS > Appendix 1: dasatinib

- SIDE-EFFECTS

  - Rare or very rare Cardiac arrest - dementia - diabetes mellitus - facial paralysis - gait abnormal - hypersensitivity vasculitis - hyperthyroidism - pure red cell aplasia - seizure - thyroiditis

  - Frequency not known Hepatitis B reactivation - nephrotic syndrome - Stevens-Johnson syndrome

- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.

- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

- BREAST FEEDING Discontinue breast-feeding.

- HEPATIC IMPAIRMENT Manufacturer advises caution.

- MONITORING REQUIREMENTS
  Manufacturer advises evaluate for signs and symptoms of underlying cardiopulmonary disease before initiation of therapy—echocardiography should be performed at treatment initiation in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease.

  Manufacturer advises monitor patients with risk factors or a history of cardiac disease for signs or symptoms of cardiac dysfunction during treatment.

  When used for Chronic phase chronic myeloid leukaemia Manufacturer advises monitor full blood count every 2 weeks for 3 months, then every 3 months or as clinically indicated thereafter.
Immune system and malignant disease

When used for Acute lymphoblastic leukaemia Manufacturer advises monitor full blood count prior to each treatment cycle and as clinically indicated thereafter. During consolidation treatment, manufacturer advises monitor full blood count every 2 days until recovery.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium (SMC) has advised (April 2019) that dasatinib (Sprycel<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of paediatric patients weighing 10 kg and above with newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (Ph<sup>+</sup> CML-CP) or Ph<sup>+</sup> CML-CP resistant or intolerant to prior therapy including imatinib. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

All Wales Medicines Strategy Group (AWMSG) No. 1514

The All Wales Medicines Strategy Group has advised (April 2019) that dasatinib (Sprycel<sup>®</sup>) is recommended as an option for use within NHS Wales for the treatment of paediatric patients weighing 10 kg and above with newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (Ph<sup>+</sup> CML-CP) or Ph<sup>+</sup> CML-CP resistant or intolerant to prior therapy including imatinib. This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

Sprycel<sup>®</sup>

BY MOUTH USING TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- Child 1-17 years: (consult product literature)

Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex

- BY MOUTH USING DISPERSIBLE TABLETS
- Child 2-17 years: (consult product literature)

Everolimus

INDICATIONS ACTION

Everolimus is a protein kinase inhibitor.

INDICATIONS AND DOSE

VOTUBIA<sup>®</sup> DISPERSIBLE TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- BY MOUTH USING DISPERSIBLE TABLETS
- Child 1-17 years: (consult product literature)

Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex

- BY MOUTH USING DISPERSIBLE TABLETS
- Child 2-17 years: (consult product literature)

VOTUBIA<sup>®</sup> TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- BY MOUTH USING TABLETS
- Child 1-17 years: (consult product literature)

CAUTIONS

History of bleeding disorders - peri-surgical period (impaired wound healing)

INTERACTIONS

Appendix 1: everolimus

SIDE-EFFECTS

Common or very common

Rare or very rare

- Congestive heart failure - embolism and thrombosis - flushing - healing impaired - hepatitis B - musculoskeletal chest pain - pancytopenia - sepsis - urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION

Reduce dose or discontinue if severe side-effects occur—consult product literature.

CONCEPTION AND CONTRCEPTION

Effective contraception must be used during and for up to 8 weeks after treatment.

PREGNANCY

Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

BREAST FEEDING

Manufacturer advises avoid.

HEPATIC IMPAIRMENT

Consult product literature.

MONITORING REQUIREMENTS

- For Votubia<sup>®</sup> preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.

- Manufacturer advises monitor blood glucose concentration, complete blood count, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.

- Manufacturer advises monitor renal function before treatment and periodically thereafter.

- Manufacturer advises monitor for signs and symptoms of infection before and during treatment.

DIRECTIONS FOR ADMINISTRATION

VOTUBIA<sup>®</sup> DISPERSIBLE TABLETS

Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.

VOTUBIA<sup>®</sup> TABLETS

Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

PRESCRIBING AND DISPENSING INFORMATION

Votubia<sup>®</sup> is available as both tablets and dispersible tablets. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

IMPORTANT SAFETY INFORMATION

Risks of incorrect dosing of oral anti-cancer medicines

See Cytotoxic drugs p. 551.

580 Targeted therapy responsive malignancy

BNFC 2019-2020

8
Targeted therapy responsive malignancy 581

**PATIENT AND CARER ADVICE**

*Pneumonitis* Non-infectious pneumonitis reported. Manufacturer advises patients and their carers should be informed to seek urgent medical advice if new or worsening respiratory symptoms occur.

*Infections* Manufacturer advises patients and their carers should be informed of the risk of infection.

**NATIONAL FUNDING/ACCESS DECISIONS**

**VOTUBIA® DISPERSIBLE TABLETS**

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 331/18

The Scottish Medicines Consortium has advised (June 2018) that everolimus (Votubia®) dispersible tablets are accepted for use within NHS Scotland for the adjunctional treatment of patients aged two years and older whose refractory partial-onset seizures, with or without secondary generalisation, are associated with tuberous sclerosis complex. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**IMPORTANT SAFETY INFORMATION**

**SIDE EFFECTS**

- **Common or very common** Alopecia - anaemia - appetite abnormal - asthenia - bone marrow disorders - chills - constipation - cough - diarrhoea - diziness - dry eye - dry mouth - dyspnoea - excessive tearing - eye inflammation - fever - fluid imbalance - flushing - gastrointestinal discomfort - gastrointestinal disorders - haemorrhage - headaches - insomnia - joint disorders - muscle complaints - nausea - neutropenia - oedema - pain - photosensitivity reaction - sensation abnormal - skin reactions - sweat changes - taste altered - thrombocytopenia - vision blurred - vomiting - weight changes

- **Rare or very rare** Angina pectoris - angioedema - arthritis - cardiac arrest - cataplexy - confusion - glaucoma - haemolytic anaemia - haemorrhagic ovarian cyst - hepatic failure (including fatal cases) - hypersensitivity vasculitis - inflammatory bowel disease - intracranial pressure increased - muscle weakness - myocardial infarction - myopathy - nail discoloration - pericardial disorders - pulmonary hypertension - seizure - severe cutaneous adverse reactions (SCARs) - tumour lysis syndrome

- **Frequency not known** Embolism and thrombosis - growth retardation - hepatitis B reactivation - pejoeplasm complications - osteonecrosis - pericarditis

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

**Dose adjustments** Start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol.

**RENAL IMPAIRMENT**

**Dose adjustments** Start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol.

**MONITORING REQUIREMENTS**

- Monitor for gastrointestinal haemorrhage.
- Monitor complete blood counts regularly.
- Monitor for fluid retention.
- Monitor liver function.
- Monitor growth in children (may cause growth retardation).

**DIRECTIONS FOR ADMINISTRATION**

Tablets may be dispersed in water or apple juice.

---

**Imatinib**

**DRUG ACTION**

Imatinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of newly diagnosed Philadelphia-chromosome-positive chronic myeloid leukaemia when bone marrow transplantation is not considered first line treatment.

Treatment of Philadelphia-chromosome-positive chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis in combination with chemotherapy.

- **BY MOUTH**
- Child: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 551.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**CAUTIONS**

Cardiac disease - hepatitis B infection - history of renal failure - risk factors for heart failure

**CAUTIONS, FURTHER INFORMATION**

- Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

**INTERACTIONS**

Appendix 1: imatinib
Targeted therapy responsive malignancy

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer imatinib tablets.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 21, 27

- **Imatinib (Non-proprietary)**
  - Imatinib (as imatinib mesilate) 100 mg: Imatinib 100mg tablets | 30 tablet (PZN) £486.66 | 60 tablet (PZN) £973.32 DT = £603.10
  - Imatinib (as imatinib mesilate) 400 mg: Imatinib 400mg tablets | 30 tablet (PZN) £1,946.67 DT = £1,157.46 | 60 tablet (PZN) £3,893.34
- **Glivec (Novartis Pharmaceuticals UK Ltd)**
  - Imatinib (as imatinib mesilate) 100 mg: Glivec 100mg tablets | 60 tablet (PZN) £1,946.67 DT = £1,157.46
  - Imatinib (as imatinib mesilate) 400 mg: Glivec 400mg tablets | 30 tablet (PZN) £1,946.67 DT = £1,157.46

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 551.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**CAUTIONS**

- **Clinically significant bradycardia**
- **Congestive heart failure**
- **Hepatitis B infection**
- **History of pancreatitis**
- **Recent myocardial infarction**
- **Susceptibility to QT-interval prolongation (including electrolyte disturbances)**
- **Unstable angina**

**CAUTIONS, FURTHER INFORMATION**

- **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

**INTERACTIONS** → Appendix 1: nilotinib

**SIDE-EFFECTS**

- **Common or very common** Alopecia, anaemia, angina, pectoris, anxiety, appetite abnormal, arthralgia, asthenia, bone marrow disorders, cardiac conduction disorders, chest discomfort, constipation, cough, decreased leucocytes, depression, diabetes mellitus, diarrhoea, dizziness, dry eye, dyslipidaemia, dyspnoea, electrolyte imbalance, eosinophilia, eye discomfort, eye disorders, eye inflammation, fever, flushing, gastrointestinal discomfort, gastrointestinal disorders, headaches, hepatic disorders, hyperbilirubinaemia, hyperglycaemia, hypertension, increased risk of infection, insomnia, muscle complaints, muscle weakness, myocardial infarction, nausea, neoplasms, neutropenia, oedema, pain, palpitations, peripheral neuropathy, QT interval prolongation, respiratory disorders, sensation abnormal, skin reactions, sweat changes, taste altered, thrombocytopenia, vertigo, vomiting, weight changes
- **Uncommon** Atherosclerosis, cerebrovascular insufficiency, chills, cyanosis, erectile dysfunction, gout, haemorrhage, heart failure, hyperaemia, malaise, oral disorders, pancreatitis, peripheral vascular disease, temperature sensation altered, vision disorders
- **Frequency not known** Breast abnormalities, chorioretinopathy, diastolic dysfunction, dry mouth, facial swelling, gynaecomastia, hepatitis B reactivation, hyperparathyroidism, hyperuricaemia, hypoglycaemia, lethargy, memory loss, menorrhagia, oesophageal pain, oropharyngeal pain, pericardial effusion, pericarditis, restless legs, sebaceous hyperplasia, syncope, tremor, urinary disorders, urine discoloration

**CONCEPTION AND CONTRACEPTION** Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for up to two weeks after stopping treatment.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—tocolytics in animal studies; see also Pregnancy and reproductive function in Cytotoxic drugs p. 551.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution (risk of increased exposure).

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor lipids before initiating treatment, at 3 and 6 months, and then yearly thereafter; monitor blood glucose before initiating treatment and then periodically during treatment, as clinically indicated.
- Manufacturer advises monitor full blood count every 2 weeks for the first 2 months of treatment, then monthly thereafter, or as clinically indicated.
- Manufacturer advises perform baseline ECG before treatment and as clinically indicated thereafter; correct any electrolyte disturbances before treatment and monitor periodically during treatment.
- Manufacturer advises monitor and actively manage cardiovascular risk factors during treatment.
- Manufacturer advises monitor liver function (including bilirubin and hepatic transaminases) monthly or as clinically indicated.

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises capsules should either be swallowed whole or the contents of each capsule may be dispersed in one teaspoon of apple sauce and taken immediately.

**PRESCRIBING AND DISPENSING INFORMATION**

All prescribers should be familiar with the Summary of Key Safety Recommendations for Tasigna ® (nilotinib) provided by the manufacturer.

**PATIENT AND CARER ADVICE**

Manufacturer advises patients and carers should seek immediate medical attention if signs or symptoms of cardiovascular events occur.

All patients should be provided with the Important Information About How to Take Your Medication leaflet provided by the manufacturer.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Capsule

**CAUTIONARY AND ADVISORY LABELS** 23, 25, 27

- **Tasigna (Novartis Pharmaceuticals UK Ltd)**
  - Nilotinib (as Nilotinib hydrochloride monohydrate) 150 mg: Tasigna 150mg capsules | 112 capsule (PZN) £2,432.85
  - Nilotinib (as Nilotinib hydrochloride monohydrate) 200 mg: Tasigna 200mg capsules | 112 capsule (PZN) £2,432.85
Chapter 9

Blood and nutrition

CONTENTS

Blood and blood-forming organs

1 Anaemias

1.1 Hypoplastic, haemolytic, and renal anaemias

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

1.2 Iron deficiency anaemia

1.3 Megaloblastic anaemia

2 Iron overload

3 Neutropenia and stem cell mobilisation

4 Platelet disorders

4.1 Essential thrombocythaemia

4.2 Immune thrombocytopenia

Nutrition and metabolic disorders

1 Acid-base imbalance

1.1 Metabolic acidosis

2 Fluid and electrolyte imbalances

2.1 Calcium imbalance

2.1a Hypocalcaemia

2.2 Low blood volume

2.3 Magnesium imbalance

2.3a Hypomagnesaemia

2.4 Phosphate imbalance

2.4a Hyperphosphataemia

2.4b Hypophosphataemia

2.5 Potassium imbalance

2.5a Hyperkalaemia

2.5b Hypokalaemia

3 Metabolic disorders

3.1 Acute porphyrias

3.2 Carnitine deficiency

3.3 Cystinosis

3.3a Nephropathic cystinosis

3.4 Fabry’s disease

3.5 Gaucher’s disease

3.6 Homocystinuria

3.7 Hypophosphatasia

3.8 Mitochondrial disorders

3.9 Mucopolysaccharidosis

3.10 Niemann-Pick type C disease

3.11 Pompe disease

3.12 Tyrosinaemia type I

3.13 Urea cycle disorders

3.14 Wilson’s disease

4 Mineral and trace elements deficiencies

4.1 Zinc deficiency

6 Nutrition (oral)

6.1 Special diets

6.1a Phenylketonuria

7 Vitamin deficiency

7.1 Neural tube defects (prevention in pregnancy)

Blood and blood-forming organs

1 Anaemias

Anaemia treatment considerations

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 572 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, Vicia faba); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:
Blood and nutrition

Ideally, information about G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others; manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals; the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common. A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

**Drugs with definite risk of haemolysis in most G6PD-deficient individuals**
- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Fluoroquinolones (including ciprofloxacin, moxifloxacin, norfloxacin, and ofloxacin)
- Methylthioninium chloride
- Nitrazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primamquil (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (such as nalidixic acid [not on UK market])
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

**Drugs with possible risk of haemolysis in some G6PD-deficient individuals**
- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfomethoxazole

Naphthalene in mothballs also causes haemolysis in G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia and may cause severe reactions in patients with haemolytic anaemia in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of these drugs.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. Reversible sideroblastic anaemias respond to treatment of the underlying cause but pyridoxine hydrochloride is indicated in pregnancy, haemolytic anaemias, or during isoniazid p. 382 treatment.

Corticosteroids have an important place in the management of haematological disorders including autoimmune haemolytic anaemia, idiopathic thrombocytopenias and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphomas, lymphoid leukemias, and paraproteinaemias, including multiple myeloma.

**Erythropoietins**

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure.

Epoetin beta p. 587 is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks.

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy. Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

### 1.1 Hypoplastic, haemolytic, and renal anaemias

**Other drugs used for Hypoplastic, haemolytic, and renal anaemias**
- Epoetins

### Oxymetholone

**INDICATIONS AND DOSE**
- **Aplastic anaemia**
  - **BY MOUTH**
    - Child: 1–5 mg/kg daily for 3 to 6 months

**INTERACTIONS**
- Appendix 1: oxymetholone

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
- **Capsule**
  - Oxymetholone (Non-proprietary)
  - Oxymetholone 50 mg: Oxymetholone 50mg capsules | 50 capsule (PMS) £17.00 (@60)

### EPOETINS

**Epoetins**

**IMPORTANT SAFETY INFORMATION**
- **MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOEITINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS**

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson...
syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

**ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION**
In chronic kidney disease, the use of erythropoietins can be considered in a child with anaemia. The aim of treatment is to relieve symptoms of anaemia and to avoid the need for blood transfusion. The optimum haemoglobin concentration is dependent on the child’s age and factors such as symptoms, comorbidities, and patient preferences. The haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia. In adults, overcorrection of haemoglobin concentration with erythropoietins in those with chronic kidney disease may increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

**CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates - pure red cell aplasia following erythropoietin therapy - uncontrolled hypertension

**CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) - concurrent infection (can impair the response to erythropoietin) - correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment - during dialysis (increase in unfraccionated or low molecular weight heparin dose may be needed) - epilepsy - inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled - ischaemic vascular disease - malignant disease - other inflammatory disease (can impair the response to erythropoietin) - sickle-cell disease (lower target haemoglobin concentration may be appropriate) - sudden stabbing migraine-like pain (warning of a hypertensive crisis) - thrombocytosis (monitor platelet count for first 8 weeks)

**SIDE-EFFECTS**
- Common or very common Arthralgia - embolism and thrombosis - headache - hypertension (dose-dependent) - influenza like illness - skin reactions - stroke
- Uncommon Hypertensive crisis (in isolated patients with normal or low blood pressure) - respiratory tract congestion - seizure
- Rare or very rare Thrombocytosis
- Frequency not known Pure red cell aplasia (more common following subcutaneous administration in patients with chronic renal failure)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypertensive crisis** In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

**Pure red cell aplasia** There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

**MONITORING REQUIREMENTS**
- Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates.

**Darbepoetin alfa**

**INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic renal failure in patients on dialysis
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis
- **BY SUBCUTANEOUS INJECTION**
  - Child 11–17 years: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in infants not on dialysis
- **BY INTRAVENOUS INJECTION**
  - Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

**Blood and nutrition**
Blood and nutrition

INTERACTIONS ➔ Appendix 1: darbepoetin alfa

SIDE-EFFECTS ➔ Common or very common: Hypersensitivity - oedema

PREGNANCY: No evidence of harm in animal studies—manufacturer advises caution.

HEPATIC IMPAIRMENT: Manufacturer advises caution (no information available).

HEPATIC IMPAIRMENT: Manufacturer advises caution.

INDICATIONS AND DOSE

Epoetin alfa

EPRELX® Pre-filled syringes

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

BY INTRAVENOUS INJECTION

Child (body-weight up to 10 kg): Initially 50 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Child (body-weight 10–30 kg): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 60–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Child (body-weight 31–60 kg): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Child (body-weight 61 kg and above): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, maintenance dose can be given as a single dose or in divided doses, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

INTERACTIONS ➔ Appendix 1: epoetin alfa

SIDE-EFFECTS ➔ Common or very common: Chills • cough • diarrhoea • fever • myalgia • nausæa • pain • peripheral oedema • vomiting

Uncommon: Hyperkalaemia

• **BREAST FEEDING**  Unlikely to be present in milk. Minimal effect on infant.

• **HEPATIC IMPAIRMENT**  Manufacturer advises caution in chronic hepatic failure.

• **PRESCRIBING AND DISPENSING INFORMATION**  Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

• **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Eprex** (Janssen-Cilag Ltd)
  - Epoetin alfa 2000 unit per 1 ml | Eprex 1,000 units/0.5ml solution for injection pre-filled syringes | 6 pre-filled disposable injection | £33.18 DT + £33.18
  - Epoetin alfa 4000 unit per 1 ml | Eprex 2,000 units/0.5ml solution for injection pre-filled syringes | 6 pre-filled disposable injection | £66.37 DT + £66.37

30-Apr-2019

**INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic renal failure

- **BY SUBCUTANEOUS INJECTION**
  
  - Neonate: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- Child: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- **BY INTRAVENOUS INJECTION**
  
  - Neonate: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- Child: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

**Prevention of anaemias of prematurity in neonates**

- **BY SUBCUTANEOUS INJECTION**
  
  - Neonate up to 33 weeks corrected gestational age (body-weight 0.75–1.5 kg): 250 units/kg 3 times a week preferably started within 3 days of birth and continued for 6 weeks, using single-dose unsupervised injection.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (MAY 2015) EPOETIN BETA (NEORECORMON): INCREASED RISK OF RETINOPATHY IN PRETERM INFANTS CANNOT BE EXCLUDED

There is a possible increased risk of retinopathy in preterm infants, when epoetin beta is used for preventing anaemia of prematurity. When using epoetin beta in preterm infants:

- consider the benefits and risks of treatment, including the possible risk of retinopathy,
- monitor the infant for features of retinopathy, and
- advise parents or carers that their baby’s eyes will be carefully monitored for any ill effects.

**INTERACTIONS**  ➔ Appendix 1: epoetin beta

**SIDE-EFFECTS**  Severe cutaneous adverse reactions (SCARS)
PREGNANCY  No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

BREAST FEEDING  Unlikely to be present in milk. Minimal effect on infant.

HEPATIC IMPAIRMENT  Manufacturer advises caution in chronic hepatic failure.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
EXCIPIENTS: May contain Phenylalanine  
- NeoRecormon  (Roche Products Ltd)  
  Epoetin beta 1667 unit per 1 ml NeoRecormon 500 units/0.3 ml solution for injection pre-filled syringes  |  6 pre-filled disposable injection (PSI)  £21.05 DT  =  £21.25  
  Epoetin beta 6667 unit per 1 ml NeoRecormon 2,000 units/0.3 ml solution for injection pre-filled syringes  |  6 pre-filled disposable injection (PSI)  £84.17 DT  =  £84.17  
  Epoetin beta 10000 unit per 1 ml NeoRecormon 3,000 units/0.3 ml solution for injection pre-filled syringes  |  6 pre-filled disposable injection (PSI)  £116.34 DT  =  £116.34  
  Epoetin beta 16667 unit per 1 ml NeoRecormon 10,000 units/0.6 ml solution for injection pre-filled syringes  |  6 pre-filled disposable injection (PSI)  £420.85 DT  =  £420.85  
  NeoRecormon 5,000 units/0.3 ml solution for injection pre-filled syringes  |  6 pre-filled disposable injection (PSI)  £210.42 DT  =  £210.42  
  Epoetin beta 20000 unit per 1 ml NeoRecormon 6,000 units/0.3 ml solution for injection pre-filled syringes  |  6 pre-filled disposable injection (PSI)  £252.50 DT  =  £252.50  
  Epoetin beta 33333 unit per 1 ml NeoRecormon 20,000 units/0.6 ml solution for injection pre-filled syringes  |  6 pre-filled disposable injection (PSI)  £841.71 DT  =  £841.71  
  Epoetin beta 50000 unit per 1 ml NeoRecormon 30,000units/0.6 ml solution for injection pre-filled syringes  |  4 pre-filled disposable injection (PSI)  £841.71 DT  =  £841.71

Epoetin zeta  
30-Apr-2019  

INDICATIONS AND DOSE  
Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis
- By intravenous injection  
  Child (body-weight up to 10 kg): Initially 50 units/kg 3 times a week, adjusted according to response, to be administered at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, to be administered over 1–5 minutes, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 ml over 4 weeks  
  Child (body-weight 10–30 kg): Initially 50 units/kg 3 times a week, adjusted according to response, to be administered at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, to be administered over 1–5 minutes, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 ml over 4 weeks  
  Child (body-weight >30 kg): Initially 50 units/kg 3 times a week, adjusted according to response, to be administered at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, to be administered over 1–5 minutes, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 ml over 4 weeks

INTERACTIONS  
- Appendix 1: epoetin zeta

SIDE-EFFECTS  
- Common or very common  Asthenia • dizziness

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

IMMUNOSUPPRESSANTS  
MONOCLONAL ANTIBODIES

Eculizumab  
04-Dec-2017

DRUG ACTION  Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

INDICATIONS AND DOSE  
Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)
- By intravenous infusion
- Child: Refer for specialist advice, experience very limited
Iron deficiency anaemia

Anaemia, iron deficiency

Iron deficiency, treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastrointestinal bleeding). The possibility of thalassaemia should be

**1.2 Iron deficiency anaemia**
Blood and nutrition supplementation is started babies of low birth-weight who are solely breast-fed; some oral preparations contain ascorbic acid p. Compound preparations unless dietary intake is adequate. All babies require an iron substantial iron stores but these stores can become depleted does not respond to iron therapy. Similarly, change rapidly. These changes are not due to iron deficiency anaemia. The oral dose of elemental iron to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates. When prescribing, express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

### Iron content of different iron salts

<table>
<thead>
<tr>
<th>Iron salt/amount</th>
<th>Content of ferrous iron</th>
</tr>

<tr>
<td>sodium feredate 190 mg</td>
<td>27.5 mg</td>
</tr>
</tbody>
</table>

### Prophylaxis of iron deficiency

In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow’s milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow’s milk, rather than fortified formula feed, is a major part of the diet.

**Compound preparations**

Some oral preparations contain ascorbic acid p. 652 to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins, except folic acid p. 594 for pregnant women.

### Parenteral iron

Iron can be administered parenterally as iron dextran p. 591, iron sucrose p. 591 or ferric carboxymaltose p. 591. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the baby cannot tolerate oral iron, or does not take it reliably, or if there is continuing bleeding loss, or in malabsorption. Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis. With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child’s body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

### MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

**Iron (injectable)**

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)**

Serious hypersensitivity reactions, including lifethreatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

**CONTRA-INDICATIONS** Disturbances in utilisation of iron - iron overload

**CAUTIONS** Allergic disorders - eczema - hepatic dysfunction - immune conditions - infection (discontinue if ongoing bacteraemia) - inflammatory conditions - oral iron should not be given until 5 days after the last injection - severe asthma

**SIDE-EFFECTS**

- **Common or very common** Dizziness - flushing - headache - hypertension - hypophosphataemia - hypotension - nausea - taste altered
- **Uncommon** Arthralgia - bronchospasm - chest pain - chills - constipation - diarrhoea - dyspnoea - fatigue - fever - gastrointestinal discomfort - hyperhidrosis - hypersensitivity - loss of consciousness - muscle
complaints - pain - peripheral oedema - sensation abnormal - skin reactions - vision blurred - vomiting

- Rare or very rare Angioedema, anxiety, circulatory collapse - influenza like illness - malaise - paller - palpitations - psychiatric disorder - seizure - syncope - tremor

SIDE-EFFECTS, FURTHER INFORMATION Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 695.

Ferric carboxymaltose

- INDICATIONS AND DOSE
  Iron-deficiency anaemia
  BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  Child: Dose calculated according to body-weight and iron deficit (consult product literature)

- UNLICENSED USE
  Not licensed for use in children under 14 years.

- INTERACTIONS
  Appendix 1: iron (injectable)

- SIDE-EFFECTS
  Rare or very rare Face oedema - flatulence

- PREGNANCY
  Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution—monitor iron status to avoid iron overload; avoid where iron overload increases risk of impairment (particularly porphyria cutanea tarda).

- PRESCRIBING AND DISPENSING INFORMATION
  A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Solution for injection
  ELECTROLYTES: May contain Sodium
  - Ferinject (Vifor Pharma UK Ltd)
    Iron (as Ferric carboxymaltose) 50 mg per 1 ml
    Ferinject 1000mg/20ml solution for injection vials | 1 vial | £154.23
    Ferinject 100mg/2ml solution for injection vials | 5 vial | £81.18
    Ferinject 500mg/10ml solution for injection vials | 5 vial | £405.88

Iron dextran

- INDICATIONS AND DOSE
  Iron-deficiency anaemia
  BY DEEP INTRAMUSCULAR INJECTION
  Child 14–17 years: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)
  BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  Child: Doses calculated according to body-weight and iron deficit (consult product literature)

- UNLICENSED USE
  Not licensed for use in children under 14 years.

- INTERACTIONS
  Appendix 1: iron (injectable)

- SIDE-EFFECTS
  Uncommon Feeling hot
  Rare or very rare Deafness (transient) - haemolysis

  Frequency not known Injection site necrosis - rheumatoid arthritis aggravated

- PREGNANCY
  Avoid in first trimester.

- HEPATIC IMPAIRMENT
  Avoid in severe impairment.

- RENAL IMPAIRMENT
  Avoid in acute renal failure.

- PRESCRIBING AND DISPENSING INFORMATION
  A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - Venofer (Vifor Pharma UK Ltd)
    Iron (as Iron dextran) 50 mg per 1 ml
    Venofer 50mg/0.5ml solution for injection vials | 5 vial | £43.52
    Venofer 50mg/2.5ml solution for injection vials | 5 vial | £90.88

Iron sucrose

- INDICATIONS AND DOSE
  Iron-deficiency anaemia
  BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  Child (body-weight up to 67 kg): Dose calculated according to body-weight and iron deficit, each divided dose should not exceed 3 mg/kg/dose (consult product literature)
  Child (body-weight 67 kg and above): Dose calculated according to body-weight and iron deficit, each divided dose should not exceed max. 200 mg/dose (consult product literature)

- UNLICENSED USE
  Not licensed for use in children.

- INTERACTIONS
  Appendix 1: iron (injectable)

- SIDE-EFFECTS
  Uncommon Asthenia
  Rare or very rare Drowsiness - urine discoloration
  Frequency not known Cold sweat - confusion - level of consciousness decreased - thrombophlebitis

- PREGNANCY
  Avoid in first trimester.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution—monitor iron status to avoid iron overload; avoid where iron overload is a precipitating factor (particularly porphyria cutanea tarda).

- PRESCRIBING AND DISPENSING INFORMATION
  A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - Venofer (Vifor Pharma UK Ltd, Imported (United States))
    Iron (as Iron sucrose) 20 mg per 1 ml
    Venofer 20mg/1ml solution for injection vials | 5 vial | £45.57

MINERALS AND TRACE ELEMENTS > IRON, ORAL

Iron (oral)

- SIDE-EFFECTS
  Common or very common Constipation - diarrhoea - gastrointestinal discomfort - nausea
  Uncommon Vomiting
  Frequency not known Appetite decreased - faeces discoloured

SIDE-EFFECTS, FURTHER INFORMATION
Iron can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel
592 Anaemias

Ferrous fumarate

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia (prophylactic)**  
- **BY MOUTH USING TABLETS**  
  - Child 12-17 years: 210 mg 1–2 times a day  
  - Child 12-17 years: 140 mg twice daily

**Iron-deficiency anaemia (therapeutic)**  
- **BY MOUTH USING TABLETS**  
  - Child 12-17 years: 210 mg 2–3 times a day  
  - Child 12-17 years: 280 mg twice daily

**GALFER® CAPSULES**

**Iron-deficiency anaemia (prophylactic)**  
- **BY MOUTH**  
  - Child 12-17 years: 305 mg daily

**By mouth**

- Neonate up to 36 weeks corrected gestational age (body-weight up to 3 kg): 0.5 mL daily, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.
- Neonate: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.
- Child 1 month–11 years: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.  
- Child 12-17 years: 10 mL once daily

**Iron-deficiency anaemia (therapeutic)**  
- **BY MOUTH**  
  - Neonate: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses.

**Ferrous gluconate**

**INDICATIONS AND DOSE**

**Prophylaxis of iron-deficiency anaemia**  
- **BY MOUTH USING TABLETS**  
  - Child 6–11 years: 300–900 mg daily  
  - Child 12-17 years: 600 mg daily

**Treatment of iron-deficiency anaemia**  
- **BY MOUTH USING TABLETS**  
  - Child 6–11 years: 300–900 mg daily  
  - Child 12-17 years: 1.2–1.8 g daily in divided doses

**INTERACTIONS**  
- Appendix 1: iron (oral)

**SIDE-EFFECTS**  
- Gastrointestinal disorders

**PRESCRIBING AND DISPENSING INFORMATION**  
- Ferrous gluconate 300 mg contains 35 mg iron.
PATIENT AND CARER ADVICE
Medicines for Children leaflet: Ferrous gluconate for iron-deficiency anaemia www.medicinesforchildren.org.uk/ferrous-gluconate-iron-deficiency-anaemia

## 1.3 Megaloblastic anaemia

### Anaemia, megaloblastic

#### Overview
Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B₁₂ or folate and it is essential to establish in every case whether deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B₁₂ is used in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare disorders of congenital transcobalamin II deficiency and homocystinuria. Vitamin B₁₂ should be given prophylactically after total ileal resection.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in large oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 595 has completely replaced cyanocobalamin p. 595 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated.

In folate-deficient megaloblastic anaemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid daily is continued to term.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis, severe Crohn’s disease and severe psoriasis.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow’s milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folinic acid p. 575 is also effective in the treatment of folate deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs; it is given as calcium folinate.

There is no justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 660.

### Vitamins and trace elements > FOLATES

#### Folic acid

- **INDICATIONS AND DOSE**
  - **Folate-deficient megaloblastic anaemia**
    - **BY MOUTH**
      - Neonate: Initially 500 micrograms/kg once daily for up to 4 months.
      - Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
      - Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states
  - **Folate supplementation in neonates**
    - **BY MOUTH**
      - Neonate: 50 micrograms once daily.

- **Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see Neural tube defects (prevention in pregnancy) p. 660)**
  - **BY MOUTH**
  - **Females of childbearing potential**: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy
- **Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see Neural tube defects (prevention in pregnancy) p. 660)**
  - **BY MOUTH**
  - **Females of childbearing potential**: 5 mg daily, to be taken before conception and until week 12 of pregnancy
**Prevention of neural tube defects (in those with sickle-cell disease)**
- **BY MOUTH**
- Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

**Prevention of methotrexate side-effects in severe Crohn’s disease**
- **BY MOUTH**
- Child: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

**Prophylaxis of folate deficiency in dialysis**
- **BY MOUTH**
- Child 1 month–11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12–17 years: 5–10 mg once daily

**Haemolytic anaemia**
- **BY MOUTH**
- Child 1 month–11 years: 2.5–5 mg once daily
- Child 12–17 years: 5–10 mg once daily

**Prevention of methotrexate side-effects in juvenile idiopathic arthritis**
- **BY MOUTH**
- Child: 1 mg daily, alternatively 5 mg once weekly, dose to be adjusted according to local guidelines, weekly dose to be taken on a different day to methotrexate dose

---

### VITAMINS AND TRACE ELEMENTS

#### Cyanocobalamin

**29-Mar-2019**

**INDICATIONS AND DOSE**
- **Vitamin B12 deficiency of dietary origin**
  - **BY MOUTH**
  - Child: 50–105 micrograms daily in 1–3 divided doses

**PRESCRIBING AND DISPENSING INFORMATION**
Currently available brands of the tablet may not be suitable for vegans.

**NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions. Cyanocobalamin solution and Cytamina® injection are not prescribable in NHS primary care.

**LESS SUITABLE FOR PRESCRIBING**
Cyanocobalamin is less suitable for prescribing.

#### Hydroxocobalamin

**20-Jul-2017**

**INDICATIONS AND DOSE**
- **Macrocytic anaemia without neurological involvement**
  - **BY INTRAMUSCULAR INJECTION**
  - Child: Initially 0.25–1 mg once daily on alternate days for 1–2 weeks, then 0.25 mg once weekly until blood count normal, then 1 mg every 2–3 months

**Macrocytic anaemia with neurological involvement**
- **BY INTRAMUSCULAR INJECTION**
- Child: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2–3 months

**Prophylaxis of macrocytic anaemias associated with vitamin B12 deficiency**
- **BY INTRAMUSCULAR INJECTION**
- Child: 1 mg every 2–3 months

**Leber’s optic atrophy**
- **BY INTRAMUSCULAR INJECTION**
- Child: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

**Congenital transcobalamin II deficiency**
- **BY INTRAMUSCULAR INJECTION**

- Neonate: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.

- Child: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.

**Methylmalonic acidemia and homocystinuria**
- **BY INTRAMUSCULAR INJECTION**
- Child: Initially 1 mg daily for 5–7 days, then adjusted according to response to up to 1 mg 1–2 times a week, this is the maintenance dose

**Methylmalonic acidemia, maintenance once intramuscular response established**
- **BY MOUTH**
- Child: 5–10 mg 1–2 times a week, some children do not respond to oral route
Iron overload

Overview
Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 598 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by ascorbic acid p. 652 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS

Deferasirox

Drug action
Deferasirox is an oral iron chelator.

Indications and dose
Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

By mouth
Child 2–5 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

By mouth
Child 6–17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every
Iron overload

3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; usual maximum 21 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 ml/kg/month of packed red blood cells) [specialist use only]

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

- **BY MOUTH**
  - Child 2–17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum–ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum–ferritin concentration; maximum 28 mg/kg per day; usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

- **BY MOUTH**
  - Child 10–17 years: Initially 7 mg/kg once daily, maintenance dose adjusted according to serum–ferritin concentration and liver–iron concentration (consult product literature); maximum 7 mg/kg per day

- **CAUTIONS** History of liver cirrhosis—not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes)—platelet count less than 50 x 10^10/litre; risk of gastrointestinal ulceration and haemorrhage, unexpected cytopaenia—consider treatment interruption

- **INTERACTIONS** → Appendix 1: iron chelators

- **SIDE-EFFECTS**
  - **Common or very common** Constipation; diarrhoea; gastrointestinal discomfort; headache; nausea; skin reactions; urine abnormalities; vomiting
  - **Uncommon** Anxiety; cataract; cholelithiasis; deafness; dizziness; fatigue; fever; gastrointestinal disorders; gastrointestinal haemorrhage (including fatal cases); hepatic disorders; laryngeal pain; maculopathy; oedema; renal tubular disorders; sleep disorder
  - **Rare or very rare** Optic neuritis
  - **Frequency not known** Acute kidney injury; alopecia; anaemia aggravated; angioedema; hypersensitivity vasculitis; metabolic acidosis; nephritis tubulointerstitial; nephrolithiasis; neutropenia; pancreatitis acute; pancytopenia; renal tubular necrosis; severe cutaneous adverse reactions (SCARs); thrombocytopenia

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment.

- **Dose adjustments** Manufacturer advises reduce initial dose considerably then gradually increase to max. 50% of normal dose in moderate impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated creatinine clearance less than 60 ml/minute. Dose adjustments Manufacturer advises reduce dose if serum–creatinine increased above age–appropriate limits or creatinine clearance less than 90 ml/minute on 2 consecutive occasions—consult product literature.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum–ferritin concentration monthly.
  - Manufacturer advises monitor liver–iron concentration every three months in children with non-transfusion-dependent thalassaemia syndromes when serum ferritin is <800 micrograms/litre.
  - Manufacturer advises monitor body–weight, height, and sexual development before treatment and then annually thereafter.

- **DIRECTIONS FOR ADMINISTRATION** For film–coated tablets, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferasirox tablets.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (June 2017) that deferasirox (Exjade®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

- Patients with myelodysplastic syndromes, the commonly cause of transfusion–dependent anaemia, were poorly represented in the clinical trial population and the economic case was not demonstrated in this group.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Deferiprone**

- **DRUG ACTION** Deferiprone is an oral iron chelator.

- **INDICATIONS AND DOSE**
  - Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra–indicated or is inadequate
  - **BY MOUTH**
    - Child 6–17 years: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

- **INTERACTIONS** → Appendix 1: deferiprone

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain (reducing dose and increasing gradually may improve tolerance); agranulocytosis; appetite increased; arthralgia; diarrhoea (reducing dose and increasing gradually may improve tolerance); fatigue; headache; nausea (reducing dose and increasing gradually may improve tolerance); neutropenia; pain; proteinuria; skin reaction; vomiting

**Blood and nutrition**
Iron overload

- urine discolouration - vomiting (reducing dose and increasing gradually may improve tolerance)

■ Frequency not known Skin reactions - zinc deficiency

■ CONCEPTION AND CONTRACEPTION Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in animal studies. Contraception advised in females of child-bearing potential.

■ PREGNANCY Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in animal studies.

■ BREAST FEEDING Manufacturer advises avoid—no information available.

■ HEPATIC IMPAIRMENT Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

■ RENAL IMPAIRMENT Manufacturer advises caution—no information available.

■ MONITORING REQUIREMENTS Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.

■ PATIENT AND CARER ADVICE Blood disorders Patients or their carers should be told how to recognise signs of neutropaenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

■ MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- Oral solution
  - CAUTIONARY AND ADVISORY LABELS 14
    - Ferriprox (Swedish Orphan Biovitrum Ltd)
    - Desferal 500 mg per ml
    - Desferal 100mg/ml oral solution sugar-free | 500 ml (PN) £152.39 DT = £152.39

- Tablet
  - CAUTIONARY AND ADVISORY LABELS 14
    - Ferriprox (Swedish Orphan Biovitrum Ltd)
    - Desferal 500 mg
    - Desferal 500mg tablets | 100 tablet (PN) £152.39 DT = £152.39
    - Desferal 1 gram
    - Desferal 1000mg tablets | 50 tablet (PN) £175.25 DT = £175.25

■ Desferrioxamine mesilate (Deferoxamine Mesilate)

■ INDICATIONS AND DOSE

- Iron poisoning
  - BY CONTINUOUS INTRAVENOUS INFUSION
  - Neonate: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service.
  - Child: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

- Aluminiun overload in dialysis patients
  - BY INTRAVENOUS INFUSION
  - Child: 5 mg/kg once weekly

- Chronic iron overload (low iron overload)
  - BY SUBCUTANEOUS INFUSION
  - Child: Initially up to 30 mg/kg 3–7 times a week, to be given over 8–12 hours, the dose should reflect the degree of iron overload

- Chronic iron overload (established overload)
  - BY SUBCUTANEOUS INFUSION
  - Child: 20–50 mg/kg daily

■ UNLICENSED USE
- When used for iron poisoning Licensed for use in children (age range not specified by manufacturer).

■ CAUTIONS
- Aluminnum-related encephalopathy (may exacerbate neurological dysfunction)

■ INTERACTIONS
- Appendix 1: iron chelators

■ SIDE-EFFECTS
- Common or very common Arthralgia - bone disorder - fever - growth retardation - headache - muscle complaints - nausea - skin reactions

- Uncommon Abdominal pain - asthm a - deafness - neurosensory - tinnitus - vomiting

- Rare or very rare Angioedema - blood disorder - cataract - diarrhoea - dizziness - encephalopathy - eye disorders - hypersensitivity - hypotension (more common when given too rapidly by intravenous injection) - increased risk of infection - nerve disorders - nervous system disorder - paraesthesia - respiratory disorders - shock - tachycardia - thrombocytopenia - vision disorders

- Frequency not known Acute kidney injury - hypocalcaemia - leucopenia - renal tubular disorder - seizure - urine red

■ PREGNANCY
- Teratogenic in animal studies. Manufacturer advises use only if potential benefit outweighs risk.

■ BREAST FEEDING
- Manufacturer advises use only if potential benefit outweighs risk—no information available.

■ RENAL IMPAIRMENT
- Use with caution.

■ MONITORING REQUIREMENTS
- Eye and ear examinations before treatment and at 3-month intervals during treatment.

- Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.

■ DIRECTIONS FOR ADMINISTRATION
- For full details and warnings relating to administration, consult product literature.

- When used for Chronic iron overload or Aluminium overload in dialysis patients For intravenous or subcutaneous infusion, reconstitute powder with Water for Injection to a concentration of 100 mg/ml; dilute with Glucose 5% or Sodium Chloride 0.9%. In haemodialysis or haemo-filtration administer over the last hour of dialysis (may be given via the dialysis fistula). Intrapertitoneal: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

■ PATIENT AND CARER ADVICE
- Medicines for Children leaflet: Desferasirox for removing excess iron www.medicinesforchildren.org.uk/desferasirox-removing-excess-iron-0

■ MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

- Powder for solution for injection
  - Desferrioxamine mesilate (Non-proprietary)
    - Desferrioxamine mesilate 500 mg: Desferal 500mg powder for solution for injection vials | 10 vial (PN) £179.50
    - Desferrioxamine mesilate 2 gram: Desferal 2g powder for solution for injection vials | 10 vial (PN) £179.50
    - Desferal (Novartis Pharmaceuticals UK Ltd)
      - Desferrioxamine mesilate 500 mg: Desferal 500mg powder for solution for injection vials | 10 vial (PN) £46.63
3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rH-G-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim below (unglycosylated rH-G-CSF) and lenograstim p. 600 (glycosylated rH-G-CSF) have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia

Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rH-G-CSF) stimulates the production of neutrophils.
- **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—spleen size should be monitored · sickle-cell disease
- **CAUTIONS, FURTHER INFORMATION**
- **SIDE-EFFECTS**
  - Common or very common Arthralgia · cutaneous vasculitis · dyspnoea · haemoptysis · headache · hypersensitivity · leucocytosis · pain · spleen abnormalities · thrombocytopenia
  - Uncommon Acute febrile neutrophilic dermatosis · capillary leak syndrome · hypoxia · pulmonary oedema · respiratory disorders · sickle cell anaemia with crisis
- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies.
- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

***Filgrastim***

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

- **INDICATIONS AND DOSE**
  - Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes
  - Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route
  - Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion
  - Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)
    - **BY SUBCUTANEOUS INJECTION**
      - Child: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature
  - Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)
    - **BY SUBCUTANEOUS INJECTION**
      - Child 16–17 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature
  - Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)
    - **BY SUBCUTANEOUS INJECTION**
      - Child: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

- **MONITORING REQUIREMENTS**
  - Full blood counts including differential white cell and platelet counts should be monitored.
  - Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

- **MONITORING REQUIREMENTS**
  - Full blood counts including differential white cell and platelet counts should be monitored.
  - Spleen size should be monitored during treatment—risk of splenomegaly and rupture.
Severe cyclic neutropenia, or idiopathic neutropenia and
history of severe or recurrent infections (distinguish
carefully from other haematological disorders)
(specialist use only)

- By subcutaneous injection
  - Child: Initially 5 micrograms/kg daily, adjusted
    accordingly to response, can be given in single or
divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use
only)

- By subcutaneous injection
  - Child: Initially 1 microgram/kg daily, subsequent doses
    increased as necessary until neutrophil count in
    normal range, then adjusted to maintain neutrophil
    counts in normal range—consult product literature;
    maximum 4 micrograms/kg per day

Neonatal neutropenia (specialist use only)

- By subcutaneous injection
  - Neonate: 10 micrograms/kg daily, to be discontinued if
    white cell count exceeds 50 x 10^9/litre.

Glycogen storage disease type 1b (specialist use only)

- By subcutaneous injection
  - Child: Initially 5 micrograms/kg daily, dose to be
    adjusted as necessary

● Unlicensed use
  Not licensed for treatment of glycogen
  storage disease or neonatal neutropenia.

● Contra-indications
  Severe congenital neutropenia
  (Kostmann’s syndrome) with abnormal cytogenetics

● Cautions
  Osteoporotic bone disease (monitor bone
  density if given for more than 6 months) - secondary acute
  myeloid leukaemia

● Side-effects
  - Common or very common
    - Anaemia, diarrhoea, dysuria,
      haemorrhage, hepatomegaly, hyperuricaemia,
      hypotension, rash, urolithiasis, uric acid urolithiasis.
  - Uncommon
    - Fluid imbalance, graft versus host disease,
      peripheral vascular disease, pseudogout, rheumatoid arthritis,
      urate urolithiasis.

● Monitoring requirements
  Regular morphological and
cytogenetic bone-marrow examinations recommended in
severe congenital neutropenia (possible risk of
myelodysplastic syndromes or leukaemia).

● Directions for administration
  For subcutaneous or intravenous infusion, dilute with Glucose 5% to
a concentration of not less than 15 micrograms/mL; to dilute
to a concentration of 2–15 micrograms/mL, add albumin
solution (human albumin solution) to produce a final
albumin solution of 2 mg/mL; not compatible with Sodium
Chloride solutions.

● Prescribing and dispensing information
  Filgrastim is a biological medicine. Biological medicines must be
prescribed and dispensed by brand name, see Biological
medicines and Biosimilar medicines, under Guidance on
prescribing p. 1.

  1 million units of filgrastim solution for injection
  contains 10 micrograms filgrastim.

● Medicinal forms
  There can be variation in the licensing of
different medicines containing the same drug.

  Solution for injection
  - Accofil (Accord Healthcare Ltd) ▼
    - Filgrastim 60 mega u per 1 ml

      injection (POM) £399.50

Lenograstim
(Recombinant human granulocyte-colony
stimulating factor; rHuG-CSF)

● Indications and dose
  Reduction in the duration of neutropenia and associated
  complications following bone-marrow transplantation for
  non-myeloid malignancy (specialist use only)
  - Reduction in the duration of neutropenia and associated
    complications following peripheral stem cell
    transplantation for non-myeloid malignancy (specialist
    use only)
  - By intravenous infusion, or by subcutaneous injection
    - Child 2-17 years: 150 micrograms/m^2 daily until
      neutrophil count stable in acceptable range (max.
      28 days), to be started the day after transplantation.
    - Intravenous infusion to be given over 30 minutes

  Reduction in the duration of neutropenia and associated
  complications following treatment with cytotoxic
  chemotherapy associated with a significant incidence of
  febrile neutropenia (specialist use only)
  - By subcutaneous injection
    - Child 2-17 years: 150 micrograms/m^2 daily until
      neutrophil count stable in acceptable range (max.
      28 days), to be started on the day after completion of
      chemotherapy

  Mobilisation of peripheral blood progenitor cells
  for harvesting and subsequent infusion, used alone
  (specialist use only)
  - By subcutaneous injection
    - Child 2-17 years: 10 micrograms/kg daily for 4–6 days
      (5–6 days in healthy donors)

  Mobilisation of peripheral blood progenitor cells, used
  following adjunctive myelosuppressive chemotherapy
  (to improve yield) (specialist use only)
  - By subcutaneous injection
    - Child 2-17 years: 150 micrograms/m^2 daily until
      neutrophil count stable in acceptable range, to be
      started 1–5 days after completion of chemotherapy, for
      timing of leukopheresis, consult product literature

● Unlicensed use
  Not licensed for use in children for
cytotoxic-induced neutropenia, mobilisation of peripheral
blood progenitor cells (monotherapy or adjunctive
therapy), or following peripheral stem cells
transplantation.

● Side-effects
  - Common or very common
    - Abdominal pain - asthenia
thrombocythaemia in patients at risk of thrombo-
anagrelide below reduces platelets in essential
Platelet disorders

Idiopathic thrombocytopenic purpura
Acute idiopathic thrombocytopenic purpura is usually self-
limited in children. A corticosteroid, such as prednisolone
p. 458, is sometimes used if idiopathic thrombocytopenic
purpura does not resolve spontaneously or if it is associated
with severe cutaneous symptoms or mucous membrane
bleeding; corticosteroid treatment should not be continued
longer than 14 days regardless of the response.

Immunoglobulin preparations may be used in idiopathic
thrombocytopenic purpura or where a temporary rapid rise
in platelets is needed, as in pregnancy or pre-operatively;
they are often used in preference to a corticosteroid. Anti-D
(RhD) immunoglobulin p. 794 is licensed for the management
of idiopathic thrombocytopenic purpura.

Other therapies that have been tried under specialist
supervision in refractory idiopathic thrombocytopenic
purpura include: azathioprine p. 536, cyclophosphamide
p. 555, vincristine sulfate p. 570, and cyclosporin p. 537.
Rituximab p. 550 [unlicensed] is also used in specialist
centres but experience of its use in children is limited. For
patients with chronic severe thrombocytopenia refractory to
other therapy, tranexamic acid p. 83 may be given to reduce
the severity of haemorrhage.

Eltrombopag p. 602 and romiplostim p. 603 are
thrombopoietin receptor agonists. They are licensed for the
treatment of chronic immune (idiopathic) thrombocytopenic
purpura in children who are refractory to other treatments,
such as corticosteroids or immunoglobulins. Eltrombopag
is an oral preparation and romiplostim is an injection which is
made biosynthetically by recombinant DNA technology; they
should both be used under the supervision of a specialist.

Splenectomy is considered in chronic thrombocytopenic
purpura if a satisfactory platelet count is not achieved with
regular immunoglobulin infusions, if there is a relapse on
withdrawing or reducing the dose of corticosteroid, and if
other therapies are considered inappropriate.

Essential thrombocythaemia
Anagrelide below reduces platelets in essential
thrombocythaemia in patients at risk of thrombo-
haemorrhagic events who have not responded adequately to
other drugs or who cannot tolerate other drugs.

4.1 Essential thrombocythaemia

Other drugs used for Essential thrombocythaemia
Hydroxycarbamide, p. 572

ANTITHROMBOTIC DRUGS > CYCLIC AMP
PHOSPHODIESTERASE III INHIBITORS

<table>
<thead>
<tr>
<th>Anagrelide</th>
</tr>
</thead>
<tbody>
<tr>
<td>28-May-2018</td>
</tr>
</tbody>
</table>

- **INDICATIONS AND DOSE**
  - Essential thrombocythaemia in patients at risk of
    thrombo-haemorrhagic events who have not responded adequately to
    other drugs or who cannot tolerate other drugs (initiated under specialist supervision)
    - By mouth
      - Child 7-17 years: Initially 500 micrograms daily, dose to be
        adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose
        1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **SIDE-EFFECTS**
  - Not licensed for use in children.
  - **CAUTIONS**
    - Cardiovascular disease—assess cardiac function before and regularly during treatment - concomitant use of
drugs that prolong QT-interval—assess cardiac function before and regularly during treatment - risk factors for QT-
interval prolongation—assess cardiac function before and regularly during treatment
  - **INTERACTIONS**
    - Appendix 1: anagrelide
  - **SIDE-EFFECTS**
    - Common or very common: Anaemia - arthralgia - asthma - chest pain - chills - confusion - congestive heart failure
      - constipation - depression - dry mouth - dysphoria - erectile dysfunction - fever - haemorrhage - hypertension
      - insomnia - malaise - memory loss - myalgia - nervousness - oedema - pain - pancreatitis - pancytopenia - pneumonia
      - pulmonary hypertension - respiratory disorders - sensation abnormal - syncope - thrombocytenia - weight changes
    - Rare or very rare: Angina pectoris - cardiomyopathy - coordination abnormal - drowsiness - dysarthria - influenza
      - like illness - myocardial infarction - nocturia - pericardial effusion - postural hypotension - renal failure - tinnitus - vasodilation - vision disorders
    - Frequency not known: Hepatitis - nephritis - tubulointerstitial

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception required during treatment.

- **PREGNANCY**
  - Manufacturer advises avoid (toxicity in
    animal studies).

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in
    milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises use with
    caution in mild impairment; avoid in moderate-to-severe
    impairment or if serum transaminases exceed 5 times the
    upper limit of normal.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid if
    estimated glomerular filtration rate less than
    50 mL/minute/1.73 m²
### 4.2 Immune thrombocytopenia

**ANTHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS**

#### Eltrombopag

**INDICATIONS AND DOSE**

**Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)**

- **By mouth**
  - Child 1-5 years: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of $50 \times 10^{9}$/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.
  - Child 6-17 years: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of $50 \times 10^{9}$/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.
  - Child 6-17 years (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of $50 \times 10^{9}$/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

**SIDE-EFFECTS**

- **Common or very common**
  - Alopecia
  - Anaemia
  - Appetite decreased
  - Asthenia
  - Cough
  - Depression
  - Diarrhoea
  - Dry eye
  - Dry mouth
  - Fever
  - Gastrointestinal discomfort
  - Gastrointestinal disorders
  - Haemolytic anaemia
  - Hepatic disorders
  - Hyperbilirubinemia
  - Increased risk of infection
  - Malaise
  - Menorrhagia
  - Muscle complaints
  - Nasal complaints
  - Nausea
  - Oral disorders
  - Oropharyngeal complaints
  - Pain
  - Peripheral oedema
  - QT interval prolongation
  - Sensation abnormal
  - Skin reactions
  - Sleep disorder
  - Sweats
  - Vertigo
  - Vision disorders
  - Vomiting

- **Uncommon**
  - Anisocytosis
  - Arrhythmias
  - Balance impaired
  - Cardiovascular disorder
  - Cataract
  - Chest pain
  - Cyanosis
  - Drowsiness
  - Ear pain
  - Electrolyte imbalance
  - Embolism and thrombosis
  - Eosinophilia
  - Excessive tearing
  - Eye inflammation
  - Eye pain
  - Feeling hot
  - Feeling jittery
  - Food poisoning
  - Gout
  - Haemorrhage
  - Headaches
  - Hemiparesis
  - Increased leucocytes
  - Lens opacity
  - Mood altered
  - Muscle weakness
  - Myocardial infarction
  - Nephritis
  - Lupus
  - Nerve disorders
  - Nocturia
  - Rectosigmoid cancer
  - Renal failure
  - Retinal pigment epitheliopathy
  - Sinus disorder
  - Sleep apnoea
  - Speech disorder
  - Sunburn
  - Thrombocytopenia
  - Tremor
  - Urine abnormalities
  - Vasodilatation
  - Wound inflammation

**CONCEPTION AND CONTRACEPTION**

Ensure effective contraception during treatment.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Manufacturer advises consider avoiding.

**Dose adjustments**

- When used for idiopathic thrombocytopenic purpura: Manufacturer advises initial dose reduction to $25 \text{ mg}$ once daily and wait at least 3 weeks before upwards titration of dose.

**RENAL IMPAIRMENT**

Use with caution.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
- Manufacturer advises regular ophthalmological examinations for cataract formation.
- Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
- For idiopathic thrombocytopenic purpura, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached ($50 \times 10^{9}$/litre or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.

**EFFECT ON LABORATORY TESTS**

Eltrombopag is highly coloured and can cause serum discoloration and interference with total bilirubin and creatinine testing. If laboratory results are inconsistent with clinical observations, manufacturer advises re-testing using another method to help determine the validity of the result.

**DIRECTIONS FOR ADMINISTRATION**

Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

**PATIENT AND CARER ADVICE**

Patient counselling is advised on how to administer eltrombopag tablets.
Romiplostim

28-Jan-2019

**DRUG ACTION**
Romiplostim is an Fc–peptide fusion protein that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

**INDICATIONS AND DOSE**
Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

- **BY SUBCUTANEOUS INJECTION**
  - Child 1–17 years: Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50×10⁹/litre or more is reached, consult product literature for further details of dose adjustments; reassess bodyweight every 12 weeks, discontinue treatment if inadequate response after 4 weeks at maximum dose

**CAUTIONS**
Risk factors for thromboembolism

**SIDE-EFFECTS**
- Common or very common Anaemia, angiodema, arthralgia, asthenia, bone marrow disorders, chills, constipation, cough, diarrhoea, dizziness, embolism and thrombosis, eye inflammation, fever, flushing, gastrointestinal discomfort, headaches, hypersensitivity, increased risk of infection, influenza-like illness, muscle complaints, nausea, oropharyngeal pain, pain, palpitations, peripheral oedema, peripheral swelling, sensation abnormal, skin reactions, sleep disorders
- Uncommon Alopecia, appetite decreased, chest pain, clonus, dehydration, depression, dry throat, dysphagia, dyspnoea, erythromelalgia, eye disorders, eye pruritus, feeling hot, feeling jittery, gastrooesophageal reflux disease, gout, haemorrhage, hair growth abnormal, hypotension, irritability, leucocytosis, malaise, muscle weakness, myocardial infarction, nasal complaints, neoplasms, oral disorders, peripheral ischaemia, peripheral neuropathy, photosensitivity reaction, pleuritic pain, portal vein thrombosis, skin nodule, splenomegaly, taste altered, thrombocytosis, tooth discoloration, vertigo, vision disorders, vomiting, weight changes

**PREGNANCY**
Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution; consider avoiding in moderate to severe impairment (risk of thromboembolic complications).

**RENAL IMPAIRMENT**
Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**
- Manufacturer advises monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment.
- Manufacturer advises monitor platelet count weekly until platelet count reaches 50×10⁹/litre or more for at least 4 weeks without dose adjustment, then monthly thereafter.
- Manufacturer advises monitor platelet count following treatment discontinuation—risk of bleeding.

**PATIENT AND CARER ADVICE**
Driving and skilled tasks
Manufacturer advises that patients and their carers should be counselled on the effects on driving and the performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2126
The Scottish Medicines Consortium has advised (February 2019) that romiplostim (Nplate®) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged one year and older who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). Romiplostim is restricted to those with severe symptomatic ITP or those with a high risk of bleeding.

**All Wales Medicines Strategy Group (AWMSG) decisions**
AWMSG No. 2468
The All Wales Medicines Strategy Group has advised (October 2017) that eltrombopag (Revolade®) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who have severe symptomatic ITP or a high risk of bleeding, and are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Revolade®** (Novartis Pharmaceuticals UK Ltd)
  - **Eltrombopag (as Eltrombopag olamine) 25 mg** Revolade 25 mg tablets | 28 tablet vial £770.00 DT = £770.00
  - **Eltrombopag (as Eltrombopag olamine) 50 mg** Revolade 50 mg tablets | 28 tablet vial £1,540.00 DT = £1,540.00
  - **Eltrombopag (as Eltrombopag olamine) 75 mg** Revolade 75 mg tablets | 28 tablet vial £2,310.00 DT = £2,310.00

**PATIENT AND CARER ADVICE**
Informed consent
Manufacturer advises that patients and their carers should be counselled on the effects on driving and the performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2126
The Scottish Medicines Consortium has advised (February 2019) that romiplostim (Nplate®) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged one year and older who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). Romiplostim is restricted to those with severe symptomatic ITP or those with a high risk of bleeding.

**All Wales Medicines Strategy Group (AWMSG) decisions**
AWMSG No. 3103
The All Wales Medicines Strategy Group has advised (March 2019) that romiplostim (Nplate®) is recommended as an option for use within NHS Wales for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in patients from 1 year of age up to 18 years of age who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Nplate (Amgen Ltd)**
  - **Romiplostim 125 microgram** Nplate 125 microgram powder for solution for injection vials | 1 vial (125 µg) £241.00
Nutrition and metabolic disorders

1 Acid-base imbalance

1.1 Metabolic acidosis

ALKALISING DRUGS

Trometamol
(Tris(hydroxymethyl)aminomethane, THAM)

- Indications and dose
  - Metabolic acidosis
    - By intravenous infusion
    - Child: To be administered at an amount appropriate to the body base deficit

- Unlicensed use
  - Unlicensed preparation.

- Contra-indications
  - Anuria: chronic respiratory acidosis

- Cautions
  - Extravasation can cause severe tissue damage

- Side-effects
  - Hepatic necrosis (following administration via umbilical vein) (in neonates) • hyperkalaemia (in renal impairment) • hypoglycaemia • respiratory depression

- Side-effects, further information
  - Respiratory support may be required because trometamol induces respiratory depression.

- Pregnancy
  - Limited information available, hypoglycaemia may harm fetus.

- Breast feeding
  - No information available.

- Renal impairment
  - Use with caution, may cause hyperkalaemia.

- Medicinal forms
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

- Solution for infusion
  - Tris (imported (Germany))
    - Trometamol 36.34 mg per 1 ml Tris 36.34% solution for infusion 20ml ampoules | 10 ampoules

2 Fluids and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy
The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance
Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium
Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 142 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride p. 623 daily by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency to reduce the risk of hyperkalaemia.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable. When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia
Acute severe hyperkalaemia calls for urgent treatment with intravenous infusion of soluble insulin (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with glucose p. 611 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, salbutamol p. 158 can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate p. 614 is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or complicating acidosis with sodium bicarbonate infusion p. 607 should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous furosemide can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

Oral sodium and water
Sodium chloride p. 610 is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from ‘special-order’ manufacturers or specialist importing companies, they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to
replace losses in children with cystic fibrosis particularly in warm weather.

**Oral rehydration therapy (ORT)**

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:
- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na+ 75 mmol, K+ 20 mmol, Cl− 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children’s fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breastfeeding or formula feeds should be offered between oral rehydration drinks.

**Oral bicarbonate**

Sodium bicarbonate is given by mouth for chronic acidotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe metabolic acidosis, sodium bicarbonate can be given intravenously. Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate p. 607 may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where hyperchloraemic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.

**Parenteral preparations for fluid and electrolyte imbalance**

**Electrolytes and water**

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 610 or glucose 5% p. 611) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

**Maintenance fluid requirements** in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride with glucose p. 611. Solutions containing 20 mmol/litre of potassium chloride p. 623 meet usual potassium requirements when given in the suggested volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred.

**Fluid requirements for children over 1 month:**

<table>
<thead>
<tr>
<th>Body-weight</th>
<th>24-hour fluid requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Under 10 kg</td>
<td>100 ml/kg</td>
</tr>
<tr>
<td>10–20 kg</td>
<td>100 ml/kg for the first 10 kg + 50 ml/kg for each 1 kg body-weight over 10 kg</td>
</tr>
<tr>
<td>Over 20 kg</td>
<td>100 ml/kg for the first 10 kg + 50 ml/kg for each 1 kg body-weight between 10–20 kg + 20 ml/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)</td>
</tr>
</tbody>
</table>

**Important** The baseline fluid requirements shown in the table should be adjusted to take account of factors that reduce water loss (e.g. increased diuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

**Replacement therapy:** initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

**Intravenous sodium**

**Intravenous** sodium chloride in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose.

**Chronic hypernatraemia** should ideally be corrected by fluid restriction. However, if sodium chloride is required, the
deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride with glucose solutions are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate. Combined sodium lactate (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

**Compound sodium lactate** (Hartmann’s solution) is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth. Glucose solutions are used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition. Glucose solutions are given with insulin for the emergency management of hyperkalaemia. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion.

**Intervenous potassium**

Potassium chloride with sodium chloride intravenous infusion p. 609 is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth. Repeated measurements of plasma potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

**Bicarbonate and trometamol**

Sodium bicarbonate is used to control severe metabolic acidosis (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia,
sodium bicarbonate below (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For chronic acidotic states, sodium bicarbonate can be given by mouth. Trometamol p. 604 (tris(hydroxymethyl)aminomethane, THAM), an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatremia, or renal impairment. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

**Plasma and plasma substitutes**

Albumin solution p. 615, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

**Plasma substitutes**

Gelatin p. 616 is a macromolecular substance that is metabolised slowly. Gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia; it may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Gelatin is rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also the management of shock.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

**Parenteral preparations for fluid and electrolyte imbalance**

**Electrolytes and water**

Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

**Intravenous sodium**

The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. Hypernatremia may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

**Bicarbonate**

**Sodium bicarbonate**

- **INDICATIONS AND DOSE**
  - Chronic acidotic states such as uraemic acidosis or renal tubular acidosis
    - By mouth
  - Neonate: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.
  - Child: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.
  - Severe metabolic acidosis
    - By slow intravenous injection, or by intravenous infusion
  - Child: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)
  - Renal hyperkalaemia
    - By slow intravenous injection
  - Neonate: 1 mmol/kg daily.
  - Child: 1 mmol/kg daily

- **Persistent cyanotic spell in a child with congenital heart disease despite optimal use of 100% oxygen and propranolol**
  - By intravenous infusion
  - Child: 1 mmol/kg, dose given to correct acidosis (or dose calculated according to arterial blood gas results), sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year

- **CONTRA-INDICATIONS**
  - With oral use Salt restricted diet

- **CAUTIONS**
  - Respiratory acidosis

- **INTERACTIONS**
  - Appendix 1: sodium bicarbonate

- **SIDE-EFFECTS**
  - With intravenous use Skin exfoliation · soft tissue necrosis · ulcer
  - With oral use Abdominal cramps · burping · flatulence · hypokalaemia · metabolic alkalosis

- **HEPATIC IMPAIRMENT**
  - With oral use Manufacturer advises caution in cirrhosis. Salt restriction will be covered in the prelims.

- **MONITORING REQUIREMENTS**
  - With intravenous use Plasma-pH and electrolytes should be monitored.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For peripheral infusion dilute 8.4% solution at least 1 in 10. For central line infusion dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage.
  - With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time.
PATIENT AND CARER ADVICE

With intravenous use

- Sodium bicarbonate (Non-proprietary) 84 mg per 1 ml
  - Solution for infusion 
  - Usual strength Sodium bicarbonate 84 mg per 1 ml
  - Potassium chloride with calcium chloride and sodium chloride and sodium lactate (Ringer’s solution)
  - Dosed according to the deficit or daily maintenance requirements (consult product literature)

- Potassium chloride with calcium chloride dihydrate and sodium chloride (Non-proprietary)
  - Potassium chloride 300 microgram per 1 ml
  - Calcium chloride 320 microgram per 1 ml
  - Sodium chloride 8.6 mg per 1 ml
  - Ringers solution for injection provides the following ions (in mmol/litre), Ca²⁺: 2.2, K⁺: 4, Na⁺: 147, Cl⁻: 156.

- Potassium chloride with calcium chloride dihydrate and sodium chloride (Non-proprietary)
  - Polyflex Ringers solution for infusion 500ml bottles | 1 bottle £6.89

- Potassium chloride with calcium chloride and sodium chloride and sodium lactate
  - Compound sodium lactate intravenous infusion contains Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 29 mmol, Cl⁻ 111 mmol/litre.

 INFORMATION

- INDICATIONS AND DOSE
  - For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium
    - BY INTRAVENOUS INFUSION
    - Child: (consult product literature)

- INTERACTIONS
  - Appendix 1: calcium salts - potassium chloride
    - Compound sodium lactate intravenous infusion contains Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 29 mmol, Cl⁻ 111 mmol/litre.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
Potassium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 623, glucose p. 611.

- **INDICATIONS AND DOSE**
  - **Electrolyte imbalance**
  - Child: Dosed according to the deficit or daily maintenance requirements

- **INTERACTIONS** → Appendix 1: potassium chloride

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Potassium chloride 0.3% contains 40 mmol each of K⁺ and Cl⁻/litre or 0.15% contains 20 mmol each of K⁺ and Cl⁻/litre with 5% of anhydrous glucose.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Infusion**
- Potassium chloride with glucose (Non-proprietary)
  - Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / Glucose 5% infusion 500ml bags | 1 bag $0.67-£3.11
  - Potassium chloride 0.3% (potassium 40mmol/1litre) / Glucose 5% infusion 1litre bags | 1 bag $0.67-£3.11
  - Potassium chloride 2 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Steriflex No.29 potassium chloride 0.2% (potassium 27mmol/litre) / Glucose 5% infusion 1litre bags | 1 bag $2.20
  - Potassium chloride 0.15% (potassium 10mmol/500ml) / Glucose 5% infusion 500ml bags | 1 bag $1.30

Potassium chloride with sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 623, sodium chloride p. 610.

- **INDICATIONS AND DOSE**
  - **Electrolyte imbalance**
  - Child: Dosed according to the deficit or daily maintenance requirements

- **INTERACTIONS** → Appendix 1: potassium chloride

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Concentration of potassium chloride to be specified by the prescriber (usually K⁺ 10–40 mmol/litre).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Infusion**
- Potassium chloride with glucose and sodium chloride (Non-proprietary)
  - Sodium chloride 1.8 mg per 1 ml, Potassium chloride 3 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / Glucose 4% / Sodium chloride 0.18% infusion 500ml bags | 1 bag $0.67-£3.11
  - Potassium chloride 0.3% (potassium 40mmol/litre) / Glucose 4% / Sodium chloride 0.18% infusion 1litre bags | 1 bag $2.20
  - Potassium chloride 1.5 mg per 1 ml, Sodium chloride 50 mg per 1 ml Potassium chloride 1.5% (potassium 20mmol/500ml) / Glucose 5% / sodium chloride 40 mmol/500ml bags | 1 bag $1.30

Potassium chloride with potassium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 623.

- **INDICATIONS AND DOSE**
  - **Potassium depletion**
  - Child: Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **INTERACTIONS** → Appendix 1: potassium chloride

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Each Sando-K® tablet contains potassium 470 mg (12 mmol of K⁺) and chloride 285mg (8 mmol of Cl⁻).

- **INTERACTIONS** → Appendix 1: potassium chloride

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Potassium chloride 0.15% with sodium chloride 0.9% contains K⁺ 20 mmol, Na⁺ 150 mmol, and Cl⁻ 170 mmol/litre or potassium chloride 0.3% with sodium chloride 0.9% contains K⁺ 40 mmol, Na⁺ 150 mmol, and Cl⁻ 190 mmol/litre.
**Blood and nutrition**

**CHLORIDE**

With intravenous use

- **Dilutional hyponatraemia**
  - Reduced fluid loss

**MEDICINAL FORMS**

- **Potassium chloride with sodium chloride (Non-proprietary)**
  - Potassium chloride 3 mg per 1 mL, Sodium chloride 9 mg per 1 mL
  - Potassium chloride 0.3% (potassium 20mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag £0.5
  - Potassium chloride 1.5 mg per 1 mL, Sodium chloride 9 mg per 1 mL
  - Potassium chloride 0.15% (potassium 20mmol/litre) / Sodium chloride 0.9% infusion 1 litre bags | 1 bag £0.5
  - Potassium chloride 0.9% infusion 500ml bags | 1 bag £0.30–£0.67
  - Potassium chloride 2 mg per 1 mL, Sodium chloride 9 mg per 1 mL
  - Steriflex No.28 potassium chloride 0.2% (potassium 13.3mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag £0.67

- **Sodium chloride (Non-proprietary)**
  - Potassium chloride 1.5 mg per 1 mL, Sodium chloride 9 mg per 1 mL
  - Sodium chloride 0.9% infusion 500ml bags | 1 bag £0.5
  - Sodium chloride 0.9% infusion 1 litre bags | 1 bag £0.20

**SIDE-EFFECTS**

- With intravenous use
  - Chills · fever · hypervolaemia · hypotension · local reaction · localised pain · paraesthesia · skin reactions · tremor · vascular irritation · venous thrombosis
  - With oral use
    - Abdominal cramps · acidosis hyperchlaemic · diarrhoea · generalised oedema · hypertension · hypotension · irritability · muscle complaints · nausea · vomiting

**MONITORING REQUIREMENTS**

- During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intravenous use
  - Sodium chloride 0.9% intravenous infusion contains Na⁺ and Cl⁻ each 150 mmol/litre. The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).
  - With oral use
    - Each Slow Sodium® tablet contains approximately 10 mmol each of Na⁺ and Cl⁻; ES®G tablets can be crushed before administration.

- The RCPhC and NPPG recommend that, when a liquid special of sodium chloride is required, the following strength is used: 5 mmol/mL.

**PATIENT AND CARER ADVICE**

**INDICATIONS AND DOSE**

- Chronic renal salt wasting
  - **BY MOUTH**
    - Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements
  - **INITIALLY BY MOUTH**
    - Neonate up to 36 weeks corrected gestational age: 2 mmol, dose to be administered in 100 mL of formula feed (consult dietician), alternatively (by mouth using modified-release tablets) 3–4 mmol, dose to be administered in 100 mL of breast milk (consult dietician).

- **Sodium replacement**
  - **BY MOUTH USING MODIFIED-RELEASE TABLETS**
    - Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements, higher doses may be needed in severe depletion
  - **BY INTRAVENOUS INSTILLATION**
    - Child: (consult local protocol)
  - Diluent for instillation of drugs to the bladder
  - (consult product literature)

**INDICATIONS AND DOSE**

- **Carbohydrate deficiency**
  - **BY MOUTH**
    - Child: 10–20 mmol/kg daily
  - **INITIALLY BY MOUTH**
    - Infants: 2–10 mmol/kg daily

**SIDE-EFFECTS**

- With intravenous use
  - Avoid excessive administration · cardiac failure · cardio-respiratory diseases · children receiving glucocorticoids · dilutional hyponatraemia · hepatic cirrhosis · hypertonstion · peripheral oedema · pulmonary oedema · reduced fluid loss · renal insufficiency · restrict intake in impaired renal function · toxoaemia of pregnancy

**MEDICINES FOR CHILDREN**

Combination available: Potassium chloride with calcium chloride and sodium chloride and sodium lactate, p. 608 - Potassium chloride with calcium chloride dihydrate and sodium chloride, p. 608 - Potassium chloride with glucose and sodium chloride, p. 609 - Potassium chloride with sodium chloride, p. 609

**Sodium chloride with glucose**

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 610, glucose below.

- **INDICATIONS AND DOSE**
  - Combined water and sodium depletion
  - **BY INTRAVENOUS INFUSION**
    - Child: (consult product literature)

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION** Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hypoglycaemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

- **MONITORING REQUIREMENTS**
  - Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.
  - During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion and other preparations.
  - **Sodium chloride with glucose (Non-proprietary)**
    - Sodium chloride 4.5 mg per 1 ml, Glucose anhydrous 25 mg per 1 ml Sodium chloride 0.45% / Glucose 2.5% infusion 500ml Vial/No.10 bags | 1 bag (P) £2.40
    - Sodium chloride 1.8 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Glucose 4% / sodium chloride 0.18% infusion 500ml bottles | 1 bottle (P) £2.40
    - Sodium chloride 0.18% / Glucose 4% infusion 1 litre bottles | 1 bottle (P) £3.98

- **Sodium and chloride 0.18% / Glucose 4% infusion 1 litre bags | 1 bag (P) £1.47

  - Sodium chloride 1.8 mg per 1 ml, Glucose anhydrous 100 mg per 1 ml Steriflex No.19 glucose 10% / sodium chloride 0.18% infusion 500ml bags | 1 bag (P) £2.34

**NUTRIENTS › Sugars**

**Glucose**

(Dextrose Monohydrate)

- **INDICATIONS AND DOSE**
  - **Establish presence of gestational diabetes**
    - **BY MOUTH**
      - Child: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid
  - **Oral glucose tolerance test**
    - **BY MOUTH**
      - Child: Test dose 1.75 g/kg (max. per dose 75 g), anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals. To be given with 200–300 mL fluid

**Neonatal hypoglycaemia**

- **BY INTRAVENOUS INFUSION**
  - Neonate: 500 mg/kg/hour, to be administered as Glucose 10% intravenous infusion, an initial dose of 250 mg/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures.

**Hypoglycaemia**

- **BY INTRAVENOUS INFUSION**
  - Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

- **Energy source**
  - **BY INTRAVENOUS INFUSION**
  - Child: (consult product literature)

- **Water replacement**
  - **BY INTRAVENOUS INFUSION**
  - Child: The volume of glucose solution needed to replace deficits may vary (consult product literature)

- **Persistent cyanosis (in combination with propranolol)**
  - When blood glucose less than 3 mmol/litre (followed by morphine)
  - **BY INTRAVENOUS INFUSION**
  - Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

- **Management of diabetic ketoacidosis**
  - **BY INTRAVENOUS INFUSION**
  - Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

- **Dose equivalence and conversion**
  - 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- **CAUTIONS**
  - Do not give alone except when there is no significant loss of electrolytes - prolonged administration
Blood and nutrition

612 Fluid and electrolyte imbalances

of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances

> **SIDE-EFFECTS** Chills · electrolyte imbalance · fever · fluid imbalance · hypersensitivity · local reaction · localised pain · polyuria · rash · venous thrombosis

> **DIRECTIONS FOR ADMINISTRATION**
>

- With intravenous use Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.

> **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.

> **EXCEPTIONS TO LEGAL CATEGORY**
>

- With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

> **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for injection, solution for infusion

> **Solution for infusion**
>

- **Glucose (Non-proprietary)**
  - Glucose anhydrous 200 mg per 1 ml Glucose 20% solution for infusion 100ml vials | 1 vial £0.14
  - Glucose anhydrous 500 mg per 1 ml Glucose 50% solution for infusion 20ml ampoules | 10 ampoule £12.00–£14.00 DT = £12.00

- Glucose 50% solution for infusion 50ml vials | 25 vial £50.00–£60.00 DT = £50.01

**ORAL REHYDRATION SALTS**

**Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride**

(Formulated as oral rehydration salts)

> **INDICATIONS AND DOSE**
>

- **Fluid and electrolyte loss in diarrhoea**
  
  - **BY MOUTH**
  
    - Child 1-11 months: 1–1½ times usual feed volume to be given
    
    - Child 1-11 years: 200 ml, to be given after every loose motion
    
    - Child 12-17 years: 200–400 ml, to be given after every loose motion, dose according to fluid loss

> **DIRECTIONS FOR ADMINISTRATION**
>

- Reconstitute 1 sachet with 200ml of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na+ 60 mmol, K+ 20 mmol, Cl− 60 mmol, citrate 10 mmol, and glucose 90 mmol.

> **PRESCRIBING AND DISPENSING INFORMATION**
>

- Flavours of oral powder formulations may include black currant, citrus, or natural.

> **PATIENT AND CARER ADVICE**
>

- After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

- Patients and carers should be advised how to reconstitute Dioralyte® Relief oral powder.
2.1 Calcium imbalance

2.1a Hypocalcaemia

ELECTROLYTES AND MINERALS > CALCIUM

Calcium salts

- CONTRA-INDICATIONS Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) - conditions associated with hypocalcaemia (e.g. some forms of malignant disease)
- CAUTIONS History of nephrolithiasis - sarcoidosis
- SIDE-EFFECTS Uncommon Constipation · diarrhoea · hypocalcaemia · nausea
- RENAL IMPAIRMENT Use with caution. Risk of hypercalcaemia and renal calculi.

Calcium carbonate

- INDICATIONS AND DOSE Phosphate binding in renal failure and hyperphosphataemia
  - BY MOUTH
    - Child 1–11 months: 120 mg 3–4 times a day, dose to be adjusted as necessary, to be taken with feeds
    - Child 1–5 years: 300 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
    - Child 6–11 years: 600 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
    - Child 12–17 years: 1.25 g 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- Calcium deficiency
  - BY MOUTH
    - Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
    - Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
    - Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
    - Child 12–17 years: 0.1 mmol 4 times a day, adjusted according to response
- INTERACTIONS → Appendix 1: calcium salts
Calcium carbonate with calcium lactate gluconate

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate p. 613.

**INDICATIONS AND DOSE**

### Calcium deficiency

- **BY MOUTH**
  - Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
  - Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
  - Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
  - Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

**INTERACTIONS** → Appendix 1: calcium salts

**PRESCRIBING AND DISPENSING INFORMATION** Each Sandocal® tablet contains 1 g calcium (Ca²⁺ 25 mmol); flavours of soluble tablet formulations may include orange.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Effervescent tablet

**INDICATIONS AND DOSE**

- **Acute hypocalcaemia**
  - Child: (consult product literature)

**CAUTIONS** Avoid in respiratory acidosis - avoid in respiratory failure

**INTERACTIONS** → Appendix 1: calcium salts

**SIDE-EFFECTS** Soft tissue calcification - taste unpleasant - vasodilation

**DIRECTIONS FOR ADMINISTRATION** Care should be taken to avoid extravasation.

**PRESCRIBING AND DISPENSING INFORMATION** Non proprietary Calcium chloride dihydrate 7.35%(calcium 20 mg or Ca" 500 micromol/mL); Calcium chloride dihydrate 10%(calcium 27.3 mg or Ca" 680 micromol/mL); Calcium chloride dihydrate 14.7%(calcium 40.1 mg or Ca" 1000 micromol/mL).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

### Solution for injection

- **Calcium chloride (Non-proprietary)**
  - Calcium chloride dihydrate 100 mg per 1 ml
    - Calcium chloride 10% solution for injection 10ml pre-filled syringes | 1 pre-filled disposable syringe | £3.42 DT + £3.42
    - Calcium chloride dihydrate 147 mg per 1 ml
      - Calcium chloride 14.7% solution for injection 5ml ampoules | 10 ampoule PHS £120.98
      - Calcium chloride 14.7% solution for injection 10ml ampoules | 10 ampoule PHS £188.28 DT + £188.28
Calcium lactate

- **INDICATIONS AND DOSE**
  - **Calcium deficiency**
  - **BY MOUTH**
  - Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
  - Child 1 month-4 years: 0.25 mmol/kg 4 times a day, adjusted according to response.
  - Child 5-11 years: 0.2 mmol/kg 4 times a day, adjusted according to response.
  - Child 12-17 years: 10 mmol 4 times a day, adjusted according to response.

- **INTERACTIONS**  
  - Appendix 1: calcium salts

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Calcium lactate (Non-proprietary) 84 tablet  
    - Calcium lactate 300 mg Calcium lactate 300mg tablets |  
      - 84 tablet £4.57  
      - 84 tablet £4.57

Calcium phosphate

- **INDICATIONS AND DOSE**
  - **Indications listed in combination monographs (available in the UK only in combination with other drugs)**
    - **BY MOUTH**
    - Child: Doses listed in combination monographs

**INTERACTIONS**  
- Appendix 1: calcium salts

**SIDE-EFFECTS**

Epi gastric pain, gastrointestinal disorder, hypercalciuria

**MEDICINAL FORMS**

No licensed medicines listed.

### 2.2 Low blood volume

**BLOOD AND RELATED PRODUCTS**

**PLASMA PRODUCTS**

#### Albumin solution

**Human Albumin Solution**

- **INDICATIONS AND DOSE**
  - Acute or sub-acute loss of plasma volume e.g., in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%) | Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%)
  - **BY INTRAVENOUS INFUSION**
  - Child: (consult product literature)

**CONTRA-INDICATIONS**

Cardiac failure, severe anaemia

**CAUTIONS**

Correct dehydration when administering concentrated solution - history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and
cardiac failure, and monitor cardiovascular and respiratory function; history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) - increased capillary permeability

- **SIDE-EFFECTS**
  - Rare or very rare Fever - flushing - nausea - shock - urticaria

- **MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5 – 5% protein) or concentrated (containing 15 – 25% protein).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Infusion**
  - **Flexbumin** (Baxalta UK Ltd)
    - Albumin solution human 200 gram per 1 litre: Flexbumin 20% infusion 100ml bags | 1 bag (POM) N
  - **Albunorm** (Octapharma Ltd)
    - Solution for infusion: Flexible bag (POM)
  - **Albunorm** (Grifols UK Ltd)
    - Albumin solution human 50 mg per 1 ml
    - Albuinorm 5% solution for infusion 250ml bottles | 1 bottle (POM) £33.75
    - Albuinorm 5% solution for infusion 100ml bottles | 1 bottle (POM) £13.50
    - Albuinorm 5% solution for infusion 500ml bottles | 1 bottle (POM) £67.50
    - Albumin solution human 200 mg per 1 ml
    - Albuinorm 20% solution for infusion 100ml bottles | 1 bottle (POM) £54.00
    - Albuinorm 20% solution for infusion 500ml bottles | 1 bottle (POM) £27.00
  - **Alburex** (CSL Behring UK Ltd)
    - Albumin solution human 50 mg per 1 ml
    - Alburex 5% solution for infusion 500ml vials | 1 vial (POM) £50.00
  - **Alburex** (B.Braun Medical Ltd)
    - Albumin solution human 200 mg per 1 ml
    - Alburex 20% solution for infusion 100ml vials | 1 vial (POM) £40.00
  - **Albutein** (Grifols UK Ltd)
    - Albumin solution human 50 mg per 1 ml
    - Albutein 5% solution for infusion 500ml vials | 1 vial (POM) N
    - Albutein 5% solution for infusion 250ml vials | 1 vial (POM) N
  - **Albumeo** (Biotest (Bioitex Ltd))
    - Solution for infusion: Flexible vial (POM)
  - **Gelaspan** (B.Braun Medical Ltd)
    - Albumin solution human 50 mg per 1 ml
    - Human Albumin Biotest 5% solution for infusion 250ml vials | 1 vial (POM) N
    - Human Albumin Biotest 20% solution for infusion 500ml vials | 1 vial (POM) N
  - **Geliflex** (Grifols Ltd)
    - Albumin solution human 50 mg per 1 ml
    - Human albumin Geliflex 5% solution for infusion 500ml bottles | 1 bottle (POM) £42.75
    - Human albumin Geliflex 5% solution for infusion 250ml vials | 1 bottle (POM) £21.38
    - Human albumin Geliflex 5% solution for infusion 100ml bottles | 1 bottle (POM) £9.90
  - **Gelamine** (Biotest (Bioitex Ltd))
    - Albumin solution human 200 mg per 1 ml
    - Human albumin Gelamine 20% solution for infusion 500ml vials | 1 vial (POM) £23.40
    - Human albumin Gelamine 20% solution for infusion 250ml vials | 1 vial (POM) £14.80
    - Human albumin Gelamine 20% solution for infusion 100ml vials | 1 vial (POM) £6.50
  - **Gelaspan** (B.Braun Medical Ltd)
    - Albumin solution human 45 mg per 1 ml
    - Gelaspan 4.5% solution for infusion 250ml bottles | 1 bottle (POM) £27.51
    - Gelaspan 4.5% solution for infusion 500ml bottles | 1 bottle (POM) £55.02
  - **Gelaspan** (B.Braun Medical Ltd)
    - Albumin solution human 200 mg per 1 ml
    - Gelaspan 20% solution for infusion 100ml bottles | 1 bottle (POM) £54.00
    - Gelaspan 20% solution for infusion 500ml bottles | 1 bottle (POM) £27.00

- **PLASMA SUBSTITUTES**

- **Indications and Dose**
  - **Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass**
    - **By Intravenous Infusion**
      - Child: Initially 10–20 mL/kg, use 3.5–4% solution

- **Caution**
  - Cardiac disease - severe liver disease

- **Caution, Further Information**
  - The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.

- **Side-effects**
  - Rare or very rare Chill - dyspnoea - fever - hyperhidrosis - hypersensitivity - hypertension - hypotension - hypoxia - tachycardia - tremor - urticaria - wheezing

- **Pregnancy**
  - Manufacturer of Geloplasma® advises avoid at the end of pregnancy.

- **Hepatic Impairment**
  - Manufacturers advise avoid preparations that contain lactate (risk of impaired lactate metabolism).

- **Renal Impairment**
  - Use with caution in renal impairment.

- **Monitoring Requirements**
  - Urine output should be monitored. Care should be taken to avoid haemotocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- **Prescribing and Dispensing Information**
  - The gelatin is partially degraded.
  - **Gelaspan®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na+ 151 mmol, K+ 4 mmol, Mg2+ 1 mmol, Cl− 103 mmol, Ca2+ 1 mmol, acetate 24 mmol/litre; **Gelofusine®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na+ 154 mmol, Cl− 124 mmol/litre; **Geloplasma®** contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na+ 150 mmol, K+ 5 mmol, Mg2+ 1.5 mmol, Cl− 100 mmol, lactate 30 mmol/litre; **Isoplex®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40g (4%), Na+ 145 mmol, K+ 4 mmol, Mg2+ 0.9 mmol, Cl− 105 mmol, lactate 25mmol/litre; **Volplex®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na+ 154 mmol, Cl− 125 mmol/litre.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Infusion**
  - **Gelaspan** (B.Braun Medical Ltd)
    - Gelatin 40 mg per 1 ml: Gelaspan 4% infusion 500ml Ecobags | 1 bag (POM) £5.95 (Hospital only)
  - **Gelofusine** (B.Braun Medical Ltd)
    - Gelatin 40 mg per 1 ml: Gelofusine 4% infusion 1 litre Ecobags | 1 bag (POM) £9.31
    - Gelofusine 4% infusion 500ml Ecobags | 1 bag (POM) £4.97
  - **Geloplasma** (Fresenius Kabi Ltd)
    - Gelatin 30 mg per 1 ml: Geloplasma 3% infusion 500ml Freeflex bags | 1 box (POM) £57.50
  - **Volplex** (Kent Pharmaceuticals Ltd)
    - Gelatin 40 mg per 1 ml: Volplex 4% infusion 500ml bags | 10 bag (POM) £75.00 (Hospital only)
2.3 Magnesium imbalance

Magnesium imbalance

Overview
Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 618 as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypomagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia
Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypercalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. Magnesium aspartate below powder for oral solution is available as a licensed preparation.

Arrhythmias
Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes.

2.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

INDICATIONS AND DOSE
Treatment and prevention of magnesium deficiency

BY MOUTH
Child 2-3 years: 4.5 mmol daily, given as one level 5 mL spoonful of Magnaspartate® powder.
Child 4-9 years: 4.5 mmol daily, given as a 5 mL level spoonful of Magnaspartate® powder, alternatively 10 mmol daily, given as 1 sachet of Magnaspartate® powder.
Child 10-17 years: 10 mmol daily, given as 1 sachet of Magnaspartate® powder.

CONTRA-INDICATIONS
Disorders of cardiac conduction

INTERAKTIONS
Appendix 1: magnesium

SIDE-EFFECTS

Uncommon
Diarrhoea - faeces soft
Rare or very rare
Fatigue - hypermagnesaemia
Frequency not known
Gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose
Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

RENAL IMPAIRMENT
Avoid in severe impairment (estimated glomerular filtration rate less than 30 mL/minute/1.73m²).

DIRECTIONS FOR ADMINISTRATION
Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

PRESCRIBING AND DISPENSING INFORMATION
Magnaspartate® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

PATIENT AND CARER ADVICE
Patients and carers should be given advice on how to administer magnesium aspartate powder.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

Powder
EXCIPIENTS: May contain Sucrose

Magnaspartate® (Kofa Healthcare) 243 mg Magnaspartate® 243mg (magnesium 10mmol) oral powder sachets | 10 sachet £9.95 DT + £18.95

Magnesium glycero-phosphate

INDICATIONS AND DOSE
Hypomagnesaemia

BY MOUTH
Child 1 month-11 years: Initially 0.2 mmol/kg 3 times a day, dose to be adjusted as necessary, dose expressed as Mg²⁺.
Child 12-17 years: Initially 4–8 mmol 3 times a day, dose to be adjusted as necessary, dose expressed as Mg²⁺.

DOSE EQUIVALENCE AND CONVERSION
Magnesium glycero-phosphate 1 g is approximately equivalent to Mg²⁺ 4 mmol or magnesium 97 mg.

NEOMAG® CHEWABLE TABLETS

Hypomagnesaemia

BY MOUTH
Child 4-11 years: Initially 1 tablet twice daily, dose to be adjusted according to the serum total magnesium level
Child 12-17 years: Initially 1 tablet 3 times a day, dose to be adjusted according to the serum total magnesium level

DOSE EQUIVALENCE AND CONVERSION
Each Neomag® chewable tablet contains Mg²⁺ 4 mmol or magnesium 97 mg.

UNLICENSED USE
Preparations other than Neomag® are not licensed for use.

INTERAKTIONS
Appendix 1: magnesium

SIDE-EFFECTS
Diarrhoea - hypermagnesaemia

Overdose
Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech

BNFC 2019–2020

Volplex (Kent Pharmaceuticals Ltd)
Gelatin 40 mg per 1 ml Volplex 4% infusion 500ml bags | 10 bag £47.00 (Hospital only)
Blood and nutrition

MEDICINAL FORMS

- Suspension, oral solution, powder
- Different medicines containing the same drug. Forms available

NEOMAG® CHEWABLE TABLETS

- Manufacturer advises avoid in severe impairment.

MONITORING REQUIREMENTS

- Manufacturer advises to monitor serum magnesium levels every 3–6 months.

DIRECTIONS FOR ADMINISTRATION

- Tablet
  - Magnesium (as Magnesium glycerophosphate) 97.2 mg: 50 tablet £13.89 DT = £22.77
  - Magnesium (as Magnesium glycerophosphate) 19.44 mg per 1 ml LiquaMag GP (magnesium 121.25mg/5ml (5mmol/5ml) oral solution sugar-free) = 200 ml £49.99
  - MagnaPhos (TriOn Pharma Ltd) Magnesium (as Magnesium glycerophosphate) 19.44 mg per 1 ml MagnaPhos 91.2mg/5ml (4mmol/5ml) oral solution = 200 ml £97.84
  - Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml MagnaPhos 121.25mg/5ml (5mmol/5ml) oral solution = 200 ml £137.87 DT = £197.84

- Chewable tablet

EXCIPIENTS: May contain Aspartame

Magnesium (as Magnesium glycerophosphate) 97.2 mg Magnesium (as Magnesium glycerophosphate) 19.44 mg per 1 ml Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml Magnesium (as Magnesium glycerophosphate) 97.2 mg

Torsade de pointes

DOSE EQUIVALENT AND CONVERSION

MagnaPhos

- Magnus sulfate

INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

- By Intravenous infusion
- Child 2–17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes

Persistent pulmonary hypertension of the newborn

- Initially by Intravenous infusion
- Neonate: Initially 200 mg/kg, to be given over 20–30 minutes, then (by continuous intravenous infusion) 20–75 mg/kg/hour for up to 5 days if response occurs after initial dose (to maintain plasma magnesium concentration between 3.5–5.5 mmol/litre).

Hypomagnesaemia

- By Intravenous infusion
- Neonate: 100 mg/kg every 6–12 hours as required, to be given over at least 10 minutes.

- Child 1 month–11 years: 50 mg/kg every 12 hours as required, to be given over at least 10 minutes
- Child 12–17 years: 1 g every 12 hours as required, to be given over at least 10 minutes

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- By Intravenous infusion, or by Intramuscular injection
- Child: 50–100 mg/kg daily; maximum 5 g per day

Neonatal hypocalcaemia

- By deep Intramuscular injection, or by Intravenous infusion
- Neonate: 100 mg/kg every 12 hours for 2–3 doses.

Torsade de pointes

- By Intravenous infusion
- Child: 25–50 mg/kg (max. per dose 2 g), to be given over 10–15 minutes, dose may be repeated once if necessary (consult local protocol)

SIDE-EFFECTS Electrolyte imbalance

- Overdose Symptoms of hypomagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

PREGNANCY

- When used for Neonatal hypocalcaemia or Hypomagnesaemia or Torsade de pointes or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.

HEPATIC IMPAIRMENT

- Avoid in hepatic coma if risk of renal failure.

RENAL IMPAIRMENT

- Increased risk of toxicity.

- Avoid or reduce dose.

UNLICENSED USE Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.

INTERACTIONS Appendix 1: magnesium

SIDE-EFFECTS Electrolyte imbalance

- Overdose Symptoms of hypomagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

PREGNANCY

- When used for Neonatal hypocalcaemia or Hypomagnesaemia or Torsade de pointes or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.

HEPATIC IMPAIRMENT

- Avoid in hepatic coma if risk of renal failure.

RENAL IMPAIRMENT

- Increased risk of toxicity.

- Avoid or reduce dose.

MONITORING REQUIREMENTS Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
### Hyperphosphataemia

#### 2.4 Phosphate imbalance

#### Phosphate imbalance

##### Oral phosphate supplements p. 621 may be required in addition to Vitamin D in children with hypophosphataemic vitamin D-resistant rickets, see also Vitamin D, under Vitamins p. 646.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of severe hypophosphataemia because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue. It is recommended that severe hypophosphataemia be treated intravenously as large doses of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of calcium phosphate in the kidney and other tissues. If used, the child should be well hydrated and electrolytes monitored.

#### Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children, sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 613.

#### Phosphate supplements in neonates

Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolarity of the milk should be considered.
**ELECTROLYTES AND MINERALS**

## Calcium

**Calcium acetate**

- **INDICATIONS AND DOSE**
  - **PHOSEX® TABLETS**
    - Phosphate binding in renal failure and hyperphosphataemia
  - **BY MOUTH**
    - Child: Dose to be adjusted according to requirements of patient, dose to be taken with meals (consult product literature)

- **INTERACTIONS**
  - Appendix 1: calcium salts

- **SIDE-EFFECTS**
  - Uncommon

**DIRECTIONS FOR ADMINISTRATION**

**Uncommon side-effects**

- **SIDE-EFFECTS**

- **EXCIPIENTS:** May contain Propylene glycol 250 mg (equivalent to calcium 250 mg or Ca²⁺ 6.2 mmol).

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Calcium salts for kidney disease www.medicinesforchildren.org.uk/calcium-salts-kidney-disease-0

**PHOSEX® TABLETS**

- Patients or carers should be given advice on how to administer Phosex® tablets.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 25
    - Phosex (Pharmacosmos UK Ltd)
      - Calcium acetate 1 gram
      - Phosex® tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or Ca²⁺ 6.2 mmol).

**PHOSPHATE BINDERS**

## Sevelamer

### Sevelamer

- **INDICATIONS AND DOSE**
  - **RENAGEL®**
    - Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis
  - **BY MOUTH**
    - Child 12–17 years: Initially 0.8–1.6 g 3 times a day, dose to be given with meals and adjusted according to serum-phosphate concentration

- **RENELA® 2.4G ORAL POWDER SACHETS**
  - Hyperphosphataemia in chronic kidney disease
  - **BY MOUTH**
    - Child 6–17 years (body surface area 0.75–1.1 m²): Initially 2.4 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks—consult product literature
    - Child 6–17 years (body surface area 1.2 m² and above): Initially 4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks—consult product literature

**CAUTIONS**

- Gastro-intestinal disorders

**SIDE-EFFECTS**

- Common or very common Constipation • diarrhoea • gastrointestinal discomfort • gastrointestinal disorders • nausea • vomiting

**FREQUENCY NOT KNOWN**

- Skin reactions

**PRECAUTIONS**

- Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Renvela 2.4G oral powder sachets

**RENELA® 800MG TABLETS**

- Patients and carers should be advised on how to administer powder for oral suspension.

**NATIONAL FUNDING/ACCESS DECISIONS**

**RENELA® 2.4G ORAL POWDER SACHETS**

- Scottish Medicines Consortium (SMC) decisions
  - The Scottish Medicines Consortium has advised (February 2018) that sevelamer carbonate (Renela®) is accepted for restricted use within NHS Scotland as second-line management of hyperphosphataemia in paediatric patients (greater than 6 years of age and a Body Surface Area greater than 0.75 m²) with chronic kidney disease receiving haemodialysis.

**RENELA® 800MG TABLETS**

- Scottish Medicines Consortium (SMC) decisions
  - The Scottish Medicines Consortium has advised (April 2011) that sevelamer carbonate (Renela®) is accepted for restricted use within NHS Scotland for the second-line management of hyperphosphataemia in adults receiving haemodialysis.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- **Powder**
  - CAUTIONARY AND ADVISORY LABELS 13
    - Renela (Sanofi)
      - Sevelamer carbonate 2.4 gram
      - Renela 2.4g oral powder sachets
      - sugar-free | 60 sachet
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 25
      - Exipients: May contain Propylene glycol
      - Renagel (Sanofi)
        - Sevelamer 800 mg Renagel 800mg tablets

**UNLICENSED USE**

- **RENAGEL®** Not licensed for use in children under 18 years.

**CONTRA-INDICATIONS**

- Bowel obstruction
2.4b Hypophosphataemia

DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

Burosumab

- **DRUG ACTION** Burosumab is a human monoclonal antibody that inhibits the activity of fibroblast growth factor 23, thereby increasing renal tubular reabsorption of phosphate and increasing serum concentration of vitamin D.

- **INDICATIONS AND DOSE** X-linked hypophosphataemia with radiographic evidence of bone disease in children and adolescents with growing skeletons (initiated by a specialist)
  - **BY SUBCUTANEOUS INJECTION**
    - Child 1-17 years: Initially 0.4 mg/kg, subsequent doses adjusted according to response and administered every 2 weeks. Dose may be increased in steps of 0.4 mg/kg at intervals of at least 4 weeks up to a maximum of 2 mg/kg (maximum dose 90 mg)—consult product literature; usual maintenance 0.8 mg/kg every 2 weeks (max. per dose 90 mg), to be administered into the arm, abdomen, buttock or thigh, each dose should be rounded to the nearest 10 mg.

- **CONTRA-INDICATIONS** Concurrent use of oral phosphate or vitamin D analogues—discontinue 1 week before initiation of burosumab.

- **SIDE-EFFECTS**
  - Common or very common Dizziness, headache, myalgia, pain in extremity, rash, tooth ache, toothache.
  - PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
  - BREAST FEEDING Manufacturer advises avoid—no information available.
  - RENAL IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor fasting serum-phosphate concentration before treatment initiation, every 2 weeks for the first month, every 4 weeks for the following 2 months, 4 weeks after dose adjustment, and as appropriate thereafter—target the lower end of the normal reference range for age to decrease the risk of ectopic mineralisation. Periodic measurement of post-prandial serum-phosphate concentration is also advised.
  - Manufacturer advises monitor for signs and symptoms of nephrocalcinosis at treatment initiation, every 6 months for the first 12 months, and annually thereafter. Also monitor plasma alkaline phosphatases, calcium, parathyroid hormone, and creatinine every 6 months (every 3 months for children aged 1–2 years) or as indicated, and urine calcium and phosphate every 3 months.

- **DIRECTIONS FOR ADMINISTRATION** Maximum volume per injection site is 1.5 mL. If a volume over 1.5 mL is required on a given dosing day, manufacturer advises the total volume should be split and given at 2 different injection sites.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2-8°C).

---

NATIONAL FUNDING/ACCESS DECISIONS

**NICE decisions**

- Burosumab for treating X-linked hypophosphataemia in children and young people (October 2018) NICE HST8
  - Burosumab (Crysvita®) is recommended, within its marketing authorisation, for treating X-linked hypophosphataemia with radiographic evidence of bone disease in children aged 1 year and over, and in young people with growing bones. It is recommended only if the manufacturer provides burosumab according to the commercial arrangement.
  - www.nice.org.uk/guidance/hst8

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **EXCipients:** May contain Polysorbates, sorbitol
  - Crysvita (Kyowa Kirin Ltd)▼
    - **Burosumab 10 mg per 1 ml** Crysvita 10mg/1ml solution for injection vials | 1 vial (£92)
    - **Burosumab 20 mg per 1 ml** Crysvita 20mg/1ml solution for injection vials | 1 vial (£98)
    - **Burosumab 30 mg per 1 ml** Crysvita 30mg/1ml solution for injection vials | 1 vial (£97)

**LAXATIVES > OSMOTIC LAXATIVES**

Phosphate

- **INDICATIONS AND DOSE** Hypophosphataemia | Hypophosphataemic rickets | Osteomalacia
  - **BY MOUTH USING EFFERVESCENT TABLETS**
    - Neonate: 1 mmol/kg daily in 1–2 divided doses, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details.
    - Child 1 month–4 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details; maximum 48 mmol per day
    - Child 5–17 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; maximum 97 mmol per day
  - **BY INTRAVENOUS INFUSION**
    - Neonate: 1 mmol/kg daily, dose to be adjusted as necessary.
    - Child 1 month–1 year: 0.7 mmol/kg daily, dose to be adjusted as necessary
    - Child 2–17 years: 0.4 mmol/kg daily, dose to be adjusted as necessary

**IMPORTANT SAFETY INFORMATION**

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the concentration of potassium should not usually exceed 40 mmol/litre. The infusion solution should be thoroughly mixed. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the rate at which they may be administered.

**CAUTIONS**

- **GENERAL CAUTIONS** Cardiac disease, dehydration, diabetes mellitus, sodium and potassium concentrations of preparations

---
622 Fluid and electrolyte imbalances

SPECIFIC CAUTIONS
• With intravenous use Avoid extravasation • severe tissue necrosis

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
• Common or very common Diarrhoea
• Frequency not known Nausea

SPECIFIC SIDE-EFFECTS
• With intravenous use Acute kidney injury • extravasation necrosis • hypocalcaemia • hypotension • metastatic calcification • oedema
• With oral use Abdominal distress

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea is a common side-effect and should prompt a reduction in dosage.

RENAI IMPAIRMENT
Dose adjustments Reduce dose.
Monitoring Monitor closely in renal impairment.

MONITORING REQUIREMENTS It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

DIRECTIONS FOR ADMINISTRATION
• With intravenous use Dilute in infusion with Sodium Chloride 0.9% or 0.45% or Glucose 5% or 10%. Administration rate of phosphate should not exceed 0.05 mmol/kg/hour. In emergencies in intensive care faster rates may be used—seek specialist advice.

PRESCRIBING AND DISPENSING INFORMATION Phosphate Sandoz® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na+ 20.4 mmol), potassium 123 mg (K+ 3.1 mmol); Polyfusor NA® contains Na+ 162 mmol/litre, K+ 19 mmol/litre, PO4 3- 100 mmol/litre; non-proprietary potassium dihydrogen phosphate injection (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Effervescent tablet
CAUTIONARY AND ADVISORY LABELS 13
• Phosphate Sandoz (HK Pharma Ltd) Sodium dihydrogen phosphate anhydrous 1.936 gram Phosphate Sandoz effervescent tablets 100 tablet 15.19.39 DT £13.39

Solution for infusion
• Phosphate (Non-proprietary) Potassium dihydrogen phosphate 136 mg per 1 ml Potassium dihydrogen phosphate 13.6% (potassium 10 mmol/10 ml) solution for infusion 10 ml ampoules 10 ampoule 101.96 DT £101.96

Infusion
• Phosphate (Non-proprietary) Potassium dihydrogen phosphate 1.295 gram per 1 litre, Disodium hydrogen phosphate anhydrous 5.75 gram per 1 litre Polyfusor NA phosphates infusion 500ml bottles 1 bottle 15.15

2.5 Potassium imbalance
2.5a Hyperkalaemia

Other drugs used for Hyperkalaemia Calcium gluconate, p. 614 • Insulin, p. 471

ANTIDOTES AND CHELATORS • CATION EXCHANGE RESINS

Calcium polystyrene sulfonate

INDICATIONS AND DOSE Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
• BY MOUTH
  • Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day
  • BY RECTUM
  • Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

• CONTRA-INDICATIONS Hyperparathyroidism • metastatic carcinoma • multiple myeloma • obstructive bowel disease • reduced gut motility (in neonates) • sarcoidosis

CAUTIONS Impaction of resin with excessive dosage or inadequate dilution

INTERACTIONS Appendix 1: polystyrene sulfonate

SIDE-EFFECTS Appetite decreased • constipation (discontinue—avoid magnesium-containing laxatives) • diarrhoea • electrolyte imbalance • epigastric discomfort • gastrointestinal disorders • gastrointestinal necrosis (in combination with sorbitol) • hypercalcaemia (in dialysed patients and occasionally in those with renal impairment) • increased risk of infection • nausea • vomiting

PREGNANCY Manufacturers advise use only if potential benefit outweighs risk—no information available.

BREAST FEEDING Manufacturers advise use only if potential benefit outweighs risk—no information available.

MONITORING REQUIREMENTS Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

DIRECTIONS FOR ADMINISTRATION
• With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder
CAUTIONARY AND ADVISORY LABELS 13, 21 (Sorbisterit® powder only)
EXCIPIENTS: May contain Sucrose
• Calcium Resonium (Sandoz)
Calcium polystyrene sulfonate 999.34 mg per 1 gram Calcium Resonium powder sugar-free 300 gram 182.16 DT £182.16
Sodium polystyrene sulfonate

- **INDICATIONS AND DOSE**
  - Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
    - **BY MOUTH**
      - Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day
    - **BY RECTUM**
      - Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.
      - Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

- **CONTRA-INDICATIONS**
  - Obstructive bowel disease • reduced gut motility (in neonates)
  - **CAUTIONS**
    - Congestive heart failure • hypertension • impaction of resin with excessive dosage or inadequate dilution • oedema
  - **INTERACTIONS** → Appendix 1: polystyrene sulfonate

- **SIDE-EFFECTS**
  - Appetite decreased • nausea • vomiting • constipation (discontinue - avoid magnesium-containing laxatives)
  - diaphoresis • electrolyte imbalance • epigastric discomfort • gastrointestinal disorders • increased risk of infection • nausea • necrosis (in combination with sorbitol) • vomiting

- **PREGNANCY**
  - Manufacturers advise use only if potential benefit outweighs risk - no information available.

- **BREAST FEEDING**
  - Manufacturers advise use only if potential benefit outweighs risk - no information available.

- **RENA L IMPAIRMENT**
  - Use with caution.

- **MONITORING REQUIREMENTS**
  - Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

- **DIRECTIONS FOR ADMINISTRATION**
  - **BY INTRAVENOUS INFUSION**
    - With rectal use: Mix each 1 g of resin with 5 mL of water or 10% glucose.
    - With oral use: Administer dose (powder) in a small amount of water or honey - do not give with fruit juice or squash, which have a high potassium content.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Forms available from special-order manufacturers include: oral suspension
    - **Powder**
      - Resonium A (Sanofi)
      - Sodium polystyrene sulfonate 999.34 mg per 1 gram
      - Effervescent tablet
      - Sodium polystyrene sulfonate 999.34 mg per 1 gram: Resonium A powder sugar-free

Potassium chloride

- **INDICATIONS AND DOSE**
  - Prevention of hypokalaemia (patients with normal diet)
    - **BY MOUTH**
      - Child: 1–2 mmol/kg daily; usual maximum: 50 mmol
  - **Electrolyte imbalance**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements.
        - **BY MOUTH**
          - Neonate: 0.5–1 mmol/kg twice daily; total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.
          - Child: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.

- **CONTRA-INDICATIONS**
  - Plasma-potassium concentration above 5 mmol/litre

- **CAUTIONS**
  - With intravenous use: seek specialist advice in very severe potassium depletion or difficult cases
  - With oral use: Cardiac disease • hiatus hernia (with modified-release preparations) • history of peptic ulcer (with modified-release preparations) • intestinal stricture (with modified-release preparations)

- **INTERACTIONS** → Appendix 1: potassium chloride

- **SIDE-EFFECTS**
  - Abdominal pain • diarrhoea • flatulence • nausea • vomiting
  - **RENA L IMPAIRMENT**
    - Avoid in severe impairment.
  - **DIRECTIONS FOR ADMINISTRATION**
    - To be dissolved in water before administration.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - These tablets do not contain chloride.

**Potassium bicarbonate with potassium acid tartrate**

- **INDICATIONS AND DOSE**
  - Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)
    - **BY MOUTH**
      - Child: (consult product literature)
  - **CONTRA-INDICATIONS**
    - Hypokalaemia • plasma-potassium concentration above 5 mmol/litre
  - **CAUTIONS**
    - Cardiac disease

**Electrolytes and minerals > Potassium**

**2.5b Hypokalaemia**

**SIDE-EFFECTS**
- Abdominal pain • diarrhoea • flatulence • nausea • vomiting

**RENA L IMPAIRMENT**
- Avoid in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**
- To be dissolved in water before administration.

**PRESCRIBING AND DISPENSING INFORMATION**
- These tablets do not contain chloride.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Effervescent tablet**
- CAUTIONARY AND ADVISORY LABELS 13, 21
  - Potassium bicarbonate with potassium acid tartrate (Non-proprietary)
    - Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg: Potassium (potassium 6.5 mmol) effervescent tablets BPC 1968 | 56 tablet £81.27 DT = £90.99

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**
- Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be thoroughly mixed. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

**CONTRA-INDICATIONS**
- Plasma-potassium concentration above 5 mmol/litre

**CAUTIONS**
- With intravenous use: seek specialist advice in very severe potassium depletion or difficult cases
- With oral use: Cardiac disease • hiatus hernia (with modified-release preparations) • history of peptic ulcer (with modified-release preparations) • intestinal stricture (with modified-release preparations)

**INTERACTIONS** → Appendix 1: potassium chloride

**SIDE-EFFECTS**
- Cardiac disease

**SPECIFIC SIDE-EFFECTS**
- Hyperkalaemia

**ELECTROLYTES AND MINERALS > POTASSIUM**

**INDICATIONS AND DOSE**
- Hyperkalaemia associated with potassium deficiency (in renal patients with normal diet)
RENAL IMPAIRMENT  Avoid in severe impairment.
Dose adjustments  Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia.
Monitoring  Close monitoring required in renal impairment—high risk of hyperkalaemia.

MONITORING REQUIREMENTS
- Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
- With intravenous use ECG monitoring should be performed in difficult cases.

DIRECTIONS FOR ADMINISTRATION
- With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloreaemic states).
- With intravenous use Potassium chloride concentrate must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well.
- Ready-mixed infusion solutions should be used when possible. For peripheral intravenous infusion, the concentration of potassium should not usually exceed 40 mmol/L. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.

PRESCRIBING AND DISPENSING INFORMATION  Kay-Cee-L® contains 1 mmol/mL each of K+ and Cl−. Potassium Tablets Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloreaemic states.

PATIENT AND CARER ADVICE  Patient or carers should be given advice on how to administer potassium chloride modified-release tablets.
- Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Ruthmol®). These should not be used by patients with renal failure as potassium intoxication may result.
- LESS SUITABLE FOR PRESCRIBING  Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion.

Modified-release tablet  CAUTIONARY AND ADVISORY LABELS 25, 27

Potassium chloride 3% (potassium 20mmol/50ml) infusion 50ml bags | 1 bag £0.00

3 Metabolic disorders

Metabolic disorders

Use of medicines in metabolic disorders
Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care. General advice on the use of medicines in metabolic disorders can be obtained from: Alder Hey Children’s Hospital, Medicines Information Centre (0151) 252 5381 and Great Ormond Street Hospital for Children, pharmacy (020) 7405 9200

Urea cycle disorders
Sodium benzoate p. 636 and sodium phenylbutyrate p. 637 are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycaemia.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as arginine p. 635 or citrulline p. 636, depending on the specific disorder.

Emergency management
For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at: www.bimdg.org.uk.

3.1 Acute porphyrias

Acute porphyrias 01-Oct-2017

Overview
The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 75 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary,
relatives of affected individuals should be screened and advised about the potential danger of certain drugs. Where there is no safe alternative, drug treatment for serious or life-threatening conditions should not be withheld from patients with acute porphyria. Where possible, the clinical situation should be discussed with a porphyria specialist for advice on how to proceed and monitor the patient. In the UK clinical advice can be obtained from the National Acute Porphyria Service or from the UK Porphyria Medicines Information Service (UKPMIS)—see details below.

Haem arginate p. 626 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from two centres (University Hospital of Wales and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyrinogenicity is available.

An up-to-date list of drugs considered safe in acute porphyrias is available from the UKPMIS, see Useful resources below.

Further information may be obtained from: porphyria.eu/ and also from:

The UK Porphyria Medicines Information Service (UKPMIS)
University Hospital of Wales
CF14 4XW
Cardiff
(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Anabolic steroids
- Antidepressants, MAOIs (contact UKPMIS for advice)
- Antidepressants, Tricyclic and related (contact UKPMIS for advice)
- Barbiturates (includes primidone and thiopental)
- Contraceptives, hormonal (for detailed advice contact UKPMIS or a porphyria specialist)
- Hormone replacement therapy (for detailed advice contact UKPMIS or a porphyria specialist)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact UKPMIS for advice)
- Progestogens (for detailed advice contact UKPMIS or a porphyria specialist)
- Protease inhibitors (contact UKPMIS for advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact UKPMIS for advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant
- Artemether with lumefantrine
- Bexarotene
- Bosantan
- Busulfan
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clemastine
- Clindamycin
- Cocaine
- Danazol
- Dapsone
- Diliazem
- Disopyramide
- Disulfiram
- Ergometrine
- Ergotamine
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Flutamide
- Fosaprepitant
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Ilosafamide
- Indapamide
- Isomethene mucate
- Isoniazid (safety uncertain, contact UKPMIS for advice)
- Ketamine
- Mefenamic acid (safety uncertain, contact UKPMIS for advice)
- Meprobamate
- Mehyldopa
- Metolazone
- Metopropone
- Milnepristone
- Minoxidil (safety uncertain, contact UKPMIS for advice)
- Mitoxane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine
- Pentoxifylline
- Pergolide
- Phenoxbenzamine
- Phenotoin
- Pivmecillinam
- Pizotifen
- Porfimer
- Raloxifene
- Rifabutin (safety uncertain, contact UKPMIS for advice)
- Rifampicin
- Riluzole
- Risperidone
- Spinonolactone
- Sulfinpyrazone
- Tamoxifen
- Temoporfin
- Thiopeta
- Tiagabine
3.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levo carnitine

(Carnitine)

- INDICATIONS AND DOSE
  Primary carnitine deficiency due to inborn errors of metabolism
  - BY MOUTH
    - Neonate: Up to 200 mg/kg daily in 2–4 divided doses.
    - Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day
    - Initially by intravenous infusion
  - Neonate; Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- UNLICENSED USE
  Not licensed for use by intravenous infusion. Tablets, chewable tablets, and oral liquid (30%) not licensed in children under 12 years. Paediatric oral solution (30%) not licensed in children under 12 years. Not licensed for use in organic acidaemias.

- CAUTIONS
  Diabetes mellitus

- SIDE-EFFECTS
  Rare or very rare Abdominal cramps - diarrhoea - nausea - skin oedema abnormal - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Sides-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- PREGNANCY
  Appropriate to use; no evidence of teratogenicity in animal studies.

- RENAL IMPAIRMENT
  Accumulation of metabolites may occur with chronic oral administration in severe impairment.

- MONITORING REQUIREMENTS
  Monitoring of free and acyl carnitine in blood and urine recommended.

- DIRECTIONS FOR ADMINISTRATION
  For intravenous infusion, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.

- PRESCRIBING AND DISPENSING INFORMATION
  When used for Organic acidaemias Levocarnitine is used in the treatment of some organic acidaemias; however, use in fatty acid oxidation is controversial.

- PATIENT AND CARETAKER ADVICE
  Medicines for Children leaflet: Carnitine for metabolic disorders www.medicinesforchildren.org.uk/carnitine-metabolic-disorders-0
3.3a Cystinosis

Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine

(Cysteamine)

**INDICATIONS AND DOSE**

Nephropathic cystinosis (specialist use only)

**BY MOUTH**

- Neonate: Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
- Child 1 month–11 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
- Child 12–17 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
- Child 12–17 years (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses.

Corneal cystine crystal deposits in patients with cystinosis (specialist use only)

- TO THE EYE
- Child 2–17 years: Apply 1 drop 4 times a day, to be applied to both eyes (minimum 4 hours between doses); dose may be reduced according to response (minimum daily dose 1 drop in each eye)

**DOSE EQUIVALENCE AND CONVERSION**

- With oral use

**INDICATIIONS AND DOSE**

Nephropathic cystinosis (specialist use only)

**ORAL SOLUTION**

- Levocarnitine (Non-proprietary)
  - L-Carnitine 300 mg per 1 ml
  - Carnitor 1g chewable tablets | 10 tablet $35.00
- L-Carnitine 100 mg per 1 ml
  - Carnitor oral single dose 1g solution $18.00
- L-Carnitine 250 mg Bio-Carnitine 250 mg capsules | 10 capsule $35.00

**SAFETY PRACTICE**

- mercaptamine-eye-drops-ocular-symptoms-cystinosis

**SIDE-EFFECTS**

- With oral use
  - Dry mouth
  - Dry eyes
  - Eye discomfort
  - Eye disorders
  - Vision blurred
  - Nausea
  - Skin reactions
  - Vomiting

**CAUTIONS**

- When used by eye
  - Contact lens wearers

**DIRECTIONS FOR ADMINISTRATION**

- With oral use
  - Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine.

**PRESCRIBING AND DISPENSING INFORMATION**

- Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated if history of hypersensitivity to penicillamine.

**PREGNANCY**

- With oral use
  - Manufacturer advises avoid—teratogenic and toxic in animal studies.

**BREAST FEEDING**

- With oral use
  - Manufacturer advises avoid—no information available.

**CONTACT LENS WEARING**

- Both eyes
  - Contact lens wearers
  - Assessment should be made
  - Patient should refer to product literature.

**HANDLING AND STORAGE**

- Prolonged storage in room temperature—refrigerated
  - Manufacturer advises store in a refrigerator (2–8°C)—after opening store at room temperature up to 25°C for up to 7 days; protect from light.

**PATIENT AND CARER ADVICE**

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

- With oral use
  - The Scottish Medicines Consortium has advised (November 2017) that mercaptamine (Procasby®) is not recommended for use within NHS Scotland for the treatment of proven nephropathic cystinosis.

**1.3 g/m² is approximately equivalent to 50 mg/kg.**
3.4 Fabry’s disease

ENZYMES

Agalsidase alfa

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**
  - **Fabry’s disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
      - Child 7-17 years: 1 mg/kg every 2 weeks
  - **INTERACTIONS** → Appendix 1: agalsidase
  - **SIDE-EFFECTS**
    - **Common or very common** Arrhythmias - asthenia - chest discomfort - chills - cough - diarrhea - dizziness - dyspnoea - excessive tearing - fever - flushing - gastrointestinal discomfort - headache - hoarseness - hypersomnia - hypertension - increased risk of infection - influenza like illness - joint disorders - malaise - musculoskeletal discomfort - myalgia - nausea - oedema - pain - palpitations - peripheral oedema - peripheral swelling - rhinorrhoea - sensation abnormal - skin reactions - taste altered - temperature sensation altered - throat complaints - tremor - vomiting
    - **Uncommon** Altered smell sensation - angioedema - hypersensitivity - sensation of pressure
    - **Frequency not known** Heart failure - hyperhidrosis - hypotension - myocardial ischaemia
  - **SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions; manage by slowing the infusion rate, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid — consult product literature.
  - **PREGNANCY** Use with caution.
  - **BREAST FEEDING** Use with caution — no information available.
  - **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, given intermittently in Sodium Chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35 – 70 mg dilute with at least 100 mL; doses 70 – 100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - **Replagal** (Shire Pharmaceuticals Ltd)
    - Agalsidase alfa 1 mg per 1 mL Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial £1,040.94
  - **Agalsidase beta**
    - **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**
  - **Fabry’s disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
      - Child 8-17 years: 1 mg/kg every 2 weeks
  - **INTERACTIONS** → Appendix 1: agalsidase
  - **SIDE-EFFECTS**
    - **Uncommon** Dysphagia - ear discomfort - eye pruritus - influenza like illness - malaise - peripheral coldness - tremor
    - **Frequency not known** Anaphylactoid reaction - hypersensitivity vasculitis - hypoxia
  - **SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions; manage by slowing the infusion rate, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid — consult product literature.
  - **PREGNANCY** Use with caution.
  - **BREAST FEEDING** Use with caution — no information available.
  - **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, given intermittently in Sodium Chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35 – 70 mg dilute with at least 100 mL; doses 70 – 100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **Fabrazyme** (Genzyme Therapeutics Ltd)
    - Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial £315.08
    - Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial £2,196.59
3.5 Gaucher’s disease

**Other drugs used for Gaucher’s disease** Migalastat, p. 633

### ENZYMES

#### Imiglucerase

**DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

#### Indications and dose

**Gaucher’s disease type I (specialist use only)**

- **By intravenous infusion**
  - Neonate: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.
  - Child: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate

**Gaucher’s disease type III (specialist use only)**

- **By intravenous infusion**
  - Neonate: Initially 60–120 units/kg every 2 weeks, adjusted according to response.
  - Child: Initially 60–120 units/kg every 2 weeks, adjusted according to response

#### Side-effects

- **Common or very common** Angioedema - cough - dyspnoea - hypersensitivity - skin reactions
- **Uncommon** Abdominal cramps - arthralgia - back pain - chest discomfort - chills - cyanosis - diarrhoea - dizziness - fatigue - fever - flushing - headache - hypotension - nausea - paraesthesia - tachycardia - vomiting
- **Pregnancy** Manufacturer advises use with caution - limited information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

Migalastat for treating Fabry disease (February 2017) NICE HS74

Migalastat is recommended, within its marketing authorisation, as an option for treating Fabry disease in people over 16 years of age with an amenable mutation, only if migalastat is provided with the discount agreed in the patient access scheme, and only if enzyme replacement therapy would otherwise be offered.

www.nice.org.uk/guidance/hst4

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium (November 2016) has advised that migalastat (Galafold®) is accepted for restricted use within NHS Scotland for long-term treatment of adults and adolescents aged 16 years and older with a confirmed diagnosis of Fabry disease (α-galactosidase A deficiency) and who have an amenable mutation—consult SMC advice for full details of restriction.

#### MEDICINAL FORMS

**There can be variation in the licensing of different medicines containing the same drug.**

**Capsule**

- **Galafold (Amicus Therapeutics UK Ltd)**
- **Migalastat (as Migalastat hydrochloride)** 123 mg Galafold 123mg capsules | 14 capsule | £16,153.85
**Velaglucerase alfa**

**DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher’s disease.

**INDICATIONS AND DOSE**

**Type I Gaucher’s disease (specialist use only)**
- **BY INTRAVENOUS INFUSION**
  - Child 4–17 years: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions are very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

**PREGNANCY** Manufacturer advises use with caution—limited information available.

**BREAST FEEDING** Manufacturer advises use with caution—no information available.

**MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

**DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.

**PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 407/07

The Scottish Medicines Consortium has advised (August 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

**Powder for solution for infusion**

**ELECTROLYTES** May contain Sodium
- **VPRIV (Shire Pharmaceuticals Ltd)**

| Velaglucerase alfa 400 unit VPRIV 400 units powder for solution for infusion vials | 1 vial | £1,410.20 |

---

**3.6 Homocystinuria**

**METHYL DONORS**

**Betaine**

**INDICATIONS AND DOSE**

Adjuvantive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)
- **BY MOUTH**
  - Neonate: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day.
  - Child 1 month–9 years: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day.
  - Child 10–17 years: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

**SIDE-EFFECTS**

- Uncommon Abdominal discomfort, agitation, alopecia, appetite decreased, brain oedema, diarrhoea, glossitis, irritability, nausea, skin reactions, urinary incontinence, vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.

**ENZYMES**

**Asfotase alfa**

**DRUG ACTION** Asfotase alfa is a human recombinant tissue-nonspecific alkaline phosphatase that promotes mineralisation of the skeleton.

**INDICATIONS AND DOSE**

Paediatric-onset hypophosphatasia (initiated by a specialist)
- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on body-weight—consult product literature for further information.
  - Child: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on body-weight—consult product literature for further information

**CAUTIONS** Hypersensitivity reactions

**FURTHER INFORMATION**

Reactions, including signs and symptoms consistent with anaphylaxis, have occurred within minutes of administration and can occur in patients.
on treatment for more than one year; if these reactions occur, manufacturer advises immediate discontinuation of treatment and initiation of appropriate medical treatment. For information on re-administration, consult product literature.

- **SIDE-EFFECTS**
  - Common or very common: Bruising tendency - chills - cutis laxa - fever - headache - hypersensitivity - irritability - lipohypertrophy - myalgia - nausea - oral hypoaesthesia - pain - skin reactions - vasodilatation

SIDE-EFFECTS, FURTHER INFORMATION: Injection-site reactions including hypertrophy, induration, skin discoloration, and cellulitis may occur, particularly in patients receiving treatment 6 times a week. Manufacturer advises rotation of injection sites to manage these reactions; interrupt treatment if severe reactions occur and administer appropriate medical therapy.

- **PREGNANCY**
  - Manufacturer advises avoid—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor serum parathyroid hormone and calcium concentrations—supplements of calcium and oral vitamin D may be required.
  - Manufacturer advises periodic ophthalmological examination and renal ultrasounds.
  - Manufacturer advises monitor for increased intracranial pressure (including fundoscopy for signs of papilloedema) periodically in patients below 5 years of age—prompt intervention required if increased intracranial pressure develops.

- **DIRECTIONS FOR ADMINISTRATION**
  - Manufacturer advises max. 1 mL per injection site; administer multiple injections if more than 1 mL is required—consult product literature.

- **HANDLING AND STORAGE**
  - Manufacturer advises store in a refrigerator (2–8 °C).

- **PATIENT AND CARER ADVICE**
  - Injection guides: The manufacturer has produced injection guides for patients and carers to support training given by health care professionals.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**
  - Asfotase alfa for treating paediatric-onset hypophosphatasia (August 2017) NICE HST6
    - Asfotase alfa is recommended as an option for treating paediatric-onset hypophosphatasia only:
      - for people who meet the criteria for treatment within the managed access arrangement (see section 4.18 of the guidance), and
      - for the duration of this arrangement and in line with the other conditions it specifies, and
      - when the manufacturer provides asfotase alfa with the confidential commercial terms agreed with NHS England.
    - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

 www.nice.org.uk/guidance/HST6

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral drops

- **Tablet**
  - Ubidecarenone (Non-proprietary)
    - Ubidecarenone 30 mg | Co-enzyme Q10 30mg tablets | 30 tablet £7.23 | 90 tablet £20.16

- **Oral drops**
  - Ubicor (Imported (Italy))
    - Ubidecarenone 5 mg per 1 ml | Ubicor 5mg/ml oral drops | 10 ml £20.24 [%]

- **Chewable tablet**
  - Ubidecarenone (Non-proprietary)
    - Ubidecarenone 25 mg | Coenzyme Q10 25mg chewable tablets sugar-free | 250 tablet £22.94 [%]

- **Capsule**
  - BioActive Q10 Uniquinol (Pharma Nord (UK) Ltd)
    - Ubidecarenone 30 mg | BioActive Q10 Uniquinol 30mg capsules | 60 capsule £11.06 | 150 capsule £22.11
    - Ubidecarenone 100 mg | BioActive Q10 Uniquinol 100mg capsules | 60 capsule £29.23 | 150 capsule £53.14

  - Super Bio-Quinone (Pharma Nord (UK) Ltd)
    - Ubidecarenone 30 mg | Super Bio-Quinone Q10 30mg capsules | 30 capsule £4.96 | 60 capsule £9.73 | 150 capsule £17.71

3.8 Mitochondrial disorders

**VITAMINS AND TRACE ELEMENTS**

- **Ubidecarenone**
  - (Ubiquinone; Co-enzyme Q10)

- **INDICATIONS AND DOSE**
  - Mitochondrial disorders
    - **BY MOUTH**
      - Neonate: Initially 5 mg 1–2 times a day, adjusted according to response, dose too be taken with food, increased if necessary up to 200 mg daily.
      - Child: Initially 5 mg 1–2 times a day, adjusted according to response, dose to be taken with food, increased if necessary up to 300 mg daily

- **UNLICENSED USE**
  - Not licensed.

- **CAUTIONS**
  - May reduce insulin requirement in diabetes mellitus

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea - dyspepsia - nausea
  - Rare or very rare: Agitation - dizziness - headache - irritability

- **HEPATIC IMPAIRMENT**
  - Dose adjustments: Reduce dose in moderate and severe impairment.

- **PATIENT AND CARER ADVICE**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral drops
3.9 Mucopolysaccharidosis

ENZYMES

Elosulfase alfa

**DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

- **INDICATIONS AND DOSE**
  - **Mucopolysaccharidosis IVA (specialist use only)**
    - By intravenous infusion
    - Neonate: 2 mg/kg once weekly.
  - Child: 2 mg/kg once weekly

- **CAUTIONS** Infusion-related reactions
  - Infusion-related reactions may occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, chills, diarrhea, dizziness, dyspnoea, fever, headache, hypersensitivity, infusion-related reaction, myalgia, nausea, oropharyngeal pain, vomiting.
  - Pregnancy: Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.
  - Breast feeding: Manufacturer advises use only if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Vimizim®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 ml infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 ml/hour, then increase to a rate of 6 ml/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 ml/hour to max. 36 ml/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 ml and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 ml/hour, then increase to a rate of 12 ml/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 ml/hour to max. 72 ml/hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks: Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - Elosulfase alfa for treating mucopolysaccharidosis type Iva (December 2015) NICE HST2
  - Elosulfase alfa, within its marketing authorisation, is recommended for funding for treating mucopolysaccharidosis type IVA (MPS IVA) according to the conditions in the managed access agreement for elosulfase alfa.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - EXCIPIENTS: May contain Polysorbates, sorbitol
  - ELECTROLYTES: May contain Sodium
  - Vimizim (BioMarin Europe Ltd)

- Elosulfase alfa 1 mg per 1 ml Vimizim 5mg/5ml concentrate for solution for infusion vials | 1 vial (HED) £750.00

Galsulfase

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

- **INDICATIONS AND DOSE**

  - **Mucopolysaccharidosis VI (specialist use only)**
    - By intravenous infusion
    - Child 5–17 years: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) – acute respiratory illness (consider delaying treatment) – infusion-related reactions can occur – respiratory disease.

- **SIDE-EFFECTS** Abdominal pain, apnoea, chest pain, chills, conjunctivitis, corneal opacity, dyspnoea, ear pain, face oedema, hypertension, increased risk of infection, infusion-related reaction, malaise, nasal congestion, reflexes absent, umbilical hernia.

- **SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute requisite dose with Sodium Chloride 0.9% to a final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over at least 4 hours.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - Naglazyme (BioMarin Europe Ltd)
  - Galsulfase 1 mg per 1 ml Naglazyme 5mg/5ml solution for infusion vials | 1 vial (HED) £820.00

Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

- **INDICATIONS AND DOSE**

  - **Mucopolysaccharidosis II (specialist use only)**
    - By intravenous infusion
    - Child 5–17 years: 500 micrograms/kg once weekly
**Laronidase**

**Drug Action** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Indications and Dose**

Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)
- By intravenous infusion
- Child: 100 units/kg once weekly

**Caution** Infusion-related reactions can occur

**Side-Effects**
- Common or very common Abdominal pain, alopecia, anaphylactic reaction, angioedema, chills, cough, diarrhoea, dizziness, dyspnoea, fatigue, fever, flushing, headache, hypotension, influenza, joint disorders, nausea, pain, pallor, paraesthesia, peripheral coldness, respiratory disorders, restlessness, skin reactions, sweat changes, tachycardia, temperature sensation altered, vomiting
- Frequency not known Cyanosis, hypoxia, oedema

**Side-Effects, Further Information** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an anti-inflammatory. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**Pregnancy** Manufacturer advises avoid unless essential—no information available.

**Breast Feeding** Manufacturer advises avoid—no information available.

**Monitoring Requirements** Monitor immunoglobulin G (IgG) antibody concentration.

**Directions for Administration** For intravenous infusion, dilute with Sodium Chloride 0.9%; body-weight under 20 kg, dilute to 100 mL, body-weight over 20 kg dilute to 250 mL; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

**Medicinal Forms** There can be variation in the licensing of different medicines containing the same drug.

**Solution for Infusion**
- Elaprase (Shire Pharmaceuticals Ltd) £ 1.985.00

**Miglustat**

**Drug Action** Miglustat is an inhibitor of glucosylceramide synthase.

**Indications and Dose**

Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)
- By mouth
  - Child 4-11 years (body surface area up to 0.48 m²): 100 mg once daily
  - Child 4-11 years (body surface area 0.48-0.73 m²): 100 mg twice daily
  - Child 4-11 years (body surface area 0.74-0.88 m²): 100 mg 3 times a day
  - Child 4-11 years (body surface area 0.89-1.25 m²): 200 mg twice daily
  - Child 4-11 years (body surface area 1.26 m² and above): 200 mg 3 times a day
  - Child 12-17 years: 200 mg 3 times a day

**Side-Effects**
- Common or very common Appetite decreased, asthenia, chills, constipation, depression, diarrhoea, dizziness, flatulence, gastrointestinal discomfort, headache, insomnia, libido decreased, malaise, muscle spasms, muscle weakness, nausea, peripheral neuropathy, sensation abnormal, thrombocytopenia, tremor, vomiting, weight decreased
- Frequency not known Growth retardation

**Conception and Contraception** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

**Pregnancy** Manufacturer advises avoid—toxicity in animal studies.

**Breast Feeding** Manufacturer advises avoid—no information available.

**Hepatic Impairment** Manufacturer advises caution (no information available).

**Renal Impairment** Avoid if estimated glomerular filtration less than 30 mL/minute/1.73 m². Child under 12 years—consult product literature.
DIRECTIONS FOR ADMINISTRATION

Monitor immunoglobulin G (IgG) antibody concentration.
▶ Monitor closely if respiratory dysfunction.
▶ Monitor closely if cardiac dysfunction.

MONITORING REQUIREMENTS

> Monitor cognitive and neurological function.
> Monitor growth and platelet count in Niemann–Pick type C disease.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Zavesca (Actelion Pharmaceuticals UK Ltd)
Miglustat 100 mg Zavesca 100 mg capsules | 84 capsule (POM) £3,934.17 (Hospital only)

BREAST FEEDING

SIDE-EFFECTS

Cluster headache. Hypersensitivity reactions: flushing, skin reactions, dyspnoea, rhinitis, rash, fever, vomiting.

CAUTIONS

Cardiac dysfunction, infusion-related reactions—consult product literature.

ENZYMES

3.11 Pompe disease

Alglucosidase alfa

DRUG ACTION

Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

INDICATIONS AND DOSE

Pompe disease (specialist use only)
▶ BY INTRAVENOUS INFUSION

Neonate: 20 mg/kg every 2 weeks.
Child: 20 mg/kg every 2 weeks

CAUTIONS

Cardiac dysfunction, infusion-related reactions—consult product literature.

SIDE-EFFECTS

Common or very common

Anxiety, arthralgia, chest discomfort, chill, cough, cyanosis, diarrhea, dizziness, fatigue, feeling hot, fever, flushing, hyperhidrosis, hypotension, irritability, local swelling, muscle complaints, nausea, oedema, pallor, paraesthesia, respiratory disorders, skin reactions, throat complaints, tremor, vomiting.

Frequency not known

Abdominal pain, angioedema, apnoea, arthralgia, cardiac arrest, dyspnoea, excessive tearing, eye inflammation, eye pain, granulocytopenia, leucopenia, photophobia, thrombocytopenia.

INTERACTIONS

Further information

Infusion-related reactions are very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

PREGNANCY

Toxicity in animal studies, but treatment should not be withheld.

BREAST FEEDING

Manufacturer advises avoid—no information available.

MONITORING REQUIREMENTS

Monitor closely if cardiac dysfunction.
Monitor closely if respiratory dysfunction.
Monitor immunoglobulin G (IgG) antibody concentration.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Myozyme (Genzyme Therapeutics Ltd)
Alglucosidase alfa 50 mg Myozyme 50 mg powder for concentrate for solution for infusion vials | 1 vial (POM) £356.06 (Hospital only)

3.12 Tyrosinaemia type I

ENZYME INHIBITORS

4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone (NTBC)

INDICATIONS AND DOSE

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)
▶ BY MOUTH

Neonate: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day.
Child: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day.

INTERACTIONS

Appendix 1: nitisinone

SIDE-EFFECTS

Common or very common

Corneal opacity, eye inflammation, eye pain, granulocytopenia, leucopenia, photophobia, thrombocytopenia.

Uncommon

Leucocytosis, skin reactions.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING

Manufacturer advises avoid—adverse effects in animal studies.

PRE-TREATMENT SCREENING

Slit-lamp examination of eyes recommended before treatment.

MONITORING REQUIREMENTS

Monitor liver function regularly.

DIRECTIONS FOR ADMINISTRATION

Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Orfadin (Swedish Orphan Biovitrum Ltd)
Nitisinone 2 mg Nitisinone 2 mg capsules | 60 capsule (POM) £423.00
Nitisinone 5 mg Nitisinone 5 mg capsules | 60 capsule (POM) £845.25
Nitisinone 10 mg Nitisinone 10 mg capsules | 60 capsule (POM) £1,546.50

Orfadin (Swedish Orphan Biovitrum Ltd)
Nitisinone 2 mg Orfadin 2 mg capsules | 60 capsule (POM) £356.00
Nitisinone 5 mg Orfadin 5 mg capsules | 60 capsule (POM) £1,127.00
Nitisinone 10 mg Orfadin 10 mg capsules | 60 capsule (POM) £2,062.00

Nitisinone 20 mg Orfadin 20 mg capsules | 60 capsule (POM) £4,512.00
3.13 Urea cycle disorders

**IMPORTANT SAFETY INFORMATION**

**EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.
Blood and nutrition

BENZOATES

Sodium benzoate

- **INDICATIONS AND DOSE**
  - **Acute hyperammonaemia due to urea cycle disorder (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
    - Neonate: Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.
    - Child: Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.

- **SIDE-EFFECTS**
  - **Metabolic acidosis • oxalate metabolism abnormal • polyneuropathy (long term use)**
  - **PREGNANCY** No information available.
  - **BREAST FEEDING** No information available.

- **MEDICINAL FORMS**
  - No licensed medicines listed.
DRUGS FOR METABOLIC DISORDERS > AMMONIA LOWERING DRUGS

Glycerol phenylbutyrate 13-Sep-2018

- **DRUG ACTION** Glycerol phenylbutyrate is a nitrogen-binding agent that provides an alternative vehicle for waste nitrogen excretion.

- **INDICATIONS AND DOSE**

  **Urea cycle disorders (specialist use only)**
  - **BY MOUTH, OR BY GASTROSTOMY TUBE, OR BY NASOGASTRIC TUBE**

  **Neonate (body surface area up to 1.3 m²):** Initially 9.4 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, each dose should be rounded up to the nearest 0.1 mL and given with each feed. For dose adjustments based on individual requirements—consult product literature.

  **Child 1–2 years (body surface area up to 1.3 m²):** Initially 9.4 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature.

  **Child 2–7 years (body surface area 1.3 m² and above):** Initially 9.4 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature.

  **DOSE EQUIVALENCE AND CONVERSION**

  - 1 mL of liquid contains 1.1 g of glycerol phenylbutyrate.
  - For patients switching from sodium phenylbutyrate or sodium benzoate—consult product literature.

- **IMPORTANT SAFETY INFORMATION**

  **EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**
  For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdorg.org.uk.

- **CONTRA-INDICATIONS** Treatment of acute hyperammonaemia

- **CAUTIONS** Intestinal malabsorption • pancreatic insufficiency

- **INTERACTIONS** → Appendix 1: glycerol phenylbutyrate

- **SIDE-EFFECTS**
  - **Common or very common** Appetite abnormal • constipation • diarrhoea • dizziness • fatigue • food aversion • gastrointestinal discomfort • gastrointestinal disorders • headache • menstrual cycle irregularities • nausea • oral disorders • peripheral oedema • skin reactions • tremor • vomiting
  - **Uncommon** Akathisia • alopecia • biliary colic • bladder pain • burping • confusion • depressed mood • drowsiness • dry mouth • dysphonia • epistaxis • fever • gastrointestinal infection viral • hot flush • hyperhidrosis • hypoaluminaemia • hypokalaemia • hypothyroidism • joint swelling • muscle spasms • nasal congestion • oropharyngeal pain • pain • paraesthesia • plantar fasciitis • speech disorder • taste altered • throat irritation • ventricular arrhythmia • weight changes
  - **Frequency not known** Anaemia • nail ridging • thrombocytosis

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises may be added to a small amount of apple sauce, ketchup, or squash puree and used within 2 hours. For administration advice via nasogastric or gastrostomy tube—consult product literature.

- **HANDLING AND STORAGE** Manufacturer advises discard contents of bottle 14 days after opening.

- **PATIENT AND CARER ADVICE**

  **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) decisions**

  SMC No. 1342/18
  The Scottish Medicines Consortium has advised (August 2018) that glycerol phenylbutyrate (Ravicti®) is accepted for use within NHS Scotland as an adjunctive therapy for chronic management of adult and paediatric patients aged 2 months and older with urea cycle disorders who cannot be managed by dietary protein restriction and or amino acid supplementation alone. Glycerol phenylbutyrate must be used with dietary protein restriction and, in some cases, dietary supplements. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Liquid**
  - Ravicti (Swedish Orphan Biovitrum Ltd) ➤
  - Glycerol phenylbutyrate 1.1 gram per 1 ml
  - Ravicti 1.1g/ml oral liquid | 25 ml [Pos] £61.00

---

**Sodium phenylbutyrate**

- **INDICATIONS AND DOSE**

  **Acute hyperammonaemia due to urea cycle disorders (specialist use only)**
  - **BY INTRAVENOUS INFUSION**

  - **Neonate:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.

  - **Child:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response

  **Maintenance treatment of hyperammonaemia due to urea cycle disorders (specialist use only)**
  - **BY MOUTH**

  - **Neonate:** Up to 250 mg/kg daily in 3–4 divided doses, with feeds.

  - **Child (body-weight up to 20 kg):** Up to 250 mg/kg daily in 3–4 divided doses, with feeds or meals

  - **Child (body-weight 20 kg and above):** 5 g/m² daily in 3–4 divided doses, with meals; maximum 12 g per day
3.14 Wilson’s disease

Other drugs used for Wilson’s disease Penicillamine, p. 639

ANTIDOTES AND CHELATORS > COPPER ABSORPTION INHIBITORS

Zinc acetate

• DRUG ACTION Zinc prevents the absorption of copper in Wilson’s disease.

• INDICATIONS AND DOSE
  Wilson’s disease (initiated under specialist supervision)
  • BY MOUTH
    • Child 1-5 years: 25 mg twice daily
    • Child 6-15 years (body-weight up to 57 kg): 25 mg 3 times a day
    • Child 6-15 years (body-weight 57 kg and above): 50 mg 3 times a day
    • Child 16-17 years: 50 mg 3 times a day
  DOSE EQUIVALENCE AND CONVERSION
  • Doses expressed as elemental zinc.

• PHARMACOKINETICS
  • Symptomatic Wilson’s disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

• CAUTIONS
  • Portal hypertension (risk of hepatic decompensation when switching from chelating agent)
  • Drug interactions: copper absorption

• SIDE-EFFECTS
  • Common or very common
    • Epigastric discomfort (usually transient)
  • Uncommon
    • Leucopenia

• CAUTIONARY AND ADVISORY LABELS
  • Zinc prevents the absorption of copper in Wilson’s disease.

• MEDICAL FORMS
  • There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, solution for infusion
  • Granules
    • Ammonaps (Swedish Orphan Biovitrum Ltd)
      Sodium phenylbutyrate 940 mg per 1 gram Ammonaps 940mg/g granules sugar-free | 266 gram | £860.00 D + £860.00
    • Pheburane (Lucane Pharma Ltd)

  • Capsule
    • CAUTIONARY AND ADVISORY LABELS 23
      • Wilzin (Recordati Rare Diseases UK Ltd)
        Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule | £132.00
        Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule | £242.00
Penicillamine

**Drug Action** Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

**Indications and Dose**

**Wilson's disease**
- **By Mouth**
  - Child 1 month–11 years: 20 mg/kg daily in 2–3 divided doses, to be taken 1 hour before food; maximum 2 g per day
  - Child 12–17 years: Initially 20 mg/kg daily in 2–3 divided doses, maintenance 0.75–1 g daily, to be taken 1 hour before food; maximum 2 g per day

**Cystinuria**
- **By Mouth**
  - Child: 20–30 mg/kg daily in 2–3 divided doses, lower doses may be used initially and increased gradually, doses to be adjusted to maintain 24-hour urinary cystine below 1 mmol/litre, maintain adequate fluid intake, to be taken 1 hour before food; maximum 3 g per day

**Contra-Indications** Lupus erythematosus

**Side-Effects**
- Common or very common: Proteinuria, thrombocytopenia
- Rare or very rare: Alopecia, breast enlargement (males and females), connective tissue disorders, haematuria (discontinue immediately if cause unknown), hypersensitivity, oral disorders, skin reactions
- Frequency not known: Agranulocytosis, aplastic anaemia, appetite decreased, fever, glomerulonephritis, Goodpasture's syndrome, haemolytic anaemia, increased risk of infection, jaundice, cholestatic, leucopenia, lupus-like syndrome, myasthenia gravis, nausea, nephrotic syndrome, neurological deterioration in Wilson's disease, neutropenia, pancreatitis, polymyositis, pulmonary haemorrhage, rash (consider dose reduction), respiratory disorders, Stevens-Johnson syndrome, taste loss (mineral deficiency in Wilson's disease), taste changes, vomiting, yellow nail syndrome

**Allergy and Cross-Sensitivity** Patients who are hypersensitive to penicillin may react rarely to penicillamine.

**Pregnancy** Fetal abnormalities reported rarely; avoid if possible.

**Breast Feeding** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**Renal Impairment**
- Dose adjustments: Reduce dose and monitor renal function or avoid (consult product literature).

**Monitoring Requirements**
- Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).
- Monitor urine for proteinuria.
- Monitor blood and platelet count regularly.

**Patient and Carer Advice** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**
- **Cautionary and Advisory Labels**: 6, 22
  - Penicillamine (Non-proprietary)
    - Penicillamine 125 mg: Penicillamine 125 mg tablets | 56 tablet 🇬🇧 £6.00 DT = £4.00
    - Penicillamine 250 mg: Penicillamine 250 mg tablets | 56 tablet 🇬🇧 £6.67 DT = £4.88

**Trientine dihydrochloride**

**Indications and Dose**

**Wilson's disease in patients intolerant of penicillamine**
- **By Mouth**
  - Child 2–11 years: Initially 0.6–1.5 g daily in 2–4 divided doses, adjusted according to response, to be taken before food
  - Child 12–17 years: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

**Interactions** → Appendix 1: trientine

**Side-Effects**
- Rare or very rare: Anaemia
- Frequency not known: Gastrointestinal disorders, nausea, neurological deterioration in Wilson's disease, rash

**Pregnancy** Teratogenic in animal studies—use only if benefit outweighs risk.
- Monitoring: Monitor maternal and neonatal serum-copper concentrations.

**Prescribing and Dispensing Information** Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **Cautionary and Advisory Labels**: 6, 22
  - Trientine dihydrochloride (Non-proprietary)
    - Trientine dihydrochloride 300 mg: Trientine dihydrochloride 300 mg capsules | 100 capsule 🇬🇧 £13.00 DT = £13.00

4 Mineral and trace elements deficiencies

4.1 Zinc deficiency

**Zinc deficiency**

**Overview**
Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.
Parenteral nutrition regimens usually include trace amounts of zinc, see also Intravenous nutrition below. If necessary, further zinc can be added to intravenous feeding regimens.

**ELECTROLYTES AND MINERALS > ZINC**

**Zinc sulfate**

- **INDICATIONS AND DOSE**
  - **Zinc deficiency or supplementation in zinc-losing conditions**
    - BY MOUTH USING EFFERVESCENT TABLETS
  - Neonate: 1 mg/kg daily, dose expressed as elemental zinc, to be dissolved in water and taken after food.
  - Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc.
  - Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc.
  - Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc.
  - **Acrodermatitis enteropathica**
    - BY MOUTH USING EFFERVESCENT TABLETS
    - Neonate: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc.
    - Child: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc.

- **UNLICENSED USE** Solvazinc® is not licensed for use in acrodermatitis enteropathica.
- **INTERACTIONS** → Appendix 1: zinc
- **SIDE-EFFECTS** Diarrhoea, gastritis, gastrointestinal discomfort, nausea, vomiting
- **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.
- **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.
- **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Each Solvazinc® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - Effervescent tablet
  - CAUTIONARY AND ADVISORY LABELS 13, 21
  - Solvazinc® (Galens Ltd)
    - Zinc sulfate monohydrate 125 mg. Solvazinc 125mg effervescent tablets sugar-free | 80 tablet [P] £17.20 DT + £17.20

---

### 5 Nutrition (intravenous)

#### Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to oral or enteral tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given under Proprietary Infusion Fluids for Parenteral Feeding p. 641.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single ‘all-in-one’ bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions.

Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

**Protein** (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (Primene®) or breast milk (Vaminolact®) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

**Energy** requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child’s age and condition. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 611 is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be

1 1000 kcal = 4200kJ; 1000 kJ = 238.8 kcal. All entries are Prescription-only medicines.
2 Excludes protein- or amino acid-derived energy

Infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

Fat (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. Additives should not be mixed with fat emulsions unless compatibility is known.

Electrolytes are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce the amount of chloride infused; hyperchloraemic acidosis or hypochloraemic alkalosis can occur in preterm neonates or children with renal impairment.

**Administration**

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature and other specialist literature should be consulted.
NUTRIENTS > PARENTERAL NUTRITION

Parenteral nutrition supplements

- INDICATIONS AND DOSE
  - Supplement in intravenous nutrition
  - By intravenous infusion, or by slow intravenous injection
  - Child: (consult product literature)

Dipeptiven 20g/100ml concentrate for solution for infusion bottles

Amino acid supplement for hypertensive or hypermetabolic states

- By intravenous infusion
- Child: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

- CAUTIONS
  - Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature, and other specialist literature should be consulted. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. Additives should not be mixed with fat emulsions unless compatibility is known.

Cernevit solution for injection vials and diluent

 Dilute solution in 5 mL water for injections.

Peditrace solution for infusion 10ml ampoules

Reduced biliary excretion - reduced biliary excretion in cholestatic liver disease - reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) - total parenteral nutrition exceeding one month

Cautions, further information

- Total parenteral nutrition exceeding one month. Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment, discontinue if manganese concentration raised or if cholestasis develops.

- Directions for administration
  - Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature, and other specialist literature should be consulted. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. Additives should not be mixed with fat emulsions unless compatibility is known.

Cernevit solution for injection vials and diluent

- Dissolve in 5 mL water for injections.

Peditrace solution for infusion 10ml ampoules

For addition to Vaminolact®, Vamin Electrolyte-Free solutions, and glucose intravenous infusions.

Additrace solution for infusion 10ml ampoules

For addition to Vamin solutions and glucose intravenous infusions.

Dipeptiven 20g/100ml concentrate for solution for infusion bottles

For addition to infusion solutions containing amino acids.

Addiphos® vials

For addition to Vamin® solutions and glucose intravenous infusions.

Decan concentrate for solution for infusion 40ml bottles

For addition to infusion solutions.

Solivito n powder for solution for infusion vials

Solvito N® powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 micrograms, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 1.13 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

Vitlipid n adult emulsion for injection 10ml ampoules

Vitlipid N® adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phenytoin sodium 15 micrograms/mL.

For adults and children over 11 years.

Vitlipid n infant emulsion for injection 10ml ampoules

Vitlipid N® infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, dl-alpha tocopherol 0.7 unit, phenytoin sodium 20 micrograms/mL.

- Medicinal forms
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

- Cernevit (Baxter Healthcare Ltd)
  - Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic Acid 414 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Pantothenic acid (as Diphosphatidylglycerol) 17.25 mg, Nicotinamide 46 mg, Ascorbic acid 125 mg, Alpha tocopherol 11.2 unit, Colecalciferol 220 unit, Retinol 3500 unit

Solution for infusion

- Parenteral nutrition supplements (Non-proprietary)
  - Sodium glycerophosphate 216 mg per 1 ml
  - Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion vials | 1 vial (BNFC) £5.60

- Additrace (Fresenius Kabi Ltd)
  - Sodium molybdate 4.85 microgram per 1 ml, Chromic chloride 5.33 microgram per 1 ml, Sodium selenite 10.5 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml

- Dipeptiven (Fresenius Kabi Ltd)
  - N2-L-alanyl-L-glutamine 200 mg per 1 ml

Solutions and glucose intravenous infusions.

- Prescribing and dispensing information
  - Cernevit solution contains dl-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 5 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as diphosphatidylglycerol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dehidrated sodium phosphate) 4.14 mg, thiamine (as carbonamiylase tetrahydrate) 3.51 mg.

Peditrace solution for infusion 10ml vials

For use in neonates (when kidney function established, usually second day of life), infants, and children.

Peditrace® solution contains traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻.

Aditrace solution for infusion 10ml ampoules

For patients over 40 kg.

Aditrace® solution contains traces of Fe³⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, Se⁴⁺, Mo⁶⁺, Cr³⁺.

Dipeptiven 20g/100ml concentrate for solution for infusion bottles

Dipeptiven® solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

Addiphos® vials

Addiphos® sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

Decan concentrate for solution for infusion 40ml bottles

For patients over 40 kg.

Decan® solution contains traces elements Fe³⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺.

Solivito n powder for solution for infusion vials

Solivito N® powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 micrograms, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

Vitlipid n adult emulsion for injection 10ml ampoules

Vitlipid N® adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phenytoin sodium 15 micrograms/mL.

For adults and children over 11 years.

Vitlipid n infant emulsion for injection 10ml ampoules

Vitlipid N® infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, dl-alpha tocopherol 0.7 unit, phenytoin sodium 20 micrograms/mL.
6 Nutrition (oral)

Enteral nutrition

Overview

Children have higher nutrient requirements per kg bodyweight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased nutritional problems during critical periods of development. Most children receiving enteral feeds for a child. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

Infant formula feeds

Child 0–12 months. Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The energy intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amylose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed, which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively, energy supplements may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load (with or without added medium chain triglyceride (MCT) oil) or the normal energy density of formula to increase the energy density. Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored.

Choosing the best formula for children depends on several factors including: nutritional requirements, gastrointestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Additional vitamins may also be needed.

Most feeds for enteral use contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency. Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Additional vitamins may also be needed.
Clinical Conditions such as renal and liver diseases. When used without the supervision of a paediatric dietician, and because of their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

Specialised formula

Highly specialised formulae are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

Feed thickeners

Carob based thickeners may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeds.

Pre-thickened formula

Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

Starched based thickeners can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

Dietary supplements for oral use

Three types of prescribable fortified dietary supplements are available: fortified milk and non-milk tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1680 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

Enteral feeding tubes

Care is required in choosing an appropriate formulation of a drug for administration through a nasogastric narrow-bore feeding tube or through a percutaneous endoscopic gastrostomy (PEG) or jejunostomy tube. Liquid preparations (or soluble tablets) are preferred; injection solutions may also be suitable for administration through an enteral tube.

If a solid formulation of a medicine needs to be given, it should be given as a suspension of particles fine enough to pass through the tube. It is possible to crush many immediate-release preparations should not be crushed.

Enteral feeds may affect the absorption of drugs and it is therefore important to consider the timing of drug administration in relation to feeds. If more than one drug needs to be given, they should be given separately and the tube should be flushed with water after each drug has been given.

Clearing blockages

Carbonated (sugar-free) drinks may be marginally more effective than water in unblocking feeding tubes, but mildly acidic liquids (such as pineapple juice or cola-based drinks) can coagulate protein in feeds, causing further blockage. If these measures fail to clear the enteral feeding tube, an alkaline solution containing pancreatic enzymes may be introduced into the tube (followed after at least 5 minutes by water). Specific products designed to break up blockages caused by formula feeds are also available.
6.1 Special diets

Nutrition in special diets

Overview

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

Coeliac disease

Coeliac disease is caused by an abnormal immune response to gluten. For management and further information, see Coeliac disease p. 27.

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuoria. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of aspartame consumed can be taken into account in the management of the condition. Where the presence of aspartame in a preparation is specified in the product literature, aspartame is listed as an excipient in the relevant product entry in BNF for Children; the child or carer should be informed of this.

Some rare forms of phenylketonuria are caused by a deficiency of tetrahydrobiopterin. Treatment involves oral supplementation of tetrahydrobiopterin p. 646; in some severe cases, the addition of the neurotransmitter precursors, levodopa and 5-hydroxytryptophan, is also necessary.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin p. 646, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

6.1a Phenylketonuria

DRUGS FOR METABOLIC DISORDERS

TETRAHYDROBIOPTERIN AND DERIVATIVES

Sapropterin dihydrochloride

14-Sep-2018

INDICATIONS AND DOSE

Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)

- BY MOUTH
  - Child 4–17 years: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)

- BY MOUTH
  - Neonate: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day
  - Child: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

CAUTIONS

- History of convulsions
- Appendix 1: Sapropterin

SIDE-EFFECTS

- Common or very common Abdominal pain - cough - diarrhoea - headache - laryngeal pain - nasal congestion - vomiting
- Frequency not known Hypersensitivity

PREGNANCY

Manufacturer advises caution—consider only if strict dietary management inadequate.

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution (no information available).

RENAL IMPAIRMENT

Manufacturer advises caution—no information available.

MONITORING REQUIREMENTS

- Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.
- Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

DIRECTIONS FOR ADMINISTRATION

Tablets should be dissolved in water and taken within 20 minutes.

PRESCRIBING AND DISPENSING INFORMATION

Sapropterin is a synthetic form of tetrahydrobiopterin.

PATIENT AND CARER ADVICE

Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 558/09

The Scottish Medicines Consortium has advised (August 2018) that sapropterin dihydrochloride (Kuvan®) is not recommended for use within NHS Scotland for the treatment of hyperphenylalaninaemia in adults and paediatric patients of all ages with phenylketonuria (who have been shown to be responsive to such treatment) as the economic case was not demonstrated.
Vitamin deficiency

7 Vitamin deficiency

Vitamins

Overview

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron-deficiency anaemia, a primary vitamin or mineral deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn’s disease.

The use of vitamins as general ‘pick-me-ups’ is of unproven value and, the ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 652 and pyridoxine hydrochloride p. 650, is unscientific and can be harmful. Many vitamin supplements are described as ‘multivitamin’ but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

Dietary reference values for vitamins are available in the Department of Health publication:

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A p. 649 (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation once enteral feeding has been established.

Vitamin B group

Deficiency of the B vitamins, other than vitamin B12, is rare in the UK and is usually treated by preparations containing thiamine p. 650 (B1), and riboflavin (B2). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate, and pantothenic acid or panthenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders. Anaphylaxis has been reported with parental B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B6) deficiency is rare, but it may occur during isoniazid p. 382 therapy or penicillamine p. 639 treatment in Wilson’s disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid p. 594 supplementation may also be beneficial in these disorders. Pyridoxine hydrochloride is also used in sideroblastic anaemia. Rarely, seizures in the neonatal period or during infancy respond to pyridoxine hydrochloride treatment; pyridoxine hydrochloride should be tried in all cases of early-onset intractable seizures and status epilepticus. Pyridoxine hydrochloride has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders require specialist management. Thiamine is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidemias and cytochrome oxidase deficiencies; biotin is used in carboxylase defects.

Folic acid and vitamin B12 are used in the treatment of megaloblastic anaemia. Folinic acid p. 575 (available as calcium folinate) is used in association with cytotoxic therapy.
**Vitamin C**

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency have been reported. Vitamin C is used to enhance the excretion of iron one month after starting desferrioxamine mesilate p. 598 therapy; it is given separately from food as it also enhances iron absorption. Vitamin C is also used in the treatment of some inherited metabolic disorders, particularly mitochondrial disorders; specialist management of these conditions is required.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a child with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

**Vitamin D**

The term Vitamin D is used for a range of compounds including ergocalciferol p. 656 (calciferol, vitamin D₂), colecalciferol p. 654 (vitamin D₃), dihydroxycholecalciferol, alfalcacidol p. 653 (1α-hydroxycholecalciferol), and calcitriol p. 653 (1,25-dihydroxycholecalciferol).

Asymptomatic vitamin D deficiency is common in the United Kingdom; symptomatic deficiency may occur in certain ethnic groups, particularly as rickets or hypocalcaemia, and rarely in association with malabsorption. The amount of vitamin D required in infancy is related to the stores built up in utero and subsequent exposure to sunlight. The amount of vitamin D in breast milk varies and some breast-fed babies, particularly if preterm or born to vitamin D deficient mothers, may become deficient. Most formula milk and supplement feeds contain adequate vitamin D to prevent deficiency.

Simple, nutritional vitamin D deficiency can be prevented by oral supplementation of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily, using multi–vitamin drops, preparations of vitamins A and D, manufactured ‘special’ solutions, or as calcium and ergocalciferol tablets (although the calcium and other vitamins in supplements are unnecessary); excessive supplementation may cause hypercalcaemia.

Inadequate bone mineralisation can be caused by a deficiency, or a lack of action of vitamin D or its active metabolite. In childhood this causes bowing and distortion of bones (rickets). In nutritional vitamin D deficiency rickets, initial high doses of ergocalciferol or colecalciferol should be reduced to supplemental doses after 8–12 weeks, as there is a significant risk of hypercalcaemia. However, calcium supplements are recommended if there is hypocalcaemia or evidence of a poor dietary calcium intake. A single large dose of ergocalciferol p. 656 or colecalciferol p. 654 can also be effective for the treatment of nutritional vitamin D deficiency rickets.

Poor bone mineralisation in neonates and young children may also be due to inadequate intake of phosphate or calcium particularly during long-term parenteral nutrition—supplementation with phosphate or calcium may be required.

*Hyppophosphataemic* rickets occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate, and hydroxylated (activated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses; the hypocalcaemia of *hypoparathyroidism* often requires higher doses in order to achieve normocalcaemia and alfacalcidol p. 653 is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease.

Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives alfacalcidol or calcitriol p. 653 should be prescribed if patients with *severe liver or renal impairment* require vitamin D therapy. Alfacalcidol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

Paricalcitol p. 657, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease.

**Vitamin E**

The daily requirement of vitamin E (tocopherol) has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

**Vitamin K**

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, menadiol sodium phosphate p. 658 can be used if supplementation with phytomenadione p. 659 by mouth has been insufficient.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; see advice on the use of vitamin K in haemorrhage.

**Multivitamins**

Multivitamin supplements are used in children with vitamin deficiencies and also in malabsorption conditions such as cystic fibrosis or liver disease. Supplementation is not required if nutrient enriched feeds are used; consult a dietician for further advice.

**Vitamin K deficiency bleeding**

Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as phytomenadione) may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies.
Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione by mouth at birth (using the contents of a phytomenadione capsule) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

**VITAMINS AND TRACE ELEMENTS**

**MULTIVITAMINS**

### Vitamins A and D

- **INDICATIONS AND DOSE**
  - Prevention of vitamin A and D deficiency
    - **BY MOUTH**
      - Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D

- **UNLICENSED USE** Not licensed in children under 6 months of age.

- **SIDE-EFFECTS**
  - Overdose: Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Capsule
    - **Vitamins a and d (Non-proprietary)**
      - Vitamin D 400 unit, Vitamin A 4000 unit
  - **EXCIPIENTS**: May contain Arachis (peanut) oil, sucrose

### Vitamins A, B group, C and D

- **INDICATIONS AND DOSE**
  - Prevention of deficiency
    - **BY MOUTH USING CAPSULES**
      - Child 1-11 years: 1 capsule daily
      - Child 12-17 years: 2 capsules daily
  - Cystic Fibrosis: prevention of deficiency
    - **BY MOUTH USING CAPSULES**
      - Child 1-7 years: 2–3 capsules daily

**ABIDEC MULTIVITAMIN DROPS**

- **PREVENTION OF DEFICIENCY**
  - **BY MOUTH USING ORAL DROPS**
  - Preterm neonate: 0.6 mL daily.
  - Neonate: 0.3 mL daily.
  - Child 1-11 months: 0.3 mL daily
  - Child 1-7 years: 0.6 mL daily

**CYSTIC FIBROSIS: PREVENTION OF DEFICIENCY**

- **BY MOUTH USING ORAL DROPS**
  - Child 1-11 months: 0.6 mL daily
  - Child 1-7 years: 1.2 mL daily

**UNLICENSED USE** Dalivit® not licensed for use in children under 6 weeks.

**PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

- To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

- Vitamin A concentration of preparations varies.

<table>
<thead>
<tr>

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Oral drops**

- **EXCIPIENTS**: May contain Arachis (peanut) oil, sucrose

- **Abidec Multivitamin (Omega Pharma Ltd)**
  - Nicotinamide 1333 microgram per 1 mL, Pyridoxine hydrochloride 1333 microgram per 1 mL, Riboflavin 1333 microgram per 1 mL, Thiamine hydrochloride 1.67 mg per 1 mL, Ascorbic acid 66.7 mg per 1 mL, Ergocalciferol 667 iu per 1 mL, Retinol (as Vitamin A palmitate) 2222 iu per 1 mL
  - Abidec Multivitamin drops | 25 mL (GSK) £3.68

- **Dalivit (Boston Healthcare Ltd)**
  - Riboflavin 667 microgram per 1 mL, Pyridoxine 833 microgram per 1 mL, Thiamine 1667 microgram per 1 mL, Nicotinamide 8.3 mg per 1 mL, Ascorbic acid 81 mg per 1 mL, Ergocalciferol 667 iu per 1 mL, Retinol (as Vitamin A palmitate) 2222 iu per 1 mL
  - Dalivit oral drops | 25 mL (GSK) £5.60

**Capsule**

- **Vitamins a, b group, c and d (Non-proprietary)**
  - Riboflavin 500 microgram, Thiamine hydrochloride 1 mg, Nicotinamide 7.5 mg, Ascorbic acid 15 mg, Vitamin D 300 unit, Vitamin A 2500 unit
  - Dalivit capsules | 1000 capsule £48.20 DT = £15.48

### Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A p. 649, ascorbic acid p. 652.

- **INDICATIONS AND DOSE**
  - Prevention of vitamin deficiency
    - **BY MOUTH**
      - Child 1 month-4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **INTERACTIONS** → Appendix 1: Ascorbic acid - vitamin A

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

- Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at...
VITAMINS AND TRACE ELEMENTS

Vitamin A (Retinol)

**INDICATIONS AND DOSE**

Vitamin A deficiency

- **BY MOUTH**
  - Neonate: 5000 units daily, higher doses may be used initially for treatment of severe deficiency.
  - Child 1-11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency.
  - Child 1-7 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency.

Prevention of deficiency in complete biliary obstruction

- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 50 000 units once a month.
  - Child 1-11 months: 50 000 units once a month.

**UNLICENSED USE** Preparations containing only vitamin A are not licensed.

**INTERACTIONS** Appendix 1: vitamin A

**SIDE-EFFECTS**

Overdose Massive overdose can cause rough skin, dry hair, an enlarged liver, and increases in erythrocyte sedimentation rate, serum calcium and serum alkaline phosphatase concentration.

Pregnancy Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.

Breastfeeding Theoretical risk of toxicity in infants of mothers taking large doses.

Monitoring requirements Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral drops, solution for injection

**Solution for injection**

- Vitamin A (Imported)
  - Retinol (as Vitamin A palmitate) 50000 unit per 1 ml Aquasol A
  - Parenteral 100,000 units/2ml solution for injection vials
  - 1 vial £6
  - Nepal Vitamin A 100,000 units/2ml solution for injection ampoules
  - 6 ampoule £20

**Oral drops**

- Arovit (Imported (Italy))
  - Vitamin A 150000 unit per 1 ml Arovit 150,000 units/ml drops
  - 7.5 ml £6

Combinations available: Vitamins A, C, and D, p. 648

**VITAMINS AND TRACE ELEMENTS**

Biotin (Vitamin H)

**INDICATIONS AND DOSE**

Isolated carboxylase defects

- **BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION**
  - Neonate: 5 mg once daily, adjusted according to response; maintenance 10–50 mg daily, higher doses may be required.

  - Child: 10 mg once daily, adjusted according to response; maintenance 10–50 mg daily, increased if necessary up to 100 mg daily.

Defects of biotin metabolism

- **BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required.

  - Child: Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required.

**PREGNANCY** No information available.

**BREAST FEEDING** No information available.

**DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed and mixed with food or drink.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Biotin for metabolic disorders www.medicinesforchildren.org.uk/biotin metabolic disorders-0

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Solution for injection**

- Biodermin (Imported (Italy))
  - Biotin 5 mg per 1 ml Biodermin 5mg/1ml solution for injection vials
  - 10 vial £9

**Tablet**

- Biotisan (Imported (Germany))
  - Biotin 10 mg Biotisan 10 mg tablet FORTE tablets
  - 30 tablet £9

- Biotess (Essential HealthCare Ltd)
  - Biotin 5 mg Biotess 5mg tablets
  - 30 tablet £13.81

  - Biotin 5 mg OroB7 5mg tablets
  - 30 tablet £33.99
**Pyridoxine hydrochloride**  
*(Vitamin B₆)*

### Indications and Dose

####isoniazid-induced neuropathy (prophylaxis)
- **By mouth**
  - Neonate: 5 mg daily.
  - Child 1 month–11 years: 5–10 mg daily
  - Child 12–17 years: 10 mg daily

####isoniazid-induced neuropathy (treatment)
- **By mouth**
  - Neonate: 5–10 mg daily.
  - Child 1 month–11 years: 10–20 mg 2–3 times a day
  - Child 12–17 years: 30–50 mg 2–3 times a day

####Prevention of penicillamine-induced neuropathy in Wilson's disease
- **By mouth**
  - Child: 50–100 mg 1–2 times a day

####Pyridoxine-dependent seizures
- **Initially by intravenous injection**
  - Neonate: Test dose 50–100 mg, repeated if necessary, if responsive, followed by an oral maintenance dose; (by mouth) maintenance 50–100 mg once daily, dose to be adjusted as necessary.
  - Child 1 month–11 years: Test dose 50–100 mg daily, if responsive, followed by an oral maintenance dose, (by mouth) maintenance 20–50 mg 1–2 times a day, dose to be adjusted as necessary, (by mouth) increased if necessary up to 30 mg/kg daily, alternatively (by mouth) increased if necessary up to 1 g daily

####Unlicensed Use
- Not licensed for prophylaxis of penicillamine-induced neuropathy in Wilson's disease.
- Not licensed for use in children.

####Caution
- With intravenous use: risk of cardiovascular collapse (with intravenous injection—resuscitation facilities must be available and monitor closely)

####Side-effects
- **Peripheral neuritis**
- **Overdose** Overdose may induce toxic effects.

####Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection.

####Tablet
- **Pyridoxine hydrochloride (Non-proprietary)**
  - Pyridoxine hydrochloride 10 mg Pyridoxine 10 mg tablets | 28 tablet (P) £16.95 DT = £16.95
  - Pyridoxine hydrochloride 20 mg Pyridoxine 20 mg tablets | 500 tablet (P) £
  - Pyridoxine hydrochloride 50 mg Pyridoxine 50 mg tablets | 28 tablet (P) £16.31 DT = £15.75

####Solution for injection
- **Pyridoxine hydrochloride (Non-proprietary)**
  - Pyridoxine hydrochloride 50 mg per 1 ml Vitamin B6 100 mg/2ml solution for injection ampoules | 10 ampoule (P) £

  - **Sicovit (Imported—Romania)**
  - Pyridoxine hydrochloride 25 mg per 1 ml Sicovit B6 50 mg/2ml solution for injection vials | 5 vial (P) £

####Oral solution
- **PyriDose (Trion Pharma Ltd)**
  - Pyridoxine hydrochloride 20 mg per 1 ml PyriDose 100 mg/5ml oral solution | 100 ml £29.86 DT = £36.79

####Capsule
- **Pyridoxine hydrochloride (Non-proprietary)**
  - Pyridoxine hydrochloride 100 mg Vitamin B6 100 mg capsules | 100 capsule (P) | 120 capsule £5.50

**Riboflavin**  
*(Riboflavin; Vitamin B₂)*

### Indications and Dose

####Metabolic diseases
- **By mouth**
  - Neonate: 50 mg 1–2 times a day, adjusted according to response.
  - Child: 50–100 mg 1–2 times a day, adjusted according to response to up to 400 mg daily

####Unlicensed Use
- Not licensed in children.

####Side-effects
- Urine discolouration
- **Pregnancy** Crosses the placenta but no adverse effects reported, information at high doses limited.
- **Breast Feeding** Present in breast milk but no adverse effects reported, information at high doses limited.

####Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, modified-release tablet, capsule, oral suspension, oral solution.

####Modified-release tablet
- **Riboflavin (Non-proprietary)**
  - Riboflavin 100 mg Vitamin B2 100 mg modified-release tablets | 60 tablet £4.46

####Tablet
- **Riboflavin (Non-proprietary)**
  - Riboflavin 100 mg Vitamin B2 100 mg tablets | 100 tablet £

####Capsule
- **Riboflavin (Non-proprietary)**
  - Riboflavin 50 mg Riboflavin 50 mg capsules | 30 capsule £3.13
  - B-2-50 (Bio-Tech Pharmacal Inc)
  - Riboflavin 50 mg B-2-50 capsules | 100 capsule £
  - E-B2 (Ennogen Healthcare Ltd)
  - Riboflavin 100 mg E-B2 100 mg capsules | 30 capsule £9.20

**Thiamine**  
*(Vitamin B₁)*

### Indications and Dose

####Maple syrup urine disease
- **By mouth**
  - Neonate: 5 mg/kg daily, dose to be adjusted as necessary.
  - Child: 5 mg/kg daily, dose to be adjusted as necessary

####Metabolic disorders | Congenital lactic acidosis
- **Initially by mouth, or by intravenous infusion**
  - Neonate: 50–200 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes.
  - Child: 100–300 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes, (by mouth) increased if necessary up to 2 g daily.
Vitamin B complex

**INDICATIONS AND DOSE**

**Treatment of deficiency**
- **By Mouth**
  - Child 1-11 months: 5 mL 3 times a day, this dose is for Vigranon B® syrup.
  - Child 1-11 years: 10 mL 3 times a day, this dose is for Vigranon B® syrup.
  - Child 12–17 years: 10–15 mL 3 times a day, this dose is for Vigranon B® syrup.

**Prophylaxis of deficiency**
- **By Mouth Using Syrup**
  - Child 1-11 months: 5 mL once daily, this dose is for Vigranon B® syrup.

**PRESCRIBING AND DISPENSING INFORMATION**

- **CAUTIONS**
  - Anaphylaxis may occasionally follow injection.
  - Breast Feeding
    - Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.
- **PREScribing and dispensing information**
  - With intravenous use
    - Some preparations may contain phenol as a preservative.
  - Thiamine HYDROCHLORIDE 100 mg
  - Thiamine hydrochloride 50 mg
  - Thiamine hydrochloride 25 mg
  - Thiamine hydrochloride 100 mg
  - Thiamine hydrochloride 50 mg
  - Thiamine hydrochloride 25 mg

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**INDICATIONS AND DOSE**

**ORAL Solution**

- **KETOVITE® LIQUID**
  - Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets
  - **By Mouth**
    - Child: 5 mL daily, dose adjusted according to condition, diet, or age, use with Ketovite® Tablets for complete vitamin supplementation.

- **KETOVITE® TABLETS**
  - Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets
  - **By Mouth**
    - Child: 1 tablet 3 times a day, dose adjusted according to condition, diet, or age, use with Ketovite® Liquid for complete vitamin supplementation.

**UNLICENSED USE**

- Not licensed in children.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM advice (September 2007)**

- Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:
  - This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
  - Intravenous administration should be by infusion over 30 minutes;
  - Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NHS restrictions**
  - Vigranon B® syrup is not prescribable in NHS primary care.

- **LESS suitable for prescribing**
  - Vitamin B compound tablets, vitamin B compound strong tablets, and Vigranon B® syrup are less suitable for prescribing.

**MEdICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**ORAL Solution**

- **Vigranon-B** (Wallace Manufacturing Chemists Ltd)
  - Pyridoxine hydrochloride 400 microgram per 1 ml, Riboflavin sodium phosphate 548 microgram per 1 ml, Dexamethasone 600 microgram per 1 ml, Thiamine hydrochloride 1 mg per 1 ml, Nicotinamide 4 mg per 1 ml | 150 ml (P) £26.00 |

**Vigranon B®**

- Use with thiamine is essential; parenteral thiamine is administered.

**BNFC 2019–2020**
Ascorbic acid (Vitamin C)

**INDICATIONS AND DOSE**

**Treatment of scurvy**
- **BY MOUTH**
  - Child: 1 month–3 years: 125–250 mg daily in 1–2 divided doses
  - Child: 4–11 years: 250–500 mg daily in 1–2 divided doses
  - Child: 12–17 years: 0.5–1 g daily in 1–2 divided doses

Adjunct to desferrioxamine (to enhance the excretion of iron 1 month after treatment)
- **BY MOUTH**
  - Child: 100–200 mg daily, to be taken 1 hour before food

**Metabolic disorders | Tyrosinaemia type III | Transient tyrosinaemia of the newborn | Glutathione synthase deficiency | Hawkinsuria**
- **BY MOUTH**
  - Neonate: 50–200 mg daily, dose to be adjusted as necessary.
  - Child: 200–400 mg daily in 1–2 divided doses, dose to be adjusted as necessary, increased if necessary up to 1 g daily

**UNLICENSED USE** Not licensed for metabolic disorders.

**CONTRA-INDICATIONS** Hyperoxaluria.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

Iron overload Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

**INTERACTIONS | Appendix 1: ascorbic acid**

**SIDE-EFFECTS** Diarrhoea | gastrointestinal disorder | hyperoxaluria | oxalate nephrolithiasis | polyuria

**PRESCRIBING AND DISPENSING INFORMATION** It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Tablet**

- **Ketovite** (Essential Pharmaceuticals Ltd)
  - Biotin 170 microgram, Folic acid 250 microgram, Pyridoxine hydrochloride 330 microgram, Acetomenaphthone 500 microgram, Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Calcium pantothenate 1.16 mg, Nicotinamide 3.3 mg, Alpha tocopherol acetate 5 mg, Ascorbic acid 16.6 mg, Inositol 50 mg
  - Ketovite tablets | 100 tablet

**Capsule**

- **Forceval** (Forum Health Products Ltd)
  - Cyanocobalamin 3 microgram, Selenium 50 microgram, Biotin 100 microgram, Iodine 140 microgram, Chromium 400 microgram, Molybdenum 250 microgram, Folic acid 600 microgram, Phosphorus 77 mg, Calcium 100 mg, Ergocalciferol 400 unit, Vitamin A 2500 unit
  - Forceval capsules | 15 capsule

**Expiry Date**

- 15 months

**VITAMINS AND TRACE ELEMENTS | VITAMIN C**
Alfacalcidol
(1α-Hydroxycholecalciferol)

**INDICATIONS AND DOSE**

- Hypophosphataemic rickets
- Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Child 1 month-11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
  - Child 12-17 years: 1 microgram once daily, dose to be adjusted as necessary

**SIDE-EFFECTS**

- Rash pustular
- Abdominal discomfort
- Arrhythmia
- Muscle weakness
- Sensory disorder
- Urinary disorders

**INTERACTIONS**

- Alfacalcidol 2 microgram per 1 ml One-Alpha 2 micrograms/ml oral drops sugar-free | 10 ml PFS £21.30 DT + £21.30

**CAPSULE**

- **EXCipients:** May contain Alcohol, propylene glycol
  - Alfacalcidol 2 microgram per 1 ml One-Alpha 2 micrograms/ml oral drops sugar-free | 10 ml PFS £21.30 DT + £21.30

**UNLICENSED USE**

- Not licensed for use in children.

**CAUTIONS**

- Nephrolithiasis - take care to ensure correct dose in infants

**SIDE-EFFECTS**

- Common or very common: Abdominal discomfort - hyperphosphataemia - rash pustular
- Uncommon: Asthenia - diarrhoea - malaise - myalgia - urolithiasis
- Rare or very rare: Dizziness
- Frequency not known: Confusion - renal impairment

**RENAIMPERATION**

- Monitor plasma-calcium concentration in renal impairment.

**DIRECTIONS FOR ADMINISTRATION**

- For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

- Solution for injection
  - **EXCipients:** May contain Alcohol, propylene glycol
  - **One-Alpha (LEO Pharma)**
    - Alfacalcidol 2 microgram per 1 ml One-Alpha 2 micrograms/ml oral drops sugar-free | 10 ml PFS £21.30 DT + £21.30

**Calcitriol**
(1,25-Dihydroxycholecalciferol)

**INDICATIONS AND DOSE**

- Vitamin D dependent rickets
- Hypophosphataemic rickets
- Persistent hypocalcaemia due to hypoparathyroidism
- Pseudo-hypoparathyroidism (limited experience)

- **BY MOUTH**
  - Child 1 month-11 years: Initially 15 nanograms/kg once daily (max. per dose 250 nanograms), increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks
  - Child 12-17 years: Initially 250 nanograms once daily, increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks; usual dose 0.5–1 microgram daily

**UNLICENSED USE**

- Take care to ensure correct dose in infants

**SIDE-EFFECTS**

- Common or very common: Urinary tract infection
- Frequency not known: Abdominal pain upper - apathy - arrhythmia - dehydration - drowsiness - fever - growth retardation - muscle weakness - paralytic ileus - polydipsia - psychiatric disorder - sensory disorder - urinary disorders - weight decreased

**RENAIMPERATION**

- Monitor plasma-calcium, phosphate, and creatinine during dosage titration.
- Monitor plasma-calcium concentration in patients receiving high doses.

**DIRECTIONS FOR ADMINISTRATION**

- Contents of capsule may be administered by oral syringe.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

- **ORAL SOLUTION**
  - Calcitriol (Non-proprietary)
    - Calcitriol 1 microgram per 1 ml Rocaltrol 1 micrograms/ml oral solution sugar-free | 10 ml PFS £
Cautions: 

There can be variation in the licensing of

Renal Impairment: 

Monitoring: Monitor plasma-calcium concentration in renal impairment.

Monitoring Requirements: Monitor plasma-calcium concentration in patients receiving high doses.

Directions for Administration: 

INVITA D3® Oral Solution: May be mixed with a small amount of milk or cold or lukewarm food immediately before administration.

Indications and Dose: Prevention of vitamin D deficiency

By Mouth: 

Child: 400 units daily

Renal Impairment: 

Monitoring: Monitor plasma-calcium concentration in renal impairment.

Monitoring Requirements: Monitor plasma-calcium concentration in patients receiving high doses.

Directions for Administration: 

INVITA D3® Oral Solution: May be mixed with a small amount of milk or cold or lukewarm food immediately before administration.

Medicinal Forms: There can be variation in the licensing of different medicines containing the same drug. Licenses available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, oral drops

Colecalciferol with calcium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 654, calcium carbonate p. 613.

**INDICATIONS AND DOSE**

Prevention and treatment of vitamin D and calcium deficiency

**BY MOUTH**

- Child: Dosed according to the deficit or daily maintenance requirements (consult product literature)

**UNLICENSED USE** *Adcal-D®* and *Calcice®* are not licensed for use in children under 12 years. *Calcichew-D®, Calcichew-D® Forte, Calci chew-D®* and *Kalcidos-D®* not licensed for use in children (age range not specified by manufacturers). *Accrete D3®* and *Natecal D3®* not licensed for use in children under 18 years.

**INTERACTIONS** → Appendix 1: calcium salts - vitamin D substances

**PRESCRIBING AND DISPENSING INFORMATION** *Accrete D3®* contains calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); *Adcal- D3®* tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); *Cact®* D3 contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet; *Calcio®* contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 10 micrograms (800 units); *Natecal D3®* contains calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); consult product literature for details of other available products.
Flavours of chewable and soluble forms may include orange, lemon, aniseed, peppermint, molasses, or tutti-frutti.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Effervescent granules**
- Colecalciferol with calcium carbonate (Non-proprietary) 880 unit Colecalciferol 880 unit / Calcium carbonate 2.5 g effervescent granules sachets | 24 sachet
- Cacit D (Theramex HQ UK Ltd) 750 mg, Colecalciferol 440 unit Cacit D effervescent granules sachets | 30 sachet DT £4.06 DT £4.06

**Effervescent tablet**
- Adcal-D (Kyoa Kirin Ltd) Calcium carbonate 2.5 gram, Colecalciferol 440 unit 60 tablet £2.95 DT £2.95
- Accre D3 (Internis Pharmaceuticals Ltd) Calcium carbonate 1.25 gram, Colecalciferol 200 unit 56 tablet £5.99 DT £5.99

**Tablet**
- EXCIPIENTS: May contain Propylene glycol
  - Accre D3 (Internis Pharmaceuticals Ltd) Calcium carbonate 1.5 gram, Colecalciferol 400 unit Accre D3 tablets | 60 tablet £2.95 DT £2.95
  - Adcal-D (Kyoa Kirin Ltd) Calcium carbonate 750 mg, Colecalciferol 200 unit Adcal-D 112 tablet £2.95 DT £2.95
  - Calcichew D (Takeda UK Ltd) Calcium carbonate 1.25 gram, Colecalciferol 400 unit Calcichew D 100 tablet £7.43 DT £7.43

**Chewable tablet**
- EXCIPIENTS: May contain Aspartame
  - Colecalciferol with calcium carbonate (Non-proprietary) Calcium carbonate 1.5 gram, Colecalciferol 400 unit 56 tablet £3.65 DT £3.65 | 112 tablet £7.49
  - Accre D3 One a Day (Internis Pharmaceuticals Ltd) Calcium carbonate 1.5 gram, Colecalciferol 880 unit Accre D3 One a Day 1000 mg/880 unit chewable tablets | 30 tablet DT £2.95 DT £2.95

**INDICATIONS AND DOSE**
- Chewable forms with calcium salts and colecalciferol or ergocalciferol should be dispensed or directed that when calciferol is prescribed or demanded, substances with the strength (expressed in micrograms or milligrams per day) not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**INTERACTIONS** → Appendix 1: calcium salts - vitamin D substances

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder**
- Calcium carbonate 3.1 gram, Colecalciferol 800 unit Calfovit D3 oral powder sachets | 30 sachet DT £4.32 DT £4.32

**Ergocalciferol** (Calciferol; Vitamin D₂)

**INDICATIONS AND DOSE**
- Nutritional vitamin-D deficiency rickets
  - BY MOUTH
  - Child 1-5 months: 3000 units daily, dose to be adjusted as necessary
  - Child 6 months-11 years: 6000 units daily, dose to be adjusted as necessary
  - Child 12-17 years: 10 000 units daily, dose to be adjusted as necessary

- Prevention of rickets
  - BY MOUTH
  - Neonate: 400 units daily.

- Child: 400–600 units daily

- Vitamin D deficiency in intestinal malabsorption or in chronic liver disease
  - BY MOUTH, OR BY INTRAMUSCULAR INJECTION
  - Child 1-11 years: 10 000–25 000 units daily, dose to be adjusted as necessary
  - Child 12-17 years: 10 000–40 000 units daily, dose to be adjusted as necessary

**CAUTIONS** Take care to ensure correct dose in infants

**INTERACTIONS** → Appendix 1: vitamin D substances

**RENAL IMPAIRMENT** Monitoring Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

**PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.

When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection.

**Tablet**
- Ergocalciferol 12.5 microgram (Einnogen Healthcare Ltd)
- Ergocalciferol 125 microgram (Cubic Pharmaceuticals Ltd)
- Ergocalciferol 10 microgram (Cubic Pharmaceuticals Ltd)

**Capsule**
- Ergocalciferol 1.25 mg (Cubic Pharmaceuticals Ltd)
- Ergocalciferol 12.5 microgram (Cubic Pharmaceuticals Ltd)
- Ergocalciferol 15 microgram (Cubic Pharmaceuticals Ltd)

**Oral solution**
- Ergocalciferol 1 microgram per 1 ml (Einnogen Healthcare Ltd)
- Ergocalciferol 10 microgram per 1 ml (Einnogen Healthcare Ltd)
- Ergocalciferol 3000 unit per 1 ml (Cubic Pharmaceuticals Ltd)

**Ergocalciferol with calcium lactate and calcium phosphate**
*(Calcium and vitamin D)*

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol p. 656, calcium lactate p. 615.

**INDICATIONS AND DOSE**
- Prevention of calcium and vitamin D deficiency
- Treatment of calcium and vitamin D deficiency
- **BY MOUTH**
- Child: (consult product literature)

**UNLICENSED USE** Calcium and Ergocalciferol tablets not licensed for use in children under 6 years.

**INTERACTIONS** → Appendix 1: calcium salts - vitamin D substances

**DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed before administration, or may be chewed.

**PRESCRIBING AND DISPENISING INFORMATION** Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units).

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Ergocalciferol with calcium lactate and calcium phosphate (Non-proprietary)
- Ergocalciferol 10 microgram, Calcium phosphate 150 mg, Calcium lactate 300 mg (Cubic Pharmaceuticals Ltd) 28 tablet pack £25.55

**Side-effects**
- Abdominal pain
- Asthenia
- Electrolyte imbalance
- Gastrointestinal discomfort
- Malaise
- Muscle cramps
- Nausea
- Palpitations
- Peripheral oedema
- Pruritus
- Pneumonia
- Taste altered
- Tinnitus
- Unusual tiredness

**Contra-indications**
- Preterm neonates (in neonates)
- Predisposition to thrombosis

**CAUTIONS**
- **PREGNANCY**
- Manufacturer advises caution, no evidence of harm in animal studies.
- **BREAST FEEDING**
- Manufacturer advises use only if potential benefit outweighs risk - no information available.

**VITAMINS AND TRACE ELEMENTS**

**VITAMIN E**

**Alpha tocopherol**
*(Tocopherol)*

**INDICATIONS AND DOSE**
- Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis
- **BY MOUTH USING ORAL SOLUTION**
- Neonate: 17 mg/kg daily, dose to be adjusted as necessary.
- Child: 17 mg/kg daily, dose to be adjusted as necessary

**CONTRA-INDICATIONS**
- Preterm neonates (in neonates)
- Predisposition to thrombosis

**CAUTIONS**
- Abdominal pain
- Diarrhoea
- Alopecia - asthenia - headache - skin reactions
- Frequency not known

**SIDE-EFFECTS**
- Abdominal pain
- Diarrhoea
- Alopecia - asthenia - headache - skin reactions
- Frequency not known

**PREGNANCY**
- Manufacturer advises caution, no evidence of harm in animal studies.

**BREAST FEEDING**
- Manufacturer advises use only if potential benefit outweighs risk - no information available.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution.

**RENAL IMPAIRMENT**
- Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content.

**Monitoring**
- Manufacturer advises monitor closely in renal impairment.
Alpha tocopheryl acetate (Tocopherol)

**INDICATIONS AND DOSE**

**Vitamin E deficiency**
- BY MOUTH
  - Neonate: 10 mg/kg once daily.
  - Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily.

**Malabsorption in cystic fibrosis**
- BY MOUTH
  - Child 1–11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes.
  - Child 1–11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes.
  - Child 12–17 years: 200–600 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes.

**Vitamin E deficiency in cholestasis and severe liver disease**
- BY MOUTH
  - Neonate: 10 mg/kg daily.
  - Child: 10 mg/kg once daily (max. per dose 100 mg).

**Malabsorption in abetalipoproteinaemia**
- BY MOUTH
  - Neonate: 100 mg/kg once daily.
  - Child: 50–150 mg/kg once daily.

**CAUTIONS**
- Increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg or in a preterm neonate (in neonates) - predisposition to thrombosis.

**INTERACTIONS** → Appendix 1: vitamin E substances.

**SIDE-EFFECTS**
- Abdominal pain (more common at high doses) - bleeding tendency, diarrhoea (more common at high doses), increased risk of thrombosis.

**PREGNANCY**
- No evidence of safety of high doses.

**BREAST FEEDING**
- Excreted in milk; minimal risk, although caution with large doses.

**MONITORING REQUIREMENTS**
- Increased bleeding tendency in vitamin K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).

**DIRECTIONS FOR ADMINISTRATION**
- Consider dilution of oral suspension for use in neonates due to high osmolality.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- **Vedrop** (Recordati Rare Diseases UK Ltd)
  - D-alpha tocopherol (as Tocofersolan) 50 mg per 1 ml
  - Oral solution sugar-free | 20 ml £4.55 DT + £4.55
  - Oral solution sugar-free | 60 ml £16.65

**VITAMINS AND TRACE ELEMENTS** ➔ **VITAMIN K**

Menadioni sodium phosphate

**INDICATIONS AND DOSE**

**Supplementation in vitamin K malabsorption**
- BY MOUTH
  - Child 1–11 years: 5–10 mg daily, dose to be adjusted as necessary.
  - Child 12–17 years: 10–20 mg daily, dose to be adjusted as necessary.

**CONTRA-INDICATIONS**
- Infants, neonates.

**CAUTIONS**
- G6PD deficiency (risk of haemolysis) - vitamin E deficiency (risk of haemolysis).

**PREGNANCY**
- Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet, solution for injection.

**Solution for injection**
- **Alpha tocopheryl acetate (Non-proprietary)**
  - Alpha tocopherol acetate 200 unit capsules | 100 capsule £11.99
  - Alpha tocopherol acetate 200 unit capsules | 300 capsule £33.99

**Oral solution**
- **EXCIPIENTS:** May contain Sucrose
  - **Alpha tocopheryl acetate (Non-proprietary)**
    - Alpha tocopherol acetate 100 mg | 100 ml £2.45

**Chewable tablet**
- **E-Tabs** (Ennogen Healthcare Ltd)
  - Alpha tocopherol acetate 100 mg | 100 capsule £19.80
  - Alpha tocopherol acetate 100 mg | 100 capsule £39.60

**Capsule**
- **Alpha tocopheryl acetate (Non-proprietary)**
  - Alpha tocopherol 75 unit capsules | 100 capsule £13.05
  - Alpha tocopherol 200 unit capsules | 30 capsule £30.05
  - Bio-E-Vitamin 200 unit capsules | 150 capsule £9.40
  - Alpha tocopherol 400 unit capsules | 30 capsule £15.12
  - E-Caps (Ennogen Healthcare Ltd)
    - Alpha tocopherol 75 unit capsules | 100 capsule £109.50
    - Alpha tocopherol 100 unit capsules | 30 capsule £84.40
  - Alpha tocopherol 200 unit capsules | 30 capsule £89.50
  - Alpha tocopherol 400 unit capsules | 30 capsule £128.50
  - Alpha tocopherol 1000 unit capsules | 30 capsule £130.20
  - **Nutra-E** (TriOn Pharma Ltd)
    - Alpha tocopherol 75 unit capsules | 100 capsule £5.86
    - Alpha tocopherol 200 unit capsules | 100 capsule £12.88
    - Alpha tocopherol 400 unit capsules | 100 capsule £18.82
    - Vita-E (Typharm Ltd)
      - Alpha tocopherol 75 unit capsules | 100 capsule £6.99
      - Alpha tocopherol 200 unit capsules | 30 capsule £5.35
      - Alpha tocopherol 400 unit capsules | 30 capsule £7.99
      - Alpha tocopherol 1000 unit capsules | 100 capsule £21.85
**Phytomenadione** (Vitamin K<sub>1</sub>)

**INDICATIONS AND DOSE**

**Neonatal prophylaxis of vitamin-K deficiency bleeding**
- **BY INTRAVENOUS INJECTION**
  - Preterm neonate: 400 micrograms/kg (max. per dose 1 mg) for 1 dose, to be given at birth, the intravenous route may be used in preterm neonates with very low birth-weight if intramuscular injection is not possible, however, it may not provide the prolonged protection of the intramuscular injection, any neonate receiving intravenous vitamin K should be given subsequent oral doses.

- **Neonate: 1 mg for 1 dose, to be given at birth.**

**Neonatal hypoprothrombinaemia | Vitamin-K deficiency bleeding**
- **BY INTRAVENOUS INJECTION**
  - **Neonate: 1 mg every 8 hours if required.**

**Neonatal biliary atresia and liver disease**
- **BY MOUTH**
  - **Neonate: 1 mg daily.**

**Reversal of coumarin anticoagulation when continued anticoagulation required or if no significant bleeding—seek specialist advice**
- **BY INTRAVENOUS INJECTION**
  - **Child: 15–30 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may be repeated as necessary**

**Reversal of coumarin anticoagulation when anticoagulation not required or if significant bleeding—seek specialist advice | Treatment of haemorrhage associated with vitamin-K deficiency—seek specialist advice**
- **BY INTRAVENOUS INJECTION**
  - **Child: 250–300 micrograms/kg (max. per dose 10 mg) for 1 dose**

**KONAKION® MM PAEDIATRIC**

**Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders**
- **BY MOUTH**
  - **Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days.**

**Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders (exclusively breast fed babies)**
- **BY MOUTH**
  - **Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days for a further 1 dose, then 2 mg for a further 1 dose 1 month after birth.**

**CAUTIONS**
- Intravenous injections should be given very slowly—risk of vascular collapse

**KONAKION® MM PAEDIATRIC** Parenteral administration in premature infant or neonate of less than 2.5 kg (increased risk of kernicterus).

**PREGNANCY** Use if potential benefit outweighs risk.

**BREAST FEEDING** Present in milk.

**HEPATIC IMPAIRMENT**

**DIRECTIONS FOR ADMINISTRATION**
- With oral use in neonates The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given.

**KONAKION® MM PAEDIATRIC** Konakion® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection. For intravenous injection, may be diluted with Glucose 5% if necessary.

**KONAKION® MM** Konakion® MM may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; not for intramuscular injection.

**MEDICINAL FORMS**

- **Tablet**
  - Menadiol (Non-proprietary)
    - Menadiol sodium phosphate (as menadiol phosphate) 10mg
      - Menadiol 10mg tablets | 100 tablet £204.49 DT + £204.49

**NEOKAY**

**Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders**
- **BY MOUTH**
  - **Neonate: 1 mg for 1 dose at birth (to protect from the risk of vitamin K deficiency bleeding in the first week).**

**Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders (exclusively breast-fed babies)**
- **BY MOUTH**
  - **Neonate: Initially 1 mg for 1 dose at birth, then 1 mg every week for 12 weeks.**

**MEDICINAL FORMS**

- **Tablet**
  - Menadiol (Neceuticals Ltd)
    - Menadiol sodium phosphate (as menadiol phosphate) 300 micrograms/kg (max. per dose 1 mg) for 1 dose
      - Menadiol 10mg tablets | 100 capsule £34.00

- **K-Cap** (Transdermal Ltd)

- **NeoKay** (Neceuticals Ltd)

**Solution for injection**

**EXCIPIENTS:** May contain Glycocholic acid, lecithin

- **Phytomenadione 10 mg per 1mL** Konakion MM Paediatric 2mg/0.2ml solution for injection ampoules | 5 ampoule £71.71 DT + £71.71

**Capsule**

- **K-Cap (Transdermal Ltd)**

- **NeoKay (Neceuticals Ltd)**

**Phytomenadione 1mg** NeoKay 1mg capsules | 12 capsule £95 DT + £3.95

**Phytomenadione 10mg** NeoKay 1mg capsules | 30 capsule £158.80

**Phytomenadione 1 mg** NeoKay 1mg capsules | 10 capsule £34.00
7.1 Neural tube defects (prevention in pregnancy)

Neural tube defects (prevention in pregnancy) 01-Aug-2017

Description of condition
Neural tube defects represent a group of congenital defects, caused by incomplete closure of the neural tube within 28 days of conception. The most common forms are anencephaly, spina bifida and encephalocele.

The main risk factors are maternal folate deficiency, maternal vitamin B₁₂ deficiency, previous history of having an infant with a neural tube defect, smoking, diabetes, obesity, and use of antiepileptic drugs. For information on smoking cessation see Smoking cessation p. 304.

Prevention in pregnancy
Pregnant women or women who wish to become pregnant should be advised to take supplementation with folic acid p. 594 before conception and until week 12 of pregnancy.

A higher daily dose (see folic acid) is recommended for women at a high risk of conceiving a child with a neural tube defect, including women who have previously had an infant with a neural tube defect, who are receiving antiepileptic medication (see Epilepsy p. 195), or who have diabetes or sickle-cell disease.

1 Arthritis

Juvenile idiopathic arthritis

Management
Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve non-steroidal anti-inflammatory drugs p. 674 (NSAIDs), a disease modifying anti-rheumatic drug (DMARD) such as methotrexate p. 563 or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids.

Rheumatic disease, suppressing drugs

Overview
Certain drugs, such as methotrexate p. 563, cytokine modulators, and sulfasalazine p. 33, are used to suppress the disease process in juvenile idiopathic arthritis (juvenile chronic arthritis); these drugs are known as disease modifying antirheumatic drugs (DMARDs). In children, DMARDs should be used under specialist supervision. Some children with juvenile idiopathic arthritis do not require DMARDs. Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine p. 639 are no longer used. Cytokine modulators have a role in polyarticular juvenile idiopathic arthritis.

Unlike NSAIDs, DMARDs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a DMARD may allow the dose of the NSAID to be reduced. DMARDs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations. They reduce the erythrocyte sedimentation rate and C-reactive protein.

Antimalarials
The antimalarial hydroxychloroquine sulfate p. 662 is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine sulfate can also be useful for systemic or discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy rarely occurs provided that the recommended doses are not exceeded. Mepacrine hydrochloride is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response
Methotrexate, given as a once weekly dose, is the DMARD of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely, the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid p. 594 has not been established—in children over 2 years a weekly dose [unlicensed indication], may be given on a different day from the methotrexate.

Azathioprine p. 536 may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of systemic lupus erythematosus and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of polymyositis which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Ciclosporin p. 537 is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

Cytokine modulators
Cytokine modulators should be used under specialist supervision.

Adalimumab p. 665, etanercept p. 667, and infliximab p. 35 inhibit the activity of tumour necrosis factor alpha (TNF-α). Adalimumab can be used for the management of active polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis. Etanercept is licensed for the treatment of the following subtypes of juvenile idiopathic arthritis: polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, psoriatic arthritis in children over 12 years who have had an inadequate response to methotrexate or cannot tolerate it, and enthesitis-related arthritis in children over 12 years who have had an inadequate response to conventional therapy or cannot tolerate it. Infliximab has been used in...
refractory polyarticular juvenile idiopathic arthritis [unlicensed indication] when other treatments, such as etanercept, have failed.

Abatacept p. 664 prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors. Canakinumab p. 543 inhibits the activity of interleukin-1 beta (IL-1β) and is licensed for the treatment of active systemic juvenile idiopathic arthritis in children over 2 years, when there has been an inadequate response to NSAIDs and systemic corticosteroids.

Tocilizumab p. 663 antagonises the actions of interleukin-6; it can be used for the management of active systemic juvenile idiopathic arthritis when there has been an inadequate response to NSAIDs and systemic corticosteroids and polyarticular juvenile idiopathic arthritis when there has been an inadequate response to methotrexate. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated. Tocilizumab is not recommended for use with other cytokine modulators.

Sulfasalazine
Sulfasalazine has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease.

Other drugs used for Arthritis

- Cyclophosphamide, p. 555
- Diclofenac sodium, p. 676
- Etoricoxib, p. 677
- Flurbiprofen, p. 678
- Ibuprofen, p. 679
- Indometacin, p. 681
- Mefenamic acid, p. 682
- Meloxicam, p. 683
- Naproxen, p. 683
- Piroxicam, p. 684

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

Hydroxychloroquine sulfate

- **INDICATIONS AND DOSE**
  - Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)
    - **BY MOUTH**
      - Child: 5–6.5 mg/kg once daily (max. per dose 400 mg), dose given based on ideal body-weight

- **UNLICENSED USE** Plaquenil® not licensed for use in children for dermatological conditions caused or aggravated by sunlight.

- **CAUTIONS** Acute porphyrias p. 624 | diabetes (may lower blood glucose) | G6PD deficiency | may aggravate myasthenia gravis | may exacerbate psoriasis | neurological disorders (especially in those with a history of epilepsy—may lower seizure threshold) | severe gastro-intestinal disorders.

- **CAUTIONS, FURTHER INFORMATION**
  - Screening for retinopathy. A review group convened by the Royal College of Ophthalmologists has updated guidelines on screening for chloroquine and hydroxychloroquine retinopathy (Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Screening 2018). There are no reports of hydroxychloroquine retinopathy in patients under the age of 18 years, or evidence for screening paediatric patients for drug toxicity. However, the guideline recommends long-term users of hydroxychloroquine under the age of 18 years who otherwise satisfy the screening criteria should be referred for screening.

- **INTERACTIONS** Appendix 1: hydroxychloroquine

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain | appetite decreased | diarrhoea | emotional lability | headache | nausea | skin reactions | vision disorders | vomiting
  - Uncommon Alopecia | corneal oedema | dizziness | eye disorders | hair colour changes | nervousness | neuromuscular dysfunction | retinopathy | seizure | tinnitus | vertigo
  - Frequency not known Acute hepatic failure | agranulocytosis | anaemia | angioedema | bone marrow disorders | bronchospasm | cardiac conduction disorders | cardiomyopathy | hearing loss | hypoglycaemia | leucopenia | movement disorders | muscle weakness | myopathy | photosensitivity reaction | psychosis | reflexes absent | severe cutaneous adverse reactions (SCARs) | thrombocytopenia | tremor | ventricular hypertrophy

- **OVERDOSE** Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

- **BREAST FEEDING** Avoid—risk of toxicity in infant.

- **HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

- **RENAI IMPAIRMENT** Manufacturer advises caution.

- **PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 21
    - Hydroxychloroquine sulfate (Non-proprietary)
    - Hydroxychloroquine sulfate 200 mg Hydrochloroquine 200mg tablets | 60 tablet [PBN] £32.49 DT = £3.70
    - Quinoric (Bristol Laboratories Ltd)
      - Hydroxychloroquine sulfate 200 mg Quinoric 200mg tablets | 60 tablet [PBN] £4.75 DT = £0.70

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

Anakinra

- **INDICATIONS AND DOSE** Cryopyrin-associated periodic syndromes (specialist use only)
  - **BY SUBCUTANEOUS INJECTION**
    - Child 8 months–17 years (body-weight 10 kg and above): 1–2 mg/kg daily, for severe cryopyrin–associated periodic syndromes, usual maintenance is 3–4 mg/kg daily, up to a maximum of 8 mg/kg daily
    - Still's disease (specialist use only)
      - **BY SUBCUTANEOUS INJECTION**
        - Child 8 months–17 years (body-weight 10–49 kg): 1–2 mg/kg daily, increased if necessary up to 4 mg/kg daily
        - Child 8 months–17 years (body-weight 50 kg and above): 100 mg daily, increased if necessary up to 4 mg/kg daily
CONTRA-INDICATIONS Active infection - neutropenia (absolute neutrophil count less than 1.5 × 10^9/litre)—do not initiate - pre-existing malignancy

CAUTIONS Elderly - history of asthma (increased risk of serious infection) - history of recurrent infection - predisposition to infection

INTERACTIONS → Appendix 1: anakinra

SIDE-EFFECTS
- Common or very common: Headache - infection - neutropenia - thrombocytopenia
- Uncommon: Skin reactions
- Frequency not known: Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION Neutropenia reported commonly—discontinue if neutropenia develops.

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.

RENAL IMPAIRMENT: Manufacturer advises caution in moderate impairment.

Dose adjustments: Manufacturer advises consider alternate day dosing in severe impairment.

PRE-TREATMENT SCREENING: Manufacturer advises patients should be screened for latent tuberculosis and viral hepatitis prior to initiation of treatment.

MONITORING REQUIREMENTS
- Manufacturer advises monitor neutrophil count before treatment, then every month for 6 months, then every 3 months thereafter.
- When used for Cryopyrin-associated periodic syndromes: Manufacturer advises monitor for CNS inflammation (including ear and eye tests) 3 months after starting treatment, then every 6 months until effective treatment doses have been identified, then yearly thereafter.
- When used for Still's disease: Manufacturer advises consider routine monitoring of hepatic enzymes during the first month of treatment.

PRESCRIBING AND DISPENSING INFORMATION
- When used for Cryopyrin-associated periodic syndromes or Still's disease: The manufacturer of Kineret® has provided a Guide for Healthcare Professionals.

PATIENT AND CARER ADVICE
Blood disorders: Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.

When used for Still's disease: A patient card and patient booklet should be provided.

When used for Cryopyrin-associated periodic syndromes: A patient booklet should be provided.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
SMC No. 05/02
The Scottish Medicines Consortium has advised (November 2002) that anakinra (Kineret®) is not recommended for the treatment of rheumatoid arthritis within NHS Scotland.

SMC No. SMC2104
The Scottish Medicines Consortium has advised (October 2018) that anakinra (Kineret®) is accepted for use within NHS Scotland for the treatment of Still’s disease, as monotherapy or in combination with other anti-inflammatory drugs and disease-modifying anti-rheumatic drugs.

Tocilizumab

INDICATIONS AND DOSE
Active systemic juvenile idiopathic arthritis [in combination with methotrexate or alone if methotrexate inappropriate, in children who have had an inadequate response to NSAIDs and systemic corticosteroids]
- BY INTRAVENOUS INFUSION
  - Child 2–17 years (body-weight up to 30 kg): 12 mg/kg every 2 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 6 weeks
  - Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 2 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 6 weeks

Polyarticular juvenile idiopathic arthritis [in combination with methotrexate or alone if methotrexate inappropriate, in children who have had an inadequate response to methotrexate]
- BY INTRAVENOUS INFUSION
  - Child 2–17 years (body-weight up to 30 kg): 10 mg/kg every 4 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks
  - Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 4 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks

ROACTEMRA® PRE-FILLED SYRINGE
Polyarticular juvenile idiopathic arthritis [in combination with methotrexate or alone if methotrexate inappropriate, in children who have had an inadequate response to methotrexate]
- BY SUBCUTANEOUS INJECTION
  - Child 2–17 years (body-weight up to 30 kg): 162 mg every 3 weeks, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks
  - Child 2–17 years (body-weight 30 kg and above): 162 mg every 2 weeks, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks

CONTRA-INDICATIONS Do not initiate if absolute neutrophil count less than 2 × 10^9/litre - severe active infection

CAUTIONS History of diverticulitis - history of intestinal ulceration - history of recurrent or chronic infection (interrupt treatment if serious infection occurs) - low absolute neutrophil count - low platelet count - predisposition to infection (interrupt treatment if serious infection occurs)
Musculoskeletal system

PATIENT AND CARER ADVICE

HANDLING AND STORAGE

With subcutaneous use
DIRECTIONS FOR ADMINISTRATION

▶ Manufacturer advises monitor for demyelinating
▶ Manufacturer advises monitor lipid pro

HEPATIC IMPAIRMENT

With subcutaneous use
Manufacturer advises monitor renal function closely in moderate-to-severe impairment—no information available.

PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

Manufacturer advises monitor lipid profile 4–8 weeks after starting treatment and then as indicated.

Manufacturer advises monitor for demyelinating disorders.

Manufacturer advises monitor hepatic transaminases, and neutrophil and platelet count at the time of the second administration, and then as indicated.

DIRECTIONS FOR ADMINISTRATION

With intravenous use For intravenous infusion, manufacturer advises for body-weight less than 30 kg, give intermittently in Sodium chloride 0.9%, dilute requisite dose to a volume of 50 ml with infusion fluid and give over 1 hour; body-weight 30 kg or greater, give intermittently in Sodium chloride 0.9%, dilute requisite dose to a volume of 100 ml with infusion fluid and give over 1 hour.

With subcutaneous use For subcutaneous injection, manufacturer advises rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer RoActemra®, after appropriate training in subcutaneous injection technique.

PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises to record the brand name and batch number after each administration.

HANDLING AND STORAGE

Manufacturer advises protect from light and store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

PATIENT AND CARER ADVICE

Manufacturer advises patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

An alert card should be provided.

Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Tocilizumab for the treatment of systemic juvenile idiopathic arthritis (December 2011) NICE TA238

Tocilizumab (RoActemra®) is recommended for the treatment of systemic juvenile idiopathic arthritis in children aged 2 years and older who have not responded adequately to NSAIDs, systemic corticosteroids and methotrexate, if the manufacturer makes tocilizumab available with the discount agreed as part of the patient access scheme.

Tocilizumab is not recommended for the treatment of systemic juvenile idiopathic arthritis in children whose disease continues to respond to methotrexate or who have not been treated with methotrexate.

Patients currently receiving tocilizumab for systemic juvenile idiopathic arthritis who do not meet these criteria should have the option to continue treatment until it is considered appropriate to stop.

www.nice.org.uk/guidance/ta238

Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Tocilizumab (RoActemra®) is recommended as an option for treatment of polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in children 2 years and older whose disease has responded inadequately to previous therapy with methotrexate and if the manufacturer provides tocilizumab with the discounts agreed in the patient access schemes.

www.nice.org.uk/guidance/ta373

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

RoActemra (Roche Products Ltd)

Tocilizumab 180 mg per 1 ml RoActemra 162mg/0.9ml solution for injection pre-filled pen | 4 pre-filled disposable injection £913.12 DT + £913.12 RoActemra 162mg/0.9ml solution for injection pre-filled syringes | 4 pre-filled disposable injection £913.12 DT + £913.12 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

RoActemra (Roche Products Ltd)

Tocilizumab 20 mg per 1 ml RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial £512.00 (Hospital only) Tocilizumab 200mg/10ml concentrate for solution for infusion vials | 1 vial £256.00 (Hospital only) Tocilizumab 80mg/4ml concentrate for solution for infusion vials | 1 vial £162.40 (Hospital only)

IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

00-Dec-2017

INDICATIONS AND DOSE

Moderate-to-severe dose polyarticular juvenile idiopathic arthritis (specialist use only)

BY INTRAVENOUS INFUSION

Child 6–17 years (body-weight up to 75 kg): 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

Child 6–17 years (body-weight 75–100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months

Child 6–17 years (body-weight ≥101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

CONTRA-INDICATIONS

Severe infection
MEDICINAL FORMS

Abatacept, adalimumab, etanercept and tocilizumab for NICE funding/decision decisions

DIRECTIONS FOR ADMINISTRATION

PREGNANCY

CONCEPTION AND CONTRACEPTION

Rare or very rare Pelvic inflammatory disease - respiratory malignancy

CONCEPTION AND CONTRACEPTION Effective contraception required during treatment and for 14 weeks after last dose.

PREGNANCY Manufacturer advises avoid unless essential.

PREGNANCY Breastfeeding Present in milk in animal studies - manufacturer advises avoid breastfeeding during treatment and for 14 weeks after last dose.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe and give over 20 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Abatacept is recommended as options for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 6 years and older whose disease has responded inadequately to other disease-modifying anti-rheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, only if the manufacturer provides abatacept with the discounts agreed in the patient access schemes.

www.nice.org.uk/TA373

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)

Abatacept 125 mg per 1 mL Orencia 125mg/1ml solution for injection pre-filled syringes | 4 pre-filled disposable injection $1.20960 DT + $1.20960 (Hospital only)

Orencia Clickject (Bristol-Myers Squibb Pharmaceuticals Ltd)

Abatacept 125 mg per 1 mL Orencia Clickject 125mg/1ml solution for injection pre-filled pen | 4 pre-filled disposable injection $1.20960 DT + $1.20960

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)

Enthesitis-related arthritis (initiated by a specialist)

BY SUBCUTANEOUS INJECTION

Child 6-17 years (body-weight 15-29 kg): 20 mg every 2 weeks

Child 6-17 years (body-weight 30 kg and above): 40 mg every 2 weeks

Crohn’s disease (initiated by a specialist)

BY SUBCUTANEOUS INJECTION

Child 6-17 years (body-weight up to 40 kg): Initially 40 mg, then 20 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, review treatment if no response within 12 weeks

Child 6-17 years (body-weight 40 kg and above): Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks

Crohn’s disease (accelerated regimen) (initiated by a specialist)

BY SUBCUTANEOUS INJECTION

Child 6-17 years (body-weight up to 40 kg): Initially 80 mg, then 40 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, review treatment if no response within 12 weeks

Child 6-17 years (body-weight 40 kg and above): Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks

Hidradenitis suppurativa (initiated by a specialist)

BY SUBCUTANEOUS INJECTION

Child 12-17 years (body-weight 30 kg and above): Initially 80 mg, followed by 40 mg after 1 week, then maintenance 40 mg every 2 weeks; increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature

continued→
**Uveitis (initiated by a specialist)**

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years (body-weight up to 30 kg): Initially 40 mg, then 20 mg after 1 week; maintenance 20 mg every 2 weeks
  - Child 2-17 years (body-weight 30 kg and above): Initially 80 mg, then 40 mg after 1 week; maintenance 40 mg every 2 weeks

**CONTRA-INDICATIONS**
Moderate or severe heart failure
- severe infection

**CAUTIONS**
Children should be brought up to date with current immunisation schedule before initiating therapy
- demyelinating disorders (risk of exacerbation)
- development of malignancy
- do not initiate until active infections are controlled (discontinue if new serious infection develops)
- hepatitis B virus—monitor for active infection
- history of malignancy
- mild heart failure
- (discontinue if symptoms develop or worsen)
- predisposition to infection

**CAUTIONS, FURTHER INFORMATION**
- **Tuberculosis**
  - Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

**INTERACTIONS**
Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**
- **Common or very common**
  - Agranulocytosis
  - alopecia
  - anaemia
  - anxiety
  - arthralgias
  - arterial occlusion
  - asthma
  - broken nails
  - chest pain
  - coagulation disorder
  - connective tissue disorders
  - cough
  - dehydration
  - depression
  - dyspnoea
  - electrolyte imbalance
  - embolism and thrombosis
  - eye inflammation
  - fever
  - flushing
  - gastrointestinal discomfort
  - gastrointestinal disorders
  - haemorrhage
  - headaches
  - healing impaired
  - hyperglycaemia
  - hypersensitivity
  - hypertension
  - increased risk of infection
  - insomnia
  - leucocytosis
  - leucopenia
  - mood altered
  - muscle spasms
  - musculoskeletal pain
  - nausea
  - neoplasms
  - nerve disorders
  - neutropenia
  - oedema
  - renal impairment
  - seasonal allergy
  - sensation abnormal
  - sepsis
  - skin reactions
  - sweat changes
  - thrombocytopenia
  - vasculitis
  - vertigo
  - vision disorders
  - vomiting

- **Uncommon**
  - Aortic aneurysm
  - congestive heart failure
  - deafness
  - demyelinating disorders
  - dysphagia
  - erectile dysfunction
  - gallbladder disorders
  - hepatic disorders
  - inflammation
  - lupus erythematosus
  - meningitis viral
  - myocardial infarction
  - nocturia
  - pancreatitis
  - respiratory disorders
  - rhabdomyolysis
  - sarcoidosis
  - solid organ neoplasms
  - stroke
  - tinnitus
  - tremor

- **Rare or very rare**
  - Cardiac arrest
  - pancytopenia
  - Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**
Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

**PREGNANCY**
Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
Manufacturer advises can be used—excreted in breast milk at very low concentrations (limited information available).

**PRE-TREATMENT SCREENING**
Tuberculosis
Manufacturer advises patients should be evaluated for active and latent tuberculosis before treatment.

**MONITORING REQUIREMENTS**
- Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
- Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
- For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**
Adalimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

**PATIENT AND CARER ADVICE**
When used to treat *hidradenitis suppurativa*, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab.

Tuberculosis patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, or, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Alert card
An alert card should be provided.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373
  - Adalimumab is recommended as an option for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 2 years and older whose disease has responded inadequately to 1 or more disease-modifying antirheumatic drugs (DMARDs) and for treating enthesitis-related JIA in patients 6 years and older whose disease has responded inadequately to, or who are intolerant of, conventional therapy.
  - [www.nice.org.uk/guidance/ta373](http://www.nice.org.uk/guidance/ta373)

- Adalimumab, etanercept and ustekinumab for treating plaque psoriasis in children and young people (July 2017) NICE TA455
  - Adalimumab is recommended as an option for treating plaque psoriasis in children and young people aged 4 years or older, only if the disease:
    - is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and
    - has not responded to standard systemic therapy, such as ciclosporin, methotrexate or phototherapy, or these options are contra-indicated or not tolerated.
  - Stop treatment at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as a 75% reduction in the PASI score from the start of treatment.
  - Patients currently receiving adalimumab who do not meet the above criteria and whose treatment was started within the NHS before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  - [www.nice.org.uk/guidance/ta455](http://www.nice.org.uk/guidance/ta455)

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (April 2015) that adalimumab (Humira®) is accepted for restricted use.
within NHS Scotland for the treatment of active enthesitis-related arthritis in children 6 years of age and over who have had an inadequate response to, or who are intolerant of, conventional therapy, and is used within specialist rheumatology services (including those working within the network for paediatric rheumatology).

The Scottish Medicines Consortium has advised (June 2017) that adalimumab (Humira®) is accepted for use within NHS Scotland for the treatment of active moderate-to-severe hidradenitis suppurativa (HS) (acne inversa) in adolescents from 12 years of age with an inadequate response to conventional systemic HS therapy.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**CAUTIONARY AND ADVISORY LABELS**

- **Humira** (AbbVie Ltd)
  - Adalimumab 50 mg per 1 ml Humira 40mg/0.4ml solution for injection pre-filled syringes | 2 pre-filled disposable injection (POD) £633.85
  - Adalimumab 40mg/0.8ml solution for injection pre-filled pen | 2 pre-filled disposable injection (POD) £633.85

- **Humira** (Biogen Idec Ltd)
  - Imraldi 40mg/0.8ml solution for injection pre-filled syringes | 2 pre-filled disposable injection (POD) £633.85

**Etanercept**

### INDICATIONS AND DOSE

**BENEPAVL® SOLUTION FOR INJECTION**

Polyarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it

- By subcutaneous injection
  - Child 2-7 years: 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

Psoriatic arthritis in adolescents who have had an inadequate response to methotrexate or who cannot tolerate it

- By subcutaneous injection
  - Child 12-17 years: 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

**Chronic, severe plaque psoriasis in children who have had an inadequate response to other systemic therapies or phototherapies or who cannot tolerate them**

- By subcutaneous injection
  - Child 6-17 years: 800 micrograms/kg once weekly (max. per dose 50 mg) for up to 24 weeks, discontinue if no response after 12 weeks

**Enbrel® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION**

Polyarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it

- By subcutaneous injection
  - Child 2-7 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 3—4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

Psoriatic arthritis in adolescents who have had an inadequate response to methotrexate or who cannot tolerate it

- By subcutaneous injection
  - Child 12-17 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 3—4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

**Chronic, severe plaque psoriasis in children who have had an inadequate response to other systemic therapies or phototherapies or who cannot tolerate them**

- By subcutaneous injection
  - Child 6-17 years: 800 micrograms/kg once weekly (max. per dose 50 mg) for up to 24 weeks, discontinue if no response after 12 weeks
**ENBREL<sup>®</sup> SOLUTION FOR INJECTION**

**Polyarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it**

- Extended oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it
  - **BY SUBCUTANEOUS INJECTION**
    - Child 2-17 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 3–4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

**Psoriatic arthritis in adolescents who have had an inadequate response to methotrexate or who cannot tolerate it**

- **BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 3–4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

**Chronic, severe plaque psoriasis in children who have had an inadequate response to other systemic therapies or phototherapies or who cannot tolerate them**

- **BY SUBCUTANEOUS INJECTION**
  - Child 6-17 years: 800 micrograms/kg once weekly (max. per dose 50 mg) for up to 24 weeks, discontinue if no response after 12 weeks

**CONTRA-INDICATIONS**

- Active infection
- Avoid injections containing benzyl alcohol in neonates

**CAUTIONS**

- Children should be brought up to date with current immunisation schedule before initiating therapy
- Development of malignancy
- Diabetes mellitus
- Heart failure (risk of exacerbation)
- Hepatitis B virus—monitor for active infection
- Hepatitis C infection (monitor for worsening infection)
- History of blood disorders
- History of malignancy
- History or increased risk of demyelinating disorders
- Predisposition to infection (avoid if predisposition to septicemia)
- Significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin

**CAUTIONS, FURTHER INFORMATION**

- **Tuberculosis**
  - Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.

**INTERACTIONS**

- **Appendix 1**: etanercept

**SIDE-EFFECTS**

- **Common or very common**
  - Cystitis
  - Fever
  - Hypersensitivity
  - Increased risk of infection
  - Pain
  - Skin reactions
  - Swelling
- **Uncommon**
  - Abscess
  - Bursitis
  - Cholecystitis
  - Diarrhoea
  - Endocarditis
  - Eye inflammation
  - Gastritis
  - Hepatic disorders
  - Myositis
  - Neoplasms
  - Respiratory disorders
  - Sepsis
  - Skin ulcers
  - Thrombocytopenia
  - Vasculitis
- **Rare or very rare**
  - Anaemia
  - Bone marrow disorders
  - Congestive heart failure
  - Cutaneous lupus erythematosus
  - Demyelination
  - Leucopenia
  - Lupus-like syndrome
  - Nerve disorders
  - Neutropenia
  - Sarcoidosis
  - Seizure
  - Severe cutaneous adverse reactions (SCARs)
  - Transverse myelitis

- **Frequency not known**
  - Abdominal pain
  - Depression
  - Dermatomyositis exacerbated
  - Headache
  - Hepatitis B reactivation
  - Inflammatory bowel disease
  - Macrophage activation syndrome
  - Nausea
  - Personality disorder
  - Post procedural infection
  - Type 1 diabetes mellitus
  - Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION**

- Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.

**PREGNANCY**

- Avoid—limited information available.

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in moderate to severe alcoholic hepatitis.

**PRE-TREATMENT SCREENING**

- Tuberculosis: Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

- Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

**PRESCRIBING AND DISPENSING INFORMATION**

- Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

**BENEPALI<sup>®</sup> SOLUTION FOR INJECTION**

- Manufacturer advises patients requiring less than the full 50 mg dose should not receive Benepali<sup>®</sup>-if an alternate dose is required, other etanercept formulations providing this option should be used.

**PATIENT AND CARER ADVICE**

- Blood disorders: Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

- Tuberculosis: Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

- Alert card: An alert card should be provided.

- Medicines for Children leaflet: Etanercept for juvenile idiopathic arthritis www.medicinesforchildren.org.uk/etanercept-juvenile-idiopathic-arthritis

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)

**NICE TA373**

- Etanercept is recommended as an option for treating:
  - Polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA, in patients 2 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate;
  - Enthesitis-related JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, conventional therapy;
  - Psoriatic JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate.

- **www.nice.org.uk/TA373**

- Adalimumab, etanercept and ustekinumab for treating plaque psoriasis in children and young people (July 2017)

- Etanercept is recommended as an option for treating plaque psoriasis in children and young people aged 6 years and older, only if the disease:
is severe, as defined by a total Psoriasis Area and
Severity Index (PASI) of 10 or more, and
has not responded to standard systemic therapy, such as
ciclosporin, methotrexate or phototherapy, or these
options are contra-indicated or not tolerated.
If the psoriasis has not responded adequately, stop
treatment at 12 weeks. An adequate response is defined as a
75% reduction in PASI score from the start of treatment.
Patients currently receiving etanercept who do not meet
the above criteria and whose treatment was started within
the NHS before this guidance was published, should have
the option to continue treatment until they and their
clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA445

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (February 2013) that etanercept (Enbrel<sup>®</sup>) is accepted for restricted
use within NHS Scotland for the treatment of polyarthritis
(rheumatoid factor positive or negative) and extended oligoarthritis in children and adolescents from the age of
2 years who have had an inadequate response to or are
intolerant of methotrexate, psoriatic arthritis in adolescents
from the age of 12 years who have had an inadequate response to or are intolerant of methotrexate,
and enthesitis-related arthritis in adolescents from the age of
12 years who have had an inadequate response to or are
intolerant of conventional therapy. It is further restricted
to use within specialist rheumatology services (including
those working within the network for paediatric
rheumatology).

MEDICINAL FORMS There can be variation in the licensing of
different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

* BENEPALI (Biogen Idec Ltd)
  - Etanercept 50 mg per 1 ml BENEPALI 50mg/1ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PDP] £656.00 DT
  - £715.00
  BENEPALI 50mg/1ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PDP] £656.00

* ENBREL (Pfizer Ltd)
  - Etanercept 50 mg per 1 ml ENBREL 50mg/1ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PDP] £715.00 DT
  - £715.00 (Hospital only)
  ENBREL 25mg/0.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PDP] £357.50 DT + £357.50 (Hospital only)

* ENBREL MYCLIC (Pfizer Ltd)

Powder and solvent for solution for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Benzyl alcohol

* ENBREL (Pfizer Ltd)
  - Etanercept 10 mg ENBREL Paediatric 10mg powder and solvent for solution for injection vials | 4 vial [PDP] £143.00 (Hospital only)
  - Etanercept 25 mg ENBREL 25mg powder and solvent for solution for injection vials | 4 vial [PDP] £357.50 (Hospital only)

Golimumab

INDICATIONS AND DOSE

Polyarticular juvenile idiopathic arthritis (initiated by a specialist)
BYSUBCUTANEOUS INJECTION
Child (body-weight 40 kg and above): 50 mg once a
month, on the same date each month, review
treatment if no response after 3–4 doses

CONTRA-INDICATIONS Moderate or severe heart failure - severe active infection

CAUTIONS Active infection (do not initiate until active
infections are controlled; discontinue if new serious
infection develops until infection controlled) - children
should be brought up to date with current immunisation
schedule before initiating therapy - demyelinating
neuropathies (risk of exacerbation) - hepatitis B virus—monitor
for active infection - history of development of malignancy
- mild heart failure (discontinue if symptoms develop or
worsen) - predisposition to infection - risk factors for
dysplasia or carcinoma of the colon—screen for dysplasia
regularly

CAUTIONS, FURTHER INFORMATION
- Tuberculosis Active tuberculosis should be treated with
standard treatment for at least 2 months before starting
golimumab. Patients who have previously received
adequate treatment for tuberculosis can start golimumab
but should be monitored every 3 months for possible
recurrence. In patients without active tuberculosis but
who were previously not treated adequately,
chemoprophylaxis should ideally be completed before
starting golimumab. In patients at high risk of tuberculosis
who cannot be assessed by tuberculin skin test,
chemoprophylaxis can be given concurrently with
golimumab. Patients who have tested negative for latent
tuberculosis, and those who are receiving or who have
completed treatment for latent tuberculosis, should be
monitored closely for symptoms of active infection.

INTERACTIONS ➤ Appendix 1: monoclonal antibodies

SIDE-EFFECTS
- Common or very common Abscess - alopecia - anaemia -
asthenia - asthma - bone fracture - chest discomfort -
depression - dizziness - fever - gastrointestinal discomfort -
gastrointestinal disorders - gastrointestinal inflammatory
orders - headache - hypersensitivity - hypertension -
increased risk of infection - insomnia - nausea -
paraesthesia - respiratory disorders - skin reactions -
stomatitis

- Uncommon Arrhythmia - balance impaired - bone marrow
orders - breast disorder - cholelithiasis - constipation -
eye inflammation - eye irritation - flushing - goitre -
hyperthyroidism - hypothyroidism - leucopenia - liver
order - menstrual disorder - myocardial ischaemia -
neoplasms - sepsis - thrombocytopenia - thrombosis -
thyroid disorder - vision disorders

- Rare or very rare Bladder disorder - congestive heart failure -
demyelination - healing impaired - hepatitis B
reactivation - lupus-like syndrome - Raynaud’s
phenomenon - renal disorder - sarcoidosis - taste altered -
vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Associated with
infections, sometimes severe, including tuberculosis,
septicemia, and hepatitis B reactivation.

CONCEPTION AND CONTRACEPTION Manufacturer advises
adequate contraception during treatment and for at least
6 months after last dose.

PREGNANCY Use only if essential.

BREAST FEEDING Manufacturer advises avoid during and
for at least 6 months after treatment—present in milk in
animal studies.

HEPATIC IMPAIRMENT Manufacturer advises caution (no
information available).

PRE-TREATMENT SCREENING Tuberculosis Patients should be evaluated for tuberculosis
before treatment.

MONITORING REQUIREMENTS Monitor for infection before,
during, and for 5 months after treatment.

DIRECTIONS FOR ADMINISTRATION Missed dose If dose administered more than 2 weeks late,
subsequent doses should be administered on the new
monthly due date.
● **PATIENT AND CARER ADVICE**

**Tuberculosis** All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

**Blood disorders** Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Alert card An alert card should be provided.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

| CAUTIONARY AND ADVISORY LABELS | 10 |
| Simponi (Merck Sharp & Dohme Ltd) |
| Gollumab 100 mg per 1 ml Simponi 50mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PFS) |
| £762.97 DT = £762.97 |
| Simponi 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £762.97 DT = £762.97 |
| Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PFS) £1,525.94 DT = £1,525.94 |

2 **Neuromuscular disorders**

**Neuromuscular disorders**

**Drugs that enhance neuromuscular transmission**

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 536 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

**Anticholinesterases**

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 837.

Neostigmine p. 672 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 64 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of myasthenia.

Pyridostigmine bromide p. 673 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine bromide are needed.

Neostigmine and pyridostigmine bromide should be given to neonates 30 minutes before feeds to improve sucking.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

**Immunosuppressant therapy**

A course of corticosteroids is an established treatment in severe cases of myasthenia gravis and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose (‘pulsed’) methylprednisolone p. 458 followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone p. 458 should be reduced slowly to the minimum effective dose.

**Skeletal muscle relaxants**

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Dantrolene sodium p. 848 acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly.

Baclofen p. 673 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

Diazepam p. 226 has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.
2.1 Muscular dystrophy

**DRUGS FOR NEUROMUSCULAR DISORDERS**

### Ataluren

**DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

**INDICATIONS AND DOSE** Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)
- **BY MOUTH**
  - Child 2–17 years (body-weight 12 kg and above): (consult product literature)

**INTERACTIONS** → Appendix 1: ataluren

**SIDE-EFFECTS**
- Common or very common: Appetite decreased, constipation, cough, enuresis, fever, fatigue, gastrointestinal discomfort, haemorrhage, headache, hypotension, hypertryglyceridaemia, nausea, pain, rash erythematous, vomiting, weight decreased

**PREGNANCY** Manufacter advises avoid—xicity in animal studies.

**BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in animal studies.

**RENAI IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

**MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and cholesterol and triglyceride concentrations at least annually.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 30 ml of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).

**PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

**Missed doses** Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Nice decisions**
- Ataluren for treating Duchenne muscular dystrophy with a nonsense mutation in the dystrophin gene (July 2016)

**NICE** Ataluren, within its marketing authorisation, is recommended for treating Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene in people aged 5 years and older who can walk, only when:
  - the manufacturer provides ataluren with the discount agreed in the patient access scheme, and
  - the conditions under which ataluren is made available are set out in the managed access agreement between the manufacturer and NHS England, which should include the conditions set out in sections 5.12–5.15 and 5.23 of the guidance.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/HST3

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (April 2016) that ataluren (Translarna®) is not recommended for use within NHS Scotland for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older as the economic case was not demonstrated.

**All Wales Medicines Strategy Group (AWMSG) decisions**

AWMSG No. 940 The All Wales Medicines Strategy Group has advised (August 2016) that the NICE HST advice for ataluren (Translarna®) for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older should be implemented within NHS Wales.

AWMSG No. 3911 The All Wales Medicines Strategy Group has advised (April 2019) that ataluren (Translarna®) is recommended for use within NHS Wales for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged from 2 years up to 5 years. This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Granules**
- Translarna (PTC Therapeutics Ltd)

  Ataluren 125 mg Translarna 125mg granules for oral suspension sachets 30 sachet
  - £2,532.00

  Ataluren 250 mg Translarna 250mg granules for oral suspension sachets 30 sachet
  - £5,064.00

  Ataluren 1 gram Translarna 1,000mg granules for oral suspension sachets 30 sachet
  - £20,256.00

**Nusinersen**

**DRUG ACTION** Nusinersen is an antisense oligonucleotide that increases the production of survival motor neurone (SMN) protein, thereby helping to compensate for the defect in the SMN1 gene found in 5q spinal muscular atrophy.

**INDICATIONS AND DOSE**
- **5q spinal muscular atrophy (initiated by a specialist)**
- **BY INTRATHecal INJECTION**

**NICE decisions**
- Nusinersen for treating 5q spinal muscular atrophy (initiated by a specialist) (April 2019)

**NICE** Nusinersen is recommended for use for the treatment of 5q spinal muscular atrophy (initiated by a specialist) for use within NHS England for the treatment of 5q spinal muscular atrophy resulting from a nonsense mutation in the SMN1 gene found in ambulatory patients aged 2 years to 21 years.

**Indications**
- Child: Initially 12 mg for 4 doses on days 0, 14, 28 and 63, then 12 mg every 4 months, for advice on missed doses—consult product literature.

**UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: NUSINERSEN (SPINRAZA®): REPORTS OF COMMUNICATING HYDROCEPHALUS NOT RELATED TO Meningitis OR BLEEDING (JULY 2018)**

Communicating hydrocephalus not related to meningitis or bleeding has been reported in patients treated with Spinraza®. Patients and caregivers should be informed about the signs and symptoms of hydrocephalus before Spinraza® is started and should be instructed to seek medical attention in case of: persistent vomiting or headache, unexplained decrease in consciousness, and
in children increase in head circumference. Patients with signs and symptoms suggestive of hydrocephalus should be further investigated by a physician with expertise in its management.

- **CAUTIONS** Risk factors for renal toxicity—monitor urine protein (preferably using a first morning urine specimen) - risk factors for thrombocytopenia and coagulation disorders—monitor platelet and coagulation profile before treatment
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.

### Neostigmine

*(Neostigmine methylsulfate)*

#### INDICATIONS AND DOSE

**Treatment of myasthenia gravis**

- **BY MOUTH**
  - Neonate: Initially 1–2 mg, then 1–5 mg every 4 hours, given 30 minutes before feeds.
  - Child 1 month–5 years: Initially 7.5 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
  - Child 6–11 years: Initially 15 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
  - Child 12–17 years: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Neonate: 150 micrograms/kg every 6–8 hours, to be given 30 minutes before feeds, then increased if necessary up to 300 micrograms/kg every 4 hours.
  - Child 1 month–11 years: 200–500 micrograms, dose repeated at suitable intervals throughout the day
  - Child 11 years–17 years: Dose repeated at suitable intervals throughout the day
- **Reversal of non-depolarising (competitive) neuromuscular blockade**
  - **BY INTRAVENOUS INJECTION**
    - Neonate: 50 micrograms/kg, to be given over 1 minute after or with glycopyrronium or atropine, followed by 25 micrograms/kg if required.
    - Child 1 month–11 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg if required
    - Child 12–17 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg (max. per dose 2.5 mg) if required

#### Appendix 1: neostigmine

- **UNLICENSED USE**
  - In neonates Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection is unlicensed.
- **CAUTIONS**
  - With intravenous use glycopyrronium or atropine should also be given when reversing neuromuscular blockade
- **INTERACTIONS**
- **SIDE-EFFECTS**
- **RENAI IMPAIRMENT**
  - Dose adjustments May need dose reduction.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.
2.3 Spasticity

Other drugs used for Spasticity Dantrolene sodium, p. 848 - Diazepam, p. 226

Spasticity

2.3 Spasticity

Pyridostigmine bromide

**INDICATIONS AND DOSE**

**Myasthenia gravis**

- Initially by mouth

- Neonate: Initially 1–1.5 mg/kg, dose repeated throughout the day, then (by mouth using immediate-release medicines) increased if necessary up to 10 mg, to be increased gradually and given 30–60 minutes before feeds.

- Child 1 month–11 years: Initially 1–1.5 mg/kg daily, then (by mouth using immediate-release medicines) increased to 7 mg/kg daily in 6 divided doses, to be increased gradually; (by mouth using immediate-release medicines) usual dose 30–360 mg daily in divided doses.

- Child 12–17 years: 30–120 mg, dose repeated throughout the day; (by mouth using immediate-release medicines) usual dose 300–600 mg daily in divided doses, consider immunosuppressant therapy if total daily dose exceeds 360 mg, down-regulation of acetylcholine receptors possible if total daily dose exceeds 450 mg.

**INTERACTIONS** → Appendix 1: pyridostigmine

**SIDE-EFFECTS** Gastrointestinal hypermotility - muscle cramps - rash

**RENAL IMPAIRMENT**

Dose adjustments Reduce dose; excreted by kidney.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**

- Neostigmine (Non-proprietary)

  Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule £5.45–£7.72 DT = £6.13

- Tablet

  Neostigmine (Non-proprietary)

  Neostigmine bromide 15 mg Neostigmine 15mg tablets | 140 tablet £120.52 DT = £120.52

**Drug Action** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

**MUSCLE RELAXANTS > CENTRALLY ACTING**

**Baclofen**

**INDICATIONS AND DOSE**

**Chronic severe spasticity of voluntary muscle**

- **BY MOUTH**

  - Child 1 month–7 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 40 mg per day.

  - Child 8–17 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 60 mg per day.

  **Severe chronic spasticity of cerebral or spinal origin unresponsive to oral antispastic drugs (oral therapy not tolerated) (specialist use only)**

- **BY INTRATECHAL INJECTION**

  - Child 4–17 years: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not more often than every 24 hours to determine initial maintenance dose; maintenance 25–200 micrograms daily, adjusted according to response, dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose retaining some spasticity to avoid sensation of paralysis.

**IMPORTANT SAFETY INFORMATION**

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

**CONTRA-INDICATIONS**

- With intrathecal use Local infection - systemic infection

- With oral use Avoid oral route in active peptic ulceration

**CAUTIONS**

**GENERAL CAUTIONS** Diabetes - epilepsy - history of peptic ulcer - hypertonic bladder sphincter - psychiatric illness - respiratory impairment

**SPECIFIC CAUTIONS**

- With intrathecal use Coagulation disorders - malnutrition (increased risk of post-surgical complications) - previous spinal fusion procedure

**INTERACTIONS** → Appendix 1: baclofen

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Confusion - constipation - depression - diarrhoea - dizziness - drowsiness - dry mouth - euphoric mood - hallucination - headache - hyperhidrosis - hypotension - nausea - paraesthesia - skin reactions - urinary disorders - vision disorders - vomiting

- Uncommon Bradycardia - hypothermia

- Rare or very rare Withdawal syndrome
SPECIFIC SIDE-EFFECTS

- Common or very common
  - With intrathecal use: Anxiety, appetite decreased, asthenia, chills, dyspnoea, fever, hyperventilation, insomnia, neuromuscular dysfunction, oedema, pain, pneumonia, respiratory disorders, seizure, sexual dysfunction
  - With oral use: Fatigue, gastrointestinal disorder, muscle weakness, myalgia, respiratory depression, sleep disorders

- Uncommon
  - With intrathecal use: Alopecia, deep vein thrombosis, dehydration, flushing, hypertension, hypoguesia, ileus, memory loss, pallor, paranoia, suicidal tendencies

- Rare or very rare
  - With oral use
    - Abdominal pain
    - Erectile dysfunction
    - Hepatic function abnormal
    - Hyperthermia, psychiatric reactions and convulsions; to exacerbate spasticity, and hyperactive state
  - With intrathecal use
    - Alopecia
    - Anxiety
    - depression
    - Hypertension
    - Hypogeusia
    - Myalgia
    - Oedema
    - Rash
    - Respiratory disorders
    - Seizure
    - Fever
    - Myalgia
    - Paranoia
    - Scoliosis
    - Sialorrhea
    - Sleep
    - Tinnitus
    - Urticaria
    - Pneumonia

- Frequency not known
  - With intrathecal use: Scoliosis
- PREGNANCY
  - Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).
- BREAST FEEDING
  - Present in milk—amount probably too small to be harmful.
- HEPATIC IMPAIRMENT
  - With oral use: Manufacturer advises use with caution—no information available.
- RENAL IMPAIRMENT
  - Excreted by the kidney.
  - Dose adjustments
    - With oral use: Risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² use mouth by only potential benefit outweighs risk.
- TREATMENT CESSATION
  - Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).
- PRESCRIBING AND DISPENSING INFORMATION
  - Flavours of oral liquid formulations may include raspberry.
- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Baclofen for muscle spasm
    - www.medicinesforchildren.org.uk/baclofen-muscle-spasm
  - Driving and skilled tasks
    - Drowsiness may affect performance of skilled tasks (e.g., driving); effects of alcohol enhanced.

3 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

Therapeutic effects

In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 278 but paracetamol is preferred.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance of these drugs. A large proportion of children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

Ibuprofen p. 679 and naproxen p. 683 are propionic acid derivatives used in children.

Ibuprofen combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker. Naproxen combines good efficacy with a low incidence of side-effects.

Diclofenac sodium p. 676, diclofenac potassium p. 675, indometacin p. 681, mefenamic acid p. 682, and piroxicam p. 684 have properties similar to those of propionic acid derivatives:

Diclofenac sodium and diclofenac potassium are similar in efficacy to naproxen.
Indomethacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Meloxicam p. 683 is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

Ketorolac trometamol 10–15 mg can be used for the short-term management of postoperative pain.

Etoricoxib p. 677, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

**Dental and orofacial pain**

Most mild to moderate dental pain and inflammation is effectively relieved by ibuprofen, diclofenac potassium or diclofenac sodium.

**NSAIDs and cardiovascular events**

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of etoricoxib. Naproxen (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

**NSAIDs and gastro-intestinal events**

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam and ketorolac trometamol are associated with the highest risk; indomethacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common although they do still occur and can be significant; use of gastro-protective drugs may be necessary.

**Asthma**

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.

**Advanced Pharmacy Services**

Children taking NSAIDs may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

**ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**

**Diclofenac potassium**

**INDICATIONS AND DOSE**

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

- **BY MOUTH**
  - Child 14-17 years: 75–100 mg daily in 2–3 divided doses

Postoperative pain

- **BY MOUTH**
  - Child 9-13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
  - Child 14-17 years: 75–100 mg daily in 2–3 divided doses

Fever in ear, nose, or throat infection

- **BY MOUTH**
  - Child 9–17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

**UNLICENSED USE** Voltarol® Rapid not licensed for use in children under 14 years or in fever.

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding, active gastro-intestinal ulceration - cerebrovascular disease, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes), history of recurrent gastro-intestinal ulceration (two or more distinct episodes), ischaemic heart disease — mild to severe heart failure — peripheral arterial disease

**CAUTIONS** Allergic disorders — cardiac impairment (NSAIDs may impair renal function) — coagulation defects — connective-tissue disorders — Crohn’s disease (may be exacerbated) — history of cardiac failure — hypertension — left ventricular dysfunction — oedema — risk factors for cardiovascular events — ulcerative colitis (may be exacerbated)

**INTERACTIONS** > Appendix 1: NSAIDs

**SIDE-EFFECTS**

- **Common or very common** Appetite decreased — diarrhoea — dizziness — gastro-intestinal discomfort — gastro-intestinal disorders — headache — nausea — skin reactions — vertigo — vomiting
- **Uncommon** Chest pain — heart failure — myocardial infarction — palpitations
- **Rare or very rare** Acute kidney injury — agranulocytosis — alopecia — anaemia — angioedema — anxiety — aplastic anaemia — asthma — confusion — constipation — depression — drowsiness — dyspnoea — erectile dysfunction — fatigue — haemolytic anaemia — haemorrhage — hearing impairment — hepatic disorders — hypersensitivity — hypertension — hypotension — inflammatory bowel disease — irritable bowel syndrome — leucopenia — memory loss — meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) — nephritis tubulointerstitial — nephrotic syndrome — oedema — oesophageal disorder — oral disorders — pancreatitis — photosensitivity reaction — pneumonitis — proteinuria —
性疾病

MEDICINAL FORMS

l RENAL IMPAIRMENT
l BREAST FEEDING
l ALLERGY AND CROSS-SENSITIVITY

▶ Frequency not known Hallucination - malaise - optic neuritis

SIDE EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs.

l ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

l PREGNANCY

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

l BREAST FEEDING

Use with caution during breast-feeding. Amount in milk too small to be harmful.

l HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

l RENAL IMPAIRMENT

Avoid if possible or use with caution. Avoid in severe impairment.

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

l INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 6 months-17 years: 1.5–2.5 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses; maximum 150 mg per day

Postoperative pain

▶ BY RECTUM

Child 6 months-17 years (body-weight 8-11 kg): 12.5 mg twice daily for maximum 4 days

Child 6 months-17 years (body-weight 12 kg and above): 1 mg/kg 3 times a day (max. per dose 50 mg) for maximum 4 days

Inflammation | Mild to moderate pain

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY RECTUM

Child 6 months-17 years: 0.3–1 mg/kg 3 times a day (max. per dose 50 mg)

DICLOMAX RETARD ◊

Pain and inflammation

▶ BY MOUTH

Child 12-17 years: 1 capsule once daily

DICLOMAX SR ◊

Pain and inflammation

▶ BY MOUTH

Child 12-17 years: 1 capsule 1–2 times a day

MOTIFENE ◊

Pain and inflammation

▶ BY MOUTH

Child 12-17 years: 1 tablet 1–2 times a day

VOLTAROL ® 75MG SR TABLETS

Pain and inflammation

▶ BY MOUTH

Child 12-17 years: 1 capsule once daily

VOLTAROL ® RETARD

Pain and inflammation

▶ BY MOUTH

Child 12-17 years: 1 tablet once daily

VOLTAROL ® SOLUTION FOR INJECTION

Postoperative pain

▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION

Child 2-17 years: 0.3–1 mg/kg 1–2 times a day for maximum 2 days, for intramuscular injection, to be injected into the gluteal muscle; maximum 150 mg per day

l UNLICENSED USE

l CONTRA-INDICATIONS

Active gastro-intestinal bleeding - active gastro-intestinal ulceration - avoid injections containing benzyl alcohol in neonates (in neonates) - avoid suppositories in proctitis - cerebrovascular disease - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease

With intravenous use: Dehydration - history of asthma - history of confirmed or suspected cerebrovascular bleeding - history of haemorrhagic diathesis - hypovolaemia - operations with high risk of haemorrhage

l CAUTIONS

Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)

l INTERACTIONS Appendix 1: NSAIDs

l SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Appetite decreased - diarrhoea - dizziness - gastrointestinal discomfort - gastrointestinal
disorders • headache • nausea • rash (discontinue) • vertigo • vomiting
  ▶ **Uncommon**  Chest pain • heart failure • myocardial infarction • palpitations
  ▶ **Rare or very rare**  Acute kidney injury • agranulocytosis • alopecia • anaemia • angioedema • anxiety • aplastic anaemia • asthma • chest pain • confusion • constipation • depression • drowsiness • dyspnoea • erectile dysfunction • fatigue • haemolytic anaemia • haemorrhage • hearing impairment • heart failure • hepatic disorders • hypersensitivity • hypertension • hypotension • irritability • leucopenia • memory loss • meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • myocardial infarction • nephritis tubulointerstitial • nephrotic syndrome • oedema • oesophageal disorder • oral disorders • palpitations • pancreatitis • photosensitivity reaction • pneumonia • proteinuria • psychiatric disorder • renal papillary necrosis • seizure • sensation abnormal • severe cutaneous adverse reactions (SCARs) • shock • skin reactions • sleep disorders • stroke • taste altered • thrombocytopenia • tinnitus • tremor • vasculitis • vision disorders
  ▶ With rectal use  Ulcerative colitis aggravated
  ▶ Frequency not known  Fertility decreased female • fluid retention • hallucination • malaise • optic neuritis • platelet aggregation inhibition

**SPECIFIC SIDE-EFFECTS**
• With parenteral use  Injection site necrosis

**SIDE-EFFECTS, FURTHER INFORMATION**  For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 674

**ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY**  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero) and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**  Use with caution during breast-feeding. Amount in milk too small to be harmful.

**HEPATIC IMPAIRMENT**  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT**  Avoid if possible or use with caution. Avoid in severe impairment.
• With intravenous use  Contra-indicated in moderate or severe renal impairment.

**Dose adjustments**  The lowest effective dose should be used for the shortest possible duration.

**Monitoring**  In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**DIRECTIONS FOR ADMINISTRATION**  For **intravenous infusion**, dilute 75 mg with 100–500 mL. Glucose 5% or Sodium Chloride 0.9% (previously buffered with 0.5 mL Sodium Bicarbonate 8.4% solution or with 1 mL Sodium Bicarbonate 4.2% solution); give over 30–120 minutes.

**PATIENT AND CARER ADVICE**  Medicines for Children leaflet; Diclofenac for pain and inflammation www.medicinesforchildren.org.uk/diclofenac-pain-and-inflammation

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

**Modified-release tablet**

**Gastro-resistant tablet**

**Diclofenac sodium (Non-proprietary)**
• **Diclofenac sodium 25 mg**  Diclofenac sodium 25 mg gastro-resistant tablets | 28 tablet (PO) £3.87–£8.99 DT = £1.77 | 84 tablet (PO) £1.50–£26.97
• **Diclofenac sodium 50 mg**  Diclofenac sodium 50 mg gastro-resistant tablets | 28 tablet (PO) £4.97 DT = £1.89 | 84 tablet (PO) £2.48–£15.00

**Dicloflex (Dexel-Pharma Ltd)**
• **Diclofenac sodium 25 mg**  Dicloflex 25 mg gastro-resistant tablets | 84 tablet (PO) £4.42
• **Diclofenac sodium 50 mg**  Dicloflex 50 mg gastro-resistant tablets | 28 tablet (PO) £2.75 DT = £1.89 (Hospital only) | 84 tablet (PO) £8.05

**Fenactol (Discovery Pharmaceuticals)**
• **Diclofenac sodium 50 mg**  Fenactol 50 mg gastro-resistant tablets | 100 tablet (PO) £3.70

**Suppository**
• **Econac (Advanz Pharma)**
  • **Diclofenac sodium 100 mg**  Econac 100mg suppositories | 10 suppository (PO) £3.04 DT = £3.64
• **Voltarol (Novartis Pharmaceuticals UK Ltd)**
  • **Diclofenac sodium 12.5 mg**  Voltarol 12.5mg suppositories | 10 suppository (PO) £0.70 DT = £0.70
• **Diclofenac sodium 25 mg**  Voltarol 25mg suppositories | 10 suppository (PO) £1.24 DT = £1.24
• **Diclofenac sodium 50 mg**  Voltarol 50mg suppositories | 10 suppository (PO) £2.04 DT = £2.04
• **Diclofenac sodium 100 mg**  Voltarol 100mg suppositories | 10 suppository (PO) £3.64 DT = £3.64

**Solution for injection**
  • **EXCIPIENTS:**  May contain Benzyl alcohol, propylene glycol
• **Voltarol (Novartis Pharmaceuticals UK Ltd)**
  • **Diclofenac sodium 25 mg per 1 ml**  Voltarol 75mg/3ml solution for injection ampoules | 10 ampoule (PO) £3.91 DT = £3.91

**Modified-release capsule**

**Diclofenac sodium 25 mg**  Diclofenac sodium 25 mg gastro-resistant capsules | 28 capsule (PO) £8.20 DT = £8.20

**Dicloflex SR**
• **Diclofenac sodium 75 mg**  Diclofenac sodium 75 mg gastro-resistant capsules | 56 capsule (PO) £11.40 DT = £11.40
• **Motifene (Daichi Sankyo UK Ltd)**
• **Diclofenac sodium 75 mg**  Motifene 75mg modified-release capsules | 56 capsule (PO) £8.00 DT = £8.00

**Etoricoxib**

**INDICATIONS AND DOSE**

**Pain and inflammation in osteoarthritis**
• **BY MOUTH**
  • Child 16–17 years: 30 mg once daily, increased if necessary to 60 mg once daily

**Pain and inflammation in rheumatoid arthritis**

**Ankylosing spondylitis**
• **BY MOUTH**
  • Child 16–17 years: 60 mg once daily, increased if necessary to 90 mg once daily

**Acute gout**
• **BY MOUTH**
  • Child 16–17 years: 120 mg once daily for maximum 8 days

**CONTRA-INDICATIONS**  Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebrovascular
disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)

**CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · dehydration · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS**

- **Common or very common** Arrhythmias · asthenia · bronchospasm · constipation · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · increased risk of infection · influenza like illness · nausea · oedema · oral ulceration · palpitations · skin reactions · vomiting

- **Uncommon** Alertness decreased · anaemia · angina pectoris · anxiety · appetite abnormal · cerebrovascular insufficiency · chest pain · congestive heart failure · conjunctivitis · cough · depression · drowsiness · dry mouth · dyspnoea · flushing · haemorrhage · hallucination · hyperkalaemia · hypersensitivity · insomnia · irritable bowel syndrome · leucopenia · myocardial infarction · pancreatitis · proteinuria · renal failure (more common in patients with pre-existing renal impairment) · sensation abnormal · taste altered · thrombocytopenia · tinnitus · vasculitis · vertigo · vision blurred · weight increased

- **Rare or very rare** Angioedema · confusion · hepatic disorders · muscle complaints · severe cutaneous adverse reactions (SCARs) · shock

- **Frequency not known** Nephritis tubulointerstitial · nephropathy

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises max. 60 mg once daily in mild impairment; max. 30 mg once daily in moderate impairment.

**RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if estimated glomerular filtration rate less than 30 mL/minute 1.73 m².

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Etoricoxib (Non-proprietary)
  - Etoricoxib 30 mg | 28 tablet | £96.00
  - Etoricoxib 60 mg | 28 tablet | £20.11
  - Etoricoxib 90 mg | 28 tablet | £22.96
  - Etoricoxib 120 mg | 7 tablet | £3.03

- Arcoxia (Merck Sharp & Dohme Ltd)
  - Arcoxia 30 mg | 28 tablet | £13.99 DT
  - Arcoxia 60 mg | 28 tablet | £24.11 DT
  - Arcoxia 90 mg | 28 tablet | £6.03

**Flurbiprofen**

**INDICATIONS AND DOSE**

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

→ BY MOUTH

- Child 12-17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

**Dysmenorrhoea**

→ BY MOUTH

- Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

**CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS** Agranulocytosis · angioedema · aplastic anaemia · asthma · bronchospasm · confusion · constipation · Crohn’s disease · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · malaise · meningeitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis · tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · platelet aggregation inhibition · renal failure (more common in patients with pre-existing renal impairment) · respiratory tract reaction · severe
cutaneous adverse reactions (SCARs) • skin reactions • stroke • thrombocytopenia • tinnitus • vertigo • visual impairment • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 674

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

PREGNANCY
Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING
Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.

HEPATIC IMPAIRMENT
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

RENAL IMPAIRMENT
Avoid if possible or use with caution. Deterioration in renal function has also been reported after topical use.

Avoid in severe impairment.

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ibuprofen

INDICATIONS AND DOSE

Pain and inflammation in musculoskeletal disorders

- Child 10-11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 12-17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

Pain and inflammation

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Child 12-17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 3 months-17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic arthritis

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 3 months-17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor’s advice only)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 2-3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

UNLICENSED USE

- With intravenous use in neonates Orphan licence for the injection for closure of ductus arteriosus in premature neonates less than 34 weeks corrected gestational age.
- With oral use Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

CONTRA-INDICATIONS
Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure • varicella infection

- With intravenous use Active bleeding (especially intracranial or gastro-intestinal); coagulation defects • ductal-dependent congenital heart disease; known or suspected necrotising enterocolitis; life-threatening infection • marked un conjugated hyperbilirubinemia • pulmonary hypertension • thrombocytopenia

CAUTIONS
Cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

- With intravenous use May mask symptoms of infection (in neonates)

CAUTIONS, FURTHER INFORMATION
- High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (≥ 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II-III), and uncontrolled hypertension.

INTERACTIONS→ Appendix 1: NSAIDs
SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Rare or very rare Gastrointestinal disorders (very common in neonates) - haemorrhage (very common in neonates) - thrombocytopenia (very common in neonates)
- Frequency not known Fluid retention (very common in neonates)

SPECIFIC SIDE-EFFECTS

- Common or very common
  - With intravenous use Intraventricular haemorrhage; neutropenia (in neonates) - periventricular leukomalacia (in neonates) - renal impairment (in neonates)
- Uncommon
  - With oral use Gastrointestinal discomfort - headache - hypersensitivity - nausea - rash (discontinue) - skin reactions
- Rare or very rare
  - With oral use Acute kidney injury - agranulocytosis - anaemia - angioedema - constipation - diarrhoea - dyspepsia - leucopenia - liver disorder - meningitis asptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - oedema - oral ulceration - pancytopenia - renal papillary necrosis - severe cutaneous adverse reactions (SCARs) - shock - vomiting
- Frequency not known
  - With oral use Asthma - Crohn’s disease - fertility decreased female - heart failure - hypertension - increased risk of arterial thromboembolism - renal failure (more common in patients with pre-existing renal impairment) - respiratory disorders - respiratory tract reaction

SIDE-EFFECTS, FURTHER INFORMATION
For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 674

Overdose
Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 859.

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

PREGNANCY
Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING
Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.

HEPATIC IMPAIRMENT
With oral use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

RENAL IMPAIRMENT
With intravenous use in neonates Avoid if possible in severe impairment.
- With oral use Avoid if possible or use with caution. Avoid in severe impairment.

Dose adjustments
- With intravenous use in neonates Use lowest effective dose.
- With oral use The lowest effective dose should be used for the shortest possible duration.

Monitoring
In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MONITORING REQUIREMENTS

DIRECTIONS FOR ADMINISTRATION
- With intravenous use in neonates For slow intravenous injection, give over 15 minutes, preferably undiluted. May be diluted with Glucose 5% or Sodium Chloride 0.9%.

PRESCRIBING AND DISPENSING INFORMATION
With oral use Flavours of syrup may include orange.
- With topical use Caution—topical preparations not generally suitable for children.

PATIENT AND CARER ADVICE

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary: Ibuprofen Oral Suspension Sugar-free may be prescribed. Ibuprofen Tablets may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY
Oral preparations can be sold to the public in certain circumstances.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13, 21

ELECTROLYTES: May contain Sodium
- Brufen (Mylan)
  - Ibuprofen 600 mg Brufen 600 mg effervescent granules sachets | 20 sachet DT = £6.80 DT = £6.80
- Modified-release tablet

  - Ibuprofen 600 mg Brufen 600 mg tablets | 60 tablet DT = £7.34
- Feminax Express (Bayer Plc)
  - Ibuprofen (as Ibuprofen lysine) 200 mg Feminax Express 342 mg tablets | 8 tablet DT = £1.76 | 16 tablet DT = £2.67
- Nurofen Express (Reckitt Benckiser Healthcare (UK) Ltd)
  - Ibuprofen (as Ibuprofen lysine) 200 mg Nurofen Express 684 mg tablets | 24 tablet DT = £6.14

Nurofen Joint & Back Pain Relief (Reckitt Benckiser Healthcare (UK) Ltd)
- Ibuprofen (as Ibuprofen sodium dihydrate) 200 mg Nurofen Joint & Back Pain Relief 256 mg caplets | 16 tablet DT = £2.44
  - Nurofen Joint & Back Pain Relief 256 mg tablets | 16 tablet DT = £2.30
- Nurofen Max Strength Joint & Back Pain Relief 512 mg tablets | 24 tablet DT = £5.82
- Nurofen Migraine Pain (Reckitt Benckiser Healthcare (UK) Ltd)
  - Ibuprofen (as Ibuprofen lysine) 200 mg Nurofen Migraine Pain 342 mg tablets | 12 tablet DT = £2.09

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21
- Ibuprofen (Non-proprietary)
  - Ibuprofen 20 mg per 1 ml Ibuprofen 100mg/5ml oral suspension sugar free sugar-free | 500 ml DT = £7.15
**Pain and inflammation in musculoskeletal disorders**

**Indomethacin**

**Indications and Dose**

**Symptomatic ductus arteriosus**

By intravenous infusion

- Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 2 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.

**Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis**

- By mouth using immediate-release medicines
- Child: 0.5–1 mg/kg twice daily, higher doses may be used under specialist supervision

**Unlicensed use**

- With oral use Not licensed for use in children.

**Contra-indications**

- With intravenous use Bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding); coagulation defects; necrotising enterocolitis; thrombocytopenia; untreated infection
- With oral use Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

**Caution**

**General Caution**

- Heart failure

**Specific Caution**

- With intravenous use Inhibition of platelet aggregation (monitor for bleeding); may induce hypotension - may mask symptoms of infection - may reduce urine output by 50% or more and precipitate renal impairment especially if extracelluar volume depleted; sepsis
- With oral use Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - epilepsy - ischaemic heart disease - peripheral arterial disease - psychiatric disturbances - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**Interactions**

- Appendix 1: NSAIDs

**Side-effects**

**Side-effects, Further Information**

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs, p. 674

**Allergy and Cross-sensitivity**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**Pregnancy**

- With oral use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**Breast Feeding**

- With oral use Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

**Hepatic Impairment**

- With intravenous use in neonates Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe impairment.
- With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
Mefenamic acid

**INDICATIONS AND DOSE**

- Indometacin 50 mg – £0.15
- Indometacin 25 mg – £0.03
- £33.15

**CONTRA-INDICATIONS**

- Contra-indicated in
  - Meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may show a possible exacerbation of symptoms in asthma, see Non-proprietary).
  - Acute porphyrias
  - Menorrhagia
  - Trauma

**SIDE-EFFECTS, FURTHER INFORMATION**

- There can be variation in the licensing of special-order manufacturers include: oral suspension (Chemidex Pharma Ltd)

**EXCIPIENTS:** May contain Ethanol

**MEDICAL FORMS**

- Solution
- Capsule
- Tablet

**CAUTIONARIO AND ADVISORY LABELS**

- Use with caution during breast-feeding.

**WARNINGS AND CAUTIONS**

- For further information, see Non-proprietary.

**FOR INFORMATION**

- For details on the management of poisoning, see Non-proprietary.

**PATIENT AND CARER ADVICE**

- Mefenamic acid (Non-proprietary)

**SIDE-EFFECTS**

- Dizziness
- Drowsiness
- Headache
- Sleeplessness
- Vomiting
- Diarrhoea
- Urinary frequency
- Micturition (discontinue)

**INTERACTIONS**

- Avoid if possible or use with caution.

**MEDICATION FORMS**

- Onset of liver damage, monitor liver function; in severe impairment, avoid in severe impairment.

**RENAI INSUFFICIENCY**

- Use with caution.

**HEPATIC IMPAIRMENT**

- Use with caution.

**BREAST FEEDING**

- Use with caution during breast-feeding.

**PREGNANCY**

- Use with caution during breast-feeding.

**ALLERGY AND CROSS-SENSITIVITY**

- Avoid if possible or use with caution.

**CAUTIONARY AND ADVISORY LABELS**

- Avoid if possible or use with caution. Avoid in
  - Severe heart disease
  - Severe ischaemic heart disease
  - Severe tissue disorders
  - Severe allergy and cross-sensitivity
  - Severe renal impairment
  - Severe hepatic disorders
  - Severe bone marrow disorders
  - Severe anaemia
  - Severe dyspnoea
  - Severe dysuria
  - Severe gastrointestinal discomfort
  - Severe eye irritation
  - Severe allergic disorders
  - Menorrhagia

**MEDICAL INSTRUCTIONS**

- Use with caution during breast-feeding.

**MENORRHAGIA**

- Anticontraception

**FOR INFORMATION**

- For details on the management of poisoning, see Non-proprietary.

**OESOPHASAL REFUX**

- Avoid if possible or use with caution.

**CONTRA-INDICATIONS**

- Avoid if possible or use with caution.

**MEDICAL FORMS**

- Onset of liver damage, monitor liver function; in severe impairment, avoid in severe impairment.

**RENAI INSUFFICIENCY**

- Use with caution.

**HEPATIC IMPAIRMENT**

- Use with caution.

**BREAST FEEDING**

- Use with caution during breast-feeding.

**PREGNANCY**

- Use with caution during breast-feeding.

**ALLERGY AND CROSS-SENSITIVITY**

- Avoid if possible or use with caution.

**CAUTIONARY AND ADVISORY LABELS**

- Avoid if possible or use with caution. Avoid in
  - Severe heart disease
  - Severe ischaemic heart disease
  - Severe tissue disorders
  - Severe allergy and cross-sensitivity
  - Severe renal impairment
  - Severe hepatic disorders
  - Severe bone marrow disorders
  - Severe anaemia
  - Severe dyspnoea
  - Severe dysuria
  - Severe gastrointestinal discomfort
  - Severe eye irritation
  - Severe allergic disorders
  - Menorrhagia

**MEDICAL INSTRUCTIONS**

- Use with caution during breast-feeding.

**MENORRHAGIA**

- Anticontraception

**FOR INFORMATION**

- For details on the management of poisoning, see Non-proprietary.

**OESOPHASAL REFUX**

- Avoid if possible or use with caution.
Meloxicam

04-Nov-2016

- **INDICATIONS AND DOSE**
  - **Exacerbation of osteoarthritis (short-term)**
    - **BY MOUTH**
    - Child 16-17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily
  - **Pain and inflammation in rheumatic disease**
    - **Ankylosing spondylitis**
    - **BY MOUTH**
    - Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
  - **Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs**
    - **BY MOUTH**
    - Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily
    - Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

- **UNLICENSED USE** Not licensed for use in children under 16 years.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastrointestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**
  - **Common or very common** Constipation - diarrhoea - gastrointestinal discomfort - gastrointestinal disorders - headache - nausea - vomiting
  - **Uncommon** Anaemia - angioedema - burping - dizziness - drowsiness - electrolyte imbalance - fluid retention - flushing - haemorrhage - hepatic disorders - hypersensitivity - oedema - skin reactions - stomatitis - vertigo
  - **Rare or very rare** Acute kidney injury - asthma - conjunctivitis - leucopenia - mood altered - nightmare - palpitations - severe cutaneous adverse reactions (SCARs) - thrombocytopenia - tinnitus - vision disorders
  - **Frequency not known** Agranulocytosis - confusion - fertility decreased female - heart failure - increased risk of arterial thromboembolism - nephritis tubulointerstitial - nephrotic syndrome - photosensitivity reaction - renal necrosis

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 674

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID— which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Use with caution during breast-feeding.

**HEPATIC IMPAIRMENT** Use with caution during breast-feeding.

**RENAI IMPAIRMENT** Avoid if possible or use with caution. Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

**SIDE-EFFECTS** Thromboembolism - angioedema - urticaria - photosensitivity reaction - nausea - vomiting - diarrhoea - vertigo.

**CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS** Agranulocytosis - alopecia - angioedema - aplastic anaemia - asthma - cognitive impairment - concentration impaired - confusion - constipation - corneal

Naproxen

01-Mar-2019

- **INDICATIONS AND DOSE**
  - **Pain and inflammation in musculoskeletal disorders**
    - **Dysmenorrhoea**
      - **BY MOUTH**
      - Child: 5 mg/kg twice daily; maximum 1 g per day
  - **Pain and inflammation in juvenile idiopathic arthritis**
    - **BY MOUTH**
    - Child 2-17 years: 5–7.5 mg/kg twice daily; maximum 1 g per day

- **UNLICENSED USE** Not licensed for use in children under 5 years for juvenile idiopathic arthritis. Not licensed for use in children under 16 years for musculoskeletal disorders or dysmenorrhoea.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS** Agranulocytosis - alopecia - angioedema - aplastic anaemia - asthma - cognitive impairment - concentration impaired - confusion - constipation - corneal
MEDICINAL FORMS

RENAL IMPAIRMENT

ALLERGY AND CROSS-SENSITIVITY

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

SIDE-EFFECTS, FURTHER INFORMATION

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

PREGNANCY
Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING
Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

HEPATIC IMPAIRMENT
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

Dose adjustments
Manufacturer advises consider dose reduction in mild to moderate impairment.

RENAI IMPAIRMENT
Avoid if possible or use with caution. Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Dose adjustments
The lowest effective dose should be used for the shortest possible duration.

Monitoring
In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

EXCEPTIONS TO LEGAL CATEGORY
Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Gastro-resistant tablet

Piroxicam

INDICATIONS AND DOSE

Relief of pain and inflammation in juvenile idiopathic arthritis

BY MOUTH

Child 6–17 years (body-weight up to 15 kg): 5 mg daily
Child 6–17 years (body-weight 15–25 kg): 10 mg daily
Child 6–17 years (body-weight 26–45 kg): 15 mg daily
Child 6–17 years (body-weight 46 kg and above): 20 mg daily

UNLICENSED USE
Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

CHMP ADVICE—PIROXICAM (JUNE 2007)

The CHMP has recommended dual restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

• piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
• piroxicam should not be used as first-line treatment in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
• piroxicam dose should not exceed 20 mg daily
• piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
• treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
• concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

CONTRA-INDICATIONS
Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding - history of gastro-intestinal
perforation - history of gastro-intestinal ulceration - inflammatory bowel disease - severe heart failure

- **CAUTIONS**
  - Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS** – Appendix 1: NSAIDs

- **SIDE-EFFECTS**
  - **Common or very common**
    - Anaemia - appetite decreased - constipation - diarrhoea - dizziness - drowsiness - eosinophilia - gastrointestinal discomfort - gastrointestinal disorders - headache - hyperglycaemia - leucopenia - nausea - oedema - rash (discontinue) - skin reactions - thrombocytopenia - tinnitus - vertigo - vomiting - weight changes
  - **Uncommon**

**SIDE-EFFECTS, FURTHER INFORMATION**

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 674

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
  - **PREGNANCY**
    - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - **BREAST FEEDING**
    - Use with caution during breast-feeding. Amount too small to be harmful.
  - **HEPATIC IMPAIRMENT**
    - Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
  - **RENAL IMPAIRMENT**
    - Avoid if possible or use with caution. Dose adjustments The lowest effective dose should be used for the shortest possible duration. Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
  - **DIRECTIONS FOR ADMINISTRATION**
    - Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing. Piroxicam orodispersible tablets may be halved to give 10 mg dose [unlicensed].
  - **LESS SUITABLE FOR PRESCRIBING**
    - Piroxicam is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Orodispensible tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 10, 21
    - **EXCIPIENTS:** May contain Aspartame
      - **Feldene Melt** (Pfizer Ltd)
        - Piroxicam 20 mg Feldene Melt 20mg tablets sugar-free |
        - 30 tablet container PT 10.53 DT £10.53
  - **Capsule**
    - **CAUTIONARY AND ADVISORY LABELS** 21
      - **Feldene (Non-proprietary)**
        - Piroxicam 10 mg Piroxicam 10mg capsules | 56 capsule container PT 16.82 DT £4.90
        - Piroxicam 20 mg Piroxicam 20mg capsules | 28 capsule container PT 5.76 DT £4.47
      - **Feldene** (Pfizer Ltd)
        - Piroxicam 10 mg Feldene 10mg capsules | 30 capsule container PT 3.86

## 4 Soft tissue and joint disorders

### 4.1 Local inflammation of joints and soft tissue

Other drugs used for Local inflammation of joints and soft tissue

Dexamethasone, p. 455 · Prednisolone, p. 458

### CORTICOSTEROIDS

#### Corticosteroids, inflammatory disorders

**Systemic corticosteroids**

In children with rheumatic diseases corticosteroids should be reserved for specific indications (e.g. when other therapies are unsuccessful or while waiting for DMARDS to take effect) and should be used only under the supervision of a specialist.

Systemic corticosteroids may be considered for the management of juvenile idiopathic arthritis in systemic disease or when several joints are affected. Systemic corticosteroids may also be considered in severe, possibly life-threatening conditions such as systemic lupus erythematosus, systemic vasculitis, juvenile dermatomyositis, Behçet’s disease, and polyarticular joint disease.

In severe conditions, short courses (‘pulses’) of high dose intravenous methylprednisolone p. 458 or a pulsed oral corticosteroid may be particularly effective for providing rapid relief, and has fewer long-term adverse effects than continuous treatment.

Corticosteroid doses should be reduced with care because of the possibility of relapse if the reduction is too rapid. If complete discontinuation of corticosteroids is not possible, consideration should be given to alternate-day (or alternate high-dose, low-dose) administration; on days when no corticosteroid is given, or a lower dose is given, an additional dose of a NSAID may be helpful. In some conditions, alternative treatment using an antimalarial or concomitant use of an immunosuppressant drug, such as azathioprine p. 536, methotrexate p. 563 or cyclophosphamide p. 555 may prove useful; in less severe conditions treatment with a NSAID alone may be adequate.

Administration of corticosteroids may result in suppression of growth and may affect the development of puberty. The risk of corticosteroid-induced osteoporosis should be considered for those on long-term corticosteroid...
Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by intra-articular injection as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Asceptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia, or conscious sedation should be used. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide p. 687 [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect. Triamcinolone acetonide below and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone acetate p. 456 should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neurapathies, which occur rarely in children. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected). Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

Hydrocortisone

**INDICATIONS AND DOSE**

**HYDROCORTISAB**

**Local inflammation of joints and soft-tissues**

- **BY INTRA-ARTICULAR INJECTION**
  - Child 1 month–11 years: 5–30 mg, select dose according to size of child and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature
  - Child 12–17 years: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

**SIDE-EFFECTS** Myocardial rupture (following recent myocardial infarction)

**INTERACTIONS** → Appendix 1: corticosteroids

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- Hydrocortisab (Advanc Pharma) Hydrocortisone acetate 25 mg per 1 ml Hydrocortisab 25mg/1ml suspension for injection ampoules | 10 ampoule £68.72 DT = £68.72

Methylprednisolone

**INDICATIONS AND DOSE**

**DEPO-MEDRONE**

**Local inflammation of joints and soft tissues**

- **BY INTRA-ARTICULAR INJECTION**
  - Child: (consult product literature)

**SIDE-EFFECTS** Angioedema, cataract, confusion - delusions - depressed mood - diarrhoea - dizziness - drug dependence - dyslipidaemia - embolism and thrombosis - epidural lipomatosis - gastrointestinal disorders - glucose tolerance impaired - hallucination - hepatitis - hiccups - hypopituitarism - increased insulin requirement - intracranial pressure increased - memory loss - metabolic acidosis - muscle weakness - myalgia - neuropathic arthropathy - peripheral oedema - psychiatric disorder - schizophrenia exacerbated - sterile abscess - suicidal ideation - vision loss - withdrawal syndrome

**PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**CAUTIONARY AND ADVISORY LABELS**

- **DEPO-MEDRONE** (Pfizer Ltd)
  - Methylprednisolone acetate 40 mg per 1 ml Depo-Medrone 40mg/1ml suspension for injection vials | 1 vial £3.44 DT = £3.44 | 10 vial £34.04
  - Depo-Medrone 80mg/2ml suspension for injection vials | 1 vial £6.18 DT = £6.18 | 10 vial £61.39
  - Depo-Medrone 120mg/3ml suspension for injection vials | 1 vial £8.96 DT = £8.96 | 10 vial £88.81

Triamcinolone acetonide

**INDICATIONS AND DOSE**

**ADCORTYL** INTRA-ARTICULAR/INTRADERMAL

**Local inflammation of joints and soft tissues**

- **BY INTRA-ARTICULAR INJECTION**
  - Child 1–17 years: 2 mg/kg (max. per dose 15 mg), for details consult product literature, dose applies for larger joints. For doses above 15 mg use Kenalog® Intra-articular/Intramuscular. If appropriate repeat treatment for relapse.

**KENALOG** VIALS

**Local inflammation of joints and soft tissues**

- **BY INTRA-ARTICULAR INJECTION**
  - Child 1–17 years: 2 mg/kg, for details consult product literature, if appropriate repeat treatment for relapse, higher doses than usual maximum have been used; Usual maximum 40 mg

**UNLICENSED USE** Not licensed for use in children under 6 years.

**INTERACTIONS** → Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE** Patient counselling is advised for triamcinolone acetonide injection (steroid card).
Soft tissue disorders

4.2 Soft tissue disorders

Soft-tissue and musculoskeletal disorders

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, paracetamol p. 278 is often adequate and should be used first. Alternatively, the lowest effective dose of a NSAID (e.g. ibuprofen p. 679) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Extravasation prevention

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula re-sited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate p. 137 patch or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose veins are prone to collapse. Children or their carers should be asked to report any pain or burning at the site of injection immediately.

Extravasation management

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) or localise and neutralise the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase p. 688. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).
**Enzymes used in soft-tissue disorders**

Hyaluronidase is used for the management of extravasation.

### ENZYMES

#### Hyaluronidase

**INDICATIONS AND DOSE**

**Extravasation**
- **BY LOCAL INFILTRATION**
- Child: (consult product literature)

**UNLICENSED USE** Licensed for use in children, but age range not specified by the manufacturer.

**CONTRA-INDICATIONS** Avoid sites where infection is present - avoid sites where malignancy is present - do not apply direct to cornea - not for anaesthesia in unexplained premature labour - not for intravenous administration - not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists - not to be used to reduce swelling of bites - not to be used to reduce swelling of stings.

**CAUTIONS** Infants (control speed and total volume and avoid overhydration especially in renal impairment).

**SIDE-EFFECTS** Oedema - periorbital oedema.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Hyaluronidase (Non-proprietary)**
  - **Hyaluronidase 1500 unit** Hyaluronidase 1,500 unit powder for solution for injection ampoules | 10 ampoule £13.55
**Chapter 11**

**Eye**

**Eye treatment: drug administration**

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—contact individual manufacturers for further information. They are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

**Eye drops and eye ointments**

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow can occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops. Both drops and ointment can cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Also see warnings relating to eye drops and contact lenses.

**Eye lotions**

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution p. 697 is usually used. Clean water will suffice in an emergency.

**Other preparations administered to the eye**

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also beused to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

**Ophthalmic Specials**

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product will not be suitable for a child’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

**Preservatives and sensitisers**

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

**Eye preparations: control of microbial contamination**

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye.
only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh supplies dispensed postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In **out-patient departments** single-application containers should be used; if multiple-application containers are used, they should be discarded after single use within one clinical session.

In **eye surgery** single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some oculic surgery). For all surgical procedures, a previously unopened container is used for each patient.

### Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

### Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, fenfluramines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including epinephrine hydrochloride p. 125 and hyaluronic acid hydrochloride p. 118). Other drugs that may affect contact lens wear are isotretinoin p. 780 (can cause conjunctival inflammation), aspirin p. 93 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 379 and sulfasalazine p. 33 (can discolor lenses).

## 1 Allergic and inflammatory eye conditions

### Eye, allergy and inflammation

#### Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery. *Topical corticosteroids* should normally only be used under expert supervision; three main dangers are associated with their use:

- a ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye.
- Bacterial, fungal, and amoebic infections pose a similar hazard;
- ‘Steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;
- a ‘steroid cataract’ can follow prolonged use.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

*Systemic corticosteroids* may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

#### Eye care, other anti-inflammatory preparations

Eye drops containing *antihistamines*, such as antazoline with xylometazoline below as *Otrivine-Antistin*®, azelastine hydrochloride p. 691, epinastine hydrochloride p. 691, ketotifen p. 691, and olopatadine p. 691, can be used for allergic conjunctivitis.

Sodium cromoglicate p. 692 and nedocromil sodium eye drops p. 692 may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis. Lodoxamide eye drops p. 691 are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

### 1.1 Allergic conjunctivitis

#### ANTIHISTAMINES

##### Antazoline with xylometazoline

- **INDICATIONS AND DOSE**
  - **Allergic conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply 2–3 times a day for maximum 7 days
  
- **CAUTIONS** Angle-closure glaucoma, cardiovascular disease, diabetes mellitus, hypertension, hyperthyroidism, phaeochromocytoma, urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines, sedating sympathomimetics, vasoconstrictor
Azelastine hydrochloride

- **INDICATIONS AND DOSE**
  - Seasonal allergic conjunctivitis
    - TO THE EYE
    - Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day
  - Perennial conjunctivitis
    - TO THE EYE
    - Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

- **SIDE-EFFECTS**
  - Common or very common Eye irritation, taste altered

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Eye drops
    - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
    - Otrivine Antistin (Thea Pharmaceuticals Ltd)
      - Xylometazoline hydrochloride 500 microgram per 1 ml, Antazoline sulfate 5 mg per 1 ml Otrivine Antistin 0.9%/0.03% eye drops | 10 ml (£3.35 DT + £3.35

Epinastine hydrochloride

- **INDICATIONS AND DOSE**
  - Seasonal allergic conjunctivitis
    - TO THE EYE
    - Child 12-17 years: Apply twice daily for maximum 8 weeks

- **SIDE-EFFECTS**
  - Common or very common Eye discomfort
  - Uncommon Dry eye, eye disorders, headache, nasal irritation, rhinitis, taste altered, visual impairment

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Eye drops
    - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
    - Optilast (Meda Pharmaceuticals Ltd)
      - Azelastine hydrochloride 500 microgram per 1 ml Optilast 0.05% eye drops | 8 ml (£6.40 DT + £6.40

Ketotifen

- **INDICATIONS AND DOSE**
  - Seasonal allergic conjunctivitis
    - TO THE EYE
    - Child 3-17 years: Apply twice daily

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

- **SIDE-EFFECTS**
  - Common or very common Eye discomfort, eye disorders, eye inflammation
  - Uncommon Conjunctival haemorrhage, drowsiness, dry eye, dry mouth, headache, skin reactions, vision disorders
  - Frequency not known Asthma exacerbated, facial swelling, oedema

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Eye drops
    - EXCIPIENTS: May contain Benzalkonium chloride
      - Ketofall (Scope Ophthalmics Ltd)
        - Ketotifen (as Ketotifen hydrogen fumarate) 250 microgram per 1 ml Ketotifen 0.25mg/ml eye drops 0.4ml unit dose | 30 unit dose (£6.95 DT + £6.95
      - Zaditen (Thea Pharmaceuticals Ltd)
        - Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml Zaditen 250micrograms/ml eye drops | 5 ml (£7.80 DT + £7.80

Olopatadine

- **INDICATIONS AND DOSE**
  - Seasonal allergic conjunctivitis
    - TO THE EYE
    - Child 3-47 years: Apply twice daily for maximum 4 months

- **SIDE-EFFECTS**
  - Common or very common Asthenia, dry eye, eye discomfort, headache, nasal dryness, taste altered
  - Uncommon Dizziness, eye disorders, eye inflammation, increased risk of infection, numbness, skin reactions, vision disorders
  - Frequency not known Drowsiness, dyspnoea, malaise, nausea, vomiting

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Eye drops
    - EXCIPIENTS: May contain Benzalkonium chloride
      - Zaditen (Novartis Pharmaceuticals UK Ltd)
        - Olopatadine (as Olopatadine hydrochloride) 1 mg per 1 ml Olopatadine 40 micrograms/ml eye drops | 4 ml (£3.00 DT + £3.00

- MAST-CELL STABILISERS

Lodoxamide

- **INDICATIONS AND DOSE**
  - Allergic conjunctivitis
    - TO THE EYE
    - Child 4-17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

- **SIDE-EFFECTS**
  - Common or very common Dry eye, eye discomfort, eye disorders, vision disorders
  - Uncommon Corneal deposits, dizziness, eye inflammation, headache, nausea
  - Rare or very rare Nasal complaints, rash, taste altered

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.
**Corticosteroids**

**Betamethasone**

- **Drug action**: Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

- **Indications and dose**: Local treatment of inflammation (short-term)
  - **To the eye using eye drop**: Apply every 1–2 hours until control then reduce frequency

- **Side-effects**: Common or very common: Eye discomfort, eye strain, taste altered

- **Medicinal forms**: No licensed medicines listed.

**Sodium cromoglicate**

- **Indications and dose**: Allergic conjunctivitis, Seasonal keratoconjunctivitis
  - **To the eye**: Apply 4 times a day

- **Side-effects**: Common or very common: Eye discomfort

- **Medicinal forms**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment, ear/eye/nose drops.

**Dexamethasone**

- **Drug action**: Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

- **Indications and dose**: Local treatment of inflammation (short-term)
  - **To the eye using eye drop**: Apply every 4–6 times a day

- **Side-effects**: Common or very common: Eye discomfort, taste altered

- **Medicinal forms**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment, ear/eye/nose drops.

**Nedocromil sodium**

- **Indications and dose**: Seasonal and perennial conjunctivitis
  - **To the eye**: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- **Side-effects**: Common or very common: Eye discomfort

- **Medicinal forms**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment, ear/eye/nose drops.

**1.2 Inflammatory eye conditions**

Other drugs used for inflammatory eye conditions

Adalimumab, p. 665
Fluorometholone

**INDICATIONS AND DOSE**

Local treatment of inflammation (short term)

- TO THE EYE
- Child: Apply every 1–2 hours until controlled then reduce frequency

**SIDE-EFFECTS**

Cataract, eye discomfort, eye disorders, eye infection, eye inflammation, rash, taste altered, vision disorders

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- FML Liquifilm (Allergan Ltd)

Fluorometholone 1 mg per 1 ml

FML Liquifilm 0.1% ophthalmic suspension | 5 ml | £1.71 DT = £1.71 | 10 ml | £2.95 DT = £2.95

**INDICATIONS AND DOSE**

Local treatment of eye inflammation and bacterial infection (short-term)

- TO THE EYE USING EYE DROP
- Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

**SIDE-EFFECTS**

Cataract, eye infection, eye inflammation, rash, taste altered, vision disorders

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- FML Liquifilm (Allergan Ltd)

Fluorometholone 1 mg per 1 ml

FML Liquifilm 0.1% ophthalmic suspension | 5 ml | £1.71 DT = £1.71 | 10 ml | £2.95 DT = £2.95

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: 2–17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

**SIDE-EFFECTS**

Cataract, eye discomfort, eye disorders, eye infection, eye inflammation, rash, taste altered, vision disorders

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Polysorbates

- FML Liquifilm (Allergan Ltd)

Fluorometholone 1 mg per 1 ml

FML Liquifilm 0.1% ophthalmic suspension | 5 ml | £1.71 DT = £1.71 | 10 ml | £2.95 DT = £2.95

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

**SIDE-EFFECTS**

Cataract, eye discomfort, eye disorders, eye infection, eye inflammation, rash, taste altered, vision disorders

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- FML Liquifilm (Allergan Ltd)

Fluorometholone 1 mg per 1 ml

FML Liquifilm 0.1% ophthalmic suspension | 5 ml | £1.71 DT = £1.71 | 10 ml | £2.95 DT = £2.95

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

**SIDE-EFFECTS**

Cataract, eye discomfort, eye disorders, eye infection, eye inflammation, rash, taste altered, vision disorders

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Polysorbates

- FML Liquifilm (Allergan Ltd)

Dexamethasone 1 mg per 1 ml

Dexamethasone 0.1% eye drops | 5 ml | £1.42 DT = £1.42 | 10 ml | £2.80 DT = £2.80

**COMBINATIONS WITH ANTI-INFECTIVES**

- Pred Forte (Bausch & Lomb UK Ltd)

Prednisolone sodium phosphate 5 mg per 1 ml

Predsol 0.5% eye drops | 10 ml | £2.00 DT = £2.00

**CORTICOSTEROIDS**

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 692, neomycin sulfate p. 714.

**INDICATIONS AND DOSE**

Local treatment of eye inflammation and bacterial infection (short-term)

- TO THE EYE USING EYE DROP
- Child: (consult product literature)

**INTERACTIONS**

Appendix 1: corticosteroids - neomycin

**LESS SUITABLE FOR PRESCRIBING**

Betamethasone with neomycin eye-drops are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Predsol (RPH Pharmaceuticals AB)

Prednisolone sodium phosphate 5 mg per 1 ml

Predsol 0.5% eye drops | 10 ml | £2.00 DT = £2.00

**Dexamethasone with framycetin sulfate and gramicidin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 692, framycetin sulfate p. 713.

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

**SIDE-EFFECTS**

Cataract, eye discomfort, eye disorders, eye infection, eye inflammation, rash, taste altered, vision disorders

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Polysorbates

- Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 8 ml | £7.50

**COMBINATIONS WITH ANTI-INFECTIVES**

- Betnesol-N ear/eye/nose drops

Betnesol-N ear/eye/nose drops | 10 ml | £2.39 DT = £2.39

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Betnesol-N (RPH Pharmaceuticals AB)

Betnesol-N ear/eye/nose drops | 10 ml | £2.39 DT = £2.39

**COMBINATIONS WITH ANTI-INFECTIVES**

- Bepanthen-N ear/eye/nose drops

Bepanthen-N ear/eye/nose drops | 10 ml | £3.00 DT = £3.00

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Polysorbates

- Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 8 ml | £7.50

**COMBINATIONS WITH ANTI-INFECTIVES**

- Betnesol-N ear/eye/nose drops

Betnesol-N ear/eye/nose drops | 10 ml | £2.39 DT = £2.39

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Polysorbates

- Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 8 ml | £7.50

**COMBINATIONS WITH ANTI-INFECTIVES**

- Betnesol-N ear/eye/nose drops

Betnesol-N ear/eye/nose drops | 10 ml | £2.39 DT = £2.39

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Polysorbates

- Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 8 ml | £7.50

**COMBINATIONS WITH ANTI-INFECTIVES**

- Betnesol-N ear/eye/nose drops

Betnesol-N ear/eye/nose drops | 10 ml | £2.39 DT = £2.39

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Polysorbates

- Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 8 ml | £7.50

**COMBINATIONS WITH ANTI-INFECTIVES**

- Betnesol-N ear/eye/nose drops

Betnesol-N ear/eye/nose drops | 10 ml | £2.39 DT = £2.39

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
**Dexamethasone with hypromellose, neomycin and polymyxin B sulfate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 692, neomycin sulfate p. 714.

### Drug Action

Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

### Indications and Dose

**Local treatment of inflammation (short-term)**

- **Child:** Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

**Local treatment of inflammation (short-term)**

- **Child:** Apply 3–4 times a day, alternatively, apply at night when used with eye drops

### Interactions

- **Appendix 1: corticosteroids - neomycin**
- **Less suitable for prescribing:** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- **Excipients:** May contain Hydroxybenzoates (parabens), woolfat and related substances (including lanolin)
- **Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram** Maxitrol eye ointment | 3.5 gram | £1.44

**Eye drops**

- **Excipients:** May contain Benzalkonium chloride, polysorbites
- **Maxitrol (Novartis Pharmaceuticals UK Ltd)**
- **Dexamethasone 1 mg per 1 ml, Hypromellose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml** Maxitrol eye drops | 5 ml | £1.68

### Immunosuppressants > Calcineurin Inhibitors and Related Drugs

**Ciclosporin (Cyclosporin)**

**Drug Action**

Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

### Indications and Dose

**Verkazia ®**

**Severe vernal keratoconjunctivitis (initiated by a specialist)**

- **Child 4-17 years:** Apply 1 drop 4 times a day, to be applied to the affected eye(s) during the vernal keratoconjunctivitis season, if signs and symptoms persist after the end of the season, treatment may be continued at the recommended dose or decreased to 1 drop twice daily once adequate control is achieved. Once resolved, treatment should be discontinued, and re-initiated upon recurrence

### Contra-Indications

- **Active or suspected ocular or peri-ocular infection**
- **History of ocular herpes—no information available**

### Interactions

- **Appendix 1: ciclosporin**

### Side-Effects

- **Cough • eye discomfort • eye disorders • eye inflammation • headache • increased risk of infection • vision blurred**

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **Verkazia (Santen UK Ltd)**
- **Ciclosporin 1 mg per 1 ml** Verkazia 0.1% eye drops 0.3ml unit dose | 120 unit dose | £288.00

### Dexamethasone and Related Drugs

**Pregnancy**

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**Breast Feeding**

Manufacturer advises avoid—limited information.

**Monitoring Requirements**

Manufacturer advises regular eye examinations when used for more than 12 months (efficacy and safety have not been studied beyond 12 months).

**Directions for Administration**

Manufacturer advises keep eyes closed for 2 minutes after using eye drops to increase local drug action and reduce systemic absorption.

**Patient and Carer Advice**

Driving and skilled tasks: Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of blurred vision.

**National Funding/Access Decisions**

**Scottish Medicines Consortium (SMC) decisions**

SMC No. SMC2111

The Scottish Medicines Consortium has advised (December 2018) that ciclosporin 1 mg/ml (0.1%) eye drops emulsion (Verkazia ®) is accepted for use within NHS Scotland for the treatment of severe vernal keratoconjunctivitis in patients from 4 to 17 years of age.

**All Wales Medicines Strategy Group (AWMSG) decisions**

AWMSG No. 2908

The All Wales Medicines Strategy Group has advised (March 2019) that ciclosporin (Verkazia ®) is recommended as an option for use within NHS Wales for the treatment of severe vernal keratoconjunctivitis in patients from 4 years of age up to 18 years of age.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **Verkazia (Santen UK Ltd)**
- **Ciclosporin 1 mg per 1 ml** Verkazia 0.1% eye drops 0.3ml unit dose | 120 unit dose | £288.00

### 1.2a Anterior uveitis

**Antimuscarinics**

**Antimuscarinics (eye)**

- **Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia - darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage - mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) - neonates at increased risk of systemic toxicity (in neonates)**

**Side-Effects**

- Dizziness • photophobia • skin reactions • tachycardia

**Patient and Carer Advice**

Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

### Atropine sulfate

**Indications and Dose**

**Cycloplegia**

- **To the eye using eye drop**
- **Child 3 months-17 years:** Apply twice daily for 3 days, before procedure
Cyclopentolate hydrochloride

- **INDICATIONS AND DOSE**

  Cycloplegia
  - TO THE EYE
  - Child: Apply 1 drop, 30–60 minutes before examination, using 1% eye drops.
  - Child: Apply 1 drop, 30–60 minutes before examination, using 0.5% eye drops.

  Uveitis
  - TO THE EYE
  - Child: Apply 1 drop 2–4 times a day, using 0.5% eye drops (1% for deeply pigmented eyes).

- **INTERACTIONS** → Appendix 1: atropine

- **SIDE-EFFECTS**

  Abdominal distension - arrhythmias - behaviour abnormal - cardio-respiratory distress - conjunctivitis (on prolonged administration) - constipation - dry mouth - eye oedema (on prolonged administration) - flushing - gastrointestinal disorders - hyperaemia (on prolonged administration) - mydriasis - palpitations - psychotic disorder - staggering - urinary disorders - vomiting

  SIDE-EFFECTS, FURTHER INFORMATION

  Systemic side-effects can occur.

- **PRESCRIBING AND DISPENSING INFORMATION**

  Although multi-dose atropine sulphate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Eye drops**

  - Atropine sulfate (Non-proprietary)
    - Atropine sulfate 10 mg per 1 ml: Atropine 1% eye drops.
    - 10 ml: £131.88 DT + £131.87
  - Atropine sulfate (Bausch & Lomb UK Ltd)
    - Atropine sulfate 10 mg per 1 ml: Minims atropine sulfate 1% eye drops 0.5ml unit dose.
    - 20 unit dose: £15.10 DT + £15.10

  Homatropine hydrobromide

- **INDICATIONS AND DOSE**

  Anterior uveitis
  - TO THE EYE
  - Child 3 months: Apply 1 drop daily, alternatively apply 1 drop once daily on alternate days, adjusted according to response, only 0.5% eye drops to be used.
  - Child 2-17 years: Apply 1 drop twice daily, adjusted according to response.

- **UNLICENSED USE**

  Not licensed for use in children under 3 months.

- **INTERACTIONS** → Appendix 1: homatropine

- **MEDICINAL FORMS**

  Forms available from special-order manufacturers: eye drops

  **Eye drops**

  - Atropine sulfate (Non-proprietary)
    - Atropine sulfate 10 mg per 1 ml: Atropine 1% eye drops.
    - 10 ml: £131.88 DT + £131.87
  - Atropine sulfate (Bausch & Lomb UK Ltd)
    - Atropine sulfate 10 mg per 1 ml: Minims atropine sulfate 1% eye drops 0.5ml unit dose.
    - 20 unit dose: £15.10 DT + £15.10

  Cyclodrinate

  - Cyclodrinate aqueous solution 0.5% (Bausch & Lomb UK Ltd)
    - 20 minims: £11.68 DT + £11.68
  - Cyclodrinate 0.5% solution (Bausch & Lomb UK Ltd)
    - 5 ml: £8.08 DT + £8.08
  - Cyclodrinate solution 0.5% (Bausch & Lomb UK Ltd)
    - 5 ml: £8.08 DT + £8.08

  Acetylcysteine

- **INDICATIONS AND DOSE**

  Tear deficiency | Impaired or abnormal mucus production
  - TO THE EYE
  - Child: Apply 3–4 times a day.

- **SIDE-EFFECTS**

  Eye discomfort - eye redness

  Ocular lubricants

  Acetylcysteine

  - **INDICATIONS AND DOSE**

  Tear deficiency | Impaired or abnormal mucus production
  - TO THE EYE
  - Child: Apply 3–4 times a day.

  - **SIDE-EFFECTS**

  Eye discomfort - eye redness
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: effervescent tablet, granules, eye drops.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate.

- **Ibut (Rayner Pharmaceuticals Ltd)**
- **Acetyl cysteine 50 mg per 1 ml** Ibut 5% eye drops | 10 ml (Pat) £16.90 DT = £16.30

**Blephagel**

TO THE EYE

Dry eye conditions

**INDICATIONS AND DOSE**

- TO THE EYE
- Child: Apply 3–4 times a day or when required

**UNLICENSED USE** Some preparations not licensed for use in children.

**PRESCRIBING AND DISPENSING INFORMATION** Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye gel**

EXCIPIENTS: May contain Benzalkonium chloride, cetrimide, disodium edetate.

- **Blephagel** (Thea Pharmaceuticals Ltd)
  - Carbomer 0.6 mg per 1 gram Blephagel 0.36% eye gel preservative free | 30 gram £7.53
- **Liquivisc** (Thea Pharmaceuticals Ltd)
  - Carbomer 974P 2.5 mg per 1 gram Liquivisc 0.25% eye gel | 10 gram £4.50 DT = £4.50

**Eye drops**

- **GelTears** (Bausch & Lomb UK Ltd)
  - Carbomer 980 2 mg per 1 gram GelTears 0.2% gel | 10 gram (Pat) £2.80 DT = £2.80
- **Viscoatears** (Bausch & Lomb UK Ltd)
  - Carbomer 980 2 mg per 1 gram Viscotears 2mg/g liquid gel | 10 gram (Pat) £1.59 DT = £2.80

**Hydroxypropyl guar with polyethylene glycol and propylene glycol**

(Formulated as an ocular lubricant)

**MEDICINAL FORMS** No licensed medicines listed.

**Hypermellose**

**INDICATIONS AND DOSE**

Tear deficiency

- TO THE EYE
- Child: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose hypermellose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **Artificial tears** (Bausch & Lomb UK Ltd)
  - Hydroxypropylcellulose 4.4 mg per 1 ml Minims artificial tears 0.44% eye drops 0.5ml unit dose | 20 unit dose (Pat) £9.33 DT = £9.33

**Refresh Ophthalmic**

Polyvinyl alcohol 14 mg per 1 ml Refresh Ophthalmic 1.4% eye drops 0.4ml unit dose | 30 unit dose £2.25

**Sno Tears**

Polyvinyl alcohol 14 mg per 1 ml Sno Tears 1.4% eye drops | 10 ml  £1.06

**Retinol palmitate with white soft paraffin and light liquid paraffin and liquid paraffin and**

Liquid paraffin with white soft paraffin and wool alcohols

**INDICATIONS AND DOSE**

Dry eye conditions

- TO THE EYE
- Child: Apply as required, best suited for application before sleep

**PATIENT AND CARER ADVICE**

May cause temporary visual disturbance. Should not be used during contact lens wear.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- Liquidparaffin with white soft paraffin and wool alcohols (Non-proprietary)

  Xailin Night eye ointment preservative free | 5 gram £2.54

**Lacrilex**

Wool alcohols 2 mg per 1 gram, Liquid paraffin 425 mg per 1 gram Lactri-lube eye ointment | 3.5 gram £3.01 | 5 gram £3.98

**Paraffin, yellow, soft**

**INDICATIONS AND DOSE**

Eye surface lubrication

- TO THE EYE
- Child: Apply every 2 hours as required

**PATIENT AND CARER ADVICE**

Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.

**Sodium chloride**

**INDICATIONS AND DOSE**

Tear deficiency | Ocular lubricants and astringents | Irrigation, including first-aid removal of harmful substances | Intra-ocular or topical irrigation during surgical procedures

- TO THE EYE
- Child: Apply as required, use 0.9% eye preparations

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose sodium chloride eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment, irrigation.

**Eye drops**
- **Saline** (Bausch & Lomb UK Ltd)
  - Sodium chloride 9 mg per 1 ml
  - Unit dose: £0.44

**Sodium hyaluronate and trehalose**

**INDICATIONS AND DOSE**

**Dry eye conditions**
- **Child:** Apply as required.
- **Adult:** Apply up to 4 times a day.

**PRESCRIBING AND DISPENSING INFORMATION** Some preparations are contained in units which are resealable and may be used for up to 12 hours. Although multi-dose sodium hyaluronate eye drops commonly contain preservatives, preservative-free units are available.

**INDICATIONS AND DOSE**

**Eye drops**
- **Lubristil** (Rayner Pharmaceuticals Ltd)
  - Lubristil 0.15% eye gel 0.4ml unit dose preservative free: £1.20

**Sodium hyaluronate**

**INDICATIONS AND DOSE**

**Dry eye conditions**
- **Child:** Apply up to 4 times a day.

**PRESCRIBING AND DISPENSING INFORMATION** Sodium hyaluronate and trehalose preparations do not contain preservatives; multi-dose preparation can be used for up to 3 months.

**INDICATIONS AND DOSE**

**Eye drops**
- **Thealoz Duo** (Thea Pharmaceuticals Ltd)
  - Thealoz Duo eye drops preservative free: £2.97

**Eye infections**

**Eye infections**

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial **blepharitis** is treated by lid hygiene and application of antibacterial eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

**Corneal ulcer** and **keratitis** require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

**Endophthalmitis** is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic therapy may be necessary.

---

**Emergency ophthalmic preparations**

- **Ocusan** (Aegyphiis Pharma S.r.o.)
  - Ocusan 0.2% eye drops 0.5ml unit dose: £0.80

- **Optive Fusion** (Allergan Ltd)
  - Optive Fusion 0.1% eye drops: £0.41

- **Oxyal** (Bausch & Lomb UK Ltd)
  - Oxyal 0.25% eye drops: £0.45

- **Vismed** (TRB Chemidica (UK) Ltd)
  - Vismed Gel Multi 0.3% eye drops preservative free: £0.81

- **Xaillin HA** (Visufarma UK Ltd)
  - Xaillin HA 0.2% eye drops: £1.72
treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

See reference to the treatment of crab lice of the eyelashes.

**Antibacterials for eye infections**

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 701 has a broad spectrum of activity and is the drug of choice for superficial eye infections.

Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 700, levofloxacin p. 700, moxifloxacin p. 700, and ofloxacin p. 701; the aminoglycosides, gentamicin below and tobramycin p. 700 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 700 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isetionate p. 701 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *actinomadura keratitis* [unlicensed indication].

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

**With corticosteroids**

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should *not* be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

**Administration**

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- **Eye drops**, apply 1 drop at least every 2 hours in severe infection then reduce frequency as infection is controlled and continue for 48 hours after healing. For less severe infection 3–4 times daily is generally sufficient.
- **Eye ointment**, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

**Antifungals for eye infections**

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis. Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

**Antivirals for eye infections**

Herspes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 702. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Also see systemic treatment of CMV retinitis.

**Antibacterials for eye infections in neonates**

Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative microorganism should be identified. Chloramphenicol eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered. Azithromycin eye drops are licensed to treat trachomatous conjunctivitis caused by *Chlamydia trachomatis* and purulent bacterial conjunctivitis in neonates. However, as there is a risk of simultaneous infection at other sites in neonates and children under 3 months presenting with conjunctivitis caused by *Chlamydia trachomatis*, systemic treatment with oral erythromycin p. 341 is required. *Gonococcal eye infections* are treated with a single-dose of parenteral cefotaxime p. 330 or ceftriaxone p. 332. Gentamicin eye drops together with appropriate systemic antibacterials are used in the treatment of *pseudomonal eye infections*; high-strength gentamicin eye drops (1.5% [unlicensed]) are available for severe infections.

### 3.1 Bacterial eye infection

**ANTIBACTERIALS > AMINOGLYCOSIDES**

**Gentamicin**

- **INDICATIONS AND DOSE**
  - **Bacterial eye infections**
    - **TO THE EYE**
      - **Child:** Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- **INTERACTIONS** → Appendix 1: aminoglycosides

- **PRESCRIBING AND DISPENSING INFORMATION** Eye drops may be sourced as a manufactured special or from specialist importing companies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Ear/eye drops solution**

  **EXCIPIENTS:** May contain Benzalkonium chloride

  **Gentamicin (Non-proprietary)**

  Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml | £2.63 DT + £2.47

  **BNFC 2019–2020**
700 Eye infections

Tobramycin

- INDICATIONS AND DOSE
  - Local treatment of infections
  - TO THE EYE
    - Child 1-17 years: Apply twice daily for 6–8 days
  - Local treatment of infections (severe infection)
  - TO THE EYE
    - Child 1-17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days

- INTERACTIONS → Appendix 1: aminoglycosides
- MEDICINAL FORMS
  - No licensed medicines listed

AZITHROMYCIN > MACROLIDES

Azithromycin

- INDICATIONS AND DOSE
  - Trachomatous conjunctivitis caused by Chlamydia trachomatis
  - Purulent bacterial conjunctivitis
  - TO THE EYE
    - Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

- INTERACTIONS → Appendix 1: macrolides
- SIDE-EFFECTS
  - Common or very common
    - Eye discomfort
  - Uncommon
    - Eye allergy

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Eye drops
    - Azyter (Thea Pharmaceuticals Ltd)
      - Azithromycin dihydrate 15 mg per 1 gram Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose [POM] £6.99 DT = £6.99

ANTIBACTERIALS > QUINOLONES

Ciprofloxacin

- INDICATIONS AND DOSE
  - Superficial bacterial eye infection
  - TO THE EYE USING EYE DROP
    - Child: Apply 4 times a day for maximum duration of treatment 21 days
  - TO THE EYE USING EYE OINTMENT
    - Child 1-17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
  - Superficial bacterial eye infection (severe infection)
  - TO THE EYE USING EYE DROP
    - Child: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
  - Corneal ulcer
  - TO THE EYE USING EYE DROP
    - Child: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
  - TO THE EYE USING EYE OINTMENT
    - Child 1-17 years: Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

- INTERACTIONS → Appendix 1: quinolones

Levofloxacin

- INDICATIONS AND DOSE
  - Local treatment of eye infections
  - TO THE EYE
    - Child 1-17 years: Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days

- INTERACTIONS → Appendix 1: quinolones
- PREGNANCY
  - Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING
  - Manufacturer advises use only if potential benefit outweighs risk.
- PRESCRIBING AND DISPENSING INFORMATION
  - Although multi-dose levofloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Eye drops
    - EXCIPIENTS: May contain Benzalkonium chloride
      - Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml Ciloxan 0.3% eye drops | 5 ml [POM] £4.70 DT = £4.70

Moxifloxacin

- INDICATIONS AND DOSE
  - Local treatment of infections
  - TO THE EYE
    - Child: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days

- CAUTIONS
  - Not recommended for neonates (in neonates)
- INTERACTIONS → Appendix 1: quinolones
- SIDE-EFFECTS
  - Rare or very rare
    - Laryngeal pain
    - Nasal discomfort

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Eye drops
    - EXCIPIENTS: May contain Benzalkonium chloride
      - Moxifloxacin (as Moxifloxacin hydrochloride) 5 mg per 1 ml Moxivig 0.5% eye drops | 5 ml [POM] £3.80 DT = £3.80
**Ofloxacin**

**INDICATIONS AND DOSE**

**Local treatment of infections**

- **TO THE EYE**
  - Child 1–17 years: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment

**CAUTIONS**

- Corneal ulcer (risk of corneal perforation) - epithelial defect (risk of corneal perforation)
- **INTERACTIONS** → Appendix 1: quinolones

**SIDE-EFFECTS**

- Oropharyngeal swelling - tongue swelling
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk (systemic quinolones have caused arthropathy in animal studies).

**BREAST FEEDING**

- Manufacturer advises avoid.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- EXCIPIENTS: May contain Benzalkonium chloride
- **Exocin** (Allergan Ltd)
  - Ofloxacin 3 mg per 1 ml Excin 0.3% eye drops | 5 ml [POM] £2.17 DT = £2.17

**ANTIBACTERIALS > OTHER**

**Chloramphenicol**

**DRUG ACTION**

- Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

**Superficial eye infections**

- **TO THE EYE USING EYE DROP**
  - Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
  - **TO THE EYE USING EYE OINTMENT**
  - Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

**INTERACTIONS** → Appendix 1: chloramphenicol

**SIDE-EFFECTS**

- Angioedema - bone marrow disorders - eye stinging - fever - paraesthesia - skin reactions
- **PREGNANCY** Avoid unless essential—no information on topical use but risk of ‘neonatal grey-baby syndrome’ with oral use in third trimester.

**BREAST FEEDING**

- Avoid unless essential— theoretical risk of bone-marrow toxicity.

**PRESCRIBING AND DISPENSING INFORMATION**

- Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Chloramphenicol for eye infections www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0

**EXCEPTIONS TO LEGAL CATEGORY**

- Chloramphenicol 0.5% eye drops (in max. pack size 10 ml) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

**Fusidic acid**

16 Jun 2017

**INDICATIONS AND DOSE**

**Staphylococcal eye infections**

- **TO THE EYE**
  - Child: Apply twice daily

**INTERACTIONS** → Appendix 1: fusidic acid

**SIDE-EFFECTS**

- Common or very common—Dry eye - eye discomfort - vision blurred
- Uncommon—Crying on application - skin reactions - watering eye
- Frequency not known—Angioedema - eye inflammation

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Modified-release drops**

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- **Fusidic acid 10 mg per 1 gram** Fusidic acid 1% modified-release eye drops | 5 gram [POM] £29.06 DT = £29.06

**ANTIPROTOZOAALs**

**Propamidine isetionate**

**INDICATIONS AND DOSE**

**Acanthamoeba keratitis infections (specialist use only)**

**Local treatment of eye infections**

- **TO THE EYE USING EYE OINTMENT**
  - Child: Apply 1–2 times a day
  - **TO THE EYE USING EYE DROP**
  - Child: Apply up to 4 times a day

**UNLICENSED USE**

- Not licensed for acanthamoeba keratitis infections.

**SIDE-EFFECTS**

- Eye discomfort - vision blurred

**PREGNANCY**

- Manufacturer advises avoid unless essential—no information available.

**BREAST FEEDING**

- Manufacture advises avoid unless essential—no information available.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- **Golden Eye (dibrompropamidine)** (Cambridge Healthcare Supplies Ltd)
  - Dibrompropamidine isetionate 1.5 mg per 1 gram Golden Eye 0.15% ointment | 5 gram [P] £3.98 DT = £3.98
**Eye procedures**

**Mydriatics and cycloplegics**

**Overview**

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide below 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye.

Cyclopentolate hydrochloride or homatropine hydrobromide p. 695 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

**ANTIMUSCARINICS**

### Tropicamide

**INDICATIONS AND DOSE**

**Fundoscopy**

- TO THE EYE
- Child: 0.5% eye drops to be applied 20 minutes before examination.

**INTERACTIONS**

- Appendix 1: tropicamide
- SIDE-EFFECTS: Eye erythema, eye irritation (on prolonged administration), eye pain, headache, hypotension, nausea, syncope, vision blurred

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCipients:** May contain Benzalkonium chloride
  - **Brolene (Propamidine)** (Sanofi)  Propamidine isetionate 1 mg per 1 ml  Brolene 0.1% eye drops 10 ml £2.80 DT + £2.80
  - **Golden Eye (propamidine)** (Cambridge Healthcare Supplies Ltd)  Propamidine isetionate 1 mg per 1 ml  Golden Eye 0.1% drops 10 ml £3.62 DT + £2.80

### 3.2 Viral eye infection

#### 3.2a Ophthalmic herpes simplex

**ANTIVIRALS > NUCLEOSIDE ANALOGUES**

**Aciclovir**

**(Aцикловир)**

**INDICATIONS AND DOSE**

Herpes simplex infection (local treatment)

- TO THE EYE USING EYE OINTMENT
- Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

**INTERACTIONS**

- Appendix 1: aciclovir

**SIDE-EFFECTS**

- Common or very common  Eye inflammation - eye pain

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Aciclovir eye ointment for herpes-simplex-infection www.medicinesforchildren.org.uk/aciclovir-eye-ointment-herpes-simplex-infection-0

There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- **Zovirax** (GlaxoSmithKline UK Ltd)  Aciclovir 30 mg per 1 gram  Zovirax 3% ophthalmic ointment 4.5 gram £9.34 DT £9.34

### Povidone-iodine

**INDICATIONS AND DOSE**

Cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

- TO THE EYE
- Neonate: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%.
- Child: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

**CONTRA-INDICATIONS**

Concomitant use of ocular antimicrobial drugs - concomitant use of ocular formulations containing mercury-based preservatives preterm neonates

**SIDE-EFFECTS**

- Rare or very rare  Eye erythema - punctate keratitis
- Frequency not known  Cytotoxicity - eye discoloration - hypothyroidism (in neonates)

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye lotion

**Eye drops**

- **EXCipients:** May contain Benzalkonium chloride, edetic acid (edta)
  - **Mydriacyl** (Alcon Eye Care Ltd)  Tropicamide 10 mg per 1 ml  Mydriacyl 1% eye drops 5 ml £1.60
  - **Tropicamide** (Bausch & Lomb UK Ltd)  Tropicamide 5 mg per 1 ml  Minims tropicamide 0.5% eye drops 0.5 ml unit dose 20 unit dose £11.18
  - **Tropicamide** (Bausch & Lomb UK Ltd)  Tropicamide 10 mg per 1 ml  Minims tropicamide 1% eye drops 0.5 ml unit dose 20 unit dose £11.31

**IODINE PRODUCTS**

**Povidone-Iodine 50 mg per 1 ml**

- **Brolene** (Propamidine)  Propamidine isetionate 1 mg per 1 ml  Brolene 0.1% eye drops 10 ml £2.80 DT £2.80

**Zovirax**

- **EXCipients:** May contain Benzalkonium chloride, edetic acid (edta)
  - **Tropicamide** (Alcon Eye Care Ltd)  Tropicamide 10 mg per 1 ml  Zovirax 3% ophthalmic ointment 4.5 gram £9.34 DT £9.34

**IODINE PRODUCTS**

**Povidone-Iodine 50 mg per 1 ml**

- **Brolene** (Propamidine)  Propamidine isetionate 1 mg per 1 ml  Brolene 0.1% eye drops 10 ml £2.80 DT £2.80

**Zovirax**

- **EXCipients:** May contain Benzalkonium chloride, edetic acid (edta)
  - **Tropicamide** (Alcon Eye Care Ltd)  Tropicamide 10 mg per 1 ml  Zovirax 3% ophthalmic ointment 4.5 gram £9.34 DT £9.34

**IODINE PRODUCTS**

**Povidone-Iodine 50 mg per 1 ml**

- **Brolene** (Propamidine)  Propamidine isetionate 1 mg per 1 ml  Brolene 0.1% eye drops 10 ml £2.80 DT £2.80

**Zovirax**

- **EXCipients:** May contain Benzalkonium chloride, edetic acid (edta)
  - **Tropicamide** (Alcon Eye Care Ltd)  Tropicamide 10 mg per 1 ml  Zovirax 3% ophthalmic ointment 4.5 gram £9.34 DT £9.34
**DIAGNOSTIC AGENTS** > **DYES**

**Fluorescein sodium**

- **INDICATIONS AND DOSE**
  - Detection of lesions and foreign bodies
  - **TO THE EYE**
  - Child: Use sufficient amount to stain damaged areas

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose fluorescein eye drops commonly contain preservatives, preserve-free unit dose vials may be available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  - Fluorescein sodium (Bausch & Lomb UK Ltd)
  - Fluorescein sodium 10 mg per 1 ml
    - Minimum fluorescein sodium 1% eye drops 0.5 ml unit dose | 20 unit dose £9.25
  - Fluorescein sodium 20 mg per 1 ml
    - Minimum fluorescein sodium 2% eye drops 0.5 ml unit dose | 20 unit dose £9.25

**MIOTICS** > **PARASYMPATHOMIMETICS**

**Acetylcholine chloride**

- **INDICATIONS AND DOSE**
  - Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis
  - **TO THE EYE**
  - Child: (consult product literature)

- **UNLICENSED USE**
  - Not licensed for use in children.

- **CAUTIONS**
  - Asthma | Gastro-intestinal spasm | Heart failure | Hyperthyroidism | Peptic ulcer | Urinary-tract obstruction

- **SIDE-EFFECTS**
  - Bradycardia | Corneal decompensation | Corneal oedema | Dyspnœa | Flushing | Hyperhidrosis | Hypotension

- **PREGNANCY**
  - Avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Avoid unless potential benefit outweighs risk—no information available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Irrigation**
  - Miochol-E (Bausch & Lomb UK Ltd)
    - Acetylcholine chloride 20 mg
      - Miochol-E 20 mg powder and solvent for solution for intraocular irrigation vials | 1 vial (Packet) £7.28
    - Miochel (Parmigina S.p.A.)
      - Acetylcholine chloride 20 mg
        - Miochel 20 mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule (Packet) £4.68 (Hospital only)

**SYMPATHOMIMETICS** > **Vasoconstrictor**

**Phenylephrine hydrochloride**

- **INDICATIONS AND DOSE**
  - **MYDRIASIS**
    - **TO THE EYE**
    - Child: Apply 1 drop, to be administered before procedure, a drop of proparacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

- **CONTRA-INDICATIONS**
  - 10% strength eye drops in children • 10% strength eye drops in neonates (in neonates) • Aneurysms • Cardiovascular disease • Hypertension • Thyrotoxicosis

- **CAUTIONS**
  - Asthma • Corneal epithelial damage • Darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage • Diabetes (avoid eye drops in long standing diabetes • Mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber • Neonates are at an increased risk of systemic toxicity • Ocular hyperaemia • Susceptibility to angle-closure glaucoma

- **INTERACTIONS**
  - Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**
  - Arrhythmias • Conjunctivitis allergic • Eye discomfort • Hypertension • Myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease • Palpitations • Periorbital pallor • Vision disorders

- **PREGNANCY**
  - Use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Use only if potential benefit outweighs risk—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose phenylephrine eye drops commonly contain preservatives, preserve-free unit dose vials may be available.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks: Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Eye drops**
  - EXCIPIENTS: May contain Disodium edetate, sodium metabisulphite
    - Phenylephrine hydrochloride (Bausch & Lomb UK Ltd)
      - Phenylephrine hydrochloride 25 mg per 1 ml
        - Minimum phenylephrine hydrochloride 2.5% eye drops 0.5 ml unit dose | 20 unit dose £11.87

**4.1 Post-operative pain and inflammation**

**Eye, surgical and peri-operative drug use**

**Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.

Sodium hyaluronate p. 698 is used during surgical procedures on the eye.

Apraclonidine p. 710, an alpha-adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.

**Balanced Salt Solution** is used routinely in intra-ocular surgery.

Povidone–iodine p. 702 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

**Ocular local anaesthetics**

Oxybuprocaine hydrochloride p. 704 and tetracaine p. 704 are widely used topical local anaesthetics. Proparacaine hydrochloride p. 704 causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride p. 852 and fluorescein sodium above is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before
minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 138, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms. Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

ANAESTHETICS, LOCAL

Fluorescein with lidocaine

- **INDICATIONS AND DOSE**
  - **Local anaesthesia**
    - **TO THE EYE**
      - Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in pre-term neonates (immature metabolising enzyme system)
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - Lidocaine and Fluorescein (Bausch & Lomb UK Ltd)
      - Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml
      - Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose [PPO] £11.69

Oxybuprocaine hydrochloride
(Benoxinate hydrochloride)

- **INDICATIONS AND DOSE**
  - **Local anaesthesia**
    - **TO THE EYE**
      - Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in preterm neonates
- **INTERACTIONS** → Appendix 1: anaesthetics, local
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose oxybuprocaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - Oxybuprocaine hydrochloride (Bausch & Lomb UK Ltd)
      - Oxybuprocaine hydrochloride 4 mg per 1 ml
      - Minims oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose | 20 unit dose [PPO] £10.56

Proxymetacaine hydrochloride

- **INDICATIONS AND DOSE**
  - **Local anaesthetic**
    - **TO THE EYE**
      - Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in preterm neonates
- **INTERACTIONS** → Appendix 1: anaesthetics, local
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - Proxymetacaine (Bausch & Lomb UK Ltd)
      - Proxymetacaine hydrochloride 5 mg per 1 ml
      - Minims proxymetacaine 0.5% eye drops 0.5ml unit dose | 20 unit dose [PPO] £12.12

### Tetracaine
(AMETHOCAINE)

- **INDICATIONS AND DOSE**
  - **Local anaesthetic**
    - **TO THE EYE**
      - Child: Apply as required

- **UNLICENSED USE** Not licensed for use in neonates.
- **CONTRA-INDICATIONS** Avoid in preterm neonates
- **INTERACTIONS** → Appendix 1: anaesthetics, local
- **SIDE-EFFECTS** Dermatitis - eye disorders - eye inflammation - paraesthesia
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - Tetracaine (Bausch & Lomb UK Ltd)
      - Tetracaine hydrochloride 5 mg per 1 ml
      - Minims tetracaine hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [PPO] £10.57 DT = £10.57
      - Tetracaine hydrochloride 10 mg per 1 ml
      - Minims tetracaine hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [PPO] £10.57 DT = £10.57

### DICLOFENAC SODIUM

- **INDICATIONS AND DOSE**
  - **Non-steroidal anti-inflammatory drugs**
    - **Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties)**
    - **Postoperative inflammation in cataract surgery, strabismus surgery, argon laser trabecuoplasty**
    - **TO THE EYE**
      - Child: (consult product literature)

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
  - Rare or very rare
    - Asthma exacerbated - dyspnoea - eye disorders - eye inflammation - hypersensitivity - oedema - skin reactions
  - Frequency not known
    - Eye discomfort - rhinitis - vision blurred

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose diclofenac sodium eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain benzalkonium chloride, disodium edetate, propylene glycol
- Voltarol Ophtha (Thea Pharmaceuticals Ltd)
- Diclofenac sodium 1 mg per 1 ml Voltarol Ophtha 0.1% eye drops 0.3ml unit dose | 5 unit dose (POM) £4.00 DT = £4.00 | 40 unit dose (POM) £32.00 DT = £32.00
- Voltarol Ophtha Multidose (Thea Pharmaceuticals Ltd)
- Diclofenac sodium 1 mg per 1 ml Voltarol Ophtha Multidose 0.1% eye drops | 5 ml (POM) £6.68 DT = £6.68

### ALLERGY AND CROSS-SENSITIVITY

- Frequency not known
- **Common or very common**

### SIDE-EFFECTS

- **TO THE EYE**
- Child: (consult product literature)

### INTERACTIONS

→ Appendix 1: NSAIDs

---

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain benzalkonium chloride, disodium edetate
- Ketorolac trometamol (Non-proprietary)
- Ketorolac trometamol 5 mg per 1 ml Ketorolac 0.5% eye drops | 5 ml (POM) £3.00–£3.99 DT = £3.00
- Acular (Allergan Ltd)
  - Ketorolac trometamol 5 mg per 1 ml Acular 0.5% eye drops | 5 ml (POM) £3.00 DT = £3.00

### ALLERGY AND CROSS-SENSITIVITY

- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

### SIDE-EFFECTS

- **Common or very common**
- Eye discomfort - haemorrhage
- Frequency not known

### INTERACTIONS

→ Appendix 1: NSAIDs

---

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain benzalkonium chloride, disodium edetate
- Ketorolac trometamol (Non-proprietary)
- Ketorolac trometamol 5 mg per 1 ml Ketorolac 0.5% eye drops | 5 ml (POM) £3.00–£3.99 DT = £3.00
- Acular (Allergan Ltd)
  - Ketorolac trometamol 5 mg per 1 ml Acular 0.5% eye drops | 5 ml (POM) £3.00 DT = £3.00

---

### Flurbiprofen

**06-Sep-2016**

**INDICATIONS AND DOSE**

Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) | Control of anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

- **TO THE EYE**
- Child: (consult product literature)

**UNLICENSED USE**

- Not licensed for use in children.

**INTERACTIONS**

→ Appendix 1: NSAIDs

**SIDE-EFFECTS**

- **Common or very common**
  - Eye discomfort
  - Haemorrhage
- Frequency not known

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

---

### Ketorolac trometamol

**13-Aug-2018**

**INDICATIONS AND DOSE**

Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

- **TO THE EYE**
- Child: (consult product literature)

**UNLICENSED USE**

- Not licensed for use in children.

**INTERACTIONS**

→ Appendix 1: NSAIDs

**SIDE-EFFECTS**

- **Common or very common**
  - Eye discomfort
  - Eye disorders
  - Eye infection
  - Eye inflammation
  - Headache
  - Hypersensitivity
  - Keratopathy
  - Retinal haemorrhage
  - Vision disorders
- **Uncommon**
  - Dry eye
- **Frequency not known**
  - Asthma exacerbated
  - Bronchospasm

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

### 5 Glaucoma and ocular hypertension

#### Glaucoma

**Overview**

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. Primary congenital glaucoma is the most common form of glaucoma in children, followed by secondary glaucomas, such as following hereditary anterior segment malformations; juvenile open-angle glaucoma is less common and usually occurs in older children.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-ocular pressure with surgery. Drug therapy is generally supportive, and can be used temporarily, pre- or post-operatively, or both, to reduce intra-ocular pressure. In secondary glaucomas, drug therapy is often used first-line, and long-term treatment may be required. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Children with an acute form of glaucoma (usually presenting with pain in older children, a cloudy cornea, and may be associated with a previous history of controlled glaucoma or recent intra-ocular surgery) need immediate referral for specialist ophthalmic assessment and treatment.

**Beta-blockers for glaucoma**

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary and secondary glaucomas, probably by reducing the rate of production of aqueous humour.

**Prostaglandin analogues for glaucoma**

The prostaglandin analogues latanoprost p. 710, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost (Xalatan® and certain non-proprietary preparations of latanoprost) is licensed for use in children. Children receiving prostaglandin analogues should be managed by a specialist.

**Sympathomimetics for glaucoma**

Apraclonidine p. 710 is an alpha-2 adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another
drug; eye drops containing 1% are used for control of intraocular pressure after anterior segment laser surgery.

Brimonidine tartrate, an alpha-2-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

Carbonic anhydrase inhibitors and systemic drugs for glaucoma

The carbonic anhydrase inhibitors, acetazolamide p. 707, brinzolamide p. 708, and dorzolamide p. 708, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

Metabolic acidosis can occur in children using topical carbonic anhydrase inhibitors; symptoms may include poor feeding and lack of weight gain.

Miotics for glaucoma

Miotics act by opening up the inefficient drainage channels in the trabecular meshwork. Pilocarpine p. 709 is a miotic used pre- and post-operatively in goniotomy and trabeculotomy; it is used occasionally for aphakic glaucoma.

BETA-ADRENOCORTICOTROPIN BLOCKERS

Betaxolol

- **INDICATIONS AND DOSE**
  - Primary and secondary glaucomas
    - TO THE EYE
    - Child: Apply twice daily

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers. Heart block.
- **CAUTIONS** Patients with corneal disease

- **INTERACTIONS** → Appendix 1: beta blockers, selective
- **SIDE-EFFECTS**
  - Common or very common Eye discomfort
  - Rare or very rare Cataract
  - Frequency not known Angioedema

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose (Betaxolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate

- **Betoptic** (Novartis Pharmaceuticals UK Ltd)
  - Betaxolol (as Betaxolol hydrochloride) 2.5 mg per 1 ml
  - Betaxolol 0.25% suspension eye drops | 5 ml (£9.24) £2.66 DT = £2.66
  - Betaxolol 0.25% eye drops suspension 0.25ml unit dose | 50 unit dose (£3.66) £12.77 DT = £13.77

- **Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml**
  - Betaxolol 0.5% eye drops | 5 ml (£8.90) £1.90 DT = £1.90

Levobunolol hydrochloride

- **INDICATIONS AND DOSE**
  - Primary and secondary glaucomas
  - TO THE EYE
  - Child: Apply 1–2 times a day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers.
- **CAUTIONS** Patients with corneal disease

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
  - Common or very common Eye discomfort
  - Frequency not known Dry eye

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose (Levobunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate

- **Betagan** (Allergan Ltd)
  - Betagan Unit Dose
  - Levo B (Allergan Ltd)
  - Betoptic (Novartis Pharmaceuticals UK Ltd)
  - Levobunolol hydrochloride 5 mg per 1 ml
  - Levobunolol 0.5% eye drops | 5 ml (£8.98) £1.90 DT = £1.90

Timolol maleate

- **INDICATIONS AND DOSE**
  - Primary congenital and primary juvenile glaucoma, for a transitional period, before surgery or following failed surgery
  - TO THE EYE
  - Child: (consult product literature)

- **Timoptol-La**
  - Reduction of intra-ocular pressure in primary and secondary glaucoma
  - TO THE EYE
  - Child: Apply once daily
Acetazolamide

INDICATIONS AND DOSE

Glaucoma

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 250–500 mg daily

CARBONIC ANHYDRASE INHIBITORS

TIOPREP®

Reduction of intra-ocular pressure primary and secondary glaucomas
- TO THE EYE
- Child: Apply once daily, to be applied in the morning

- UNLICENSED USE Not licensed for use in children.
- CONTRA-INDICATIONS Also consider contra-indications listed for systemically administered beta blockers.
- bradycardia - heart block
- CAUTIONS Consider also cautions listed for systemically administered beta blockers.
- patients with corneal disease
- INTERACTIONS Appendix 1: beta blockers, non-selective
- SIDE-EFFECTS
- Common or very common Eye discomfort - eye disorders - eye inflammation - vision disorders
- Rare or very rare Angioedema

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- BREAST FEEDING Manufacturer advises avoidance.

- NATIONAL FUNDING/ACCESS DECISIONS

TIOPREP® Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (February 2014) that timolol gel eye drops (Tioprep®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye gel

EXCIPIENTS: May contain Benzodiazecinium bromide

- Timoptol-LA (Santen UK Ltd)
- Timolol (as Timolol maleate) 2.5 mg per 1 ml
  - Timolol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml (POD) £3.12 DT = £3.12
- Timolol (as Timolol maleate) 5 mg per 1 ml
  - Timolol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml (POD) £3.12 DT = £3.12

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- Timolol maleate (Non-proprietary)
- Timolol (as Timolol maleate) 2.5 mg per 1 ml
  - Timolol 0.25% eye drops | 5 ml (POD) £0.98 DT = £0.98
- Timolol (as Timolol maleate) 5 mg per 1 ml
  - Timolol 0.5% eye drops | 5 ml (POD) £1.00 DT = £1.00
  - Eysano (Aspire Pharma Ltd)
  - Timolol (as Timolol maleate) 2.5 mg per 1 ml
  - Eysano 2.5mg/ml eye drops | 5 ml (POD) £8.45 DT = £8.45
  - Timolol (as Timolol maleate) 5 mg per 1 ml
  - Eysano 5mg/ml eye drops | 5 ml (POD) £9.65 DT = £9.65
- Timolol (Santen UK Ltd)
- Timolol (as Timolol maleate) 2.5 mg per 1 ml
  - Timolol 0.25% eye drops | 5 ml (POD) £3.12 DT = £3.12
  - Timolol (as Timolol maleate) 5 mg per 1 ml
  - Timolol 0.5% eye drops | 5 ml (POD) £3.12 DT = £3.12
- Tiopex (Thea Pharmaceuticals Ltd)
- Timolol (as Timolol maleate) 1 mg per 1 gram
  - Tiopex 1mg/g eye gel 0.4% unit dose | 30 unit dose (POD) £7.49 DT = £7.49

Combinations available: Dorzolamide with timolol, p. 709

Glaucoma

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 250–500 mg daily

Allergic and cross-sensitivity

Contra-indicated if history of sulfonamide hypersensitivity.

Epilepsy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION
- Neonate: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day.

- Child 1 month–11 years: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day; maximum 750 mg per day
- Child 12–17 years: 250 mg 2–4 times a day

Raised intracranial pressure

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION
- Child 1 month–11 years: Initially 8 mg/kg 3 times a day, then increased if necessary up to 100 mg/kg daily

- UNLICENSED USE Not licensed for the treatment of glaucoma.
- CONTRA-INDICATIONS Adrenocortical insufficiency - hyperchloraemic acidosis - hypokalaemia - hypernatraemia - long-term administration in chronic angle-closure glaucoma

CAUTIONS Avoid extravasation at injection site (risk of necrosis) - diabetes mellitus - impaired alveolar ventilation (risk of acidosis) - not generally recommended for long-term use - pulmonary obstruction (risk of acidosis) - renal calculi

- INTERACTIONS Appendix 1: acetazolamide
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Rare or very rare
- Common or very common

SPECIFIC SIDE-EFFECTS

- Uncommon
- Rare or very rare

- With oral use: Osteomalacia
- With oral use: Ataxia - hyperglycaemia - hypoglycaemia - renal tubular necrosis

- Frequency not known

SIDE-EFFECTS, FURTHER INFORMATION Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally — patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering bicarbonate.

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated if history of sulfonamide hypersensitivity.
708 Glaucoma and ocular hypertension

- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in animal studies).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 3**
  - Acetazolamide (Non-proprietary)
    - Acetazolamide 250 mg Acetazolamide 250mg tablets | 112 tablet (£75.36 DT + £12.81)
  - **Powder for solution for injection**
    - Diamox (Advanz Pharma)
      - Acetazolamide 500 mg Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial (£14.76)
  - **Modified-release capsule**
    - Diamox SR (Advanz Pharma)
      - Acetazolamide 250 mg Diamox SR 250mg capsules | 30 capsule (£16.66 DT + £16.66)
    - Etyazox (Teva UK Ltd)
      - Acetazolamide 250 mg Etyazox 250mg modified-release capsules | 30 capsule (£16.60 DT + £16.66)

**Brinzolamide**

- **INDICATIONS AND DOSE**
  - Reduction of intra-ocular pressure in primary and secondary glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone if unresponsive to beta-blockers or if beta-blockers contra-indicated
  - **TO THE EYE**
    - Child: Apply 3 times a day
  - Raised intra-ocular pressure in primary and secondary glaucoma as adjunct to a beta-blocker
  - **TO THE EYE**
    - Child: Apply twice daily

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Renal tubular immaturity or abnormality—risk of metabolic acidosis—systemic absorption follows topical application
- **INTERACTIONS**
  - Appendix 1: dorzolamide
- **SIDE-EFFECTS**
  - **Common or very common** Eye discomfort, eye disorders - taste altered - vision disorders
  - **Rare or very rare** Alopecia - angina pectoris - drowsiness - irritability - optic nerve disorder - respiratory disorders - tinnitus
  - **Frequency not known** Appetite decreased - arthralgia - asthma - hypertension - malaise - peripheral oedema - tremor - urinary frequency increased - vertigo

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Use only if benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **PREScribing AND Dispensing INFORMATION** Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**Dorzolamide**

- **INDICATIONS AND DOSE**
  - Raised intra-ocular pressure in primary and secondary glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated
  - **TO THE EYE**
    - Child: Apply 3 times a day
  - Raised intra-ocular pressure in primary and secondary glaucoma as adjunct to a beta-blocker
  - **TO THE EYE**
    - Child: Apply twice daily

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Chronic corneal defects - history of intra-ocular surgery - history of renal calculi - immature renal tubules (neonates and infants) — risk of metabolic acidosis - low endothelial cell count - systemic absorption follows topical application
- **INTERACTIONS**
  - Appendix 1: dorzolamide
- **SIDE-EFFECTS**
  - **Common or very common** Asthenia - eye discomfort - eye disorders - eye inflammation - headache - nausea - paraesthesia - taste bitter - vision disorders
  - **Rare or very rare** Angioedema - bronchospasm - dizziness - dry mouth - dyspnoea - epistaxis - local reaction - pain - severe cutaneous adverse reactions (SCARs) - skin reactions - throat irritation - urolithiasis

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can cause sulfonamide-like side-effects and may require discontinuation if severe.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate.
Dorzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, dorzolamide p. 708, timolol maleate p. 706.

**INDICATIONS AND DOSE**

- Raised intra-ocular pressure in open-angle glaucoma
- When beta-blockers alone not adequate
- Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate

- **INTERACTIONS**
  - To the eye
  - Child: Apply twice daily

- **SIDE-EFFECTS**
  - Bradycardia
  - Bronchospasm
  - Conjunctival vascular congestion
  - Gastrointestinal upset
  - Hypersalivation
  - Nausea
  - Retinal detachment
  - Retinal detachment has occurred in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **UNLICENSED USE**
  - Not licensed for use in children.

- **MEDIACIN FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**EYE DROPS**

**EXCIPIENTS:**
- May contain Benzalkonium chloride
- Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Dorzolamide 20mg/ml eye drops | 5 ml (£47.28) = £22.20 DT = £22.20
- Pilocarpine hydrochloride 1% eye drops | 10 ml (£47.28) = £22.20
- Pilocarpine hydrochloride 2% eye drops | 10 ml (£47.28) = £22.27 DT = £22.77
- Pilocarpine hydrochloride 4% eye drops | 10 ml (£47.28) = £28.40 DT = £28.40
- Pilocarpine nitrate (Bausch & Lomb UK Ltd)
- Pilocarpine nitrate 20 mg per 1 ml
- Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose (£12.47) = £12.47

**DORZOLAMIDE WITH TIMOLOL**

- Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Timolol (as Timolol maleate) 5 mg per 1 ml
- Timolol 5mg/ml eye drops | 5 ml (£77.70) = £27.16 TD = £22.04
- Cosopt (Santen UK Ltd)
- Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Cosopt 20mg/ml | 5mg/ml eye drops | 5 ml (£77.70) = £10.05 TD = £2.04
- Cosopt iMulti (Santen UK Ltd)
- Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Cosopt iMulti 20mg/ml | 5mg/ml eye drops | 10 ml (£77.70) = £28.00
- Eylando (Aspire Pharma Ltd)
- Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Eylando 20mg/ml | 5mg/ml eye drops | 5 ml (£77.70) = £14.29

**Pilocarpine**

- **DRUG ACTION**
  - Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

- **INDICATIONS AND DOSE**
  - Raised intra-ocular pressure
  - TO THE EYE
  - Child 1 month-1 year: Apply 1 drop 3 times a day, doses are for 0.5% or 1% solution

**MEDIACIN FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**EYE DROPS**

**EXCIPIENTS:**
- May contain Benzalkonium chloride
- Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Dorzolamide 20mg/ml eye drops | 5 ml (£47.28) = £22.28
- Eyelido (Aspire Pharma Ltd)
- Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Eyelido 20mg/ml eye drops | 5 ml (£47.28) = £12.09
- Trusopt (Santen UK Ltd)
- Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
- Trusopt 20mg/ml eye drops 0.2ml unit dose preservative free | 60 unit dose (£38.09) = £12.09
- Trusopt 20mg/ml eye drops | 5 ml (£47.28) = £6.33 TD = £2.38

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks
  - Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.
PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

**Latanoprost**

**INDICATIONS AND DOSE**

Reduction of intra-ocular pressure in raised intra-ocular pressure and glaucoma

- **TO THE EYE**
  - Child: Apply once daily, to be administered preferably in the evening

**SIDE-EFFECTS**

- **Common or very common** Eye discoloration - eye discomfort - eye disorders - eye inflammation - vision disorders
- **Uncommon** Dry eye - rash
- **Rare or very rare** Asthma - chest pain - dyspnoea - unstable angina
- **Frequency not known** Arthralgia - dizziness - headache - myalgia - ophthalmic herpes simplex - palpitations

**PREGNANCY**

Manufacturer advises avoid.

**BREAST FEEDING**

May be present in milk - manufacturer advises avoid.

**MONITORING REQUIREMENTS**

Monitor for changes to eye coloration.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as a possible difference in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair may also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)**

Following reformulation of Xalatan®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpetic simplex keratitis - history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Aphakia - asthma - children less than 1 year—limited information available - history of herpetic keratitis - history of significant ocular viral infections - peri-operative period of cataract surgery - preterm neonates less than 36 weeks gestational age - no information available - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis

**UNLICENSED USE**

0.5% drops are not licensed for use

- **SIDE-EFFECTS**
  - **Common or very common** Eye disorders
  - **Uncommon** Bradycardia - conjunctival haemorrhage - diarrhoea - dry eye - eye discomfort - eye inflammation - gastrointestinal discomfort - irritability - libido decreased - nasal dryness - palpitations - postural hypotension - sensation abnormal - sleep disorders - syncope - vision disorders - vomiting

**SYMPATHOMIMETICS > ALPHA2-ADRENERGIC AGONISTS**

**Apraclonidine**

**DRUG ACTION** Apraclonidine is an alpha2-adrenergic agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

**INDICATIONS AND DOSE**

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

- **TO THE EYE**
  - Child: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

**Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug**

- **TO THE EYE**
  - Child 12-17 years: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

**UNLICENSED USE**

0.5% drops are not licensed for use in children under 12 years. 1% drops are not licensed for use in children.

**CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease

**CAUTIONS** Cerebrovascular disease - depression - heart failure - history of angina - hypertension - loss of effect may occur over time - Raynaud’s syndrome - recent myocardial infarction - reduction in vision in end-stage glaucoma (suspend treatment) - severe coronary insufficiency - thromboangiitis obliterans - vasovagal attack

**INTERACTIONS** Appendix 1: apraclonidine

**SIDE-EFFECTS**

- **Common or very common** Eye disorders
- **Uncommon** Bradycardia - conjunctival haemorrhage - diarrhoea - dry eye - eye discomfort - eye inflammation - gastrointestinal discomfort - irritability - libido decreased - nasal dryness - palpitations - postural hypotension - sensation abnormal - sleep disorders - syncope - vision disorders - vomiting

**NATIONAL FUNDING/ACCESS DECISIONS**

**MONOPOST®**

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (June 2013) that Monopost® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.
Optic neuropathy 711

- **Rare or very rare** Chest pain · dry mouth · fatigue · headache · hyperhidrosis · pain in extremity · pruritus · taste altered · temperature sensation altered

**SIDE-EFFECTS, FURTHER INFORMATION** Since absorption may follow topical application, systemic effects may occur—see clonidine hydrochloride p. 103.

**Ocular intolerance** Manufacturer advises withdrawal if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution (no information available).
- **RENA L IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

  - **Excipients:** May contain Benzalkonium chloride
  - **Iopidine** (Novartis Pharmaceuticals UK Ltd)
    - **Apraclonidine** (as Apraclonidine hydrochloride) 5 mg per 1 ml Iopidine 5mg/ml eye drops | 5 ml £10.88 DT = £0.88
    - **Apraclonidine** (as Apraclonidine hydrochloride) 10 mg per 1 ml Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose £77.85 DT = £77.85

6 Retinal disorders

6.1 Optic neuropathy

**DRUGS FOR METABOLIC DISORDERS > ANTIOXIDANTS**

**Idebenone**

- **Drug Action** Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

- **INDICATIONS AND DOSE**
  - **Leber’s Hereditary Optic Neuropathy (initiated by a specialist)**
    - **By mouth**
    - Child 12-17 years: 300 mg 3 times a day

**SIDE-EFFECTS**

- **Common or very common** Cough · diarrhoea · increased risk of infection · pain
- **Frequency not known** Agranulocytosis · anaemia · anxiety · appetite decreased · azotaemia · delirium · dizziness · dyspepsia · hallucination · headache · hepatitis · leucopenia · malaise · movement disorders · nausea · neutropenia · poriomania · seizure · skin reactions · stupor · thrombocytopenia · urine discolouration · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as this may mask colour changes due to other causes (e.g. renal or blood disorders).
Chapter 12
Ear, nose and oropharynx

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-inflammatory which is not used systemically (such as neomycin sulfate p. 714 or flucloxicin) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-inflammatory or solvent may occur and resistance to antibacterials is a problem with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 715 may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical aminoglycosides or polymyxins in children with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in children with chronic suppurative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 278 or ibuprofen p. 679, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell.

When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 357 is the drug of choice; oral ciprofloxacin p. 714 or a systemic aminoglycoside may be needed for pseudomonal infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments are then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is a self-limiting condition that mainly affects children. It is characterised by inflammation in the middle ear associated with effusion and accompanied by the rapid onset of signs and symptoms of an ear infection. The infection can be caused by viruses or bacteria; often both are present simultaneously.

Children with acute otitis media usually present with symptoms such as ear pain, rubbing of the ear, fever, irritability, crying, poor feeding, restlessness at night, cough, or rhinorrhoea. Symptoms usually improve within 3 to 7 days without antibacterial drugs. The use of antibacterials...
generally does not prevent common complications of acute otitis media such as short-term hearing loss, perforated eardrum, or recurrent infection. Acute complications such as mastoiditis, meningitis, intracranial abscess, sinus thrombosis, and facial nerve paralysis, are rare. Children and their carers should be given advice about the usual duration of acute otitis media, self-care of symptoms such as pain and fever with paracetamol or ibuprofen p. 679, and when to seek medical help. In children aged 3 years and over who do not have a perforated eardrum, pain can be relieved with anaesthetic ear drops in addition to oral analgesics [unlicensed use]. Children and their carers should be reassured that antibacterial drugs are usually not required.

An immediate antibacterial drug should be given if the child is systemically very unwell, has signs or symptoms of a more serious illness, or is at high risk of complications such as significant heart, lung, renal, liver or neuromuscular disease, immunosuppression, cystic fibrosis, and young children who were born prematurely. An immediate antibacterial drug can also be considered if otorrhoea is present, or in children under 2 years of age with bilateral otitis media. See **Antibacterial therapy for otitis media** in Ear infections, antibacterial therapy p. 315.

Children with acute otitis media associated with a severe systemic infection or acute complications should be referred to hospital.

**Otitis media with effusion**

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

**Chronic otitis media**

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa; this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial; a swab should be taken to identify infecting organisms and antibacterial sensitivity.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 714 or ofloxacin eye drops p. 701 used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides or polymyxins** [unlicensed indications] cautiously in children with chronic suppurative otitis media and perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

**Removal of ear wax**

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax causing discomfort or impaired hearing may be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops p. 718 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 718 or urea hydrogen peroxide p. 718 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children unable to cooperate with the procedure, in children who have had otitis media in the last six weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

**Administration**

To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

1 Otitis externa

**ANTIBACTERIALS › AMINOGLYCOSIDES**

**Framycetin sulfate**

- **INDICATIONS AND DOSE**
  - Bacterial infection in otitis externa
  - TO THE EAR
  - Child: (consult product literature)

- **CONTRA-INDICATIONS** Perforated tympanic membrane

- **CAUTIONS** Avoid prolonged use

- **SIDE-EFFECTS** Local reaction

- **MEDICINAL FORMS** No licensed medicines listed.

Combinations available: Dexamethasone withframycetin sulfate and gramicidin, p. 693
**Gentamicin**

**INDICATIONS AND DOSE**

**Bacterial infection in otitis externa**
- **TO THE EAR**
- **Child:** Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)

**CONTRA-INDICATIONS**
- Patent grommet (although may be used by specialists, see Ear p. 712) • perforated tympanic membrane (although may be used by specialists, see Ear p. 712)
- **CAUTIONS** Avoid prolonged use
- **INTERACTIONS** → Appendix 1: neomycin
- **SIDE-EFFECTS** Local reaction

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops 

**Ear/eye drops solution**
- Excipients: May contain benzalkonium chloride
- Gentamicin (Non-proprietary)
- Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml
  - Gentamicin 0.3% ear/eye drops 10 ml £2.63 DT = £2.47

**Gentamicin with hydrocortisone**

**INDICATIONS AND DOSE**

**Eczematous inflammation in otitis externa**
- **TO THE EAR**
- **Child:** Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 450.

**CONTRA-INDICATIONS**
- Patent grommet (although may be used by specialists, see Ear p. 712) • perforated tympanic membrane (although may be used by specialists, see Ear p. 712)
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local reaction
- **PATIENT AND CARER ADVICE**

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Ear drops**
- Excipients: May contain benzalkonium chloride, disodium edetate
- Gentamicin with hydrocortisone (Non-proprietary)
  - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml
  - Hydrocortisone acetate 10 mg per 1 ml
  - Gentamicin 0.3% / Hydrocortisone acetate 1% ear drops 10 ml £29.86 DT = £29.66

**Neomycin sulfate**

**INDICATIONS AND DOSE**

**Bacterial infection in otitis externa**
- **TO THE EAR**
- **Child:** (consult product literature)

**CONTRA-INDICATIONS**
- Patent grommet (although may be used by specialists, see Ear p. 712) • perforated tympanic membrane (although may be used by specialists, see Ear p. 712)
- **CAUTIONS** Avoid prolonged use
- **INTERACTIONS** → Appendix 1: neomycin
- **SIDE-EFFECTS** Local reaction

**MEDICINAL FORMS**
- No licensed medicines listed.

**Antibacterials → Quinolones**

**Ciprofloxacin**

**INDICATIONS AND DOSE**

**Acute otitis externa**
- **TO THE EAR**
- **Child 1-17 years:** Apply 0.25 mL, twice daily for 7 days, each 0.25 mL dose contains 0.5 mg ciprofloxacin

**CAUTIONS**
- Known (or at risk of) perforated tympanic membrane
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
  - Uncommon Ear pruritus
  - **HANDLING AND STORAGE** Manufacturer advises discard any ampoules remaining 8 days after opening the pouch.
  - **PATIENT AND CARER ADVICE**
    - Medicines for Children leaflet: Ciprofloxacin drops for infection www.medicinesforchildren.org.uk/ciprofloxacin-drops-infection

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
- SMC No. 1320/18
  - The Scottish Medicines Consortium has advised (April 2018) that ciprofloxacin ear drops (Cetraxal®) are recommended for use within NHS Scotland for the treatment of acute otitis externa in adults and children over 1 year with an intact tympanic membrane, caused by ciprofloxacin susceptible microorganisms when off-label or unlicensed ciprofloxacin formulations would otherwise be used.

All Wales Medicines Strategy Group (AWMSG) decisions
- AWMSG No. 1343
  - The All Wales Medicines Strategy Group has advised (July 2018) that ciprofloxacin (Cetraxal®) is recommended as an option for use within NHS Wales for the treatment of acute otitis externa in adults and children older than 1 year with an intact tympanic membrane, caused by ciprofloxacin susceptible microorganisms.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Ear drops**
- Cetraxal (Aspire Pharma Ltd)
  - Ciprofloxacin (as Ciprofloxacin hydrochloride) 2 mg per 1 ml
  - Cetraxal 2 mg/ml ear drops 0.25 ml unit dose 15 unit dose £6.01 DT = £6.01

**Combinations available:**
- Ciprofloxacin with dexamethasone, p. 716 • Ciprofloxacin with flucloxacillin acetate, p. 716
ANTIBACTERIALS › OTHER

Chloramphenicol

• **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

• **INDICATIONS AND DOSE**
  - **Bacterial infection in otitis externa**
    - TO THE EAR
    - Child: Apply 2–3 drops 2–3 times a day

• **CAUTIONS** Avoid prolonged use

• **INTERACTIONS** → Appendix 1: chloramphenicol

• **SIDE-EFFECTS**
  - Blood disorder
  - Bone marrow depression

• **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Chloramphenicol ear drops are less suitable for prescribing.

• **MEDICINAL FORMS**
  - **Ear drops**
    - Chloramphenicol 100 mg per 1 ml
      - 10 ml [P] £10.32 DT = £26.32
    - Chloramphenicol 100 mg per 1 ml
      - 10 ml [P] £13.10 DT = £34.31

• **LESS SUITABLE FOR PRESCRIBING** Chloramphenicol ear drops are less suitable for prescribing.

• **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Ear drops**
  - EXCIPIENTS: May contain Propylene glycol
    - Chloramphenicol (Non-proprietary)
      - Chloramphenicol 50 mg per 1 ml
        - Chloramphenicol 5% ear drops
          - 10 ml [P] £7.01 DT = £19.20
      - Chloramphenicol 100 mg per 1 ml
        - Chloramphenicol 10% ear drops
          - 10 ml [P] £9.46 DT = £25.77

ANTIFUNGALS › IMIDAZOLE ANTIFUNGALS

Clotrimazole

• **INDICATIONS AND DOSE**
  - **Fungal infection in otitis externa**
    - TO THE EAR
    - Child: Apply 2–3 times a day continue for at least 14 days after disappearance of infection

• **INTERACTIONS** → Appendix 1: antifungals, azoles

• **SIDE-EFFECTS**
  - Local reaction

• **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Clotrimazole for fungal infections

- www.medicinesforchildren.org.uk/clotrimazole-fungal-infections

• **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Liquid**
  - Canesten (clotrimazole) (Bayer Plc)
    - Clotrimazole 10 mg per 1 ml
      - Canesten 1% solution
        - 20 ml [P] £2.53 DT = £6.85

CORTICOSTEROIDS

Betamethasone

• **INDICATIONS AND DOSE**

- **BETNESOL®**
  - Eczematous inflammation in otitis externa
    - TO THE EAR
    - Child: Apply 2–3 drops every 2–3 hours, reduce frequency when relief obtained

- **VISTAMETHASONE®**
  - Eczematous inflammation in otitis externa
    - TO THE EAR
    - Child: Apply 2–3 drops every 3–4 hours, reduce frequency when relief obtained

- **CONTRA-INDICATIONS** Avoid alone in the presence of untreated infection (combine with suitable anti-infective)

- **CAUTIONS** Avoid prolonged use

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS**

Flumetasone pivalate with clioquinol

• **INDICATIONS AND DOSE**
  - **Eczematous inflammation in otitis externa**
  - **Mild bacterial or fungal infections in otitis externa**

  - TO THE EAR
  - Child 2–17 years: 2–3 drops twice daily for 7–10 days, to be instilled into the ear

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS; RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 450.

- **CONTRA-INDICATIONS** Iodine sensitivity

- **CAUTIONS** Avoid prolonged use • manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

- **SIDE-EFFECTS** Parasthesia • skin reactions

- **PATIENT AND CARER ADVICE** Clioquinol stains skin and clothing

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Ear drops**
    - Flumetasone pivalate with clioquinol (Non-proprietary)
      - Flumetasone pivalate 200 microgram per 1 ml, Clioquinol 10 mg per 1 ml
      - Flumetasone 0.2% / Clioquinol 1% ear drops
        - 7.5 ml [P] £11.34 DT = £31.34
        - 10 ml [P] £15.13 DT = £45.13

Prednisolone

• **INDICATIONS AND DOSE**
  - **Eczematous inflammation in otitis externa**

    - TO THE EAR
    - Child: Apply 2–3 drops every 2–3 hours, frequency to be reduced when relief obtained

- **CONTRA-INDICATIONS** Avoid alone in the presence of untreated infection (combine with suitable anti-infective)

- **CAUTIONS** Avoid prolonged use

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Local reaction
Corticosteroids > Corticosteroid combinations with anti-infectives

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 715, neomycin sulphate p. 714.

**Indications and dose**
Eccematous inflammation in otitis externa
- To the ear using ear drops
  - Child: Apply 2–3 drops 3–4 times a day

**Contra-indications**
Patent grommet (although may be used by specialists, see Ear p. 712).

**Cautions**
Avoid prolonged use

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: Cilodex ear drops and Cilodex ear drops solution.

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml
Betnesol-N ear drops
Betnesol-N ear drops solution

**Excipients:** May contain Benzalkonium chloride, disodium edetate.

**National funding/access decisions**
The Scottish Medicines Consortium (SMC) has advised (July 2017) that dexamethasone with ciprofloxacin (Cilodex®) is accepted for restricted use within NHS Scotland for the treatment of acute otitis media in patients with tympanostomy tubes (AOMT).

**Ciprofloxacin with fluocinolone acetonide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ciprofloxacin, p. 714.

**Indications and dose**
- Acute otitis externa | Acute otitis media in patients with tympanostomy tubes
  - To the ear
  - Child: Apply 4 drops twice daily for 7 days

**Acute otitis externa**
- Child 1-5 years: Apply 4 drops twice daily for 7 days

**Important safety information**
MHRA/CHM advice: Corticosteroids: Rare risk of central serous choriorétinopathy with local as well as systemic administration (August 2017)
See Corticosteroids, general use p. 450.

**Contra-indications**
Fungal ear infections - viral ear infections

**Interactions**
- Appendices 1: fluocinolone - quinolones

**Side-effects**
- Common or very common Ear discomfort
- Uncommon Crying - dizziness - fatigue - flushing - headache - hearing impairment - increased risk of infection - irritability - otorrhoea - paraesthesia - skin reactions - taste altered - vomiting

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug.

Ear drops

Excipients: May contain Benzalkonium chloride, disodium edetate.

Betamethasone with neomycin

Corticosteroids, general use

**PATIENT AND CARER ADVICE**
Manufacturer advises counselling on administration.

**Important safety information**
MHRA/CHM advice: Corticosteroids: Rare risk of central serous choriorétinopathy with local as well as systemic administration (August 2017)

Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 455, framycetin sulfate p. 713.

**INDICATIONS AND DOSE**

- **Eczematous inflammation in otitis externa**
  - **TO THE EAR**
  - **Child:** 2–3 drops 3–4 times a day

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE:** CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)
  - See Corticosteroids, general use p. 450.

**CAUTIONS**
- Avoid prolonged use

**INTERACTIONS**
- Appendix 1: corticosteroids

**LESS SUITABLE FOR PRESCRIBING**
- Sofradex® is less suitable for prescribing.

**MEDICINAL FORMS**
- No licensed medicines listed.

Dexamethasone with glacial acetic acid and neomycin sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 455, neomycin sulfate p. 714.

**INDICATIONS AND DOSE**

- **Eczematous inflammation in otitis externa**
  - **TO THE EAR**
  - **Child:** 2–3 drops 3–4 times a day

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE:** CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)
  - See Corticosteroids, general use p. 450.

**CONTRA-INDICATIONS**
- Patent grommet (although may be used by specialists, see Ear p. 712) - perforated tympanic membrane (although may be used by specialists, see Ear p. 712)

**CAUTIONS**
- Avoid prolonged use

**INTERACTIONS**
- Appendix 1: corticosteroids - neomycin

**SIDE-EFFECTS**
- Paraesthesia - skin reactions - vision blurred

Hydrocortisone with neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 456, neomycin sulfate p. 714.

**INDICATIONS AND DOSE**

- **Bacterial infection in otitis externa**
  - **TO THE EAR**
  - **Child:** 3–17 years: Apply 3 drops 3–4 times a day for 7 days (review treatment if there is no clinical improvement)

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE:** CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)
  - See Corticosteroids, general use p. 450.

**INTERACTIONS**
- Appendix 1: corticosteroids - neomycin - polymyxins

**RENAL IMPAIRMENT**
- Manufacturer advises avoid prolonged, unsupervised use.

**Dose adjustments**
- Manufacturer advises reduce dose.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **EXCIPIENTS:** May contain hydroxybenzoates (parabens)
  - Otomize® (Teva UK Ltd)
  - Dexamethasone 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram, Acetic acid glacial 20 mg per 1 gram
  - Otomize ear spray
  - 5 ml
  - £3.27

**DERMATOLOGICAL DRUGS**

Aluminium acetate

**INDICATIONS AND DOSE**

- **Inflammation in otitis externa**
  - **TO THE EAR**
  - **Child:** To be inserted into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**UNLICENSED USE**
- Not licensed for use in children.

**DIRECTIONS FOR ADMINISTRATION**
- For ear drops 8% - dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared.

**MEDICINAL FORMS**
- Forms available from special-order manufacturers include: ear drops
2 Removal of earwax

**BICARBONATE**

**Sodium bicarbonate**

***INDICATIONS AND DOSE***

- Removal of ear wax (with 5% ear drop solution)
  - TO THE EAR
  - Child: (consult product literature)

***INTERACTIONS*** → Appendix 1: sodium bicarbonate

***SIDE-EFFECTS***

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Ear drops**
  - Sodium bicarbonate (Non-proprietary)
    - Sodium bicarbonate 50 mg per 1 ml
    - Sodium bicarbonate 5% ear drops | 10 ml £1.23–£1.25
  - KliarVax Sodium Bicarbonate (Essential-Healthcare Ltd)
    - Sodium bicarbonate 50 mg per 1 ml
    - KliarVax Sodium Bicarbonate ear drops | 10 ml £0.97

**SOFTENING DRUGS**

**Almond oil**

***INDICATIONS AND DOSE***

- Removal of ear wax
  - TO THE EAR
  - Child: Allow drops to warm to room temperature before use (consult product literature)

***DIRECTIONS FOR ADMINISTRATION*** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

***MEDICINAL FORMS*** There can be variation in the licensing of different medicines containing the same drug.

- Liquid
  - Almond oil (Non-proprietary)
    - Almond oil 1 ml per 1 ml
      - Almond oil liquid | 50 ml £0.95 DT = £0.95
      - 70 ml £0.85 | 200 ml £2.68

**Docusate sodium** 20-Apr-2016

***INDICATIONS AND DOSE***

- Removal of ear wax
  - Child: 1-17 years: (consult product literature)

***INTERACTIONS*** → Appendix 1: docusate sodium

***SIDE-EFFECTS*** Skin reactions

***LESS SUITABLE FOR PRESCRIBING*** Ear drops less suitable for prescribing.

***MEDICINAL FORMS*** There can be variation in the licensing of different medicines containing the same drug.

- **Ear drops**
  - Docusate sodium 5 mg per 1 ml
    - Molcer ear drops | 15 ml £5.60
  - Waxsol (Meda Pharmaceuticals Ltd)
    - Docusate sodium 5 mg per 1 ml
      - Waxsol ear drops | 10 ml £1.95 DT = £1.95

---

**Olive oil**

***INDICATIONS AND DOSE***

- Removal of ear wax
  - TO THE EAR
  - Child: Apply twice daily for several days (if wax is hard and impacted)

***DIRECTIONS FOR ADMINISTRATION*** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Allow ear drops to warm to room temperature before use.

***MEDICINAL FORMS*** There can be variation in the licensing of different medicines containing the same drug.

- **Spray**
  - Earol (HL Healthcare Ltd)
    - Earol olive oil ear spray | 10 ml
  - **Ear drops**
    - Olive oil (Non-proprietary)
      - Olive oil ear drops | 10 ml £1.35–£1.42
    - Arjun (Arjun Products Ltd)
      - Arjun ear drops | 10 ml £1.26
    - Cerumol (olive oil) (Thorton & Ross Ltd)
      - Cerumol olive oil ear drops | 10 ml
    - KliarVax (Essential-Healthcare Ltd)
      - KliarVax Olive Oil ear drops | 10 ml £0.97
    - Oleax (JR Biomedical Ltd)
      - Oleax ear drops | 15 ml £1.40
    - Olive oil (Thorton & Ross Ltd)
      - Care olive oil ear drops | 10 ml £1.42
    - St George’s (St George’s Medical Ltd)
      - Olive oil ear drops | 10 ml £1.40 | 20 ml £2.70

**Urea hydrogen peroxide**

***INDICATIONS AND DOSE***

- Softening and removal of ear wax
  - TO THE EAR
  - Child: (consult product literature)

***PATIENT AND CARER ADVICE*** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

***LESS SUITABLE FOR PRESCRIBING*** Urea-hydrogen peroxide ear drops are less suitable for prescribing.

***MEDICINAL FORMS*** There can be variation in the licensing of different medicines containing the same drug.

- **Ear drops**
  - Exterol (Dermal Laboratories Ltd)
    - Urea hydrogen peroxide 50 mg per 1 gram
      - Exterol 9% ear drops | 8 ml £1.75 DT = £2.89
  - Otex (Thornton & Ross Ltd)
    - Urea hydrogen peroxide 50 mg per 1 gram
      - Otex 9% ear drops | 8 ml £2.89

---

**Nose**

**Rhinitis**

Rhinitis is often self-limiting. Many nasal preparations contain sympathomimetic drugs which can give rise to rebound congestion (rhinitis medicamentosa) and may damage the nasal cilia. Sodium chloride 0.9% solution p. 610 may be used as a douche or ‘sniff’ following endonasal surgery.
Administration
To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

Drugs used in nasal allergy
Mild allergic rhinitis is controlled by antihistamines (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 174) or topical nasal corticosteroids; systemic nasal decongestants are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal corticosteroids; sodium cromoglicate p. 725 is an alternative, but may be less effective. The topical antihistamine, azelastine hydrochloride p. 722, is useful for controlling breakthrough symptoms in allergic rhinitis. Azelastine hydrochloride is less effective than nasal corticosteroids, but probably more effective than sodium cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous long-term treatment may be required in perennial rhinitis.

Montelukast p. 168 is less effective than topical nasal corticosteroids; it can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral corticosteroids for short periods. Oral corticosteroids may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide p. 722 can reduce watery rhinorrhoea.

Corticosteroids
Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred) and in pulmonary tuberculosis.

Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps
Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy
If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 723, budesonide p. 724, fluticasone p. 724, or sodium cromoglicate may be considered.

Topical nasal decongestants
Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucus secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of warm moist air may be useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should not be recommended. Volatile substances such as menthol and eucalyptus may encourage inhalation of warm moist air (see also Aromatic inhalations, cough preparations and systemic nasal decongestants p. 191).

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (rhinitis medicamentosa) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

Ephedrine hydrochloride p. 720 nasal drops is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 721 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (Naseptin ®) cream may be effective.

Nasal preparations for infection
There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis; see elimination of nasal staphylococci. In children, acute complications such as peri-orbital cellulitis require hospital treatment.

Nasal staphylococci
Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin ®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 722 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant Staphylococcus aureus (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

For eradication of MRSA also consult local infection control policy. See also MRSA p. 375.
1 Nasal congestion

SYMPATHOMIMETICS > VASOCONSTRICTOR

Ephedrine hydrochloride

- INDICATIONS AND DOSE
  Nasal congestion | Sinusitis affecting the maxillary antrum
  - BY INTRanasAL ADMINISTRATION
  - Child 12–17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops

IMPORTANT SAFETY INFORMATION

CHM/MHRA ADVICE
The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days’ treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- CAUTIONS
  Avoid excessive or prolonged use - cardiovascular disease - diabetes mellitus - hypertension - hypothyroidism

- INTERACTIONS
  Appendix 1: sympathomimetics, vasoconstrictor

- SIDE-EFFECTS
  - Common or very common
  - Anxiety, headache, insomnia, nausea
  - Frequency not known
    - Appetite decreased, arrhythmia, circulation impaired, dermatitis, dizziness, drug dependence, dry mouth, dyspnoea, hallucination, hyperglycaemia, hyperhidrosis, hypersalivation, hypertension, hypokalaemia, hypotension, irritability, muscle weakness, mydriasis, pain, palpitations, paranoia, piloerection, rebound congestion, syncope, thirst, tremor, urinary disorders, vasoconstriction, vasodilation, vomiting
  - PREGNANCY
    - Manufacturer advises avoid
  - BREAST FEEDING
    - Present in milk; manufacturer advises avoid - irritability and disturbed sleep reported

- PRESCRIBING AND DISPENSING INFORMATION
  For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.

- PROFESSION SPECIFIC INFORMATION
  Dental practitioners’ formulation
  Ephedrine nasal drops may be prescribed.

- EXCEPTIONS TO LEGAL CATEGORY
  Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops

  Nasal drops
    - Ephedrine hydrochloride (Non-proprietary)
      Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml | £1.90–£1.94 DT = £1.90
      Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml | £1.94–£2.01 DT = £1.94

Pseudoephedrine hydrochloride

- INDICATIONS AND DOSE
  Congestion of mucous membranes of upper respiratory tract
  - BY MOUTH
    - Child 6–11 years: 30 mg 3–4 times a day
    - Child 12–17 years: 60 mg 3–4 times a day

- IMPORTANT SAFETY INFORMATION
  Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

  - CAUTIONS
    - Diabetes - heart disease - hypertension - hypothyroidism - raised intra-ocular pressure
  - INTERACTIONS
    - Appendix 1: sympathomimetics, vasoconstrictor
  - SIDE-EFFECTS
    - Angle closure glaucoma, anxiety, arrhythmias, circulation impaired, dry mouth, hallucination, headache, hypertension, irritability, nausea, palpitations, psychiatric disorder, skin reactions, sleep disorders, tremor, urinary retention, vomiting
  - PREGNANCY
    - Deferential closure of the abdominal wall (gastrochisis) reported very rarely in newborns after first trimester exposure
  - BREAST FEEDING
    - May suppress lactation; avoid if lactation not well established or if milk production insufficient
  - HEPATIC IMPAIRMENT
    - Manufacturer advises caution in severe impairment
  - RENAL IMPAIRMENT
    - Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
  - LESS SUITABLE FOR PRESCRIBING
    - Pseudoephedrine hydrochloride is less suitable for prescribing
  - EXCEPTIONS TO LEGAL CATEGORY
    - Galpseud® and Sudafed® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Oral solution
  - EXCIPIENTS: May contain Alcohol
    - Galpseud (Thornton & Ross Ltd) Pseudoephedrine hydrochloride 6 mg per 1 ml Galpseud 30mg/5ml linctus sugar-free | 2000 ml [GR] £14.00
    - Sudafed Non-Drowsy Decongestant (McNeil Products Ltd) Pseudoephedrine hydrochloride 6 mg per 1 ml Sudafed Decongestant 30mg/5ml liquid | 100 ml [GR] £2.22

  Tablet
  - Galpseud (Thornton & Ross Ltd) Pseudoephedrine hydrochloride 60 mg Galpseud 60mg tablets | 24 tablet [PIN] £2.25 | 100 tablet [PIN] £5.42 DT = £5.42
    - Sudafed Non-Drowsy Decongestant (McNeil Products Ltd) Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60mg tablets | 12 tablet [PIN] £2.43
Xylometazoline hydrochloride

</tbody>
</table>

**INDICATIONS AND DOSE**

**NASAL CONGESTION**

- **BY INTRanasAL ADMINISTRATION USING NASAL DROPS**
  - Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril.
  - Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril.

**INDICATIONS AND DOSE**

**NASAL SPRAY**

- Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril.

**CAUTIONS**

- Angle-closure glaucoma.
- Avoid excessive or prolonged use.
- Cardiovascular disease.
- Diabetes mellitus.
- Hypertension.
- Hypothyroidism.
- Rebound congestion.

**SIDE-EFFECTS**

**CARDIOVASCULAR**

- Headache.
- Hypersensitivity.
- Nasal dryness.
- Nausea.
- Paraesthesia.

**VISUAL IMPAIRMENT**

- Visual impairment.

**FURTHER INFORMATION**

- Rebound congestion: Symptomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.

**INTERACTIONS**

- Appendix 1: sympathomimetics, vasoconstrictor.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Otrivine** (GlaxoSmithKline Consumer Healthcare)
  - Xylometazoline hydrochloride 1 mg per 1 ml
  - Otrivine Congestion Relief 0.1% nasal spray | 10 ml | £3.05 DT = £2.18
  - Otrivine Adult Measured Dose Sinusitis spray | 10 ml | £2.62 DT = £1.28
  - Otrivine Allergy Relief 0.1% nasal spray | 10 ml | £2.62 DT = £1.28
  - Otrivine Adult nasal spray | 10 ml | £2.18 DT = £1.18
  - Otrivine Adult Dose Mometasone 0.1% nasal spray | 10 ml | £2.62 DT = £1.28

- **Sudafed Congestion Relief** (McNeil Products Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml
  - Sudafed Congestion Relief 0.1% nasal spray | 10 ml | £3.46 DT = £2.18

- **Sudafed Non-Drowsy Decongestant** (McNeil Products Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml
  - Sudafed Blocked Nose 0.1% spray | 15 ml | £1.76

**Sudafed Sinus-Ease** (McNeil Products Ltd)

- Xylometazoline hydrochloride 1 mg per 1 ml
- Sudafed Sinus-Ease 0.1% nasal spray | 15 ml | £2.80

**Nasal drops**

- **Otrivine** (GlaxoSmithKline Consumer Healthcare)
  - Xylometazoline hydrochloride 500 microgram per 1 ml
  - Otrivine adult drops | 10 ml | £1.91 DT = £1.91

- **Xylometazoline hydrochloride 1 mg per 1 ml**
  - Otrivine Adult 0.1% nasal drops | 10 ml | £2.18 DT = £2.18

2 Nasal infection

**Sinusitis (acute)**

**Description of condition**

Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses. Acute sinusitis (rhinosinusitis) is a self-limiting condition usually triggered by a viral upper respiratory tract infection such as the ‘common cold’.

Occasionally, acute sinusitis may become complicated by a bacterial infection (see Antibacterial therapy for acute sinusitis in Nose infections, antibacterial therapy p. 317).

Children with acute sinusitis, particularly young children, often present with non-specific symptoms in the upper respiratory tract, including nasal blockage or congestion, discoloured nasal discharge, or cough during the day or night.

Symptoms usually improve within 2 to 3 weeks without requiring treatment.

Rarely, acute sinusitis may lead to orbital, intracranial or skeletal complications (e.g. periorbital cellulitis, symptoms or signs of meningitis).

**Aims of treatment**

Treatment is aimed at managing symptoms including pain, fever, and nasal congestion as well as treatment of bacterial infection if present.

**Treatment**

Children presenting with symptoms for around 10 days or less, should be given advice about the usual duration of acute sinusitis, self-care of pain or fever with paracetamol p. 278 or ibuprofen p. 679, and when to seek medical help. Children and their carers should be reassured that antibiotics are usually not required.

Children (over the age of 12) presenting with symptoms for around 10 days or more with no improvement could be considered for treatment with a high-dose nasal corticosteroid, such as mometasone furoate p. 725 [unlicensed use] or fluticasone p. 724 [unlicensed use] for 14 days.

If the child is systemically very unwell, has signs and symptoms of a more serious illness or condition, or is at high-risk of complications, an immediate antibiotic could be offered if deemed appropriate. (see Antibacterial therapy for acute sinusitis in Nose infections, antibacterial therapy p. 317).

Children presenting with symptoms of acute sinusitis associated with a severe systemic infection or with orbital or intracranial complications should be referred to hospital.

722 Nasal inflammation, nasal polyps and rhinitis

ANTIBACTERIALS > AMINOGLYCOSIDES

Chlorhexidine with neomycin

- **INDICATIONS AND DOSE**
  - **Eradication of nasal carriage of staphylococci**
  - **BY INTRANASAL ADMINISTRATION**
  - **Child**: Apply 2–3 times a day for 5 days
  - **Preventing nasal carriage of staphylococci**
  - **BY INTRANASAL ADMINISTRATION**
  - **Child**: Apply twice daily

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol).
  - **Naseptin (Alliance Pharmaceuticals Ltd)**
    - Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram
    - Naseptin nasal cream | 15 gram (POD) £1.99 DT = £1.99

- **SIDE-EFFECTS**
  - Common or very common
    - **Skin reactions**
  - **PREGNANCY**
    - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
  - **BREAST FEEDING**
    - No information available.
  - **RENAL IMPAIRMENT**
    - Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Nasal ointment**
    - **Betabond (GlaxoSmithKline UK Ltd)**
      - Mupirocin (as Mupirocin calcium) 20 mg per 1 gram
    - **Bactroban 2% nasal ointment | 3 gram (POD)** £4.24 DT = £4.24

ANTIBACTERIALS > OTHER

Mupirocin

- **INDICATIONS AND DOSE**
  - **BACTROBAN NASAL ©**
    - **For eradication of nasal carriage of staphylococci, including meticillin-resistant Staphylococcus aureus (MRSA)**
    - **BY INTRANASAL ADMINISTRATION**
    - **Child**: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

- **SIDE-EFFECTS**
  - Common or very common
    - **Skin reactions**
  - **PREGNANCY**
    - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
  - **BREAST FEEDING**
    - No information available.
  - **RENAL IMPAIRMENT**
    - Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

ANTIBACTERIALS > OTHER

Betamethasone with neomycin

- **INDICATIONS AND DOSE**
  - **Nasal infection**
    - **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**
    - **Child**: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **INTERACTIONS**
  - **Appendix 1: corticosteroids • neomycin**
  - **LESS SUITABLE FOR PRESCRIBING**
    - Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

**EXCIPIENTS**: May contain Benzalkonium chloride, disodium edetate

- **Betnesol-N (RPH Pharmaceuticals AB)**
  - Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml
  - Betnesol-N ear/eye/nose drops | 10 ml (POD) £2.39 DT = £2.39

3 Nasal inflammation, nasal polyps and rhinitis

Other drugs used for Nasal inflammation, nasal polyps and rhinitis

Desloratadine, p. 177 • Fexofenadine hydrochloride, p. 178 • Ketotifen, p. 182 • Rupatadine, p. 179

ANTIHISTAMINES > NON-SEDATING

Azelastine hydrochloride

- **INDICATIONS AND DOSE**
  - **Allergic rhinitis**
    - **BY INTRANASAL ADMINISTRATION**
    - **Child 6-17 years**: 1 spray twice daily, to be administered into each nostril
  - **DOSE EQUIVALENCE AND CONVERSION**
    - 1 spray equivalent to 140 micrograms.

- **INTERACTIONS**
  - **Appendix 1: antihistamines, non-sedating**
  - **SIDE-EFFECTS**
    - Common or very common
      - **Taste bitter (if applied incorrectly)**
    - **Uncommon**
      - Epistaxis • nasal complaints

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Rhinolast (Meda Pharmaceuticals Ltd)**
  - Azelastine hydrochloride 140 microgram per 1 actuation
  - Rhinolast 140 microgram/dose nasal spray | 22 ml (POD) £10.50 DT = £10.50

Combinations available: Fluticasone with azelastine, p. 725

ANTIMUSCARINICS

Ipratropium bromide

- **INDICATIONS AND DOSE**
  - **Rhinorrhoea associated with allergic and non-allergic rhinitis**
    - **BY INTRANASAL ADMINISTRATION**
    - **Child 12-17 years**: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
  - **DOSE EQUIVALENCE AND CONVERSION**
    - 1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS**
  - Avoid spraying near eyes • bladder outflow obstruction • cystic fibrosis • susceptibility to angle-closure glaucoma

- **INTERACTIONS**
  - **Appendix 1: ipratropium**
CORTICOSTEROIDS

Nasal inflammation, nasal polyps and rhinitis

SIDE-EFFECTS
- Common or very common: Epistaxis, gastrointestinal motility disorder, headache, nasal complaints, throat complaints
- Uncommon: Corneal oedema, eye disorders, eye pain, nausea, respiratory disorders, stomatitis, vision disorders
- Rare or very rare: Palpitations

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with hypersensitivity to atropine or its derivatives.

PREGNANCY
Manufacturer advises only use if potential benefit outweighs the risk.

BREAST FEEDING
No information available—manufacturer advises only use if potential benefit outweighs risk.

PATIENT AND CARER ADVICE
Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).

SIDE-EFFECTS
Driving and skilled tasks
Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

INTERACTIONS
Appendix 1: corticosteroids

Corticosteroids (intranasal)

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: CORTICOSTEROIDS; RARE RISK OF CENTRAL SEROUS CHIORETINOPTHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

CAUTIONS
Avoid after nasal surgery (until healing has occurred)- avoid in pulmonary tuberculosis- avoid in the presence of untreated nasal infections- patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

CAUTIONS, FURTHER INFORMATION
- Systemic absorption: Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

SIDE-EFFECTS
- Common or very common: Altered smell sensation, epistaxis, headache, nasal complaints, taste altered, throat irritation
- Rare or very rare: Glaucoma, nasal septum perforation (more common following nasal surgery), vision blurred

MEXICAN FORMS
There can be variation in the licensing of different medicines containing the same drug.

Spray
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Ipratropium bromide 21 microgram per 1 dose Rinatec, nasal spray 180 dose $6.54 DT + $6.54

Beclometasone dipropionate (Beclometasone dipropionate)

INDICATIONS AND DOSE
Prophylaxis and treatment of allergic and vasomotor rhinitis
- BY INTRANASAL ADMINISTRATION
- Child 6-17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

INTERACTIONS
Appendix 1: corticosteroids

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Spray
EXCIPIENTS: May contain Benzalkonium chloride, polysorbates
- Beclometasone dipropionate (Non-proprietary) Beclometasone dipropionate 50 microgram per 1 dose Beclometasone 50micrograms/dose nasal spray 200 dose $3.02 DT = $3.02
- Beconase (GlaxoSmithKline UK Ltd, Omega Pharma Ltd) Beclometasone dipropionate 50 microgram per 1 dose Beconase Aqueous 50micrograms/dose nasal spray 200 dose $2.63 DT = $3.02
- Nasobec (Teva UK Ltd) Beclometasone dipropionate 50 microgram per 1 dose Nasobec Aqueous 50micrograms/dose nasal spray 200 dose $3.06 DT = $3.02

Betamethasone

INDICATIONS AND DOSE
BETNESOL®
Non-infected inflammatory conditions of nose
- BY INTRANASAL ADMINISTRATION
- Child: Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

VISTAMETHASONE®
Non-infected inflammatory conditions of nose
- BY INTRANASAL ADMINISTRATION
- Child: Apply 2–3 drops twice daily, dose to be applied into each nostril

INTERACTIONS
Appendix 1: corticosteroids

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ear, eye/nose drops solution
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Betnesol (RPH Pharmaceuticals AB) Betamethasone sodium phosphate 1 mg per 1 ml BETNESOL 0.1% eye/ear/nose drops 5 ml $1.02 | 10 ml $1.16 DT = $2.32
12
Ear, nose and oropharynx

MEDICINAL FORMS

- Rare or very rare different medicines containing the same drug.
- Rhinocort
- Aircort (Imported (Italy))
- Budeflam Aquanase (Imported (South Africa))
- EXCIPIENTS: May contain Disodium edetate, polysorbates, potassium
- Rhinitis
- BY INTRANASAL ADMINISTRATION
- Child 12-17 years: 128 micrograms once daily, dose to be administered into each nostril; reduced to 64 micrograms once daily when control achieved.
- Nasal polyps
- BY INTRANASAL ADMINISTRATION
- Child 12-17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

Rhinitis

- BY INTRANASAL ADMINISTRATION
- Child 12-17 years: 64 micrograms twice daily, dose to be administered into each nostril

Nasal polyps

- BY INTRANASAL ADMINISTRATION
- Child 12-17 years: 64 micrograms twice daily, dose to be administered into each nostril

SIDE-EFFECTS

- Rare or very rare Adrenal suppression

INTERACTIONS

- Appendix 1: corticosteroids

SIDE-EFFECTS, FURTHER INFORMATION
Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

INTERACTIONS

- Appendix 1: corticosteroids

SIDE-EFFECTS

- Adrenal suppression

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Disodium edetate, polysorbates, potassium

- Budelam Aquanase (Imported (South Africa))
- Budesonide 100 microgram per 1 dose Budelam Aquanase 100micrograms/dose nasal spray | 120 dose £26
- Aircort (Imported (Italy))
- Budesonide 100 microgram per 1 dose Aircort 100micrograms/dose nasal spray | 200 dose £44

**Triamcinolone acetonide**

**INDICATIONS AND DOSE**
- **Prophylaxis and treatment of allergic rhinitis**
- **BY INTRanasal ADMINISTRATION**
  - Child 2-5 years: 55 micrograms once daily, dose to be sprayed into each nostril
  - Child 6-11 years: 55 micrograms once daily, dose to be sprayed into each nostril; reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved; maximum duration of treatment 3 months
  - Child 12-17 years: 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved

**UNLICENSED USE**
- Not licensed for use in children under 6 years.

**INTERACTIONS** → Appendix 1: corticosteroids

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Spray**
  - **Nasacort** (Sanofi) Triamcinolone acetonide 55 microgram per 1 dose
  - **Dymista** (Meda Pharmaceuticals Ltd) Mometasone furoate (Non-proprietary) 50 microgram per 1 dose

**Mast-Cell Stabilisers**

**Sodium cromoglicate**
(Sodium cromoglycate)

**INDICATIONS AND DOSE**
- **Prophylaxis of allergic rhinitis**
- **BY INTRanasal ADMINISTRATION**
  - Child: 1 spray 2–4 times a day, to be administered into each nostril

**SIDE-EFFECTS**
- Rare or very rare Bronchospasm (transient)
- Frequency not known Local reaction

**MEDICINAL FORMS**
- No licensed medicines listed.

**Oropharynx**

**1 Dry mouth**

**Treatment of dry mouth**

**Overview**
Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.
Artificial saliva products

- **Artificial saliva products**
  
  **AS SALIVA ORTHANA® LOZENGES**
  Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

- **INDICATIONS AND DOSE**
  Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)
  - **BY MOUTH**
  - Child: 1 lozenge as required, allow to dissolve slowly in the mouth

**PRESCRIBING AND DISPENSING INFORMATION**
AS Saliva Orthana® lozenges do not contain fluoride.
AS Saliva Orthana lozenges (A.S Pharma Ltd)
30 lozenges | NHS indicative price = £3.50 • Drug Tariff (Part VIII C) price = £3.50

**AS SALIVA ORTHANA® SPRAY**
Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 g/litre, with preservatives and flavouring agents, pH neutral.

- **INDICATIONS AND DOSE**
  Symptomatic treatment of dry mouth
  - **BY MOUTH**
  - Child: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
AS Saliva Orthana® Oral Spray may be prescribed.

**BIOXTRA® GEL**
Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

- **INDICATIONS AND DOSE**
  Dry mouth as a result of having (or having undergone) radiotherapy | Dry mouth as a result of sicca syndrome
  - **BY MOUTH**
  - Child: Apply as required, apply to oral mucosa

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
BioXtra® Gel may be prescribed.
BioXtra Dry Mouth oral gel (R.L.S. Products Ltd)
40 ml | NHS indicative price = £3.94 • Drug Tariff (Part IXa)

**BIOTENE ORALBALANCE®**
Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

- **INDICATIONS AND DOSE**
  Symptomatic treatment of dry mouth
  - **BY MOUTH**
  - Child: Apply as required, apply to gums and tongue

**PATIENT AND CARER ADVICE**
Avoid use with toothpastes containing detergents (including foaming agents).

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Biotene Oralbalance® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

Biotene Oralbalance dry mouth saliva replacement gel (GlaxoSmithKline Consumer Healthcare) Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 1200 unit, Muramidase 12 mg 50 gram | NHS indicative price = £4.46 • Drug Tariff (Part IXa)

**GLANDOSANE®**
Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

- **INDICATIONS AND DOSE**
  Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)
  - **BY MOUTH**
  - Child: Apply as required, spray onto oral and pharyngeal mucosa

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Glandosane® Aerosol Spray may be prescribed.

Glandosane synthetic saliva spray lemon (Fresenius Kabi Ltd)
50 ml | NHS indicative price = £5.68 • Drug Tariff (Part IXa)

Glandosane synthetic saliva spray natural (Fresenius Kabi Ltd)
50 ml | NHS indicative price = £5.68 • Drug Tariff (Part IXa)

Glandosane synthetic saliva spray peppermint (Fresenius Kabi Ltd)
50 ml | NHS indicative price = £5.68 • Drug Tariff (Part IXa)

**ORALIEVE MOISTURISING MOUTH SPRAY**
aqua, glycerin, xylitol, poloxamer 407, sodium benzoate, monosodium phosphate, xanthan gum, aroma, disodium phosphate, benzoic acid, whey protein, lactoferrin, lactoperoxidase, potassium thiocyanate, glucose oxidase, SLS free, alcohol free, pH 5.8

Oralieve moisturising mouth spray (Oralieve UK)
50 ml | NHS indicative price = £4.95 • Drug Tariff (Part IXa)

**ORALIEVE GEL**
Symptomatic treatment of dry mouth
- **BY MOUTH**
- Child: Apply as required, particularly at night, to oral mucosa

**PRESCRIBING AND DISPENSING INFORMATION**
Contains traces of milk protein and egg white protein.

**SST®**
Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

- **INDICATIONS AND DOSE**
  Symptomatic treatment of dry mouth
  - **BY MOUTH**
  - Child: 1 tablet as required, allow tablet to dissolve slowly in the mouth

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
May be prescribed as Saliva Stimulating Tablets.

**SALIVEZE®**
Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

- **INDICATIONS AND DOSE**
  Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)
  - **BY MOUTH**
  - Child: Apply 1 spray as required, spray onto oral mucosa
2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays
There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes and gargarces
Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride p. 610 mouthwash with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 728, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris. Concentrations greater than 1.5% in children may cause ulceration and tissue damage.

Chlorhexidine below is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetical stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine

**INDICATIONS AND DOSE**

**Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers**

- **BY MOUTH USING MOUTHWASH**
  - Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

**Oral hygiene and plaque inhibition and gingivitis**

- **BY MOUTH USING DENTAL GEL**
  - Child: Apply 1–2 times a day, to be brushed on the teeth

**Oral candidiasis | Management of apthous ulcers**

- **BY MOUTH USING DENTAL GEL**
  - Child: Apply 1–2 times a day, to affected areas

**Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers**

- **BY MOUTH USING OROMUCOSAL SPRAY**
  - Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

**Bladder irrigation and catheter patency solutions**

- **BY INTRAVESICAL INSTILLATION**
  - Child: (consult product literature)

**UNLICENSED USE**

- With oral (topical) use Corsodyl® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

**SIDE-EFFECTS**

- Common or very common
  - With oromucosal use Dry mouth • hypersensitivity • oral disorders • taste altered • tongue discolouration • tooth discoloration

**SIDE-EFFECTS, FURTHER INFORMATION** If desquamation occurs with mucosal irritation, discontinue treatment.

**PATIENT AND CARER ADVICE**

- With oral (topical) use Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse...
the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**
- With oral (topical) use Corsodyl® dental gel may be prescribed as Chlorhexidine Gluconate Gel; Corsodyl® mouthwash may be prescribed as Chlorhexidine Mouthwash; Corsodyl® oral spray may be prescribed as Chlorhexidine Oral Spray.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Dental gel**
- Corsodyl® (GlaxoSmithKline Consumer Healthcare)
- Chlorhexidine gluconate 10 mg per 1 gram: Chlorhexidine 1% dental gel sugar-free | 50 gram | £1.56 DT = £1.56

**Irrigation**
- Chlorhexidine (Non-proprietary)
  - Chlorhexidine gluconate 0.2% mouthwash aniseed | 300 ml | £2.09 DT = £4.18
  - Chlorhexidine gluconate 0.2% mouthwash mouthwash | 300 ml | £2.44 DT = £4.18
  - Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 ml | £2.57 DT = £4.18
  - Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 ml | £2.06 DT = £4.18
- Corsodyl® (GlaxoSmithKline Consumer Healthcare)
- Chlorhexidine gluconate 0.2% mouthwash | 100 ml | £1.56 DT = £3.12
- Uro-Tainer (chlorhexidine) (B.Braun Medical Ltd)
- Chlorhexidine acetate 200 microgram per 1 ml: Uro-Tainer chlorhexidine 1:5000 catheter maintenance solution | 100 ml | £2.70

**Mouthwash**
- Chlorhexidine (Non-proprietary)
  - Chlorhexidine gluconate 2 mg per 1 ml: Chlorhexidine gluconate 0.2% mouthwash | 300 ml | £2.09 DT = £4.18
  - Chlorhexidine gluconate 0.2% mouthwash | 300 ml | £2.44 DT = £4.18
  - Chlorhexidine gluconate 0.2% mouthwash plain | 300 ml | £2.57 DT = £4.18
  - Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 ml | £2.06 DT = £4.18
- Corsodyl® (GlaxoSmithKline Consumer Healthcare)
- Chlorhexidine gluconate 2 mg per 1 ml: Corsodyl 0.2% mouthwash aniseed | 300 ml | £2.44 DT = £4.18
- Corsodyl® Mint 0.2% mouthwash | 300 ml | £2.57 DT = £4.18
- Chlorhexidine 0.2% mouthwash alcohol free | 300 ml | £2.06 DT = £4.18
- Curasept (Curaprox (UK) Ltd)
- Chlorhexidine gluconate 2 mg per 1 ml: Curasept 0.2% oral rinse | 200 ml | £1.56 DT = £3.12

**Irrigation solution**
- Chlorhexidine (Non-proprietary)
  - Chlorhexidine gluconate 200 microgram per 1 ml: Chlorhexidine acetate 0.02% irrigation solution 1 litre bottles | 1 bottle | £0.99 DT = £1.98
  - Chlorhexidine acetate 500 microgram per 1 ml: Chlorhexidine acetate 0.05% irrigation solution 1 litre bottles | 1 bottle | £2.87 DT = £5.74

**Hexetidine 06-Aug-2018**

**INDICATIONS AND DOSE**

**Oral hygiene**
- By mouth using mouthwash
- Child 12-17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

**SIDE-EFFECTS**
- Rare: anaesthesia, taste altered
- Frequency not known: Cough, dry mouth, dysphagia, dryness, nausea, salivary gland enlargement, vomiting

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Mouthwash**
- Oraldene (McNeil Products Ltd)
  - Hexetidine 1 mg per 1 ml: Oraldene 0.1% mouthwash peppermint sugar-free | 200 ml | £2.92 DT = £2.92

**Hydrogen peroxide**

**DRUG ACTION** Hydrogen peroxide is an oxidising agent.

**INDICATIONS AND DOSE**

**Oral hygiene (with hydrogen peroxide 6%)**
- By mouth using mouthwash
- Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

**Peroxyl®**

**Oral hygiene**
- By mouth using mouthwash
- Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime

**PRESCRIBING AND DISPENSING INFORMATION**
- When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

**HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**
- Hydrogen Peroxide Mouthwash may be prescribed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Mouthwash**
- Peroxyl (Colgate-Palmolive (UK) Ltd)
  - Hydrogen peroxide 15 mg per 1 ml: Peroxyl 1.5% mouthwash sugar-free | 300 ml | £2.94 DT = £2.94

**Sodium bicarbonate with sodium chloride**

**INDICATIONS AND DOSE**

**Oral hygiene**
- By mouth using mouthwash
- Child: (consult product literature)

**DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of mouthwash may include peppermint.

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary
- Compound sodium chloride mouthwash may be prescribed.

**MEDICINAL FORMS** Forms available from special-order manufacturers include: mouthwash

**Sodium chloride**

**INDICATIONS AND DOSE**

**Oral hygiene**
- By mouth using mouthwash
- Child: Rinse or gargle as required

**DIRECTIONS FOR ADMINISTRATION** Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium...
bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

**PRESCRIBING AND DISPENSING INFORMATION** No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary Compound Sodium Chloride Mouthwash may be prescribed.

**MEDICINAL FORMS** No licensed medicines listed.

## 2.1 Dental caries

### Fluoride imbalance

**Overview**
Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

### VITAMINS AND TRACE ELEMENTS

#### Sodium fluoride

**INDICATIONS AND DOSE**

**Prophylaxis of dental caries for water content less than 300 micrograms/litre (0.3 parts per million) of fluoride ion**
- BY MOUTH USING TABLETS
  - Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)

**Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3-0.7 parts per million) of fluoride ion**
- BY MOUTH USING TABLETS
  - Child 3-5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)

**Prophylaxis of dental caries for water content above 700 micrograms/litre (0.7 parts per million) of fluoride ion**
- Child 6 months-17 years: Supplements not advised

**SIDE-EFFECTS**
Dental fluorosis

**DIRECTIONS FOR ADMINISTRATION**
Tablets should be sucked or dissolved in the mouth and taken preferably in the evening. For mouthwash, rinse mouth for 1 minute and then spit out.

**CONTRA-INDICATIONS**
Not for areas where drinking water is fluoridated

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral tablet formulations may include orange.

**PATIENT AND CARER ADVICE**
Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Tablets may be prescribed as Sodium Fluoride Tablets.
Oral drops may be prescribed as Sodium Fluoride Oral Drops.
Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%. 

---

**Dental caries 729**

**Prophylaxis of dental caries for water content above 700 micrograms/litre (0.7 parts per million) of fluoride ion**
- Child 6 months-17 years: Supplements not advised

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**
- BY MOUTH USING MOUTHWASH
  - Child 6-17 years: Rinse or gargle 10 mL daily

**DOSE EQUIVALENCE AND CONVERSION**
- Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
- These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (Br Dent J 1997; 182: 6–7).

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**
- BY MOUTH USING PASTE
  - Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**
- BY MOUTH USING PASTE
  - Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

**EN-DE-KAY® FLUORINSE**

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**
- BY MOUTH USING MOUTHWASH
  - Child 8-17 years: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL.
Ear, nose and oropharynx

  Sodium fluoride 500 microgram per 1 ml Colgate FluorGard 0.05% daily rinse mouthwash sugar-free | 400 ml £2.99
  Colgate FluorGard 0.05% daily rinse sugar-free | 400 ml (G04) £2.99
- Endekay (Manx Healthcare Ltd)
  Sodium fluoride 500 microgram per 1 ml Endekay 0.05% daily fluoride mouthwash sugar-free | 250 ml (G03) £1.51 DT + £1.51 sugar-free | 500 ml (G03) £2.45

Oral ulceration and inflammation

Ulceration and inflammation
Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy. It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Children with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer in adults or secondary causes such as leukaemia.

Simple mouthwashes
A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes
Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash p. 727 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids
Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets p. 456 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Local analgesics
Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. When local anaesthetics are used in the mouth, care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Benzydamine hydrochloride p. 731 and flurbiprofen p. 678 are non-steroidal anti-inflammatory drugs (NSAIDs).

Benzydamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillitis and post-irritation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat in adolescents.

Choline salicylate p. 732 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration in adults and children over 16 years of age.

Other preparations
Doxycycline p. 364 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis
Low-dose doxycycline (Periostat®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal infections, antibacterial therapy p. 733. See also Mouthwashes and other preparations for oropharyngeal use p. 727 for mouthwashes used for oral hygiene and plaque inhibition.

Dental information
Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales.
There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.
Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).
ANAESTHETICS, LOCAL

Lidocaine hydrochloride (Lignocaine hydrochloride)

- **INDICATIONS AND DOSE**
  - **Dental practice**
    - **BY BUCCAL ADMINISTRATION USING OINTMENT**
    - Child: Rub gently into dry gum
  - **LARYNGOJET®**
  - Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract
    - **TO MUCOUS MEMBRANES**
      - Child: Up to 3 mg/kg (max. per dose 200 mg), to be given as a single dose sprayed, instilled (if a cavity) or applied with a swab; reduce dose according to size, age, and condition of child
  - **XYLOCAINE®**
  - Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation
    - **TO MUCOUS MEMBRANES**
      - Child: Up to 3 mg/kg

- **CAUTIONS** Can damage plastic cuffs of endotracheal tubes
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity
    - Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, meptivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%.
  - **XYLOCAINE®** May be prescribed as lidocaine spray 10%.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment
  - **Spray**
    - Xylocaine (Aspen Pharma Trading Ltd)
      - Lidocaine 10 mg per 1 actuation
    - Xylocaine 10mg/dose spray sugar-free | 50 ml £6.29 DT = £6.29
  - **Ointment**
    - Lidocaine hydrochloride (Non-proprietary)
      - Lidocaine hydrochloride 50 mg per 1 gram
      - Lidocaine 5% ointment 15 gram £3.00 DT = £6.18

ANAESTHETICS, LOCAL

Flurbiprofen

- **INDICATIONS AND DOSE**
  - **Relief of sore throat**
    - **BY MOUTH USING LOZENGES**
      - Child 12-17 years: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day

- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Oral ulceration (move lozenge around mouth) · taste altered
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of
asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Lozenges**
    - Strefen (Reckitt Benckiser Healthcare (UK) Ltd)
  - Flurbiprofen 8.75 mg Strefen Honey and Lemon 8.75mg lozenges | 16 lozenges (P) £3.23 DT + £3.23

**CORTICOSTEROIDS**

- **Betamethasone**
  - **INDICATIONS AND DOSE**
    - **Oral ulceration**
      - TO THE LESION USING SOLUBLE TABLETS
      - Child 12-17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
  - **UNLICENSED USE** Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.
  - **CONTRA-INDICATIONS** Untreated local infection
  - **INTERACTIONS** → Appendix 1: corticosteroids
  - **PATIENT AND CARER ADVICE** Patient counselling is advised
  - **PROFESSION SPECIFIC INFORMATION**
    - Dental practitioners’ formulary

- **Hydrocortisone**
  - **INDICATIONS AND DOSE**
    - **Mild oral and perioral lesions**
      - TO THE LESION USING BUCCAL TABLET
      - Child 12-17 years: 500 micrograms 4 times a day, to be swallowed
  - **SIDE-EFFECTS** Bronchospasm

**SALICYLIC ACID AND DERIVATIVES**

- **Choline salicylate**
  - **INDICATIONS AND DOSE**
    - **Mild oral and perioral lesions**
      - TO THE LESION
      - Child 16-17 years: Apply 0.5 inch, with gentle massage, not more often than every 3 hours
  - **CONTRA-INDICATIONS** Children under 16 years
  - **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.
  - **PROFESSION SPECIFIC INFORMATION**
    - Dental practitioners’ formulary

**Salicylic acid with rhubarb extract**

- **INDICATIONS AND DOSE**
  - **Mild oral and perioral lesions**
    - TO THE LESION
    - Child 16-17 years: Apply 3–4 times a day maximum duration 7 days
  - **CONTRA-INDICATIONS** Children under 16 years
  - **PRESCRIPTION ADVICE**
    - Reye’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.
    - The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.
    - Salicylic acid products should not be used near the eyes or on sensitive skin areas.
    - Salicylic acid products should not be used near the eyes or on sensitive skin areas.
    - Salicylates may give rise to salicylate poisoning

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE: HYDROCORTISONE MUCO-ADHESIVE BUCCAL TABLETS SHOULD NOT BE USED OFF-LABEL FOR ADRENAL INSUFFICIENCY IN CHILDREN DUE TO SERIOUS RISKS (DECEMBER 2018)**

- The MHRA has received reports of off-label use of hydrocortisone muco-adhesive buccal tablets for adrenal insufficiency in children.
- Healthcare professionals are advised that:
  - Hydrocortisone muco-adhesive buccal tablets are indicated only for local use in the mouth for aphthous ulceration and should not be used to treat adrenal insufficiency;
  - substitution of licensed oral hydrocortisone formulations with muco-adhesive buccal tablets can result in insufficient cortisol absorption and, in stress situations, life-threatening adrenal crisis;
- only hydrocortisone products licensed for adrenal replacement therapy should be used.

- **CONTRA-INDICATIONS** Untreated local infection
- **INTERACTIONS** → Appendix 1: corticosteroids
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
    - **Muco-adhesive buccal tablet**
      - Hydrocortisone (Non-proprietary)
      - Hydrocortisone (as Hydrocortisone sodium succinate) 2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet (P) £7.94 DT + £7.80
Oropharyngeal infections

4 Oropharyngeal bacterial infections

Oropharyngeal infections, antibacterial therapy

Pericoronitis
Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 344, or alternatively, amoxicillin p. 351
- **Suggested duration of treatment** 3 days or until symptoms resolve.

Gingivitis (acute necrotising ulcerative)
Antibacterial required only if systemic features of infection.

- Metronidazole, or alternatively, amoxicillin
- **Suggested duration of treatment** 3 days or until symptoms resolve.

Abscess (periapical or periodontal)
Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or alternatively, metronidazole
- **Suggested duration of treatment** 5 days.

Periodontitis
Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or alternatively in adults and children over 12 years, doxycycline p. 364

Sore throat (acute)
Acute sore throat is usually triggered by a viral infection and is self-limiting. Symptoms can last for around 1 week, and most people will improve within this time without treatment with antibiotics, regardless of the cause.

**Note**: Antibacterial therapy is required only in patients with severe systemic symptoms, signs, and symptoms of a more serious illness or condition, or those at high risk of complications. Patients with severe systemic infection or severe suppurative complications such as peri-tonsillar abscess (quinsy), acute otitis media, acute sinusitis or cellulitis should be referred to hospital.

- Phenoxymethylpenicillin p. 350
- **Suggested duration of treatment** 5 to 10 days.
- If penicillin-allergic, clarithromycin p. 340 (or erythromycin p. 341)
- **Suggested duration of treatment** 5 days.

Antibacterial therapy is required only in patients with severe systemic symptoms, signs, and symptoms of a more serious illness or condition, or those at high risk of complications. Patients with severe systemic infection or severe suppurative complications such as peri-tonsillar abscess (quinsy), acute otitis media, acute sinusitis or cellulitis should be referred to hospital.

- Phenoxymethylpenicillin p. 350
- **Suggested duration of treatment** 5 to 10 days.
- If penicillin-allergic, clarithromycin p. 340 (or erythromycin p. 341)
- **Suggested duration of treatment** 5 days.

5 Oropharyngeal fungal infections

Oropharyngeal fungal infections

Overview
Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush**
Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics, or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 734 or miconazole...
below may be needed. Fluconazole p. 389 is effective for unresponsive infections or if a topical antifungal drug cannot be used. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

**Acute erythematous candidiasis**
Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

**Angular cheilitis**
Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida spp.*) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as infecting, infective factors. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 371; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 767 can be used.

**Immunocompromised patients**
See advice on prevention of fungal infections under Immunocompromised children in Antifungals, systemic use p. 385.

Antiseptic mouthwashes can have a role in the prevention of oral candidiasis in immunocompromised children.

**Drugs used in oropharyngeal candidiasis**
Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is used by local application (as an oral gel) in the mouth but it is also absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-negative bacteria including streptococci and staphylococci. In neonates, nystatin oral suspension or miconazole oral gel is used for the treatment of oropharyngeal candidiasis; to prevent re-infection it is important to ensure that the mother’s breast nipples and the teats of feeding bottles are cleaned adequately.

Fluconazole given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when infection is severe. Nystatin may be used in neonates, but it is not licensed for use in this patient group. Itraconazole p. 390 can be used for fluconazole-resistant infections.

If candidal infection fails to respond after 1 to 2 weeks of treatment with antifungal drugs the child should be sent for treatment with antifungal drugs. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract.

### ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

#### Miconazole

**02-Apr-2019**

**INDICATIONS AND DOSE**

**Oral candidiasis**

- **Neonate:** 1 mL 2–4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.

- **Child 1–2 months:** 1.25 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.

- **Child 2–7 years:** 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.

- **Appendix**

  - **INTERACTIONS** → Appendix 1: antifungals, azoles

#### Fluconazole given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when infection is severe.

**Intestinal candidiasis**

- **BY MOUTH USING ORAL GEL**

- **Child 4 months–17 years:** 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared.

- **UNLICENSED USE** Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.

- **CONTRA-INDICATIONS** Infants with impaired swallowing reflex

- **CAUTIONS** Avoid in Acute porphyrias p. 624

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**

  - **Uncommon** Skin reactions

  - **Frequency not known** Angioedema

- **PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in animal studies.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.

- **PROFESSION SPECIFIC INFORMATION**

  - **Dental practitioners’ formulary** Miconazole Oromucosal Gel may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

**CAUTIONARY AND ADVISORY LABELS**

- **9**

**Oral gel**

- **Daktarin** (Johnson & Johnson Ltd, Janssen-Cilag Ltd)

- **Miconazole 20 mg per 1 gram**

  - **DT = £ 3.78**
  - **DT = £ 3.78**
  - **sugar-free**
  - **sugar-free**
  - **15 gram**
  - **80 gram**

**ANTIFUNGALS > POLYENE ANTIFUNGALS**

**Nystatin**

- **15-Feb-2017**

- **INDICATIONS AND DOSE**

  - **Oral candidiasis**

    - **BY MOUTH**

      - **Neonate:** 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved, to be given after feeds.

      - **Child:** 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved

- **UNLICENSED USE** Nystatin may be used in neonates, but it is not licensed for use in this patient group.

- **CAUTIONS** Contact with eyes and mucous membranes should be avoided.

- **SIDE-EFFECTS** Abdominal distress, angioedema, diarrhoea, face oedema, nausea, sensitisation, skin reactions, Stevens-Johnson syndrome, vomiting.
PATIENT AND CARER ADVICE
Counselling advised with oral suspension (use of pipette, hold in mouth, after food).
Medicines for Children leaflet: Nystatin for Candida infection
www.medicinesforchildren.org.uk/nystatin-candida-infection

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary
Nystatin Oral Suspension may be prescribed.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

CAUTIONARY AND ADVISORY LABELS
EXCIPIENTS: May contain Ethanol

Nystatin (Non-proprietary)
Nystatin 100000 unit per 1 ml Nystatin 100,000 units/ml oral suspension 30 ml £2.43 DT = £2.03

6 Oropharyngeal viral infections

Oropharyngeal viral infections

Management
Viral infections are the most common cause of a sore throat. It is usually a self-limiting condition which does not benefit from anti-infective treatment. Adequate analgesia may be all that is required.

Children with varicella–zoster infection often develop painful lesions in the mouth and throat. Benzydamine hydrochloride p. 731 may be used to provide local analgesia. Chlorhexidine mouthwash or gel p. 727 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In severe herpetic stomatitis systemic aciclovir p. 420 or valaciclovir p. 422 may be used for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used to prevent frequently recurring herpes simplex lesions of the mouth particularly when associated with the initiation of erythema multiforme. See the treatment of labial herpes simplex infections.
## Skin conditions, management

### Topical preparations

When prescribing topical preparations for the treatment of skin conditions in children, the site of application, the condition being treated, and the child’s (and carer’s) preference for a particular vehicle all need to be taken into consideration.

### Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at [www.bad.org.uk](http://www.bad.org.uk).

The vehicle in topical preparations for the skin affects the degree of hydration, has a mild anti-inflammatory effect, and aids the penetration of the active drug. Therefore, the vehicle, as well as the active drug, should be chosen on the basis of their suitability for the child’s skin condition.

**Applications** are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

**Collodions** are painted on the skin and allowed to dry to leave a flexible film over the site of application.

**Creams** are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

**Gels** consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

**Lotions** have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. **Shake lotions** (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

**Ointments** are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. **Water-soluble ointments** contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

**Paste**s are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur inlichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

**Dusting powders** are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

**Dilution**

The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

### Suitable quantities for prescribing

**Suitable quantities of dermatological preparations to be prescribed for specific areas of the body**

<table>
<thead>
<tr>
<th>Area of body</th>
<th>Creams and Ointments</th>
<th>Lotions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face</td>
<td>15–30 g</td>
<td>100 ml</td>
</tr>
<tr>
<td>Both hands</td>
<td>25–50 g</td>
<td>200 ml</td>
</tr>
<tr>
<td>Scalp</td>
<td>50–100 g</td>
<td>200 ml</td>

<td>400 g</td>
<td>500 ml</td>
</tr>
<tr>
<td>Groins and genitalia</td>
<td>15–25 g</td>
<td>100 ml</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for children 12-18 years for twice daily application for 1 week; smaller quantities will be required for children under 12 years. These recommendations do not apply to corticosteroid preparations.
Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(2-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

Neonates

Caution is required when prescribing topical preparations for neonates—their large body surface area in relation to body mass increases susceptibility to toxicity from systemic absorption of substances applied to the skin. Topical preparations containing potentially sensitising substances such as corticosteroids, aminoglycosides, iodine, and parasiticidal drugs should be avoided. Preparations containing alcohol should be avoided because they can dehydrate the skin, cause pain if applied to raw areas, and the alcohol can cause necrosis. In preterm neonates, the skin is more fragile and offers a poor barrier, especially in the first fortnight after birth. Preterm infants, especially if below 32 weeks corrected gestational age, may also require special measures to maintain skin hydration.

Emollients

Emollients hydrate the skin, soften the skin, act as barrier to water and external irritants, and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis; they should be applied immediately after washing or bathing to maximise the effect of skin hydration. The choice of an appropriate emollient will depend on the severity of the condition, the child’s (or carer’s) preference, and the site of application. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for handwashing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for older children are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for younger children reflect this.

MHRA/CHM advice (updated December 2018): Emollients:

New information about risk of severe and fatal burns with paraffin-containing and paraffin-free emollients

Emollients are an important and effective treatment for chronic dry skin disorders and people should continue to use these products. However, healthcare professionals must ensure that patients and their carers understand the fire risk associated with the build-up of residue on clothing and bedding and can take action to minimise the risk. There is a fire risk with all paraffin-containing emollients, regardless of paraffin concentration, and it cannot be excluded with paraffin-free emollients. A similar risk may apply to products that are applied to the skin over large body areas, or in large volumes for repeated use for more than a few days.

Healthcare professionals should advise patients not to smoke or go near naked flames because clothing, bedding, dressings, and other fabrics that have been in contact with an emollient or emollient-treated skin can rapidly ignite. Washing these materials at high temperature may reduce emollient build-up but not totally remove it.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticon p. 752, natural oils, and paraffins, to help protect the skin from abrasion and irritation; they are used to protect intact skin around stomas and pressure sores, and as a barrier against nappy rash. In neonates, barrier preparations which do not contain potentially sensitising excipients are preferred. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations with zinc oxide or titanium salts are used to aid healing of uninfected, excoriated skin.

Nappy rash (Dermatitis)

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 762 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids (see cautions). If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 748 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with
an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

Emollients for neonates

In the neonate, a preservative-free paraffin-based emollient hydrates the skin without affecting the normal skin flora; substances such as olive oil are also used. The development of blisters (epidermolysis bullosa) or ichthyosis may be alleviated by applying liquid and white soft paraffin ointment while awaiting dermatological investigation.

Dermatological Drugs \(\Rightarrow\) BARRIER PREPARATIONS

**Barrier creams and ointments**

- **INDICATIONS AND DOSE**
  - For use as a barrier preparation
  - To the skin
  - Child: (consult product literature)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **EXCIPIENTS:** May contain Woolfat and related substances (including lanolin)
      - Barrier creams and ointments (Non-proprietary)
        - Cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram, Zinc and Castor oil ointment | 30 gram (GSL) £5.14–£5.19
        - Zinc and Castor oil cream | 100 gram (GSL) £1.46
      - **Metanium** (Thornton & Ross Ltd)
        - Titanium salicylate 30 mg per 1 gram, Titanium peroxide 50 mg per 1 gram, Titanium dioxide 200 mg per 1 gram
        - Metanium Nappy Rash ointment | 30 gram (GSL) £2.24 DT + £2.24
  - **Spray**
    - CAUTIONARY AND ADVISORY LABELS: 15
    - **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), woolfat and related substances (including lanolin)
      - **Sprilox** (M L Overridge Ltd)
        - Dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram, Spiron aerosol spray | 115 gram (GSL) £8.90 DT + £8.90
  - **Cream**
    - **EXCIPIENTS:** May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, woolfat and related substances (including lanolin)
      - **Conotrane** (LEO Pharma)
        - Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram
        - Conotrane cream | 100 gram (GSL) £0.88 DT + £0.88
      - **Drapolene** (Supra Enterprises Ltd)
        - Benzalkonium chloride 100 microgram per 1 gram, Cetrime 2 mg per 1 gram
        - Drapoline cream | 100 gram (GSL) £1.76
      - **Siopel** (Derma UK Ltd)
        - Cetrime 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram
        - Siopel cream | 50 gram (GSL) £4.65
      - **Sudocrem** (Yeovil Uk Ltd)
        - Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzyl benzoate 10.1 mg per 1 gram, Wool fat hydrous 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram
        - Sudocrem antiseptic healing cream | 30 gram (GSL) £1.45
      - **Tretinol** (Deakin Chemist, London)
        - Benzyl cinnamate 1.5 mg per 1 gram

**Dermatological Drugs \(\Rightarrow\) EMOLLIENTS**

Emollient bath and shower products, antimicrobial-containing

- **INDICATIONS AND DOSE**
  - **DERMOL** ® 200 SHOWER EMOLLIENT
  - Dry and pruritic skin conditions including eczema and dermatitis
    - To the skin
    - Child: To be applied to the skin or used as a soap substitute
  - **DERMOL** ® 600 BATH EMOLLIENT
  - Dry and pruritic skin conditions including eczema and dermatitis
    - To the skin
    - Child 1-2 years: 15–30 mL/bath, not to be used undiluted
    - Child 2-17 years: 5–10 mL/bath, not to be used undiluted
  - **DERMOL** ® WASH EMULSION
  - Dry and pruritic skin conditions including eczema and dermatitis
    - To the skin
    - Child: To be applied to the skin or used as a soap substitute
  - **EMULSIDERM** ®
  - Dry skin conditions including eczema and ichthyosis
    - To the skin
    - Child 1-2 years: 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
    - Child 2-17 years: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed
  - **OLIATUM** ® PLUS
  - Topical treatment of eczema, including eczema at risk from infection
    - To the skin
    - Child 6-11 months: 1 mL/bath, not to be used undiluted
    - Child 1-7 years: 2–3 capfuls/bath, not to be used undiluted

**IMPORTANT SAFETY INFORMATION**

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CVM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS

See Emollient and barrier preparations p. 737.

- **DIRECTIONS FOR ADMINISTRATION**
  - Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Bath additive**

- **CAUTIONARY AND ADVISORY LABELS: 15**
  - **EXCIPIENTS:** May contain Acetylated lanolin alcohols, isopropyl palmitate, polysorbates
Emollient bath and shower products, paraffin-containing

**Dry skin conditions**
- TO THE SKIN
  - Child: To be applied to wet or dry skin and rinse

**CETRABEN® BATH**

**Dry skin conditions, including eczema**
- TO THE SKIN
  - Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 0.5–1 capful/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 1–2 capfuls/bath, alternatively, to be applied to wet skin and rinse

**DERMALO®**

**Dermatitis | Dry skin conditions, including ichthyosis**
- TO THE SKIN
  - Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

**DOUBLEBASE® EMOLLIENT BATH ADDITIVE**

**Dry skin conditions including dermatitis and ichthyosis**
- TO THE SKIN
  - Neonate: 5–10 mL/bath.
  - Child 1 month–11 years: 5–10 mL/bath
  - Child 12–17 years: 15–20 mL/bath

**DOUBLETAB® EMOLLIENT SHOWER GEL**

**Dry, chapped, or itchy skin conditions**
- TO THE SKIN
  - Child: To be applied to wet or dry skin and rinse, or apply to dry skin after showering

**DERMAL 600® (Dermal Laboratories Ltd)**

Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram
Dermal 600 bath emollient | 600 mL | £7.55

**EMULSIDERM® (Dermal Laboratories Ltd)**

Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram
Emulsiderm emollient | 200 mL | £3.85 | 1000 mL | £12.90

**OILATUM PLUS** (GlaxoSmithKline Consumer Healthcare)

Triclosan 20 mg per 1 gram, Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram
Oilatum Plus bath additive | 500 mL | £12.22

**Dry skin conditions including eczema, xeroderma, and ichthyosis**
- TO THE SKIN
  - Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 15 mL/bath, alternatively, to be applied to wet skin and rinse

**E45® WASH CREAM**

Endogenous and exogenous eczema, xeroderma, and ichthyosis
- TO THE SKIN
  - Child: To be used as a soap substitute

**HYDROMOL® BATH AND SHOWER EMOLLIENT**

**Dry skin conditions | Eczema | Ichthyosis**
- TO THE SKIN
  - Neonate: 0.5 capful/bath, alternatively apply to wet skin and rinse.
  - Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively apply to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

**LPL 63.4®**

**Dry skin conditions**
- TO THE SKIN
  - Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

**OILATUM® EMOLLIENT BATH ADDITIVE**

**Dry skin conditions including dermatitis and ichthyosis**
- TO THE SKIN
  - Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

**OILATUM® JUNIOR BATH ADDITIVE**

**Dry skin conditions including dermatitis and ichthyosis**
- TO THE SKIN
  - Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

**QV® BATH OIL**

**Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus**
- TO THE SKIN
  - Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1–11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 1–17 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse
**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Bath additive**

Dry and scaling skin disorders

**DERMATONICS ONCE HEEL BALM®**

**Dry skin on soles of feet**

- TO THE SKIN
- Child 12–17 years: Apply once daily

**E45® ITCH RELIEF CREAM**

- Dry, scaling, and itching skin
- TO THE SKIN
- Child: Apply twice daily

**EUCERIN® INTENSIVE CREAM**

- Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis
- TO THE SKIN
- Child: Apply twice daily, to be applied thinly and rubbed into area

**EUCERIN® INTENSIVE LOTION**

- Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis
- TO THE SKIN
- Child: Apply twice daily, to be applied sparingly and rubbed into area

**FLEXITOL®**

- Dry skin on soles of feet and heels
- TO THE SKIN
- Child 12–17 years: Apply 1–2 times a day

**HYDROMOL® INTENSIVE**

- Dry, scaling, and itching skin
- TO THE SKIN
- Child: Apply twice daily, to be applied thinly

**IMUERM® EMOLLIENT**

- Dry skin conditions including eczema, psoriasis or dermatitis
- TO THE SKIN
- Child: Apply to skin or use as a soap substitute

**NUTRAPLUS®**

- Dry, scaling, and itching skin
- TO THE SKIN
- Child: Apply 2–3 times a day

---

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS

See Emollient and barrier preparations p. 737.

---

**DRUG ACTION** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients.

**INDICATIONS AND DOSE**

- AQUADRATE®
- Dry, scaling, and itching skin
  - TO THE SKIN
  - Child: Apply twice daily, to be applied thinly

- BALNEUM® CREAM
- Dry skin conditions
  - TO THE SKIN
  - Child: Apply twice daily

- BALNEUM® PLUS CREAM
- Dry, scaling, and itching skin
  - TO THE SKIN
  - Child: Apply twice daily

- CALMURID®
- Dry, scaling, and itching skin
  - TO THE SKIN
  - Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

---

**EMOLLIENTS, UREA-CONTAINING**

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

  - Child: Apply twice daily

- CALMURID®
- Dry, scaling, and itching skin
  - TO THE SKIN
  - Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

2 Infections of the skin

Skin infections

Antibacterial preparations for the skin

Topical antibacterial preparations are used to treat localised bacterial skin infections caused by Gram-positive organisms (particularly by staphylococci or streptococci). Systemic antibacterial treatment is more appropriate for deep-seated infections (particularly by staphylococci or streptococci). Systemic antibacterials are used to treat wounds infected with anaerobic bacteria. Superficial bacterial infection of the skin may be treated with a topical antiseptic such as povidone-iodine p. 303.

Problems associated with the use of topical antibacterials include bacterial resistance, contact sensitisation, and superinfection. In order to minimise the development of resistance, antibacterials used systemically (e.g. fusidic acid p. 371) should not generally be chosen for topical use. Resistant organisms are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Neomycin sulfate p. 746 applied topically may cause sensitisation and cross-sensitivity with other aminoglycoside antibacterials such as gentamicin p. 322 may occur. Topical antibacterials applied over large areas can cause systemic toxicity; otoxicity with neomycin sulfate and with polymyxins p. 747 is a particular risk for neonates and children with renal impairment. Superficial bacterial infection of the skin may be treated with a topical antiseptic such as povidone-iodine p. 784 which also softens crusts, or hydrogen peroxide 1% cream p. 786.

Bacterial infections such as impetigo and folliculitis can be treated with a short course of topical fusidic acid; mupirocin p. 748 should be used only to treat meticillin-resistant Staphylococcus aureus.

For extensive or long-standing impetigo, an oral antibacterial such as flexifloxacin p. 357 (or clarithromycin p. 340 in children with penicillin-allergy) should be used. A mild antiseptic may help to soften crusts. Mild antiseptics may be useful in reducing the spread of infection, but there is little evidence to support the use of topical antiseptics alone in the treatment of impetigo.

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. Erysipelas, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

Staphylococcal scaled-skin syndrome requires urgent treatment with a systemic antibacterial, such as fluclaxacillin.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although Staphylococcus aureus strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic, such as povidone-iodine, chlorhexidine p. 785, or alcohol, can be used; their use should be discussed with the local microbiologist.

Mupirocin ointment contains macrogols; extensive absorption of macrogols through the mucous membranes or through application to thin or damaged skin may result in renal toxicity, especially in neonates. Mupirocin nasal ointment is formulated in a paraffin base and may be more suitable for the treatment of MRSA-infected open wound in neonates.

Metronidazole gel p. 746 is used topically in children to reduce the odour associated with anaerobic infections and for the treatment of periorificial rosacea; oral metronidazole is used to treat wounds infected with anaerobic bacteria. Silver sulfadiazine p. 747 is licensed for the prevention and treatment of infection in burns but the use of appropriate dressings may be more effective. Systemic effects may occur following extensive application of silver sulfadiazine; its use is not recommended in neonates.

Antibacterial preparations also used systemically

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 733 for further information on angular cheilitis.

Metronidazole is used topically to treat rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Antifungal preparations for the skin

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Specimens of scale, nail or hair should be sent for mycological examination before starting treatment, unless the diagnosis is certain.

Dermatophytes

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manus), foot (tinea pedis, athlete’s foot), or nail (tinea unguium, onychomycosis). Tinea capitis is a common childhood...
infection that requires systemic treatment with an oral antifungal; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm.

Tinea corporis and tinea pedis infections in children respond to treatment with a topical imidazole (clotrimazole p. 748, econazole nitrate p. 748, or miconazole p. 749) or terbinafine cream p. 750. Nystatin p. 734 is less effective against tinea.

Compound benzoic acid ointment (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic children with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of toconazole p. 749 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy. Chronic paronychia on the fingers (usually due to a candidal infection) should be treated with topical clotrimazole or nystatin, but these preparations should be used with caution in children who suck their fingers. Chronic paronychia of the toes (usually due to dermatophyte infection) can be treated with topical terbinafine.

Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo p. 749 or selenium sulfide shampoo. Topical imidazole antifungals such as clotrimazole, econazole nitrate and miconazole or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with an azole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis

Candidal skin infections can be treated with topical imidazole antifungals clotrimazole p. 748, econazole nitrate p. 748, or miconazole p. 749; topical terbinafine p. 750 is an alternative. Topical application of nystatin p. 734 is also effective for candidiasis but it is ineffective against dermatoophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 389; systemic treatment with griseofulvin p. 394 or terbinafine is not appropriate for refractory candidiasis. See the treatment of oral candidiasis and for the management of nappy rash.

Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with Candida.

Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 762) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertriginous eczema associated with candida.

Antiviral preparations for the skin

Aciclovir cream p. 753 is used for the treatment of initial and recurrent labial, cutaneous, and genital herpes simplex infections in children; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections or if cold sores recur frequently.

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear. Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Parasiticidal preparations for the skin

| Suitable quantities of parasiticidal preparations |
|---|---|---|---|---|
| Area of body | Skin creams | Lotions | Cream rinses |
| Scalp | Skin creams | 50–100 mL | |
| Body | Skin creams | 50–100 mL | |
| Body (scabies) | 30–60 g | 100 mL | |
| Body (crab lice) | 30–60 g | 100 mL | |

These amounts are usually suitable for a child 12–17 years for single application.

Scabies

Permethrin p. 752 is used for the treatment of scabies (Sarcoptes scabiei); malathion p. 752 can be used if permethrin is inappropriate.

Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin. Ivermectin p. 398 (available from ‘special-order’ manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone.

Application

Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin. All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching

The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 775 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine at night may also be useful.

Head lice

Dimeticon p. 752 is effective against head lice (Pediculus humanus capitis) and acts on the surface of the organism. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is not recommended for use in children.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present.
Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated at the same time.

**MHRA/CHM advice: Head lice eradication products: risk of serious burns if treated hair is exposed to open flames or other sources of ignition (March 2018)**

Some products for the eradication of head lice infestations are combustible/flammable when on the hair and can ignite and cause serious harm in the presence of an open flame or other source of ignition such as when lighting cigarettes.

Patients and carers should be advised on the safe and correct use of head lice eradication treatments and if appropriate, should be advised that they should not smoke around treated hair and that it should be kept away from open flames or other sources of ignition, including in the morning after overnight application until hair is washed.

**Wet combing methods**

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process. Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

- Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hsbusines.hscni.net/services/2034.htm](http://www.hsbusines.hscni.net/services/2034.htm)

**Crab lice**

Permethrin and malathion are used to eliminate crab lice (*Pthirus pubis*); permethrin is not licensed for treatment of crab lice in children under 18 years. An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

**Parasiticidal preparations**

Dimeticone p. 752 coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

Malathion p. 752 is recommended for scabies, head lice and crab lice. The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, except in the treatment of hyperkeratotic scabies in children, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be avoided since the likelihood of eradication of lice is not increased.

Permethrin p. 752 is effective for scabies. It is also active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice. Permethrin is also effective against crab lice but it is not licensed for this purpose in children under 18 years.
**ANTIBACTERIALS > POLYMIXINS**

### Polymixins

- **INDICATIONS AND DOSE**
  - **Bacterial skin infections**
    - **Child**: Apply twice daily, may be applied more frequently if required

- **SIDE-EFFECTS**
  - Sensitisation

- **MEDICINAL FORMS**
  - No licensed medicines listed.

**ANTIBACTERIALS > SULFONAMIDES**

### Silver sulfadiazine

- **INDICATIONS AND DOSE**
  - **Prophylaxis and treatment of infection in burn wounds**
    - **Child**: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries

- **INTERACTIONS**
  - Appendices 1: polymyxins

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions

- **SIDE-EFFECTS**
  - Leucopenia - skin reactions

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with sensitivity to sulfonamides.

- **PREGNANCY**
  - Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

- **BREAST FEEDING**
  - Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

**INDICATIONS AND DOSE**

Fungal skin infections
- **TO THE SKIN**
  - **Child:** Apply 2–3 times a day

**CAUTIONS**

Contact with eyes and mucous membranes should be avoided

**INTERACTIONS**

→ Appendix 1: antifungals, azoles

**SIDE-EFFECTS**

Oedema - pain - paraesthesia - skin reactions - syncope

**PREGNANCY**

Minimal absorption from skin; not known to be harmful.

**PRESCRIBING AND DISPENSING INFORMATION**

Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Clotrimazole for fungal infections

www.medicinesforchildren.org.uk/clotrimazole-fungal-infections

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- **Flamazine (Smith & Nephew Healthcare Ltd)**
  - Sulfadiazine silver 10 mg per 1 gram Flamazine 1% cream |
    - 20 gram (£2.91) |
    - 50 gram (£3.85 DT = £3.65) |
    - 250 gram (£10.32 DT = £10.32) |
    - 500 gram (£18.27 DT = £18.27)

**Econazole nitrate**

**INDICATIONS AND DOSE**

Fungal skin infections
- **TO THE SKIN**
  - **Child:** Apply twice daily

**SIDE-EFFECTS**

- Common or very common: Pain, skin reactions
- Uncommon: Swelling
- Frequency not known: Angioedema

**PREGNANCY**

Treatment should be discontinued if side-effects are severe.

**PRESCRIBING AND DISPENSING INFORMATION**

Avoid contact with eyes and mucous membranes

**CAUTIONS**

Avoid contact with eyes and mucous membranes

**SIDE-EFFECTS**

- Common or very common: Pain, skin reactions
- Uncommon: Swelling
- Frequency not known: Angioedema

**PREGNANCY**

Minimal absorption from skin; not known to be harmful.

**Other drugs used for Fungal skin infections**
Griseofulvin, p. 394 - Hydrocortisone with clotrimazole, p. 766
Ketoconazole

02-Apr-2019

- **INDICATIONS AND DOSE**
  - **Treatment of seborrhoeic dermatitis and dandruff**
    - TO THE SKIN USING SHAMPOO
    - Child 12-17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
  - **Prophylaxis of seborrhoeic dermatitis and dandruff**
    - TO THE SKIN USING SHAMPOO
    - Child 12-17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing
  - **Treatment of pityriasis versicolor**
    - TO THE SKIN USING SHAMPOO
    - Child 12-17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CONTRA-INDICATIONS** Acute porphyrias p. 624
- **CAUTIONS** Avoid contact with eyes - avoid contact with mucous membranes
- **INTERACTIONS** Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
  - Common or very common
  - Skin reactions
  - Uncommon
  - Alopecia - angioedema - excessive tearing - folliculitis - hair changes
  - Rare or very rare
  - Eye irritation - taste altered
- **EXCEPTIONS TO LEGAL CATEGORY**
  - For Seborrhoeic dermatitis and dandruff Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Shampoo**
    - Ketoconazole 20 mg per 1 gram
    - 120 mL (£3.36 DT - £3.36)
    - Dandravil (Transdermal Ltd)
    - Ketoconazole 20 mg per 1 gram
    - 120 mL (£3.39 DT - £3.36)
  - **Cream**
    - Ketoconazole 2% cream
    - 15 gram (£2.51) 30 gram (£1.82 DT - £1.82)
    - Gyno-Daktarin (Janssen-Cilag Ltd)
    - Miconazole nitrate 20 mg per 1 gram
    - 15 g (£4.33 DT - £4.33)
      - Gyno-Pevaryl (Janssen-Cilag Ltd, Thornton & Ross Ltd)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Avoid in Acute porphyrias p. 624 - contact with eyes and mucous membranes should be avoided
- **INTERACTIONS** Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
  - Uncommon
  - Skin reactions
  - Frequency not known
- **PREGNANCY** Absorbed from the skin in small amounts; manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Miconazole cream may be prescribed.
- **INTERNATIONAL FUNDING/ACCESS DECISIONS**
  - NHS restrictions Daktarin® powder and Daktarin® cream 15 g is not prescribable in NHS primary care.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - Daktarin® powder and Daktarin® cream
    - 15 g (£2.95 DT - £2.95)
    - Gyno-Daktarin 2% vaginal cream
    - 78 gram (£4.33 DT - £4.33)
  - **Paint**
    - Tioconazole 283 mg per 1 mL
    - Ticogal 283mg/ml medicated nail lacquer
      - 12 mL (£27.38 - £28.74 DT - £28.74)
    - Trosyl (Pfizer Ltd)
    - Tioconazole 283 mg per 1 mL
      - Trosyl 283mg/ml nail solution
      - 12 mL (£27.38 DT - £28.74)

Tioconazole

02-Apr-2019

- **INDICATIONS AND DOSE**
  - **Fungal nail infections**
    - By transungual application
    - Child: Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Contact with eyes and mucous membranes should be avoided - use with caution if child likely to suck affected digits
- **SIDE-EFFECTS**
  - Common or very common
  - Peripheral oedema
  - Uncommon
  - Skin reactions
  - Frequency not known
  - Nail disorder - pain - paraesthesia - peri-orbital oedema
- **PREGNANCY** Manufacturer advises avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Paint**
    - Tioconazole (Non-proprietary)
    - Tioconazole 283 mg per 1 mL
      - Ticogal 283mg/ml medicated nail lacquer
      - 12 mL (£27.38 - £28.74 DT - £28.74)
    - Trosyl (Pfizer Ltd)
    - Tioconazole 283 mg per 1 mL
      - Trosyl 283mg/ml nail solution
      - 12 mL (£27.38 DT - £28.74)

Miconazole

02-Apr-2019

- **INDICATIONS AND DOSE**
  - **Fungal skin infections**
    - TO THE SKIN
    - Neonate: Apply twice daily continuing for 10 days after lesions have healed.
ANTIFUNGALS

Amorolfine

**INDICATIONS AND DOSE**

**Fungal nail infections**
- By transungual application
  - Child 1 month-11 years: Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
  - Child 12-17 years: Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
- Child 17 years (body-weight 10-19 kg): 62.5 mg once daily for 2-4 weeks
- Child 17 years (body-weight 20-39 kg): 125 mg once daily for 2-4 weeks
- Child 17 years (body-weight 40 kg and above): 250 mg once daily for 2-4 weeks

**SIDE-EFFECTS**
- Rare or very rare
  - Nail discolouration
  - Skin reactions
- Uncommon
  - Photosensitivity reaction
  - Malaise

**INTERACTIONS**

**Terbinaine**

**INDICATIONS AND DOSE**

**Tinea pedis**
- TO THE SKIN USING CREAM
  - Child: Apply 1–2 times a day for up to 1 week, to be applied thinly
- BY MOUTH USING TABLETS
  - Child 1 month-11 years (body-weight 10-19 kg): 62.5 mg once daily for 2–6 weeks
  - Child 1-17 years (body-weight 20-39 kg): 125 mg once daily for 2–6 weeks
  - Child 17 years (body-weight 40 kg and above): 250 mg once daily for 2-6 weeks

**Tinea corporis**
- TO THE SKIN USING CREAM
  - Child: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
- BY MOUTH USING TABLETS
  - Child 17 years (body-weight 10-19 kg): 62.5 mg once daily for 4 weeks
  - Child 17 years (body-weight 20-39 kg): 125 mg once daily for 4 weeks
  - Child 17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

**SIDE-EFFECTS**
- Rare or very rare
  - Nausea
  - Smell altered
  - Tinnitus

**INTERACTIONS**
- Table 1: terbinafine

**UNLICENSED USE**
- Not licensed for use in children under 12 years.
- Avoid contact with ears.
- Avoid contact with eyes and mucous membranes.

**PATIENT AND CARER ADVICE**

- Avoid nail varnish or artificial nails during treatment.
- Avoid contact with ears.
- Avoid contact with eyes and mucous membranes.

---

**Tinea cruris**

- TO THE SKIN USING CREAM
  - Child: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

**Tinea capitis**

- BY MOUTH USING TABLETS
  - Child 1-17 years (body-weight 10-19 kg): 62.5 mg once daily for 4 weeks
  - Child 17 years (body-weight 20-39 kg): 125 mg once daily for 4 weeks
  - Child 17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

**Dermatophyte infections of the nails**

- BY MOUTH USING TABLETS
  - Child 1-17 years (body-weight 10-19 kg): 62.5 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)
  - Child 17 years (body-weight 20-39 kg): 125 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)
  - Child 17 years (body-weight 40 kg and above): 250 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

**Cutaneous candidiasis| Pityriasis versicolor**

- TO THE SKIN USING CREAM
  - Child: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

**SIDE-EFFECTS**
- Rare or very rare
  - Nausea
  - Smell altered
  - Tinnitus

**INTERACTIONS**
- Table 1: terbinafine

**UNLICENSED USE**
- Not licensed for use in children.

**CAUTIONS**
- With oral use autoimmune disease (risk of lupus-erythematosus-like effect)
- With topical use contact with eyes and mucous membranes.

**SPECIFIC SIDE-EFFECTS**
- Metabolic disturbance
- Gastrointestinal symptoms
- Skin reactions
- Skin reactions

**Indecoxoate with zinc undecenoate**

**INDICATIONS AND DOSE**
- **TREATMENT**
  - **TO THE SKIN**
    - CHILD: Apply twice daily, continuing for 7 days after lesions have healed
  - **PREVENTION**
    - CHILD: Apply once daily

**SIDE-EFFECTS**
- Rare or very rare Skin irritation

**LICENSED USE**
- Mycopharma licensed for use in children (age range not specified by manufacturer)

**UNLICENSED USE**
- Mycopharma licensed for use in children

**LICENSED USE**
- Mycopharma licensed for use in children

**UNLICENSED USE**
- Mycopharma licensed for use in children

### ANTISEPTICS AND DISINFECTANTS

#### Chlorhexidine with nystatin

**INDICATIONS AND DOSE**
- **TREATMENT**
  - **TO THE SKIN**
    - CHILD: Apply 2–3 times a day, continuing for 7 days after lesions have healed

**SIDE-EFFECTS**
- Hypersensitivity - skin reactions
2.3 Parasitic skin infections

PARASITICIDES

Dimeticone

- **INDICATIONS AND DOSE**
  - Head lice
    - Child: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

- **UNLICENSED USE**: Not licensed for use in children under 6 months except under medical supervision.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: HEAD LICE ERADICATION PRODUCTS: RISK OF SERIOUS BURNS IF TREATED HAIR IS EXPOSED TO OPEN FLAMES OR OTHER SOURCES OF IGNITION (MARCH 2018)

See Skin infections p. 744.

- **CAUTIONS**: Avoid contact with eyes - children under 6 months, medical supervision required

**SIDE-EFFECTS**

- Alopecia - dryness - eye irritation
- Hypersensitivity - skin reactions

- **UNLICENSED USE**: Not licensed for use in children under 6 months except under medical supervision.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Liquid**
  - Hedrin (Thornton & Ross Ltd)
  - Dimeticone 40 mg per 1 gram
  - Lyclear (dimeticone) (Omega Pharma Ltd)

**Cutaneous spray solution**

- Hedrin (Thornton & Ross Ltd)
- Dimeticone 40 mg per 1 gram

**Malathion**

- **INDICATIONS AND DOSE**
  - Head lice
    - Child: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours

  - Crab lice
    - Child: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight

  - Scabies
    - Child: Apply once weekly for 2 doses, apply preparation over whole body, wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated

- **UNLICENSED USE**: Not licensed for use in children under 6 months except under medical supervision.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: HEAD LICE ERADICATION PRODUCTS: RISK OF SERIOUS BURNS IF TREATED HAIR IS EXPOSED TO OPEN FLAMES OR OTHER SOURCES OF IGNITION (MARCH 2018)

See Skin infections p. 744.

- **CAUTIONS**: Alcoholic lotions not recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice - avoid contact with eyes - children under 6 months, medical supervision required - do not use lotion more than once a week for 5 consecutive weeks - do not use on broken or secondarily infected skin

- **SIDE-EFFECTS**: Angioedema - eye swelling - hypersensitivity - skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION**
  - For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears.

- **MEDIcINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

- Excipients: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)
- Derbac-M (G.R. Lane Health Products Ltd)
- Malathion 5 mg per 1 gram
- Dimeticone 40 mg per 1 gram

**Permethrin**

- **INDICATIONS AND DOSE**
  - Scabies
    - Child: Apply once weekly for 2 doses, apply 5% preparation over whole body including face, neck, scalp and ears then wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream

- **UNLICENSED USE**: Dermal Cream (scabies), not licensed for use in children under 2 months; not licensed for treatment of crab lice in children under 18 years. Creme Rinse (head
2.4 Viral skin infections

**ANTIVIRALS**

**Aciclovir**

(Acyclovir)

- **INDICATIONS AND DOSE**
  - **Herpes simplex infection (local treatment)**
    - **Child:** Apply 5 times a day for 5–10 days, to be applied to lesions approximately every 4 hours, starting at first sign of attack
  - **Unlicensed use**—Cream licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS**
  - Avoid cream coming in to contact with eyes and mucous membranes

- **INTERACTIONS**— Appendix 1: aciclovir

- **SIDE-EFFECTS**
  - **Uncommon**—Skin reactions

- **PREGNANCY**
  - Limited absorption from topical aciclovir preparations.

**3 Inflammatory skin conditions**

**3.1 Eczema and psoriasis**

**Eczema**

**Types and management**

The main types of eczema (dermatitis) in children are atopic, irritant and allergic contact; different types may co-exist. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification caused by scratching and rubbing. *Seborrheic dermatitis* is also common in infants.

Management of eczema involves the removal or treatment of contributory factors; known or suspected irritants and contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; *BNF for Children* lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires emollients applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition, and the age of the child. Mild corticosteroids are generally used on the face and on flexures; the more potent corticosteroids are generally required for use on lichenified areas of eczema or for severe eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In children with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 767) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. Wet elasticated viscose stockinette is used for ‘wet-wrap’ bandaging over topical corticosteroids or emollients to cool the skin and relieve itching, but there is an increased risk of infection and excessive absorption of the corticosteroid; ‘wet-wrap’ bandaging should be used under specialist supervision.
See Wound management products and elasticated garments for details of elasticated viscose stockinet tubular bandages and garments, and silk clothing.

Infection
Bacterial infection (commonly with Staphylococcus aureus and occasionally with Streptococcus pyogenes) can exacerbate eczema. A topical antibacterial may be used for small areas of mild infection; treatment should be limited to a short course (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving moderate to severe, widespread, or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Preparations that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid combined with a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema (eczema herpeticum) and treatment under specialist supervision with a systemic antiviral drug is indicated. Secondary bacterial infection often exacerbates eczema herpeticum.

Management of other features of eczema
Lichenification, which results from repeated scratching, is treated initially with a potent corticosteroid. Bandages containing ichthammol p. 757 (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. Coal tar and ichthammol can be useful in some cases of chronic eczema. Discoid eczema, with thickened plaques in chronic atopic eczema, is usually treated with a topical antiseptic preparation, a potent topical corticosteroid, and paste bandages containing ichthammol with zinc oxide.

A non-sedating antihistamine may be of some value in relieving severe itching or urticaria associated with eczema. A sedating antihistamine can be used at night if itching causes sleep disturbance, but a large dose may be needed and drowsiness may persist on the following day.

Exudative (‘weeping’) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution p. 784 (1 in 10,000) can be used as a soak in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system.

Seborrhoeic dermatitis
Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia. Infantile seborrhoeic dermatitis affects particularly the body folds, nappy area and scalp; it is treated with emollients and mild topical corticosteroids with suitable antimicrobials. Infantile seborrhoeic dermatitis affecting the scalp (cradle cap) is treated by hydrating the scalp using natural oils and the use of mild shampoo.

In older children, seborrhoeic dermatitis affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 749 and coal tar) and combinations of mild topical corticosteroids with suitable antimicrobials are used to treat older children.

Medicated bandages
Zinc paste bandages (see Wound management products and elasticated garments) are used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

Psoriasis
Management
Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary. Guttate psoriasis is a distinctive form of psoriasis that characteristically occurs in children and young adults, often following a streptococcal throat infection or tonsillitis.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not occur until the drug has been taken for weeks or months.

Emollients, in addition to their effects on dryness, scaling and cracking, may have an antiproliferative effect in psoriasis. They are particularly useful in inflammatory psoriasis and in chronic stable plaque psoriasis.

For chronic stable plaque psoriasis on extensor surfaces of trunk and limbs preparations containing coal tar are moderately effective, but the smell is unacceptable to some children. Vitamin D and its analogues are effective and cosmetically acceptable alternatives to preparations containing coal tar or dithranol p. 768. Dithranol is an effective topical antipsoriatic agent but it irritates and stains the skin and it should be used only under specialist supervision. Adverse effects of dithranol are minimised by using a ‘short-contact technique’ and by starting with low concentration preparations. Tazarotene, a topical retinoid for the treatment of mild to moderate plaque psoriasis, is not recommended for use in children under 18 years. These medications can irritate the skin particularly in the flexures and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Widespread unstable psoriasis of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient ointment, cream, or oil and usually combined with salicylic acid p. 791 as a keratolytic.

Some preparations for psoriasis affecting the scalp combine salicylic acid with coal tar or sulfur. The preparation should be applied generously and left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. for itch), it can be used in the morning.

Flexural psoriasis can be managed with short-term use of a mild potency topical corticosteroid. Calcipotriol p. 773 or tacalcitol p. 774 can be used in the longer term; calcipotriol p. 773 is more likely to cause irritation in flexures and should be avoided. Low-strength tar preparations can also be used.
Facial psoriasis can be treated with short-term use of a mild topical corticosteroid; if this is ineffective, calcitriol, tacalcitol, or a low-strength tar preparation can be used.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used as first-line treatment for plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

Coal tar p. 768 has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Contact of coal tar products with normal skin is not normally harmful and preparations containing coal tar can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. Leave-on preparations that remain in contact with the skin, such as creams or ointments, containing up to 6% coal tar may be used on children 1 month to 2 years; leave-on preparations containing coal tar 10% may be used on children over 2 years with more severe psoriasis. Tar baths and tar shampoos may also be helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 20–30 minutes (‘short contact’ technique). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

A topical corticosteroid is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis e.g. erythrodermic psoriasis or generalised pustular psoriasis on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid. Very potent topical corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Phototherapy

Phototherapy is available in specialist centres under the supervision of a dermatologist. Narrow band ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for guttate psoriasis. It can be considered for children with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis. The use of phototherapy and photochemotherapy in children is limited by concerns over carcinogenicity and premature ageing.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including the localised palmoplantar pustular psoriasis. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment

Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (see Eczema and psoriasis, drugs affecting the immune response below).

Acitretin p. 772, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication of acitretin is severe psoriasis resistant to other forms of therapy. It is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases; adverse effects are a limiting factor. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months.

Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. Continuous treatment for longer than 6 months is not usually necessary in psoriasis. However, some patients, particularly those with severe ichthyosis, may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly. Topical preparations containing keratolytics should normally be stopped before administration of acitretin. Liberal use of emollients should be encouraged and topical corticosteroids can be continued if necessary.

Acitretin is teratogenic; in females of child-bearing age, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

Topical treatment

The vitamin D and analogues, calcipotriol p. 773, calcitriol p. 773, and tacalcitol p. 774 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

Eczema and psoriasis, drugs affecting the immune response

Overview

Drugs affecting the immune response are used for eczema or psoriasis. Pimecrolimus p. 770 by topical application is licensed for mild to moderate atopic eczema. Tacrolimus p. 770 is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatment unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema.

Topical corticosteroids have a role in eczema and a limited role in psoriasis. A systemic corticosteroid such as prednisolone p. 458 may be used in severe refractory eczema.
Systemic drugs acting on the immune system are generally used by specialists in a hospital setting. Ciclosporin p. 537 by mouth can be used for severe psoriasis and for severe eczema. Azathioprine p. 536 or mycophenolate mofetil p. 544 are also used for severe refractory eczema in children. Methotrexate p. 563 can be used for severe resistant psoriasis; the dose is given once weekly and adjusted according to severity of the condition and biochemical measurements. Folic acid p. 594 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid can be given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Etanercept p. 667 (a cytokine modulator) is licensed in children over 6 years of age for the treatment of severe plaque psoriasis that is inadequately controlled by other systemic treatments and photochemotherapy, or when these other treatments cannot be used because of intolerance or contra-indications.

Adalimumab p. 665 (a cytokine modulator) is licensed in children over 4 years for the treatment of severe chronic plaque psoriasis that is inadequately controlled by other topical treatments and phototherapies, or when these treatments are inappropriate.

CORTICOSTEROIDS

Topical corticosteroids

Overview

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), particularly eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the child’s condition.

In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. Topical corticosteroids may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe psutular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild topical corticosteroid for a short period (2–4 weeks) for flexural and facial psoriasis, and to use a more potent corticosteroid such as betamethasone p. 758 or fluocinonide p. 761 for psoriasis of the scalp, palms, or soles.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis.

Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intrallesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

Perioral lesions

Hydrocortisone cream 1% p. 762 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 767 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include Candida spp. and many Gram-positive bacteria including streptococci and staphylococci.

Choice

Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). Disposable nappies and tight fitting pants also increase the risk of side-effects by increasing absorption of the corticosteroid. The inclusion of urea or salicylic acid p. 791 also increases the penetration of the corticosteroid.

In the BNF for Children, topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’; the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Topical hydrocortisone is usually used in children under 1 year of age. Moderately potent and potent topical corticosteroids should be used with great care in children and for short periods (1–2 weeks) only. A very potent corticosteroid should be initiated under the supervision of a specialist.

Appropriate topical corticosteroids for specific conditions are:

- insect bites and stings—mild corticosteroid such as hydrocortisone 1% cream;
- inflamed nappy rash causing discomfort in infant over 1 month—mild corticosteroid such as hydrocortisone 0.5% or 1% for up to 7 days (combined with antimicrobial if infected);
- mild to moderate eczema, flexural and facial eczema or psoriasis—mild corticosteroid such as hydrocortisone 1%;
- severe eczema of the face and neck—moderately potent corticosteroid for 3–5 days only, if not controlled by a mild corticosteroid;
- severe eczema on the trunk and limbs—moderately potent or potent corticosteroid for 1–2 weeks only, switching to a less potent preparation as the condition improves;
- eczema affecting area with thickened skin (e.g. soles of feet)—potent topical corticosteroid in combination with urea or salicylic acid (to increase penetration of corticosteroid).
Absorption through the skin
*Mild* and *moderately potent* topical corticosteroids are associated with few side-effects but particular care is required when treating neonates and infants, and in the use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome, depending on the area of the body being treated and the duration of treatment. Absorption of corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from corticosteroid is greatest from severely MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

Cream

**CAUTIONARY AND ADVISORY LABELS** 28

**Beclometasone dipropionate (Non-proprietary)**

Beclometasone dipropionate 250 microgram per 1 gram Beclometasone 0.025% cream | 30 gram [POM] £68.00 DT = £68.00

Ointment

**CAUTIONARY AND ADVISORY LABELS** 28

**Beclometasone dipropionate (Non-proprietary)**

Beclometasone dipropionate 250 microgram per 1 gram Beclometasone 0.025% ointment | 30 gram [POM] £68.00 DT = £68.00

---

**Alclometasone dipropionate** 21-Dec-2017

**INDICATIONS AND DOSE**

**Inflammatory skin disorders such as eczemas**

→ **TO THE SKIN**

Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Alclometasone dipropionate cream 0.05%; moderate

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**SIDE-EFFECTS**

Vasodilation

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on the application of alclometasone dipropionate cream.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

**CAUTIONARY AND ADVISORY LABELS** 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

**Alclometasone dipropionate (Non-proprietary)**

Alclometasone dipropionate 500 microgram per 1 gram Boots Derma Care Eczema & Dermatitis Flare-Up 0.05% cream | 15 gram [P]

---

**Betamethasone dipropionate** (Betamethasone dipropionate)

**INDICATIONS AND DOSE**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids / Psoriasis**

→ **TO THE SKIN**

Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Betamethasone dipropionate cream and ointment 0.025%; potent.

**UNLICENSED USE**

Not licensed for use in children under 1 year.

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

Vasodilation - vision blurred

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids / Psoriasis

→ **TO THE SKIN**

Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Betamethasone valerate 0.25% cream and ointment: moderate. Betamethasone valerate 0.1% cream, lotion, ointment, and scalp application: potent. Betamethasone valerate 0.12% foam: potent. Betamethasone dipropionate 0.05% cream, lotion, and ointment: potent.

**UNLICENSED USE**

Betacap®, Betnovate® and Betnovate-RD® are not licensed for use in children under 1 year. Bettamousse® is not licensed for use in children under 6 years.

**CAUTIONS**

Use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

Vasodilation

**PATIENT AND CARER ADVICE**

Patient counselling is advised for betamethasone cream, ointment, scalp application and foam (application).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

Foam

**CAUTIONARY AND ADVISORY LABELS** 15, 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

**Bettamousse** (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram Betamethasone 0.1% cutaneous foam | 100 gram [POM] £9.75 DT = £9.75

Cream

**CAUTIONARY AND ADVISORY LABELS** 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

**Betamethasone (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram Betamethasone valerate 0.1% cream | 15 gram [POM] £3.00 | 30 gram [POM] £5.99 DT = £1.61 | 100 gram [POM] £11.99 DT = £5.37

**Audavate** (Auden McKenzie (Pharma Division) Ltd, Actavis UK Ltd)

Betamethasone (as Betamethasone valerate) 250 microgram per 1 gram Audavate RD 0.025% cream | 100 gram [POM] £2.99 DT = £1.15

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram Audavate 0.1% cream | 30 gram [POM] £1.14 DT = £1.61 | 100 gram [POM] £3.24 DT = £5.37

---

This length can be measured in terms of a **fingertip unit** (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

‘Wet-wrap bandaging’ increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

**PRESCRIBING AND DISPENSING INFORMATION**

The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.
Calcipotriol with betamethasone
March 2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcipotriol p. 773, betamethasone p. 454, 758.

- INDICATIONS AND DOSE

**DOVOBET® GEL**

Scalp psoriasis
- TO THE SKIN
  - Child 12–17 years (specialist use only): Apply 1–4 g once daily usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, shampoo off after leaving on scalp overnight or during day, when different preparations containing calcipotriol used together, maximum total calcipotriol 3.75 mg in any one week

**Mild to moderate plaque psoriasis**
- TO THE SKIN
  - Child 12–17 years (specialist use only): Apply once daily for up to 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week; maximum 75 g per week

**DOVOBET® OINTMENT**

Stable plaque psoriasis
- TO THE SKIN
  - Child 12–17 years (specialist use only): Apply once daily for up to 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week; maximum 75 g per week

- **UNLICENSED USE** Dovobet® not licensed for use in children.

- **CONTRA-INDICATIONS**

  **ENSTILAR®** Erythrodermic psoriasis - pustular psoriasis

- **INTERACTIONS**
  - Appendix 1: corticosteroids - vitamin D substances

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- CLOBETASOL (Bayer)
  - Calcipotriol (as Calcipotriol hydrate) 50 microgram per 1 gram, Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 gram Dovobet ointment | 30 gram | £19.84 DT = £19.84 | 60 gram | £39.68 | 120 gram | £73.86

**Gel**

- CLOBETASOL (Bayer)
  - Calcipotriol (as Calcipotriol monohydrate) 50 microgram per 1 gram, Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 gram Dovobet gel | 60 gram | £37.21 DT = £37.21 | 120 gram | £69.31

**Calcipotriol with betamethasone**

- **INDICATIONS AND DOSE**

  Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids

  - TO THE SKIN
    - Child 1–17 years: Apply 1–2 times a day for up to 4 weeks, to be applied thinly

  **POTENCY**

  - Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

- **UNLICENSED USE** Dermovate® not licensed for use in children under 1 year.

- **PATIENT AND CARER ADVICE**

  - Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.
Scalp application Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste.
  - Cream
    - **CAUTIONARY AND ADVISORY LABELS**
    - **EXCIPIENTS:** May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol.
    - **Eumovate (GlaxoSmithKline Consumer Healthcare, GlaxoSmithKline UK Ltd)**
      - **Clotetasone butyrate 500 microgram per 1 gram**
        - Eumovate
        - **Cream**
          - **Eczema and Dermatitis:** 0.05% cream | 15 gram
          - **Psoriasis:** 0.1% cream | 15 gram
          - **Diflucortolone valerate**
          - **Cream**
        - **Dermovate (GlaxoSmithKline UK Ltd)**
          - **Clotetasone butyrate 500 microgram per 1 gram**
            - **Dermovate**
            - **Cream**
          - **Nerisone (Meadow Laboratories Ltd)**
            - **Clotetasone butyrate 500 microgram per 1 gram**
              - **Nerisone Forte**
    - **Ointment**
      - **CAUTIONARY AND ADVISORY LABELS**
      - **EXCIPIENTS:** May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol.
      - **ClobaDerm (Auden McKenzie (Pharma Division) Ltd)**
        - **Clotetasone butyrate 500 microgram per 1 gram**
          - **ClobaDerm**
          - **Ointment**
      - **Clobetasol propionate 500 microgram per 1 gram**
        - **Clobetasol propionate 500 microgram per 1 gram**
    - **Liquid**
      - **CAUTIONARY AND ADVISORY LABELS**
      - **EXCIPIENTS:** May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol.
      - **Eumovate (GlaxoSmithKline UK Ltd)**
        - **Clotetasone butyrate 500 microgram per 1 gram**
          - **Eumovate**
          - **Cream**
      - **Dermovate (GlaxoSmithKline UK Ltd)**
        - **Clotetasone butyrate 500 microgram per 1 gram**
          - **Dermovate**
          - **Cream**
      - **Clobetasol propionate 500 microgram per 1 gram**
        - **Clobetasol propionate 500 microgram per 1 gram**

- **INDICATIONS AND DOSE**
  - **Eczemas and dermatitis of all types**
  - **Maintenance between courses of more potent corticosteroids**
  - **TO THE SKIN**
    - Child: Apply 1–2 times a day, to be applied thinly
  - **POTENCY**
    - Clotetasone butyrate 0.05% cream and ointment: moderate.
  - **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
  - **PATIENT AND CARER ADVICE** Patients or carers should be advised on the application of clotetasone butyrate containing preparations.
  - **EXCEPTIONS TO LEGAL CATEGORY** Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in adults and children over 12 years provided pack does not contain more than 15 g.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment,
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS**
    - **EXCIPIENTS:** May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens).
    - **Nerisone (Meadow Laboratories Ltd)**
      - **Diflucortolone valerate 1 mg per 1 gram**
        - **Nerisone Forte**
    - **Cream**
      - **CAUTIONARY AND ADVISORY LABELS**
      - **EXCIPIENTS:** May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens).
      - **Nerisone (Meadow Laboratories Ltd)**
        - **Diflucortolone valerate 1 mg per 1 gram**
          - **Nerisone Forte**
    - **Cream**
      - **CAUTIONARY AND ADVISORY LABELS**
      - **EXCIPIENTS:** May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens).
      - **Nerisone (Meadow Laboratories Ltd)**
        - **Diflucortolone valerate 1 mg per 1 gram**
          - **Nerisone Forte**

**Diflucortolone valerate**

- **INDICATIONS AND DOSE**
  - **Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.3% diflucortolone valerate)**
  - **Short-term treatment of severe exacerbations (using 0.1% diflucortolone valerate)**
  - **Psoriasis (using 0.3% diflucortolone valerate)**
  - **TO THE SKIN**
    - Child 1 month–3 years: Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly
    - Child 4–17 years: Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly; maximum 60 g per week
  - **Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.1% diflucortolone valerate)**
  - **Psoriasis (using 0.1% diflucortolone valerate)**
  - **TO THE SKIN**
    - Child: Apply 1–2 times a day for up to 4 weeks, to be applied thinly
  - **POTENCY**
    - Diflucortolone valerate 0.1% cream and ointment: potent.
    - Diflucortolone valerate 0.3% cream and ointment: very potent.
  - **UNLICENSED USE** Nerisone® licensed for use in children (age range not specified by manufacturer); Nerisone Forte® not licensed for use in children under 4 years.
  - **PRESCRIBING AND DISPENSING INFORMATION** Patients or carers should be advised on application of diflucortolone valerate containing preparations.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS**

**BNFC 2019–2020**
Fludroxycortide
(Flurandrenolone)

**INDICATIONS AND DOSE**

- **Inflammatory skin disorders such as eczemas**
  - **TO THE SKIN**
  - **Child:** Apply 1–2 times a day, to be applied thinly

**POTENCY**

- Fludroxycortide 0.0125% cream and ointment: moderate

**HAELAN® TAPE**

- Chronic localised recalcitrant dermatoses (but not acute or weeping)
  - **TO THE SKIN**
  - **Child:** Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

**UNLICENSED USE**

- Licensed for use in children (age range not specified by manufacturer).

**SIDE-EFFECTS**

- Cushing’s syndrome - increased risk of infection - vasodilation

**PATIENT AND CARER ADVICE**

- Patients or carers should be counselled on application of fludroxycortide cream and ointment.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- **CAUTIONARY AND ADVISORY LABELS** 28

- **EXCIPIENTS:** May contain Propylene glycol, woolfat and related substances (including lanolin)
  - **Synalar** (Reig Jofre UK Ltd)
    - Flucinolone acetonide 62.5 microgram per 1 gram Synalar 1 in 4 Dilution 0.00625% ointment | 50 gram (£84) £4.84 DT = £4.84
    - Flucinolone acetonide 250 microgram per 1 gram Synalar 0.025% ointment | 30 gram (£14.14) £4.14 DT = £4.14 | 100 gram (£111.75) £11.75 DT = £11.75

**Cream**

- **CAUTIONARY AND ADVISORY LABELS** 28

- **EXCIPIENTS:** May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), polyborates, propylene glycol
  - **Synalar** (Reig Jofre UK Ltd)
    - Flucinolone acetonide 62.5 microgram per 1 gram Synalar 1 in 4 Dilution 0.00625% cream | 50 gram (£84) £4.84 DT = £4.84
    - Flucinolone acetonide 250 microgram per 1 gram Synalar 0.025% cream | 30 gram (£14.14) £4.14 DT = £4.14 | 100 gram (£111.75) £11.75 DT = £11.75

**Gel**

- **CAUTIONARY AND ADVISORY LABELS** 28

- **EXCIPIENTS:** May contain Hydroxybenzoates (parabens), propylene glycol
  - **Synalar** (Reig Jofre UK Ltd)
    - Flucinolone acetonide 250 microgram per 1 gram Synalar 0.025% gel | 30 gram (£5.56) £5.56 DT = £5.56 | 60 gram (£10.02) £10.02 DT = £10.02

**Combinations available:** Flucinolone acetonide with clioquinol, p. 765
  - Fluocinolone acetonide with neomycin, p. 765

Fluocinolone acetonide

**INDICATIONS AND DOSE**

- **Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids**

**Psoriasis**

- **TO THE SKIN**
  - **Child:** Apply 1–2 times a day, to be applied thinly

**POTENCY**

- Fluocinolone acetonide 0.025% cream, gel, and ointment: potent.
- Fluocinolone acetonide 0.00625% cream and ointment: moderate.
- Fluocinolone acetonide 0.0025% cream: mild.

**INTERACTIONS**

- Appendix 1: fluorocinolone

**SIDE-EFFECTS**

- Vasodilation

**PRESCRIBING AND DISPENSING INFORMATION**

- Gel is useful for application to the scalp and other hairy areas.

**PATIENT AND CARER ADVICE**

- Patient counselling is advised for fluorocinolone acetonide cream, gel and ointment (application).
Fluticasone

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids
- **Psoriasis**
  - **Child 1–2 months:** Apply 1–2 times a day, to be applied thinly
  - **Child 3 months–17 years:** Apply 1–2 times a day, to be applied thinly

**POTENCY**
- Fluticasone cream 0.05%: potent.
- Fluticasone ointment 0.005%: potent.

**UNLICENSED USE**
Not licensed for use in children under 3 months.

**INTERACTIONS**
Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on application of fluticasone creams and ointments.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **Fluticasone (Non-proprietary)**
  - Fluticasone propionate 50 microgram per 1 gram
  - Cutivate (GlaxoSmithKline UK Ltd)
  - Fluticasone propionate 500 microgram per 1 gram
  - Cutivate (GlaxoSmithKline UK Ltd)

**Ointment**

- **Fluticasone (Non-proprietary)**
  - Fluticasone propionate 50 microgram per 1 gram
  - Cutivate (GlaxoSmithKline UK Ltd)
  - Fluticasone propionate 500 microgram per 1 gram

Hydrocortisone

**DRUG ACTION**
Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

**INDICATIONS AND DOSE**
Mild inflammatory skin disorders such as eczemas
- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly

**Nappy rash**
- **TO THE SKIN**
  - Child: Apply 1–2 times a day for no longer than 1 week, discontinued as soon as the inflammation subsides

**POTENCY**
- Hydrocortisone cream and ointment 0.5 to 2.5%: mild

**INTERACTIONS**
Appendix 1: corticosteroids

**SIDE-EFFECTS**
Vasodilation

**PRESCRIBING AND DISPENSING INFORMATION**
When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied. Although Diaderm™ contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP.

**PATIENT AND CARER ADVICE**
Patient counselling is advised for hydrocortisone cream and ointment (application).

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**
Hydrocortisone Cream 1% 15 g may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**
Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in patients over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Cream**

- **Fluticasone (Non-proprietary)**
  - Fluticasone 5 mg per 1 gram
  - Hydrocortisone 0.5% cream
  - 15 gram (PSt) £44.00 DT = £1.01 | 30 gram (PSt) £2.02–£88.00

  - Hydrocortisone 2.5% ointment
  - 15 gram (PSt) £44.00 DT = £24.57 | 30 gram (PSt) £49.14–£88.00

**Combinations available:**

Hydrocortisone butyrate

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
  - Child 1–17 years: Apply 1–2 times a day, to be applied thinly

**POTENCY**
- Hydrocortisone butyrate 0.1% cream, liquid, and ointment: potent

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer hydrocortisone butyrate lotion, cream, ointment and scalp lotion.

Medicines for Children leaflet: Hydrocortisone (topical) for eczema www.medicinesforchildren.org.uk/hydrocortisone-topical-eczema
Mometasone furoate

• INDICATIONS AND DOSE
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids
▶ TO THE SKIN
▶ Child 1 month-1 year: Apply once daily, to be applied thinly (to scalp in case of lotion)
▶ Child 2-17 years: Apply once daily, to be applied thinly
POTENCY
▶ Mometasone furoate 0.1% cream, ointment, and scalp lotion: potent.

• UNLICENSED USE Not licensed for use in children under 2 years.
• INTERACTIONS ▶ Appendix 1: corticosteroids

Corticosteroids > Corticosteroid combinations with anti-infectives

Betamethasone with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 756.

• INDICATIONS AND DOSE
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids
▶ TO THE SKIN
▶ Child: (consult product literature)
POTENCY
▶ Betamethasone (as valerate) 0.1% with clioquinol cream and ointment: potent.

• UNLICENSED USE Betamethasone and clioquinol preparations is not licensed for use in children under 1 year.
• INTERACTIONS ▶ Appendix 1: corticosteroids
• PATIENT AND CARER ADVICE Stains clothing. Patients or carers should be counselled on application of betamethasone with clioquinol preparations.

Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 454, clotrimazole p. 748.

• INDICATIONS AND DOSE
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids
▶ TO THE SKIN
▶ Child: (consult product literature)
POTENCY
▶ Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

• UNLICENSED USE Lotriderm® not licensed for use in children under 12 years.
• INTERACTIONS ▶ Appendix 1: antifungals, azoles - corticosteroids
• PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.
Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 758, fusidic acid p. 371.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
- TO THE SKIN
- Child: (consult product literature)

**POTENCY**
- Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

**LICENSED USE**
Betamethasone with neomycin (Non-proprietary)
Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram
- Ointment
- Cream

**INTERACTIONS**
- Appendix 1: corticosteroids • fusidic acid

**PATIENT AND CARER ADVICE**
Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- CAUTIONARY AND ADVISORY LABELS 2B
- BETAMETHASONE (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram
- Lotriderm (Merck Sharp & Dohme Ltd) £6.84 DT + £6.34

**Betamethasone with neomycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 758, neomycin sulfate p. 746.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
- TO THE SKIN
- Child: 1–2 times a day, to be applied thinly

**POTENCY**
- Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

**LICENSED USE**
Betamethasone and neomycin preparations not licensed for use in children under 2 years.

**INTERACTIONS**
- Appendix 1: corticosteroids • neomycin

**PATIENT AND CARER ADVICE**
Patient counselling is advised for betamethasone with neomycin cream and ointment (application).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- CAUTIONARY AND ADVISORY LABELS 2B
- BETAMETHASONE (as Betamethasone valerate) 1 mg per 1 gram
- Neomycin sulfate 5 mg per 1 gram
- Neomycin 5 mg per 1 gram
- Betamethasone valerate 0.1% / Neomycin 0.5% ointment
- 50 mg £8.88 DT + £31.56 | 100 mg £97.00 DT + £104.52

**Cream**
- CAUTIONARY AND ADVISORY LABELS 2B
- BETAMETHASONE (as Betamethasone valerate) 1 mg per 1 gram
- Neomycin sulfate 5 mg per 1 gram
- Neomycin 5 mg per 1 gram
- Betamethasone valerate 0.1% / Neomycin 0.5% cream
- 50 mg £8.88 DT + £31.56 | 100 mg £97.00 DT + £104.52

**Betamethasone with salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 758, salicylic acid p. 791.

**INDICATIONS AND DOSE**
DIPROSALIC ® OINTMENT
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
- TO THE SKIN
- Child: Apply 1–2 times a day, max. 60 g per week

**POTENCY**
- Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

**DIPROSALIC ® SCALP APPLICATION**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
- TO THE SKIN
- Child: Apply 1–2 times a day, apply a few drops

**POTENCY**
- Betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

**INTERACTIONS**
- Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE**
DIPROSALIC ® OINTMENT Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.

DIPROSALIC ® SCALP APPLICATION Patients or carers should be counselled on application of betamethasone and salicylic acid scalp application.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- DIPROSALIC ® OINTMENT
- DIPROSALIC ® SCALP APPLICATION

**Cream**
- CAUTIONARY AND ADVISORY LABELS 2B
- BETAMETHASONE (as Betamethasone valerate) 1 mg per 1 gram, Salicylic acid 20 mg per 1 gram
- £0.50 DT + £6.38 | 60 gram £12.76
- £0.65 DT + £6.38 | 60 gram £12.45 DT + £12.76

**Liquid**
- CAUTIONARY AND ADVISORY LABELS 2B
- BETAMETHASONE (as Betamethasone dipropionate) 500 microgram per 1 ml, Salicylic acid 20 mg per 1 ml
- £0.05/2% scalp application | 100 ml £10.10 DT + £10.10
Clobetasol propionate with neomycin sulfate and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 759, neomycin sulfate p. 746.

- **INDICATIONS AND DOSE**
  - Short-term treatment only of severe resistant inflammatory skin disorders such as calcified, chronic eczemas associated with infection and unresponsive to less potent corticosteroids | Psoriasis associated with infection
  - **TO THE SKIN**
  - Child: (consult product literature)
  - **POTENCY**
  - Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

- **UNLICENSED USE**
  - Clobetasol with neomycin and nystatin preparations not licensed for use in children under 2 years.

- **INTERACTIONS**
  - Appendix 1: neomycin

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

- **M EDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **CAUTIONARY AND ADVISORY LABELS**
    - **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

Clobetasone butyrate with nystatin and oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasone butyrate p. 760, oxytetracycline p. 367.

- **INDICATIONS AND DOSE**
  - Steroid-responsive dermatoses where candidal or bacterial infection is present
  - **TO THE SKIN**
  - Child: (consult product literature)
  - **POTENCY**
  - Clobetasone butyrate 0.05% with nystatin and oxytetracycline cream: moderate.

- **INTERACTIONS**
  - Appendix 1: tetracyclines

- **PATIENT AND CARER ADVICE**
  - Stains clothing.

- **M EDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

Fluocinolone acetonide with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 761.

- **INDICATIONS AND DOSE**
  - Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection
  - **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
  - **POTENCY**
  - Clioquinol 3% with fluocinolone acetonide 0.025% cream and ointment: potent.

- **INTERACTIONS**
  - Appendix 1: fluocinolone

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for clioquinol with fluocinolone acetonide cream and ointment (application). Ointment stains clothing.

- **M EDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 761, neomycin sulfate p. 746.

- **INDICATIONS AND DOSE**
  - Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection
  - **TO THE SKIN**
  - Child 1–11 months: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
  - Child 1–17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
  - **POTENCY**
  - Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

- **INTERACTIONS**
  - Appendix 1: fluocinolone, neomycin

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.
Hydrocortisone with benzalkonium chloride, dimeticone and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 762, dimeticone p. 752.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- CAUTIONARY AND ADVISORY LABELS 28
- EXCIPIENTS: May contain Propylene glycol, woolfat and related substances (including lanolin)
  - Synalar N (Reig Jofre UK Ltd)
  - Fluocinolone acetate 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram Synalar N ointment | 30 gram £4.36

**INTERACTIONS** → Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE** Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- CAUTIONARY AND ADVISORY LABELS 28
- EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid
  - Timodine (Alliance Pharmaceuticals Ltd)
  - Benzalkonium chloride 1 mg per 1 gram, Hydrocortisone 5 mg per 1 gram, Dimeticone 350 100 mg per 1 gram, Nystatin 100000 unit per 1 gram Timodine cream | 30 gram £3.37

**INDICATIONS AND DOSE**
- Mild inflammatory skin disorders such as eczemas associated with infection
  - TO THE SKIN
  - Child: Apply 3 times a day until lesion has healed, to be applied thinly
- POTENCY
  - Benzalkonium with dimeticone, hydrocortisone acetate 0.5%, and nystatin cream: mild

**INTERACTIONS** → Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE** Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 762, chlorhexidine p. 785.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- CAUTIONARY AND ADVISORY LABELS 28
- EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
  - Hydrocortisone with chlorhexidine hydrochloride and nystatin
    - (Non-proprietary)
    - Chlorhexidine acetate 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram, Nystatin 100000 unit per 1 gram
    - Nystatin 100,000 units/g / Chlorhexidine acetate 1% / Hydrocortisone 1% ointment | 30 gram £5.29 DT = £5.29

**Cream**
- CAUTIONARY AND ADVISORY LABELS 28
- EXCIPIENTS: May contain Benzy alcohol, cetoesteryl alcohol (including cetyl and stearyl alcohol), polysorbates
  - Hydrocortisone with chlorhexidine hydrochloride and nystatin
    - (Non-proprietary)
    - Hydrocortisone 5 mg per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram
    - Nystatin 100,000 units/g / Chlorhexidine hydrochloride 1% / Hydrocortisone 0.5% cream | 30 gram £5.29 DT = £5.29

**INDICATIONS AND DOSE**
- Mild inflammatory skin disorders such as eczemas (associated with fungal infection)
  - TO THE SKIN
  - Child: (consult product literature)
- POTENCY
  - Clotrimazole with hydrocortisone 1% cream: mild

**INTERACTIONS** → Appendix 1: antifungals, azoles - corticosteroids

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clotrimazole with hydrocortisone cream.

**EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation in patients 10 years and over.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- CAUTIONARY AND ADVISORY LABELS 28
- EXCIPIENTS: May contain Benzyl alcohol, cetoesteryl alcohol (including cetyl and stearyl alcohol)
  - Canesten HC (Bayer Plc)
  - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten HC cream | 30 gram £2.42 DT = £2.42

Hydrocortisone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 762, fusidic acid p. 371.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- CAUTIONARY AND ADVISORY LABELS 28
  - Hydrocortisone with fusidic acid cream: mild

**INDICATIONS AND DOSE**
- Mild inflammatory skin disorders such as eczemas
  - TO THE SKIN
  - Child: To be applied thinly (consult product literature)
- POTENCY
  - Hydrocortisone with fusidic acid cream: mild

**INTERACTIONS** → Appendix 1: corticosteroids - fusidic acid

**PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with fusidic acid preparations.
Hydrocortisone with miconazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 762, miconazole p. 749.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - **EXCIPIENTS**: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), polymers, potassium sorbate
    - Fucidin H (Fusidic acid / Hydrocortisone) (LEO Pharma)
      - Hydrocortisone acetate 10 mg per 1 gram, Fusidic acid 20 mg per 1 gram Fucidin H cream | 30 gram (POM) £6.02 DT = £6.02
      - 60 gram (POM) £12.05 DT = £12.05
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - **EXCIPIENTS**: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, potassium sorbate
    - Ichthammol (Non-proprietary)
      - Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Ichthammol ointment | 30 gram (POM) £5.01 DT = £5.01

- **INDICATIONS AND DOSE**
  - **Mild inflammatory skin disorders such as eczemas associated with infections**
    - **TO THE SKIN**
    - **Child**: (consult product literature)
  - **POTENCY**
    - Hydrocortisone 1% with miconazole cream and ointment: mild

- **INTERACTIONS** → Appendix 1: antifungals, azoles · corticosteroids
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with miconazole preparations.
- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
    - May be prescribed as Miconazole and Hydrocortisone Cream or Ointment for max. 28 days.
  - **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube of hydrocortisone with miconazole cream is on sale to the public for the treatment of athlete’s foot and candidal intertrigo in children over 10 years.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - **Terra-Cortril** (Intrapharm Laboratories Ltd)
      - Hydrocortisone 10 mg per 1 gram, Oxymetazoline (as Oxymetazoline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram (POM) £5.01 DT = £5.01

**DERMATOLOGICAL DRUGS** → **ANTI-INFECTIVES**

**Ichthammol**

- **INDICATIONS AND DOSE**
  - **Chronic lichenified eczema**
    - **TO THE SKIN**
    - **Child**: 1-17 years: Apply 1–3 times a day

- **UNLICENSED USE** No information available.
- **SIDE-EFFECTS** Skin irritation

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - **Terra-Cortril** (Intrapharm Laboratories Ltd)
      - Hydrocortisone 10 mg per 1 gram, Oxymetazoline (as Oxymetazoline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram (POM) £5.01 DT = £5.01
  - **Cream**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - **EXCIPIENTS**: May contain Butylated hydroxyanisole, disodium edetate
    - **Daktacort** (Janssen-Cilag Ltd)
      - Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort ointment | 30 gram (POM) £2.50 DT = £2.50

**Ichthammol with zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

- **INDICATIONS AND DOSE**
  - **Chronic lichenified eczema**
    - **TO THE SKIN**
    - **Child**: (consult product literature)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste
  - **Liquids**
    - **Ichthammol (Non-proprietary)**
      - Ichthammol 1 mg per 1 mg Ichthammol liquid | 100 gram (GSS) £12.86 DT = £12.86 | 500 gram (GSS) £41.47

- **CONTRA-INDICATIONS** Children under 12 years

**Hydrocortisone with oxytetracycline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 762, oxytetracycline p. 367.

- **INDICATIONS AND DOSE**
  - **Mild inflammatory skin disorders such as eczemas**
    - **TO THE SKIN**
    - **Child 12-17 years**: (consult product literature)
  - **POTENCY**
    - Hydrocortisone 1% with oxytetracycline ointment: mild

- **INTERACTIONS** → Appendix 1: corticosteroids · tetracyclines
- **PREGNANCY** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth.
- **BREAST FEEDING** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - **Terra-Cortril** (Intrapharm Laboratories Ltd)
      - Hydrocortisone 10 mg per 1 gram, Oxymetazoline (as Oxymetazoline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram (POM) £5.01 DT = £5.01

- **INTERACTIONS** → Appendix 1: corticosteroids · tetracyclines
- **PREGNANCY** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth.
- **BREAST FEEDING** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - **Terra-Cortril** (Intrapharm Laboratories Ltd)
      - Hydrocortisone 10 mg per 1 gram, Oxymetazoline (as Oxymetazoline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram (POM) £5.01 DT = £5.01

**DERMATOLOGICAL DRUGS** → **ANTI-INFECTIVES**

**Ichthammol**

- **INDICATIONS AND DOSE**
  - **Chronic lichenified eczema**
    - **TO THE SKIN**
    - **Child**: 1-17 years: Apply 1–3 times a day

- **UNLICENSED USE** No information available.
- **SIDE-EFFECTS** Skin irritation

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste
  - **Liquids**

      - Ichthammol 1 mg per 1 mg Ichthammol liquid | 100 gram (GSS) £12.86 DT = £12.86 | 500 gram (GSS) £41.47

**Ichthammol with zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

- **INDICATIONS AND DOSE**
  - **Chronic lichenified eczema**
    - **TO THE SKIN**
    - **Child**: (consult product literature)
DERMATOLOGICAL DRUGS > ANTRACEN

**Dithranol**
*(Anthralin)*

- **INDICATIONS AND DOSE**
  - **Subacute and chronic psoriasis**
  - **TO THE SKIN**
  - Child: (consult product literature)
  - **DITHROCREAM®**
  - **Subacute and chronic psoriasis**
  - **TO THE SKIN**
  - Child: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)
  - **MICANOL®**
  - **Subacute and chronic psoriasis**
  - **TO THE SKIN**
  - Child: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

- **UNLICENSED USE**
  - **MICANOL®** Micanol® licensed for use in children, but not recommended for infants or young children (age range not specified by manufacturer).
  - **DITHROCREAM®** Dithrocream® is licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS**
  - Acute and pustular psoriasis - hypersensitivity

- **CAUTIONS**
  - Avoid sensitive areas of skin - avoid use near eyes

- **SIDE-EFFECTS**
  - Skin reactions

- **PREGNANCY**
  - No adverse effects reported.

- **BREAST FEEDING**
  - No adverse effects reported.

- **DIRECTIONS FOR ADMINISTRATION**
  - When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.
  - **MICANOL®** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.

- **PATIENT AND CARER ADVICE**
  - Dithranol can stain the skin, hair and fabrics.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

- **Cream**

  - **CAUTIONARY AND ADVISORY LABELS**
  - **28 EXCipients:** May contain cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol
  - **Dithrocream** (Dermal Laboratories Ltd)

  - **Dithranol 5 mg per 1 gram** Dithrocream 0.5% cream | 50 gram £4.66 DT + £4.66
  - **Dithranol 10 mg per 1 gram** Dithrocream 1% cream | 50 gram £5.42 DT + £5.42
  - **Dithranol 20 mg per 1 gram** Dithrocream 2% cream | 50 gram £6.79 DT + £6.79

  - Combinations available: **Coal tar with dithranol and salicylic acid**, p. 769

**Dithranol with salicylic acid and zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol above, salicylic acid p. 791.

- **INDICATIONS AND DOSE**
  - **Subacute and chronic psoriasis**
  - **TO THE SKIN**
  - Child: (consult local protocol)

- **MEDICINAL FORMS**
  - Forms available from special-order manufacturers include: ointment, paste

DERMATOLOGICAL DRUGS > TARS

**Coal tar**

- **INDICATIONS AND DOSE**
  - **Psoriasis | Chronic atopic eczema**
  - **TO THE SKIN USING PASTE**
  - Child: Apply 1–3 times a day, start application with low-strength preparations
  - **TO THE SKIN**
  - Child: 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child’s bath. Use Coal Tar Solution BP

  - **ALPHOSYL 2 IN 1® SHAMPOO**

  - **Psoriasis | Seborrhoeic dermatitis | Scaling | Itching**
  - **TO THE SKIN**
  - Child: Apply every 2–3 days

  - **Dandruff**
  - **TO THE SKIN**
  - Child: Apply 1–2 times a week as required

  - **EXOREX® LOTION**

  - **Psoriasis**
  - **TO THE SKIN**
  - Child: Apply 2–3 times a day, to be applied to skin or scalp; can be diluted with a few drops of water before applying

  - **PSORIDERM® SCALP LOTION**

  - **Scalp psoriasis**
  - **TO THE SKIN**
  - Child: As required

- **CONTRA-INDICATIONS**
  - Avoid broken or inflamed skin - avoid eye area - avoid genital area - avoid mucosal areas - avoid rectal area - infection - sore, acute, or pustular psoriasis

- **CAUTIONS**
  - Application to face - application to skin flexures

- **SIDE-EFFECTS**
  - Photosensitivity reaction - skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Coal Tar Solution BP contains coal tar 20%, Strong Coal Tar Solution BP contains coal tar 40%.

- **HANDLING AND STORAGE**
  - Use suitable chemical protection gloves for extemporaneous preparation. May stain skin, hair and fabric.
PATIENT AND CARER ADVICE  May stain skin, hair and fabric.

  Coal tar solution 25 mg per 1 ml  Psoriderm shampoo | 250 ml | £4.74 DT + £4.74

Coal tar with coconut oil and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 768, salicylic acid p. 791.

INDICATIONS AND DOSE
  
  Scaly scalp disorders: Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap
  
  Child: Apply daily as required

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Shampoo  
  
  Capasal  (Dermal Laboratories Ltd)
  
  Salicylic acid 5 mg per 1 gram, Coal tar distilled 10 mg per 1 gram, Coconut oil 10 mg per 1 gram  Capasal Therapeutic shampoo | 250 ml | £4.69

Coal tar with dithranol and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 768, dithranol p. 768, salicylic acid p. 791.

INDICATIONS AND DOSE
  
  Subacute and chronic psoriasis
  
  Child: Apply up to twice daily

UNLICENSED USE  Psorin® is licensed for use in children (age range not specified by manufacturer).

MEDICINAL FORMS  Forms available from special-order manufacturers include: ointment

Coal tar with lecithin

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 768.

INDICATIONS AND DOSE
  
  Psoriasis
  
  TO THE SKIN
  
  Child: Apply 1–2 times a day, cream to be applied to the skin or scalp

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Cream  EXCIPIENTS: May contain Isopropyl palmitate, propylene glycol
  
  Psoriderm  (Dermal Laboratories Ltd)
  
  Lecithin 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram  Psoriderm cream | 225 ml | £9.42 DT + £9.42

Coal tar with salicylic acid and precipitated sulfur

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 768, salicylic acid p. 791.

INDICATIONS AND DOSE
  
  CCOOIS® OINTMENT
  
  Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
  
  TO THE SKIN USING SCALP OINTMENT
  
  Child 6–11 years: Medical supervision required
  
  Child 12–17 years: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

SEBCO® OINTMENT
  
  Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
  
  TO THE SKIN USING SCALP OINTMENT
  
  Child 6–11 years: Medical supervision required
  
  Child 12–17 years: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Ointment  EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)
  
  CCoos (RPH Pharmaceuticals AB)
  
  Coal tar solution 120 mg per 1 gram  CCoos ointment | 40 gram | £6.22 | 100 gram | GSK £11.69
  
  Sebco (Derma UK Ltd)
  
  Coal tar solution 120 mg per 1 gram  Sebco ointment | 40 gram | GSK £6.20 | 100 gram | GSK £11.67
Coal tar with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 768.

**INDICATIONS AND DOSE**

Psoriasis | Chronic atopic eczema

▶ **TO THE SKIN**

Child: Apply 1–2 times a day

**MEDICINAL FORMS**

Forms available from special-order manufacturers include: ointment, paste

**IMMUNOSUPPRESSANTS** > CALCINEURIN INHIBITORS AND RELATED DRUGS

Pimecrolimus

**INDICATIONS AND DOSE**

Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)

▶ **TO THE SKIN**

Child 2–17 years: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

**CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions - application under occlusion - congenital epidermal barrier defects - contact with eyes - contact with mucous membranes - generalised erythroderma - immunodeﬁciency - infection at treatment site

**CAUTIONS**

Alcohol consumption (risk of facial ﬂushing and skin irritation) - avoid other topical treatments except emollients at treatment site - UV light (avoid excessive exposure to sunlight and sunlamps)

**INTERACTIONS** ▶ Appendix 1: pimecrolimus

**SIDE-EFFECTS**

▶ Common or very common | Increased risk of infection

▶ Rare or very rare | Skin discolouration

▶ Frequency not known | Skin papilloma

**PREGNANCY**

Manufacturer advises avoid; toxicity in animal studies following systemic administration.

**BREAST FEEDING**

Manufacturer advises caution; ensure infant does not come in contact with treated areas.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82

Topical pimecrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years. Pimecrolimus should be used within its licensed indications.

www.nice.org.uk/TA82

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 4, 11, 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

▶ Elidel (Meda Pharmaceuticals Ltd)

Pimecrolimus 10 mg per 1 gram Elidel 1% cream | 30 gram £37.41 DT + £37.41 | 60 gram £72.30 DT + £72.30 | 100 gram £100.07 DT + £100.07

Tacrolimus

**DRUG ACTION**

Tacrolimus is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)

▶ **TO THE SKIN**

Child 2–17 years: Apply twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks), 0.03% ointment to be applied thinly, then reduced to once daily until lesion clears

Child 16–17 years: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)

▶ **TO THE SKIN**

Child 2–15 years: Apply twice daily, 0.03% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

Child 16–17 years: Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

**CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions - application under occlusion - congenital epidermal barrier defects - contact with eyes - avoid contact with mucous membranes - congenital epidermal barrier defects - generalised erythroderma - immunodeﬁciency - infection at treatment site

**CAUTIONS**

UV light (avoid excessive exposure to sunlight and sunlamps)

**INTERACTIONS** ▶ Appendix 1: tacrolimus

**SIDE-EFFECTS**

▶ Common or very common | Alcohol intolerance - increased risk of infection - sensation abnormal - skin reactions

▶ Uncommon | Lymphadenopathy

▶ Frequency not known | Malignancy - neoplasms

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of hypersensitivity to macrolides.

**PREGNANCY**

Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.

**BREAST FEEDING**

Avoid—present in breast milk (following systemic administration).
**INHIBITORS**

- **Medicinal forms**
  - **National Funding/Access decisions**
    - **NICE decisions**
      - Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82
        
        Tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

      - **Topical tacrolimus** is recommended as an option for the second-line treatment for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.

      - **Cautionary and advisory labels**
        - **by subcutaneous injection** (specialist use only)
          - **Photochemotherapy**, or when these treatments cannot respond to other systemic treatments or moderate-to-severe plaque psoriasis that has not responded to other systemic treatments or those over 17 years of age.

        - **NICE decisions**
          - **Adalimumab, etanercept and ustekinumab** for treating plaque psoriasis in children and young people (July 2017) NICE TA455

          Ustekinumab is recommended as an option for treating plaque psoriasis in children and young people aged 12 years or older, only if the disease:

        - **is severe, as defined by a total PASI of 10 or more**,
11-Sep-2018

● has not responded to standard systemic therapy, such as ciclosporin, methotrexate or phototherapy, or these options are contra-indicated or not tolerated.

If the psoriasis has not responded adequately, stop treatment at 16 weeks. An adequate response is defined as a 75% reduction in PASI score from the start of treatment. Patients currently receiving ustekinumab who do not meet the above criteria and whose treatment was started within the NHS before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA455

RETINOID AND RELATED DRUGS

Acitretin

11-Sep-2018

● INDICATIONS AND DOSE

Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) | Palmarplantar pustular psoriasis (under expert supervision) | Severe congenital ichthyosis (under expert supervision)

▸ BY MOUTH
- Child 1 month–11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day
- Child 12–17 years: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

Severe Darier’s disease (keratosis follicularis) (under expert supervision)

▸ BY MOUTH
- Child 1 month–11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day
- Child 12–17 years: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

Harlequin ichthyosis (under expert supervision)

▸ BY MOUTH
- Neonate: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required.

● CONTRA-INDICATIONS

Hyperlipidaemia

● CAUTIONS

Avoid excessive exposure to sunlight and unsupervised use of sunlamps - diabetes (can alter glucose tolerance - initial frequent blood glucose checks) - do not donate blood during and for 2 years after stopping therapy (teratogenic risk) - in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) - investigate atypical musculoskeletal symptoms

● INTERACTIONS

▸ Appendix 1: retinoids

● SIDE-EFFECTS

▸ Common or very common Abdominal pain - arthralgia - brittle nails - conjunctivitis - diarrhoea - dry mouth - gastrointestinal disorder - haemorrhage - hair texture abnormal - headache - increased risk of infection - mucosal abnormalities - myalgia - nausea - oral disorders - peripheral oedema - skin reactions - thirst - vomiting - xerophthalmia

▸ Uncommon Dizziness - hepatic disorders - photosensitivity reaction - vision disorders

▸ Rare or very rare Bone pain - exostosis - idiopathic intracranial hypertension - peripheral neuropathy

▸ Frequency not known Angioedema - capillary leak syndrome - drowsiness - dysphonia - flushing - glucose tolerance impaired - granuloma - hearing impairment - hyperhidrosis - malaise - pyogenic granuloma - retinoic acid syndrome - taste altered - tinnitus

SIDE-EFFECTS, FURTHER INFORMATION

Exostosis Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which acitretin is a metabolite) and premature epiphyseal closure in children.

Benign intracranial hypertension Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

● CONCEPTION AND CONCEPTION

Effective contraception must be used.

Pregnancy prevention In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progesteron-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

▸ PREGNANCY

Avoid—teratogenic.

▸ BREAST FEEDING

Avoid.

▸ HEPATIC IMPAIRMENT

Manufacturer advises avoid in severe impairment.

▸ RENAL IMPAIRMENT

Avoid in severe impairment; increased risk of toxicity.

● MONITORING REQUIREMENTS

▸ Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.

▸ Check liver function at start, at least every 4 weeks for first 2 months and then every 3 months.

● PRESCRIBING AND DISPENSING INFORMATION

Prescribing for women of child-bearing potential Each prescription for acitretin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.

● PATIENT AND CARER ADVICE

Females of child-bearing potential must be advised on pregnancy prevention. A patient information leaflet should be provided.
Eczema and psoriasis

**Salicylic Acid with zinc oxide**

**INDICATIONS AND DOSE**

**Hyperkeratotic skin disorders**
- **TO THE SKIN**
- **Child:** Apply twice daily

**CAUTIONS**
- Avoid broken skin - avoiding inflamed skin

**SIDE-EFFECTS**
- Skin reactions

**PRESCRIBING AND DISPENSING INFORMATION**
- Zinc and Salicylic Acid Paste is also referred to as Lassar’s Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar’s Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

**MEDICINAL FORMS**
- Forms available from special-order manufacturers include: paste

**VITAMINS AND TRACE ELEMENTS**

**Calcipotriol**

**INDICATIONS AND DOSE**

**Plaque psoriasis**
- **TO THE SKIN USING OINTMENT**
- **Child 6-11 years:** Apply twice daily, when preparations used together maximum total calcipotriol 2.5 mg in any one week (e.g. scalp solution 20 mL with ointment 30 g); maximum 50 g per week
- **Child 12-17 years:** Apply twice daily, when preparations used together maximum total calcipotriol 3.75 mg in any one week (e.g. scalp solution 30 mL with ointment 45 g); maximum 75 g per week

**Scalp psoriasis**
- **TO THE SKIN USING SCALP LOTION**
- **Child 6-11 years (specialist use only):** Apply twice daily, when preparations used together maximum total calcipotriol 2.5 mg in any one week (e.g. scalp solution 20 mL with ointment 30 g); maximum 30 mL per week
- **Child 12-17 years (specialist use only):** Apply twice daily, when preparations used together maximum total calcipotriol 3.75 mg in any one week (e.g. scalp solution 30 mL with ointment 45 g); maximum 45 mL per week

**UNLICENSED USE**
- Calcipotriol ointment and scalp solution not licensed for use in children.

**CONTRA-INDICATIONS**
- Calcium metabolism disorders

**Calcitriol**

(1,25-Dihydroxycholecalciferol)

**INDICATIONS AND DOSE**

**Mild to moderate plaque psoriasis**
- **TO THE SKIN**
- **Child 12-17 years:** Apply twice daily, not more than 35% of body surface to be treated daily; maximum 30 g per day

**CONTRA-INDICATIONS**
- Do not apply under occlusion - patients with calcium metabolism disorders

**CAUTIONS**
- Avoid excessive exposure to sunlight and sunlamps - avoid on face - erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia)

**INTERACTIONS**
- Appendix 1: vitamin D substances

**SIDE-EFFECTS**
- Common or very common
- Skin reactions
- Uncommon
- Increased risk of infection
- Rare or very rare
  - Hypercalcaemia
  - Hypercalciuria
  - Phototoxicity

**PREGNANCY**
- Manufacturers advise avoid unless essential.

**BREAST FEEDING**
- No information available.

**HEPATIC IMPAIRMENT**
- Manufacturers advise avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**
- Manufacturers advise avoid in severe impairment.

**ADVICE**
- Patient information leaflet for Dovonex® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.
- Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

**PRESCRIBING AND DISPENSING INFORMATION**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, liquid, ointment, paste. There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, liquid, ointment, paste.
4 Perspiration

4.1 Hyperhidrosis

Hyperhidrosis

Overview

Aluminium chloride hexahydrate p. 775 is a potent antiperspirant used in the treatment of axillary, palmar, and plantar hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use tap water or glycopyrronium bromide below (as a 0.05% solution) in the iontophoretic treatment of hyperhidrosis of palms and soles. Botox® contains botulinum toxin type A complex p. 265 and is available for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihydrotic treatment; intradermal treatment is unlikely to be tolerated by most children and should be administered under hospital specialist supervision.

ANTIMUSCARINICS

Glycopyrronium bromide (Glycopyrrolate)

13-Sep-2017

INDICATIONS AND DOSE

Iontophoretic treatment of hyperhidrosis

TO THE SKIN

Child: Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature).

CONTRA-INDICATIONS

Infections affecting the treatment site

CONTRA-INDICATIONS, FURTHER INFORMATION Contra-indications applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

CAUTIONS

CAUTIONS, FURTHER INFORMATION Cautions applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

INTERACTIONS

INTERACTIONS → Appendix 1: glycopyrronium

SIDE-EFFECTS

Abdominal discomfort - eating disorder - pain - paraesthesia

SIDE-EFFECTS, FURTHER INFORMATION The possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects are unlikely with topical use.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for iontophoresis

Glycopyrronium bromide (Non-proprietary)

Glycopyrronium bromide 1 mg per 1 mg Glycopyrronium bromide powder for solution for iontophoresis | 3 gram £327.00 DT = £327.00
In pruritus ani, the underlying cause such as faecal soiling, eczema, psoriasis, or haemorrhoid infection should be treated.

Other drugs used for Pruritus
Alimemazine tartrate, p. 180
Cetirizine hydrochloride, p. 176
Chlorphenamine maleate, p. 180
Hydroxyzine hydrochloride, p. 181
Levocetirizine hydrochloride, p. 178

Antipruritics

Calamine with zinc oxide

5 Pruritus

Topical local antipruritics

Overview
Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (such as eczema, psoriasis, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying cause should be treated. Local antipruritics have a role in the treatment of pruritus in palliative care. Pruritus caused by cholestasis generally requires a bile acid sequestrant.

An emollient may be of value where the pruritus is associated with dry skin. Preparations containing calamine or crotamiton below are sometimes used but are of uncertain value.

A topical preparation containing dexamethasone 5% p. 776 is licensed for the relief of pruritus in eczema in children over 12 years; it can cause drowsiness and there may be a risk of sensitisation.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

Crotamiton

- **INDICATIONS AND DOSE**
  - **Pruritus (including pruritus after scabies)**
    - **TO THE SKIN**
      - Child 1 month–2 years (on doctor’s advice only): Apply once daily
      - Child 3–17 years: Apply 2–3 times a day
  - **CONTRA-INDICATIONS**
    - Acute exudative dermatoses
  - **CAUTIONS**
    - Avoid use in buccal mucosa - avoid use near eyes - avoid use on broken skin - avoid use on very inflamed skin - use on doctor’s advice for children under 5 years
  - **PREGNANCY**
    - Manufacturer advises avoid, especially during the first trimester—no information available.
**Rosacea and Acne**

**Rosacea and Acne**

Acne vulgaris in children

Acne vulgaris commonly affects children around puberty and occasionally affects infants. Treatment of acne should be commenced early to prevent scarring; lesions may worsen before improving. The choice of treatment depends on age, severity, and whether the acne is predominantly inflammatory or comedonal.

**Mild to moderate acne** is generally treated with topical preparations, such as benzoyl peroxide p. 779, azelaic acid p. 779, and retinoids.

**For moderate to severe inflammatory acne** or where topical preparations are not tolerated or are ineffective or where application to the site is difficult, systemic treatment with oral antibacterials may be effective. Co-cyprindol p. 777 (cyprome acetate with ethinylestradiol) has anti-androgenic properties and may be useful in young women with acne refractory to other treatments.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, acne with scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe oral isotretinoin p. 780.

**Acne in neonates and infants**

Inflammatory papules, pustules, and occasionally comedones may develop at birth or within the first month; most neonates with acne do not require treatment. Acne developing at 3–6 months of age may be more severe and persistent; lesions are usually confined to the face. Topical preparations containing benzoyl peroxide (at the lowest strength possible to avoid irritation), adapalene p. 779, or tretinoin p. 574 may be used if treatment for infantile acne is necessary. In infants with inflammatory acne, oral erythromycin p. 341 is used because topical preparations for acne are not well tolerated. In cases of erythromycin-resistant acne, oral isotretinoin can be given on the advice of a consultant dermatologist.

**Acne: topical preparations**

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide or topical retinoids. Alternatively, topical application of an antibacterial such as erythromycin or clindamycin p. 778 may be effective for inflammatory acne. However, topical antibacterials are probably no more effective than benzoyl peroxide and may promote the emergence of resistant organisms. If topical preparations prove inadequate, oral preparations may be needed. The choice of product and formulation (gel, solution, lotion, or cream) is largely determined by skin type, patient preference, and previous usage of acne products.

**Benzoyl peroxide and azelaic acid**
