Topical tretinoin p. 769, its isomer isotretinoin p. 1045, and adapalene p. 1045 (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne.

Other topical preparations for acne

Preparations containing aluminium oxide p. 1042 are not considered beneficial in acne.

A topical preparation of nicotinamide p. 1048 is available for inflammatory acne.

Oral preparations for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomedonal treatment (e.g. with topical benzoyl peroxide p. 1044) may also be required.

Either oxytetracycline p. 498 or tetracycline p. 498 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 995 and lymecycline p. 497 are alternatives to tetracycline.

Although minocycline p. 498 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin p. 1043 in a twice daily dose is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 462 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol p. 1042) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not

responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

Oral retinoid for acne

The retinoid isotretinoin p. 1045 reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Iso tretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must **not** be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

Rosacea

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1048 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical metronidazole p. 1008 or to topical azelaic acid p. 1043. Alternatively oral administration of oxytetracycline p. 498 or tetracycline p. 498, or erythromycin p. 1043, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 995 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin p. 1045 is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

7.1 Acne

ABRASIVE AGENTS

Aluminium oxide

INDICATIONS AND DOSE

Acne vulgaris

TO THE SKIN

- ▶ Adult: Apply 1-3 times a day, to be used instead of soap
- CONTRA-INDICATIONS Superficial venules telangiectasia
- CAUTIONS Avoid contact with eves

- SIDE-EFFECTS Skin irritation (discontinue use temporarily)
- TREATMENT CESSATION Discontinue use temporarily if skin becomes irritated.
- LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing (not considered beneficial).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dacto

EXCIPIENTS: May contain Fragrances, n-(3-chloroallyl)hexaminium chloride (quaternium 15)

► Brasivol (GlaxoSmithKline Consumer Healthcare)
Aluminium oxide 380 mg per 1 gram Brasivol Fine No.1 38%
paste | 75 gram | GSL| £2.76

ANTI-ANDROGENS

Co-cyprindiol

INDICATIONS AND DOSE

Moderate to severe acne in women of child-bearing age refractory to topical therapy or oral antibacterials | Moderately severe hirsutism

Y MOUTH

- Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly
- CONTRA-INDICATIONS Acute porphyria · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease or for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding
- CAUTIONS Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice arterial disease gene mutations associated with breast cancer (e.g. BRCA 1) history of severe depression especially if induced by hormonal contraceptive hyperprolactinaemia—seek specialist advice inflammatory bowel disease including Crohn's disease migraine personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) risk factors for venous thromboembolism sickle-cell disease undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

Venous thromboembolism There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levnongestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

• INTERACTIONS → Appendix 1 (oestrogens).

SIDE-EFFECTS

- \blacktriangleright Rare Rarely gallstones \cdot systemic lupus erythematosus
- ► Very rare Photosensitivity
- ▶ Frequency not known Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast enderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps · liver impairment · nausea · nervousness · reduced menstrual loss · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB · visual disturbances · vomiting · 'spotting' in early cycles
- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.
- BREAST FEEDING Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.
- HEPATIC IMPAIRMENT Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- PRESCRIBING AND DISPENSING INFORMATION A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram Epiduo 0.1%/2.5% gel | 45 gram PoM £17.91

Isotretinoin

INDICATIONS AND DOSE

Topical treatment of mild to moderate acne

 Adult: Apply 1–2 times a day, to be applied thinly Severe acne (under expert supervision) | Acne which is associated with psychological problems (under expert supervision) | Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision) | Acne with scarring (under expert supervision) | Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)

 Adult: Initially 500 micrograms/kg daily in 1-2 divided doses, increased if necessary to 1 mg/kg daily for 16-24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

CONTRA-INDICATIONS

- \blacktriangleright With oral use hyperlipidaemia \cdot hypervitaminosis A
- ▶ With topical use perioral dermatitis · rosacea

CAUTIONS

- With oral use avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression · monitor for depression
- With topical use allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) avoid accumulation in angles of the nose avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin avoid exposure to UV light (including sunlight, solariums) avoid in severe acne involving large areas avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics caution in sensitive areas such as the neck personal or familial history of non-melanoma skin cancer.

INTERACTIONS

▶ With oral use → Appendix 1 (retinoids). Avoid keratolytics.

SIDE-EFFECTS

- ► Common or very common
- With oral use anaemia arthralgia dryness of eyes (with blepharitis and conjunctivitis) dryness of lips (sometimes cheilitis) dryness of nasal mucosa (with epistaxis) dryness of pharyngeal mucosa (with hoarseness) dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus) epidermal fragility (trauma may cause

blistering) · haematuria · headache · myalgia · neutropenia · proteinuria · raised blood-glucose concentration · raised plasma-triglyceride concentration · raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration) · raised serum-transaminase concentration · thrombocytopenia · thrombocytosis

- Rare
- With oral use aggressive behaviour · alopecia · anxiety · depression · mood changes · skin reactions
- Verv rare
- ▶ With oral use acne fulminans allergic vasculitis arthritis benign intracranial hypertension • blurred vision • bone changes following long-term administration · calcification of tendons and ligaments following long-term administration · cataracts · colour blindness · convulsions · corneal opacities · decreased night vision · decreased tolerance to contact lenses · diabetes mellitus · dizziness · drowsiness · early epiphyseal closure following long-term administration · exacerbation of acne · gastrointestinal haemorrhage · glomerulonephritis · Gram-positive infections of skin and mucous membranes · granulomatous lesions · haemorrhagic diarrhoea · hepatitis · hirsutism · hyperuricaemia · impaired hearing · increased sweating · inflammatory bowel disease · keratitis · lymphadenopathy · malaise · nail dystrophy · nausea · papilloedema · paronychia · photophobia · photosensitivity · psychosis · raised serum-creatine kinase concentration · reduced bone density following long-term administration · skeletal hyperostosis following long-term administration · skin hyperpigmentation · suicidal ideation · tendinitis · visual disturbances
- ► Frequency not known
- With oral use Stevens-Johnson syndrome · toxic epidermal necrolvsis
- With topical use blistering of skin · burning · crusting of skin · dry or peeling skin · erythema · eye irritation · increased sensitivity to UVB light or sunlight · oedema · pruritus · stinging

SIDE-EFFECTS. FURTHER INFORMATION

Management of side-effects Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis. Psychiatric side-effects require expert referral. Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops. Visual disturbances require expert referral and possible withdrawal.

CONCEPTION AND CONTRACEPTION

▶ With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment-perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogenonly contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- With topical use Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered sufficiently effective).
- PREGNANCY Contra-indicated in pregnancy (teratogenic).
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT
- ▶ With oral use Avoid—further impairment may occur.
- RENAL IMPAIRMENT
- With oral use In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

MONITORING REQUIREMENTS

- With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).
- PRESCRIBING AND DISPENSING INFORMATION Isotretinoin is an isomer of tretinoin.

PATIENT AND CARER ADVICE

- With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment. Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.
- With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

MEDICINAL FORMS

Tretinoin with clindamycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, clindamycin p. 467, tretinoin p. 769.

INDICATIONS AND DOSE

Facial acne

TO THE SKIN

- Child 12-17 years: Apply daily, (to be applied thinly at bedtime)
- Adult: Apply daily, (to be applied thinly at bedtime)
- CONTRA-INDICATIONS Perioral dermatitis personal or familial history of non-melanoma skin cancer rosacea
- CAUTIONS Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid in severe acne involving large areas · avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck
- SIDE-EFFECTS Blistering of skin · burning · crusting of skin · dry or peeling skin (discontinue if severe) · erythema · eye irritation · increased sensitivity to UVB light or sunlight · oedema · pruritus · stinging · temporary changes of skin pigmentation
- CONCEPTION AND CONTRACEPTION Females of childbearing age must use effective contraception (oral progestogen-only contraceptives not considered sufficiently effective).
- PREGNANCY Contra-indicated in pregnancy.
- BREAST FEEDING Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.
- PATIENT AND CARER ADVICE If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal

response and the treatment should be continued until no new lesions develop.

7.2 Rosacea

Brimonidine tartrate

INDICATIONS AND DOSE

Facial ervthema in rosacea

TO THE SKIN

- ► Adult: Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks; maximum 5 mg per day
- CAUTIONS Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangitis obliterans
- INTERACTIONS → Appendix 1 (brimonidine).
- SIDE-EFFECTS
- ➤ Common or very common burning sensation at application site · stinging at application site
- Uncommon Dry mouth, heachache, paraesthesia, skin irritation, dry skin
- PREGNANCY Limited information available; manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution.
- RENAL IMPAIRMENT Manufacturer advises use with caution.
- DIRECTIONS FOR ADMINISTRATION Avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin.

- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving).
 Patients should be advised on administration of gel.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that brimonidine (Mirvaso®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe persistent facial erythema associated with rosacea in adult patients.

8 Scalp and hair conditions

Scalp and hair conditions

Dandruff is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium p. 1049 may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis. Ketoconazole shampoo p. 1011 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used.

Shampoos containing coal tar with salicylic acid p. 1035 may also be useful. A cream or an ointment containing coal tar with salicylic acid p. 1035 is very helpful in Psoriasis p. 1017 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Cradle cap in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

Hirsutism

Hirsutism may result from hormonal disorders or as a sideeffect of drugs such as minoxidil p. 1049, corticosteroids, anabolic steroids, androgens, danazol p. 636, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Éflornithine p. 1050 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1042 may be effective for moderately severe hirsutism. Metformin hydrochloride p. 594 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

Androgenetic alopecia

Finasteride p. 676 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil p. 1049 may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

ANTISEPTICS AND DISINFECTANTS

Benzalkonium chloride

INDICATIONS AND DOSE

Seborrhoeic scalp conditions associated with dandruff and scaling

TO THE SKIN

- ► Child: Apply as required
- ► Adult: Apply as required

8.1 Alopecia

PERIPHERAL VASODILATORS

Minoxidil

INDICATIONS AND DOSE

REGAINE® FOR MEN EXTRA STRENGTH FOAM

Androgenetic alopecia

TO THE SKIN

 Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks

REGAINE® FOR MEN EXTRA STRENGTH SOLUTION

Androgenetic alopecia

TO THE SKIN

► Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

REGAINE® FOR WOMEN REGULAR STRENGTH

Androgenetic alopecia

TO THE SKIN

- Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year
- CONTRA-INDICATIONS Phaeochromocytoma
- CAUTIONS Avoid contact with broken, infected, shaved, or inflamed skin · avoid contact with eyes · avoid contact with mouth · avoid contact with mucous membranes · avoid inhalation of spray mist · avoid occlusive dressings

CAUTIONS, FURTHER INFORMATION

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

- INTERACTIONS Caution—avoid topical drugs which enhance absorption.
- SIDE-EFFECTS
- ▶ Common or very common Headache · local irritation
- ► Uncommon Changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks) hypotension

SIDE-EFFECTS, FURTHER INFORMATION

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

- PREGNANCY Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.
- BREAST FEEDING Present in milk but not known to be harmful.
- PATIENT AND CARER ADVICE Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.

MEDICINAL FORMS

8.2 Hirsutism

Eflornithine

 DRUG ACTION An antiprotozoal drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

INDICATIONS AND DOSE

Adjunct to laser therapy for facial hirsutism in women TO THE SKIN

 Adult: Apply twice daily, to be applied thinly, discontinue use if no improvement after 4 months of treatment

SIDE-EFFECTS

- Common or very common Acne · burning at application site · rash · stinging at application site
- ► Uncommon Abnormal hair growth abnormal hair texture
- PREGNANCY Toxicity in animal studies—manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- PATIENT AND CARER ADVICE Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after eflornithine, do not wash treated area for 4 hours after application.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

9 Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1051 or povidone-iodine p. 1053, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1052, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10000 p. 1052, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin sulfate p. 1009 or lanolin.

ALCOHOLS

Industrial methylated spirit (Alcohol)

INDICATIONS AND DOSE

Skin preparation before injection

- ► Child: Apply as required
- ► Adult: Apply as required
- CONTRA-INDICATIONS Neonates
- CAUTIONS Avoid broken skin · flammable · patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants
- INTERACTIONS For the interactions following the *ingestion* of alcohol, see Appendix 1 (alcohol).
- SIDE-FFFFCTS

Overdose Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.

13 i i y For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 1123.

• PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Surgical Spirit, BP consists of methyl salicylate 0.5 mL, diethyl phthalate 2%, castor oil 2.5%, in industrial methylated spirit.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ALCOHOL (Non-proprietary)

Industrial methylated spirit 70% | 600 ml £5.71 Ethanol 950 ml per 1 litre, Wood naphtha 50 ml per 1 litre Industrial methylated spirit 95% | 600 ml £5.82 | 1000 ml

- Adult: Use as a pre-operative scrub for hand and skin disinfection

VIDENE® TINCTURE

Skin disinfection

TO THE SKIN

- ▶ Adult: Apply undiluted in pre-operative skin disinfection
- CONTRA-INDICATIONS Avoid regular use in patients with thyroid disorders · concomitant use of lithium · corrected gestational age under 32 weeks · infants body-weight under 1.5 kg · regular use in neonates
- CAUTIONS Broken skin · large open wounds

CAUTIONS, FURTHER INFORMATION

Large open wounds The application of povidone-iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

VIDENE® TINCTURE

Procedures involving hot wire cautery and diathermy

- SIDE-EFFECTS
- ▶ Rare Sensitivity
- PREGNANCY Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.
- BREAST FEEDING Avoid regular or excessive use.
- RENAL IMPAIRMENT Avoid regular application to inflamed or broken skin or mucosa.
- EFFECT ON LABORATORY TESTS May interfere with thyroid function tests

9.1 Minor cuts and abrasions

Minor cuts and abrasions

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine p. 1052 may be used to treat infected wounds or burns, but its use has now been largely superseded by other antispetics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1052 is used to clean minor cuts and abrasions. When prepared extemporaneously, the BP states Cetrimide Cream 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, consists of liquid paraffin 50% in freshly boiled and cooled purified water.

Flexible colloidon (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

ANTISEPTICS AND DISINFECTANTS

Cetrimide with chlorhexidine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1051.

INDICATIONS AND DOSE

Skin disinfection such as wound cleansing and obstetrics TO THE SKIN

- ▶ Child: To be used undiluted
- ▶ Adult: To be used undiluted

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

10 Skin disfigurement

Camouflagers

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked 'ACBS' cannot be prescribed on the NHS for postoperative scars and other deformities except as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

CAMOUFLAGES

- Covermark classic foundation (Derma UK Ltd) 15 ml (ACBS) • NHS indicative price = £11.86 (22 shades)

11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

HEPARINOIDS

Heparinoid

INDICATIONS AND DOSE

Superficial thrombophlebitis | Bruising | Haematoma TO THE SKIN

- ► Adult: Apply up to 4 times a day
- CONTRA-INDICATIONS Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes
- LESS SUITABLE FOR PRESCRIBING Hirudoid[®] is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

► **Hirudoid** (Genus Pharmaceuticals Ltd) **Heparinoid 3 mg per 1 gram** Hirudoid 0.3% gel | 50 gram P £3.99

DT price = £3.99

12 Warts and calluses

Warts and calluses

Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid p. 1057, formaldehyde, glutaraldehyde or silver nitrate p. 1056 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and bilstering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin (the major active ingredient of podophyllum) may be used for *soft*, *non-keratinised* external anogenital warts. Patients with a limited number of external warts or *keratinised* lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream p. 1057 is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis.

Inosine pranobex p. 550 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

ALDEHYDES AND DERIVATIVES

Formaldehyde

INDICATIONS AND DOSE

Warts, particularly plantar warts

TO THE SKIN

- ► Child: Apply twice daily
- ► Adult: Apply twice daily
- CAUTIONS Impaired peripheral circulation · not suitable for application to anogenital region · not suitable for application to face · not suitable for application to large areas · patients with diabetes at risk of neuropathic ulcers · protect surrounding skin and avoid broken skin · significant peripheral neuropathy
- SIDE-EFFECTS Skin irritation skin ulceration (with high concentrations)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Liquid

► FORMALDEHYDE (Non-proprietary)

IMMUNE RESPONSE MODIFIERS

Imiquimod

INDICATIONS AND DOSE

ALDARA®

Warts (external genital and perianal)

TO THE SKIN

 Adult: Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

Superficial basal cell carcinoma

TO THE SKIN

 Adult: Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment

Actinic keratosis

TO THE SKIN

 Adult: Apply 3 times a week for 4 weeks, to be applied to lesion at night, assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses

ZYCLARA[©]

Actinic keratosis

TO THE SKIN

- Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day
- CAUTIONS Autoimmune disease avoid broken skin avoid contact with eyes avoid contact with lips avoid contact

with nostrils · avoid open wounds · immunosuppressed patients · not suitable for internal genital warts · uncircumcised males (risk of phimosis or stricture of foreskin)

SIDE-EFFECTS

- ► Common or very common Burning sensation erosion erythema excoriation headache influenza-like symptoms itching local reactions myalgia oedema scabbing
- ► Uncommon Alopecia · local ulceration
- ► Rare Cutaneous lupus erythematosus-like effect Stevens-Johnson syndrome
- ▶ Very rare Dysuria
- ► Frequency not known Permanent hyperpigmentation permanent hypopigmentation
- CONCEPTION AND CONTRACEPTION May damage latex condoms and diaphragms.
- PREGNANCY No evidence of teratogenicity or toxicity in animal studies: manufacturer advises caution.
- BREAST FEEDING No information available.

• DIRECTIONS FOR ADMINISTRATION

ALDARA®

Important Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

Important Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water

1 Immunoglobulin therapy

Immunoglobulins

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1063 and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh.

Further information on the use of immunoglobulins is included in Public Health England's *Immunoglobulin Handbook* www.gov.uk/phe, and in the Department of Health's publication, *Immunisation against Infectious Disease*, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1065 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1064 is available from the Specialist and Reference Microbiology

Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1062 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin p. 1063 ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin p. 1063 (containing 10%–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A** virus (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin p. 1063 (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, consult *Clinical Guidelines for Immunoglobulin Use* (www.gov.uk/dh).

Hepatitis /

Hepatitis A vaccine p. 1081 is preferred for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin p. 1063 is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine p. 1081 can be given at the same time, but it should be given at a separate injection site.

Meacles

Intravenous or subcutaneous normal immunoglobulin p. 1063 may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- · non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1087 for prophylaxis following exposure to measles.

Rubella

Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin p. 1063 should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1087.

Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see *Immunoglobulin Handbook* (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1063 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

Hepatitis B immunoglobulin

Disease-specific hepatitis B immunoglobulin p. 1062 ('HBIG') is available for use in association with hepatitis B vaccine p. 1083 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

Rabies immunoglobulin

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 1064 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 1090 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin p. 1064, it should be given within 7 days of starting the course of rabies vaccine.

Tetanus immunoglobulin

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1065 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 1008 and wound cleansing, should also be used for the treatment of established cases of tetanus.

Varicella-zoster immunoglobulin

Varicella-zoster immunoglobulin p. 1065 (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks' gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone; children 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; adults about 40 mg daily for more than 1 week.

Important: for full details consult *Immunisation against Infectious Disease*. Varicella-zoster vaccine p. 1092 is available.

Anti-D (Rho) immunoglobulin

Anti-D (Rh_0) immunoglobulin p. 1061 is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh_0) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh₀) immunoglobulin p. 1061 should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh₀) immunoglobulin p. 1061 is also given when significant feto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-

D (Rh₀) immunoglobulin below is determined according to the level of exposure to rhesus-positive blood.

Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh₀) immunoglobulin below is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

MMR vaccine

Measles, mumps and rubella vaccine, live p. 1087 may be given in the postpartum period with anti-D (Rh₀) immunoglobulin below injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

IMMUNOGLOBULINS

Anti-D (Rh₀) immunoglobulin

INDICATIONS AND DOSE

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, following birth of rhesus-positive infant BY DEEP INTRAMUSCULAR INJECTION

Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

BY DEEP INTRAMUSCULAR INJECTION

 Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

BY DEEP INTRAMUSCULAR INJECTION

 Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, antenatal prophylaxis

BY DEEP INTRAMUSCULAR INJECTION

 Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, antenatal prophylaxis (alternative NICE recommendation)

BY DEEP INTRAMUSCULAR INJECTION

 Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 34 weeks gestation

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, following $Rh_0(D)$ incompatible blood transfusion

BY DEEP INTRAMUSCULAR INJECTION

 Females of childbearing potential: 100-125 units/mL, dose per mL transfused rhesus-positive red cells given, subcutaneous route used for patients with bleeding disorders

RHOPHYLAC®

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

Females of childbearing potential: 1000–1500 units, dose to administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

 Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, antenatal prophylaxis

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

► Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, following $Rh_0(D)$ incompatible blood transfusion

BY INTRAVENOUS INJECTION

- Females of childbearing potential: 50 units/mL, dose per mL of transfused rhesus-positive blood, alternatively 100 units/mL, dose per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders
- CONTRA-INDICATIONS Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients treatment of idiopathic thrombocytopenia purpura in splenectomised patients
- CAUTIONS Immunoglobulin A deficiency · possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

MMR vaccine may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

- INTERACTIONS → Appendix 1 (immunoglobulins).
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Rare Anaphylaxis · dyspnoea · hypotension · tachycardia · urticaria
- ► Frequency not known Abdominal pain · arthralgia · asthenia · back pain · diarrhoea · dizziness · drowsiness ·

fever \cdot headache \cdot hypertension \cdot hypotension \cdot injection site pain \cdot malaise \cdot myalgia \cdot nausea \cdot pruritus \cdot rash \cdot sweating \cdot vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use abdominal distension · abdominal pain · blood pressure fluctuations · deep vein thrombosis · haemolytic anaemia · injection site reactions · myocardial infarction · pulmonary embolism · stroke · thromboembolic events
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins
 need to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

➤ Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative. www.nice.org.uk/TA156

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Hepatitis B immunoglobulin

INDICATIONS AND DOSE

Prophylaxis against hepatitis B infection
BY INTRAMUSCULAR INJECTION

► Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material

BY INTRAVENOUS INFUSION

► Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

Prevention of hepatitis B in haemodialysed patients
BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

Prophylaxis against re-infection of transplanted liver BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients

BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2-3 weeks after last dose of intravenous hepatitis B immunoglobulin
- ► Adult (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin
- CAUTIONS IgA deficiency · interference with live virus vaccines

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Common or very common Injection site reactions

Uncommon Abdominal pain anaphylaxis arthralgia buccal ulceration chest pain dizziness dyspnoea glossitis headache tremor

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use abdominal distension · abdominal pain · blood pressure fluctuations · deep vein thrombosis · haemolytic anaemia · injection site reactions · myocardial infarction · pulmonary embolism · stroke · thromboembolic events
- PRESCRIBING AND DISPENSING INFORMATION Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins
 need to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

MEDICINAL FORMS

Normal immunoglobulin

INDICATIONS AND DOSE

To control outbreaks of hepatitis A
BY DEEP INTRAMUSCULAR INJECTION

► Adult: 500 mg

Rubella in pregnancy, prevention of clinical attack BY DEEP INTRAMUSCULAR INJECTION

Females of childbearing potential: 750 mg

Antibody deficiency syndromes

BY SUBCUTANEOUS INFUSION

► Adult: (consult product literature)

SUBGAM®

Hepatitis A prophylaxis in outbreaks

BY INTRAMUSCULAR INJECTION

Adult: 750 mg

UNLICENSED USE

SUBGAM® Subgam® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against hepatitis A or rubella.

 CONTRA-INDICATIONS Patients with selective IgA deficiency who have known antibody against IgA

FLEBOGAMMA® DIF SOLUTION FOR INFUSION

Hereditary fructose intolerance (contains sorbitol)

GAMMAPLEX® SOLUTION FOR INFUSION

Hereditary fructose intolerance (contains sorbitol)

HIZENTRA® SOLUTION FOR INFUSION

Hyperprolinaemia (contains L-proline)
PRIVIGEN® SOLUTION FOR INFUSION
Hyperprolinaemia (contains L-proline)

CAUTIONS

GENERAL CAUTIONS

Agammaglobulinaemia with or without IgA deficiency hypogammaglobulinaemia with or without IgA deficiency interference with live virus vaccines

SPECIFIC CAUTIONS

With intravenous use ensure adequate hydration · obesity · renal insufficiency · risk factors for arterial thromboembolic events · risk factors for venous thromboembolic events · thromboembolic disorders

OCTAGAM® SOLUTION FOR INFUSION

Falsely elevated results with blood glucose testing systems (contains maltose)

CAUTIONS, FURTHER INFORMATION

Interference with live virus vaccines Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

- INTERACTIONS → Appendix 1 (immunoglobulins).
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Rare Acute renal failure · anaphylaxis · aseptic meningitis
 cutaneous skin reactions · hypotension
- ► Frequency not known Arthralgia · chills · diarrhoea · dizziness · fever · headache · low back pain · muscle spasms · myalgia · nausea

SPECIFIC SIDE-EFFECTS

With intravenous use abdominal distension abdominal pain blood pressure fluctuations deep vein thrombosis haemolytic anaemia injection site reactions myocardial infarction pulmonary embolism stroke thromboembolic events

SIDE-EFFECTS, FURTHER INFORMATION

Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

- MONITORING REQUIREMENTS Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.
- DIRECTIONS FOR ADMINISTRATION Preparations for subcutaneous use may be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.
 For intravenous use

KIOVIG® SOLUTION FOR INFUSION

Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

GAMUNEX® SOLUTION FOR INFUSION

Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

- PRESCRIBING AND DISPENSING INFORMATION Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.
- With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins
 need to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

Rabies immunoglobulin

INDICATIONS AND DOSE

Post-exposure prophylaxis against rabies infection
BY LOCAL INFILTRATION OR BY INTRAMUSCULAR INJECTION

- Child: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)
- Adult: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)
- CAUTIONS IgA deficiency · interference with live virus vaccines
- SIDE-EFFECTS
- ► Rare Anaphylaxis arthralgia buccal ulceration chest tightness dizziness dyspnoea glossitis tremor
- ► Frequency not known Facial oedema · injection site pain · injection site swelling
- PRESCRIBING AND DISPENSING INFORMATION The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose. Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins
 need to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► RABIES IMMUNOGLOBULIN (Non-proprietary)

Rabies immunoglobulin human 500 unit Rabies immunoglobulin human 500unit solution for injection vials | 1 vial PoM £412.13

Tetanus immunoglobulin

INDICATIONS AND DOSE

Post-exposure prophylaxis

BY INTRAMUSCULAR INJECTION

- Child: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
- Adult: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

Treatment of tetanus infection

BY INTRAMUSCULAR INJECTION

- Child: 150 units/kg, dose may be given over multiple sites
- Adult: 150 units/kg, dose may be given over multiple sites
- CAUTIONS IgA deficiency interference with live virus vaccines
- SIDE-EFFECTS
- ► Rare Anaphylaxis arthralgia buccal ulceration chest tightness dizziness dyspnoea glossitis tremor
- ► Frequency not known Facial oedema · injection site swelling · pain at injection site
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins
 need to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

MEDICINAL FORMS

Solution for injection

► TETANUS IMMUNOGLOBULIN (Non-proprietary)

Tetanus immunoglobulin human 250 unit Tetanus immunoglobulin human 250unit solution for injection vials | 1 vial PoM £45.00

Varicella-zoster immunoglobulin (Antivaricella-zoster Immunoglobulin)

INDICATIONS AND DOSE

Prophylaxis against varicella infection

BY DEEP INTRAMUSCULAR INJECTION

- Adult: 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease
- CAUTIONS IgA deficiency · interference with live virus vaccines
- SIDE-EFFECTS
- ▶ Rare Anaphylaxis
- ► Frequency not known Injection site pain · injection site swelling

- DIRECTIONS FOR ADMINISTRATION Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.
- PRESCRIBING AND DISPENSING INFORMATION Available from selected Public Health England and NHS laboratories (also from BPL).
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins
 need to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► VARICELLA-ZOSTER IMMUNOGLOBULIN (Non-proprietary)
Varicella-Zoster immunoglobulin human 250 mg Varicella-Zoster immunoglobulin human 250mg solution for injection vials |
1 vial [PoM] £350.00

2 Post-exposure prophylaxis

ANTITOXINS

Botulism antitoxin

 DRUG ACTION A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of Clostridium botulinum.

INDICATIONS AND DOSE

Post exposure prophylaxis of botulism

BY INTRAMUSCULAR INJECTION

► Adult: (consult product literature)

SIDE-EFFECTS Hypersensitivity reactions SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions It is essential to read the contraindications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- PRE-TREATMENT SCREENING All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).
- PRESCRIBING AND DISPENSING INFORMATION Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

 BOTULISM ANTITOXIN (Non-proprietary)
 Botulinum antitoxin type A 750 unit per 1 ml, Botulinum antitoxin type B 500 unit per 1 ml, Botulinum antitoxin type E **50 unit per 1 ml** Botulism-Antitoxin Behring 25g/250ml solution for infusion bottles | 1 bottle | PoM| no price available

Diphtheria antitoxin (Dip/Ser)

INDICATIONS AND DOSE

Passive immunisation in suspected cases of diphtheria BY INTRAVENOUS INFUSION

 Adult: Dose should be given without waiting for bacteriological confirmation (consult product literature)

CAUTIONS

Hypersensitivity Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

- SIDE-EFFECTS
- ► Common or very common Hypersensitivity reactions
- PRE-TREATMENT SCREENING Diphtheria antitoxin is derived from horse serum and reactions are common; tests for hypersensitivity should be carried out before use.
- PRESCRIBING AND DISPENSING INFORMATION Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

3 Tuberculosis diagnostic test

DIAGNOSTICS

Tuberculin purified protein derivative (Tuberculin PPD)

INDICATIONS AND DOSE

Mantoux test

BY INTRADERMAL INJECTION

► Child: 2 units for one dose

► Adult: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)

▶ Child: 10 units for 1 dose
▶ Adult: 10 units for 1 dose

Dose equivalence and conversion

2 units is equivalent to 0.1 mL of 20 units/mL strength. 10 units is equivalent to 0.1 mL of 100 units/mL strength.

CAUTIONS

Mantoux test Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine.

 PRESCRIBING AND DISPENSING INFORMATION Available from ImmForm (SSI brand). The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

4 Vaccination

Vaccines

Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
- detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
- extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (ICVI).

Chapters from the handbook are available at www.immunisation.dh.gov.uk

The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales). For most up to date immunisation schedule consult The complete routine immunisation schedule available at (www.gov.uk)

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against Haemophilus influenzae type b, meningococcal C, and hepatitis B after primary immunisation.

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only	Bacillus Calmette-Guérin vaccine p. 1078 Hepatitis B vaccine p. 1083
2 months	Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1079 First dose Pneumococcal vaccine p. 1089 First dose Rotavirus vaccine p. 1090 First dose
3 months	Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1079 Second dose Meningococcal group C vaccine p. 1088 First dose Rotavirus vaccine p. 1090 Second dose
4 months	Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1079 Third dose Pneumococcal vaccine p. 1089 Second dose
12-13 months	Measles, mumps and rubella vaccine, live p. 1087 First dose Pneumococcal vaccine p. 1089 Single booster dose Haemophilus influenzae type B with meningococcal group C vaccine p. 1080 Single booster dose
Between 3 years and 4 months, and 5 years	Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1080 Single booster dose. Note: Preferably allow interval of at least 3 years after completing primary course Measles, mumps and rubella vaccine, live p. 1087 Second dose
11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-14 years of age in Scotland.	Human papillomavirus vaccines p. 1085 If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed. The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, for those females who started the schedule with <i>Cervarix®</i> under the national immunisation programme, but did not complete the vaccination course, the course can be completed with <i>Gardasil®</i> .
13-15 years	Meningococcal group C vaccine p. 1088 Single booster dose
13-18 years	Diphtheria with poliomyelitis and tetanus vaccine p. 1080 Single booster dose. Note: Can be given at the same time as the booster dose of meningococcal group C conjugate vaccine at 13-15 years of age.
During adult life, women of child-bearing age susceptible to rubella	Measles, mumps and rubella vaccine, live p. 1087 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation.
During adult life, those entering or being at university who are at risk of meningococcal group C disease	Meningococcal group C vaccine p. 1088 Single dose. Note: Should be offered to those of any age entering or being at university who have never been vaccinated against meningococcal group C disease, or those born after September 1995 who are entering university and only received meningococcal group C vaccine under the age of 10 years
During adult life, if not previously immunised	Diphtheria with poliomyelitis and tetanus vaccine p. 1080
70 years	Varicella-zoster vaccine p. 1092 Single dose

Vaccines and HIV infection

HIV-positive individuals with or without symptoms can receive the following live vaccines:

· MMR (but avoid if immunity significantly impaired; use of normal immunoglobulin should be considered after exposure to measles), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella-zoster immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus;

and the following inactivated vaccines:

• anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should **not** receive:

• BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), vellow fever (if yellow fever risk is unavoidable, specialist advice should be sought)

The above advice differs from that for other immunocompromised patients; Immunisation Guidelines for HIV-infected Adults issued by British HIV Association (BHIVA) are available at www.bhiva.org

Vaccines and asplenia

The following vaccines are recommended for asplenic patients or those with splenic dysfunction:

• haemophilus influenzae type b; influenza; meningococcal A, C, W135, and Y conjugate; pneumococcal.

Vaccines and antisera availability

Anthrax vaccine p. 1078 and yellow fever vaccine, live p. 1092, botulism antitoxin p. 1065, diphtheria antitoxin p. 1066, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency treatment of poisoning

Enquiries for vaccines not available commercially can also be made to:

Public Health England

Vaccines and Countermeasures Response Department Public Health England Wellington House 133-155 Waterloo Road London SE1 8UG vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

University Hospital of Wales

Welsh Medicines Information Centre University Hospital of Wales Cardiff CF14 4XW (029) 2074 2979

In Northern Ireland:

Northern Health and Social Care Trust

Pharmacy and Medicines Management Centre Northern Health and Social Care Trust Beech House Antrim Hospital Site Bush Road Antrim BT41 2RL rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine

Anthrax vaccine p. 1078 is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with B. anthracis. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis. Advice on the use of anthrax vaccine p. 1078 for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

BCG vaccine

BCG (Bacillus Calmette-Guérin) vaccine p. 1078 should be given intradermally by operators skilled in the technique.

The expected reaction to successful BCG vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should **not** be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculoprotein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0-12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients,

clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients) at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;

 individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.gov.uk/phe.

Bladder instillations of BCG are licensed for the management of bladder carcinoma.

See also Tuberculosis p. 501 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

Tuberculosis Diagnostic Agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of tuberculin purified protein derivative p. 1066 (PPD).

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: QuanitFERON® TB Gold and T-SPOT®.TB. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.gov.uk/ phe.

Botulism antitoxin

A polyvalent botulism antitoxin p. 1065 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Cholera vaccine

Cholera vaccine p. 1079 (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V.cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

Diphtheria vaccine

Diphtheria-containing vaccines are prepared from the toxin of Corynebacterium diphtheriae and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary

immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose]. tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Diphtheria-containing vaccines for children over 10 years and adults

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time: it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with C. diphtheriae or C. ulcerans should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dosel, tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined: those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

Haemophilus influenzae type B conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing Haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12-13 months of age.

Children 1-10 years who have not been immunised against Haemophilus influenzae type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed. these children should be given 3 doses of diphtheria. tetanus, pertussis (acellular, component), and poliomyelitis (inactivated). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

Invasive Haemophilus influenzae type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

See also use of rifampicin p. 508 in the prevention of secondary cases of Haemophilus influenzae type b disease. Individuals diagnosed with asplenia, splenic dysfunction, or complement deficiency at:

- under 2 years of age should be vaccinated according to the Immunisation Schedule. The booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), given at 12-13 months of age, should be followed at least 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. An additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given after the second birthday;
- over 2 years of age should receive one dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine.

Hepatitis A vaccine

Hepatitis A vaccine p. 1081 is prepared from formaldehydeinactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- laboratory staff who work directly with the virus:
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- · individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- · patients with severe liver disease;
- travellers to high-risk areas;
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on reimmunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Intramuscular normal immunoglobulin p. 1063 is recommended for use in addition to hepatitis A vaccine p. 1081 for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

Hepatitis B vaccine

Hepatitis B vaccine p. 1083 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and hepatitis B immunoglobulin given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for eantigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother's e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;

- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients' tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties:
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- · foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances. Generally, three or four doses are required for primary immunisation; an 'accelerated schedule' is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis.

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook *Immunisation against Infectious Disease*. Specific hepatitis B immunoglobulin p. 1062 ('HBIG') is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection.

A combined hepatitis A and B vaccine p. 1082 is also available.

Human papillomavirus vaccine

Human papillomavirus vaccines p. 1085 is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccines will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6-24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first (see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more. Females receiving their first dose aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4-6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. If a 3-dose course of vaccination has been started before September 2014, then where possible this should be completed; if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. Under the national programme in England, females remain eligible to receive the human papillomavirus vaccines p. 1085 up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccines should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 1085 in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- · chronic renal disease;
- · chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine p. 1085 is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza

immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action.

Unless contra-indicated, the live influenza vaccine p. 1085, Fluenz $Tetra^{\oplus}$, is preferred in children aged 2-18 years because it provides a higher level of protection than inactivated influenza vaccine p. 1085. From 1 September 2014, seasonal influenza vaccine will also be offered to all children aged 2-4 years (i.e. those born between 2 September 2009 and 1 September 2012).

Information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.gov.uk/phe.

Japanese encephalitis vaccine

Japanese encephalitis vaccine p. 1086 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org).

Measles, Mumps and Rubella vaccine

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine, live p. 1087 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contraindication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in seronegative women of childbearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery

is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months-5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live p. 1087 immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Trave

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

Meningococcal vaccine

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

A meningococcal group B vaccine, Bexsero[®], is licensed in the UK against infection caused by Neisseria meningitidis serogroup B. Bexsero[®] contains 3 recombinant Neisseria meningitidis serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against Neisseria meningitidis serogroup B; the

proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation

Meningococcal group C conjugate vaccine provides longterm protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 3 months of age; 2 booster doses are recommended, the first is given at 12–13 months of age (combined with haemophilus influenzae type b vaccine), and the second at 13–15 years of age (see Immunisation Schedule).

Unimmunised children aged 4–12 months should be given 1 dose of meningococcal group C conjugate vaccine and then they should be vaccinated according to the Immunisation Schedule. Unimmunised children aged 1–10 years should be given 1 dose of meningococcal group C conjugate vaccine, followed by a booster dose at 13–15 years of age. Unimmunised individuals aged 10–25 years should be given 1 dose of meningococcal group C conjugate vaccine, but a booster dose is not required.

From August 2014 there will be a catch-up programme for individuals aged under 25 years who are attending university for the first time and who did not receive a dose of meningococcal group C conjugate vaccine at 13–15 years of age

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org)

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine p. 1089 is required for those traveling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts

For advice on the immunisation of *laboratory workers and close contacts* of cases of meningococal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

Pertussis vaccine

Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough)

requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1-10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussiscontaining vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; Boostrix-IPV®) between 28 to 38 weeks of pregnancy; the optimal time for vaccination is between 28-32 weeks of pregnancy. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 28-38 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Local reactions do not contra-indicate further doses. The vaccine should not be withheld from children with a history to a preceding dose of:

- · fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- · severe local reaction, irrespective of extent.

Pneumococcal vaccine

Pneumococcal vaccine p. 1089 protects against infection with Streptococcus pneumoniae (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. Pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococci, whereas pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide

from either 10 capsular types (Synflorix®) or 13 capsular types (Prevenar 13®) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (Prevenar 13®) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age. the second at 4 months, and the third at 12-13 months (see Immunisation Schedule).

Pneumococcal vaccine is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years:
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease:
- chronic renal disease;
- chronic liver disease;
- · diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may
- · child under 5 years with a history of invasive pneumococcal disease;
- at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; patients should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

Choice of vaccine

Children under 2 years at increased risk of pneumococcal infection (see list) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12-13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Revaccination

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

Poliomyelitis vaccine

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

Rabies vaccine

Rabies vaccine p. 1090 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis

Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are

likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rables is indicated during pregnancy if there is substantial risk of exposure to rables and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hbs.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine p. 1090, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England's Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/ (028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin p. 1064 is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation

course can be discontinued if it is proved that the individual was not at risk.

Rotavirus vaccine

Rotavirus vaccine p. 1090 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses. the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6-15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine p. 1090 virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

Smallpox vaccine

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the posteradication era should be consulted at www.gov.uk/phe.

Tetanus vaccine

Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses (see Diphtheriacontaining Vaccines).

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus: those abusing drugs by injection should be vaccinated if unimmunised-booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised

Wounds

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough

- For clean wounds: fully immunised individuals (those) who have received a total of 5 doses of a tetanuscontaining vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)
- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, coamoxiclay, or metronidazole) may also be required for tetanus-prone wounds.

Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine, inactivated p. 1091 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3-5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

Typhoid vaccine

Typhoid vaccine p. 1091 is available as Vi capsular polysaccharide (from Salmonella typhi) vaccine for injection and as live attenuated Salmonella typhi for oral use.

Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic, especially if staying with or visiting local people;
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is
- laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi.

Typhoid vaccination is not a substitute for scrupulous personal hygiene.

Capsular polysaccharide typhoid vaccine p. 1091 is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1-2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

Oral typhoid vaccine p. 1091 is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to Salmonella typhi, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

Varicella-zoster vaccine

The live varicella-zoster vaccine p. 1092, Varilrix® and Varivax®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella-zoster vaccine p. 1092 virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy;

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

The high potency, live varicella-zoster vaccine p. 1092, $Zostavax^{\otimes}$, is recommended for the prevention of herpes zoster (shingles) in adults who are, or were, 70 years of age on 1 September 2014. The 2014-15, catch-up programme with $Zostavax^{\otimes}$ will be offered to all who are, or were, 78 or 79 years of age on 1 September 2014. A single dose of $Zostavax^{\otimes}$ is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although $Zostavax^{\otimes}$ is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella-zoster immunoglobulin p. 1065 is used to protect susceptible individuals at increased risk of varicella infection.

Yellow fever vaccine

Yellow fever vaccine, live p. 1092 is indicated for those travelling or living in areas where infection is endemic and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Travel vaccinations

See advice on Malaria, treatment p. 529.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although

all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East. Asia. and South America.

Travellers to areas that have a high incidence of **poliomyelitis** or **tuberculosis** should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world.

Protection against **hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against **rabies** is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a **tetanus** booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on **diphtheria**, on **Japanese encephalitis**, and on **tick-borne encephalitis** is included in *Health Information* for Overseas Travel.

Food hygiene

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org.

The handbook, Health Information for Overseas Travel (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

VACCINES

Vaccines

CONTRA-INDICATIONS

Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

• CAUTIONS Acute illness • minor illnesses

CAUTIONS, FURTHER INFORMATION

Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset. Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Specialist advice should be sought for those being treated

with high doses of corticosteroids (dose equivalents of

prednisolone: adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

The Royal College of Paediatrics and Child Health has produced a statement, Immunisation of the Immunocompromised Child (2002) (available at www.rcpch.ac.uk).

Predisposition to neurological problems When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contraindication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule. When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the

- INTERACTIONS → Appendix 1 (vaccines).
- SIDE-FFFFCTS

GENERAL SIDE-EFFECTS

condition is stable.

- ► Common or very common Fatigue · fever · gastro-intestinal disturbances · headache · irritability · loss of appetite · lymphangitis · malaise · myalgia
- ▶ Very rare Anaphylaxis (can be fatal) angioedema (can be fatal) · bronchospasm (can be fatal) · hypersensitivity reactions (can be fatal) · urticaria (can be fatal)
- ► Frequency not known Arthralgia · asthenia · dizziness · drowsiness · influenza-like symptoms · lymphadenopathy · paraesthesia · rash

SPECIFIC SIDE-EFFECTS

► Common or very common

With intradermal use or intramuscular use or subcutaneous use induration may develop at the injection site. inflammation · local reactions · pain · redness · sterile abscess may develop at the injection site

SIDE-EFFECTS, FURTHER INFORMATION

Occasionally serious adverse reactions can occur—these should always be reported to the CHM. Post-immunisation pyrexia in infants The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed. paracetamol can be given. Ibuprofen can be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

 ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).

- PREGNANCY Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.
- BREAST FEEDING Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease.
 There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.
- DIRECTIONS FOR ADMINISTRATION If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart.

Vaccines should not be given intravenusly. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with **bleeding disorders** such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting blood borne infections, such as HIV.

- Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.
- HANDLING AND STORAGE Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines need to be stored at 2-8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Anthrax vaccine

INDICATIONS AND DOSE

Pre-exposure immunisation against anthrax | Post-exposure immunisation

BY INTRAMUSCULAR INJECTION

 Adult: Initially 1 dose every 3 weeks for 3 doses, followed by 1 dose after 6 months, to be administered in the deltoid region, 1 dose is equivalent to 0.5 mL

Booster

BY INTRAMUSCULAR INJECTION

- Adult: 1 dose every 12 months, to be administered in deltoid region, 1 dose is equivalent to 0.5 mL
- PRESCRIBING AND DISPENSING INFORMATION Available from Public Health England's Centre for Emergency Preparedness and Response (Porton Down).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Thiomersal

► ANTHRAX VACCINE (Non-proprietary)

Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5ml ampoules | 5 ampoule PoM no price available

Bacillus Calmette-Guérin vaccine

 DRUG ACTION BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis which stimulates the development of immunity to M. tuberculoris

INDICATIONS AND DOSE

Immunisation against tuberculosis

BY INTRADERMAL INJECTION

- Child 1-11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- Adult: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- CONTRA-INDICATIONS Generalised septic skin conditions neonate in household contact with known or suspected case of active tuberculosis

CONTRA-INDICATIONS, FURTHER INFORMATION

A lesion-free site should be used to administer BCG vaccine to patients with eczema.

CAUTIONS

BCG vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

· CIDE EFFECTS

- ▶ Rare Disseminated complications osteitis osteomyelitis
- ► Frequency not known Prolonged ulceration at the injection site subcutaneous abscess at the injection site
- PRE-TREATMENT SCREENING Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see tuberculin purified protein derivative p. 1066). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

• DIRECTIONS FOR ADMINISTRATION

Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb $\equiv 0.1 \ \text{mL}$ injection, 3 mm bleb $\equiv 0.05 \ \text{mL}$ injection; if considerable

resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

 PRESCRIBING AND DISPENSING INFORMATION Available from health organisations or direct from ImmForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).

MEDICINAL FORMS

INDICATIONS AND DOSE

Primary immunisation

BY INTRAMUSCULAR INJECTION

- ► Child 2 months-10 years: 0.5 mL every month for 3 doses
- UNLICENSED USE Infanrix-IPV + Hib® not licensed for use in children over 36 months; *Pediacel*® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10
- SIDE-EFFECTS Atopic dermatitis hypotonia restlessness · sleep disturbances · unusual crying in infants

SIDE-EFFECTS, FURTHER INFORMATION

Side effects of vaccines containing pertussis The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- · severe local reaction, irrespective of extent.
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood schedule from health organisations or ImmForm.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cholera vaccine

INDICATIONS AND DOSE

Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations) BY MOUTH

- ► Child 2-5 years: 1 dose every 1-6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- ► Child 6-17 years: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- ▶ Adult: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

Booster

BY MOUTH

- ► Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
- ► Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
- Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
- CONTRA-INDICATIONS Acute gastro-intestinal illness
- SIDE-FFFFCTS
- ▶ Rare Cough respiratory symptoms rhinitis
 - Very rare Insomnia · sore throat
- ► Frequency not known Abdominal pain and cramps diarrhoea · nausea · vomiting

DIRECTIONS FOR ADMINISTRATION

- In children Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2-6 years. discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.
- In adults Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

Diphtheria with pertussis, poliomyelitis vaccine and tetanus

INDICATIONS AND DOSE

First booster dose

BY INTRAMUSCULAR INJECTION

 Child 3-10 years: 0.5 mL, to be given 3 years after primary immunisation

Vaccination of pregnant women against pertussis BY INTRAMUSCULAR INJECTION

- Females of childbearing potential: 0.5 mL for 1 dose
- SIDE-EFFECTS Restlessness sleep disturbances unusual crying in infants

SIDE-EFFECTS. FURTHER INFORMATION

Side effects of vaccines containing pertussis The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.
- PREGNANCY Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussiscontaining vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood immunisation schedule from health organisations or ImmForm. Available for vaccination of pregnant women from ImmForm.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- ▶ Boostrix-IPV (GlaxoSmithKline UK Ltd) Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection PoM no price available
- ► Infanrix-IPV (GlaxoSmithKline UK Ltd) Infanrix-IPV vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection PoM £17.56
- ▶ Repevax (sanofi pasteur MSD Ltd) Repevax vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.00

Diphtheria with poliomyelitis and tetanus vaccine

INDICATIONS AND DOSE

Primary immunisation

BY INTRAMUSCULAR INJECTION

- ► Child 10-17 years: 0.5 mL every month for 3 doses
- ▶ Adult: 0.5 mL every month for 3 doses

Booster doses

BY INTRAMUSCULAR INJECTION

► Child 10-17 years: 0.5 mL for 1 dose, first booster dose should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the

- primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
- Adult: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
- SIDE-EFFECTS Restlessness sleep disturbances unusual crying in infants
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood schedule from health organisations or ImmForm

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

► Revaxis (sanofi pasteur MSD Ltd)

Revaxis vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.50

Haemophilus influenzae type b with meningococcal group C vaccine

INDICATIONS AND DOSE

Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae* type b component)

BY INTRAMUSCULAR INJECTION

► Child 12-13 months: 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against *Haemophilus influenza* type b) | Booster dose after recovery from *Haemophilus influenzae* type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

BY INTRAMUSCULAR INJECTION

► Child 1-9 years: 0.5 mL for 1 dose

Booster dose after recovery from *Haemophilus influenzae* type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)

BY INTRAMUSCULAR INJECTION

- ► Child 1-17 years: 0.5 mL for 1 dose
- ► Adult: 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

BY INTRAMUSCULAR INJECTION

 Child 12-13 months: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine, followed by 0.5 mL for 1 dose, the second dose should be given after the second birthday Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)

BY INTRAMUSCULAR INJECTION

- ► Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine
- ▶ Adult: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine
- UNLICENSED USE Not licensed for use in patients over 2 years.
- SIDE-EFFECTS
- ▶ Rare Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- ► Frequency not known Atopic dermatitis hypotonia
- PRESCRIBING AND DISPENSING INFORMATION Available as part of the childhood immunisation schedule from ImmForm.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Menitorix (GlaxoSmithKline IJK Ltd)

Menitorix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial Pom £37.76

Hepatitis A vaccine

INDICATIONS AND DOSE

AVAXIM®

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

- ► Child 16-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

VAOTA® PAEDIATRIC

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

► Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

HAVRIX MONODOSE®

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

► Child 1-15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The

- subcutaneous route may be used for patients with bleeding disorders
- ▶ Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ► Adult: Initially 1 mL for 1 dose, then 1 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

VAQTA® ADULT

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

▶ Adult: Initially 1 mL for 1 dose, then 1 mL after 6-18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

EPAXAL[®]

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

- ► Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ► Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Immunisation against hepatitis A infection (splenectomised patients)

BY INTRAMUSCULAR INJECTION

- ► Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 1-6 months, dose given as booster; booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ► Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 1-6 months, dose given as booster; booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

ALLERGY AND CROSS-SENSITIVITY

Epaxal® contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, therefore contraindicated in those hypersensitive to eggs or chicken proteins.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

- ► Avaxim (sanofi pasteur MSD Ltd) Avaxim vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £18.10 | 10 pre-filled disposable injection [PoM] £181.00
- ► Havrix (GlaxoSmithKline UK Ltd) Havrix Monodose vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection PoM £22.14 | 10 prefilled disposable injection PoM £221.43 Havrix Junior Monodose vaccine suspension for injection 0.5ml prefilled syringes | 1 pre-filled disposable injection PoM £16.77 | 10 pre-filled disposable injection PoM £16.77 |
- ► VAQTA (sanofi pasteur MSD Ltd)
 VAQTA Adult vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection PoM £18.10
 VAQTA Paediatric vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection PoM £14.74

Emulsion for injection

Epaxal (Janssen-Cilag Ltd)

Epaxal vaccine emulsion for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection PoM £23.81 | 10 pre-filled disposable injection PoM £23.81

Hepatitis A and B vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1081, hepatitis B vaccine p. 1083.

INDICATIONS AND DOSE

TWINRIX® PAEDIATRIC

Immunisation against hepatitis A and hepatitis B infection
BY INTRAMUSCULAR INJECTION

• Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX® ADULT

Immunisation against hepatitis A and hepatitis B infection BY INTRAMUSCULAR INJECTION

- Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- Adult: Initially 1 mL every 1 month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Immunisation against hepatitis A and hepatitis B infection (accelerated schedule for travellers departing within 1 month)

BY INTRAMUSCULAR INJECTION

• Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Adult: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

AMBIRIX®

Immunisation against hepatitis A and hepatitis B infection BY INTRAMUSCULAR INJECTION

• Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Important safety information

Ambirix[®] and Twinrix[®] are not recommended for postexposure prophylaxis following percutaneous (needlestick), ocular, or mucous membrane exposure to hepatitis B virus.

PRESCRIBING AND DISPENSING INFORMATON

AMBIRIX®

Primary course should be completed with $Ambirix^{\otimes}$ (single component vacines given at appropriate intervals maybe used for booster dose).

TWINRIX® PREPARATIONS

Primary course should be completed with *Twinrix*® (single component vacines given at appropriate intervals maybe used for booster dose).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

- ► Ambirix (GlaxoSmithKline UK Ltd)

 Ambirix vaccine suspension for injection 1ml pre-filled syringes |

 1 pre-filled disposable injection PoM £31.18
- ➤ Twinrix (GlaxoSmithKline UK Ltd)
 Twinrix Paediatric vaccine suspension for injection 0.5ml pre-filled
 syringes | 1 pre-filled disposable injection [PoM] £20.79
 Twinrix Adult vaccine suspension for injection 1ml pre-filled
 syringes | 1 pre-filled disposable injection [PoM] £33.31 | 10 prefilled disposable injection [PoM] £33.13

Hepatitis A with typhoid vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1081, typhoid vaccine p. 1091.

INDICATIONS AND DOSE

VIATIM

Immunisation against hepatitis A and typhoid infection (primary course)

BY INTRAMIISCHI AR INJECTION

- Child 16-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
- Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous

route may be used for patients with bleeding disorders, booster dose given using single component vaccines

Immunisation against hepatitis A and typhoid infection (primary course)

BY INTRAMUSCULAR INJECTION

- ► Child 15-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
- Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

- Hepatyrix (GlaxoSmithKline UK Ltd) Hepatyrix vaccine suspension for injection 1ml pre-filled syringes 1 pre-filled disposable injection PoM £37.21 | 10 pre-filled disposable injection PoM £372.10
- VIATIM (sanofi pasteur MSD Ltd) ViATIM vaccine suspension for injection 1ml pre-filled syringes 1 pre-filled disposable injection [PoM] £29.80

Hepatitis B vaccine

INDICATIONS AND DOSE

ENGERIX B®

Immunisation against hepatitis B infection

BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, anterolateral thigh is preferred site in neonates, infants and young children; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive
- ► Child 1 month-15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- ▶ Child 1 month-15 years: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- ► Child 16-17 years: 20 micrograms every month for 3 months, followed by 20 micrograms after 9 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: 20 micrograms every month for 3 months, followed by 20 micrograms after 9 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule in exceptional cases, e.g. for travellers departing within 1 month)

BY INTRAMUSCULAR INJECTION

▶ Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms after 11 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection, alternative

BY INTRAMIISCIII AR INJECTION

► Child 11-15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (for neonates born to hepatitis B surface antigen-positive mother) BY INTRAMUSCULAR INJECTION

▶ Neonate: 10 micrograms once a month for 3 months, first dose to be given at birth with hepatitis B immunoglobulin injection (separate site), followed by 10 micrograms after 10 months for 1 dose. anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients) BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 10 micrograms every month for 2 months, followed by 10 micrograms after 5 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- ► Child 1 month-15 years: 10 micrograms every month for 2 months, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants and young continued →

- children; not to be injected into the buttock (vaccine efficacy reduced)
- ► Child 16-17 years: 40 micrograms every month for 3 months, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 3 months, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms every month for 3 months, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms every month for 3 months, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

HBVAXPRO®

Immunisation against hepatitis B infection

BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid

muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms every month for 3 months, followed by 5 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms every month for 3 months, followed by 5 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Neonate born to hepatitis B surface antigen-positive mother BY INTRAMUSCULAR INJECTION

▶ Neonate: 5 micrograms every month for 3 months, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 9 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Chronic haemodialysis patients

BY INTRAMUSCULAR INJECTION

- Child 16-17 years: 40 micrograms every month for 2 months, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- ► Adult: 40 micrograms every month for 2 months, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

EENDDIY®

Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)

BY INTRAMUSCULAR INJECTION

 Child 15-17 years: 20 micrograms every month for 3 months, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced) Adult: 20 micrograms every month for 3 months, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Thiomersal

► Engerix B (GlaxoSmithKline UK Ltd)

Hepatitis B virus surface antigen 20 microgram per 1 ml Engerix B 20micrograms/1ml vaccine suspension for injection vials | 1 vial PoM £12.34 | 10 vial PoM £123.41 | 10 vial PoM £123.41 | 10 mid PoM £12.34 | 10 mid PoM £12.34 | 10 mid PoM £12.39 | 10 mid PoM £12.39 | 10 pre-filled disposable injection PoM £12.39 | 10 pre-filled disposable injection

Human papillomavirus vaccines

INDICATIONS AND DOSE

GARDASIL®

Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

BY INTRAMUSCULAR INJECTION

- ▶ Child 9-17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1 month for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL after 3 months, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1 month for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL after 3 months, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)

BY INTRAMUSCULAR INJECTION

 Child 9-13 years (female): 0.5 mL, for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

CERVARIX®

Prevention of premalignant genital lesions and cervical cancer

BY INTRAMUSCULAR INJECTION

- ➤ Child 9-14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5-7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
- ➤ Child 15-17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1-2.5 months for 1 dose, then 0.5 mL after 5-12 months for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1-2.5 months for 1 dose, then 0.5 mL after 5-12 months for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- PREGNANCY Not known to be harmful, but vaccination should be postponed until completion of pregnancy.
- PRESCRIBING AND DISPENSING INFORMATION To avoid confusion, prescribers should specify the brand to be dispensed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ➤ Cervarix (GlaxoSmithKline UK Ltd)
 Cervarix vaccine suspension for injection 0.5ml pre-filled syringes |
 1 pre-filled disposable injection PoM £80.50
- ► Gardasil (sanofi pasteur MSD Ltd)
 Gardasil vaccine suspension for injection 0.5ml pre-filled syringes |
 1 pre-filled disposable injection PoM £86.50

Influenza vaccine

INDICATIONS AND DOSE

Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)

BY INTRAMUSCULAR INJECTION

► Child 6 months-9 years: 0.5 mL for 1 dose, followed by 0.5 mL after at least 4 weeks for 1 dose

BY INTRANASAL ADMINISTRATION

► Child 2-9 years: 0.1 mL for 1 dose, followed by 0.1 mL after at least 4 weeks for 1 dose, 0.1 ml dose to be administered into each nostril

Annual immunisation against seasonal influenza

BY INTRAMUSCULAR INJECTION

- ► Child 6 months-17 years: 0.5 mL for 1 dose
- ► Adult: 0.5 mL for 1 dose

continued →

BY INTRADERMAL INJECTION

- ► Adult 18-59 years: 9 micrograms for 1 dose, dose to be injected into deltoid region
- ► Adult 60 years and over: 15 micrograms for 1 dose, dose to be injected into deltoid region

BY INTRANASAL ADMINISTRATION

- ► Child 2-17 years: 0.1 mL for 1 dose, dose to be administered into each nostril
- UNLICENSED USE Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.

FLUARIX TETRA® SUSPENSION FOR INJECTION

Not licensed for use in children under 3 years of age.

OPTAFLU® SUSPENSION FOR INJECTION

Not licensed for use in children and adolescents under 18 years.

FLUVIRIN® SUSPENSION FOR INJECTION

Not licensed for use in children under 4 years.

 CONTRA-INDICATIONS Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

FLUENZ TETRA® SPRAY

Severe asthma, active wheezing, concomitant use with antiviral therapy for influenza

CONTRA-INDICATIONS, FURTHER INFORMATION FLUENZ TETRA® SPRAY

Concomitant use with antivirals Avoid antivirals for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the antiviral.

 CAUTIONS Increased risk of fever in child 5–9 with preparations marketed by Pfizer or CSL Biotherapies

ENZIRA® SUSPENSION FOR INJECTION

Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Uncommon Epistaxis
- ► Frequency not known Febrile convulsions transient thrombocytopenia vasculitis (in adults)

SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use rhinorrhoea
- ALLERGY AND CROSS-SENSITIVITY Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.
- PREGNANCY Inactivated vaccines not known to be harmful.

FLUENZ TETRA® SPRAY

Avoid in pregnancy.

 BREAST FEEDING Inactivated vaccines not known to be harmful.

FLUENZ TETRA® SPRAY

Avoid in breast-feeding.

 PRESCRIBING AND DISPENSING INFORMATION FLUARIX TETRA® SUSPENSION FOR INJECTION

Ovalbumin content less than 100 nanograms/mL.

PATIENT AND CARER ADVICE

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

FLUENZ TETRA® SPRAY

Avoid close contact with severely immunocompromised patients for 1-2 weeks after vaccination.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Gentamicin, kanamycin, neomycin penicillins, polymyxin b, thiomersal

- ► Optaflu (Novartis Vaccines and Diagnostics Ltd)

 Optaflu vaccine suspension for injection 0.5ml pre-filled syringes |

 1 pre-filled disposable injection PoM £6.59

Emulsion and suspension for emulsion for injection

Pandemrix H1N1 (GlaxoSmithKline UK Ltd) ▼ Pandemrix vaccine emulsion and suspension for emulsion for injection | 500 dose PoM no price available

Spray

EXCIPIENTS: May contain Gelatin, gentamicin

► Fluenz Tetra (AstraZeneca UK Ltd) ▼
Fluenz Tetra vaccine nasal suspension 0.2ml unit dose | 10 unit dose | PoM| £180.00

Japanese encephalitis vaccine

INDICATIONS AND DOSE

Immunisation against Japanese encephalitis
BY INTRAMUSCULAR INJECTION

- ► Child 2 months-2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders
- Child 3-17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders
- ► Adult: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders

Vaccination 1087

Booster dose

BY INTRAMUSCULAR INJECTION

Adult: 0.5 mL after 1-2 years, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders, for those at continued risk, the booster dose should be given 1 year after completing the primary course

SIDE-FFFFCTS

- Uncommon Cough (in children) · migraine (in adults) · vertigo (in adults)
- ► Rare Dyspnoea (in adults) neuritis (in adults) palpitation (in adults) tachycardia (in adults) thrombocytopenia (in adults)
- PREGNANCY Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

➤ Ixiaro (Novartis Vaccines and Diagnostics Ltd)
Ixiaro vaccine suspension for injection 0.5ml pre-filled syringes |
1 pre-filled disposable injection PoM £59.50

Measles, mumps and rubella vaccine, live

INDICATIONS AND DOSE

Primary immunisation against measles, mumps, and rubella (first dose)

BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION

► Child 12-13 months: 0.5 mL for 1 dose

Primary immunisation against measles, mumps, and rubella (second dose)

BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION

► Child 40 months-5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)

BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION

► Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose) | Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation

BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION

- Child 6 months-17 years: (consult product literature or local protocols)
- ► Adult: (consult product literature or local protocols)
- UNLICENSED USE Not licensed for use in children under 9 months.

Important safety information

MMR VACCINATION AND BOWEL DISEASE OR AUTISM Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

 CAUTIONS Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation

Administration with other vaccines MMR vaccine should

CAUTIONS, FURTHER INFORMATION

not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered. MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

SIDE-EFFECTS

- ► **Uncommon** Parotid swelling (usually in the third week) sleep disturbances unusual crying in infants
- Rare Arthropathy (2 to 3 weeks after immunisation) idiopathic thrombocytopenic purpura
- ► Frequency not known Optic neuritis peripheral neuritis SIDE-EFFECTS, FURTHER INFORMATION

Malaise, fever, or a rash can occur after the first dose of MMR vaccine-most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures-occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection) Idiopathic thrombocytopenic purpura Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR. Aseptic meningitis Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious. Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

 ALLERGY AND CROSS-SENSITIVITY MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to eggcontaining food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

- CONCEPTION AND CONTRACEPTION Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Meningococcal group B vaccine (rDNA, component, adsorbed)

INDICATIONS AND DOSE

Immunisation against Neisseria meningitidis, primary immunisation

BY DEEP INTRAMUSCULAR INJECTION

▶ Child 2-5 months: 0.5 mL at least every month for 3 doses, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against Neisseria meningitidis, primary immunisation booster dose

BY DEEP INTRAMUSCULAR INJECTION

► Child 1-2 years: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against Neisseria meningitidis, primary immunisation (in unimmunised patients)

BY DEEP INTRAMUSCULAR INJECTION

- ► Child 6-11 months: 0.5 mL at least every 2 months for 2 doses, booster dose of 0.5 mL given between 1-2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ► Child 12-23 months: 0.5 mL at least every 2 months for 2 doses, booster dose of 0.5 mL given 12-24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in
- ► Child 2-10 years: 0.5 mL at least every 2 months for 2 doses, injected preferably into deltoid region (or anterolateral thigh in infants)
- ► Child 11-17 years: 0.5 mL at least every month for 2 doses, injected preferably into deltoid region
- ▶ Adult: 0.5 mL at least every month for 2 doses, injected preferably into deltoid region

SIDE-EFFECTS

- ▶ Rare Kawasaki disease (in children) symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known Unusual crying (in children)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Kanamycin

▶ Bexsero (Novartis Vaccines and Diagnostics Ltd) ▼ Bexsero vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.00

Meningococcal group C vaccine

INDICATIONS AND DOSE

Primary immunisation against Neisseria meningitidis BY INTRAMUSCULAR INJECTION

► Child 3 months: 0.5 mL for 1 dose, the primary immunisation dose is followed by a booster dose of meningococcal group C conjugate vaccine combined with haemophilus influenzae type b vaccine at 12-13 months of age

Second booster dose for immunisation against Neisseria meningitidis

BY INTRAMUSCULAR INJECTION

► Child 13-15 years: 0.5 mL for 1 dose

Immunisation against Neisseria meningitidis in an unimmunised patient

BY INTRAMIISCIII AR INJECTION

- ► Child 4-11 months: 0.5 mL for 1 dose, the primary immunisation dose is followed by a booster dose of meningococcal group C conjugate vaccine combined with haemophilus influenzae type b vaccine at 12-13 months of age, then 0.5 mL for 1 dose, this second booster dose to be given at 13-15 years of age
- ► Child 1-9 years: 0.5 mL for 1 dose, then 0.5 mL for 1 dose, this booster dose to be given at 13-15 years of
- ► Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
- Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Patients attending university for the first time (who did not receive second booster dose at 13-15 years)

BY INTRAMUSCULAR INJECTION

► Adult 18-24 years: 0.5 mL for 1 dose

Patients with confirmed serogroup C disease (who have previously been immunised)

BY INTRAMUSCULAR INJECTION

- ► Child 1-17 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital
- Adult 18-24 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

- ▶ Rare Symptoms of meningitis (but no evidence that vaccine causes meningococcal C meningitis)
- DIRECTIONS FOR ADMINISTRATION Menjugate Kit® may be used via subcutaneous route in children with bleeding disorders.
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood immunisation schedule from www. immform.dh.gov.uk.

MEDICINAL FORMS

Pneumococcal vaccine

INDICATIONS AND DOSE

Immunisation against pneumococcal infection

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

- ► Child 2-17 years: 0.5 mL for 1 dose
- ► Adult: 0.5 mL for 1 dose

Immunisation in patients at increased risk of pneumococcal disease

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ Child 2-4 years: 0.5 mL for 1 dose, dose should be administered after the second birthday or at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed)
- ► Child 5-17 years: 0.5 mL for 1 dose
- ► Adult: 0.5 mL for 1 dose

PREVENAR 13®

Primary immunisation against pneumococcal infection (first

BY INTRAMUSCULAR INJECTION

▶ Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (second dose)

BY INTRAMUSCULAR INJECTION

► Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (third dose)

BY INTRAMUSCULAR INJECTION

► Child 12-13 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)

BY INTRAMUSCULAR INJECTION

► Child 12 months-4 years: 0.5 mL for 1 dose, Deltoid muscle is preferred site of injection in young children: anterolateral thigh is preferred site in infants

Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfuntion (who have not been vaccinated or not completed the primary course)

BY INTRAMUSCULAR INJECTION

► Child 12 months-4 years: 0.5 mL every 2 months for 2

SYNFLORIX®

Immunisation against pneumococcal infection BY INTRAMISCIII AR INJECTION

► Child 6 weeks-5 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

UNLICENSED USE

PREVEN∆R 13[®]

The dose in BNF publications may differ from that in product literature.

• CONTRA-INDICATIONS Concomitant use of high potency varicella-zoster vaccine (Zostavax®) with pneumococcal polysaccharide vaccine (in adults)

PRESCRIBING AND DISPENSING INFORMATON

Available as part of childhood immunisation schedule from Immform www.immform.dh.gov.uk

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

 Synflorix (GlaxoSmithKline UK Ltd) Synflorix vaccine suspension for injection 0.5ml pre-filled syringes 1 pre-filled disposable injection PoM £27.60

Rabies vaccine

INDICATIONS AND DOSE

Pre-exposure prophylaxis

BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL every week for 2 doses (on days 0 and 7), followed by 1 mL after 21 days for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel
- ▶ Adult: 1 mL every week for 2 doses (on days 0 and 7), followed by 1 mL after 21 days for 1 dose (on day 28), to be administered in deltoid region, for those at continous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)

BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL after 1 year for 1 dose, then 1 mL every 3-5 years for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentation of antirabies antibodies
- ▶ Adult: 1 mL after 1 year for 1 dose, then 1 mL every 3-5 years for 1 dose, to be administered in deltoid region, the frequency of booster doses may alternatively be determined according to plasmaconcentation of antirabies antibodies

Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)

BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL after 10 years for 1 dose, to be administered in deltoid region or anterolateral thigh
- ▶ Adult: 1 mL after 10 years for 1 dose, to be administered in deltoid region

Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or postexposure prophylaxis with cell-derived rabies vaccine) BY INTRAMUSCULAR INJECTION

- ► Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3-7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary
- Adult (administered on expert advice): 1 mL for 1 dose. followed by 1 mL after 3-7 days for 1 dose, to be administered in deltoid region, rabies immunoglobulin is not necessary

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) BY INTRAMUSCULAR INJECTION

 Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given beween day 28-30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not

- ▶ Adult (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given beween day 28-30, to be administered in deltoid region, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained). rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk
- SIDE-EFFECTS Paresis
- PREGNANCY Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities. pregnancy is not considered a contra-indication to postexposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Rotavirus vaccine

• DRUG ACTION Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

INDICATIONS AND DOSE

Immunisation against gastro-enteritis caused by rotavirus

- ▶ 6-24 weeks: 1.5 mL at least every 4 weeks for 2 doses, first dose must be given between 6-15 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)
- CONTRA-INDICATIONS History of intussusception predisposition to intussusception · severe combined immunosuppression

CONTRA-INDICATIONS, FURTHER INFORMATION

Immunosuppresion With the exception of severe combined immunodeficiency, rotavirus vaccine is not contraindicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

• CAUTIONS Diarrhoea (postpone vaccination) • immunosuppressed close contacts · vomiting (postpone vaccination)

CAUTIONS, FURTHER INFORMATION The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

- SIDE-EFFECTS Abdominal cramps · abdominal pain · diarrhoea · nausea · vomiting
- PATIENT AND CARER ADVICE The rotavirus vaccine virus is excreted in the stool and may be transmitted to close

contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

► Rotarix (GlaxoSmithKline UK Ltd)
Rotarix vaccine live oral suspension 1.5ml pre-filled syringes | 1 unit dose [PoM] £34.76

Tick-borne encephalitis vaccine, inactivated

INDICATIONS AND DOSE

Initial immunisation against tick-borne encephalitis
BY INTRAMUSCULAR INJECTION

- ➤ Child 1-15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1-3 months for 1 dose, then 0.25 mL after 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosympressants), antibody concentration may be
 - immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Child 16-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

Immunisation against tick-borne encephalitis, booster doses BY INTRAMUSCULAR INJECTION

- ► Child 1-17 years: First dose to be given within 3 years after initial course completed and then every 3-5 years (consult product literature)
- Adult: First dose to be given within 3 years after initial course completed and then every 3-5 years (consult product literature)
- ALLERGY AND CROSS-SENSITIVITY Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Gentamicin, neomycin

► TicoVac (Masta Ltd)

TicoVac Junior vaccine suspension for injection 0,25ml pre-filled syringes | 1 pre-filled disposable injection [PoM £28.00 TicoVac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM £32.00

Typhoid vaccine

INDICATIONS AND DOSE

Immunisation against typhoid fever

BY INTRAMUSCULAR INJECTION

- ➤ Adult: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection

 BY MOUTH
- ► Adult: 1 capsule every 2 days for 3 doses

CONTRA-INDICATIONS

- ▶ With oral use acute gastro-intestinal illness
- INTERACTIONS → Appendix 1 (vaccines).

Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:

- antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

SIDE-EFFECTS

- ► With oral use abdominal cramps abdominal pain diarrhoea nausea vomiting
- DIRECTIONS FOR ADMINISTRATION Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

HANDLING AND STORAGE

 With oral use It is important to store capsules in a refrigerator.

• PATIENT AND CARER ADVICE

 With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

Vivotif (PaxVax Ltd)

Vivotif vaccine gastro-resistant capsules | 3 capsule Pom £14.77

Solution for injection

► Typherix (GlaxoSmithKline UK Ltd)

Salmonella typhi Vi capsular polysaccharide 50 microgram per 1 ml Typherix 25micrograms/0.5ml vaccine solution for injection prefilled syringes | 1 pre-filled disposable injection PoM £9.93 | 10 pre-filled disposable injection PoM £9.93

Typhim Vi (sanofi pasteur MSD Ltd)

Salmonella typhi Vi capsular polysaccharide 50 microgram per 1 ml Typhim Vi 25micrograms/0.5ml vaccine solution for injection prefilled syringes | 1 pre-filled disposable injection | PoM £9.30 | 10 pre-filled disposable injection | PoM £9.30 |

Varicella-zoster vaccine

INDICATIONS AND DOSE

VARILRIX®

Prevention of varicella infection (chickenpox)

BY SUBCUTANEOUS INJECTION

- ► Child 1-17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region
- ► Adult: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region

VARIVAX®

Prevention of varicella infection (chickenpox)

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh)
- Child 13-17 years: 0.5 mL every 4-8 weeks for 2 doses, to be administered preferably into the deltoid region (or higher anterolateral thigh in children)
- ► Adult: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region

Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

 Child 1-12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh)

ZOSTAVAX®

Prevention of herpes zoster (shingles)

BY SUBCUTANEOUS INJECTION

- ► Adult 70-79 years: 0.65 mL for 1 dose, to be administered preferably into the deltoid region
- CAUTIONS Post-vaccination close contact with susceptible individuals

CAUTIONS, FURTHER INFORMATION Rarely, the varicellazoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose.

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella. Administration with MMR vaccine Varicella—zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

• SIDE-EFFECTS

- ► Rare Thrombocytopenia
- ► Frequency not known Conjunctivitis · varicella-like rash
- CONCEPTION AND CONTRACEPTION Avoid pregnancy for 3 months after vaccination.
- PRESCRIBING AND DISPENSING INFORMATON ZOSTAVAX®

Advice in the BNF may differ from that in product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- Varivax vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial |PoM| £30.28
- Zostavax (sanofi pasteur MSD Ltd)

Zostavax powder and solvent for suspension for injection 0.65ml prefilled syringes | 1 pre-filled disposable injection [Pom] £99.96

Yellow fever vaccine, live

INDICATIONS AND DOSE

Immunisation against yellow fever

BY DEEP SUBCUTANEOUS INJECTION

- Child 6-8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
- ► Child 9 months-17 years: 0.5 mL for 1 dose
- ► Adult: 0.5 mL for 1 dose
- CONTRA-INDICATIONS Children under 6 months · history of thymus dysfunction
- CAUTIONS Individuals over 60 years—greater risk of vaccine-associated adverse effects (in adults)

CAUTIONS, FURTHER INFORMATION

Administration with MMR vaccine Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

• SIDE-EFFECTS Neurotropic disease · viscerotropic disease SIDE-EFFECTS, FURTHER INFORMATION

Vaccine-associated adverse effects Very rare adverse effects, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

- ALLERGY AND CROSS-SENSITIVITY Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.
- PREGNANCY Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.
- BREAST FEEDING Avoid; seek specialist advice if exposure to virus cannot be avoided.

1.5	Peri-operative analgesia	1106
1.4	Neuromuscular blockade reversal	page 1105

General anaesthesia

General anaesthesia

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery. anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction'); lower doses may be required in premedicated patients.

Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia

Propofol p. 1095, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive

Thiopental sodium p. 412 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1095 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction

Ketamine p. 1110 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 267 or midazolam p. 414.

Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid angesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1096 is being administered.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 1098 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients.

Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1097 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1098 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide

Nitrous oxide p. 1096 is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For *anaesthesia*, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1102 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1101 is used in the treatment of malignant hyperthermia.

Surgery and long-term medication

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about **all** drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or

has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives; for advice on hormone replacement therapy. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

Anaesthesia, sedation, and resuscitation in dental practice

Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 267 and temazepam p. 420 are effective anxiolytics for dental treatment in adults.

For details of anaesthesia, sedation, and resuscitation in dental practice see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Conscious Sedation in the Provision of Dental Care; report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003.

Guidance is also included in *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, June 2012 (www.sdcep.org.uk).

ANAESTHETICS (GENERAL, INTRAVENOUS)

Etomidate

INDICATIONS AND DOSE

Induction of anaesthesia

BY SLOW INTRAVENOUS INJECTION

- ► Adult: 150-300 micrograms/kg (max. per dose 60 mg), to be administered over 30-60 seconds (over 60 seconds in patients in whom hypotension might be hazardous)
- ▶ Elderly: 150-200 micrograms/kg (max. per dose 60 mg), to be administered over 30-60 seconds (over 60 seconds in patients in whom hypotension might be hazardous)

Important safety information

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

• CAUTIONS Acute porphyrias p. 864 (avoid) • acute circulatory failure (shock) · adrenal insufficiency · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia

CAUTIONS, FURTHER INFORMATION

Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

- INTERACTIONS → Appendix 1 (anaesthetics, general).
- SIDE-EFFECTS
- ► Common or very common Apnoea · hyperventilation · hypotension · nausea · rash · stridor · vomiting
- **Uncommon** Arrhythmias · cough · hiccups · hypersalivation hypertension • phlebitis
- ► Frequency not known AV block cardiac arrest extraneous muscle movement (high incidence) · pain on injection · respiratory depression · seizures · shivering · Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Pain on injection Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.

Extraneous muscle movement Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- HEPATIC IMPAIRMENT Reduce dose in liver cirrhosis.
- DIRECTIONS FOR ADMINISTRATION To be administered over 30-60 seconds (over 60 seconds in patients in whom hypotension might be hazardous).
- PATIENT AND CARER ADVICE Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Propylene glycol

► Hypnomidate (Janssen-Cilag Ltd) Etomidate 2 mg per 1 ml Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule PoM £6.90

Emulsion for injection

► ETOMIDATE (Non-proprietary)

Etomidate 2 mg per 1 ml Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule Pom £15.62

Propofol

INDICATIONS AND DOSE

Induction of anaesthesia using 0.5% or 1% injection BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS

- ▶ Adult 18-54 years: Usual dose 1.5-2.5 mg/kg, to be administered at a rate of 20-40 mg every 10 seconds until response. For debilitated patients use dose for 55 vears and over
- ▶ Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Induction of anaesthesia using 2% injection

BY INTRAVENOUS INFUSION

- ► Adult 18-54 years: Usual dose 1.5-2.5 mg/kg, to be administered at a rate of 20-40 mg every 10 seconds until response. For debilitated patients use dose for 55 vears and over
- ► Adult 55 years and over: Usual dose 1-1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Maintenance of anaesthesia using 1% injection

INITIALLY BY INTRAVENOUS INFUSION

- ► Adult: Usual dose 4-12 mg/kg/hour, alternatively (by slow intravenous injection) 25-50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
- ► Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25-50 mg, dose may be repeated according to response

Maintenance of anaesthesia using 2% injection BY INTRAVENOUS INFUSION

- ▶ Adult: Usual dose 4-12 mg/kg/hour, for debilitated patients use dose for elderly
- ▶ Elderly: Usual dose 3-6 mg/kg/hour

Sedation of ventilated patients in intensive care using 1% or 2% injection

BY CONTINUOUS INTRAVENOUS INFUSION

▶ Adult: Usual dose 0.3-4 mg/kg/hour, adjusted according to response

Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

BY SLOW INTRAVENOUS INJECTION

► Adult: Initially 0.5–1 mg/kg, to be administered over 1-5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

Maintenance of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

INITIALLY BY INTRAVENOUS INFUSION

► Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10-20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration continued →

Maintenance of sedation for surgical and diagnostic procedures using 2% injection

INITIALLY BY INTRAVENOUS INFUSION

 Adult: Initially 1.5-4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10-20 mg using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Important safety information

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CAUTIONS Acute circulatory failure (shock) cardiac impairment - cardiovascular disease - elderly - epilepsy fixed cardiac output - hypotension - hypovolaemia - raised intracranial pressure - respiratory impairment
- INTERACTIONS → Appendix 1 (anaesthetics, general).
- SIDE-FFFFCTS
- ► Common or very common Headache · hypotension · tachycardia · transient apnoea
- ► Uncommon Phlebitis · thrombosis
- ► Rare Anaphylaxis · arrhythmia · convulsions (onset can be delayed) · delayed recovery from anaesthesia · euphoria
- ▶ Very rare Discoloration of urine pancreatitis pulmonary oedema sexual disinhibition
- ▶ Frequency not known Bradycardia pain on intravenous injection • propofol infusion syndrome • significant extraneous muscle movements

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia Bardycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.

Extraneous muscle movement Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection Can be reduced by intravenous lidocaine. Propofol infusion syndrome Prolonged infusion of propofol doses exceeding 4 mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

- PREGNANCY Max. dose for maintenance of anaesthesia 6 mg/kg/hour. May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Use with caution.
- MONITORING REQUIREMENTS Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.
- DIRECTIONS FOR ADMINISTRATION Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site coadministered with Glucose 5% or Sodium chloride 0.9%. 0.5% emulsion for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Dipravan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% emulsion for infusion; do not dilute.

 PATIENT AND CARER ADVICE Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Emulsion for injection

- ► PROPOFOL (Non-proprietary)

ANAESTHETICS (VOLATILE LIQUID)

Nitrous oxide

INDICATIONS AND DOSE

Maintenance of anaesthesia in conjunction with other anaesthetic agents

BY INHALATION

► Adult: 50-66 %, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia

BY INHALATION

► Adult: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient's needs

Important safety information

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

CAUTIONS Entrapped air following recent underwater dive

 pneumothorax • presence of intracranial air after head
 injury • recent intra-ocular gas injection

CAUTIONS, FURTHER INFORMATION

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

- INTERACTIONS → Appendix 1 (anaesthetics, general).
- SIDE-EFFECTS Depression of white cell formation hypoxia megaloblastic anaemia neurological toxic effects

SIDE-EFFECTS. FURTHER INFORMATION

Hypoxia Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Prolonged exposure Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by

intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.

- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- MONITORING REQUIREMENTS
- ► Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.
- ▶ Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.
- DIRECTIONS FOR ADMINISTRATION For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50 % of each gas (Entonox®, Equanox®) is used.
- HANDLING AND STORAGE Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-

MEDICINAL FORMS

Volatile halogenated anaesthetics

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CONTRA-INDICATIONS Susceptibility to malignant hyperthermia
- CAUTIONS Can trigger malignant hyperthermia · raised intracranial pressure (can increase cerebrospinal pressure)
- ► Common or very common Arrhythmias · cardiorespiratory depression · hypotension
- ▶ Frequency not known Convulsions mood changes (that can last several days)
- ALLERGY AND CROSS-SENSITIVITY Can cause hepatotoxicity in those sensitised to halogenated
- DIRECTIONS FOR ADMINISTRATION Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the

- carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.
- PATIENT AND CARER ADVICE Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

Desflurane

INDICATIONS AND DOSE

Induction of anaesthesia (but not recommended) ΒΥ ΙΝΗΔΙ ΔΤΙΩΝ

▶ Adult: 4–11 %, to be inhaled through specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen) BY INHALATION

▶ Adult: 2-6 %, to be inhaled through a specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or oxygen-enriched

ΒΥ ΙΝΗΔΙ ΔΤΙΟΝ

▶ Adult: 2.5-8.5 %, to be inhaled through a specifically calibrated vaporiser

Important safety information

Desflurane should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- INTERACTIONS → Appendix 1 (anaesthetics, general).
- SIDE-EFFECTS Apnoea · breath-holding · cough · increased secretions · laryngospasm
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- PATIENT AND CARER ADVICE Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

► Suprane (Baxter Healthcare Ltd)

Anaesthesia

Isoflurane

INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxideoxygen)

BY INHALATION

 Adult: Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen) BY INHALATION

► Adult: 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1 % may be required when given with oxygen alone

 $\label{lem:maintenance} \mbox{ Maintenance of anaesthesia in caesarean section (in nitrous oxide-oxygen)}$

BY INHALATION

► Adult: 0.5–0.75 %, to be administered using specifically calibrated vaporiser

Important safety information

Isoflurane should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- INTERACTIONS → Appendix 1 (anaesthetics, general).
- SIDE-EFFECTS Breath-holding · cough · irritate mucous membrane · laryngospasm
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- PATIENT AND CARER ADVICE Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

► ISOFLURANE (Non-proprietary)

Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml PoM £35.29 (Hospital only) | Isoflurane volatile liquid | 250 ml P £47.50 (Hospital only)

► AErrane (Baxter Healthcare Ltd)

Isoflurane 1 ml per 1 ml $\,$ AErrane volatile liquid | 250 ml $\,$ P $\,$ no price available (Hospital only)

Sevoflurane

INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxideoxygen)

BY INHALATION

► Adult: Initially 0.5–1 %, adjusted according to response, then increased to up to 8 %, to be administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or nitrous oxideoxygen)

BY INHALATION

► Adult: 0.5–3 %, adjusted according to response, to be administered using specifically calibrated vaporiser

Important safety information

Sevoflurane should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CAUTIONS Susceptibility to OT-interval prolongation
- INTERACTIONS → Appendix 1 (anaesthetics, general). Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.
- SIDE-EFFECTS Cardiac arrest · dystonia · leucopenia · torsade de pointes · urinary retention
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- RENAL IMPAIRMENT Use with caution.
- PATIENT AND CARER ADVICE Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

1.1 Anaesthetic adjuvants

Pre-medication and peri-operative drugs

Drugs that affect gastric pH

Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastrooesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A H₂-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; 'clear' (non-particulate) antacids such as sodium citrate are preferred.

Antimuscarinic drugs

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 912 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol and suxamethonium chloride.

Atropine sulfate below is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in acute arrhythmias after myocardial infarction.

Hyoscine hydrobromide p. 344 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 1100 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

Phenothiazines do not effectively reduce secretions when used alone.

Sedative drugs

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of preoperative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1132 is used to antagonise the effects of benzodiazepines.

Diazepam p. 267 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 420 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 412 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 414 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Other drugs for sedation

Dexmedetomidine p. 1110 and clonidine hydrochloride p. 137 are alpha₂-adrenergic agonists with sedative properties. Dexmedetomidine p. 1110 is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride p. 137 [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1133. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil p. 1132 is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Doxapram hydrochloride p. 261 is a central and respiratory stimulant but is of limited value in anaesthesia.

ANTIMUSCARINICS

Atropine sulfate

The properties listed below are those particular to the drug only. For properties common to the class, see Antimuscarinics Systemic, p. 668.

INDICATIONS AND DOSE

Premedication

BY INTRAVENOUS INJECTION

- ► Child 12-17 years: 300-600 micrograms, to be administered immediately before induction of anaesthesia
- Adult: 300-600 micrograms, to be administered immediately before induction of anaesthesia

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ► Child 12-17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
- ► Adult: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

BY INTRAVENOUS INJECTION

- ► Child 12-17 years: 0.6-1.2 mg
- ► Adult: 0.6-1.2 mg

Intra-operative bradycardia

BY INTRAVENOUS INJECTION

- ► Child 12-17 years: 300-600 micrograms, larger doses may be used in emergencies
- Adult: 300-600 micrograms, larger doses may be used in emergencies continued →

Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)
BY INTRAVENOUS INJECTION

- Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
- Adult: 2 mg every 5-10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

Bradycardia due to acute massive overdosage of betablockers

BY INTRAVENOUS INJECTION

- ► Child: 40 micrograms/kg (max. per dose 3 mg)
- ▶ Adult: 3 mg

Excessive bradycardia associated with beta-blocker use BY INTRAVENOUS INJECTION

 Adult: 0.6-2.4 mg in divided doses (max. per dose 600 micrograms)

Bradycardia following myocardial infarction (particularly if complicated by hypotension)

BY INTRAVENOUS INJECTION

► Adult: 500 micrograms every 3-5 minutes; maximum 3 mg

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

ву моитн

▶ Adult: 0.6-1.2 mg daily, dose to be taken at night

UNLICENSED USE

 With use in children Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication. Not licensed for the control of muscarinic side-effects of edrophonium in reversal of competitive neuromuscular block.

Important safety information

Antimuscarininc drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- PREGNANCY Not known to be harmful; manufacturer advises caution.
- BREAST FEEDING May suppress lactation; small amount present in milk—manufacturer advises caution.
- MONITORING REQUIREMENTS
- With intravenous use Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.
- LESS SUITABLE FOR PRESCRIBING
- With oral use Atropine tablets less suitable for prescribing.
 Any clinical benefit as a gastro-intestinal antispasmodic is outweighed by atropinic side-effects.
- EXCEPTIONS TO LEGAL CATEGORY
- With intramuscular use or intravenous use or subcutaneous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

1.2 Malignant hyperthermia

MUSCLE RELAXANTS

Dantrolene sodium

 DRUG ACTION Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

INDICATIONS AND DOSE

Malignant hyperthermia

BY RAPID INTRAVENOUS INJECTION

► Adult: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course

Chronic severe spasticity of voluntary muscle BY MOUTH

► Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

CONTRA-INDICATIONS

 With oral use acute muscle spasm avoid when spasticity is useful, for example, locomotion

CAUTIONS

- With intravenous use avoid extravasation (risk of tissue necrosis)
- With oral use females (hepatotoxicity) · history of liver disorders (hepatotoxicity) · if doses greater than 400 mg daily (hepatotoxicity) · impaired cardiac function · impaired pulmonary function · patients over 30 years (hepatotoxicity) · therapeutic effect may take a few weeks to develop discontinue if no response within 6–8 weeks
- INTERACTIONS → Appendix 1 (muscle relaxants).

 With oral use Caution if concomitant use of benefot
- With oral use Caution if concomitant use of hepatotoxic drugs.

SIDE-EFFECTS

- Common or very common With oral use abdominal pain anorexia · asthenia · chills · diarrhoae (withdraw if severe, discontinue treatment if recurs on re-introduction) · dizziness · drowsiness · fatigue · fever · headache · hepatotoxicity · nausea · pericarditis · pleural effusion · rash · respiratory depression · seizures · speech disturbances · visual disturbances · vomiting
- ► Uncommon ► With oral use confusion · constipation · crystalluria · depression · dysphagia · dyspnoea · erratic blood pressure · exacerbation of cardiac insufficiency · haematuria · increased sweating · increased urinary frequency · insomnia · nervousness · tachycardia · urinary incontinence · urinary retention
- Frequency not known > With intravenous use dizziness erythema hepatotoxicity injection-site reactions pulmonary oedema rash swelling thrombophlebitis weakness

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Potentially life-threatening hepatotoxicity reported—discontinue if abnormal liver function tests or symptoms of liver disorder; re-introduce only if complete reversal of hepatotoxicity.

PREGNANCY

- With intravenous use Use only if potential benefit outweighs risk.
- With oral use Avoid use in chronic spasticity—embryotoxic in animal studies.

BREAST FEEDING

- With intravenous use Present in milk—use only if potential benefit outweighs risk.
- With oral use Present in milk—manufacturer advises avoid use in chronic spasticity.
- HEPATIC IMPAIRMENT Avoid—may cause severe liver damage (injection may be used in an emergency for malignant hyperthermia).

MONITORING REQUIREMENTS

- With oral use Test liver function before and at intervals during therapy.
- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
 - With oral use
 Hepatotoxicity Patients should be told how to recognise signs
 of liver disorder and advised to seek prompt medical
 attention if symptoms such as anorexia, nausea, vomiting,
 fatigue, abdominal pain, dark urine, or pruritus develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

1.3 Neuromuscular blockade

Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with

acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 912. Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium bromide p. 1104, rocuronium bromide p. 1105, and vecuronium bromide p. 1105, and the

benzylisoquinolinium group, comprising atracurium besilate p. 1103, cisatracurium p. 1104, and mivacurium p. 1104.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride. These drugs can be classified by their duration of action as shortacting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes nonenzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

Depolarising neuromuscular blocking drugs

Suxamethonium chloride below has the most rapid onset of action of any of the neuromuscular blocking drugs and is

ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride (below) should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride below use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium chloride below and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride below but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

Drugs for reversal of neuromuscular blockade Anticholinesterases

Anticholinesterases reverse the effects of the nondepolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 1100 or alternatively atropine sulfate p. 1099, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade

Sugammadex p. 1106 is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide or vecuronium bromide. In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

NEUROMUSCULAR BLOCKING DRUGS (DEPOLARISING)

Suxamethonium chloride (Succinylcholine chloride)

 DRUG ACTION Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery and intubation

BY INTRAVENOUS INJECTION

► Adult: 1-1.5 mg/kg

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

• CONTRA-INDICATIONS Duchenne muscular dystrophy • family history of malignant hyperthermia • hyperkalaemia • low plasma-cholinesterase activity (including severe liver

disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · prolonged immobilisation (risk of hyperkalaemia) · severe burns

- CAUTIONS Cardiac disease neuromuscular disease raised intra-ocular pressure (avoid in penetrating eye injury) respiratory disease severe sepsis (risk of hyperkalaemia)
- INTERACTIONS → Appendix 1 (muscle relaxants).
- SIDE-FFFFCTS
- Common or very common Flushing · hyperkalaemia · increased gastric pressure · increased intra-ocular pressure · myoglobinaemia · myoglobinuria · postoperative muscle pain · rash
- ▶ Rare Apnoea · arrhythmias · bronchospasm · cardiac arrest · limited jaw mobility · prolonged respiratory depression
- ► Very rare Anaphylactic reactions malignant hyperthermia
- ► Frequency not known Bradycardia (may occur with repeated doses) hypertension hypotension rhabdomyolysis tachycardia (occurs with single use)

SIDE-EFFECTS, FURTHER INFORMATION Bradycardia Premedication with atropine reduces

Bradycardia Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

- ALLERGY AND CROSS-SENSITIVITY Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- PREGNANCY Mildly prolonged maternal neuromuscular blockade may occur.
- BREAST FEEDING Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breastfeeding may be resumed once the mother recovered from neuromuscular black
- HEPATIC IMPAIRMENT Prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ► SUXAMETHONIUM CHLORIDE (Non-proprietary)

 Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride 100mg/2ml solution for injection ampoules | 10 ampoule PoM 55.76-£700
- ➤ Anectine (GlaxoSmithKline UK Ltd)

 Suxamethonium chloride 50 mg per 1 ml Anectine 100mg/2ml solution for injection ampoules | 5 ampoule PoM £3.57

NEUROMUSCULAR BLOCKING DRUGS (NON-DEPOLARISING)

Non-depolarising neuromuscular blocking drugs

Important safety information

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

 CAUTIONS Burns (resistance can develop, increased doses may be required) · cardiovascular disease (reduce rate of administration) · electrolyte disturbances (response unpredictable) · fluid disturbances (response unpredictable) · hypothermia (activity prolonged, lower doses required) · myasthenia gravis (activity prolonged, lower doses required) · neuromuscular disorders (response unpredictable)

- INTERACTIONS → Appendix 1 (muscle relaxants).
- ALLERGY AND CROSS-SENSITIVITY Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- PREGNANCY Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.
- BREAST FEEDING Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts.
 Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

Atracurium besilate (Atracurium besylate)

INDICATIONS AND DOSE

Neuromuscular blockade (short to intermediate duration) for surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

Neuromuscular blockade during intensive care

 Adult: Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion)
 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

SIDE-EFFECTS

- ► Very rare Anaphylactoid reactions
- ► Frequency not known Acute myopathy (after prolonged use in intensive care) bronchospasm hypotension seizures skin flushing tachycardia

SIDE-EFFECTS. FURTHER INFORMATION

Cardiovascular effects Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

 DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Tracrium®; Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► ATRACURIUM BESILATE (Non-proprietary)

Atracurium besilate 10 mg per 1 ml Atracurium besilate 250mg/25ml solution for injection vials | 1 vial [PoM] 116.50 Atracurium besilate 25mg/2.5ml solution for injection ampoules | 5 ampoule [PoM] £8.50-£9.25 Atracurium besilate 50mg/5ml solution for injection ampoules | 5 ampoule [PoM] £15.00-£17.50 Atracurium besilate 250mg/25ml solution for injection ampoules | 2 ampoule [PoM] £25.29

► Tracrium (GlaxoSmithKline UK Ltd)

Atracurium besilate 10 mg per 1 ml Tracrium 250mg/25ml solution for injection vials | 2 vial [PoM] £25.81 Tracrium 25mg/2.5ml solution for injection ampoules | 5 ampoule [PoM] £8.28 Tracrium 50mg/5ml solution for injection ampoules | 5 ampoule [PoM] £15.02

Cisatracurium

INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes, alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stabilisation

Neuromuscular blockade (intermediate duration) during intensive care

INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 150 micrograms/kg, initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- SIDE-EFFECTS Acute myopathy (after prolonged use in intensive care) · bradycardia
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (Nimbex®, Nimbex Forte®), give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.
- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► CISATRACURIUM (Non-proprietary)

Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Cisatracurium besilate 20mg/10ml solution for injection vials | 5 vial PoM £37.75 (Hospital only) | 5 vial PoM £37.75 (Sisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Cisatracurium besilate 150mg/30ml solution for injection vials | 1 vial PoM £45.00 (Hospital only) | 1 vial PoM £18.66

► Nimbex (GlaxoSmithKline UK Ltd)

Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Nimbex

20mg/10ml solution for injection ampoules | 5 ampoule PoM £37.75

Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Nimbex

Forte 150mg/30ml solution for injection vials | 1 vial | PoM £31.09

Mivacurium

INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

 Adult: 70-250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8-10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6-7 micrograms/kg/minute

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- CAUTIONS Burns (low plasma cholinesterase activity; dose titration required) • elderly
- SIDE-EFFECTS
- Very rare Anaphylactoid reactions
- ▶ Frequency not known Bronchospasm hypotension skin flushing • tachycardia
- HEPATIC IMPAIRMENT Reduce dose in severe impairment.
- RENAL IMPAIRMENT Clinical effect prolonged in renal failure—reduce dose according to response.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Mivacron (GlaxoSmithKline UK Ltd)

Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacron 10mg/5ml solution for injection ampoules | 5 ampoule PoM £13.95 Mivacron 20mg/10ml solution for injection ampoules | 5 ampoule PoM £22.57

Pancuronium bromide

INDICATIONS AND DOSE

Neuromuscular blockade (long duration) during surgery and intubation

BY INTRAVENOUS INJECTION

► Adult: Initially 100 micrograms/kg, then 20 micrograms/kg as required

Neuromuscular blockade (long duration) during intensive care

BY INTRAVENOUS INJECTION

 Adult: Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- SIDE-EFFECTS Acute myopathy (after prolonged use in intensive care) hypertension tachycardia SIDE-EFFECTS, FURTHER INFORMATION Pancuronium lacks histamine-releasing effect, but
- vagolytic and sympathomimetic effects can cause tachycardia and hypertension.
- HEPATIC IMPAIRMENT Possibly slower onset, higher dose requirement, and prolonged recovery time.
- RENAL IMPAIRMENT Use with caution; prolonged duration of block.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► PANCURONIUM BROMIDE (Non-proprietary)

Pancuronium bromide 2 mg per 1 ml Pancuronium bromide 4mg/2ml solution for injection ampoules | 10 ampoule PoM £50.00

Rocuronium bromide

INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 600 micrograms/kg; (by intravenous injection) maintenance 150 micrograms/kg, alternatively (by intravenous infusion) maintenance 300–600 micrograms/kg/hour, adjusted according to response
- Elderly: Initially 600 micrograms/kg; (by intravenous injection) maintenance 75–100 micrograms/kg, alternatively (by intravenous infusion) maintenance up to 400 micrograms/kg/hour, adjusted according to response

Neuromuscular blockade (intermediate duration) during intensive care

INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 600 micrograms/kg, initial dose is optional; (by intravenous infusion) maintenance 300–600 micrograms/kg/hour for first hour, then (by intravenous infusion), adjusted according to response

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

SIDE-EFFECTS

- ▶ Very rare Anaphylactoid reactions
- ▶ Frequency not known Acute myopathy (after prolonged use in intensive care) • bronchospasm • hypotension • skin flushing • tachycardia
- HEPATIC IMPAIRMENT Reduce dose.
- RENAL IMPAIRMENT Reduce maintenance dose; prolonged paralysis.
- DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► ROCURONIUM BROMIDE (Non-proprietary)

Rocuronium bromide 10 mg per 1 ml Rocuronium bromide 50mg/5ml solution for injection vials | 10 vial [PoM] £28.90-£30.00 Rocuronium 100mg/10ml solution for injection vials | 10 vial [PoM] £60.00

► Esmeron (Merck Sharp & Dohme Ltd)

Rocuronium bromide 10 mg per 1 ml Esmeron 50mg/5ml solution for injection vials | 10 vial PoM £28.92 (Hospital only)

Esmeron 100mg/10ml solution for injection vials | 10 vial PoM £57.85 (Hospital only)

Vecuronium bromide

INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

 Adult: 80-100 micrograms/kg; (by intravenous injection) maintenance 20-30 micrograms/kg, adjusted according to response, max.
 100 micrograms/kg in caesarean section, alternatively (by intravenous infusion) maintenance 0.8-1.4 micrograms/kg/minute, adjusted according to response

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

SIDE-EFFECTS

- ▶ Very rare Anaphylactoid reactions
- ► Frequency not known Acute myopathy (after prolonged use in intensive care) bronchospasm hypotension skin flushing tachycardia
- HEPATIC IMPAIRMENT Use with caution in significant impairment.
- RENAL IMPAIRMENT Use with caution.
- DIRECTIONS FOR ADMINISTRATION Reconstitute each vial
 with 5 mL Water for Injections to give 2 mg/mL solution;
 alternatively reconstitute with up to 10 mL Glucose 5% or
 Sodium Chloride 0.9% or Water for Injections—
 unsuitable for further dilution if not reconstituted with
 Water for Injections. For continuous intravenous infusion,
 dilute reconstituted solution to a concentration up to
 40 micrograms/L with Glucose 5% or Sodium Chloride
 0.9%; reconstituted solution can also be given via drip
 tubing

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Norcuron (Merck Sharp & Dohme Ltd)

Vecuronium bromide 10 mg Norcuron 10mg powder and solvent for solution for injection vials | 10 vial PoM £33.73 (Hospital only)

1.4 Neuromuscular blockade reversal

Drugs used for Neuromuscular blockade reversal not listed below; Neostigmine, p. 912

Glycopyrronium bromide with neostigmine

The properties listed below are those particular to the combination only. For the properties of the components please consider, glycopyrronium bromide p. 1100, neostigmine p. 912.

INDICATIONS AND DOSE

Reversal of non-depolarising neuromuscular blockade BY INTRAVENOUS INJECTION

 Adult: 1-2 mL, repeated if necessary, alternatively 0.02 mL/kilogram (max. per dose 2 mL), repeated if necessary, dose to be given over 10-30 seconds

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► GLYCOPYRRONIUM BROMIDE WITH NEOSTIGMINE (Nonproprietary)

Glycopyrronium bromide 500 microgram per 1 ml, Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml / Glycopyrronium bromide 500micrograms/1ml solution for injection ampoules | 10 ampoule | PoM| £9.11

esthesia

CHELATORS AND ANTIDOTES

Sugammadex

INDICATIONS AND DOSE

Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium

BY INTRAVENOUS INJECTION

 Adult: Initially 2-4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details Immediate reversal of neuromuscular blockade induced by rocuronium

BY INTRAVENOUS INJECTION

► Adult: 16 mg/kg (consult product literature)

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- CAUTIONS Cardiovascular disease (recovery may be delayed) · elderly (recovery may be delayed) · pre-existing coagulation disorders · recurrence of neuromuscular blockade—monitor respiratory function until fully recovered · use of anticoagulants (unrelated to surgery) · wait 24 hours before re-administering rocuronium · wait 24 hours before re-administering vecuronium
- INTERACTIONS → Appendix 1 (sugammadex).
- SIDE-EFFECTS Bradycardia bronchospasm cardiac arrest hypersensitivity reactions
- PREGNANCY Use with caution—no information available.
- RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/ minute/1.73 m².
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium, has advised (February 2013) that sugammadex (Bridion) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

▶ Bridion (Merck Sharp & Dohme Ltd)

Sugammadex (as Sugammadex sodium) 100 mg per 1 ml Bridion 500mg/5ml solution for injection vials | 10 vial [PoM] £1,491.00 (Hospital only) Bridion 200mg/2ml solution for injection vials | 10 vial [PoM] £596.40 (Hospital only)

1.5 Peri-operative analgesia

Peri-operative analgesia

Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain. Acemetacin p. 917, diclofenac sodium p. 921, diclofenac potassium p. 920, flurbiprofen p. 994, ibuprofen p. 927, ketoprofen p. 930, paracetamol p. 354, parecoxib p. 1108, and ketorolac trometamol p. 1107 are licensed for

postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac sodium, can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac sodium and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac trometamol is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Preoperative use of opioid analgesics is generally limited to those patients who require control of existing pain. See general notes on opioid analgesics and their use in postoperative pain. See also the management of opioid-induced respiratory depression.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 357, fentanyl p. 362, and remifentanil p. 1108 are particularly useful because they act within 1-2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw: this can be managed by the use of neuromuscular blocking drugs. are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

Bupivacaine with fentanyl

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1113, fentanyl p. 362.

INDICATIONS AND DOSE

Postoperative pain (once epidural block established)
BY CONTINUOUS EPIDURAL INFUSION

 Adult: 4-18.75 mg/hour of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 8-30 micrograms/hour of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours, to be administered by thoracic, upper abdominal or lower abdominal epidural infusion

During labour (once epidural block established)

BY CONTINUOUS LUMBAR EPIDURAL INFUSION

▶ Adult: 10-18.75 mg/hour of bupivacaine to be administered and 16-30 micrograms/hour of fentanyl to be administered

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, infusion

Solution for infusion

► Bufvl (AMCo)

Bupivacaine hydrochloride 1 mg per 1 ml, Fentanyl 2 microgram per 1 ml Bufyl 1mg/ml and 2micrograms/ml 250ml infusion bags 20 bag PoM £170.00 (Hospital only) Schedule 2 (CD) Bufyl 1mg/ml and 2micrograms/ml 500ml infusion bags | 10 bag Pom £92.00 (Hospital only) Schedule 2 (CD) Bupivacaine hydrochloride 1.25 mg per 1 ml, Fentanyl (as Fentanyl citrate) 2 microgram per 1 ml Bufyl 1.25mg/ml and 2micrograms/ml 250ml infusion bags | 20 bag PoM £181.00 (Hospital only) Schedule 2 (CD) Bufyl 1.25mg/ml and 2micrograms/ml 500ml infusion bags | 10 bag [PoM] £92.00 (Hospital only) Schedule 2 (CD)

NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Ketorolac trometamol

INDICATIONS AND DOSE

Short-term management of moderate to severe acute postoperative pain only

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Adult (body-weight up to 50 kg): Initially 10 mg, then 10-30 mg every 4-6 hours as required for maximum duration of treatment 2 days, to be given over at least 15 seconds, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- Adult (body-weight 50 kg and above): Initially 10 mg, then 10-30 mg every 4-6 hours as required for maximum duration of treatment 2 days, to be given over at least 15 seconds, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
- ► Elderly: Initially 10 mg, then 10-30 mg every 4-6 hours as required for maximum duration of treatment 2 days, to be given over at least 15 seconds, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- CONTRA-INDICATIONS Active or history of gastrointestinal bleeding · active or history of gastro-intestinal ulceration · coagulation disorders · complete or partial syndrome of nasal polyps · confirmed or suspected cerebrovascular bleeding · dehydration · following operations with high risk of haemorrhage or incomplete haemostasis · haemorrhagic diatheses · history of gastrointestinal perforation · hypovolaemia · severe heart failure
- CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) . cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- INTERACTIONS → Appendix 1 (NSAIDs).
- SIDE-EFFECTS
- ▶ Rare Alveolitis aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic

- damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure . pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis
- ► Frequency not known Abnormal dreams · angioedema · asthma · blood disorders · bradycardia · bronchospasm · chest pain · colitis (induction of or exacerbation of) · confusion · convulsions · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · euphoria · fluid retention (rarely precipitating congestive heart failure) . flushing · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastrointestinal ulceration · haematuria · hallucinations · headache · hearing disturbances · hyperkalaemia · hyperkinesia · hypersensitivity reactions · hypertension · hyponatraemia · insomnia · malaise · myalgia · nausea · nervousness · optic neuritis · pain at injection site · pallor · palpitation · paraesthesia · photosensitivity · psychosis · purpura · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · sweating · taste disturbances · thirst · tinnitus · urinary frequency · vertigo · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- ALLERGY AND CROSS-SENSITIVITY Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- RENAL IMPAIRMENT
- With intramuscular use or intravenous use The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection. Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ► KETOROLAC TROMETAMOL (Non-proprietary) Ketorolac trometamol 30 mg per 1 ml Ketorolac 30 mg/1 ml
- solution for injection ampoules | 6 ampoule PoM £6.56 ► Toradol (Roche Products Ltd)
- Ketorolac trometamol 30 mg per 1 ml Toradol 30 mg/1ml solution for injection ampoules | 5 ampoule Pom £5.36

Parecoxih

 DRUG ACTION Parecoxib is a selective inhibitor of cyclooxygenase-2.

INDICATIONS AND DOSE

Short-term management of acute postoperative pain BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ► Adult: Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
- Elderly (body-weight up to 50 kg): Initially 20 mg; maximum 40 mg per day
- CONTRA-INDICATIONS Active gastro-intestinal bleeding active gastro-intestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease
- CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · elderly (risk of serious side-effects and fatalities) · following coronary artery bypass graft surgery · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- INTERACTIONS → Appendix 1 (NSAIDs).
- SIDE-EFFECTS
- ➤ Common or very common Alveolar osteitis · flatulence · hypoaesthesia · hypokalaemia · hypotension · postoperative anaemia · sweating
- ► Uncommon Anorexia · arthralgia · bradycardia · cardiovascular events · ecchymosis · hyperglycaemia · malaise · pulmonary embolism
- Rare Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure pulmonary eosinophilia · Stevens-Johnson syndrome toxic epidermal necrolysis · visual disturbances
- ► Frequency not known Angioedema · blood disorders · blood pressure may be raised · bronchospasm · circulatory collapse · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · rashes · renal failure (especially in patients with pre-existing renal impairment) · tachycardia · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

ALLERGY AND CROSS-SENSITIVITY Contraindicated in
patients with a history of hypersensitivity to aspirin or
any other NSAID—which includes those in whom attacks
of asthma, angioedema, urticaria or rhinitis have been
precipitated by aspirin or any other NSAID.
 Contraindicated in patients with a history of allergic drug
reactions including sulfonamide hypersensitivity.

- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Avoid—present in milk.
- HEPATIC IMPAIRMENT Halve dose in moderate impairment (max. 40 mg daily).

Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.

- RENAL IMPAIRMENT The lowest effective dose should be used for the shortest possible duration.
 Avoid if possible or use with caution.
 In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2003) that parecoxib is **not** recommended for use within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Dynastat (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder for solution for injection vials | 10 vial PoM £49.60

Powder and solvent for solution for injection

Dynastat (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder and solvent for solution for injection vials | 5 vial PoM £28.34

OPIOIDS

Remifentanil

The properties listed below are those particular to the drug only. For properties common to the class, see Opioids, p. 357.

INDICATIONS AND DOSE

Analgesia and enhancement of anaesthesia at induction INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 0.25-1 microgram/kg, dose to be administered over at least 30 seconds, then (by intravenous infusion) 30-60 micrograms/kg/hour, alternatively (by intravenous infusion) initially 30-60 micrograms/kg/hour, if patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia

 Adult: Initially 0.25-1 microgram/kg, dose to be administered over at least 30 seconds, according to anaesthetic technique and adjusted according to response, followed by (by intravenous infusion) 3-120 micrograms/kg/hour, intravenous infusion may be given with or without initial intravenous injection dose; in light anaesthesia supplemental doses by intravenous injection every 2-5 minute

Assisted ventilation: analgesia and sedation in intensivecare patients (for max 3 days)

BY INTRAVENOUS INFUSION

 Adult: Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–44.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients
BY INTRAVENOUS INFUSION

 Adult: Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia BY INTRAVENOUS INFUSION

 Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5-6 micrograms/kg/hour

Cardiac surgery

► Adult: (consult product literature)

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- UNLICENSED USE Remifentanil doses in BNF may differ from those in product literature.
- CONTRA-INDICATIONS Analgesia in conscious patients
- SIDE-EFFECTS
- ► Common or very common Hypertension
- ▶ Uncommon Hypoxia
- ▶ Rare Asystole
- ► Frequency not known AV block convulsions

SIDE-EFFECTS, FURTHER INFORMATION

Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

Respiratory depression In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression.

- PREGNANCY No information available.
- BREAST FEEDING Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.
- RENAL IMPAIRMENT No dose adjustment necessary in renal impairment.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (Ultiva®), give continuously in Glucose 5% or Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).

PRESCRIBING AND DISPENSING INFORMATION

Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► REMIFENTANIL (Non-proprietary)

Remifentanil (as Remifentanyl hydrochloride) 1 mg Remifentanil
1mg powder for concentrate for solution for injection vials |
5 vial [Pom § 25.58-25.60 (Hospital only) Schedule 2 (CD)
Remifentanil (as Remifentanyl hydrochloride) 2 mg Remifentanil
2mg powder for concentrate for solution for injection vials |
5 vial [Pom § 25.9.13-£51.5 (Hospital only) Schedule 2 (CD)
Remifentanil (as Remifentanyl hydrochloride) 5 mg Remifentanil

Ultiva (GlaxoSmithKline UK Ltd)

Remifentanil (as Remifentanyl hydrochloride) 1 mg Ultiva 1mg powder for solution for injection vials | 5 vial Pom no price available (Hospital only) Schedule 2 (CD)

Remifentanil (as Remifentanyl hydrochloride) 2 mg Ultiva 2mg powder for solution for injection vials | 5 vial Pom no price available (Hospital only) Schedule 2 (CD)

Remifentanil (as Remifentanyl hydrochloride) 5 mg Ultiva 5mg powder for solution for injection vials | 5 vial Pom no price available (Hospital only) Schedule 2 (CD)

Hyoscine hydrobromide with papaveretum

The properties listed below are those particular to the combination only. For the properties of the components please consider, hyoscine hydrobromide p. 344, papaveretum p. 371.

INDICATIONS AND DOSE

Premedication

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

► Adult: 0.5-1 mL

 LESS SUITABLE FOR PRESCRIBING Hyoscine hydrobromide with papaveretum is less suitable for prescribing.

MEDICINAL FORMS

Medicines not identified.

1.6 Peri-operative sedation

Conscious sedation for clinical procedures

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be monitored carefully; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

ALPHA2-ADRENOCEPTOR AGONISTS

Dexmedetomidine

INDICATIONS AND DOSE

 $\label{eq:maintenance} \textbf{Maintenance of sedation during intensive care}$

BY INTRAVENOUS INFUSION

 Adult: 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour

Important safety information

Dexmedetomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

- CONTRA-INDICATIONS Acute cerebrovascular disorders second- or third-degree AV block (unless pacemaker fitted) uncontrolled hypotension
- CAUTIONS Abrupt withdrawal after prolonged use bradycardia · ischaemic heart disease · malignant hyperthermia · severe cerebrovascular disease (especially at higher doses) · severe neurological disorders · spinal cord injury
- SIDE-EFFECTS
- Common or very common Agitation · blood pressure changes · bradycardia · changes in blood sugar · dry mouth · hyperthermia · myocardial infarction · myocardial ischaemia · nausea · tachycardia · vomiting
- ► Uncommon Abdominal distension · AV block · decreased cardiac output · dyspnoea · hallucination · hypoalbuminaemia · metabolic acidosis · thirst
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.
- HEPATIC IMPAIRMENT Dose reduction may be required.
 Manufacturer advises caution.
- MONITORING REQUIREMENTS Monitor cardiac function.
 Monitor respiratory function in non-intubated patients.
- DIRECTIONS FOR ADMINISTRATION To be diluted before use.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Dexdor (Orion Pharma (UK) Ltd)

Dexmedetomidine (as Dexmedetomidine hydrochloride) 100 microgram per 1 ml Dexdor 1mg/10ml concentrate for solution for infusion vials | 4 vial PoM £313.20 (Hospital only) Dexdor 400micrograms/4ml concentrate for solution for infusion vials | 4 vial PoM £125.28 (Hospital only) Dexdor 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £78.30 (Hospital only) |

ANAESTHETICS (GENERAL, INTRAVENOUS, NMDA RECEPTOR ANTAGONISTS)

25 ampoule PoM £391.50 (Hospital only)

Ketamine

INDICATIONS AND DOSE

Induction and maintenance of anaesthesia for short procedures

BY INTRAMUSCULAR INJECTION

 Adult: Initially 6.5-13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12-25 minutes of surgical anaesthesia

BY INTRAVENOUS INJECTION

 Adult: Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

Diagnostic manoeuvres and procedures not involving intense pain

BY INTRAMUSCULAR INJECTION

Adult: Initially 4 mg/kg

Induction and maintenance of anaesthesia for long

BY INTRAVENOUS INFUSION

 Adult: Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/ml; maintenance 10–45 micrograms/kg/minute, adjusted according to response

Important safety information

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CONTRA-INDICATIONS Acute porphyrias p. 864 eclampsia head trauma hypertension pre-eclampsia raised intracranial pressure severe cardiac disease stroke
- CAUTIONS Acute circulatory failure (shock) cardiovascular disease dehydration elderly fixed cardiac output hallucinations head injury hypertension hypovolaemia increased cerebrospinal fluid pressure intracranial mass lesions nightmares predisposition to seizures psychotic disorders raised intra-ocular pressure respiratory tract infection thyroid dysfunction
- INTERACTIONS → Appendix 1 (anaesthetics, general).
- SIDE-EFFECTS
- ► Common or very common Diplopia · hallucinations · hypertension · nausea · nightmares · nystagmus · rash · tachycardia · transient psychotic effects · vomiting
- ► **Uncommon** Arrhythmias · bradycardia · hypotension · larvngospasm · respiratory depression
- ▶ Rare Apnoea · cystitis · cystitis · haemorrhagic cystitis · hypersalivation · insomnia
- Frequency not known Raised intra-ocular pressure SIDE-EFFECTS, FURTHER INFORMATION Transient psychotic effects Incidence of hallucinations, nightmares, and other transient psychotic effects can be reduced by a benzodiazepine such as diazepam or midazolam.
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Avoid for at least 12 hours after last dose
- HEPATIC IMPAIRMENT Consider dose reduction.
- DIRECTIONS FOR ADMINISTRATION

For *continuous intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% *or* Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia.

For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% *or* Sodium Chloride 0.9% *or* Water for Injections.

 PATIENT AND CARER ADVICE Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution, spray, oral suspension

Solution for injection

► Ketalar (Pfizer Ltd)

Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml Ketalar 200mg/20ml solution for injection vials | 1 vial PoM £5.06 (Hospital only) Schedule 4 (CD Benz)

Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml Ketalar 500mg/10ml solution for injection vials | 1 vial PoM £8.77 (Hospital only) Schedule 4 (CD Benz)

Ketamine (as Ketamine hydrochloride) 100 mg per 1 ml Ketalar 1g/10ml solution for injection vials | 1 vial PoM £16.10 (Hospital only) Schedule 4 (CD Benz)

2 Local anaesthesia

Local anaesthesia

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1113 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Chloroprocaine hydrochloride p. 1114, a paraaminobenzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes

Levobupivacaine p. 1115, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 1116 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 196) is about 90 minutes.

Prilocaine hydrochloride p. 1120 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1121 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1122, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential.

Use of vasoconstrictors

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is **not** advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics **articaine** and mepivacaine hydrochloride p. 1119 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin

can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

Severe local anaesthetic-induced cardiovascular toxicity

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid. [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion. Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity - Accompanying notes.

ANAESTHETICS (LOCAL)

Articaine hydrochloride with adrenaline

(Carticaine hydrochloride with epinephrine)

INDICATIONS AND DOSE

Infiltration anaesthesia in dentistry

► Adult: Consult expert dental sources

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS Application to damaged skin application to the middle ear (may cause ototoxicity) complete heart block · injection into infected tissues · injection into inflamed tissues · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block)

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

• CAUTIONS Arrhythmias · arteriosclerosis · cardiovascular disease · cerebrovascular disease · cor pulmonale · debilitated patients (consider dose reduction) · diabetes mellitus · elderly (consider dose reduction) · epilepsy · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · hypovolaemia · impaired cardiac conduction · impaired respiratory function · ischaemic heart disease · myasthenia gravis · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · shock · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used

- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS Angina · angle-closure glaucoma · anorexia · anxiety · arrhythmias · blurred vision · cardiac arrest · cold extremities · confusion · convulsions · difficulty in micturition · dizziness · drowsiness · dry mouth · dyspnoea · feeling of inebriation · headache · hyperglycaemia · hypersalavation · hypertension (risk of cerebral haemorrhage) · hypokalaemia · insomnia · lightheadedness · metabolic acidosis · methaemoglobinaemia · muscle twitching · mydriasis · myocardial depression (resulting in hypotension and bradycardia) · myocardial infarction · nausea · numbness of the tongue and perioral region · pallor · palpitation · paraesthesia (including sensations of hot and cold) . peripheral vasodilatation (resulting in hypotension and bradycardia) · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · restlessness · sweating · tachycardia · tinnitus · tissue necrosis at injection site and of extremities, bowel, liver and kidneys · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremor · urinary retention · vomiting · weakness

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Use only if potential benefit outweighs risk no information available.
- BREAST FEEDING Avoid breast-feeding for 48 hours after administration.

- HEPATIC IMPAIRMENT Use with caution; increased risk of side-effects in severe impairment.
- RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.
- MONITORING REQUIREMENTS Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

► Septanest (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge [PoM] no price available

Bupivacaine hydrochloride

INDICATIONS AND DOSE

Surgical anaesthesia, lumbar epidural block

BY REGIONAL ADMINISTRATION

 Adult: 75-150 mg, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia, field block

BY REGIONAL ADMINISTRATION

 Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, thoracic epidural block BY THORACIC EPIDURAL

BY THORACIC EPIDURAL
► Adult: 12.5-50 mg, dose administered using a

2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, caudal epidural block

BY REGIONAL ADMINISTRATION

► Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, major nerve block

BY REGIONAL ADMINISTRATION

 Adult: 50-175 mg, dose administered using 5 mg/mL (0.5%) solution

Acute pain, intra-articular block

BY INTRA-ARTICULAR INJECTION

 Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

Acute pain, thoracic epidural block

BY CONTINUOUS EPIDURAL INFUSION

 Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, labour

BY CONTINUOUS EPIDURAL INFUSION

 Adult: 6.25-12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Acute pain, lumbar epidural block

INITIALLY BY LUMBAR EPIDURAL

Adult: 15–37.5 mg, then (by lumbar epidural)
 15–37.5 mg at least every 30 minutes, repeated when required, alternatively (by continuous epidural infusion)
 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%)
 or 2.5 mg/mL (0.25%)
 solution

Acute pain, field block

BY REGIONAL ADMINISTRATION

 Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

MARCAIN HEAVY

Intrathecal anaesthesia for surgery

BY INTRATHECAL INJECTION

▶ Adult: 10-20 mg

Important safety information

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

 CONTRA-INDICATIONS Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS. FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- CAUTIONS Cardiovascular disease · cerebral atheroma · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypertension · hypotension · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · myocardial depression may be more severe and more resistant to treatment · shock
- INTERACTIONS → Appendix 1 (bupivacaine).
- SIDE-EFFECTS Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

 ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.

- PREGNANCY Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Use with caution in severe impairment.
- RENAL IMPAIRMENT Use with caution in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

► BUPIVACAINE HYDROCHLORIDE (Non-proprietary)

Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine 0.25% solution for injection 10ml Sure-Amp ampoules | 20 ampoule PoM

Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 0.5% solution for injection 10ml Sure-Amp ampoules | 20 ampoule PoM 518 30

Bupivacaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule PoM no price available

Marcain (AstraZeneca UK Ltd)

Bupivacaine hydrochloride 2.5 mg per 1 ml Marcain 0.25% solution for injection 10ml Polyamp Steripack ampoules | 5 ampoule PoM £7.92

Bupivacaine hydrochloride 5 mg per 1 ml Marcain 0.5% solution for injection 10ml Polyamp Steripack ampoules | 5 ampoule PoM 59.25

Infusion

► BUPIVACAINE HYDROCHLORIDE (Non-proprietary)

Bupivacaine hydrochloride 1 mg per 1 ml Bupivacaine 100mg/100ml (0.1%) infusion bags | 20 bag [PoM] no price available Bupivacaine 250mg/250ml (0.1%) infusion bags | 20 bag [PoM] no price available

Bupivacaine hydrochloride 1.25 mg per 1 ml Bupivacaine 312.5mg/250ml (0.125%) infusion bags | 20 bag PoM no price available

Bupivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, adrenaline/epinephrine p. 196, bupivacaine hydrochloride p. 1113.

INDICATIONS AND DOSE

Surgical anaesthesia

BY LUMBAR EPIDURAL OR BY LOCAL INFILTRATION OR BY CAUDAL EPIDURAL

► Adult: (consult product literature)

Acute pain management

BY LUMBAR EPIDURAL OR BY LOCAL INFILTRATION

► Adult: (consult product literature)

CAUTIONS

CAUTIONS, FURTHER INFORMATION

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► ADRENALINE WITH BUPIVACAINE (Non-proprietary)

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml,

Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine

25mg/10ml (0.25%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule PoM £25.00 Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 50mg/10ml (0.5%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule | PoMI £27.00

Chloroprocaine hydrochloride

INDICATIONS AND DOSE

Intrathecal anaesthesia for surgical procedures lasting up to 40 minutes

BY SLOW INTRATHECAL INJECTION

 Adult: 40-50 mg, dose depends on desired length of block

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

Important safety information

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- CONTRA-INDICATIONS Application to the middle ear (can cause ototoxicity) avoid injection into infected tissues avoid injection into inflamed tissues complete heart block preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) severe anaemia should not be applied to damaged skin CONTRA-INDICATIONS, FURTHER INFORMATION Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- CAUTIONS Acute porphyrias p. 864 · cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock
- INTERACTIONS → Appendix 1 (chloroprocaine).
- SIDE-FEFFCTS
- ▶ Uncommon Hypertension
- Frequency not known Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful

surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine: reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Avoid—no information available.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Use with caution in severe impairment.
- RENAL IMPAIRMENT Use with caution in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Ampres (AMCo)

Chloroprocaine hydrochloride 10 mg per 1 ml Ampres 50mg/5ml solution for injection ampoules | 10 ampoule PoM £87.50

Levobupivacaine

INDICATIONS AND DOSE

Acute postoperative pain

BY CONTINUOUS EPIDURAL INFUSION

▶ Adult: 12.5-18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute labour pain

INITIALLY BY LUMBAR EPIDURAL

▶ Adult: 15-25 mg every 15 minutes as required, dose administered using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 5-12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution

Surgical anaesthesia, peripheral nerve block

BY REGIONAL ADMINISTRATION

► Adult: 2.5-150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, peribulbular nerve block BY REGIONAL ADMINISTRATION

▶ Adult: 37.5-112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia for caesarean section

BY LUMBAR EPIDURAL

▶ Adult: 75-150 mg, to be given over 15 -20 minutes, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia

BY LUMBAR EPIDURAL

▶ Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution

BY INTRATHECAL INJECTION

▶ Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution

BY LOCAL INFILTRATION

► Adult: 2.5-150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body- weight.

Important safety information

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

• CONTRA-INDICATIONS Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects. and the local anaesthetic effect may also be reduced by altered local pH.

- CAUTIONS Cardiovascular disease debilitated patients (consider dose reduction) • elderly (consider dose reduction) • epilepsy • hypovolaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis · shock
- INTERACTIONS → Appendix 1 (levobupivacaine).
- SIDE-EFFECTS Anaemia · arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · pyrexia · restlessness · sweating · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine: reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester-toxicity in animal studies. May cause fetal

distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Use with caution.
- DIRECTIONS FOR ADMINISTRATION For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%
- PRESCRIBING AND DISPENSING INFORMATION

Levobupivacaine is an isomer of bupivacaine.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Chirocaine (AbbVie Ltd)

Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Chirocaine 25mg/10ml solution for injection ampoules | 10 ampoule PoM £14.11 (Hospital only)

Lidocaine hydrochloride

(Lignocaine hydrochloride)

INDICATIONS AND DOSE

Dental practice

BY BUCCAL ADMINISTRATION USING OINTMENT

▶ Adult: Rub gently into dry gum

Infiltration anaesthesia

BY LOCAL INFILTRATION

 Adult: Dose to be given according to patient's weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

Intravenous regional anaesthesia and nerve block

► Adult: Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritis ani, pruritis vulvae, herpes zoster, or herpes labialis) | Lubricant in cystoscopy | Lubricant in proctoscopy TO THE SKIN USING OINTMENT

► Adult: Apply 1–2 mL as required, avoid long-term use

Sore nipples from breast-feeding

TO THE SKIN USING OINTMENT

 Adult: Apply using gauze and wash off immediately before next feed

LARYNGOJET®

Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract

TO MUCOUS MEMBRANES

 Adult: 40-200 mg, to be given as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient); usual dose 160 mg

IMX 4®

Anaesthesia before venous cannulation or venepuncture

- Child 1-2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 3-11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- ➤ Child 1-17 years: Apply 1-2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- Adult: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

XYLOCAINE[®]

Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation

TO MUCOUS MEMBRANES

Adult: Lin to 20 dose

Adult: Up to 20 doses

Dental practice

TO MUCOUS MEMBRANES

► Adult: 1–5 doses

Maxillary sinus puncture

TO MUCOUS MEMBRANES

► Adult: 3 doses

During delivery in obstetrics

TO THE SKIN

► Adult: Up to 20 doses

VERSATIS®

Postherpetic neuralgia

TO THE SKIN

Adult: Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

Important safety information

For local infiltration, the licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

All grades of atrioventricular block - severe myocardial depression - sino-atrial disorders

SPECIFIC CONTRA-INDICATIONS

When used by regional administration Application to the middle ear (can cause ototoxicity) avoid injection into infected tissues avoid injection into inflamed tissues. preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · severe myocardial depression · should not be applied to damaged skin

CONTRA-INDICATIONS. FURTHER INFORMATION

▶ When used by regional administration

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

CAUTIONS

- With intravenous use Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) · congestive cardiac failure (consider lower dose) · post cardiac surgery (consider lower dose)
- When used by regional administration Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) · congestive cardiac failure (consider lower dose) · post cardiac surgery (consider lower dose) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock
- With oral (topical) use Avoid anaesthesia of the pharynx before meals-risk of choking - can damage plastic cuffs of endotrachial tubes
- INTERACTIONS → Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.
- SIDE-EFFECTS
- ► Common or very common
- With intravenous use Bradycardia (may lead to cardiac arrest) · confusion · convulsions · dizziness (particularly if injection too rapid) · drowsiness (particularly if injection too rapid) · hypotension (may lead to cardiac arrest) · paraesthesia (particularly if injection too rapid) · respiratory depression
- When used by regional administration Bradycardia (may lead to cardiac arrest) · confusion · convulsions · hypotension (may lead to cardiac arrest) · respiratory depression
- ▶ Rare
- With intravenous use or by regional administration Anaphylaxis
- ► Frequency not known
- ▶ When used by regional administration Arrhythmias · blurred vision · cardiac arrest · feeling of inebriation · headache · hypoglycaemia (following intrathecal or extradural administration) · methaemoglobinaemia · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · nystagmus · peripheral vasodilatation (resulting in hypotension and bradycardia) · rash · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Topical application A single application of a topical lidocaine preparation does not generally cause systemic side-effects.

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local

anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinaemia Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride; neonates and infants under 6 months are particularly susceptible to methaemoglobinaemia.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.
 When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- BREAST FEEDING Present in milk but amount too small to be harmful.
- HEPATIC IMPAIRMENT Caution—increased risk of sideeffects.
- RENAL IMPAIRMENT Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%

 NATIONAL FUNDING/ACCESS DECISIONS VFRSATIS[®]

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2008) that Versatis® is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective.

Lidocaine hydrochloride 50 mg per 1 ml, Phenylephrine hydrochloride 5 mg per 1 ml Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml PoM £11.48

Lidocaine with prilocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1116, prilocaine hydrochloride p. 1120.

INDICATIONS AND DOSE

Anaesthesia before minor skin procedures including venepuncture

TO THE SKIN

- Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
- Child 3-11 months: Apply up to 2 g for maximum 4 hours before procedure, to be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- Child 1-11 years: Apply 1-5 hours before procedure (2-5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- Child 12-17 years: Apply 1–5 hour before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)
- Adult: Apply 1–5 hour before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

Anaesthesia on genital skin before injection of local anaesthetics

TO THE SKIN

 Adult: Apply for 15 minutes (in adult men) and 60 minutes (in adult women), to be applied under occlusive dressing

Anaesthesia before surgical treatment of lesions on genital mucosa

TO THE SKIN

► Adult: Apply up to 10 g, to be applied 5–10 minutes before procedure

Anaesthesia before cervical curettage

TO THE SKIN

 Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer

TO THE SKIN

- ▶ Adult: Apply up to 10 g for 30-60 minutes, to be applied under occlusive dressing
- CONTRA-INDICATIONS Use in child less than 37 weeks corrected gestational age

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

► Pliaglis (Galderma (UK) Ltd)

Lidocaine 70 mg, Tetracaine 70 mg Pliaglis 70mg/g / 70mg/g cream | 15 gram PoM £22.95

Mepivacaine hydrochloride

INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry

- ► Child 3-17 years: Consult expert dental sources
- ► Adult: Consult expert dental sources

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

 CONTRA-INDICATIONS Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) - should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- CAUTIONS Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock
- SIDE-EFFECTS Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Use with caution in early pregnancy.
- BREAST FEEDING Use with caution.
- HEPATIC IMPAIRMENT Use with caution; increased risk of side-effects in severe impairment.
- RENAL IMPAIRMENT Use with caution; increased risk of side-effects.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Scandonest plain (Deproco UK Ltd)

Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge Pom no price available

Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, adrenaline/epinephrine p. 196, mepivacaine hydrochloride p. 1119.

INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry
BY LOCAL INFILTRATION

► Adult: (consult product literature)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

Scandonest special (Deproco UK Ltd)

Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge | PoM | no price available

Prilocaine hydrochloride

INDICATIONS AND DOSE

CITANEST 1%®

Infiltration anaesthesia | Nerve block

BY REGIONAL ADMINISTRATION

 Adult: 100-200 mg/minute, dose adjusted according to site of administration and response, increased if necessary up to 400 mg, dose may need to be adjusted in elderly or debilitated patients

PRILOTEKAL®

Spinal anaesthesia

BY INTRATHECAL INJECTION

 Adult: Usual dose 40-60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

• CONTRA-INDICATIONS Acquired methaemoglobinaemia anaemia · application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · congenital methaemoglobinaemia · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local DH.

- CAUTIONS Acute porphyrias p. 864 · cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · neonates and infants under 6 months are particularly susceptible to methaemoglobinaemia · severe or untreated hypertension · shock
- INTERACTIONS → Appendix 1 (prilocaine).
 Caution with concomitant use of drugs that cause methaemoglobinaemia.
- SIDE-EFFECTS Arrhythmias blurred vision cardiac arrest convulsions dizziness drowsiness feeling of inebriation headache hypertension lightheadedness methaemoglobinaemia (with high doses) muscle twitching myocardial depression (resulting in hypotension and bradycardia) nausea numbness of the tongue and perioral region paraesthesia (including sensations of hot and cold) peripheral vasodilatation (resulting in hypotension and bradycardia) restlessness tinnitus transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) tremors vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinaemia Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).
- BREAST FEEDING Present in milk but not known to be harmful.
- HEPATIC IMPAIRMENT Lower doses may be required for intrathecal anaesthesia. Use with caution.
- RENAL IMPAIRMENT Lower doses may be required for intrathecal anaesthesia. Use with caution.
- NATIONAL FUNDING/ACCESS DECISIONS PRILOTEKAL[®]

Scottish Medicines Consortium (SMC) Decisions

 With intrathecal use The Scottish Medicines Consortium has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (*Prilotekal* [®]) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

MEDICINAL FORMS

INDICATIONS AND DOSE

Acute pain, peripheral nerve block

BY REGIONAL ADMINISTRATION

 Adult: 10-20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

Acute pain, field block

BY REGIONAL ADMINISTRATION

 Adult: 2-200 mg, dose administered using a 2 mg/mL (0.2%) solution

Acute pain, lumbar epidural block

BY LUMBAR EPIDURAL

 Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

Acute labour pain

BY CONTINUOUS EPIDURAL INFUSION

 Adult: 12-20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Acute postoperative pain

BY CONTINUOUS EPIDURAL INFUSION

 Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Postoperative pain, thoracic epidural block

BY CONTINUOUS EPIDURAL INFUSION

 Adult: 12-28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Surgical anaesthesia, field block

BY REGIONAL ADMINISTRATION

► Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, major nerve block (brachial plexus block)

BY REGIONAL ADMINISTRATION

 Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)

BY THORACIC EPIDURAL

► Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia for caesarean section BY LUMBAR EPIDURAL

► Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, lumbar epidural block BY LUMBAR EPIDURAL

 Adult: 113-200 mg, dose administered using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

• CONTRA-INDICATIONS Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

Emergency treatment of poisoning

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about the degree of risk or about management.

Hospital admission

Benzodiazepine toxicity

Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 104, iron, paracetamol p. 354, tricyclic antidepressants, and cophenotrope p. 55 (diphenoxylate with atropine, Lomotil®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to

Further information

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number: Tel: 0844 892 0111.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours)

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol p. 354, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the

poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 851 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin p. 104 poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amfetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

Convulsions

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 412 or diazepam p. 267 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 414 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam can be administered as a rectal solution.

Methaemoglobinaemia

Drug- or chemical-induced methaemoglobinaemia should be treated with methylthioninium chloride p. 1135 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinaemia.

Removal and elimination

Prevention of absorption

Given by mouth, activated charcoal p. 1130 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

Active elimination techniques

Repeated doses of activated charcoal by mouth *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Activated charcoal p. 1130 should **not** be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of *emesis* (e.g. with ipecacuanha) is **not** recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

Specific Drugs

Alcohol

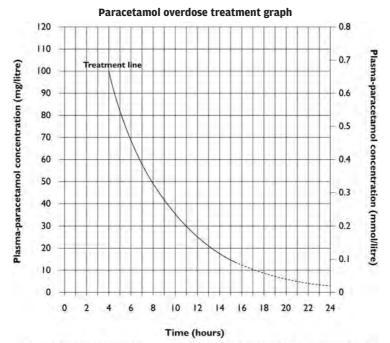

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Analgesics

Aspirin

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses

Patients whose plasma-paracetamol concentrations are on or above the **treatment line** should be treated with acetylcysteine by intravenous infusion.

The prognostic accuracy after 15 hours is uncertain, but a plasma-paracetamol concentration on or above the treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of Medicines and Healthcare products Regulatory Agency

should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

Opioids

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1133 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene; the long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required.

Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 848, or magnesium sulfate p. 858, or both; arrhythmias may occur for up to 12 hours.

Paracetamol

In cases of **intravenous paracetamol poisoning** contact the **National Poisons Information Service** for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1134 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving

acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the **National Poisons Information Service** for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol overdoses, and advice should be sought from the **National Poisons Information Service**.

icute overdose

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Patients who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 1130 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Patients at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line ('treatment line') joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in patients:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose
 of more than 150 mg/kg of paracetamol, even if the
 plasma-paracetamol concentration is not yet available;
 acetylcysteine can be discontinued if the plasmaparacetamol concentration is later reported to be below
 the treatment line on the paracetamol treatment graph,
 provided that the patient is asymptomatic and liver
 function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the *treatment line* on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

'Staggered' overdose, uncertain time of overdose, or therapeutic excess

A 'staggered' overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a 'staggered' overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g. carbamazepine p. 387, efavirenz p. 558, nevirapine p. 560, phenobarbital p. 409, phenytoin p. 398, primidone p. 401, rifabutin p. 507, rifampicin p. 508, St John's wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient's risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

Acetylcysteine dose and administration

For paracetamol overdosage, acetylcysteine p. 1134 is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine, for adults and children of bodyweight 40 kg and over, in terms of the volume of Acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to Glucose Intravenous Infusion 5% p. 852.

First infusion (based on an acetylcysteine dose of approx. 150mg/kg)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 200mL Glucose Intravenous Infusion 5%: infuse over 1 hour.

First infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare first infusion
40-49 kg	34 mL
50-59 kg	42 mL
60-69 kg	49 mL
70-79 kg	57 mL
80-89 kg	64 mL
90-99 kg	72 mL
100-109 kg	79 mL
≥110 kg	83 mL (max. dose)

Second infusion (based on an acetylcysteine dose of approx. 50mg/ kg; start immediately after completion of first infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 500mL Glucose Intravenous Infusion 5%; infuse over 4 hours.

Second infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare second infusion
40-49 kg	12 mL
50-59 kg	14 mL
60-69 kg	17 mL
70-79 kg	19 mL
80-89 kg	22 mL
90-99 kg	24 mL
100-109 kg	27 mL
≥110 kg	28 mL (max. dose)

Third infusion (based on an acetylcysteine dose of approx. 100mg/kg; start immediately after completion of second infusion)-add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose Intravenous Infusion 5%: infuse over 16 hours.

Third infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare third infusion
40-49 kg	23 mL
50-59 kg	28 mL
60-69 kg	33 mL
70-79 kg	38 mL
80-89 kg	43 mL
90-99 kg	48 mL
100-109 kg	53 mL
≥110 kg	55 mL (max. dose)

Antidepressants

Tricyclic and related antidepressants

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended ORS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

Selective serotonin re-uptake inhibitors (SSRIs)

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see Convulsions) p. 1124. Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarials

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons **Information Service** is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotics

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 326 or diazepam p. 267 (emulsion preferred).

Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1130 can be given within 1 hour of ingesting a significant quantity of a secondgeneration antipsychotic drug.

Benzodiazepines

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated p. 1130 can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1132 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

Beta blockers

Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions.

Acute massive overdosage must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 1099 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 618 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not

available, intravenous isoprenaline (available from 'specialorder' manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated p. 1130 should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 857 or calcium gluconate p. 857 is given by injection; atropine sulfate p. 1099 is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the **National Poisons Information Service** if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 839, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually

necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Wholebowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

Stimulants

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 267 or lorazepam p. 412; advice should be sought from the **National Poisons Information Service** on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam p. 267 to control agitation and cooling measures for hyperthermia (see *Body temperature*); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy

Ecstasy (methylenedioxymethamfetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methylenedioxymethamfetamine poisoning is supportive, with diazepam p. 267 to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 349 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 863 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be

controlled by intravenous administration of lorazepam p. 412 or diazepam p. 267 (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a shortacting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Other poisons

Consult either the **National Poisons Information Service** day and night or TOXBASE, see under the National Poisons Information Service.

Cyanides

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1131 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should **not** be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1131 followed by sodium thiosulfate p. 1131 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 837 (*Cyanokit* —no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol

Fomepizole (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals

Heavy metal antidotes include succimer (DMSA) [unlicensed], unlithol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases

Carbon monoxide

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 202. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons

Information Service if the patient is pregnant or in cases

Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS sprav

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing pralidoxime chloride p. 1131 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticides

Organophosphorus insecticides

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1099 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride p. 1131, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is

continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (Vipera berus). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 196. Indications for european viper snake venom antiserum treatment p. 1136 include systemic envenoming, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the european viper snake venom antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service.

Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the european viper snake venom antiserum.

Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine p. 196; selfadministered intramuscular adrenaline/epinephrine (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45° C). People stung by jellyfish and Portuguese man-o'-war around the UK coast

should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the **National Poisons Information Service** or TOXBASE.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

1 Active elimination from the gastro-intestinal tract

CHELATORS AND ANTIDOTES

Charcoal, activated

INDICATIONS AND DOSE

Reduction of absorption of poisons in the gastro-intestinal system

ву моитн

- ▶ Neonate: 1 g/kg.
- ► Child 1 month-11 years: 1 g/kg (max. per dose 50 g)
- ► Child 12-17 years: 50 g
- ► Adult: 50 g

Active elimination of poisons

ву моитн

- Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated.
- Child 1 month-11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated
- ➤ Child 12-17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, dose may be reduced if higher doses not tolerated but this may compromise efficacy
- Adult: Ínitially 50 g, then 50 g every 4 hours. reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, dose may be reduced if higher doses not tolerated but this may compromise efficacy

Accelerated elimination of teriflunomide

BY MOUTH USING GRANULES

▶ Adult: 50 g every 12 hours for 11 days

Accelerated elimination of leflunomide (washout procedure) BY MOUTH USING GRANULES

- ▶ Adult: 50 g 4 times a day for 11 days
- UNLICENSED USE Activated charcoal doses in BNF may differ from those in product literature.
- CAUTIONS Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration ensure airway protected) · reduced gastrointestinal motility (risk of obstruction)
- SIDE-EFFECTS Black stools
- DIRECTIONS FOR ADMINISTRATION Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► CHARCOAL, ACTIVATED (Non-proprietary)

Activated charcoal 300 mg J.L. Bragg's Medicinal Charcoal tablets | 100 tablet GSL £2.11 | 250 tablet GSL £5.16

Capsule

► CHARCOAL, ACTIVATED (Non-proprietary)

Activated charcoal 300 mg J.L. Bragg's Charcoal capsules | 50 capsule £2.11 | 100 capsule £3.06

Granules

➤ Carbomix (Beacon Pharmaceuticals Ltd)
Activated charcoal 813 mg per 1 gram Carbomix 81.3% granules (sugar-free) | 50 gram P £11.90

Oral suspension

➤ Charcodote (Teva UK Ltd)

Activated charcoal 200 mg per 1 ml Charcodote 200mg/ml oral suspension (sugar-free) | 250 ml | P £11.88

2 Chemical toxicity

2.1 Cyanide toxicity

CHELATORS AND ANTIDOTES

Dicobalt edetate

INDICATIONS AND DOSE

Severe poisoning with cyanides

BY INTRAVENOUS INJECTION

- Child: Consult the National Poisons Information Service
- Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity
- CAUTIONS Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness
- SIDE-EFFECTS Anaphylactoid reactions · cardiac abnormalities · facial oedema · hypotension · laryngeal oedema · tachycardia · vomiting
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► DICOBALT EDETATE (Non-proprietary)

Dicobalt edetate 15 mg per 1 ml Dicobalt edetate 300mg/20ml solution for injection ampoules | 6 ampoule PoM £117.20

Sodium nitrite

INDICATIONS AND DOSE

Poisoning with cyanides (used in conjunction with sodium thiosulfate)

BY INTRAVENOUS INJECTION

- Child: 4-10 mg/kg (max. per dose 300 mg), to be given over 5-20 minutes followed by sodium thiosulphate injection
- ► Adult: 300 mg, to be given over 5–20 minutes (as sodium nitrite injection 30 mg/mL)

Dose equivalence and conversion

4-10 mg/kg equates to 0.13-0.33 mL/kg of a 3% solution.

Dose max. of 300 mg equates to 10 mL of a 3% solution.

- SIDE-EFFECTS Flushing (due to vasodilatation) headache (due to vasodilatation)
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Sodium thiosulfate

INDICATIONS AND DOSE

Poisoning with cyanides (used in conjunction with sodium nitrite)

BY INTRAVENOUS INJECTION

- Child: 400 mg/kg (max. per dose 12.5 g), to be given over 10 minutes, dose may be repeated in severe cyanide poisoning if dicobalt edetate not available
- Adult: 12.5 g, to be given over 10 minutes (as sodium thiosulfate injection 500 mg/mL), dose may be repeated in severe cyanide poisoning if dicobalt edetate not available

Dose equivalence and conversion

400 mg/kg equates to 0.8 mL/kg of a 50% solution.

 EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion, liquid

2.2 Organophosphorous toxicity

Drugs used for Organophosphorous toxicity not listed below; *Atropine sulfate*, p. 1099

CHELATORS AND ANTIDOTES

Pralidoxime chloride

INDICATIONS AND DOSE

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent BY INTRAVENOUS INFUSION

 Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

continued \rightarrow

- Adult: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
- UNLICENSED USE Pralidoxime chloride doses may differ from those in product literature. Licensed for use in children (age range not specified by manufacturer).
- CONTRA-INDICATIONS Poisoning with carbamates poisoning with organophosphorus compounds without anticholinesterase activity
- CAUTIONS Myasthenia gravis
- SIDE-EFFECTS Disturbances of vision · dizziness · drowsiness · headache · hyperventilation · muscular weakness · nausea · tachycardia
- RENAL IMPAIRMENT Use with caution.
- DIRECTIONS FOR ADMINISTRATION The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.
- In children For intravenous infusion, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.
- PRESCRIBING AND DISPENSING INFORMATION Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres).
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

3 Drug toxicity

3.1 Benzodiazepine toxicity

BENZODIAZEPINE ANTAGONISTS

Flumazenil

INDICATIONS AND DOSE

Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures

BY INTRAVENOUS INJECTION

 Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300-600 micrograms; maximum 1 mg per course

Reversal of sedative effects of benzodiazepines in intensive care

BY INTRAVENOUS INJECTION

 Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course

Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after initial dose)

INITIALLY BY INTRAVENOUS INFUSION

 Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection)
 300 micrograms, adjusted according to response

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use.

- CONTRA-INDICATIONS Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines
- CAUTIONS Avoid rapid injection following major surgery avoid rapid injection in high-risk or anxious patients benzodiazepine dependence (may precipitate withdrawal symptoms) elderly ensure neuromuscular blockade cleared before giving head injury (rapid reversal of benzodiazepine sedation may cause convulsions) history of panic disorders (risk of recurrence) prolonged benzodiazepine therapy for epilepsy (risk of convulsions) short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)

 SIDE-EFFECTS
- ► Common or very common Nausea · vomiting
- ▶ Uncommon Anxiety · fear · palpitation
- Frequency not known Agitation · chills · convulsions (particularly in those with epilepsy) · dizziness · flushing · sensory disturbance · sweating · tachycardia · transient hypertension
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Avoid breast-feeding for 24 hours.
- HEPATIC IMPAIRMENT Carefully titrate dose.
- DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► FLUMAZENIL (Non-proprietary)

Flumazenil 100 microgram per 1 ml Flumazenil 500micrograms/5ml solution for injection ampoules | 5 ampoule PoMl £67.50-£72.46

3.2 Digoxin toxicity

CHELATORS AND ANTIDOTES

Digoxin-specific antibody

INDICATIONS AND DOSE

Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary.

BY INTRAVENOUS INFUSION

- Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
- Adult: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

DIRECTIONS FOR ADMINISTRATION

 With intravenous use in adults For intravenous infusion (DigiFab®), give intermittently in Sodium chloride 0.9%.
 Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ DigiFab (BTG International Ltd)

Digoxin-specific antibody fragments 40 mg DigiFab 40mg powder for solution for infusion vials | 1 vial PoM £750.00 (Hospital only)

3.3 Heparin toxicity

CHELATORS AND ANTIDOTES

Protamine sulfate

INDICATIONS AND DOSE

Overdosage with intravenous injection of unfractionated heparin

BY INTRAVENOUS INJECTION

 Adult: Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg

Overdosage with intravenous infusion of unfractionated heparin

BY INTRAVENOUS INJECTION

► Adult: 25–50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute

Overdosage with subcutaneous injection of unfractionated heparin

INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises
 100 units heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course

Overdosage with subcutaneous injection of low molecular weight heparin

BY INTRAVENOUS INJECTION OR BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg
- CAUTIONS Excessive doses can have an anticoagulant effect
- SIDE-EFFECTS Anaphylaxis · angioedema · back pain · bradycardia · dyspnoea · flushing · hypersensitivity reactions · hypertension · hypotension · lassitude · nausea · pulmonary oedema · rebound bleeding · vomiting
- ALLERGY AND CROSS-SENSITIVITY Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).
- MONITORING REQUIREMENTS Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.

 PRESCRIBING AND DISPENSING INFORMATION The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► PROTAMINE SULFATE (Non-proprietary)

Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules | 5 ampoule PoM no price available Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule PoM £49.55

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

3.4 Opioid toxicity

OPIOID RECEPTOR ANTAGONISTS

Naloxone hydrochloride

INDICATIONS AND DOSE

Overdosage with opioids

BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- Neonate: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates.
- Child 1 month-11 years: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates
- Child 12-17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response, then review diagnosis; further doses may be required if respiratory function deteriorates, 4 mg dose may be required in seriously poisoned patients
- Adult: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response, then review diagnosis; further doses may be required if respiratory function deteriorates, 4 mg dose may be required in seriously poisoned natients

BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Neonate: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative *intravenous injection* dose is that which maintained satisfactory ventilation for at least 15 minutes.
- Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes
- Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous continued →

injection dose is that which maintained satisfactory ventilation for at least 15 minutes

Overdosage with opioids in a non-medical setting BY INTRAMUSCULAR INJECTION

Adult: 400 micrograms every 2-3 minutes, to be injected into deltoid region or anterolateral thigh. Each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up

Reversal of postoperative respiratory depression INITIALLY BY INTRAVENOUS INJECTION

- Neonate: 1 microgram/kg, repeated every 2-3 minutes if required.
- ► Child 1 month-11 years: 1 microgram/kg, repeated every 2-3 minutes if required
- ► Child 12-17 years: Initially 100–200 micrograms, alternatively 1.5–3 micrograms/kg; if response inadequate, give subsequent dose (by intravenous injection) of 100 micrograms every 2 minutes; alternatively, subsequent doses of 100 micrograms can be given by intramuscular injection every 1–2 hours
- Adult: Initially 100–200 micrograms, alternatively 1.5–3 micrograms/kg; if response inadequate, give subsequent dose (by intravenous injection) of 100 micrograms every 2 minutes; alternatively, subsequent doses of 100 micrograms can be given by intramuscular injection every 1–2 hours

Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour

BY INTRAMUSCULAR INJECTION

- ► Neonate: 200 micrograms, alternatively 60 micrograms/kg, to be given as a single dose at birth. BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION
- Neonate: 10 micrograms/kg, repeated every 2-3 minutes if required.

administration has more rapid onset of action.

PHARMACOKINETICS

Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

Important: Only give by subcutaneous or intramuscular routes if intravenous route is not feasible; intravenous

 UNLICENSED USE Naloxone doses in BNF may differ from those in product literature.

Important safety information

SAFE PRACTICE

Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

 CAUTIONS Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported) · maternal physical dependence on opioids (may precipitate withdrawal in newborn) · pain · physical dependence on opioids (precipitates withdrawal)

CAUTIONS, FURTHER INFORMATION

Titration of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.

- SIDE-EFFECTS
- ► Common or very common Cardiac arrest (in children) · dizziness · dyspnoea (in children) · headache · hypertension · hyperventilation (in children) · hypotension · nausea · pulmonary oedema (in children) · tachycardia · ventricular fibrillation (in children) · vomiting

- Uncommon Agitation (in children) · arrhythmia (in adults)
 bradycardia (in adults) · diarrhoea · dry mouth ·
 excitement (in children) · hyperventilation (in adults) ·
 paraesthesia (in children) · sweating · tremor
- ► Rare Seizures (in adults)
- Very rare Anaphylaxis (in adults) · cardiac arrest (in adults) · erythema multiforme · hypersensitivity reactions (in adults) · pulmonary oedema (in adults) · seizures (in children) · ventricular fibrillation (in adults)
- ► Frequency not known Agitation (in adults)
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Not orally bioavailable.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use in children For continuous intravenous infusion, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%
- With intravenous use in adults For intravenous infusion (Minijet® Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloide 0.9%. Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► NALOXONE HYDROCHLORIDE (Non-proprietary)

Naloxone hydrochloride 20 microgram per 1 ml Naloxone 40micrograms/2ml solution for injection ampoules | 10 ampoule PoM £55.00

Naloxone hydrochloride 400 microgram per 1 ml Naloxone 400micrograms/1ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.40
Naloxone 2mg/5ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.40
Naloxone 400micrograms/1ml solution for injection ampoules | 3 ampoule [PoM] £1.70 | 10 ampoule [PoM] £41.00-£53.70
Naloxone 800micrograms/2ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.40
Naloxone hydrochloride 1 mg per 1 ml Naloxone 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable

injection PoM £16.80

▶ Prenoxad (Martindale Pharmaceuticals Ltd)

Naloxone hydrochloride 1 mg per 1 ml Prenoxad 2mg/2ml solution
for injection pre-filled syringes | 1 pre-filled disposable
injection PoM £18.00

3.5 Paracetamol toxicity

CHELATORS AND ANTIDOTES

Acetylcysteine

INDICATIONS AND DOSE

Paracetamol overdosage

BY INTRAVENOUS INFUSION

- ➤ Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%
- ➤ Child (body-weight 20-39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose

Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%

- Adult (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%
- CAUTIONS Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) - atopy
 may slightly increase INR · may slightly increase prothrombin time
- SIDE-EFFECTS Hypersensitivity-like reactions · rashes · slight increase in INR and prothrombin time

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity-like reactions Hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised shortacting beta₂ agonist)—contact the National Poisons Information Service if reaction severe.

- DIRECTIONS FOR ADMINISTRATION
- ► In children Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.
- With intravenous use in adults For intravenous infusion (Parvolex®), give continuously in Glucose 5% or Sodium chloride 0.9%. Glucose Intravenous Infusion 5% is the preferred fluid; Sodium Chloride Intravenous Infusion 0.9% is an alternative if Glucose Intravenous Infusion 5% is unsuitable.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: granules, tablet, eye drops, effervescent tablet, oral solution, capsule, liquid

Solution for infusion

ELECTROLYTES: May contain Sodium

► ACETYLCYSTEINE (Non-proprietary)

Acetylcysteine 200 mg per 1 ml Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule PoM £19.58-£24.99

Parvolex (Phoenix Labs Ltd)

Acetylcysteine 200 mg per 1 ml Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £22.50

4 Methaemoglobinaemia

CHELATORS AND ANTIDOTES

Methylthioninium chloride (Methylene blue)

INDICATIONS AND DOSE

Drug- or chemical-induced methaemoglobinaemia BY SLOW INTRAVENOUS INJECTION

 Child 3 months-17 years: Initially 1-2 mg/kg, then 1-2 mg/kg after 30-60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course ➤ Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

Aniline- or dapsone-induced methaemoglobinaemia BY SLOW INTRAVENOUS INJECTION

- Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
- Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
- CAUTIONS Children under 3 months (more susceptible to methaemoglobinaemia from high doses of methylthioninium) · chlorate poisoning (reduces efficacy of methylthioninium) · G6PD deficiency (seek advice from National Poisons Information Service) · methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) · pulse oximetry may give false estimation of oxygen saturation
- INTERACTIONS → Appendix 1 (methylthioninium).
- SIDE-EFFECTS Abdominal pain · agitation · anxiety · arrhythmia · blue-green discoloration of faeces · blue-green discoloration of skin · blue-green discoloration of urine · chest pain · confusion · dizziness · dyspnoea · fever · haemolytic anaemia · headache · hyperbilirubinaemia (in infants) · hypertension · hypotension · methaemoglobinaemia · mydriasis · nausea · sweating · tachypnoea · tremor · yomiting
- PREGNANCY No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.
- BREAST FEEDING Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.
- RENAL IMPAIRMENT Use with caution in severe impairment; dose reduction may be required.

DIRECTIONS FOR ADMINISTRATION

With intravenous use in children For intravenous injection, may be diluted with Glucose 5% to minimise injectionsite pain; not compatible with Sodium Chloride 0.9%.

■ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, irrigation solution.

Solution for injection

➤ METHYLTHIONINIUM CHLORIDE (Non-proprietary)
Methylthioninium chloride 5 mg per 1 ml Methylthioninium
chloride Proveblue 50mg/10ml solution for injection ampoules |
5 ampoule [₱oM] £196.89

5 Snake bites

ANTISERA

European viper snake venom antiserum

INDICATIONS AND DOSE

Systemic envenoming from snake bites

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Child: Initially 10 mL for 1 dose, then 10 mL after 1-2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
- ➤ Adult: Initially 10 mL for 1 dose, then 10 mL after 1-2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

Severe systemic envenoming from snake bites in patients presenting with clinical features

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
- Adult: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
- DIRECTIONS FOR ADMINISTRATION By intravenous injection give over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).
- PRESCRIBING AND DISPENSING INFORMATION To order, email immform@dh.gsi.gov.uk.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

Appendix 1Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs), as for other adverse drug reactions.

Drug interactions may be **pharmacodynamic** or **pharmacokinetic**.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types: Affecting absorption The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

Due to changes in protein binding To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than ransient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

Affecting metabolism Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of *in-vitro* information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function. Serious interactions The symbol • has been placed against interactions that are **potentially serious** and where concomitant administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

Abacavir

- Analgesics: abacavir possibly reduces plasma concentration of METHADONE
- Antibacterials: plasma concentration of abacavir possibly reduced by RIFAMPICIN
- Antiepileptics: plasma concentration of abacavir possibly reduced by FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antivirals: abacavir possibly reduces effects of RIBAVIRIN; plasma concentration of abacavir reduced by • TIPRANAVIR
- Orlistat: absorption of abacavir possibly reduced by ORLISTAT Abatacept
- Cytotoxics: increased risk of side-effects when abatacept given with ADALIMUMAB; avoid concomitant use of abatacept with
 CERTOLIZUMAB PEGOL, GOLIMUMAB OF INFLIXIMAB
- Etanercept: avoid concomitant use of abatacept with
- ETANERCEPT
- Vaccines: risk of generalised infections when abatacept given with live • VACCINES—avoid concomitant use

Abiraterone

- Analgesics: abiraterone increases plasma concentration of DEXTROMETHORPHAN
- Antibacterials: plasma concentration of abiraterone possibly reduced by • RIFABUTIN—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by • RIFAMPICIN—manufacturer of abiraterone advises avoid concomitant use
- Antidepressants: plasma concentration of abiraterone possibly reduced by • ST JOHN'S WORT—manufacturer of abiraterone advises avoid concomitant use
- Antiepileptics: plasma concentration of abiraterone possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE manufacturer of abiraterone advises avoid concomitant use
 Acarbose see Antidiabetics

ACE Inhibitors

- Alcohol: enhanced hypotensive effect when ACE inhibitors given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with ALDESLEUKIN
- Aliskiren: increased risk of hyperkalaemia, hypotension, and impaired renal function when ACE inhibitors given with
- ALISKIREN—avoid concomitant use
- Allopurinol: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with ALLOPURINOL especially in renal impairment
- Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when ACE inhibitors given with GENERAL ANAESTHETICS
- Analgesics: increased risk of renal impairment when ACE inhibitors given with NSAIDs, also hypotensive effect antagonised
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia, hypotension, and impaired renal function when ACE inhibitors given with ● ANGIOTENSIN-II RECEPTOR ANTAGONISTS—avoid concomitant use
- Antacids: absorption of ACE inhibitors possibly reduced by ANTACIDS; absorption of captopril, enalapril and fosinopril reduced by ANTACIDS
- Antibacterials: plasma concentration of active metabolite of imidapril reduced by RIFAMPICIN (reduced antihypertensive effect); quinapril tablets reduce absorption of TETRACYCLINES (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with TRIMETHOPRIM
- Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with HEPARINS

ACE Inhibitors (continued)

- Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by MAOIs
- ► Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of INSULIN, METFORMIN and SULFONYLUREAS
- Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with ANTIPSYCHOTICS
- Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with ANXIOLYTICS AND HYPNOTICS
- Avanafil: hypotensive effect of enalapril possibly enhanced by
- Azathioprine: increased risk of anaemia or leucopenia when captopril given with AZATHIOPRINE especially in renal impairment; increased risk of anaemia when enalapril given with AZATHIOPRINE especially in renal impairment
- Bee Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with ● BEE VENOM EXTRACTS
- Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with BETA-BLOCKERS
- ► Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with CALCIUM-CHANNEL BLOCKERS
- Cardiac Glycosides: captopril possibly increases plasma concentration of DIGOXIN
- Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with ◆ CICLOSPORIN
- Clonidine: enhanced hypotensive effect when ACE inhibitors given with CLONIDINE; antihypertensive effect of captopril possibly delayed by previous treatment with CLONIDINE
- Corticosteroids: hypotensive effect of ACE inhibitors antagonised by CORTICOSTEROIDS
- Cytotoxics: increased risk of angioedema when ACE inhibitors given with • EVEROLIMUS
- Diazoxide: enhanced hypotensive effect when ACE inhibitors given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when ACE inhibitors given with • DIURETICS; increased risk of severe hyperkalaemia when ACE inhibitors given with • POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Lithium: ACE inhibitors reduce excretion of LITHIUM (increased plasma concentration)
- Methyldopa: enhanced hypotensive effect when ACE inhibitors given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when ACE inhibitors given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when ACE inhibitors given with NITRATES
- Oestrogens: hypotensive effect of ACE inhibitors antagonised by OESTROGENS
- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with • POTASSIUM SALTS
- Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with ALPROSTADIL
- Sodium Aurothiomalate: flushing and hypotension reported when ACE inhibitors given with ● SODIUM AUROTHIOMALATE
- ► Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE
- Wasp Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with • WASP VENOM EXTRACTS

Acebutolol see Beta-blockers

Aceclofenac see NSAIDs Acemetacin see NSAIDs

Acenocoumarol see Coumarins

Acetazolamide see Diuretics

Aciclovir

- NOTE Interactions do not apply to topical aciclovir preparations
- Aminophylline: aciclovir possibly increases plasma concentration of AMINOPHYLLINE

Aciclovir (continued)

- Ciclosporin: increased risk of nephrotoxicity when aciclovir given with CICLOSPORIN
- Mycophenolate: plasma concentration of aciclovir increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate increased
- > Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with TACROLIMUS
- Theophylline: aciclovir possibly increases plasma concentration of THEOPHYLLINE

Acitretin see Retinoids

Aclidinium see Antimuscarinics

Acrivastine see Antihistamines

Adalimumah

- Abatacept: increased risk of side-effects when adalimumab given with ABATACEPT
- Anakinra: avoid concomitant use of adalimumab with
- ΔNΔKINRΔ
- · Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- · Vaccines: risk of generalised infections when monoclonal antibodies given with live . VACCINES—avoid concomitant use Adefovir
- > Antivirals: avoidance of adefovir advised by manufacturer of
- Interferons: manufacturer of adefovir advises caution with PEGINTERFERON ALFA

Adenosine

NOTE Possibility of interaction with drugs tending to impair myocardial conduction

- Aminophylline: anti-arrhythmic effect of adenosine antagonised by AMINOPHYLLINE—manufacturer of adenosine advises avoid aminophylline for 24 hours before adenosine
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE OF ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when antiarrhythmics given with other • ANTI-ARRHYTHMICS
- · Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with • ANTIPSYCHOTICS that prolong the QT interval
- · Beta-blockers: increased myocardial depression when antiarrhythmics given with • BETA-BLOCKERS
- ▶ Caffeine citrate: anti-arrhythmic effect of adenosine antagonised by CAFFEINE CITRATE—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
- Dipyridamole: effect of adenosine enhanced and extended by • DIPYRIDAMOLE (important risk of toxicity)—reduce dose of adenosine, see p. 87
- ▶ Nicotine: effects of adenosine possibly enhanced by NICOTINE
- ▶ Theophylline: anti-arrhythmic effect of adenosine antagonised by THEOPHYLLINE-manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine

Adrenaline (epinephrine) see Sympathomimetics

Adrenergic Neurone Blockers

- Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with ALCOHOL
- Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with . GENERAL ANAFSTHETICS
- » Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIS; hypotensive effect of adrenergic neurone blockers antagonised by TRICYCLICS
- Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by HALOPERIDOL; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of

Adrenergic Neurone Blockers

Antipsychotics (continued)

CHLORPROMAZINE; enhanced hypotensive effect when adrenergic neurone blockers given with PHENOTHIAZINES

- Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with ANXIOLYTICS AND HYPNOTICS
- ▶ Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with CALCIUM-CHANNEL **BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with CLONIDINE
- Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with CO-BENELDOPA, CO-CARELDOPA or
- Methyldopa: enhanced hypotensive effect when adrenergic neurone blockers given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with BACLOFEN or **TIZANIDINE**
- Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with NITRATES
- Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by OESTROGENS
- ▶ Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by PIZOTIFEN
- Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with ALPROSTADIL
- Sympathomimetics: increased risk of hypertension when guanethidine given with • ADRENALINE (EPINEPHRINE); hypotensive effect of guanethidine antagonised by
 - DEXAMFETAMINE and LISDEXAMFETAMINE; hypotensive effect of adrenergic neurone blockers antagonised by • EPHEDRINE,
 - ISOMETHEPTENE, METARAMINOL, METHYLPHENIDATE,
 - NORADRENALINE (NOREPINEPHRINE), OXYMETAZOLINE, ● PHENYLEPHRINE.
 ● PSEUDOEPHEDRINE and
 ● XYLOMETAZOLINE
- Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Adsorbents see Kaolin

- Anti-arrhythmics: plasma concentration of afatinib possibly increased by AMIODARONE—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours
- Antibacterials: plasma concentration of afatinib possibly increased by ERYTHROMYCIN—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by RIFAMPICIN
- Antifungals: plasma concentration of afatinib possibly increased by ITRACONAZOLE and KETOCONAZOLE—manufacturer of afatinib advises separating administration of itraconazole and ketoconazole by 6 to 12 hours
- Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of afatinib increased by RITONAVIR—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; plasma concentration of afatinib possibly increased by SAQUINAVIRmanufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours
- ▶ Calcium-channel Blockers: plasma concentration of afatinib possibly increased by VERAPAMIL—manufacturer of afatinib advises separating administration of verapamil by 6 to 12

Afatinib (continued)

- Ciclosporin: plasma concentration of afatinib possibly increased by CICLOSPORIN—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours
- Tacrolimus: plasma concentration of afatinib possibly increased by TACROLIMUS—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours

Agalsidase Alfa and Beta

- Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by AMIODARONE (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antibacterials: effects of agalsidase alfa and beta possibly inhibited by GENTAMICIN (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antimalarials: effects of agalsidase alfa and beta possibly inhibited by CHLOROQUINE and HYDROXYCHLOROQUINE (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Agomelatine

- Antibacterials: manufacturer of agomelatine advises avoid concomitant use with • CIPROFLOXACIN
- Antidepressants: metabolism of agomelatine inhibited by
 FLUVOXAMINE (increased plasma concentration)
- Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and
 • ARTENIMOL WITH PIPERAQUINE
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE

Albendazole

- Anthelmintics: plasma concentration of both drugs possibly reduced when albendazole given with LEVAMISOLE
 Anticollegies: plasma concentration of albendazole reduced
- Antiepileptics: plasma concentration of albendazole reduced by ● CARBAMAZEPINE, ● FOSPHENYTOIN, ● PHENOBARBITAL,
- PHENYTOIN and PRIMIDONE—consider increasing albendazole dose when given for systemic infections
- Antivirals: plasma concentration of active metabolite of albendazole reduced by • RITONAVIR—consider increasing albendazole dose when given for systemic infections
- Corticosteroids: plasma concentration of active metabolite of albendazole increased by DEXAMETHASONE
- Grapefruit Juice: plasma concentration of active metabolite of albendazole increased by GRAPEFRUIT JUICE
- Ulcer-healing Drugs: effects of albendazole possibly enhanced by CIMETIDINE

Alcohol

- ACE Inhibitors: enhanced hypotensive effect when alcohol given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: increased sedative effect when alcohol given with INDORAMIN; enhanced hypotensive effect when alcohol given with ALPHA-BLOCKERS
- Analgesics: enhanced hypotensive and sedative effects when alcohol given with OPIOID ANALGESICS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anthelmintics: possibility of disulfiram-like reaction when alcohol given with LEVAMISOLE
- Antibacterials: disulfiram-like reaction when alcohol given
 with METRONIDAZOLE; possibility of disulfiram-like reaction
 when alcohol given with TINIDAZOLE; increased risk of
 convulsions when alcohol given with ◆CYCLOSERINE
- Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with • COUMARINS or
 PHENINDIONE
- Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with • MAOIS (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with • SRBIS; increased sedative effect when alcohol given with • MIRTAZAPINE, • TRICYCLIC-RELATED ANTIDEPRESSANTS or • TRICYCLICS
- Antidiabetics: alcohol enhances hypoglycaemic effect of ANTIDIABETICS; increased risk of lactic acidosis when alcohol given with METFORMIN

Alcohol (continued)

- Antiepileptics: alcohol possibly increases CNS side-effects of CARBAMAZEPINE; chronic heavy consumption of alcohol possibly reduces plasma concentration of FOSPHENYTOIN and PHENYTOIN; increased sedative effect when alcohol given with PHENOBARBITAL or PRIMIDONE; increased risk of blurred vision when alcohol given with RETIGABINE
- Antifungals: possibility of disulfiram-like reaction when alcohol given with KETOCONAZOLE; effects of alcohol possibly enhanced by GRISEOFULVIN
- Antihistamines: increased sedative effect when alcohol given with ANTIHISTAMINES (possibly less effect with non-sedating antihistamines)
- Antimuscarinics: increased sedative effect when alcohol given with HYOSCINE
- Antipsychotics: increased sedative effect when alcohol given with ANTIPSYCHOTICS
- ► Anxiolytics and Hypnotics: increased sedative effect when alcohol given with ANXIOLYTICS AND HYPNOTICS
- Avanafil: possible enhanced hypotensive effect when alcohol given with AVANAFIL
- Beta-blockers: enhanced hypotensive effect when alcohol given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with CALCIUM-CHANNEL BLOCKERS; plasma concentration of alcohol possibly increased by VERAPAMIL
- Clonidine: enhanced hypotensive effect when alcohol given with CLONIDINE
- Cytotoxics: disulfiram-like reaction when alcohol given with PROCARBAZINE; avoidance of alcohol advised by manufacturer of • TRABECTEDIN
- Dapoxetine: increased sedative effect when alcohol given with
 DAPOXETINE
- Diazoxide: enhanced hypotensive effect when alcohol given with DIAZOXIDE
- Disulfiram: disulfiram reaction when alcohol given with DISULFIRAM
- Diuretics: enhanced hypotensive effect when alcohol given with DIURETICS
- ► Dopaminergics: alcohol reduces tolerance to BROMOCRIPTINE
- Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of LOMITAPIDE
- Lofexidine: increased sedative effect when alcohol given with LOFEXIDINE
- Methyldopa: enhanced hypotensive effect when alcohol given with METHYLDOPA
- Metoclopramide: absorption of alcohol possibly increased by METOCLOPRAMIDE
- Moxonidine: enhanced hypotensive effect when alcohol given with MOXONIDINE
- Muscle Relaxants: increased sedative effect when alcohol given with BACLOFEN, METHOCARBAMOL OT TIZANIDINE
- Nicorandil: alcohol possibly enhances hypotensive effect of NICORANDIL
 Nitrates: enhanced hypotensive effect when alcohol given
- with NITRATES

 Paraldehyde: increased sedative effect when alcohol given
- with

 PARALDEHYDE

 Retinoids: presence of alcohol causes etretinate to be formed
- Retinolds: presence of alcohol causes etretinate to be formed from • ACITRETIN (increased risk of teratogenicity in women of child-bearing potential)
- Sympathomimetics: alcohol possibly enhances effects of METHYLPHENIDATE
- Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Aldesleukin

- ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with ACE INHIBITORS
- Alpha-blockers: enhanced hypotensive effect when aldesleukin given with ALPHA-BLOCKERS
- ► Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antivirals: aldesleukin possibly increases plasma concentration of INDINAVIR

Aldesleukin (continued)

- Beta-blockers: enhanced hypotensive effect when aldesleukin given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when aldesleukin given with CLONIDINE
- Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with

 CORTICOSTEROIDS
- Cytotoxics: manufacturer of aldesleukin advises avoid concomitant use with • CISPLATIN, • DACARBAZINE and
 VINBLASTINE
- ▶ Diazoxide: enhanced hypotensive effect when aldesleukin given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when aldesleukin given with DIURETICS
- Methyldopa: enhanced hypotensive effect when aldesleukin given with METHYLDOPA
- Moxonidine: enhanced hypotensive effect when aldesleukin given with MOXONIDINE
- Nitrates: enhanced hypotensive effect when aldesleukin given with NITRATES
- Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Alemtuzumab

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use
 Alendronic Acid see Bisphosphonates

Alfacalcidol see Vitamins

Alfentanil see Opioid Analgesics

Alfuzosin see Alpha-blockers

Alimemazine see Antihistamines

Aliskiren

- ACE Inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with • ACE INHIBITORS—avoid concomitant use
- Analgesics: hypotensive effect of aliskiren possibly antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS—avoid concomitant use; plasma concentration of aliskiren possibly reduced by IRBESARTAN
- Antibacterials: plasma concentration of aliskiren reduced by
- Anticoagulants: increased risk of hyperkalaemia when aliskiren given with HEPARINS
- Antifungals: plasma concentration of aliskiren increased by KETOCONAZOLE; plasma concentration of aliskiren increased by • ITRACONAZOLE—avoid concomitant use
- ► Calcium-channel Blockers: plasma concentration of aliskiren increased by VERAPAMIL
- Ciclosporin: plasma concentration of aliskiren increased by
 CICLOSPORIN—avoid concomitant use
- Diuretics: aliskiren reduces plasma concentration of FUROSEMIDE; increased risk of hyperkalaemia when aliskiren given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Grapefruit Juice: plasma concentration of aliskiren reduced by
 GRAPEFRUIT JUICE—avoid concomitant use
- Potassium Salts: increased risk of hyperkalaemia when aliskiren given with POTASSIUM SALTS

Alitretinoin see Retinoids

Alkylating Drugs *see* Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estramustine, Ifosfamide, Lomustine, Melphalan, and Thiotepa

Allopurinol

- ACE Inhibitors: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when allopurinol given with ACE INHIBITORS especially in renal impairment
- ► Aminophylline: allopurinol possibly increases plasma concentration of AMINOPHYLLINE

Allopurinol (continued)

- Antibacterials: increased risk of rash when allopurinol given with AMOXICILLIN, AMPICILLIN or CO-AMOXICLAV
- Anticoagulants: allopurinol possibly enhances anticoagulant effect of COUMARINS
- Antivirals: allopurinol increases plasma concentration of
 DIDANOSINE (risk of toxicity)—avoid concomitant use
- Azathioprine: allopurinol enhances effects and increases toxicity of • AZATHIOPRINE (reduce dose of azathioprine to one quarter of usual dose)
- ► Ciclosporin: allopurinol possibly increases plasma concentration of CICLOSPORIN (risk of nephrotoxicity)
- Cytotoxics: avoidance of allopurinol advised by manufacturer of © CAPECITABINE; allopurinol enhances effects and increases toxicity of © MERCAPTOPURINE (reduce dose of mercaptopurine to one quarter of usual dose)
- Diuretics: increased risk of hypersensitivity when allopurinol given with THIAZIDES AND RELATED DIURETICS especially in renal impairment
- Theophylline: allopurinol possibly increases plasma concentration of THEOPHYLLINE

Almotriptan see 5HT₁-receptor Agonists (under HT)

Alogliptin see Antidiabetics
Alpha₂-adrenoceptor Stimulants see Apraclonidine,
Brimonidine, Clonidine, and Methyldopa

Alpha-blockers

- ACE Inhibitors: enhanced hypotensive effect when alphablockers given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with ADRENERGIC NEURONE BLOCKERS
- ► Alcohol: enhanced hypotensive effect when alpha-blockers given with ALCOHOL; increased sedative effect when indoramin given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when alphablockers given with ALDESLEUKIN
- Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with • GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of alpha-blockers antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with ANGIOTENSIN-II
- Antidepressants: manufacturer of indoramin advises avoid concomitant use with MAOIS; enhanced hypotensive effect when alpha-blockers given with MAOIS
- Antifungals: plasma concentration of alfuzosin possibly increased by KETOCONAZOLE; plasma concentration of tamsulosin increased by • KETOCONAZOLE
- Antipsychotics: enhanced hypotensive effect when alphablockers given with ANTIPSYCHOTICS
- Antivirals: plasma concentration of doxazosin and tamsulosin possibly increased by BOCEPREVIR—manufacturer of boceprevir advises avoid concomitant use; plasma concentration of alfuzosin possibly increased by
 RITONAVIR—avoid concomitant use; avoidance of alfuzosin
- advised by manufacturer of TELAPREVIR

 Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with ANXIOLYTICS AND
- Avanafil: enhanced hypotensive effect when alpha-blockers given with
 AVANAFIL—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Beta-blockers: enhanced hypotensive effect when alphablockers given with

 BETA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with

 CALCIUM-CHANNEL BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin; plasma concentration of tamsulosin increased by VERAPAMIL
- ► Cardiac Glycosides: prazosin increases plasma concentration of
- Clonidine: enhanced hypotensive effect when alpha-blockers given with CLONIDINE

Alpha-blockers (continued)

- Cobicistat: plasma concentration of alfuzosin possibly increased by

 COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- ► Corticosteroids: hypotensive effect of alpha-blockers antagonised by CORTICOSTEROIDS
- Cytotoxics: avoidance of alfuzosin advised by manufacturer of IDELALISIB
- Diazoxide: enhanced hypotensive effect when alpha-blockers given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when alpha-blockers given with o DIURETICS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Dopaminergics: enhanced hypotensive effect when alphablockers given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Methyldopa: enhanced hypotensive effect when alphablockers given with METHYLDOPA
- Moxisylyte: possible severe postural hypotension when alphablockers given with

 MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when alpha-blockers given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when alphablockers given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when alpha-blockers given with NITRATES
 Oestrogens: hypotensive effect of alpha-blockers antagonised
- by OESTROGENS

 Prostaglandins: enhanced hypotensive effect when alpha-
- blockers given with ALPROSTADIL

 Sildenafil: enhanced hypotensive effect when alpha-blockers given with SILDENAFIL (avoid alpha-blockers for 4 hours after sildenafil)—when patient is stable on the alpha blocker initiate sildenafil at the lowest possible dose
- Sympathomimetics: avoid concomitant use of tolazoline with
 ADRENALINE (EPINEPHRINE) or DOPAMINE
- Tadalafil: enhanced hypotensive effect when alpha-blockers given with • TADALAFIL—when patient is stable on the alpha blocker initiate tadalafil at the lowest possible dose; enhanced hypotensive effect when doxazosin given with
- TADALAFIL—manufacturer of tadalafil advises avoid concomitant use
- Ulcer-healing Drugs: effects of tolazoline antagonised by
- CIMETIDINE and RANITIDINE
- Vardenafil: enhanced hypotensive effect when alpha-blockers given with VARDENAFIL—when patient is stable on the alpha blocker initiate vardenafil at the lowest possible dose separate doses by 6 hours (except with tamsulosin)
- Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Alpha-blockers (post-synaptic) see Alpha-blockers

Alprazolam see Anxiolytics and Hypnotics

Alprostadil see Prostaglandins

Aluminium Hydroxide see Antacids

Amantadine

- Antimalarials: plasma concentration of amantadine possibly increased by QUININE
- Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with ANTIPSYCHOTICS
- ► Bupropion: increased risk of side-effects when amantadine given with BUPROPION
- Memantine: increased risk of CNS toxicity when amantadine given with MEMANTINE (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: increased risk of extrapyramidal side-effects when amantadine given with METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- ► Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with TETRABENAZINE

Ambrisentan

 Antibacterials: plasma concentration of ambrisentan possibly increased by RIFAMPICIN

Ambrisentan (continued)

Ciclosporin: plasma concentration of ambrisentan increased by
 CICLOSPORIN (see under Ambrisentan, p. 162)

Amikacin see Aminoglycosides

Amiloride see Diuretics

Aminoglycosides

- Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of AGALSIDASE ALFA AND BETA (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by INDOMETACIN
- Antibacterials: neomycin reduces absorption of PHENOXYMETHYLPENICILLIN; increased risk of nephrotoxicity when aminoglycosides given with COLISTIMETHATE SODIUM or POLYMYXINS; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with CAPREOMYCIN or
- VANCOMYCIN; possible increased risk of nephrotoxicity when aminoglycosides given with CEPHALOSPORINS
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with • COUMARINS OF • PHENINDIONE
- Antidiabetics: neomycin possibly enhances hypoglycaemic effect of ACARBOSE, also severity of gastro-intestinal effects increased
- Antifungals: increased risk of nephrotoxicity when aminoglycosides given with AMPHOTERICIN
- Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with BISPHOSPHONATES
- Cardiac Glycosides: gentamicin possibly increases plasma concentration of DIGOXIN; neomycin reduces absorption of DIGOXIN
- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with • CICLOSPORIN
- Cytotoxics: neomycin possibly reduces absorption of METHOTREXATE; neomycin reduces bioavailability of SORAFENIB; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with • PLATINUM COMPOUNDS
- Diuretics: increased risk of otoxicity when aminoglycosides given with • LOOP DIURETICS
- Mannitol: manufacturer of tobramycin advises avoid concomitant use with MANNITOL
- Muscle Relaxants: aminoglycosides enhance effects of NON-DEPOLARISING MUSCLE RELAXANTS and ● SUXAMETHONIUM
- Parasympathomimetics: aminoglycosides antagonise effects of
 NEOSTIGMINE and PYRIDOSTIGMINE
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with • TACROLIMUS
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF
- ► Vitamins: neomycin possibly reduces absorption of VITAMIN A Aminophylline
- Allopurinol: plasma concentration of aminophylline possibly increased by ALLOPURINOL
- Anaesthetics, General: increased risk of convulsions when aminophylline given with KETAMINE
- Anti-arrhythmics: aminophylline antagonises anti-arrhythmic effect of ADENOSINE—manufacturer of adenosine advises avoid aminophylline for 24 hours before adenosine; plasma concentration of aminophylline increased by PROPAFENONE
- Antibacterials: plasma concentration of aminophylline possibly increased by CLARITHROMYCIN and ISONIAZID; plasma concentration of aminophylline increased by ● ERYTHROMYCIN (also aminophylline may reduce absorption of oral erythromycin); plasma concentration of aminophylline increased by ● CIPROFLOXACIN and ● NORFLOXACIN; metabolism of aminophylline accelerated by RIFAMPICIN (reduced plasma concentration); possible increased risk of convulsions when aminophylline given with ● QUINOLONES
- Antidepressants: plasma concentration of aminophylline increased by • FLUVOXAMINE (concomitant use should usually be avoided, but where not possible halve aminophylline dose and monitor plasma-aminophylline concentration); plasma concentration of aminophylline possibly reduced by ST JOHN'S WORT

Aminophylline (continued)

- Antiepileptics: metabolism of aminophylline accelerated by CARBAMAZEPINE, ● PHENOBARBITAL and ● PRIMIDONE (reduced effect); plasma concentration of both drugs reduced when aminophylline given with ● FOSPHENYTOIN and ● PHENYTOIN
- Antifungals: plasma concentration of aminophylline possibly increased by ● FLUCONAZOLE and ● KETOCONAZOLE
- Antivirals: plasma concentration of aminophylline possibly increased by ACICLOVIR and VALACICLOVIR; metabolism of aminophylline accelerated by ● RITONAVIR (reduced plasma concentration)
- Anxiolytics and Hypnotics: aminophylline possibly reduces effects of BENZODIAZEPINES
- Caffeine citrate: avoidance of aminophylline advised by manufacturer of CAFFEINE CITRATE
- Calcium-channel Blockers: plasma concentration of aminophylline possibly increased by CALCIUM-CHANNEL BLOCKERS (enhanced effect); plasma concentration of aminophylline increased by □ILTIAZEM; plasma concentration of aminophylline increased by VERAPAMIL (enhanced effect)
- Corticosteroids: increased risk of hypokalaemia when aminophylline given with CORTICOSTEROIDS
- Cytotoxics: plasma concentration of aminophylline possibly increased by METHOTREXATE
- Deferasirox: plasma concentration of aminophylline increased by • DEFERASIROX (consider reducing dose of aminophylline)
- Disulfiram: metabolism of aminophylline inhibited by DISULFIRAM (increased risk of toxicity)
- Diuretics: increased risk of hypokalaemia when aminophylline given with ACETAZOLAMIDE, LOOP DIURETICS OR THIAZIDES AND RELATED DIURETICS
- Doxapram: increased CNS stimulation when aminophylline given with DOXAPRAM
- Interferons: metabolism of aminophylline inhibited by
 INTERFERON ALFA and PEGINTERFERON ALFA (consider reducing dose of aminophylline)
- Leukotriene Receptor Antagonists: plasma concentration of aminophylline possibly increased by ZAFIRLUKAST, also plasma concentration of zafirlukast reduced
- Lithium: aminophylline increases excretion of LITHIUM (reduced plasma concentration)
- Oestrogens: plasma concentration of aminophylline increased by OESTROGENS (consider reducing dose of aminophylline)
- Pentoxifylline: plasma concentration of aminophylline increased by PENTOXIFYLLINE
- Roflumilast: avoidance of aminophylline advised by manufacturer of ROFLUMILAST
- ► Sulfinpyrazone: plasma concentration of aminophylline reduced by SULFINPYRAZONE
- Sympathomimetics: manufacturer of aminophylline advises avoid concomitant use with EPHEDRINE in children
- Sympathomimetics, Beta₂: increased risk of hypokalaemia when aminophylline given with high doses of BETA₂
 SYMPATHOMIMETICS
- Ulcer-healing Drugs: metabolism of aminophylline inhibited by
 CIMETIDINE (increased plasma concentration); absorption of aminophylline possibly reduced by SUCRALFATE (give at least 2 hours apart)
- Vaccines: plasma concentration of aminophylline possibly increased by INFLUENZA VACCINE

Aminosalicylates see individual drugs

Amiodarone

NOTE Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped

- Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of AGALSIDASE ALFA AND BETA (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE OF ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when antiarrhythmics given with other ◆ ANTI-ARRHYTHMICS; increased risk of ventricular arrhythmias when amiodarone given with ◆ DISOPYRAMIDE or ◆ DRONEDARONE—avoid concomitant use;

Amiodarone

- Anti-arrhythmics (continued) amiodarone increases plasma concentration of • FLECAINIDE (halve dose of flecainide)
- Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with parenteral • ERYTHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with • LEVOFLOXACIN or
 - MOXIFLOXACIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with SULFAMETHOXAZOLE and TRIMETHOPRIM (as co-trimoxazole)—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole; increased risk of ventricular arrhythmias when amiodarone given with DELAMANID; avoidance of amiodarone advised by manufacturer of FIDAXOMICIN; possible increased risk of ventricular arrhythmias when amiodarone given with TELITHROMYCIN
- Anticoagulants: amiodarone inhibits metabolism of
 - COUMARINS and PHENINDIONE (enhanced anticoagulant effect); amiodarone increases plasma concentration of
- DABIGATRAN (see under Dabigatran Etexilate, p. 117)
- Antidepressants: avoidance of amiodarone advised by manufacturer of ◆ CITALOPRAM and ◆ ESCITALOPRAM (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with ◆ TRICYCLICS—avoid concomitant use
- Antiepileptics: amiodarone inhibits metabolism of
- FOSPHENYTOIN and PHENYTOIN (increased plasma concentration)
- Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with • MIZOLASTINE—avoid concomitant use
- Antimalarials: avoidance of amiodarone advised by
 manufacturer of ARTEMETHER WITH LUMEFANTRINE (risk of
 ventricular arrhythmias); avoidance of amiodarone advised
 by manufacturer of ARTENIMOL WITH PIPERAQUINE (possible
 risk of ventricular arrhythmias); increased risk of ventricular
 arrhythmias when amiodarone given with CHLOROQUINE,
 HYDROXYCHLOROQUINE, MEFLOQUINE or QUININE—avoid
 concomitant use
- Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with • TOLTERODINE
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
 - ANTIPSYCHOTICS that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with
 BENPERIDOL—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias
- when amiodarone given with AMISULPRIDE, DROPERIDOL, ● HALOPERIDOL, ● PHENOTHIAZINES, ● PIMOZIDE Or
- ZUCLOPENTHIXOL—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with
 SULPRIDE
- Antivirals: plasma concentration of amiodarone possibly increased by • ATAZANAVIR; possible increased risk of bradycardia when amiodarone given with . DACLATASVIR and • SIMEPREVIR (with sofosbuvir)—see under Amiodarone, p. 88; plasma concentration of amiodarone possibly increased by • FOSAMPRENAVIR (increased risk of ventricular arrhythmias-avoid concomitant use); plasma concentration of amiodarone possibly increased by . INDINAVIR-avoid concomitant use; plasma concentration of amiodarone increased by . RITONAVIR (increased risk of ventricular arrhythmias-avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with SAQUINAVIR—avoid concomitant use; possible increased risk of bradycardia when amiodarone given with . SOFOSBUVIRsee under Amiodarone, p. 88; avoidance of amiodarone advised by manufacturer of • TELAPREVIR (risk of ventricular arrhythmias)
- Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with • ATOMOXETINE
- Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with • BETA-BLOCKERS; increased myocardial depression when anti-

Amiodarone

- Beta-blockers (continued)
 - arrhythmics given with BETA-BLOCKERS; increased risk of ventricular arrhythmias when amiodarone given with
 - SOTALOL-avoid concomitant use
- Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with • DILTIAZEM or • VERAPAMIL
- ► Ciclosporin: amiodarone possibly increases plasma concentration of CICLOSPORIN
- Cobicistat: plasma concentration of amiodarone possibly increased by ◆ COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Colchicine: amiodarone possibly increases risk of COLCHICINE toxicity
- Cytotoxics: amiodarone possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with BOSUTINIB; amiodarone possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of amiodarone advised by manufacturer of IDELALISIB; possible increased risk of ventricular arrhythmias when amiodarone given with VANDETANIB—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ARSENIC TRIOXIDE
- Diuretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with ACETAZOLAMIDE, LOOP DIURETICS or THIAZIDES AND RELATED DIURETICS; amiodarone increases plasma concentration of EPLERENONE (reduce dose of eplerenone)
- Fingolimod: possible increased risk of bradycardia when amiodarone given with • FINGOLIMOD
- Grapefruit Juice: plasma concentration of amiodarone increased by GRAPEFRUIT JUICE
- Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with • IVABRADINE
- Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with *SIMVASTATIN (see under Simvastatin, p. 181); separating administration from amiodarone by 12 hours advised by manufacturer of LOMITAPIDE
- Lithium: manufacturer of amiodarone advises avoid concomitant use with • LITHIUM (risk of ventricular arrhythmias)
- Orlistat: plasma concentration of amiodarone possibly reduced by ORLISTAT
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with Pentamidine ISETIONATE—avoid concomitant use
- ► Thyroid Hormones: amiodarone can affect serum concentrations of THYROID HORMONES—monitor thyroid function closely
- Ulcer-healing Drugs: plasma concentration of amiodarone increased by CIMETIDINE

Amisulpride see Antipsychotics

Amitriptyline see Antidepressants, Tricyclic Amlodipine see Calcium-channel Blockers

Amoxicillin see Penicillins

Amphotericin

NOTE Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics

- Antibacterials: increased risk of nephrotoxicity when amphotericin given with AMMNOGLYCOSIDES or POLYMYXINS; possible increased risk of nephrotoxicity when amphotericin given with VANCOMYCIN
- Antifungals: amphotericin reduces renal excretion and increases cellular uptake of FLUCYTOSINE (toxicity possibly increased); effects of amphotericin possibly antagonised by IMIDAZOLES and TRIAZOLES; plasma concentration of amphotericin possibly increased by MICAFUNGIN
- Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with CARDIAC GLYCOSIDES

Amphotericin (continued)

- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with CICLOSPORIN
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with • CORTICOSTEROIDS—avoid concomitant use unless corticosteroids needed to control reactions
- Cytotoxics: increased risk of ventricular arrhythmias when amphotericin given with • ARSENIC TRIOXIDE
- Diuretics: increased risk of hypokalaemia when amphotericin given with LOOP DIURETICS OF THIAZIDES AND RELATED DIURETICS
- ► Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with PENTAMIDINE ISETIONATE
- Sodium Stibogluconate: possible increased risk of arrhythmias when amphotericin given after ● SODIUM STIBOGLUCONATE manufacturer of sodium stibogluconate advises giving 14 days apart
- Tacrolimus: increased risk of nephrotoxicity when amphotericin given with • TACROLIMUS

Ampicillin see Penicillins

Anabolic Steroids

- Anticoagulants: anabolic steroids enhance anticoagulant effect of ● COUMARINS and ● PHENINDIONE
- Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of ANTIDIABETICS

Anaesthetics, General

NOTE See also Surgery and Long-term Medication, under General Anaesthesia in BNF

- ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with • ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with • ALPHA-BLOCKERS
- Aminophylline: increased risk of convulsions when ketamine given with AMINOPHYLLINE
- Analgesics: metabolism of etomidate inhibited by FENTANYL (consider reducing dose of etomidate); effects of thiopental possibly enhanced by ASPIRIN; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by OPIOID ANALGESICS
- Angiotensin-il Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: increased risk of hepatotoxicity when isoflurane given with ISONIAZID; effects of thiopental enhanced by SULFONAMIDES; hypersensitivity-like reactions can occur when general anaesthetics given with intravenous VANCOMYCIN
- Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with TRICYCLICS
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with • ANTIPSYCHOTICS; effects of thiopental enhanced by DROPERIDOL
- Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when general anaesthetics given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with CALCIUM-CHANNEL BLOCKERS; general anaesthetics enhance hypotensive effect of • VERAPAMIL (also AV delay)
- Clonidine: enhanced hypotensive effect when general anaesthetics given with CLONIDINE
- Cytotoxics: nitrous oxide increases antifolate effect of
 METHOTREXATE—avoid concomitant use
- Diazoxide: enhanced hypotensive effect when general anaesthetics given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when general anaesthetics given with DIURETICS

Anaesthetics, General (continued)

- Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with • DOXAPRAM (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
- Memantine: increased risk of CNS toxicity when ketamine given with • MEMANTINE (manufacturer of memantine advises avoid concomitant use)
- Methyldopa: enhanced hypotensive effect when general anaesthetics given with METHYLDOPA
- Metoclopramide: effects of thiopental enhanced by METOCLOPRAMIDE
- Moxonidine: enhanced hypotensive effect when general anaesthetics given with MOXONIDINE
- Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with ● SUXAMETHONIUM; volatile liquid general anaesthetics enhance effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM; ketamine enhances effects of ATRACURIUM
- Nitrates: enhanced hypotensive effect when general anaesthetics given with NITRATES
- Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with OXYTOCIN
- Sympathomimetics: manufacturer of isoflurane advises avoid concomitant use with ●SYMPATHOMIMETICS (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with ●ADRENALINE (EPINEPHRINE) or ●NORADRENALINE (NOREPINEPHRINE); increased risk of hypertension when volatile liquid general anaesthetics given with ●METHYLPHENIDATE
- ► Theophylline: increased risk of convulsions when ketamine given with THEOPHYLLINE
- Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Anaesthetics, General (intravenous) see Anaesthetics, General
Anaesthetics, General (volatile liquids) see Anaesthetics,
General

Anaesthetics, Local see Bupivacaine, Chloroprocaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine Anagrelide

- Cilostazol: manufacturer of anagrelide advises avoid concomitant use with • CILOSTAZOL
- Phosphodiesterase Type-3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with ● ENOXIMONE and
- MILRINONE

Anakinra

- Cytotoxics: avoid concomitant use of anakinra with
- ADALIMUMAB, CERTOLIZUMAB PEGOL, GOLIMUMAB or
- INFLIXIMAB
- Etanercept: avoid concomitant use of anakinra with
 FTANERCEPT
- Vaccines: risk of generalised infections when anakinra given with live • VACCINES—avoid concomitant use
- Analgesics see Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

Angiotensin-II Receptor Antagonists

- Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALDESLEUKIN
- Aliskiren: increased risk of hyperkalaemia, hypotension, and impaired renal function when angiotensin-II receptor antagonists given with

 ALISKIREN—avoid concomitant use; irbesartan possibly reduces plasma concentration of ALISKIREN

Angiotensin-II Receptor Antagonists (continued)

- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with GENERAL ANAESTHETICS
- Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDs, also hypotensive effect antagonised
- Antibacterials: plasma concentration of losartan and its active metabolite reduced by RIFAMPICIN; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with TRIMETHOPRIM
- Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with HEPARINS
- Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIS
- Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ANTIPSYCHOTICS
- Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ANXIOLYTICS
 AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CALCIUM-CHANNEL BLOCKERS
- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with • CICLOSPORIN
- Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CLONIDINE
- Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ● DIURETICS; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ● POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Lithium: angiotensin-II receptor antagonists reduce excretion of • LITHIUM (increased plasma concentration)
- Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with NITRATES
- Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by OESTROGENS
- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with • POTASSIUM
- Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALPROSTADIL
- Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with TACROLIMUS
- Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Antacid:

NOTE Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

ACE Inhibitors: antacids possibly reduce absorption of ACE INHIBITORS; antacids reduce absorption of CAPTOPRIL, ENALAPRIL and FOSINOPRIL

Antacids (continued)

- Analgesics: antacids possibly reduce absorption of ACEMETACIN; alkaline urine due to some antacids increases excretion of ASPIRIN
- Anthelmintics: sodium bicarbonate increases the excretion of DIETHYLCARBAMAZINE
- Antibacterials: antacids reduce absorption of AZITHROMYCIN, CEFACLOR, CIPROFLOXACIN, ISONIAZID, LEVOFLOXACIN, MOXIFLOXACIN, NORFLOXACIN, OFLOXACIN, RIFAMPICIN and TETRACYCLINES; avoid concomitant use of antacids with METHENAMINE; oral magnesium salts (as magnesium trisilicate) reduce absorption of NITROFURANTOIN
- ► Antiepileptics: antacids reduce absorption of FOSPHENYTOIN, GABAPENTIN and PHENYTOIN
- ► Antifungals: antacids reduce absorption of ITRACONAZOLE and KETOCONAZOLE
- ► Antihistamines: antacids reduce absorption of FEXOFENADINE
- Antimalarials: antacids reduce absorption of CHLOROQUINE and HYDROXYCHLOROQUINE; oral magnesium salts (as magnesium trisilicate) reduce absorption of PROGUANIL
- Antipsychotics: antacids reduce absorption of PHENOTHIAZINES and SULPIRIDE
- Antivirals: antacids reduce absorption of ATAZANAVIR (give at least 2 hours before or 1 hour after antacids); aluminium hydroxide reduces absorption of DOLUTEGRAVIRmanufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; oral magnesium salts reduce absorption of DOLUTEGRAVIRmanufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral magnesium salts; aluminium hydroxide reduces absorption of ELVITEGRAVIR (give at least 4 hours apart); oral magnesium salts reduce absorption of ELVITEGRAVIR (give at least 4 hours apart); aluminium hydroxide reduces plasma concentration of RALTEGRAVIR manufacturer of raltegravir advises avoid concomitant use; oral magnesium salts reduce plasma concentration of RALTEGRAVIR-manufacturer of raltegravir advises avoid concomitant use; manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after RILPIVIRINE; antacids reduce absorption of TIPRANAVIR (give at least 2 hours apart)
- ▶ Bile Acids: antacids possibly reduce absorption of BILE ACIDS
- Bisphosphonates: antacids reduce absorption of BISPHOSPHONATES
- ► Cardiac Glycosides: antacids possibly reduce absorption of DIGOXIN
- ► Corticosteroids: antacids reduce absorption of DEFLAZACORT
- Ottotoxics: aluminium hydroxide and oral magnesium salts possibly reduce absorption of ESTRAMUSTINE—manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of BOSUTINIB; antacids possibly reduce plasma concentration of ● ERLOTINIB—give antacids at least 4 hours before or 2 hours after erlotinib
- Deferasirox: antacids containing aluminium possibly reduce absorption of DEFERASIROX (manufacturer of deferasirox advises avoid concomitant use)
- Deferiprone: antacids containing aluminium possibly reduce absorption of DEFERIPRONE (manufacturer of deferiprone advises avoid concomitant use)
- Dipyridamole: antacids possibly reduce absorption of DIPYRIDAMOLE
- ► Eltrombopag: antacids reduce absorption of ELTROMBOPAG (give at least 4 hours apart)
- Folates: antacids possibly reduce absorption of FOLIC ACID (manufacturer of folic acid advises give at least 2 hours apart)
- Firon Salts: oral magnesium salts (as magnesium trisilicate) reduce absorption of oral IRON SALTS
- ► Lipid-regulating Drugs: antacids reduce absorption of ROSUVASTATIN

 ► Lithium: sodium bicarbonate increases excretion of LITHIUM
- (reduced plasma concentration)
 ► Mycophenolate: antacids reduce absorption of MYCOPHENOLATE
- ▶ Penicillamine: antacids reduce absorption of PENICILLAMINE
- Polystyrene Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with POLYSTYRENE

Antacids

- Polystyrene Sulfonate Resins (continued)
 SULFONATE RESINS; risk of metabolic alkalosis when oral
 magnesium salts given with POLYSTYRENE SULFONATE RESINS
- Riociguat: antacids reduce absorption of RIOCIGUAT (give at least 2 hours before or 1 hour after riociguat)
- Sympathomimetics: aluminium hydroxide possibly increases absorption of PSEUDOEPHEDRINE
- Thyroid Hormones: antacids possibly reduce absorption of LEVOTHYROXINE
- Ulcer-healing Drugs: antacids possibly reduce absorption of LANSOPRAZOLE

Antazoline see Antihistamines

Anthelmintics see individual drugs

Anthrax Vaccine see Vaccines

Anti-D Immunoglobulins see Immunoglobulins

Anti-arrhythmics see Adenosine, Amiodarone, Disopyramide, Dronedarone, Flecainide, Lidocaine, and Propafenone

Antibacterials see individual drugs

Antibiotics (cytotoxic) *see* Bleomycin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, Mitoxantrone, and Pixantrone

Anticoagulants see Apixaban, Argatroban, Bivalirudin, Coumarins, Dabigatran, Danaparoid, Fondaparinux, Heparins, Phenindione, and Rivaroxaban

Antidepressants see Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John's Wort; Venlafaxine

 $\begin{array}{lll} \textbf{Antidepressants, Noradrenaline Re-uptake Inhibitors} & see \\ \textbf{Reboxetine} \end{array}$

Antidepressants, SSRI

NOTE see also Dapoxetine

- Alcohol: sedative effects possibly increased when SSRIs given with ALCOHOL
- Aminophylline: fluvoxamine increases plasma concentration of
 AMINOPHYLLINE (concomitant use should usually be avoided, but where not possible halve aminophylline dose and monitor plasma-aminophylline concentration)
- Anaesthetics, Local: fluvoxamine inhibits metabolism of
- ADPIVACAINE—avoid prolonged administration of ropivacaine
 Analgesics: increased risk of bleeding when SSRIs given with
 NSAIDS or ASPIRIN; possible increased serotonergic effects

when SSRIs given with FENTANYL; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of METHADONE; increased risk of CNS toxicity

when SSRIs given with • TRAMADOL
• Anti-arrhythmics: manufacturer of citalopram and

- escitalopram advises avoid concomitant use with

 AMIODARONE (risk of ventricular arrhythmias); manufacturer
 of citalopram and escitalopram advises avoid concomitant
 use with DISOPYRAMIDE (risk of ventricular arrhythmias);
 manufacturer of citalopram and escitalopram advises avoid
 concomitant use with DRONEDARONE (risk of ventricular
 arrhythmias); fluoxetine increases plasma concentration of
 FLECAINIDE; fluoxetine and paroxetine possibly inhibit
 metabolism of PROPAFENONE
- Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with *intravenous*
- ERYTHROMYCIN (risk of ventricular arrhythmias);
 manufacturer of citalopram and escitalopram advises avoid concomitant use with ● MOXIFLOXACIN (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with ● TELITHROMYCIN
- Anticoagulants: SSRIs possibly enhance anticoagulant effect of
 COUMARINS; possible increased risk of bleeding when SSRIs given with
 DABIGATRAN
- Antidepressants: avoidance of fluvoxamine advised by manufacturer of ● REBOXETINE; possible increased serotonergic effects when SSRIs given with DULOXETINE; fluvoxamine inhibits metabolism of ● DULOXETINE—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping ● MAOIS, also MAOIS should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not

Antidepressants, SSRI

- Antidepressants (continued)
- be started until 2 weeks after stopping MAOIS, also MAOIS should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by MAOIS (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with MOCLOBEMIDE, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start MOCLOBEMIDE for at least 1 week; after stopping fluoxetine do not start
- MOCLOBEMIDE for 5 weeks; increased serotonergic effects when SSRIs given with ST JOHN'S WORT—avoid concomitant use; fluvoxamine inhibits metabolism of AGOMELATINE (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with MIRTAZAPINE; SSRIs increase plasma concentration of some TRICYCLICS; manufacturer of citalopram and escitalopram advises avoid concomitant use with TRICYCLICS (risk of ventricular arrhythmias)
- Antiepileptics: SSRIs antagonise anticonvulsant effect of
 ANTIEPILEPTICS (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of
- CARBAMAZEPINE; fluoxetine and fluvoxamine increase plasma concentration of FOSPHENYTOIN; plasma concentration of sertraline possibly reduced by FOSPHENYTOIN and PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of paroxetine reduced by FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE; fluoxetine and fluvoxamine increase plasma concentration of PHENYTOIN
- Antifungals: plasma concentration of paroxetine possibly increased by TERBINAFINE
- Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with MMZOLASTINE (risk of ventricular arrhythmias); antidepressant effect of SSRIs possibly antagonised by CYPROHEPTADINE
- Antimalarials: avoidance of antidepressants advised by manufacturer of ◆ ARTEMETHER WITH LUMEFANTRINE and ARTEMIMOL WITH PIPERAQUINE; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with ARTEMETHER WITH LUMEFANTRINE—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with ARTEMIMOL WITH PIPERAQUINE—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram and escitalopram given with CHLOROQUINE; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with QUININE—avoid concomitant use
- Antimuscarinics: paroxetine increases plasma concentration of DARIFENACIN and PROCYCLIDINE
- · Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of • DROPERIDOL (risk of ventricular arrhythmias); manufacturer of citalogram and escitalopram advises avoid concomitant use with • HALOPERIDOL (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of • CLOZAPINE, HALOPERIDOL and RISPERIDONE; fluvoxamine possibly increases plasma concentration of ASENAPINE and HALOPERIDOL; paroxetine inhibits metabolism of PERPHENAZINE (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of • ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by ASENAPINE; fluvoxamine, paroxetine and sertraline increase plasma concentration of CLOZAPINE; citalogram possibly increases plasma concentration of CLOZAPINE (increased risk of toxicity); fluvoxamine increases plasma concentration of OLANZAPINE; manufacturer of citalogram and escitalogram advises avoid concomitant use with • PHENOTHIAZINES (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram

advises avoid concomitant use with • PIMOZIDE (risk of

ventricular arrhythmias); SSRIs possibly increase plasma

concentration of • PIMOZIDE (increased risk of ventricular

Antidepressants, SSRI

- Antipsychotics (continued) arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of RISPERIDONE (increased risk of toxicity)
- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by DARUNAVIR; plasma concentration of SSRIs possibly increased by ●RITONAVIR; plasma concentration of paroxetine possibly reduced by RITONAVIR
- Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of ALPRAZOLAM; fluvoxamine increases plasma concentration of some BENZODIAZEPINES; fluvoxamine increases plasma concentration of ● MELATONIN—avoid concomitant use; sedative effects possibly increased when sertraline given with ZOLPIDEM
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE; fluoxetine and paroxetine possibly inhibit metabolism of ATOMOXETINE
- Beta-blockers: citalopram and escitalopram increase plasma concentration of METOPROLOL; paroxetine possibly increases the plasma concentration of METOPROLOL—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of PROPRANOLOL; increased risk of ventricular arrhythmias when citalopram given with SOTALOL—avoid concomitant use; manufacturer of escitalopram advises avoid concomitant use with SOTALOL (risk of ventricular arrhythmias)
- Bupropion: plasma concentration of citalopram possibly increased by BUPROPION
- ► Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of NIFEDIPINE (increased plasma concentration)
- Clopidogrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of CLOPIDOGREL
- Dapoxetine: possible increased risk of serotonergic effects
 when SSRIs given with DAPOXETINE (manufacturer of
 dapoxetine advises SSRIs should not be started until 1 week
 after stopping dapoxetine, avoid dapoxetine for 2 weeks after
 stopping SSRIs)
- . Dopaminergics: increased risk of CNS toxicity when SSRIs given with . RASAGILINE; fluvoxamine should not be started until 2 weeks after stopping • RASAGILINE; fluoxetine should not be started until 2 weeks after stopping • RASAGILINE, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; avoidance of citalogram and escitalopram advised by manufacturer of SELEGILINE; increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with • SELEGILINE (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when paroxetine given with • SELEGILINE (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with • SELEGILINE (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline)
- Grapefruit Juice: plasma concentration of sertraline possibly increased by GRAPEFRUIT JUICE
- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of ● TAMOXIFEN to active metabolite (avoid concomitant use)
- 5HT₁-receptor Agonists: increased risk of CNS toxicity when citalopram given with 5HT, AGONISTS (manufacturer of citalopram advises avoid concomitant use); fluvoxamine inhibits the metabolism of FROVATRIPTAN; possible increased serotonergic effects when SSRIs given with NARATRIPTAN; CNS toxicity reported when sertraline given with SUMATRIPTAN; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with SUMATRIPTAN; fluvoxamine possibly inhibits metabolism of ZOLMITRIPTAN (reduce dose of zolmitriptan)
- ► 5HT₃-receptor Antagonists: possible increased serotonergic effects when SSRIs given with 5HT₃ ANTAGONISTS

Antidepressants, SSRI (continued)

- Lipid-regulating Drugs: separating administration from fluoxetine and fluoxamine by 12 hours advised by manufacturer of LOMITAPIDE
- Lithium: Increased risk of CNS effects when SSRIs given with
 LITHIUM (lithium toxicity reported)
- Methylthioninium: risk of CNS toxicity when SSRIs given with
- METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Metoclopramide: CNS toxicity reported when SSRIs given with METOCLOPRAMIDE
- Muscle Relaxants: fluvoxamine increases plasma concentration of • TIZANIDINE (increased risk of toxicity)—avoid concomitant use
- Parasympathomimetics: paroxetine increases plasma concentration of GALANTAMINE
- Pentamidine Isetionate: manufacturer of citalopram and escitalopram advises avoid concomitant use with
- PENTAMIDINE ISETIONATE (risk of ventricular arrhythmias)
 Pirfenidone: fluvoxamine increases plasma concentration of
- Printindore: Indoxamine increases plasma concentration of
 PIRFENIDONE—manufacturer of pirfenidone advises avoid
 concomitant use
- Pomalidomide: fluvoxamine increases plasma concentration of
 - POMALIDOMIDE
- Ranolazine: paroxetine increases plasma concentration of RANOLAZINE
- Roflumilast: fluvoxamine inhibits the metabolism of ROFLUMILAST
- Sympathomimetics: metabolism of SSRIs possibly inhibited by METHYLPHENIDATE
- Theophylline: fluvoxamine increases plasma concentration of • THEOPHYLLINE (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)
- Ticagrelor: possible increased risk of bleeding when citalopram, paroxetine or sertraline given with TICAGRELOR
- Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by CIMETIDINE; fluvoxamine possibly increases plasma concentration of LANSOPRAZOLE; plasma concentration of escitalopram increased by OMEPRAZOLE

Antidepressants, SSRI (related) see Duloxetine and Venlafaxine

Antidepressants, Tricyclic

- Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS
- Alcohol: increased sedative effect when tricyclics given with
 ALCOHOL
- ► Alpha₂-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of APRACLONIDINE and BRIMONIDINE
- Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with GENERAL ANAESTHETICS
- Analgesics: increased risk of CNS toxicity when tricyclics given with •TRAMADDL; side-effects possibly increased when tricyclics given with NEFOPAM; sedative effects possibly increased when tricyclics given with OPIOID ANALGESICS
- Anti-arrhythmics: increased risk of ventricular arrhythmias
 when tricyclics given with ◆MMODARONE—avoid concomitant
 use; increased risk of ventricular arrhythmias when tricyclics
 given with ◆DISOPYRAMIDE or ◆FLECAINIDE; avoidance of
 tricyclics advised by manufacturer of ◆DRONEDARONE (risk of
 ventricular arrhythmias); increased risk of arrhythmias when
 tricyclics given with ◆PROPAFENONE
- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with • MONIFLOXACIM—avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics that prolong the QT interval given with
 - DELAMANID; possible increased risk of ventricular arrhythmias when tricyclics given with • TELITHROMYCIN
- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of • COUMARINS
- Antidepressants: avoidance of tricyclics advised by manufacturer of ◆ CITALOPRAM and ◆ ESCITALOPRAM (risk of ventricular arrhythmias); possible increased serotonergic

Antidepressants, Tricyclic

- Antidepressants (continued)
- effects when amitriptyline or clomipramine given with DULOXETINE; increased risk of hypertension and CNS excitation when tricyclics given with MAOIS, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start
- MOCLOBEMIDE for at least 1 week; plasma concentration of some tricyclics increased by SSRIS; plasma concentration of amitriptyline reduced by ST JOHN'S WORT
- Antiepileptics: tricyclics antagonise anticonvulsant effect of

 ANTIEPILEPTICS (convulsive threshold lowered); metabolism
 of tricyclics accelerated by CARBAMAZEPINE (reduced plasma
 concentration and reduced effect); plasma concentration of
 tricyclics possibly reduced by FOSPHENYTOIN and
- PHENYTOIN; metabolism of tricyclics possibly accelerated by
 PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)
- Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by FLUCONAZOLE; plasma concentration of tricyclics possibly increased by TERBINAFINE
- Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with ANTIHISTAMINES
- Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and
 ARTENIMOL WITH PIPERAQUINE
- Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with ANTIMUSCARINICS
- Antipsychotics: avoidance of tricyclics advised by manufacturer of • DROPERIDOL, • FLUPHENAZINE,
- HALOPERIDOL, SULPIRIDE and ZUCLOPENTHIXOL (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with CLOZAPINE; increased risk of antimuscarinic side-effects when tricyclics given with PHENOTHIAZINES; possible increased risk of ventricular arrhythmias when tricyclics given with RISPERIDONE
- Antivirals: plasma concentration of tricyclics possibly increased by ● RITONAVIR; increased risk of ventricular arrhythmias when tricyclics given with ● SAQUINAVIR—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with ANXIOLYTICS AND HYPNOTICS
- Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with • ATOMOXETINE; possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Beta-blockers: plasma concentration of imipramine increased by LABETALOL and PROPRANOLOL; increased risk of ventricular arrhythmias when tricyclics given with • SOTALOL
- Bupropion: plasma concentration of tricyclics possibly increased by BUPROPION (possible increased risk of convulsions)
- Calcium-channel Blockers: plasma concentration of imipramine increased by DILTIAZEM and VERAPAMIL; plasma concentration of tricyclics possibly increased by DILTIAZEM and VERAPAMIL
- Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with CANNABIS EXTRACT
- Clonidine: tricyclics antagonise hypotensive effect of
 CLONIDINE, also increased risk of hypertension on clonidine withdrawal
- Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with ARSENIC TRIOXIDE
- Dapoxetine: possible increased risk of serotonergic effects when tricyclics given with • DAPOXETINE (manufacturer of dapoxetine advises tricyclics should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricyclics)
- Disulfiram: metabolism of tricyclics inhibited by DISULFIRAM (increased plasma concentration); concomitant amitriptyline reported to increase DISULFIRAM reaction with alcohol
- Diuretics: increased risk of postural hypotension when tricyclics given with DIURETICS
- Dopaminergics: caution with tricyclics advised by manufacturer of ENTACAPONE; increased risk of CNS toxicity

Antidepressants, Tricyclic

- Dopaminergics (continued)
 - when tricyclics given with RASAGILINE; CNS toxicity reported when tricyclics given with SELEGILINE
- Histamine: tricyclics theoretically antagonise effects of HISTAMINE—manufacturer of histamine advises avoid concomitant use
- ▶ Lithium: risk of toxicity when tricyclics given with LITHIUM
- Methylthioninium: risk of CNS toxicity when clomipramine given with • METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Moxonidine: tricyclics possibly antagonise hypotensive effect of MOXONIDINE (manufacturer of moxonidine advises avoid concomitant use)
- Muscle Relaxants: tricyclics enhance muscle relaxant effect of BACLOFEN
- Nicorandil: tricyclics possibly enhance hypotensive effect of NICORANDIL
- Nitrates: tricyclics reduce effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)
- Oestrogens: antidepressant effect of tricyclics antagonised by OESTROGENS (but side-effects of tricyclics possibly increased due to increased plasma concentration)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with • PENTAMIDINE ISETIONATE
- Sodium Oxybate: increased risk of side-effects when tricyclics given with SODIUM OXYBATE
- Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with ◆ADRENALINE (EPINEPHRINE) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by METHYLPHENIDATE; increased risk of hypertension and arrhythmias when tricyclics given with ◆NORADRENALINE (NOREPINEPHRINE) or PHENYLEPHRINE
- Thyroid Hormones: effects of tricyclics possibly enhanced by THYROID HORMONES; effects of amitriptyline and imipramine enhanced by THYROID HORMONES
- Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by CIMETIDINE; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by CIMETIDINE (increased plasma concentration)

Antidepressants, Tricyclic (related)

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with • ALCOHOL
- Alpha₂-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of APRACLONIDINE and BRIMONIDINE
- Antibacterials: plasma concentration of trazodone possibly increased by CLARITHROMYCIN
- Anticoagulants: trazodone may enhance or reduce anticoagulant effect of WARFARIN
- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping • MAOIs, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclicrelated antidepressants do not start • MOCLOBEMIDE for at least 1 week
- FOSPHENYTOIN and PHENYTOIN; metabolism of mianserin accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)
- Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with ANTIHISTAMINES
- Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and
 • ARTENIMOL WITH PIPERAQUINE

Antidepressants, Tricyclic (related) (continued)

- Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with ANTIMUSCARINICS
- Antivirals: plasma concentration of trazodone increased by
 RITONAVIR (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with
 - SAQUINAVIR—avoid concomitant use; plasma concentration of trazodone possibly increased by TELAPREVIR
- Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with ANXIOLYTICS AND HYPNOTICS
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with DIAZOXIDE
- Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)
- Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with HYDRALAZINE OF SODIUM NITROPRUSSIDE

Antidiabetics

- NOTE Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption NOTE Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption
- ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by ACE INHIBITORS
- Alcohol: hypoglycaemic effect of antidiabetics enhanced by ALCOHOL; increased risk of lactic acidosis when metformin given with ALCOHOL
- Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by ANABOLIC STEROIDS
- Analgesics: effects of sulfonylureas possibly enhanced by
 NSAIDS; lixisenatide possibly reduces the absorption of PARACETAMOL when given 1 to 4 hours before paracetamol
- Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by DISOPYRAMIDE
- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by NEOMYCIN, also severity of gastro-intestinal effects increased; effects of repaglinide enhanced by CLARITHROMYCIN; effects of glibenclamide possibly enhanced by NORFLOXACIN; plasma concentration of canagliflozin and nateglinide reduced by ●RFAMPICIN; effects of linagliptin possibly reduced by ●RFAMPICIN; hypoglycaemic effect of repaglinide possibly antagonised by RIFAMPICIN; effects of sulfonylureas enhanced by ●CHLORAMPHENICOL; metabolism of tolbutamide accelerated by ●RIFAMYCINS (reduced effect); metabolism of sulfonylureas possibly accelerated by
- RIFAMYCINS (reduced effect); effects of sulfonylureas rarely enhanced by SULFONAMIDES and TRIMETHOPRIM; hypoglycaemic effect of sulfonylureas possibly enhanced by TETRACYCLINES; hypoglycaemic effect of repaglinide possibly enhanced by TRIMETHOPRIM—manufacturer advises avoid concomitant use
- Anticoagulants: exenatide possibly enhances anticoagulant effect of WARFARIN; hypoglycaemic effect of sulfonylureas possibly enhanced by COUMARINS, also possible changes to anticoagulant effect
- Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by MAOIs; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by MAOIs
- Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with PIOGLITAZONE
- Antiepileptics: tolbutamide transiently increases plasma concentration of FOSPHENYTOIN and PHENYTOIN (possibility of toxicity); plasma concentration of glibenclamide possibly reduced by TOPIRAMATE; plasma concentration of metformin possibly increased by TOPIRAMATE
- Antifungals: plasma concentration of pioglitazone, saxagliptin and tolbutamide increased by KETOCONAZOLE; plasma

Antidiabetics

- · Antifungals (continued)
- oncentration of sulfonylureas increased by ●FLUCONAZOLE and ●MICONAZOLE; hypoglycaemic effect of gliclazide and glipizide enhanced by ●MICONAZOLE—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by FLUCONAZOLE; hypoglycaemic effect of repaglinide possibly enhanced by ITRACONAZOLE; hypoglycaemic effect of glipizide possibly enhanced by POSACONAZOLE; plasma concentration of sulfonylureas possibly increased by VORICONAZOLE
- Antihistamines: thrombocyte count depressed when metformin given with KETOTIFEN (manufacturer of ketotifen advises avoid concomitant use)
- Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by PHENOTHIAZINES
- Antivirals: plasma concentration of tolbutamide possibly increased by RITONAVIR; plasma concentration of metformin increased by TELAPREVIR (consider reducing dose of metformin)
- ► Aprepitant: plasma concentration of tolbutamide reduced by APREPITANT
- Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with BETA-BLOCKERS; hypoglycaemic effect of insulin enhanced by BETA-BLOCKERS
- Bosentan: increased risk of hepatotoxicity when glibenclamide given with • BOSENTAN—avoid concomitant use
- Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with NIFEDIPINE
- Cardiac Glycosides: canagliflozin and sitagliptin increase plasma concentration of DIGOXIN; acarbose possibly reduces plasma concentration of DIGOXIN
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by CICLOSPORIN
- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by CORTICOSTEROIDS
- Cytotoxics: avoidance of repaglinide advised by manufacturer of • LAPATINIB; plasma concentration of metformin possibly increased by VANDETANIB (consider reducing dose of metformin)
- Deferasirox: plasma concentration of repaglinide increased by DEFERASIROX
- Diazoxide: hypoglycaemic effect of antidiabetics antagonised by DIAZOXIDE
- Diuretics: canagliflozin possibly enhances diuretic effect of DIURETICS; manufacturer of canagliflozin advises avoid concomitant use with LOOP DIURETICS; hypoglycaemic effect of antidiabetics antagonised by LOOP DIURETICS and THIAZIDES AND RELATED DIURETICS; dapagliflozin possibly enhances diuretic effect of LOOP DIURETICS and THIAZIDES AND RELATED DIURETICS
- Fosaprepitant: plasma concentration of tolbutamide reduced by FOSAPREPITANT
- Hormone Antagonists: requirements for antidiabetics possibly reduced by LANREOTIDE, OCTREOTIDE and PASIREOTIDE
- ► Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by LEFLUNOMIDE
- · Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by COLESEVELAM; absorption of glimepiride reduced by COLESEVELAM—manufacturer of glimepiride advises give at least 4 hours before colesevelam; hypoglycaemic effect of acarbose possibly enhanced by COLESTYRAMINE; hypoglycaemic effect of nateglinide possibly enhanced by GEMFIBROZIL; increased risk of severe hypoglycaemia when repaglinide given with • GEMFIBROZILavoid concomitant use; plasma concentration of glibenclamide possibly increased by FLUVASTATIN; manufacturer of canagliflozin advises give at least 1 hour before or 4-6 hours after BILE ACID SEQUESTRANTS; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with FIBRATES; separating administration from linagliptin by 12 hours advised by manufacturer of LOMITAPIDE
- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by OESTROGENS

Antidiabetics (continued)

- Orlistat: avoidance of acarbose advised by manufacturer of ORLISTAT
- Pancreatin: hypoglycaemic effect of acarbose antagonised by PANCREATIN
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by PROGESTOGENS
- Sulfinpyrazone: effects of sulfonylureas enhanced by
 SULFINPYRAZONE
- Teriflunomide: plasma concentration of repaglinide increased by TERIFLUNOMIDE
 Testosterone: hypoglycaemic effect of antidiabetics possibly
- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by TESTOSTERONE
- Ulcer-healing Drugs: excretion of metformin reduced by CIMETIDINE (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by CIMETIDINE
- Antiepileptics see Carbamazepine, Eslicarbazepine, Ethosuximide, Fosphenytoin, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenobarbital, Phenytoin, Pregabalin, Primidone, Retigabine, Rufinamide, Sodium valproate, Stiripentol, Tiagabine, Topiramate, Valproic acid, Vigabatrin, and Zonisamide
- Antifungals see Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin; Micafungin; Terbinafine

Antifungals, Imidazole

- Alcohol: possibility of disulfiram-like reaction when ketoconazole given with ALCOHOL
- ► Aliskiren: ketoconazole increases plasma concentration of
- Alpha-blockers: ketoconazole possibly increases plasma concentration of ALFUZOSIN; ketoconazole increases plasma concentration of ● TAMSULOSIN
- Analgesics: ketoconazole inhibits metabolism of
 BUPRENORPHINE (reduce dose of buprenorphine); possible increased risk of ventricular arrhythmias when ketoconazole given with METHADONE—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of OXYCODONE; manufacturer of ketoconazole advises avoid concomitant use with PARACETAMOL
- ► Antacids: absorption of ketoconazole reduced by ANTACIDS
- Anthelmintics: ketoconazole increases plasma concentration of PRAZIONANTEL
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ketoconazole given with • DISOPYRAMIDE—avoid concomitant use; ketoconazole increases plasma concentration of • DRONEDARONE—avoid concomitant use
- Antibacterials: manufacturer of ketoconazole advises avoid
 concomitant CLARITHROMYCIN in severe renal impairment;
 metabolism of ketoconazole accelerated by RIFAMPICIN
 (reduced plasma concentration), also plasma concentration
 of rifampicin may be reduced by ketoconazole; ketoconazole
 increases plasma concentration of BEDAQUILINE—avoid
 concomitant use if ketoconazole given for more than 14
 days; avoidance of ketoconazole advised by manufacturer of
 FIDAXOMICIN; plasma concentration of ketoconazole possibly
 reduced by ISONIAZID; ketoconazole increases the plasma
 concentration of TELITHROMYCIN—avoid in severe renal and
 hepatic impairment
- Anticoagulants: ketoconazole increases plasma concentration
 of ◆ APIXABAN —manufacturer of apixaban advises avoid
 concomitant use; miconazole enhances anticoagulant effect
 of ◆ COUMARINS (miconazole oral gel and possibly vaginal and
 topical formulations absorbed); ketoconazole enhances
 anticoagulant effect of ◆ COUMARINS; ketoconazole increases
 plasma concentration of ◆ DABIGATRAN and ◆ RIVAROXABAN —
 avoid concomitant use
- Antidepressants: avoidance of imidazoles advised by manufacturer of • REBOXETINE; ketoconazole increases plasma concentration of MIRTAZAPINE
- Antidiabetics: miconazole enhances hypoglycaemic effect of
 GLICLAZIDE and

 GLIPIZIDE—avoid concomitant use;

Antifungals, Imidazole

PERAMPANEL

- Antidiabetics (continued)
 - ketoconazole increases plasma concentration of PIOGLITAZONE, SAXAGLIPTIN and TOLBUTAMIDE; miconazole increases plasma concentration of \bullet SULFONYLUREAS

increased); ketoconazole increases plasma concentration of

- ► Antifungals: imidazoles possibly antagonise effects of AMPHOTERICIN
- Antihistamines: imidazoles possibly inhibit metabolism of
 MIZOLASTINE (avoid concomitant use)
- Antimalarials: avoidance of imidazoles advised by manufacturer of ● ARTEMETHER WITH LUMEFANTRINE; avoidance of imidazoles advised by manufacturer of ● ARTEMIMOL WITH PIPPERAQUINE (possible risk of ventricular arrhythmias); ketoconazole increases plasma concentration of MEFLOQUINE
- Antimuscarinics: absorption of ketoconazole reduced by ANTIMUSCARINICS; ketoconazole increases plasma concentration of DARIFENACIN—avoid concomitant use; manufacturer of fesoterodine advises dose reduction when ketoconazole given with FESOTERODINE—consult fesoterodine product literature; ketoconazole increases plasma concentration of OXYBUTYNIN; ketoconazole increases plasma concentration of oSOLIFENACIN—see under Solifenacin, p. 670; avoidance of ketoconazole advised by manufacturer of ● TOLIERODINE
- Antipsychotics: ketoconazole inhibits metabolism of

 ARIPIPRAZOLE (reduce dose of aripiprazole); ketoconazole increases plasma concentration of ◆LURASIDONE—avoid concomitant use; increased risk of ventricular arrhythmias when imidazoles given with ◆PIMOZIDE—avoid concomitant use; imidazoles possibly increase plasma concentration of ◆QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- · Antivirals: ketoconazole increases plasma concentration of • BOCEPREVIR; ketoconazole increases the plasma concentration of ● DACLATASVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of both drugs increased when ketoconazole given with DARUNAVIR: plasma concentration of ketoconazole reduced by • EFAVIRENZ; plasma concentration of ketoconazole increased by FOSAMPRENAVIR (also plasma concentration of fosamprenavir possibly increased); ketoconazole increases plasma concentration of ● INDINAVIR and ● MARAVIROC (consider reducing dose of indinavir and maraviroc); plasma concentration of ketoconazole reduced by

 NEVIRAPINE avoid concomitant use; plasma concentration of ketoconazole increased by • RITONAVIR (reduce dose of ketoconazole); imidazoles possibly increase plasma concentration of SAQUINAVIR; ketoconazole increases plasma concentration of • SAQUINAVIR—manufacturer of ketoconazole advises avoid concomitant use; avoidance of ketoconazole advised by manufacturer of ● SIMEPREVIR; plasma concentration of both drugs possibly increased when ketoconazole given with TELAPREVIR (increased risk of ventricular arrhythmias)-reduce dose of ketoconazole
- Anxiolytics and Hypnotics: ketoconazole increases plasma concentration of ◆ALPRAZOLAM—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of ◆MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam); ketoconazole increases plasma concentration of ZOLPIDEM
- ► Aprepitant: ketoconazole increases plasma concentration of
- Avanafil: ketoconazole increases plasma concentration of
 Avanafil—avoid concomitant use

Antifungals, Imidazole (continued)

- Beta-blockers: ketoconazole possibly increases plasma concentration of NADOLOL
 Recentary ketoconazole increases plasma concentration
- Bosentan: ketoconazole increases plasma concentration of BOSENTAN
- Cannabis Extract: ketoconazole increases plasma concentration of CANNABIS EXTRACT
- Ciclosporin: ketoconazole inhibits metabolism of
- CICLOSPORIN (increased plasma concentration); miconazole possibly inhibits metabolism of CICLOSPORIN (increased plasma concentration)
- Cilostazol: ketoconazole increases plasma concentration of
 CILOSTAZOL (see under Cilostazol, p. 206)
- ► Cinacalcet: ketoconazole inhibits metabolism of CINACALCET (increased plasma concentration)
- Cobicistat: plasma concentration of ketoconazole possibly increased by COBICISTAT—manufacturer of cobicistat advises reduce dose of ketoconazole
- · Colchicine: ketoconazole possibly increases risk of
- COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ketoconazole possibly inhibits metabolism of CORTICOSTEROIDS; ketoconazole increases the plasma concentration of inhaled and oral (and possibly also intranasal and rectal) ● BUDESONIDE; ketoconazole increases plasma concentration of active metabolite of ● CICLESONIDE; ketoconazole possibly increases plasma concentration of inhaled FLUTICASONE; ketoconazole inhibits the metabolism of METHYLPREDNISOLONE; ketoconazole increases plasma concentration of inhaled MOMETASONE
- Cytotoxics: ketoconazole inhibits the metabolism of IFOSFAMIDE; possible increased risk of neutropenia when ketoconazole given with BRENTUXIMAB VEDOTIN; ketoconazole possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of ketoconazole by 6 to 12 hours; ketoconazole increases plasma concentration of AXITINIB (reduce dose of axitinib—consult axitinib product literature); ketoconazole increases the plasma concentration of
 - BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ketoconazole increases plasma concentration of BORTEZOMIB, CABOZANTINIB, DABRAFENIB, ETOPOSIDE, IDELALISIB, IMATINIB and PONATINIB; ketoconazole increases plasma concentration of CRIZOTINIB,
- LAPATINIB, NILOTINIB and REGORAFENIB—avoid concomitant use; ketoconazole possibly increases plasma concentration of DASATINIB; ketoconazole inhibits metabolism of ERLOTINIB and SUNITINIB (increased plasma concentration); ketoconazole increases plasma concentration of • EVEROLIMUS-manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of ● IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); ketoconazole increases plasma concentration of • PAZOPANIB (reduce dose of pazopanib): manufacturer of ruxolitinib advises dose reduction when ketoconazole given with • RUXOUTINIB—consult ruxolitinih product literature; ketoconazole increases plasma concentration of active metabolite of • TEMSIROLIMUS-avoid concomitant use; avoidance of ketoconazole advised by manufacturer of • CABAZITAXEL; in vitro studies suggest a possible interaction between ketoconazole and DOCETAXEL (consult docetaxel product literature); ketoconazole reduces plasma concentration of • IRINOTECAN (but concentration of active metabolite of irinotecan increased)-avoid

concomitant use; ketoconazole increases plasma

advises avoid concomitant use

concentration of • VINFLUNINE-manufacturer of vinflunine

Antifungals, Imidazole (continued)

- Dapoxetine: ketoconazole increases plasma concentration of
 DAPOXETINE—manufacturer of dapoxetine advises avoid
- DAPOXETINE—manufacturer of dapoxetine advises avoid concomitant use
- Diuretics: ketoconazole increases plasma concentration of
 EPLERENONE—avoid concomitant use
- Domperidone: manufacturer of ketoconazole advises avoid concomitant use with • DOMPERIDONE (risk of ventricular arrhythmias)
- Ergot Alkaloids: manufacturer of ketoconazole advises avoid concomitant use with ◆ ERGOT ALKALOIDS; increased risk of ergotism when imidazoles given with ◆ ERGOTAMINE—avoid concomitant use
- Fingolimod: ketoconazole increases plasma concentration of
 FINGOLIMOD
- Fosaprepitant: ketoconazole increases plasma concentration of FOSAPREPITANT
- ► Hormone Antagonists: manufacturer of ketoconazole advises avoid concomitant use with PASIREOTIDE
- 5HT₁-receptor Agonists: ketoconazole increases plasma concentration of ALMOTRIPTAN (increased risk of toxicity); ketoconazole increases plasma concentration of ● ELETRIPTAN (risk of toxicity)—avoid concomitant use
- Ivabradine: ketoconazole increases plasma concentration of
 - IVABRADINE—avoid concomitant use
- Ivacaftor: ketoconazole increases plasma concentration of
 IVACAFTOR (see under Ivacaftor, p. 257)
- Lanthanum: absorption of ketoconazole possibly reduced by
- LANTHANUM (give at least 2 hours apart)
- Lenalidomide: ketoconazole possibly increases plasma concentration of ◆LENALIDOMIDE (increased risk of toxicity)
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with ATORVASTATIN; possible increased risk of myopathy when ketoconazole given with
 - ATORVASTĀTIN—manufacturer of ketoconazole advises avoid concomitant use; increased risk of myopathy when ketoconazole given with SIMVASTATIN (avoid concomitant use); possible increased risk of myopathy when miconazole given with SIMVASTATIN; ketoconazole increases plasma concentration of LOMITAPIDE—avoid concomitant use
- Macitentan: ketoconazole increases plasma concentration of
 MaCITENTAN
- Mirabegron: when given with ketoconazole avoid or reduce dose of MIRABEGRON in hepatic or renal impairment—see Mirabegron, p. 671
- Nintedanib: ketoconazole increases plasma concentration of
- NINTEDANIB
- Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with OESTROGENS
- Parasympathomimetics: ketoconazole increases plasma concentration of GALANTAMINE
- Ranolazine: ketoconazole increases plasma concentration of
 RANOLAZINE—avoid concomitant use
- Retinoids: ketoconazole increases plasma concentration of ALITRETINOIN; ketoconazole possibly increases risk of
 TRETINOIN toxicity
- Riociguat: avoidance of ketoconazole advised by manufacturer of RIOCIGUAT
- Sildenafil: ketoconazole increases plasma concentration of
 SILDENAFIL—reduce initial dose of sildenafil for erectile dysfunction and avoid concomitant use of sildenafil for pulmonary hypertension
- Sirolimus: ketoconazole increases plasma concentration of
 SIROLIMUS—avoid concomitant use; miconazole increases
- SIROLIMUS—avoid concomitant use; miconazole increases plasma concentration of SIROLIMUS
 Sympathomimetics, Beta; ketoconazole increases plasma
- concentration of OLODATEROL; ketoconazole inhibits metabolism of SALMETEROL (increased plasma concentration)
- Tacrolimus: ketoconazole increases plasma concentration of
 TACROLIMUS (consider reducing dose of tacrolimus);
 miconazole oral gel possibly increases plasma concentration of
 TACROLIMUS
- Tadalafil: ketoconazole increases plasma concentration of • TADALAFIL—avoid concomitant use of tadalafil for pulmonary hypertension

Antifungals, Imidazole (continued)

- Theophylline: ketoconazole possibly increases plasma concentration of • THEOPHYLLINE
- Ticagrelor: ketoconazole increases plasma concentration of
 TICAGRELOR—manufacturer of ticagrelor advises avoid concomitant use
- Tolvaptan: ketoconazole increases plasma concentration of TOLVAPTAN—manufacturer of ketoconazole advises avoid concomitant use
- Ulcer-healing Drugs: absorption of ketoconazole reduced by HISTAMINE H₂-ANTAGONISTS, PROTON PUMP INHIBITORS and SUCRALFATE
- Ulipristal: ketoconazole increases plasma concentration of low-dose ulipristal—manufacturer of low-dose ulipristal advises avoid concomitant use
- Vardenafil: ketoconazole increases plasma concentration of
- VARDENAFIL—avoid concomitant use
- Vitamins: miconazole possibly reduces effects of ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL and VITAMIN D; ketoconazole possibly increases plasma concentration of PARICALCITOL

Antifungals, Polyene see Amphotericin

Antifungals, Triazole

NOTE In general, fluconazole interactions relate to multipledose treatment

- Aliskiren: itraconazole increases plasma concentration of
 ALISKIREN—avoid concomitant use
- Aminophylline: fluconazole possibly increases plasma concentration of ● AMINOPHYLLINE
- Analgesics: fluconazole increases plasma concentration of CELECOXIB (halve dose of celecoxib); voriconazole increases plasma concentration of DICLOFENAC, IBUPROFEN and
 - OXYCODONE; fluconazole increases plasma concentration of FLURBIPROFEN, IBUPROFEN and METHADONE; fluconazole increases plasma concentration of PARECOXIB (reduce dose of parecoxib); voriconazole increases plasma concentration of ALFENTANIL and METHADONE (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of ALFENTANIL (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of ALFENTANIL; triazoles possibly increase plasma concentration of FENTANYL; itraconazole possibly increase plasma concentration of METHADONE (increased risk of ventricular

arrhythmias); itraconazole increases plasma concentration of

- ► Antacids: absorption of itraconazole reduced by ANTACIDS
- Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with • DISOPYRAMIDE; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of • DROMEDARONE
- · Antibacterials: plasma concentration of itraconazole increased by CLARITHROMYCIN; manufacturer of fluconazole advises avoid concomitant use with ERYTHROMYCIN; triazoles possibly increase plasma concentration of • RIFABUTIN (increased risk of uveitis-reduce rifabutin dose); posaconazole increases plasma concentration of • RIFABUTIN (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of . RIFABUTIN, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of • RIFABUTIN (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by • RIFABUTIN and • RIFAMPICIN—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of posaconazole reduced by . RIFAMPICIN; plasma concentration of voriconazole reduced by • RIFAMPICIN—avoid concomitant use; metabolism of fluconazole accelerated by • RIFAMPICIN (reduced plasma concentration); fluconazole possibly increases plasma concentration of BEDAQUILINE-avoid concomitant use if fluconazole given for more than 14 days
- Anticoagulants: avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of APIXABAN; fluconazole, itraconazole and voriconazole enhance

Antifungals, Triazole

- Anticoagulants (continued) anticoagulant effect of ● COUMARINS; avoidance of itraconazole advised by manufacturer of DABIGATRAN and RIVAROXABAN; avoidance of posaconazole and voriconazole advised by manufacturer of RIVAROXABAN
- Antidepressants: avoidance of triazoles advised by manufacturer of ● REBOXETINE; fluconazole possibly increases plasma concentration of AMITRIPTYLINE and NORTRIPTYLINE; plasma concentration of voriconazole reduced by ● ST JOHN'S WORT—avoid concomitant use
- Antidiabetics: posaconazole possibly enhances hypoglycaemic effect of GLIPIZIDE; fluconazole possibly enhances hypoglycaemic effect of NATEGLINIDE; itraconazole possibly enhances hypoglycaemic effect of REPAGLINIDE; fluconazole increases plasma concentration of ●SULFONYLUREAS; voriconazole possibly increases plasma concentration of SULFONYLUREAS
- Antiepileptics: fluconazole possibly increases plasma concentration of CARBAMAZEPINE; plasma concentration of voriconazole possibly reduced by ◆ CARBAMAZEPINE,
 PHENOBARBITAL and ◆ PRIMIDONE—avoid concomitant use; plasma concentration of itraconazole and posaconazole
 - possibly reduced by CARBAMAZEPINE; voriconazole increases plasma concentration of FOSPHENYTOIN and PHENYTOIN, also fosphenytoin and phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for fosphenytoin and phenytoin toxicity); plasma concentration of posaconazole reduced by
 - FOSPHENYTOIN and PHENYTOIN; plasma concentration of itraconazole reduced by FOSPHENYTOIN and PHENYTOIN— avoid concomitant use; fluconazole increases plasma concentration of FOSPHENYTOIN and PHENYTOIN (consider reducing dose of fosphenytoin and phenytoin); plasma concentration of itraconazole and posaconazole possibly reduced by PHENOBARBITAL; plasma concentration of itraconazole and posaconazole possibly reduced by PRIMIDONE
- Antifungals: triazoles possibly antagonise effects of AMPHOTERICIN; monitoring for increased voriconazole side effects advised by manufacturer of FLUCOMAZOLE if voriconazole given after fluconazole; plasma concentration of itraconazole increased by MICAFUNGIN (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by TERBINAFINE
- \bullet Antihistamines: itraconazole inhibits metabolism of
- MIZOLASTINE—avoid concomitant use
- Antimalarials: avoidance of triazoles advised by manufacturer of ◆ ARTEMETHER WITH LUMEFANTRINE; avoidance of triazoles advised by manufacturer of ◆ ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antimuscarinics: avoidance of itraconazole advised by manufacturer of DARIFENACIN and TOLTERODINE; manufacturer of fesoterodine advises dose reduction when itraconazole given with FESOTERODINE—consult fesoterodine product literature; itraconazole possibly increases plasma concentration of ● SOLIFENACIN—see under Solifenacin, p. 670
- Antipsychotics: itraconazole possibly increases plasma concentration of HALOPERIDOL; itraconazole possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of LURASIDONE—avoid concomitant use; fluconazole possibly increases the plasma concentration of LURASIDONE (see under Lurasidone, p. 315); increased risk of ventricular arrhythmias when triazoles given with PIMOZIDE—avoid concomitant use; triazoles possibly increase plasma concentration of LURASIDONE (see under Lurasidone).
- QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use; itraconazole possibly increases side-effects of RISPERIDONE
- Antivirals: plasma concentration of voriconazole increased or decreased by • ATAZANAVIR and plasma concentration of atazanavir also reduced; posaconazole increases plasma

Antifungals, Triazole

- Antivirals (continued)
- concentration of ATAZANAVIR; itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of • DACLATASVIR-reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of voriconazole reduced by . EFAVIRENZ, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of itraconazole and posaconazole reduced by • EFAVIRENZ; plasma concentration of both drugs may increase when itraconazole given with FOSAMPRENAVIR; plasma concentration of posaconazole possibly reduced by FOSAMPRENAVIR; itraconazole increases plasma concentration of • INDINAVIR (consider reducing dose of indinavir); fluconazole increases plasma concentration of • NEVIRAPINE, RITONAVIR and TIPRANAVIR; plasma concentration of itraconazole possibly reduced by NEVIRAPINE—consider increasing dose of itraconazole; plasma
- concomitant use; combination of itraconazole with

 RITONAVIR may increase plasma concentration of either drug
 (or both); triazoles possibly increase plasma concentration of
 SAQUINAVIR; fluconazole, itraconazole, posaconazole and
 voriconazole possibly increase plasma concentration of

concentration of voriconazole reduced by • RITONAVIR—avoid

- SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of voriconazole possibly affected by TELAPREVIR (possible increased risk of ventricular arrhythmias); plasma concentration of posaconazole possibly increased by TELAPREVIR (increased risk of ventricular arrhythmias); plasma concentration of itraconazole possibly increased by ▼ELAPREVIR; fluconazole increases plasma concentration of ZIDOVUDINE (increased risk of toxicity)
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of ALPRAZOLAM; fluconazole and voriconazole increase plasma concentration of DIAZEPAM (risk of prolonged sedation); fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of
 MIDAZOLAM (risk of prolonged sedation); itraconazole
- MIDAZOLAM (risk of prolonged sedation); itraconazole increases plasma concentration of BUSPIRONE (reduce dose of buspirone)
- Avanafil: itraconazole and voriconazole possibly increase plasma concentration of ● AVANAFIL—manufacturer of avanafil advises avoid concomitant use; fluconazole possibly increases plasma concentration of ● AVANAFIL—see under Avanafil, p. 698
- Bosentan: fluconazole possibly increases plasma concentration of ◆ BOSENTAN—avoid concomitant use; itraconazole possibly increases plasma concentration of BOSENTAN
- Calcium-channel Blockers: negative inotropic effect possibly
 increased when itraconazole given with CALCIUM-CHANNEL
 BLOCKERS; itraconazole inhibits metabolism of ●FELODIPINE
 (increased plasma concentration); avoidance of itraconazole
 advised by manufacturer of LERCANIDIPINE; itraconazole
 possibly inhibits metabolism of DIHYDROPYRIDINES (increased
 plasma concentration)
- Cardiac Glycosides: itraconazole increases plasma concentration of ● DIGOXIN
- Ciclosporin: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of ◆ CICLOSPORIN (increased plasma concentration)
- Cilostazol: itraconazole possibly increases plasma concentration of ◆ CILOSTAZOL (see under Cilostazol, p. 206)
- Clopidogrel: fluconazole, itraconazole and voriconazole possibly reduce antiplatelet effect of ● CLOPIDOGREL
 Coblicistat: plasma concentration of itraconazole possibly increased by COBICISTAT—manufacturer of cobicistat advises reduce dose of itraconazole
- Corticosteroids: itraconazole possibly inhibits metabolism of CORTICOSTEROIDS and METHYLPREDNISOLONE; itraconazole increases the plasma concentration of inhaled and oral (and

Antifungals, Triazole

- Corticosteroids (continued)
 possibly also intranasal and rectal) BUDESONIDE;
 itraconazole increases plasma concentration of inhaled
- Cytotoxics: itraconazole inhibits metabolism of Busulfan (increased risk of toxicity); fluconazole and itraconazole possibly increase side-effects of CyclophosphamIDE; itraconazole possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours; itraconazole possibly increases plasma concentration of AXITINIB (reduce dose of axitinib—consult axitinib product literature); fluconazole, itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of ●BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; itraconazole possibly increases plasma concentration of CABOZANTINIB; itraconazole and voriconazole possibly increase plasma concentration of ●CRIZOTINIB—manufacturer of crizotinib advises avoid

 CRIZOTINIB—manufacturer of crizotinib advises avoid
- concomitant use; avoidance of itraconazole advised by manufacturer of DASATINIB and • TEMSIROLIMUS (plasma concentration of dasatinib and temsirolimus possibly increased); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • EVEROLIMUSmanufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of GEFITINIB; fluconazole, itraconazole and voriconazole possibly increase the plasma concentration of • IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of . LAPATINIB; avoidance of itraconazole and voriconazole advised by manufacturer of • NILOTINIB; itraconazole and voriconazole possibly increase plasma concentration of • PAZOPANIB (reduce dose of pazopanib); itraconazole and voriconazole possibly increase plasma concentration of PONATINIB-consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when fluconazole, itraconazole, posaconazole and voriconazole given with
- RUNOLITINIB—consult ruxolitinib product literature; itraconazole and voriconazole possibly increase the plasma concentration of ● CABAZITAXEL—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; itraconazole and voriconazole possibly increase plasma concentration of ● DOCETAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of toxicity when itraconazole given with ● IRINOTECAN—avoid concomitant use; itraconazole possibly increases risk of ● VINBLASTINE,
- VINDESINE, VINFLUNINE and VINORELBINE toxicity;
 posaconazole possibly inhibits metabolism of VINBLASTINE
 and VINCRISTINE (increased risk of neurotoxicity);
 itraconazole increases risk of VINCRISTINE toxicity
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fluconazole given with DAPOXETINE (see under Dapoxetine, p. 703); avoidance of itraconazole advised by manufacturer of ▶ DAPOXETINE (increased risk of toxicity)
- Diuretics: fluconazole increases plasma concentration of EPLERENONE (reduce dose of eplerenone); itraconazole increases plasma concentration of ● EPLERENONE—avoid concomitant use; plasma concentration of fluconazole increased by HYDROCHLOROTHIAZIDE
- Domperidone: possible increased risk of ventricular arrhythmias when itraconazole or voriconazole given with
 DOMPERIDONE—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when voriconazole given with ERGOMETRINE—avoid concomitant use; manufacturer of itraconazole advises avoid concomitant use with ERGOMETRINE (increased risk of ergotism); increased risk of ergotism when triazoles given with ERGOTAMINE—avoid concomitant use
- 5HT₁-receptor Agonists: itraconazole increases plasma concentration of • ELETRIPTAN (risk of toxicity)—avoid concomitant use

Antifungals, Triazole (continued)

- Ivabradine: fluconazole increases plasma concentration of IVABRADINE—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of ● IVABRADINE avoid concomitant use
- Ivacaftor: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of •IVACAFTOR (see under Ivacaftor, p. 257); fluconazole increases plasma concentration of •IVACAFTOR (see under Ivacaftor, p. 257)
- Lenalidomide: itraconazole possibly increases plasma concentration of • LENALIDOMIDE (increased risk of toxicity)
- Leukotriene Receptor Antagonists: fluconazole increases plasma concentration of ZAFIRLUKAST
- Lipid-regulating Drugs: increased risk of myopathy when itraconazole, posaconazole or voriconazole given with
 ATORVASTATIN; possible increased risk of myopathy when fluconazole given with ATORVASTATIN or SIMVASTATIN; fluconazole increases plasma concentration of FLUVASTATIN; possible increased risk of myopathy; itraconazole increases plasma concentration of ROSUVASTATIN adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when itraconazole or posaconazole given with SIMVASTATIN (avoid concomitant use); increased risk of myopathy when voriconazole given with SIMVASTATIN; avoidance of triazoles advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Mirabegron: when given with itraconazole avoid or reduce dose of MIRABEGRON in hepatic or renal impairment—see Mirabegron, p. 671
- Oestrogens: plasma concentration of voriconazole increased by OESTROGENS
- Progestogens: plasma concentration of voriconazole possibly increased by PROGESTOGENS
- Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • RANOLAZINE manufacturer of ranolazine advises avoid concomitant use
- Retinoids: fluconazole and voriconazole possibly increase risk of • TRETINOIN toxicity
- ► Riociguat: avoidance of itraconazole and voriconazole advised by manufacturer of RIOCIGUAT
- ► Sildenafil: itraconazole increases plasma concentration of SILDENAFIL—reduce initial dose of sildenafil
- Sirolimus: fluconazole and posaconazole possibly increase plasma concentration of SIROLIMUS; itraconazole and voriconazole increase plasma concentration of ◆ SIROLIMUS avoid concomitant use
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of ◆ TACROLIMUS (consider reducing dose of tacrolimus)
- Tadalafil: itraconazole possibly increases plasma concentration of TADALAFIL
- Theophylline: fluconazole possibly increases plasma concentration of ● THEOPHYLLINE
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by ◆ CIMETIDINE and ◆ ESOMEPRAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of posaconazole possibly reduced by
 - FAMOTIDINE, LANSOPRAZOLE, NIZATIDINE, OMEPRAZOLE,
- ◆ PANTOPRAZOLE, ◆ RABEPRAZOLE and ◆ RANITIDINE manufacturer of posaconazole suspension advises avoid concomitant use; voriconazole possibly increases plasma concentration of ESOMEPRAZOLE; voriconazole increases plasma concentration of OMEPRAZOLE (consider reducing dose of omeprazole); absorption of itraconazole reduced by HISTAMINE H₂-ANTAGONISTS and PROTON PUMP INHIBITORS
- Ulipristal: avoidance of itraconazole advised by manufacturer of ULIPRISTAL
- Vardenafil: itraconazole possibly increases plasma concentration of • VARDENAFIL—avoid concomitant use

NOTE Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)

Antihistamines (continued)

- Alcohol: increased sedative effect when antihistamines given with ALCOHOL (possibly less effect with non-sedating antihistamines)
- Analgesics: sedative effects possibly increased when sedating antihistamines given with • OPIOID ANALGESICS
- ► Antacids: absorption of fexofenadine reduced by ANTACIDS
- Anti-arrhythmics: increased risk of ventricular arrhythmias
 when mizolastine given with AMIODARONE, DISOPYRAMIDE
 or FLECAINIDE—avoid concomitant use; manufacturer of
 mizolastine advises avoid concomitant use with PROPAFENONE
 (possible risk of ventricular arrhythmias)
- Antibacterials: manufacturer of loratadine advises plasma concentration possibly increased by ERYTHROWCIN metabolism of mizolastine inhibited by • ERYTHROWCIN avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with • MOXIFLOXACIN avoid concomitant use; effects of fexofenadine possibly reduced by RIFAMPICIN; metabolism of mizolastine possibly inhibited by • MACROLIDES (avoid concomitant use)
- Antidepressants: avoidance of mizolastine advised by manufacturer of ◆ CITALOPRAM and ◆ ESCITALOPRAM (risk of ventricular arrhythmias); increased antimuscarinic and sedative effects when antihistamines given with MAOIs or TRICYCLICS; manufacturer of promethazine advises avoid for 2 weeks after stopping MAOIs; manufacturer of hydroxyzine advises avoid concomitant use with MAOIs; cyproheptadine possibly antagonises antidepressant effect of SSRIs; possible increased antimuscarinic and sedative effects when antihistamines given with TRICYCLIC-RELATED ANTIDEPRESSANTS
- Antidiabetics: thrombocyte count depressed when ketotifen given with METFORMIN (manufacturer of ketotifen advises avoid concomitant use)
- Antifungals: metabolism of mizolastine inhibited by
 ■ITRACONAZOLE—avoid concomitant use; metabolism of mizolastine possibly inhibited by IMIDAZOLES (avoid concomitant use)
- Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with ANTIMUSCARINICS
- Antivirals: plasma concentration of chlorphenamine possibly increased by LOPINAVIR; plasma concentration of nonsedating antihistamines possibly increased by RITONAVIR; increased risk of ventricular arrhythmias when mizolastine given with • SAQUINAVIR—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with
 SOTALOL—avoid concomitant use
- ▶ Betahistine: antihistamines theoretically antagonise effect of
- Cytotoxics: possible increased risk of ventricular arrhythmias when mizolastine given with • VANDETANIB—avoid concomitant use
- ► Grapefruit Juice: plasma concentration of bilastine reduced by GRAPEFRUIT JUICE
- Histamine: antihistamines theoretically antagonise effects of HISTAMINE—manufacturer of histamine advises avoid concomitant use
- ► Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by CIMETIDINE; plasma concentration of hydroxyzine increased by CIMETIDINE
- Ulipristal: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after ULIPRISTAL

Antihistamines, Non-sedating *see* Antihistamines **Antihistamines, Sedating** *see* Antihistamines

Antimalarials see Artemether with Lumefantrine, Artenimol with Piperaquine, Chloroquine, Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, Pyrimethamine, and Ouinine

Antimetabolites *see* Capecitabine, Cladribine, Cytarabine, Decitabine, Fludarabine, Fluorouracil, Gemcitabine,

Antimetabolites (continued)

Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, Tegafur, and Tioguanine

Antimuscarinics

- NOTE Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation
- Alcohol: increased sedative effect when hyoscine given with
- Analgesics: possible increased risk of antimuscarinic sideeffects when antimuscarinics given with CODEINE; increased risk of antimuscarinic side-effects when antimuscarinics given with NEFOPAM
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with ◆AMIODARONE, ◆DISOPYRAMIDE or ◆FLECANIDE; increased risk of antimuscarinic side-effects when antimuscarinics given with DISOPYRAMIDE
- Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with CLARITHROMYCIN and TELITHROMYCIN—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with CLARITHROMYCIN and ERYTHROMYCIN; plasma concentration of darifenacin possibly increased by ERYTHROMYCIN; plasma concentration of active metabolite of fesoterodine reduced by RIFAMPICIN
- Antidepressants: plasma concentration of darifenacin and procyclidine increased by PAROXETINE; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or TRICYCLICS; possible increased antimuscarinic sideeffects when antimuscarinics given with TRICYCLIC-RELATED ANTIDEPRESSANTS
- Antifungals: antimuscarinics reduce absorption of
 KETOCONAZOLE; manufacturer of fesoterodine advises dose
 reduction when fesoterodine given with ITRACONAZOLE and
 KETOCONAZOLE—consult fesoterodine product literature;
 plasma concentration of darifenacin increased by
 KETOCONAZOLE—avoid concomitant use; plasma
 concentration of solifenacin increased by *KETOCONAZOLE—
 see under Solifenacin, p. 670; plasma concentration of
 oxybutynin increased by KETOCONAZOLE; manufacturer of
 tolterodine advises avoid concomitant use with ITRACONAZOLE
 and *KETOCONAZOLE; manufacturer of darifenacin advises
 avoid concomitant use with ITRACONAZOLE; plasma
 concentration of solifenacin possibly increased by
- ITRACONAZOLE—see under Solifenacin, p. 670
- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with ANTIHISTAMINES
- Antipsychotics: antimuscarinics possibly reduce effects of HALOPERIDOL; increased risk of antimuscarinic side-effects when antimuscarinics given with CLOZAPINE; antimuscarinics reduce plasma concentration of PHENOTHIAZINES, but risk of antimuscarinic side-effects increased
- Antivirals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with ATAZANAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR—consult fesoterodine product literature; manufacturer of darifenacin advises avoid concomitant use with ATAZANAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR and TIPRANAVIR; manufacturer of tolterodine advises avoid concomitant use with FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR and SAQUINAVIR; plasma concentration of solifenacin possibly increased by RITONAVIR—see under Solifenacin, p. 670
- Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with • SOTALOL
- Calcium-channel Blockers: plasma concentration of solifenacin increased by VERAPAMIL; manufacturer of darifenacin advises avoid concomitant use with VERAPAMIL
- Cardiac Glycosides: darifenacin possibly increases plasma concentration of DIGOXIN
- Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with CICLOSPORIN
- Domperidone: antimuscarinics antagonise effects of DOMPERIDONE on gastro-intestinal activity

Antimuscarinics (continued)

- Dopaminergics: antimuscarinics possibly reduce absorption of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA
- Hormone Antagonists: possible increased risk of bradycardia when ipratropium or oxybutynin given with PASIREOTIDE
- Memantine: effects of antimuscarinics possibly enhanced by MEMANTINE
- Metoclopramide: antimuscarinics antagonise effects of METOCLOPRAMIDE on gastro-intestinal activity
- Nitrates: antimuscarinics possibly reduce effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)
- Parasympathomimetics: antimuscarinics antagonise effects of PARASYMPATHOMIMETICS

Antipsychotics

NOTE Increased risk of toxicity with myelosuppressive drugs NOTE Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis

- ► ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with ADRENERGIC NEURONE BLOCKERS; higher doses of chlorpromazine antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS; haloperidol antagonises hypotensive effect of ADRENERGIC NEURONE BLOCKERS
- Adsorbents: absorption of phenothiazines possibly reduced by KAOLIN
- Alcohol: increased sedative effect when antipsychotics given with ALCOHOL
- Alpha-blockers: enhanced hypotensive effect when antipsychotics given with ALPHA-BLOCKERS
- Anaesthetics, General: droperidol enhances effects of THIOPENTAL; enhanced hypotensive effect when antipsychotics given with • GENERAL ANAESTHETICS
- Analgesics: possible severe drowsiness when haloperidol given
 with ACEMETACIN or INDOMETACIN; increased risk of ventricular
 arrhythmias when antipsychotics that prolong the QT
 interval given with METHADONE; increased risk of ventricular
 arrhythmias when amisulpride given with METHADONE—
 avoid concomitant use; increased risk of convulsions when
 antipsychotics given with TRAMADOL; enhanced hypotensive
 and sedative effects when antipsychotics given with OPIOID
 ANALGESICS
- ► Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antacids: absorption of phenothiazines and sulpiride reduced by ANTACIDS
- - ◆ AMIODARONE—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with ◆ AMIODARONE or ◆ DISOPYRAMIDE; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozide or zuclopenthixol given with
- DISOPYRAMIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with
- DISOPYRAMIDE—avoid concomitant use; increased risk of
- ventricular arrhythmias when phenothiazines given with

 DISOPYRAMIDE; avoidance of phenothiazines advised by
 manufacturer of DRONEDARONE (risk of ventricular
- manufacturer of DRONEDARONE (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with FLECAINIDE
- Antibacterials: plasma concentration of lurasidone possibly increased by ● CLARITHROMYCIN and ● TELITHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with ● CLARITHROMYCIN, ● MOXIFLOXACIN or ● TELITHROMYCIN—avoid concomitant use; plasma concentration of quetiapine possibly increased by
- CLARITHROMYCIN—manufacturer of quetiapine advises avoid

Antipsychotics

- · Antibacterials (continued)
 - concomitant use; plasma concentration of lurasidone possibly increased by ERYTHROMYCIN (see under Lurasidone, p. 315); increased risk of ventricular arrhythmias when amisulpride given with ERYTHROMYCIN—avoid concomitant use; plasma concentration of clozapine possibly increased by ERYTHROMYCIN (nossible increased risk of convulsions).
 - ERYTHROMYCIN (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with ◆ ERYTHROMYCIN—avoid concomitant use; plasma concentration of quetiapine increased by
- ERYTHROMYCIN—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with parenteral ERYTHROMYCIN; increased risk of ventricular arrhythmias when zuclopenthixol given with parenteral ERYTHROMYCIN—avoid concomitant use; plasma concentration of clozapine increased by CIPROFLOXACIN; plasma concentration of olanzapine possibly increased by CIPROFLOXACIN; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopenthixol given with
- MOXIFLOXACIN—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with
- MOXIFLOXACIN—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by RIFABUTIN and RIFAMPICIN (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of lurasidone reduced by RIFAMPICIN—avoid concomitant use; plasma concentration of clozapine possibly reduced by RIFAMPICIN; metabolism of haloperidol accelerated by RIFAMPICIN (reduced plasma concentration); avoid concomitant use of clozapine with CHLORAMPHENICOL or
- SULFONAMIDES (increased risk of agranulocytosis); increased risk of ventricular arrhythmias when droperidol, haloperidol or pimozide given with DELAMANID; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with DELAMANID; manufacturer of droperidol advises avoid concomitant use with MACROLIDES (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when chlorpromazine given with
- TELITHROMYCIN; plasma concentration of quetiapine possibly increased by TELITHROMYCIN
- Antidepressants: plasma concentration of clozapine possibly increased by CITALOPRAM (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of ● CITALOPRAM (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of ● ESCITALOPRAM (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by ● FLUOXETINE and
 - PAROXETINE (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by
 - FLUOXETINE; manufacturer of droperidol advises avoid concomitant use with FLUOXETINE, FLUVOXAMINE,
 - SERTRALINE and TRICYCLICS (risk of ventricular arrhythmias); plasma concentration of asenapine and haloperidol possibly increased by FLUVOXAMINE; plasma concentration of clozapine and olanzapine increased by
 - FLUVOXAMINE; asenapine possibly increases plasma concentration of PAROXETINE; plasma concentration of clozapine increased by PAROXETINE and SERTRALINE; plasma concentration of risperidone possibly increased by PAROXETINE (increased risk of toxicity); metabolism of perphenazine inhibited by PAROXETINE (reduce dose of perphenazine); plasma concentration of haloperidol increased by VENLAFAXINE; clozapine possibly increases CNS effects of MAOIS; plasma concentration of pimozide possibly increased by SSRIS (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of lurasidone possibly reduced by ST JOHN'S WORT—avoid concomitant use; plasma concentration of aripiprazole possibly reduced by ST JOHN'S WORT (avoid concomitant use

or consider increasing the dose of aripiprazole-consult

Antipsychotics

- Antidepressants (continued)
 aripiprazole product literature); manufacturer of
 fluphenazine, haloperidol, sulpiride and zuclopenthixol
 advises avoid concomitant use with TRICYCLICS (risk of
 ventricular arrhythmias); increased risk of antimuscarinic
 side-effects when phenothiazines given with TRICYCLICS;
 possible increased risk of ventricular arrhythmias when
 risperidone given with TRICYCLICS; possible increased
 antimuscarinic side-effects when clozapine given with
 TRICYCLICS
- Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of SULFONYLUREAS
- Antiepileptics: antipsychotics antagonise anticonvulsant effect
 of ◆ ANTIEPILEPTICS (convulsive threshold lowered);
 metabolism of haloperidol, olanzapine, quetiapine and
 risperidone accelerated by CARBAMAZEPINE (reduced plasma
 concentration); metabolism of clozapine accelerated by
 ◆CARBAMAZEPINE (reduced plasma concentration), also avoid
 concomitant use of drugs with substantial potential for
 causing agranulocytosis; plasma concentration of
 aripiprazole reduced by ◆ CARBAMAZEPINE (avoid concomitant
 use or consider increasing the dose of aripiprazole —consult
 aripiprazole product literature); plasma concentration of
 paliperidone reduced by ◆ CARBAMAZEPINE; plasma
 concentration of lurasidone possibly reduced by
 ◆ CARBAMAZEPINE, ◆ FOSPHENYTOIN, ◆ PHENOBARBITAL,
 - PHENYTOIN and PRIMIDONE—avoid concomitant use; chlorpromazine possibly increases or decreases plasma concentration of FOSPHENYTOIN and PHENYTOIN; metabolism of clozapine and quetiapine accelerated by FOSPHENYTOIN (reduced plasma concentration); plasma concentration of aripiprazole possibly reduced by FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE (avoid concomitant use or consider increasing the dose of aripiprazole-consult aripiprazole product literature); plasma concentration of haloperidol reduced by FOSPHENYTOIN and PHENYTOIN; metabolism of haloperidol accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with PHENOBARBITAL and PRIMIDONE: plasma concentration of clozapine possibly reduced by PHENOBARBITAL and PRIMIDONE; metabolism of clozapine and quetiapine accelerated by PHENYTOIN (reduced plasma concentration); increased risk of side-effects including neutropenia when olanzapine given with • SODIUM VALPROATE and • VALPROIC ACID; plasma concentration of clozapine possibly increased or decreased by SODIUM VALPROATE and VALPROIC ACID
- · Antifungals: plasma concentration of lurasidone increased by • KETOCONAZOLE—avoid concomitant use: metabolism of aripiprazole inhibited by • KETOCONAZOLE (reduce dose of aripiprazole); plasma concentration of lurasidone possibly increased by • FLUCONAZOLE (see under Lurasidone, p. 315); plasma concentration of lurasidone possibly increased by • ITRACONAZOLE, • POSACONAZOLE and • VORICONAZOLE—avoid concomitant use; plasma concentration of aripiprazole possibly increased by • ITRACONAZOLE (reduce dose of aripiprazole-consult aripiprazole product literature); sideeffects of risperidone possibly increased by ITRACONAZOLE; plasma concentration of haloperidol possibly increased by ITRACONAZOLE; increased risk of ventricular arrhythmias when pimozide given with ● IMIDAZOLES or ● TRIAZOLES—avoid concomitant use; plasma concentration of quetiapine possibly increased by ● IMIDAZOLES and ● TRIAZOLESmanufacturer of quetiapine advises avoid concomitant use

Antipsychotics

- · Antimalarials (continued)
 - QUININE—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when risperidone given with ● MEFLOQUINE; increased risk of ventricular arrhythmias when pimozide given with
 ● MEFLOQUINE or ● QUININE—avoid concomitant use; manufacturer of amisulpride advises avoid concomitant use with MEFLOQUINE; possible increased risk of ventricular arrhythmias when risperidone given with ● QUININE
- Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with ANTIMUSCARINICS; plasma concentration of phenothiazines reduced by ANTIMUSCARINICS, but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by ANTIMUSCARINICS
- Antipsychotics: increased risk of ventricular arrhythmias when amisulpride, pimozide or sulpiride given with ● DROPERIDOL avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with ● DROPERIDOL—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of ● FLUPENTIXOL, ● FLUPHENAZINE, ● HALOPERIDOL,
 ● PIPOTIAZINE, ● RISPERIDONE OT ● ZUCLOPENTHIXOL as cannot
- PIPOTIZZINE, RISPERIDONE OF ZUCLOPENTHIXOL as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with HALOPERIDOL; chlorpromazine possibly increases plasma concentration of HALOPERIDOL; increased risk of ventricular arrhythmias when droperidol given with HALOPERIDOL— avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with PHENOTHIAZINES— avoid concomitant use; lurasidone possibly increases plasma concentration of PIMOZIDE (increased risk of toxicity); possible increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with RISPERIDONE; increased risk of ventricular arrhythmias when pimozide given with SULPIRIDE
- Antivirals: plasma concentration of aripiprazole possibly increased by
 • ATAZANAVIR,
 • DARUNAVIR,
 • FOSAMPRENAVIR,
 • INDINAVIR,
 • LOPINAVIR,
 • RITONAVIR,
 • SAQUINAVIR and
- TIPRANAVIR (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of quetiapine possibly increased by ATAZANAVIR, BOCEPREVIR,
- DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR,
- RITONAVIR, SAQUINAVIR, TELAPREVIR and TIPRANAVIR—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of pimozide possibly increased by
- ATAZANAVIR—avoid concomitant use; avoidance of pimozide advised by manufacturer of BOCEPREVIR and TELAPREVIR; plasma concentration of lurasidone possibly increased by
- BOCEPREVIR, INDINAVIR, RITONAVIR, SAQUINAVIR and
- TELAPREVIR—avoid concomitant use; plasma concentration of aripiprazole possibly reduced by EFAVIRENZ and
- NEVIRAPINE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by EFAVIRENZ, INDINAVIR and SAQUINAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by FOSAMPRENAVIR and RITONAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of antipsychotics possibly increased by RITONAVIR; plasma concentration of olanzapine reduced by RITONAVIR—consider increasing dose of olanzapine; avoidance of clozapine advised by manufacturer of RITONAVIR (increased risk of toxicity); increased risk of ventricular arrhythmias when clozapine, haloperidol or phenothiazines given with SAQUINAVIR—avoid concomitant
- Anxiolytics and Hypnotics: increased sedative effect when antipsychotics given with ANXIOLYTICS AND HYPNOTICS; plasma concentration of haloperidol possibly increased by ALPRAZOLAM; lurasidone increases plasma concentration of MIDAZOLAM; serious adverse events reported with concomitant use of clozapine and

Antipsychotics

- Anxiolytics and Hypnotics (continued)
- BENZODIAZEPINES (causality not established); increased risk of hypotension, bradycardia and respiratory depression when *intramuscular* olanzapine given with *parenteral*
- BENZODIAZEPINES; plasma concentration of haloperidol increased by BUSPIRONE
- Aprepitant: avoidance of pimozide advised by manufacturer of
 APREPITANT
- Atomoxetine: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with
 ATOMOXETINE
- Beta-blockers: enhanced hypotensive effect when phenothiazines given with BETA-BLOCKERS; plasma concentration of both drugs may increase when chlorpromazine given with PROPRANOLOL; increased risk of ventricular arrhythmias when droperidol or zuclopenthixol given with SOTALOL—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide or sulpiride given with SOTALOL; possible increased risk of ventricular arrhythmias when risperidone given with SOTALOL; possible increased risk of ventricular arrhythmias when haloperidol given with
- SOTALOL—avoid concomitant use
- Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with CALCIUM-CHANNEL BLOCKERS; plasma concentration of lurasidone increased by ◆ DILTIAZEM (see under Lurasidone, p. 315); plasma concentration of lurasidone possibly increased by ◆ VERAPAMIL (see under Lurasidone, p. 315)
- ► Clonidine: enhanced hypotensive effect when phenothiazines given with CLONIDINE
- Cobicistat: plasma concentration of lurasidone possibly increased by • COBICISTAT—avoid concomitant use; plasma concentration of pimozide possibly increased by
 - COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: avoid concomitant use of clozapine with
- ARSENIC TRIOXIDE; increased risk of ventricular arrhythmias when haloperidol given with ARSENIC TRIOXIDE
 Deferasirox: avoidance of clozapine advised by manufacturer
- of DEFERASIROX
- Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with DESFERRIOXAMINE; avoidance of prochlorperazine advised by manufacturer of DESFERRIOXAMINE
- Diazoxide: enhanced hypotensive effect when phenothiazines given with DIAZOXIDE
- Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by • DIURETICS; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by • DIURETICS (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with DIURETICS
- Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with AMANTADINE; antipsychotics antagonise effects of APOMORPHINE, CO-BENELDOPA, CO-CARELODPA, LEVODOPA and PERGOLIDE; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of BROMOCRIPTINE and CABERGOLINE; manufacturer of amisulpride advises avoid concomitant use of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA (antagonism of effect); avoidance of antipsychotics advised by manufacturer of PRAMIPEXOLE, ROPINIROLE and ROTIGOTINE (antagonism of effect)

Antipsychotics (continued)

- Ergot Alkaloids: lurasidone possibly increases plasma
- concentration of ERGOT ALKALOIDS (increased risk of toxicity)

 Fosaprepitant: avoidance of pimozide advised by manufacturer
 of FOSAPREPITANT
- Grapefruit Juice: manufacturer of lurasidone and pimozide advises avoid concomitant use with GRAPEFRUIT JUICE; plasma concentration of quetiapine possibly increased by
 GRAPEFRUIT JUICE—manufacturer of quetiapine advises avoid concomitant use
- Histamine: antipsychotics theoretically antagonise effects of HISTAMINE—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with • TAMOXIFEN (risk of ventricular arrhythmias)
- Ivabradine: increased risk of ventricular arrhythmias when pimozide given with ● IVABRADINE
- Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol given with • LITHIUM; possible risk of toxicity when olanzapine given with LITHIUM; extrapyramidal side-effects of quetiapine possibly increased by LITHIUM; increased risk of extrapyramidal side-effects when sulpiride given with LITHIUM
- Memantine: effects of antipsychotics possibly reduced by MEMANTINE
- Methyldopa: enhanced hypotensive effect when antipsychotics given with METHYLDOPA (also increased risk of extrapyramidal effects)
- Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with METOCLOPRAMIDE
- Moxonidine: enhanced hypotensive effect when phenothiazines given with MOXONIDINE
- Muscle Relaxants: promazine possibly enhances effects of SUXAMETHONIUM
- Nitrates: enhanced hypotensive effect when phenothiazines given with NITRATES
- Penicillamine: avoid concomitant use of clozapine with
 PENICILLAMINE (increased risk of agranulocytosis)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with
- PENTAMIDINE ISETIONATE—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with PENTAMIDINE ISETIONATE

 Coding Pentament in the provided provided
- Sodium Benzoate: haloperidol possibly reduces effects of SODIUM BENZOATE
- Sodium Oxybate: antipsychotics possibly enhance effects of SODIUM OXYBATE
- Sodium Phenylbutyrate: haloperidol possibly reduces effects of SODIUM PHENYLBUTYRATE
- Sympathomimetics: antipsychotics antagonise hypertensive
 effect of SYMPATHOMIMETICS; antipsychotic effects of
 chlorpromazine possibly antagonised by DEXAMFETAMINE;
 chlorpromazine possibly reduces effects of
 LISDEXAMFETAMINE; side-effects of risperidone possibly
 increased by METHYLPHENIDATE
- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with • TACROLIMUS (risk of ventricular arrhythmias)
- ► Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with TETRABENAZINE
- Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by CIMETIDINE; plasma concentration of clozapine possibly reduced by OMEPRAZOLE; absorption of sulpiride reduced by SUCRALFATE
- Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Antivirals see individual drugs

Anxiolytics and Hypnotics

 ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with ACE INHIBITORS

Anxiolytics and Hypnotics (continued)

- ► Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with ADRENERGIC NEURONE BLOCKERS
- ► Alcohol: increased sedative effect when anxiolytics and hypnotics given with ALCOHOL
- Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with ALPHA-BLOCKERS
- Aminophylline: effects of benzodiazepines possibly reduced by AMINOPHYLLINE
- ► Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with GENERAL ANAESTHETICS
- Analgesics: metabolism of midazolam possibly inhibited by FENTANYL; increased sedative effect when anxiolytics and hypnotics given with OPIOID ANALGESICS
- ► Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: metabolism of midazolam inhibited by • CLARITHROMYCIN, • ERYTHROMYCIN and • TELITHROMYCIN (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by ERYTHROMYCIN (reduce dose of buspirone); metabolism of zopiclone inhibited by ERYTHROMYCIN; manufacturer of zolpidem advises avoid concomitant use with CIPROFLOXACIN; metabolism of benzodiazepines possibly accelerated by RIFAMPICIN (reduced plasma concentration); metabolism of diazepam and zaleplon accelerated by RIFAMPICIN (reduced plasma concentration); metabolism of buspirone possibly accelerated by RIFAMPICIN; metabolism of zolpidem accelerated by RIFAMPICIN (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by RIFAMPICIN; metabolism of diazepam inhibited by ISONIAZID
- Anticoagulants: chloral may transiently enhance anticoagulant effect of COUMARINS
- Antidepressants: plasma concentration of alprazolam increased by FLUOXETINE; plasma concentration of melatonin increased by FLUVOXAMINE—avoid concomitant use; plasma concentration of some benzodiazepines increased by FLUVOXAMINE; sedative effects possibly increased when zolpidem given with SERTRALINE; manufacturer of buspirone advises avoid concomitant use with MAOIS; avoidance of buspirone for 14 days after stopping TRANYLCYPROMINE advised by manufacturer of tranylcypromine; plasma concentration of oral midazolam possibly reduced by ST JOHN'S WORT; increased sedative effect when anxiolytics and hypnotics given with MIRTAZAPINE, TRICYCLIC-RELATED ANTIDEPRESSANTS OF TRICYCLICS.
- Antiepileptics: plasma concentration of midazolam reduced by CARBAMAZEPINE and PERAMPANEL; plasma concentration of clonazepam often reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE; benzodiazepines possibly increase or decrease plasma concentration of FOSPHENYTOIN and PHENYTOIN; diazepam increases or decreases plasma concentration of FOSPHENYTOIN and PHENYTOIN; increased sedative effect when anxiolytics and hypnotics given with PHENOBARBITAL or PRIMIDONE; clobazam possibly increases plasma concentration of SODIUM VALPROATE and VALPROIC ACID; plasma concentration of diazepam and lorazepam possibly increased by SODIUM VALPROATE; increased risk of side-effects when clonazepam given with SODIUM VALPROATE or VALPROIC ACID; plasma concentration of clobazam increased by STIRIPENTOL; plasma concentration of diazepam and lorazepam possibly increased by VALPROIC ACID
- ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE (risk of

Anxiolytics and Hypnotics

- Antifungals (continued)
- prolonged sedation); plasma concentration of buspirone increased by ITRACONAZOLE (reduce dose of buspirone); plasma concentration of diazepam increased by
 VORICONAZOLE (risk of prolonged sedation)
- Antihistamines: increased sedative effect when anxiolytics and hypnotics given with ANTIHISTAMINES
- Antipsychotics: increased sedative effect when anxiolytics and hypnotics given with ANTIPSYCHOTICS; alprazolam possibly increases plasma concentration of HALOPERIDOL; buspirone increases plasma concentration of HALOPERIDOL; serious adverse events reported with concomitant use of benzodiazepines and CLOZAPINE (causality not established); plasma concentration of midazolam increased by LURASIDONE; increased risk of hypotension, bradycardia and respiratory depression when parenteral benzodiazepines given with intramuscular • OLANZAPINE
- Antivirals: plasma concentration of midazolam possibly increased by • ATAZANAVIR—avoid concomitant use of oral midazolam; plasma concentration of oral midazolam increased by • BOCEPREVIR—manufacturer of boceprevir advises avoid concomitant use; increased risk of prolonged sedation when midazolam given with • EFAVIRENZ-avoid concomitant use; plasma concentration of midazolam possibly increased by . FOSAMPRENAVIR, . INDINAVIR, • RITONAVIR and • TELAPREVIR (risk of prolonged sedationavoid concomitant use of oral midazolam); increased risk of prolonged sedation when alprazolam given with • INDINAVIR—avoid concomitant use; plasma concentration of anxiolytics and hypnotics possibly increased by • RITONAVIR; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by • RITONAVIR (risk of extreme sedation and respiratory depression-avoid concomitant use); plasma concentration of buspirone increased by RITONAVIR (increased risk of toxicity); plasma concentration of midazolam increased by . SAQUINAVIR (risk of prolonged sedation-avoid concomitant use of oral midazolam); plasma concentration of oral midazolam increased by SIMEPREVIR
- Aprepitant: plasma concentration of midazolam increased by APREPITANT (risk of prolonged sedation)
- Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with CALCIUM-CHANNEL BLOCKERS; midazolam increases absorption of LERCANIDIPINE; metabolism of midazolam inhibited by DILTIAZEM and VERAPAMIL (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by DILTIAZEM and VERAPAMIL (reduce dose of buspirone)
- Cardiac Glycosides: alprazolam increases plasma concentration of DIGOXIN (increased risk of toxicity)
- ► Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with CLONIDINE
- Cytotoxics: plasma concentration of midazolam increased by
 CRIZOTINIB and NILOTINIB; avoidance of oral midazolam advised by manufacturer of IDELALISIB
- Deferasirox: plasma concentration of midazolam possibly reduced by DEFERASIROX
- Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with DIAZOXIDE
- Disulfiram: metabolism of benzodiazepines inhibited by DISULFIRAM (increased sedative effects); increased risk of temazepam toxicity when given with DISULFIRAM
- Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with DIURETICS; administration of chloral with parenteral FUROSEMIDE may displace thyroid hormone from binding sites
- Dopaminergics: benzodiazepines possibly antagonise effects of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA
- ► Fosaprepitant: plasma concentration of midazolam increased by FOSAPREPITANT (risk of prolonged sedation)

Anxiolytics and Hypnotics (continued)

- Grapefruit Juice: plasma concentration of oral midazolam possibly increased by GRAPEFRUIT JUICE; plasma concentration of buspirone increased by GRAPEFRUIT JUICE
- Ivacaftor: plasma concentration of midazolam increased by IVACAFTOR
- Lipid-regulating Drugs: plasma concentration of midazolam possibly increased by ATORVASTATIN; separating administration from alprazolam by 12 hours advised by manufacturer of LOMITAPIDE
- Lithium: increased risk of neurotoxicity when clonazepam given with LITHIUM
- Lofexidine: increased sedative effect when anxiolytics and hypnotics given with LOFEXIDINE
- Methyldopa: enhanced hypotensive effect when anxiolytics and hypnotics given with METHYLDOPA
- Methylthioninium: possible risk of CNS toxicity when buspirone given with ● METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with MOXONIDINE; sedative effects possibly increased when benzodiazepines given with MOXONIDINE
- Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when anxiolytics and hypotics given with NITRATES
- Oestrogens: plasma concentration of melatonin increased by OESTROGENS; plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by OESTROGENS; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by OESTROGENS
- Progestogens: plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by PROGESTOGENS; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by PROGESTOGENS
 Sedium Ovebate, beneading prince subpage of Profest of a CODUM.
- Sodium Oxybate: benzodiazepines enhance effects of SODIUM OXYBATE (avoid concomitant use)
- ► Theophylline: effects of benzodiazepines possibly reduced by THEOPHYLLINE
- Ulcer-healing Drugs: plasma concentration of melatonin increased by CIMETIDINE; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by CIMETIDINE (increased plasma concentration); metabolism of diazepam possibly inhibited by ESOMEPRAZOLE and OMEPRAZOLE (increased plasma concentration)
- Vasodilator Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Apixaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous • DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
- KETOROLAC (avoid concomitant use, including low-dose heparins)
- Antibacterials: manufacturer of apixaban advises avoid concomitant use with CLARITHROMYCIN and TELITHROMYCIN; plasma concentration of apixaban possibly reduced by
 RIFAMPICIN—manufacturer of apixaban advises avoid
- concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism
- Anticoagulants: increased risk of haemorrhage when apixaban given with other ● ANTICOAGULANTS (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with
 - DABIGATRAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of apixaban possibly reduced by • ST JOHN'S WORT—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism

Apixaban (continued)

- Antiepileptics: plasma concentration of apixaban possibly reduced by • CARBAMAZEPINE—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; plasma concentration of apixaban possibly reduced by
 - FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and
 PRIMIDONE
- Antifungals: plasma concentration of apixaban increased by

 KETOCONAZOLE—manufacturer of apixaban advises avoid concomitant use; manufacturer of apixaban advises avoid concomitant use with ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE
- Antivirals: manufacturer of apixaban advises avoid concomitant use with ATAZANAVIR, BOCEPREVIR, DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR, TELAPREVIR and TIPRANAVIR
- Cobicistat: manufacturer of apixaban advises avoid concomitant use with COBICISTAT
- Sulfinpyrazone: increased risk of bleeding when apixaban given with SULFINPYRAZONE

Apomorphine

- Antipsychotics: effects of apomorphine antagonised by ANTIPSYCHOTICS
- Dopaminergics: effects of apomorphine possibly enhanced by ENTACAPONE
- 5HT₃-receptor Antagonists: possible increased hypotensive effect when apomorphine given with • ONDANSETRON—avoid concomitant use
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA

Apraclonidine

- Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIS, TRICYCLIC-RELATED ANTIDEPRESSANTS and TRICYCLICS
- Sympathomimetics: manufacturer of apraclonidine advises avoid concomitant use with SYMPATHOMIMETICS

Anrenitan

- Antibacterials: plasma concentration of aprepitant possibly increased by CLARITHROMYCIN and TELITHROMYCIN; plasma concentration of aprepitant reduced by RIFAMPICIN
- Anticoagulants: aprepitant possibly reduces anticoagulant effect of WARFARIN
- Antidepressants: manufacturer of aprepitant advises avoid concomitant use with ● ST JOHN'S WORT
- ► Antidiabetics: aprepitant reduces plasma concentration of
- Antiepileptics: plasma concentration of aprepitant possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of aprepitant increased by KETOCONAZOLE
- Antipsychotics: manufacturer of aprepitant advises avoid concomitant use with • PIMOZIDE
- Antivirals: plasma concentration of aprepitant possibly increased by RITONAVIR
- Anxiolytics and Hypnotics: aprepitant increases plasma concentration of MIDAZOLAM (risk of prolonged sedation)
- Avanafil: aprepitant possibly increases plasma concentration of AVANAFIL—see under Avanafil, p. 698
- ► Calcium-channel Blockers: plasma concentration of both drugs may increase when aprepitant given with DILTIAZEM
- Corticosteroids: aprepitant inhibits metabolism of DEXAMETHASONE and METHYLPREDNISOLONE (reduce dose of dexamethasone and methylprednisolone)
- Cytotoxics: aprepitant possibly increases the plasma concentration of • BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; aprepitant possibly increases the plasma concentration of • IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when aprepitant given with DAPOXETINE (see under Dapoxetine, p. 703)

Aprepitant (continued)

- Oestrogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing • OESTROGENS (alternative contraception recommended)
- Progestogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing • PROGESTOGENS (alternative contraception recommended)

Argatroban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous • DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with • KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● APIXABAN, ● DABIGATRAN and ● RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Aripiprazole see Antipsychotics

Arsenic Trioxide

- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with ◆ AMIODARONE or
- DISOPYRAMIDE
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with ● DELAMANID, ● ERYTHROMYCIN,
 LEVOFLOXACIN Or ● MOXIFLOXACIN
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with • AMITRIPTYLINE or • CLOMIPRAMINE
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with • AMPHOTERICIN
- Antimalarials: avoidance of arsenic trioxide advised by manufacturer of • ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with • ANTIPSYCHOTICS that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with • HALOPERIDOL; avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with ◆ SOTALOL
- Cytotoxics: possible increased risk of ventricular arrhythmias when arsenic trioxide given with • VANDETANIB—avoid concomitant use
- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by ◆ ACETAZOLAMIDE,
 LOOP DIURETICS OF ◆ THIAZIDES AND RELATED DIURETICS

Artemether with Lumefantrine

- Anti-arrhythmics: manufacturer of artemether with lumefantrine advises avoid concomitant use with
 AMIODARONE, • DISOPYRAMIDE and • FLECAINIDE (risk of ventricular arrhythmias)
- Antibacterials: manufacturer of artemether with lumefantrine advises avoid concomitant use with • MACROLIDES and
 QUINOLONES
- Antidepressants: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with
 CITALOPRAM or • ESCITALOPRAM—avoid concomitant use; manufacturer of artemether with lumefantrine advises avoid concomitant use with • ANTIDEPRESSANTS
- Antifungals: manufacturer of artemether with lumefantrine advises avoid concomitant use with • IMIDAZOLES and
- TPIAZOLES
- Antimalarials: manufacturer of artemether with lumefantrine advises avoid concomitant use with ANTIMALARIALS; increased risk of ventricular arrhythmias when artemether with lumefantrine given with QUININE
- Antivirals: manufacturer of artemether with lumefantrine advises caution with ATAZANAVIR, FOSAMPRENAVIR, INDINAVIR,

Artemether with Lumefantrine

- · Antivirals (continued)
 - LOPINAVIR, RITONAVIR, SAQUINAVIR and TIPRANAVIR; avoidance of artemether with lumefantrine advised by manufacturer of
 - BOCEPREVIR; plasma concentration of lumefantrine increased when artemether with lumefantrine given with DARUNAVIR; plasma concentration of artemether with lumefantrine reduced by EFAVIRENZ and ETRAVIRINE
- Cytotoxics: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with
 - VANDETANIB—avoid concomitant use
- ► Grapefruit Juice: plasma concentration of artemether with lumefantrine possibly increased by GRAPEFRUIT JUICE
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Ulcer-healing Drugs: manufacturer of artemether with lumefantrine advises avoid concomitant use with
 CIMETIDINE
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Artenimol with Piperaguine

- NOTE Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped
- Analgesics: manufacturer of artenimol with piperaquine advises avoid concomitant use with • METHADONE (possible risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of artenimol with piperaquine advises avoid concomitant use with • AMIODARONE and
 DISOPYRAMIDE (possible risk of ventricular arrhythmias)
- Antibacterials: manufacturer of artenimol with piperaquine advises avoid concomitant use with • MACROLIDES and
 MOXIFLOXACIN (possible risk of ventricular arrhythmias); manufacturer of artenimol with piperaquine advises avoid concomitant use with RIFAMPICIN
- Antidepressants: possible increased risk of ventricular arrhythmias when artenimol with piperaquine given with
- CITALOPRAM or ESCITALOPRAM—avoid concomitant use; manufacturer of artenimol with piperaquine advises avoid concomitant use with ANTIDEPRESSANTS
- Antiepileptics: manufacturer of artenimol with piperaquine advises avoid concomitant use with CARBAMAZEPINE,
 FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: manufacturer of artenimol with piperaquine advises avoid concomitant use with • IMIDAZOLES and
 TRIAZOLES (possible risk of ventricular arrhythmias)
- Antihistamines: manufacturer of artenimol with piperaquine advises avoid concomitant use with
 MIZOLASTINE (possible risk of ventricular arrhythmias)
- Antipsychotics: manufacturer of artenimol with piperaquine advises avoid concomitant use with • DROPERIDOL,
 - HALOPERIDOL, PHENOTHIAZINES and PIMOZIDE (possible risk of ventricular arrhythmias)
- Beta-blockers: manufacturer of artenimol with piperaquine advises avoid concomitant use with • SOTALOL (possible risk of ventricular arrhythmias)
- Cytotoxics: manufacturer of artenimol with piperaquine advises avoid concomitant use with • ARSENIC TRIOXIDE (possible risk of ventricular arrhythmias); manufacturer of artenimol with piperaquine advises avoid concomitant use with • VINBLASTINE, • VINCRISTINE, • VINFLUNINE and
- VINORELBINE
- Domperidone: manufacturer of artenimol with piperaquine advises avoid concomitant use with • DOMPERIDONE (possible risk of ventricular arrhythmias)
- ► Grapefruit Juice: manufacturer of artenimol with piperaquine advises avoid concomitant use with GRAPEFRUIT JUICE

Artenimol with Piperaguine (continued)

- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Pentamidine Isetionate: manufacturer of artenimol with piperaquine advises avoid concomitant use with
- PENTAMIDINE ISETIONATE (possible risk of ventricular arrhythmias)
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Ascorbic acid see Vitamins

Asenapine see Antipsychotics

Aspirin

- Adsorbents: absorption of aspirin possibly reduced by KAOLIN
- Anaesthetics, General: aspirin possibly enhances effects of THIOPENTAL
- Antacids: excretion of aspirin increased by alkaline urine due to some ANTACIDS
- Anticoagulants: increased risk of bleeding when aspirin given with • COUMARINS or • PHENINDIONE (due to antiplatelet effect); aspirin enhances anticoagulant effect of • HEPARINS
- Antidepressants: increased risk of bleeding when aspirin given with ● SSRIS or ● VENLAFAXINE
- Antiepileptics: aspirin enhances effects of FOSPHENYTOIN, PHENYTOIN, SODIUM VALPROATE and VALPROIC ACID
- Clopidogrel: increased risk of bleeding when aspirin given with CLOPIDOGREL
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with CORTICOSTEROIDS, also corticosteroids reduce plasma concentration of salicylate
- Cytotoxics: aspirin reduces excretion of METHOTREXATE (increased risk of toxicity); aspirin possibly reduces renal excretion of PEMETREXED—consult product literature
- ▶ lloprost: increased risk of bleeding when aspirin given with
- Leukotriene Receptor Antagonists: aspirin increases plasma concentration of ZAFIRLUKAST
- Metoclopramide: rate of absorption of aspirin increased by METOCLOPRAMIDE (enhanced effect)
- ► Sulfinpyrazone: aspirin antagonises effects of SULFINPYRAZONE

Atazanavir

- Antacids: absorption of atazanavir reduced by ANTACIDS (give at least 2 hours before or 1 hour after antacids)
- Anti-arrhythmics: atazanavir possibly increases plasma concentration of ● AMIODARONE and ● LIDOCAINE
- Antibacterials: plasma concentration of both drugs increased when atazanavir given with CLARITHROMYCIN; atazanavir increases plasma concentration of ●RIFABUTIN (reduce dose of rifabutin); plasma concentration of atazanavir reduced by
- RIFAMPICIN—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of TELITHROMYCIN
- Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of WARFARIN; avoidance of atazanavir advised by manufacturer of APIXABAN and RIVAROXABAN
- Antidepressants: plasma concentration of atazanavir reduced by ST JOHN'S WORT—avoid concomitant use
- Antifungals: plasma concentration of atazanavir increased by POSACONAZOLE; atazanavir increases or decreases the plasma concentration of ● VORICONAZOLE and plasma concentration of atazanavir also reduced
- Antimalarials: caution with atazanavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; atazanavir possibly increases plasma concentration of ● QUININE (increased risk of toxicity)
- Antimuscarinics: avoidance of atazanavir advised by manufacturer of DARIFENACIN; manufacturer of fesoterodine advises dose reduction when atazanavir given with FESOTERODINE—consult fesoterodine product literature

Atazanavir (continued)

- Antipsychotics: atazanavir possibly increases plasma concentration of ◆ARPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); atazanavir possibly increases plasma concentration of ◆PIMOZIDE—avoid concomitant use; atazanavir possibly increases plasma concentration of ◆QUETIAPINE manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of atazanavir reduced by
 BOCEPREVIR; atazanavir increases the plasma concentration of DACLATASVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); absorption of atazanavir reduced by DIDANOSINE tablets (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with EFAVIRENZ (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of ELVITEGRAVIR (reduce dose of elvitegravir); avoid concomitant use of atazanavir with INDINAVIR; atazanavir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by
 - NEVIRAPINE—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with
- SAQUINAVIR—avoid concomitant use; atazanavir possibly reduces plasma concentration of TELAPREVIR, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by TENOFOVIR, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of TIPRANAVIR (also plasma concentration of atazanavir reduced)
- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of • MIDAZOLAM—avoid concomitant use of *oral* midazolam
- Avanafil: atazanavir possibly increases plasma concentration of • AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: atazanavir increases plasma concentration of ● DILTIAZEM (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of VERAPAMIL
- Colchicine: atazanavir possibly increases risk of ◆ COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: atazanavir possibly increases plasma concentration of AXITINIB (reduce dose of axitinib—consult axitinib product literature); atazanavir possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of CRIZOTINIB and EVEROLIMUS—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); atazanavir possibly increases plasma concentration of PAZOPANIB (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of CABAZITAXEL; atazanavir possibly inhibits metabolism of IRINOTECAN (increased risk of toxicity)

 IRINOTECAN (increased risk of toxicity)
- Dapoxetine: avoidance of atazanavir advised by manufacturer of • DAPOXETINE (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ● ERGOT ALKALOIDS—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with ◆ ATORVASTATIN OF PRAVASTATIN; atazanavir increases plasma concentration of
 ROSUVASTATIN—adjust dose of rosuvastatin (consult product
- ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with • SIMVASTATIN (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of ETHINYLESTRADIOL
- Orlistat: absorption of atazanavir possibly reduced by
 ORLISTAT
- Progestogens: atazanavir increases plasma concentration of NORETHISTERONE

Atazanavir (continued)

- Ranolazine: atazanavir possibly increases plasma concentration of ● RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: atazanavir possibly increases side-effects of
 SILDENAFIL
- Sirolimus: atazanavir possibly increases plasma concentration of ● SIROLIMUS
- Tacrolimus: atazanavir possibly increases plasma concentration of ● TACROLIMUS
- Ticagrelor: atazanavir possibly increases plasma concentration of ● TICAGRELOR—manufacturer of ticagrelor advises avoid concomitant use
- Ulcer-healing Drugs: manufacturer of atazanavir advises adjust
 doses of both drugs when atazanavir given with CIMETIDINE
 and NIZATIDINE—consult atazanavir product literature;
 plasma concentration of atazanavir reduced by FAMOTIDINE
 and RANITIDINE (adjust doses of both drugs—consult
 atazanavir product literature); plasma concentration of
 atazanavir reduced by PROTON PUMP INHIBITORS—avoid or
 adjust dose of both drugs (consult product literature)

Atenolol see Beta-blockers

Atomoxetine

- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with • METHADONE; possible increased risk of convulsions when atomoxetine given with TRAMADOL
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with
 AMIODARONE or
 DISOPYRAMIDE
- Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with parenteral • ERYTHROMYCIN; increased risk of ventricular arrhythmias when atomoxetine given with • MOXIFLOXACIN
- Antidepressants: metabolism of atomoxetine possibly
 inhibited by FLUOXETINE and PAROXETINE; possible increased
 risk of convulsions when atomoxetine given with
 ANTIDEPRESSANTS; atomoxetine should not be started until 2
 weeks after stopping MAOIS, also MAOIs should not be
 started until at least 2 weeks after stopping atomoxetine;
 increased risk of ventricular arrhythmias when atomoxetine
 given with TRICYCLICS
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with • MEFLOQUINE
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with ● ANTIPSYCHOTICS that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with • SOTALOL
- Bupropion: possible increased risk of convulsions when atomoxetine given with BUPROPION
- Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by • DIURETICS
- ► Sympathomimetics, Beta₂: Increased risk of cardiovascular sideeffects when atomoxetine given with *parenteral* SALBUTAMOL

Atorvastatin see Statins

Atovaquone

- Antibacterials: manufacturer of atovaquone advises avoid concomitant use with RIFABUTIN (plasma concentration of both drugs reduced); plasma concentration of atovaquone reduced by • RIFAMPICIN (and concentration of rifampicin increased)—avoid concomitant use; plasma concentration of atovaquone reduced by TETRACYCLINE
- Antivirals: plasma concentration of atovaquone reduced by
 EFAVIRENZ—avoid concomitant use; atovaquone possibly reduces plasma concentration of INDINAVIR; plasma concentration of atovaquone possibly reduced by RITONAVIR—manufacturer of atovaquone advises avoid concomitant use; atovaquone increases plasma concentration of ZIDOVUDINE (increased risk of toxicity)
- Cytotoxics: atovaquone possibly increases plasma concentration of ETOPOSIDE
- ► Histamine: avoidance of atovaquone advised by manufacturer
- Metoclopramide: plasma concentration of atovaquone reduced by METOCLOPRAMIDE—avoid concomitant use

Atracurium see Muscle Relaxants Atropine see Antimuscarinics

Avanafil

- ACE Inhibitors: avanafil possibly enhances hypotensive effect of ENALAPRIL
- Alcohol: possible enhanced hypotensive effect when avanafil given with ALCOHOL
- Alpha-blockers: enhanced hypotensive effect when avanafil given with • ALPHA-BLOCKERS—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Antibacterials: plasma concentration of avanafil possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by
 - ERYTHROMYCIN—see under Avanafil, p. 698; plasma concentration of avanafil possibly reduced by RIFAMPICIN—manufacturer of avanafil advises avoid concomitant use
- Antiepileptics: plasma concentration of avanafil possibly reduced by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE manufacturer of avanafil advises avoid concomitant use
- · Antifungals: plasma concentration of avanafil increased by
 - KETOCONAZOLE—avoid concomitant use; plasma concentration of avanafil possibly increased by FLUCONAZOLE—see under Avanafil, p. 698; plasma concentration of avanafil possibly increased by
- ITRACONAZOLE and VORICONAZOLE—manufacturer of avanafil advises avoid concomitant use
- Antivirals: plasma concentration of avanafil possibly increased by ● ATAZAMAVIR, ● INDINAVIR and ● SAQUINAVIR—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly reduced by EFAVIRENZ manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by ● FOSAMPRENAVIR—see under Avanafil, p. 698; plasma concentration of avanafil significantly increased by ● RITONAVIR—avoid concomitant use
- Bosentan: plasma concentration of avanafil possibly reduced by BOSENTAN—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of avanafil possibly increased by ● DILTIAZEM and ● VERAPAMIL—see under Avanafil, p. 698
- Fosaprepitant: plasma concentration of avanafil possibly increased by FOSAPREPITANT
- Grapefruit Juice: plasma concentration of avanafil possibly increased by GRAPEFRUIT JUICE— manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Nicorandil: avanafil significantly enhances hypotensive effect of • NICORANDIL (avoid concomitant use)
- Nitrates: avanafil significantly enhances hypotensive effect of
 NITRATES (avoid concomitant use)
- Riociguat: possible enhanced hypotensive effect when avanafil given with • RIOCIGUAT—avoid concomitant use

Axitinib

- Antibacterials: plasma concentration of axitinib possibly increased by CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly decreased by RIFABUTIN (increase dose of axitinib—consult axitinib product literature); plasma concentration of axitinib decreased by RIFAMPICIN (increase dose of axitinib—consult axitinib product literature)
- Antidepressants: plasma concentration of axitinib possibly reduced by ST JOHN'S WORT—consider increasing dose of axitinib
- Antiepileptics: plasma concentration of axitinib possibly decreased by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (increase dose of axitinib—consult axitinib product literature)
- Antifungals: plasma concentration of axitinib increased by KETOCONAZOLE (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly

Avitinih

Antifungals (continued)

increased by ITRACONAZOLE (reduce dose of axitinib—consult axitinib product literature)

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of axitinib possibly increased by ATAZANAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR (reduce dose of axitinib—consult axitinib product literature)
- Corticosteroids: plasma concentration of axitinib possibly decreased by DEXAMETHASONE (increase dose of axitinib consult axitinib product literature)
- Grapefruit Juice: plasma concentration of axitinib possibly increased by GRAPEFRUIT JUICE

Azathioprine

- ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with CAPTOPRIL especially in renal impairment; increased risk of anaemia when azathioprine given with ENALAPRIL especially in renal impairment
- Antibacterials: increased risk of haematological toxicity when azathioprine given with • SULFAMETHOXAZOLE (as cotrimoxazole); increased risk of haematological toxicity when azathioprine given with • TRIMETHOPRIM (also with cotrimoxazole)
- Anticoagulants: azathioprine possibly reduces anticoagulant effect of ● COUMARINS
- Antivirals: myelosuppressive effects of azathioprine possibly enhanced by ● RIBAVIRIN
- Febuxostat: avoidance of azathioprine advised by manufacturer of • FEBUXOSTAT

Azelastine see Antihistamines

Azilsartan *see* Angiotensin-II Receptor Antagonists **Azithromycin** *see* Macrolides

Aztreonam

- Anticoagulants: aztreonam possibly enhances anticoagulant effect of • COUMARINS
- ► Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Baclofen see Muscle Relaxants

Bambuterol see Sympathomimetics, Beta2

Basiliximab

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use
 BCG Vaccine see Vaccines

Beclometasone see Corticosteroids

Bedaquiline

- Antibacterials: plasma concentration of bedaquiline possibly increased by CIPROFLOXACIN, CLARITHROMYCIN and ERYTHROMYCIN—avoid concomitant use if ciprofloxacin, clarithromycin and erythromycin given for more than 14 days; manufacturer of bedaquiline advises avoid concomitant use with MOXIFLOXACIN; plasma concentration of bedaquiline possibly reduced by RIFABUTIN—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline reduced by RIFAMPICIN—manufacturer of bedaquiline advises avoid concomitant use; possible increased risk of ventricular arrhythmias when bedaquiline given with CLOFAZIMINE
- Antidepressants: plasma concentration of bedaquiline possibly reduced by ST JOHN'S WORT—manufacturer of bedaquiline advises avoid concomitant use
- Antiepileptics: plasma concentration of bedaquiline possibly reduced by ● CARBAMAZEPINE, ● FOSPHENYTOIN and
- PHENYTOIN—manufacturer of bedaquiline advises avoid concomitant use
- Antifungals: plasma concentration of bedaquiline increased by KETOCONAZOLE—avoid concomitant use if ketoconazole given for more than 14 days; plasma concentration of bedaquiline possibly increased by FLUCONAZOLE—avoid concomitant use if fluconazole given for more than 14 days

Bedaquiline (continued)

- Antivirals: plasma concentration of bedaquiline possibly reduced by EFAVIRENZ and ETRAVIRINE—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline possibly increased by RITONAVIR—avoid concomitant use if ritonavir given for more than 14 days
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Bee Venom Extracts

 ACE Inhibitors: possible severe anaphylactoid reaction when bee venom extracts given with ● ACE INHIBITORS

Belimuma

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

 Rendamistine
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)

Bendroflumethiazide see Diuretics

Benperidol see Antipsychotics

Benzodiazepines see Anxiolytics and Hypnotics

Benzthiazide see Diuretics
Benzylpenicillin see Penicillins

Beta-blockers

NOTE Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind

- ► ACE Inhibitors: enhanced hypotensive effect when betablockers given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when beta-blockers given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when beta-blockers given with ALDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when betablockers given with • ALPHA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Anaesthétics, General: enhanced hypotensive effect when betablockers given with GENERAL ANAESTHETICS
- Anaesthetics, Local: propranolol increases risk of BUPIVACAINE toxicity
- Analgesics: hypotensive effect of beta-blockers antagonised by NSAIDs; plasma concentration of esmolol possibly increased by MORPHINE
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: increased myocardial depression when betablockers given with • ANTI-ARRHYTHMICS; increased risk of ventricular arrhythmias when sotalol given with
- AMIODARONE, DISOPVRAMIDE OF DRONEDARONE—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with
- AMIODARONE; plasma concentration of metoprolol and propranolol possibly increased by DRONEDARONE; increased risk of myocardial depression and bradycardia when betablockers given with FLECAINIDE; propranolol increases risk of LIDOCAINE toxicity; nadolol possibly increases risk of LIDOCAINE toxicity; plasma concentration of metoprolol and propranolol increased by PROPAFENONE
- Antibacterials: increased risk of ventricular arrhythmias when sotalol given with MOXIFLOXACIN—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by RIFAMPICIN (plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by RIFAMPICIN; plasma concentration of oral timolol possibly reduced by RIFAMPICIN; increased risk of ventricular arrhythmias when sotalol given with DELAMANID
- Antidepressants: plasma concentration of metoprolol increased by CITALOPRAM and ESCITALOPRAM; increased risk of

Beta-blockers

- Antidepressants (continued)
 - ventricular arrhythmias when sotalol given with
 - CITALOPRAM—avoid concomitant use; avoidance of sotalol advised by manufacturer of ESCITALOPRAM (risk of ventricular arrhythmias); plasma concentration of propranolol increased by FLUVOXAMINE; plasma concentration of metoprolol possibly increased by PAROXETINE—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); labetalol and propranolol increase plasma concentration of IMIPRAMINE; enhanced hypotensive effect when beta-blockers given with MAOIs; increased risk of ventricular arrhythmias when sotalol given with TRICYCLICS
- Antidiabetics: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with ANTIDIABETICS; betablockers enhance hypoglycaemic effect of INSULIN
- Antiepileptics: plasma concentration of propranolol possibly reduced by PHENOBARBITAL and PRIMIDONE
- Antifungals: plasma concentration of nadolol possibly increased by KETOCONAZOLE
- Antihistamines: increased risk of ventricular arrhythmias when sotalol given with • MIZOLASTINE—avoid concomitant use
- Antimalarials: avoidance of metoprolol and sotalol advised by manufacturer of ● ARTEMETHER WITH LUMEFANTRINE; avoidance of sotalol advised by manufacturer of ● ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias); increased risk of bradycardia when beta-blockers given with MEFLOQUINE
- Antimuscarinics: increased risk of ventricular arrhythmias when sotalol given with • TOLTERODINE
- Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with ● DROPERIDOL or ● ZUCLOPENTHIXOL—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with ● HALOPERIDOL—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with ● CHLORPROMAZINE; increased risk of ventricular arrhythmias when sotalol given with ● AMISULPRIDE, ● PHENOTHIAZINES, ● PIMOZIDE or
 - SULPIRIDE; enhanced hypotensive effect when beta-blockers given with PHENOTHIAZINES; possible increased risk of ventricular arrhythmias when sotalol given with
 - RISPERIDONE
- Antivirals: increased risk of ventricular arrhythmias when sotalol given with ◆SAQUINAVIR—avoid concomitant use; avoidance of sotalol advised by manufacturer of ◆TELAPREVIR (risk of ventricular arrhythmias); avoidance of metoprolol for heart failure advised by manufacturer of ◆TIPRAMAVIR
- Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with ANXIOLYTICS AND HYPNOTICS
- Atomoxetine: increased risk of ventricular arrhythmias when sotalol given with • ATOMOXETINE
- Calcium-channel Blockers: enhanced hypotensive effect when
 beta-blockers given with CALCIUM-CHANNEL BLOCKERS; possible
 severe hypotension and heart failure when beta-blockers
 given with ONIFEDIPINE; increased risk of AV block and
 bradycardia when beta-blockers given with ODILTIAZEM;
 asystole, severe hypotension and heart failure when betablockers given with OVERAPAMIL (see under Verapamil,
 p. 156)
- ► Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with CARDIAC GLYCOSIDES
- Ciclosporin: carvedilol increases plasma concentration of
 CICLOSPORIN
- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with

 CLONIDINE (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Corticosteroids: hypotensive effect of beta-blockers antagonised by CORTICOSTEROIDS
- Cytotoxics: possible increased risk of ventricular arrhythmias when sotalol given with Deboutines; possible increased risk of bradycardia when beta-blockers given with CRIZOTINIB; possible increased risk of ventricular arrhythmias when sotalol given with ONDETANIB—avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with ORDETANIE TRIOXIDE

Beta-blockers (continued)

- Diazoxide: enhanced hypotensive effect when beta-blockers given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when beta-blockers given with DIURETICS; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by ◆LOOP DIURETICS or ◆THIAZIDES AND RELATED DIURETICS
- Dopaminergics: enhanced hypotensive effect when betablockers given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Frgot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with ERGOTAMINE
- Fingolimod: possible increased risk of bradycardia when betablockers given with • FINGOLIMOD
- Hormone Antagonists: possible increased risk of bradycardia when carteolol, metoprolol, propranolol or sotalol given with PASIREOTIDE
- 5HT₁-receptor Agonists: propranolol increases plasma concentration of RIZATRIPTAN (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Ivabradine: increased risk of ventricular arrhythmias when sotalol given with ●IVABRADINE
- Methyldopa: enhanced hypotensive effect when beta-blockers given with METHYLDOPA
- Mirabegron: plasma concentration of metoprolol increased by MIRABEGRON
- Moxisylyte: possible severe postural hypotension when betablockers given with • MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when beta-blockers given with MOXONIDINE
- Muscle Relaxants: propranolol enhances effects of MUSCLE RELAXANTS; enhanced hypotensive effect when beta-blockers given with BACLOFEN; possible enhanced hypotensive effect and bradycardia when beta-blockers given with TIZANIDINE
- Nitrates: enhanced hypotensive effect when beta-blockers given with NITRATES
- Oestrogens: hypotensive effect of beta-blockers antagonised by OESTROGENS
- Parasympathomimetics: propranolol antagonises effects of NEOSTIGMINE and PYRIDOSTIGMINE; increased risk of arrhythmias when beta-blockers given with PILOCARPINE
- Prostaglandins: enhanced hypotensive effect when betablockers given with ALPROSTADIL
- Ranolazine: avoidance of sotalol advised by manufacturer of
 RANOLAZINE
- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with ADRENALINE (EPINEPHRINE), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with DOBUTAMINE; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with NORADRENALINE (NOREPINEPHRINE)
- ► Thyroid Hormones: metabolism of propranolol accelerated by LEVOTHYROXINE
- Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by CIMETIDINE; plasma
- concentration of *oral* timolol possibly increased by CIMETIDINE

 Vasodilator Antihypertensives: enhanced hypotensive effect
- when beta-blockers given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Betahistine

 Antihistamines: effect of betahistine theoretically antagonised by ANTIHISTAMINES

Betamethasone see Corticosteroids

Betaxolol see Beta-blockers

Bethanechol see Parasympathomimetics

Bevacizumab

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Bexarotene

- \bullet Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)

Bexarotene (continued)

 Lipid-regulating Drugs: plasma concentration of bexarotene increased by • GEMFIBROZIL—avoid concomitant use

Bezafibrate see Fibrates

Bicalutamide

- Anticoagulants: bicalutamide possibly enhances anticoagulant effect of COUMARINS
- Lipid-regulating Drugs: separating administration from bicalutamide by 12 hours advised by manufacturer of LOMITAPIDE

Biguanides see Antidiabetics

Bilastine see Antihistamines

Bile Acid Sequestrants *see* Colesevelam, Colestipol, and Colestyramine

Bile Acids

- Antacids: absorption of bile acids possibly reduced by ANTACIDS
- Ciclosporin: ursodeoxycholic acid increases absorption of
 CICLOSPORIN
- ► Lipid-regulating Drugs: absorption of bile acids possibly reduced by COLESTIPOL and COLESTYRAMINE

Bisoprolol see Beta-blockers

Bisphosphonates

- ▶ Antacids: absorption of bisphosphonates reduced by ANTACIDS
- Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with AMINOGLYCOSIDES
- Calcium Salts: absorption of bisphosphonates reduced by CALCIUM SALTS
- Cytotoxics: sodium clodronate increases plasma concentration of ● ESTRAMUSTINE
- Iron Salts: absorption of bisphosphonates reduced by oral IRON SALTS

Bivalirudin

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous • DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
- KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with • APIXABAN, • DABIGATRAN and
- RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Bleomycin

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: bleomycin possibly reduces absorption of DIGOXIN tablets
- Cytotoxics: increased risk of pulmonary toxicity when bleomycin given with BRENTUXIMAB VEDOTIN—avoid concomitant use; increased pulmonary toxicity when bleomycin given with CISPLATIN

Boceprevir

- Alpha-blockers: boceprevir possibly increases plasma concentration of DOXAZOSIN and TAMSULOSIN—manufacturer of boceprevir advises avoid concomitant use
- Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with BUPRENORPHINE; boceprevir possibly affects plasma concentration of METHADONE
- Antibacterials: manufacturer of boceprevir advises avoid concomitant use with

 RIFAMPICIN (plasma concentration of boceprevir possibly reduced)
- Anticoagulants: avoidance of boceprevir advised by manufacturer of APIXABAN
- Antiepileptics: manufacturer of boceprevir advises avoid concomitant use with • CARBAMAZEPINE, • FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE (plasma concentration of boceprevir possibly reduced)
- Antifungals: plasma concentration of boceprevir increased by
 KETOCONAZOLE
- Antimalarials: manufacturer of boceprevir advises avoid concomitant use with • ARTEMETHER WITH LUMEFANTRINE

Boceprevir (continued)

- Antipsychotics: boceprevir possibly increases plasma concentration of ●LURASIDONE—avoid concomitant use; manufacturer of boceprevir advises avoid concomitant use with ●PIMOZIDE; boceprevir possibly increases plasma concentration of ●QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: boceprevir reduces plasma concentration of
 ATAZANAVIR; boceprevir possibly increases the plasma concentration of DACLATASVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); avoid concomitant use of boceprevir with DARUNAVIR; effects of both drugs possibly reduced when boceprevir given with ETRAVIRINE; avoidance of boceprevir advised by manufacturer of FOSAMPRENAVIR, NEVIRAPINE and TIPRAMAVIR; manufacturers advise avoid concomitant use of boceprevir with LOPINAVIR; boceprevir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with RITOMAVIR
- Anxiolytics and Hypnotics: boceprevir increases plasma concentration of oral • MIDAZOLAM—manufacturer of boceprevir advises avoid concomitant use
- Cardiac Glycosides: boceprevir possibly increases side-effects of DIGOXIN
- Ciclosporin: boceprevir increases plasma concentration of
 CICLOSPORIN
- Cilostazol: boceprevir possibly increases plasma concentration of • CILOSTAZOL (see under Cilostazol, p. 206)
- Cobicistat: avoidance of boceprevir advised by manufacturer of COBICISTAT
- Cytotoxics: boceprevir possibly increases the plasma concentration of ●BOSUTINB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of boceprevir advises avoid concomitant use with ●DASATINIB, ● ERLOTINIB, ● GEFITINIB, ● IMATINIB,
 - with DASATINIB, ERLOTINIB, GEFITINIB, IMATINIB, ■ LAPATINIB, ● NILOTINIB, ● PAZOPANIB, ● SORAFENIB and
- SUNITINIB; manufacturer of ruxolitinib advises dose reduction when boceprevir given with RUXOLITINIB—consult ruxolitinib product literature
- Domperidone: possible increased risk of ventricular arrhythmias when boceprevir given with • DOMPERIDONE avoid concomitant use
- Ergot Alkaloids: manufacturer of boceprevir advises avoid concomitant use with • ERGOT ALKALOIDS
- Lipid-regulating Drugs: boceprevir increases plasma concentration of ATORVASTATIN (reduce dose of atorvastatin); boceprevir increases plasma concentration of PRAVASTATIN; manufacturers advise avoid concomitant use of boceprevir with • SIMVASTATIN
- Progestogens: boceprevir increases plasma concentration of DROSPIRENONE (increased risk of toxicity)
- Sirolimus: boceprevir increases plasma concentration of
 SIROLIMUS (increased risk of toxicity—reduce sirolimus dose)
- Tacrolimus: boceprevir increases plasma concentration of
 TACROLIMUS (reduce dose of tacrolimus)

Bortezomib

- Antibacterials: plasma concentration of bortezomib reduced by
 RIFAMPICIN—manufacturer of bortezomib advises avoid concomitant use
- Antidepressants: plasma concentration of bortezomib possibly reduced by ST JOHN'S WORT—manufacturer of bortezomib advises avoid concomitant use
- Antiepileptics: plasma concentration of bortezomib possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of bortezomib advises avoid concomitant use
- Antifungals: plasma concentration of bortezomib increased by KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)

Bosentan

- Antibacterials: plasma concentration of bosentan reduced by
- RIFAMPICIN—avoid concomitant use
- Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of COUMARINS

Bosentan (continued)

- Antidiabetics: increased risk of hepatotoxicity when bosentan given with • GLIBENCLAMIDE—avoid concomitant use
- · Antifungals: plasma concentration of bosentan increased by KETOCONAZOLE; plasma concentration of bosentan possibly increased by • FLUCONAZOLE—avoid concomitant use; plasma concentration of bosentan possibly increased by ITRACONAZOLE
- · Antivirals: avoidance of bosentan advised by manufacturer of ELVITEGRAVIR and TIPRANAVIR; bosentan possibly reduces plasma concentration of INDINAVIR; plasma concentration of bosentan increased by • LOPINAVIR and • RITONAVIR (consider reducing dose of bosentan); bosentan possibly reduces plasma concentration of TELAPREVIR, also plasma concentration of bosentan possibly increased
- Avanafil: bosentan possibly reduces plasma concentration of AVANAFIL-manufacturer of avanafil advises avoid concomitant use
- Ciclosporin: plasma concentration of bosentan increased by • CICLOSPORIN (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- ▶ Cobicistat: avoidance of bosentan advised by manufacturer of
- Cytotoxics: bosentan possibly reduces plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid concomitant use
- ▶ Lipid-regulating Drugs: bosentan reduces plasma concentration of SIMVASTATIN
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing • OESTROGENS (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing • PROGESTOGENS (alternative contraception recommended)
- ▶ Riociguat: bosentan reduces plasma concentration of RIOCIGIIAT
- Sildenafil: bosentan reduces plasma concentration of SILDENAFIL, also plasma concentration of bosentan increased ▶ Tadalafil: bosentan reduces plasma concentration of TADALAFIL

- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with • METHADONE
- Antacids: manufacturer of bosutinib advises separating administration with ANTACIDS by about 12 hours
- · Anti-arrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with • AMIODARONE and DISOPYRAMIDE; plasma concentration of bosutinib possibly increased by • DRONEDARONE—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- · Antibacterials: plasma concentration of bosutinib possibly increased by • CIPROFLOXACIN, • CLARITHROMYCIN, • ERYTHROMYCIN and • TELITHROMYCIN—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with . MOXIFLOXACIN; plasma concentration of bosutinib possibly reduced by • RIFABUTINmanufacturer of bosutinib advises avoid concomitant use; plasma concentration of bosutinib reduced by • RIFAMPICIN manufacturer of bosutinib advises avoid concomitant use
- · Antidepressants: plasma concentration of bosutinib possibly reduced by • ST JOHN'S WORT—manufacturer of bosutinib advises avoid concomitant use
- · Antiepileptics: plasma concentration of bosutinib possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE manufacturer of bosutinib advises avoid concomitant use
- · Antifungals: plasma concentration of bosutinib increased by KETOCONAZOLE—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly increased by • FLUCONAZOLE,
- ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antimalarials: possible increased risk of ventricular arrhythmias when bosutinib given with . CHLOROQUINE and HYDROXYCHLOROOUINE

Bosutinib (continued)

- Antipsychotics: possible increased risk of ventricular arrhythmias when bosutinib given with • HALOPERIDOL; avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of bosutinib possibly increased by • ATAZANAVIR, • BOCEPREVIR, • DARUNAVIR,
- FOSAMPRENAVIR, INDINAVIR, RITONAVIR, SAQUINAVIR and
- TELAPREVIR-manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly reduced by • EFAVIRENZ and • ETRAVIRINE manufacturer of bosutinib advises avoid concomitant use
- Aprepitant: plasma concentration of bosutinib possibly increased by • APREPITANT-manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Beta-blockers: possible increased risk of ventricular arrhythmias when bosutinib given with . SOTALOL
- Bosentan: plasma concentration of bosutinib possibly reduced by • BOSENTAN—manufacturer of bosutinib advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by ● DILTIAZEM and ● VERAPAMILmanufacturer of bosutinib advises avoid or consider reducing dose of hosutinib
- Cytotoxics: plasma concentration of bosutinib possibly increased by • IMATINIB-manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Domperidone: manufacturer of bosutinib advises avoid concomitant use with • DOMPERIDONE (risk of ventricular arrhythmias)
- Fosaprepitant: plasma concentration of bosutinib possibly increased by • FOSAPREPITANT—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Grapefruit Juice: plasma concentration of bosutinib possibly increased by • GRAPEFRUIT JUICE—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Modafinil: plasma concentration of bosutinib possibly reduced by • MODAFINIL—manufacturer of bosutinib advises avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of bosutinib reduced by LANSOPRAZOLE

Brentuximab vedotin

- > Antibacterials: effects of brentuximab vedotin possibly reduced by RIFAMPICIN
- · Antifungals: possible increased risk of neutropenia when brentuximab vedotin given with • KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: increased risk of pulmonary toxicity when brentuximab vedotin given with • BLEOMYCIN—avoid concomitant use
- · Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use **Brimonidine**

> Antidepressants: manufacturer of brimonidine advises avoid concomitant use with MAOIS, TRICYCLIC-RELATED ANTIDEPRESSANTS and TRICYCLICS

Brinzolamide see Diuretics

Bromocriptine

- ► Alcohol: tolerance of bromocriptine reduced by ALCOHOL
- Antibacterials: plasma concentration of bromocriptine increased by ERYTHROMYCIN (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by MACROLIDES (increased risk of toxicity)
- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of bromocriptine antagonised by ANTIPSYCHOTICS
- Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by DOMPERIDONE
- Hormone Antagonists: plasma concentration of bromocriptine increased by OCTREOTIDE
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by METOCLOPRAMIDE

Bromocriptine (continued)

• Sympathomimetics: risk of toxicity when bromocriptine given with • ISOMETHEPTENE

Buclizine see Antihistamines Budesonide see Corticosteroids Bumetanide see Diuretics

Bupivacaine

- Anti-arrhythmics: increased myocardial depression when bupivacaine given with ANTI-ARRHYTHMICS
- Beta-blockers: increased risk of bupiyacaine toxicity when given with • PROPRANOLOL

Buprenorphine see Opioid Analgesics

Bupropion

- · Antidepressants: bupropion possibly increases plasma concentration of CITALOPRAM; manufacturer of bupropion advises avoid for 2 weeks after stopping • MAOIS; manufacturer of bupropion advises avoid concomitant use with • MOCLOBEMIDE; bupropion possibly increases plasma concentration of TRICYCLICS (possible increased risk of convulsions)
- Antiepileptics: plasma concentration of bupropion reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN; metabolism of bupropion inhibited by SODIUM VALPROATE and VALPROIC ACID
- Antivirals: metabolism of bupropion accelerated by EFAVIRENZ (reduced plasma concentration); plasma concentration of bupropion reduced by RITONAVIR
- Atomoxetine: possible increased risk of convulsions when bupropion given with ATOMOXETINE
- Dopaminergics: increased risk of side-effects when bupropion given with AMANTADINE, CO-BENELDOPA, CO-CARELDOPA or
- Hormone Antagonists: bupropion possibly inhibits metabolism of • TAMOXIFEN to active metabolite (avoid concomitant use)
- · Methylthioninium: possible risk of CNS toxicity when bupropion given with • METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Buspirone see Anxiolytics and Hypnotics Busulfan

- Analgesics: metabolism of intravenous busulfan possibly inhibited by PARACETAMOL (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol)
- Antibacterials: plasma concentration of busulfan increased by
- METRONIDAZOLE (increased risk of toxicity)
- Antiepileptics: plasma concentration of busulfan possibly reduced by FOSPHENYTOIN and PHENYTOIN
- Antifungals: metabolism of busulfan inhibited by ITRACONAZOLE (increased risk of toxicity)
- · Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when busulfan given with TIOGUANINE

Butyrophenones see Antipsychotics

Cabazitaxel

- · Antibacterials: plasma concentration of cabazitaxel possibly increased by • CLARITHROMYCIN and • TELITHROMYCINmanufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises avoid concomitant use with • RIFABUTIN: plasma concentration of cabazitaxel reduced by • RIFAMPICINmanufacturer of cabazitaxel advises avoid concomitant use
- Antidepressants: manufacturer of cabazitaxel advises avoid concomitant use with . ST JOHN'S WORT
- Antiepileptics: manufacturer of cabazitaxel advises avoid concomitant use with • CARBAMAZEPINE, • FOSPHENYTOIN, • PHENOBARBITAL, • PHENYTOIN and • PRIMIDONE
- · Antifungals: manufacturer of cabazitaxel advises avoid concomitant use with • KETOCONAZOLE; plasma concentration of cabazitaxel possibly increased by • ITRACONAZOLE and
 - VORICONAZOLE—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel
- · Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)

Cabazitaxel (continued)

· Antivirals: manufacturer of cabazitaxel advises avoid concomitant use with • ATAZANAVIR; plasma concentration of cabazitaxel possibly increased by • INDINAVIR, • RITONAVIR and SAOUINAVIR—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel

Cabergoline

- Antibacterials: plasma concentration of cabergoline increased by ERYTHROMYCIN (increased risk of toxicity); plasma concentration of cabergoline possibly increased by MACROLIDES (increased risk of toxicity)
- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of cabergoline antagonised by ANTIPSYCHOTICS
- Domperidone: hypoprolactinaemic effect of cabergoline possibly antagonised by DOMPERIDONE
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by METOCLOPRAMIDE

Cabozantinib

- Antibacterials: plasma concentration of cabozantinib possibly increased by CLARITHROMYCIN and ERYTHROMYCIN; plasma concentration of cabozantinib reduced by • RIFAMPICINavoid concomitant use
- Antidepressants: plasma concentration of cabozantinib possibly reduced by ST JOHN'S WORT—manufacturer of cabozantinib advises avoid concomitant use
- Antiepileptics: plasma concentration of cabozantinib possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE—avoid concomitant use
- Antifungals: plasma concentration of cabozantinib increased by KETOCONAZOLE; plasma concentration of cabozantinib possibly increased by ITRACONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of cabozantinib possibly increased by RITONAVIR
- Corticosteroids: plasma concentration of cabozantinib possibly reduced by DEXAMETHASONE—manufacturer of cabozantinib advises avoid concomitant use
- Grapefruit Juice: plasma concentration of cabozantinib possibly increased by GRAPEFRUIT JUICE

Caffeine citrate

- Aminophylline: manufacturer of caffeine citrate advises avoid concomitant use with AMINOPHYLLINE
- Anti-arrhythmics: caffeine citrate antagonises anti-arrhythmic effect of ADENOSINE—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
- Antiepileptics: plasma concentration of caffeine citrate reduced by FOSPHENYTOIN and PHENYTOIN; caffeine citrate possibly antagonises effects of PHENOBARBITAL and PRIMIDONE
- ▶ Theophylline: manufacturer of caffeine citrate advises avoid concomitant use with THEOPHYLLINE
- Ulcer-healing Drugs: plasma concentration of caffeine citrate increased by CIMETIDINE

Calcitriol see Vitamins

Calcium Salts

NOTE see also Antacids

- Antibacterials: calcium salts reduce absorption of CIPROFLOXACIN and TETRACYCLINE
- ▶ Antivirals: calcium salts reduce absorption of DOLUTEGRAVIR manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts; manufacturer of rilpivirine advises give calcium salts 2 hours before or 4 hours after BIL PIVIRINE
- Bisphosphonates: calcium salts reduce absorption of BISPHOSPHONATES
- ▶ Cardiac Glycosides: large intravenous doses of calcium salts can precipitate arrhythmias when given with CARDIAC GLYCOSIDES
- Corticosteroids: absorption of calcium salts reduced by CORTICOSTEROIDS

Calcium Salts (continued)

- Cytotoxics: calcium salts reduce absorption of ESTRAMUSTINE (manufacturer of estramustine advises avoid concomitant administration)
- Diuretics: increased risk of hypercalcaemia when calcium salts given with THIAZIDES AND RELATED DIURETICS
- Eltrombopag: calcium salts possibly reduce absorption of ELTROMBOPAG (give at least 4 hours apart)
- ▶ Fluorides: calcium salts reduce absorption of FLUORIDES
- ▶ Iron Salts: calcium salts reduce absorption of oral IRON SALTS
- Thyroid Hormones: calcium salts reduce absorption of LEVOTHYROXINE
- ▶ Zinc: calcium salts reduce absorption of ZINC

Calcium-channel Blockers

- NOTE Dihydropyridine calcium-channel blockers include amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine
- ACE Inhibitors: enhanced hypotensive effect when calciumchannel blockers given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when calcium-channel blockers given with ALCOHOL; verapamil possibly increases plasma concentration of ALCOHOL
- Aldesleukin: enhanced hypotensive effect when calciumchannel blockers given with ALDESLEUKIN
- Aliskiren: verapamil increases plasma concentration of ALISKIREN
- Alpha-blockers: verapamil increases plasma concentration of TAMSULOSIN; enhanced hypotensive effect when calciumchannel blockers given with • ALPHA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alphablockers such as prazosin
- Aminophylline: calcium-channel blockers possibly increase plasma concentration of

 AMINOPHYLLINE (enhanced effect);
 diltiazem increases plasma concentration of AMINOPHYLLINE;
 verapamil increases plasma concentration of
 AMINOPHYLLINE (enhanced effect)
- Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with GENERAL ANAESTHETICS or ISOFLURANE; hypotensive effect of verapamil enhanced by
 GENERAL ANAESTHETICS (also AV delay)
- Analgesics: hypotensive effect of calcium-channel blockers antagonised by NSAIDs; diltiazem inhibits metabolism of ALFENTANIL (risk of prolonged or delayed respiratory depression)
- ► Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with AMIODARONE; increased risk of myocardial depression and asystole when verapamil given with DISOPYRAMIDE or FLECAINIDE; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with
- DRONEDARONE; nifedipine increases plasma concentration of
 DRONEDARONE
- Antibacterials: metabolism of calcium-channel blockers possibly inhibited by CLARITHROW/CIN, ERYTHROM/CIN and TELITHROM/CIN (increased risk of side-effects); manufacturer of lercanidipine advises avoid concomitant use with ERYTHROM/CIN; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by RIFAMPICIN (plasma concentration significantly reduced); metabolism of isradipine and nicardipine possibly accelerated by
 - RIFAMPICIN (possible significantly reduced plasma concentration); plasma concentration of felodipine possibly reduced by RIFAMPICIN; avoidance of verapamil advised by manufacturer of FIDAXOMICIN
- Anticoagulants: verapamil possibly increases plasma concentration of ● DABIGATRAN (see under Dabigatran Etexilate, p. 117)
- Antidepressants: metabolism of nifedipine possibly inhibited by FLUOXETINE (increased plasma concentration); diltiazem and verapamil increase plasma concentration of IMIPRAMINE;

Calcium-channel Blockers

- Antidepressants (continued)
 enhanced hypotensive effect when calcium-channel blockers
 given with MADIS; plasma concentration of nifedipine reduced
 by St JOHN'S WORT; plasma concentration of amlodipine and
 - by ST JOHN'S WORT; plasma concentration of amlodipine and felodipine possibly reduced by ST JOHN'S WORT; plasma concentration of verapamil significantly reduced by ST JOHN'S WORT; diltiazem and verapamil possibly increase plasma concentration of TRICYCLICS
 - Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with INSULIN
- Antiepileptics: effects of dihydropyridines, nicardipine and nifedipine probably reduced by CARBAMAZEPINE; effects of felodipine and isradipine reduced by CARBAMAZEPINE; diltiazem and verapamil enhance effects of CARBAMAZEPINE; diltiazem and verapamil enhance effects of CARBAMAZEPINE; manufacturer of nimodipine advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN (plasma concentration of nimodipine possibly reduced); effects of felodipine and verapamil reduced by FOSPHENYTOIN; manufacturer of isradipine advises avoid concomitant use with FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE; diltiazem increases plasma concentration of FOSPHENYTOIN and PHENYTOIN but also effect of diltiazem reduced; effects of calcium-channel blockers probably
 - reduced; effects of calcium-channel blockers probably reduced by PHENOBARBITAL and PRIMIDONE; manufacturer of nimodipine advises avoid concomitant use with
- PHENOBARBITAL and PRIMIDONE (plasma concentration of nimodipine reduced); effects of felodipine and verapamil reduced by PHENYTOIN
- Antifungals: metabolism of dihydropyridines possibly
 inhibited by ITRACONAZOLE and KETOCONAZOLE (increased
 plasma concentration); metabolism of felodipine is inhibited
 by
 KETOCONAZOLE (increased plasma concentration)—
 manufacturer of ketoconazole advises avoid concomitant
 use; manufacturer of lercanidipine advises avoid concomitant
 use with ITRACONAZOLE and KETOCONAZOLE; negative inotropic
 effect possibly increased when calcium-channel blockers
 given with ITRACONAZOLE; metabolism of felodipine inhibited
 by
 ITRACONAZOLE (increased plasma concentration); plasma
 concentration of nifedipine increased by MICAFUNGIN
- Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with MEFLOQUINE
- Antimuscarinics: avoidance of verapamil advised by manufacturer of DARIFENACIN; verapamil increases plasma concentration of SOLIFENACIN
- Antipsychotics: enhanced hypotensive effect when calciumchannel blockers given with ANTIPSYCHOTICS; diltiazem increases the plasma concentration of ● LURASIDONE (see under Lurasidone, p. 315); verapamil possibly increases the plasma concentration of ● LURASIDONE (see under Lurasidone, p. 315)
- Antivirals: plasma concentration of verapamil possibly increased by ATAZANAVIR; plasma concentration of diltiazem increased by ATAZANAVIR (reduce dose of diltiazem); plasma concentration of diltiazem reduced by EFAVIRENZ; manufacturer of lercanidipine advises avoid concomitant use with RITONAVIR; plasma concentration of calcium-channel blockers possibly increased by RITONAVIR; caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil advised by manufacturer of TELAPREVIR; plasma concentration of amlodipine increased by TELAPREVIR (consider reducing dose of amlodipine)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when calcium-channel blockers given with AnXIOLYTICS AND HYPNOTICS; diltiazem and verapamil inhibit metabolism of MIDAZOLAM (increased plasma concentration with increased sedation); absorption of lercanidipine increased by MIDAZOLAM; diltiazem and verapamil increase plasma concentration of BUSPIRONE (reduce dose of buspirone)
- Aprepitant: plasma concentration of both drugs may increase when diltiazem given with APREPITANT
- Avanafil: diltiazem and verapamil possibly increase plasma concentration of ● AVANAFIL—see under Avanafil, p. 698
- Beta-blockers: enhanced hypotensive effect when calciumchannel blockers given with BETA-BLOCKERS; increased risk of

Calcium-channel Blockers

- Beta-blockers (continued)
- AV block and bradycardia when diltiazem given with BETA-BLOCKERS; asystole, severe hypotension and heart failure when verapamil given with • BETA-BLOCKERS (see under Verapamil, p. 156); possible severe hypotension and heart failure when nifedipine given with • BETA-BLOCKERS
- Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with NIFEDIPINE
- Cardiac Glycosides: diltiazem, lercanidipine and nicardipine increase plasma concentration of ● DIGOXIN; verapamil increases plasma concentration of ● DIGOXIN, also increased risk of AV block and bradycardia; nifedipine possibly increases plasma concentration of ● DIGOXIN
- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of • CicLosporin; combination of lercanidipine with • CicLosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by CICLOSPORIN (increased risk of toxicity including gingival hyperplasia)
- ► Cilostazol: diltiazem increases plasma concentration of CILOSTAZOL (consider reducing dose of cilostazol)
- ► Clonidine: enhanced hypotensive effect when calcium-channel blockers given with CLONIDINE
- Colchicine: diltiazem and verapamil possibly increase risk of
 COLCHICINE toxicity—suspend or reduce dose of colchicine
- (avoid concomitant use in hepatic or renal impairment)

 Corticosteroids: hypotensive effect of calcium-channel
 blockers antagonised by CORTICOSTEROIDS; diltiazem increases
 plasma concentration of METHYLPREDNISOLONE
- Cytotoxics: verapamil possibly increases plasma concentration of DOXORUBICIN; verapamil possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of ●BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of bradycardia when diltiazem or verapamil given with CRICTINIB; plasma concentration of both drugs may increase when verapamil given with ●EVEROLIMUS (consider reducing the dose of everolimus —consult everolimus product literature); diltiazem and verapamil possibly increase the plasma concentration of ●IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); nifedipine possibly inhibits metabolism of VINCRISTINE
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when diltiazem and verapamil given with DAPOXETINE (see under Dapoxetine, p. 703)
- Diazoxide: enhanced hypotensive effect when calciumchannel blockers given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when calcium-channel blockers given with DURETICS; diltiazem and verapamil increase plasma concentration of EPLERENONE (reduce dose of eplerenone)
- Dopaminergics: enhanced hypotensive effect when calciumchannel blockers given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Fingolimod: possible increased risk of bradycardia when diltiazem or verapamil given with • FINGOLIMOD
- ► Fosaprepitant: plasma concentration of both drugs may increase when diltiazem given with FOSAPREPITANT
- Grapefruit Juice: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by GRAPEFRUIT JUICE; plasma concentration of amlodipine possibly increased by GRAPEFRUIT JUICE
- Hormone Antagonists: diltiazem and verapamil increase plasma concentration of DUTASTERIDE; possible increased risk of bradycardia when diltiazem or verapamil given with PASIREOTIDE
- Ivabradine: diltiazem and verapamil increase plasma concentration of ● IVABRADINE—avoid concomitant use
- Lenalidomide: verapamil possibly increases plasma concentration of ● LENALIDOMIDE (increased risk of toxicity)

Calcium-channel Blockers (continued)

- Lipid-regulating Drugs: diltiazem increases plasma concentration of ATORVASTATIN—possible increased risk of myopathy; plasma concentration of verapamil increased by ATORVASTATIN, also possible increased risk of myopathy (consider reducing dose of atorvastatin); possible increased risk of myopathy when amlodipine and diltiazem given with SIMVASTATIN (see under Simvastatin, p. 181); increased risk of myopathy when verapamil given with SIMVASTATIN (see under Simvastatin, p. 181); separating administration from amlodipine and lacidipine by 12 hours advised by manufacturer of LOMITAPIDE; avoidance of diltiazem and verapamil advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Lithium: neurotoxicity may occur when diltiazem or verapamil given with LITHIUM without increased plasma concentration of lithium
- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and ● PARENTERAL MAGNESIUM in pre-eclampsia
- Methyldopa: enhanced hypotensive effect when calciumchannel blockers given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when calciumchannel blockers given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when calciumchannel blockers given with MOXONIDINE
- Muscle Relaxants: verapamil enhances effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM; enhanced hypotensive effect when calcium-channel blockers given with BACLOFEN or TIZANIDINE; manufacturer of verapamil advises avoid concomitant use of intravenous DANTROLENE; possible increased risk of ventricular arrhythmias when diltiazem given with intravenous DANTROLENE—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of NON-DEPOLARISING MUSCLE RELAXANTS
- Nitrates: enhanced hypotensive effect when calcium-channel blockers given with NITRATES
- Oestrogens: hypotensive effect of calcium-channel blockers antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when calciumchannel blockers given with ALPROSTADIL
- Ranolazine: diltiazem and verapamil increase plasma concentration of RANOLAZINE (consider reducing dose of ranolazine)
- Sildenafil: enhanced hypotensive effect when amlodipine given with SILDENAFIL
- Širolimus: diltiazem increases plasma concentration of
 SIROLIMUS; plasma concentration of both drugs increased when verapamil given with • SIROLIMUS; nicardipine possibly increases plasma concentration of SIROLIMUS
- Sulfinpyrazone: plasma concentration of verapamil reduced by SULFINPYRAZONE
- Tacrolimus: diltiazem, nicardipine and nifedipine increase plasma concentration of ●TACROLIMUS; felodipine and verapamil possibly increase plasma concentration of TACROLIMUS
- ► Ticagrelor: diltiazem increases plasma concentration of
- Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by CIMETIDINE (increased plasma concentration); plasma concentration of isradipine increased by CIMETIDINE (halve dose of isradipine)
- Ulipristal: avoidance of verapamil advised by manufacturer of low-dose ULIPRISTAL
- Vardenafil: enhanced hypotensive effect when nifedipine given with VARDENAFIL
- Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with HYDRALAZINE, MINOXIDIL Or SODIUM NITROPRUSSIDE

Calcium-channel Blockers (dihydropyridines) see Calciumchannel Blockers

Canagliflozin see Antidiabetics

Canakinumab

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Candesartan see Angiotensin-II Receptor Antagonists Cannabis Extract

- Antibacterials: plasma concentration of cannabis extract reduced by

 RIFAMPICIN—manufacturer of cannabis extract advises avoid concomitant use
- Antidepressants: plasma concentration of cannabis extract possibly reduced by ●ST JOHN'S WORT—manufacturer of cannabis extract advises avoid concomitant use; possible increased risk of hypertension and tachycardia when cannabis extract given with TRICYCLICS
- Antiepileptics: plasma concentration of cannabis extract possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE—
 manufacturer of cannabis extract advises avoid concomitant
 use
- Antifungals: plasma concentration of cannabis extract increased by KETOCONAZOLE

Canecitahin

- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with • ALLOPURINOL
- Antibacterials: metabolism of capecitabine inhibited by METRONIDAZOLE (increased toxicity)
- Anticoagulants: capecitabine enhances anticoagulant effect of
 COUMARINS
- Antiepileptics: capecitabine possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: capecitabine possibly increases plasma concentration of ERLOTINIB
- Filgrastim: neutropenia possibly exacerbated when capecitabine given with FILGRASTIM
- Folates: toxicity of capecitabine increased by FOLIC ACID avoid concomitant use
- Lipegfilgrastim: neutropenia possibly exacerbated when
- capecitabine given with LIPEGFILGRASTIM
 Pegfilgrastim: neutropenia possibly exacerbated when
- capecitabine given with PEGFILGRASTIM

 Ulcer-healing Drugs: metabolism of capecitabine inhibited by CIMETIDINE (increased plasma concentration)

Capreomycin

- Antibacterials: increased risk of nephrotoxicity when capreomycin given with COLISTIMETHATE SODIUM or POLYMYXINS; increased risk of nephrotoxicity and ototoxicity when capreomycin given with AMINOGLYCOSIDES or VANCOMYCIN
- ► Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with PLATINUM COMPOUNDS
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Captopril see ACE Inhibitors

Carbamazepine

- Alcohol: CNS side-effects of carbamazepine possibly increased by ALCOHOL
- Aminophylline: carbamazepine accelerates metabolism of AMINOPHYLLINE (reduced effect)
- Analgesics: effects of carbamazepine enhanced by
 DEXTROPROPOXYPHENE; carbamazepine possibly accelerates metabolism of FENTANNY (reduced effect); carbamazepine reduces plasma concentration of METHADONE; carbamazepine reduces effects of TRAMADOL; carbamazepine possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- Anthelmintics: carbamazepine reduces plasma concentration of ALBENDAZOLE and PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections

Carbamazepine (continued)

- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of • DRONEDARONE—avoid concomitant use
- Antibacterials: plasma concentration of carbamazepine increased by CLARITHROMYCIN (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by ERYTHROMYCIN; plasma concentration of carbamazepine reduced by RIFABUTIN; carbamazepine accelerates metabolism of DOXYCYCLINE (reduced effect); carbamazepine possibly reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use; avoidance of carbamazepine advised by manufacturer of DELAMANID; plasma concentration of carbamazepine increased by ISONIAZID (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces
- or 2 weeks after carbamazepine)

 Anticoagulants: carbamazepine possibly reduces plasma concentration of APIXABAN—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; carbamazepine accelerates metabolism of COUMARINS (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of □ABIGATRAN—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis

plasma concentration of • TELITHROMYCIN (avoid during and

- Antidepressants: carbamazepine possibly reduces plasma concentration of REBOXETINE; plasma concentration of carbamazepine increased by ● FLUOXETINE and ● FLUVOXAMINE; carbamazepine reduces plasma concentration of ● MIANSERIN, MIRTAZAPINE and TRAZODONE; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ● TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); manufacturer of carbamazepine advises avoid for 2 weeks after stopping ● MAOIS, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics antagonised by
- SSRIS and TRICYCLICS (convulsive threshold lowered); plasma concentration of carbamazepine possibly reduced by STJOHN'S WORT; carbamazepine accelerates metabolism of
- TRICYCLICS (reduced plasma concentration and reduced effect)
- · Antiepileptics: carbamazepine possibly reduces plasma concentration of ESLICARBAZEPINE but risk of side-effects increased; carbamazepine possibly reduces plasma concentration of ETHOSUXIMIDE and RETIGABINE; plasma concentration of both drugs often reduced when carbamazepine given with FOSPHENYTOIN or PHENYTOIN, also plasma concentration of fosphenytoin or phenytoin may be increased; carbamazepine often reduces plasma concentration of LAMOTRIGINE, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with LEVETIRACETAM; plasma concentration of carbamazepine sometimes reduced by OXCARBAZEPINE (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine reduces plasma concentration of
- PERAMPANEL (see under Perampanel, p. 398); carbamazepine possibly increases plasma concentration of PHENOBARBITAL and PRIMIDONE; plasma concentration of both drugs possibly reduced when carbamazepine given with RUFINAMIDE; carbamazepine reduces plasma concentration of SODIUM VALPROATE and VALPROIC ACID, also plasma concentration of active metabolite of carbamazepine increased; plasma concentration of rorbamazepine reduces plasma concentration of TIAGABINE and ZONISAMIDE; carbamazepine often reduces plasma concentration of TIAGABINE and ZONISAMIDE; carbamazepine often reduces plasma concentration of TOPIRAMATE
- Antifungals: plasma concentration of carbamazepine possibly increased by KETOCONAZOLE, also plasma concentration of ketoconazole possibly reduced; plasma concentration of carbamazepine possibly increased by FLUCONAZOLE and

Carbamazepine

- Antifungals (continued)
- MICONAZOLE; carbamazepine possibly reduces plasma concentration of ITRACONAZOLE and POSACONAZOLE; carbamazepine possibly reduces plasma concentration of VORICONAZOLE—avoid concomitant use; carbamazepine possibly reduces plasma concentration of CASPOFUNGIN—consider increasing dose of caspofungin
- Antimalarials: avoidance of carbamazepine advised by manufacturer of ARTENIMOL WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered); carbamazepine accelerates metabolism of HALOPERIDOL, OLANZAPINE, QUETIAPINE and RISPERIDONE (reduced plasma concentration); carbamazepine reduces plasma concentration of ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole —consult aripiprazole product literature); carbamazepine accelerates metabolism of CLOZAPINE (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine possibly reduces plasma concentration of LURASIDONE avoid concomitant use; carbamazepine reduces plasma concentration of PALIPERIDONE
- Antivirals: avoidance of carbamazepine advised by manufacturer of ●BOCEPREVIR and ● RILPIVIRINE (plasma concentration of boceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of
 ●DACLATASVIR and ● SIMEPREVIR—manufacturer of daclatasvir
- and simeprevir advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of DARUNAVIR, FOSAMPRENAVIR, LOPINAVIR, SAQUINAVIR and TIPRANAVIR; avoidance of carbamazepine advised by manufacturer of DOLUTEGRAVIR, ELVITEGRAVIR, ETRAVIRINE, SOFOSBUVIR and TELAPREVIR; plasma concentration of both drugs reduced when carbamazepine given with EFAVIRENZ; carbamazepine possibly reduces plasma concentration of
- INDINAVIR, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of NEVIRAPINE; plasma concentration of carbamazepine possibly increased by

 RITONAVIR
- Anxiolytics and Hypnotics: carbamazepine often reduces plasma concentration of CLONAZEPAM; carbamazepine reduces plasma concentration of MIDAZOLAM
- Aprepitant: carbamazepine possibly reduces plasma concentration of APREPITANT
- Avanafil: carbamazepine possibly reduces plasma concentration of AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Bupropion: carbamazepine reduces plasma concentration of BUPROPION
- Calcium-channel Blockers: carbamazepine reduces effects of FELODIPINE and ISRADIPINE; carbamazepine probably reduces effects of DIHYDROPYRIDINES, NICARDIPINE and NIFEDIPINE; avoidance of carbamazepine advised by manufacturer of NIMODIPINE (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by • DILTIAZEM and • VERAPAMIL
- Cannabis Extract: carbamazepine possibly reduces plasma concentration of

 — CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Ciclosporin: carbamazepine accelerates metabolism of
- CICLOSPORIN (reduced plasma concentration)
- Clopidogrel: carbamazepine possibly reduces antiplatelet effect of • CLOPIDOGREL
- Cobicistat: carbamazepine possibly reduces plasma concentration of ◆ COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: carbamazepine accelerates metabolism of
 CORTICOSTEROIDS (reduced effect)
- Cytotoxics: carbamazepine possibly decreases plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); carbamazepine possibly reduces plasma concentration of BORTEZOMIB, • BOSUTINIB, CRIZOTINIB,
 - IBRUTINIB, IDELALISIB and PONATINIB—manufacturer of

Carbamazepine

- Cytotoxics (continued)
- bortezomib, bosutinib, crizotinib, ibrutinib, idelalisib and ponatinib advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of • CABOZANTINIBavoid concomitant use; avoidance of carbamazepine advised by manufacturer of • CABAZITAXEL, DABRAFENIB, GEFITINIB and VEMURAFENIB; avoidance of carbamazepine advised by manufacturer of DASATINIB, VANDETANIB and • VISMODEGIB (plasma concentration of dasatinib, vandetanib and vismodegib possibly reduced); carbamazepine reduces plasma concentration of ● IMATINIB and ● LAPATINIB—avoid concomitant use; carbamazepine possibly reduces plasma concentration of ERIBULIN; carbamazepine reduces plasma concentration of IRINOTECAN and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when carbamazepine given with PROCARBAZINE
- Diuretics: increased risk of hyponatraemia when carbamazepine given with DIURETICS; plasma concentration of carbamazepine increased by • ACETAZOLAMIDE; carbamazepine reduces plasma concentration of
 EPLERNONE—avoid concomitant use
- Fingolimod: carbamazepine reduces plasma concentration of FINGOLIMOD
- Fosaprepitant: carbamazepine possibly reduces plasma concentration of FOSAPREPITANT
- Hormone Antagonists: carbamazepine possibly reduces plasma concentration of ● ABIRATERONE — manufacturer of abiraterone advises avoid concomitant use; metabolism of carbamazepine inhibited by ● DANAZOL (increased risk of toxicity); carbamazepine possibly accelerates metabolism of TOREMIFENE (reduced plasma concentration)
- 5HT₃-receptor Antagonists: carbamazepine accelerates metabolism of ONDANSETRON (reduced effect)
- Ivacaftor: carbamazepine possibly reduces plasma concentration of ● IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of ◆ SIMVASTATIN—consider increasing dose of simvastatin
- ▶ Lithium: neurotoxicity may occur when carbamazepine given with LITHIUM without increased plasma concentration of lithium
- Macitentan: avoidance of carbamazepine advised by manufacturer of MACITENTAN
- Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of NON-DEPOLARISING MUSCLE RELAXANTS (accelerated recovery from neuromuscular blockade)
- Oestrogens: carbamazepine accelerates metabolism of
 OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Progestogens: carbamazepine accelerates metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see
 Contraceptive Interactions in BNF)
- Retinoids: plasma concentration of carbamazepine possibly reduced by ISOTRETINOIN
- Roflumilast: carbamazepine possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Theophylline: carbamazepine accelerates metabolism of THEOPHYLLINE (reduced effect)
- Thyroid Hormones: carbamazepine accelerates metabolism of THYROID HORMONES (may increase requirements for thyroid hormones in hypothyroidism)
- Tibolone: carbamazepine accelerates metabolism of TIBOLONE (reduced plasma concentration)
- Ticagrelor: carbamazepine possibly reduces plasma concentration of TICAGRELOR

Carbamazepine (continued)

- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by • CIMETIDINE (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of • ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vitamins: carbamazepine possibly increases requirements for ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D

Carbapenems see Ertapenem, Imipenem with Cilastatin, and Meropenem

Carbonic Anhydrase Inhibitors see Diuretics

Carboplatin see Platinum Compounds

Carboprost see Prostaglandins

Cardiac Glycosides

- ACE Inhibitors: plasma concentration of digoxin possibly increased by CAPTOPRIL
- Alpha-blockers: plasma concentration of digoxin increased by PRAZOSIN
- Aminosalicylates: absorption of digoxin possibly reduced by SILLEASALAZINE
- Analgesics: plasma concentration of cardiac glycosides possibly increased by NSAIDs, also possible exacerbation of heart failure and reduction of renal function
- Antacids: absorption of digoxin possibly reduced by ANTACIDS
 Anti-arrhythmics: plasma concentration of digoxin increased
- by AMIODARONE, DRONEDARONE and PROPAFENONE (halve dose of digoxin)
- Antibacterials: plasma concentration of digoxin possibly increased by GENTAMICIN, TELITHROMYCIN and TRIMETHOPPIM; absorption of digoxin reduced by MEOMYCIN; plasma concentration of digoxin possibly reduced by RIFAMPICIN; plasma concentration of digoxin increased by MACROLIDES (increased risk of toxicity)
- Antidepressants: plasma concentration of digoxin reduced by
 ST JOHN'S WORT—avoid concomitant use
- Antidiabetics: plasma concentration of digoxin possibly reduced by ACARBOSE; plasma concentration of digoxin increased by CANAGLIFLOZIN and SITAGLIPTIN
- Antiepileptics: plasma concentration of digoxin possibly reduced by FOSPHENYTOIN and PHENYTOIN
- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ● AMPHOTERICIN; plasma concentration of digoxin increased by ● ITRACONAZOLE
- Antimalarials: plasma concentration of digoxin possibly increased by ● CHLOROQUINE and ● HYDROXYCHLOROQUINE; possible increased risk of bradycardia when digoxin given with MEFLOQUINE; plasma concentration of digoxin increased by ● QUINNINE
- Antimuscarinics: plasma concentration of digoxin possibly increased by DARIFENACIN
- Antivirals: side-effects of digoxin possibly increased by BOCEPREVIR; plasma concentration of digoxin increased by
 DACLATASVIR, ETRAVIRINE, SIMEPREVIR and TELAPREVIR; plasma concentration of digoxin possibly increased by RITONAVIR
- Anxiolytics and Hypnotics: plasma concentration of digoxin increased by ALPRAZOLAM (increased risk of toxicity)
- ▶ Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with BETA-BLOCKERS
- Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of CALCIUM
- Calcium-channel Blockers: plasma concentration of digoxin increased by ● DILTIAZEM, ● LERCANIDIPINE and ● NICARDIPINE; plasma concentration of digoxin possibly increased by
- NIFEDIPINE; plasma concentration of digoxin increased by
 VERAPAMIL, also increased risk of AV block and bradycardia
- Ciclosporin: plasma concentration of digoxin increased by
 CICLOSPORIN (increased risk of toxicity)
- ► Cobicistat: plasma concentration of digoxin possibly increased by COBICISTAT—reduce initial dose of digoxin
- Colchicine: possible increased risk of myopathy when digoxin given with COLCHICINE

Cardiac Glycosides (continued)

- Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with CORTICOSTEROIDS
- Cytotoxics: absorption of digoxin tablets possibly reduced by BLEOMYCIN, CARMUSTINE, CYCLOPHOSPHAMIDE, CYTARABINE, DOXORUBICIN, MELPHALAN, METHOTREXATE, PROCARBAZINE and VINCRISTINE; possible increased risk of bradycardia when digoxin given with CRIZOTINIB; manufacturer of digoxin advises give IBRUTINIB at least 6 hours before or after ibrutinib; plasma concentration of digoxin increased by VANDETANIB—possible increased risk of bradycardia
- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ● ACETAZOLAMIDE, ● LOOP DIURETICS of ● THIAZIDES AND RELATED DIURETICS; plasma concentration of digoxin possibly increased by POTASSIUM CANRENOATE; plasma concentration of digoxin increased by
 - SPIRONOLACTONE
- Ivacaftor: plasma concentration of digoxin increased by IVACAFTOR
- Lenalidomide: plasma concentration of digoxin possibly increased by LENALIDOMIDE
- ► Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by COLESTIPOL and COLESTYRAMINE; plasma concentration of digoxin possibly increased by ATORVASTATIN
- Mirabegron: plasma concentration of digoxin increased by MIRABEGRON—reduce initial dose of digoxin
- Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with SUXAMETHONIUM; possible increased risk of bradycardia when cardiac glycosides given with TIZANIDINE
- Penicillamine: plasma concentration of digoxin possibly reduced by PENICILLAMINE
- Ranolazine: plasma concentration of digoxin increased by RANOLAZINE
- Sympathomimetics, Beta₂: plasma concentration of digoxin possibly reduced by SALBUTAMOL
- Ticagrelor: plasma concentration of digoxin increased by
- TICAGRELOR
- Tolvaptan: plasma concentration of digoxin increased by TOLVAPTAN (increased risk of toxicity)
- Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by PROTON PUMP INHIBITORS; absorption of cardiac glycosides possibly reduced by SUCRALFATE
- Ulipristal: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after ULIPRISTAL

Carmustine

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: carmustine possibly reduces absorption of DIGOXIN tablets
- Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by CIMETIDINE

Carteolol see Beta-blockers

Carvedilol see Beta-blockers

Caspofungin

- Antibacterials: plasma concentration of caspofungin initially increased and then reduced by RIFAMPICIN (consider increasing dose of caspofungin)
- Antiepileptics: plasma concentration of caspofungin possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN consider increasing dose of caspofungin
- Antivirals: plasma concentration of caspofungin possibly reduced by EFAVIRENZ and NEVIRAPINE—consider increasing dose of caspofungin
- Ciclosporin: plasma concentration of caspofungin increased by CICLOSPORIN (manufacturer of caspofungin recommends
- monitoring liver enzymes)

 Corticosteroids: plasma concentration of caspofungin possibly reduced by DEXAMETHASONE—consider increasing dose of
- caspofungin

 Tacrolimus: caspofungin reduces plasma concentration of
- TACROLIMUS

Catumaxomab

Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)

Catumaxomab (continued)

· Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Cefaclor see Cephalosporins Cefadroxil see Cephalosporins

Cefalexin see Cephalosporins Cefixime see Cephalosporins

Cefotaxime see Cephalosporins

Cefradine see Cephalosporins

Ceftaroline see Cephalosporins

Ceftazidime see Cephalosporins

Ceftriaxone see Cephalosporins

Cefuroxime see Cephalosporins

Celecoxib see NSAIDs

Celiprolol see Beta-blockers Cephalosporins

- ► Antacids: absorption of cefaclor reduced by ANTACIDS
- Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with AMINOGLYCOSIDES
- · Anticoagulants: cephalosporins possibly enhance anticoagulant effect of • COUMARINS
- Teriflunomide: plasma concentration of cefaclor increased by **TERIFILINOMIDE**
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Certolizumab pegol

- Abatacept: avoid concomitant use of certolizumab pegol with ABATACEPT
- Anakinra: avoid concomitant use of certolizumab pegol with ANAKINRA
- · Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis) · Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Cetirizine see Antihistamines Cetuximab

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- · Vaccines: risk of generalised infections when monoclonal antibodies given with live . VACCINES—avoid concomitant use

Chenodeoxycholic Acid see Bile Acids

Chloral see Anxiolytics and Hypnotics

Chloramphenicol

- Antibacterials: metabolism of chloramphenicol accelerated by RIFAMPICIN (reduced plasma concentration)
- · Anticoagulants: chloramphenicol enhances anticoagulant effect of • COUMARINS
- Antidiabetics: chloramphenicol enhances effects of
- SULFONYLUREAS
- · Antiepileptics: chloramphenicol increases plasma concentration of ● FOSPHENYTOIN and ● PHENYTOIN (increased risk of toxicity); metabolism of chloramphenicol possibly accelerated by ● PHENOBARBITAL and ● PRIMIDONE (reduced plasma concentration)
- · Antipsychotics: avoid concomitant use of chloramphenicol with • CLOZAPINE (increased risk of agranulocytosis)
- Ciclosporin: chloramphenicol possibly increases plasma concentration of • CICLOSPORIN
- · Clopidogrel: chloramphenicol possibly reduces antiplatelet effect of • CLOPIDOGREL
- Hydroxocobalamin: chloramphenicol reduces response to HYDROXOCOBALAMIN
- Tacrolimus: chloramphenicol possibly increases plasma concentration of • TACROLIMUS
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Chlordiazepoxide see Anxiolytics and Hypnotics

Chloroprocaine

- Antibacterials: chloroprocaine possibly inhibits effects of
- SULFONAMIDES (manufacturer of chloroprocaine advises avoid concomitant use)

Adsorbents: absorption of chloroquine reduced by KAOLIN

Chloroquine (continued)

ESCITALOPRAM

- Agalsidase Alfa and Beta: chloroquine possibly inhibits effects of AGALSIDASE ALFA AND BETA (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antacids: absorption of chloroquine reduced by ANTACIDS
- Anthelmintics: chloroquine reduces plasma concentration of PRAZIQUANTEL—consider increasing praziquantel dose when given for systemic infections
- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine given with . AMIODARONE—avoid
- concomitant use • Antibacterials: increased risk of ventricular arrhythmias when chloroquine given with • MOXIFLOXACIN—avoid concomitant
- Antidepressants: possible increased risk of ventricular arrhythmias when chloroquine given with • CITALOPRAM and
- · Antimalarials: avoidance of antimalarials advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE; increased risk of convulsions when chloroquine given with MEEL OOLINE
- · Antipsychotics: increased risk of ventricular arrhythmias when chloroquine given with • DROPERIDOL—avoid concomitant use
- Cardiac Glycosides: chloroquine possibly increases plasma concentration of • DIGOXIN
- Ciclosporin: chloroquine increases plasma concentration of CICLOSPORIN (increased risk of toxicity)
- Cytotoxics: possible increased risk of ventricular arrhythmias when chloroquine given with . BOSUTINIB
- ▶ Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Lanthanum: absorption of chloroquine possibly reduced by LANTHANUM (give at least 2 hours apart)
- Laronidase: chloroquine possibly inhibits effects of LARONIDASE (manufacturer of laronidase advises avoid concomitant use)
- Parasympathomimetics: chloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of NEOSTIGMINE and PYRIDOSTIGMINE
- Ulcer-healing Drugs: metabolism of chloroquine inhibited by CIMETIDINE (increased plasma concentration)
- ► Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Chlorothiazide see Diuretics

Chlorphenamine see Antihistamines

Chlorpromazine see Antipsychotics

Chlortalidone see Diuretics

Cholera Vaccine see Vaccines Ciclesonide see Corticosteroids

Ciclosporin

- ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with • ACE INHIBITORS
- Aliskiren: ciclosporin increases plasma concentration of
- ALISKIREN—avoid concomitant use
- ▶ Allopurinol: plasma concentration of ciclosporin possibly increased by ALLOPURINOL (risk of nephrotoxicity)
- · Ambrisentan: ciclosporin increases plasma concentration of
 - AMBRISENTAN (see under Ambrisentan, p. 162)
- · Analgesics: increased risk of nephrotoxicity when ciclosporin given with . NSAIDS; ciclosporin increases plasma concentration of • DICLOFENAC (halve dose of diclofenac)
- · Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with • ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: plasma concentration of ciclosporin possibly increased by AMIODARONE and PROPAFENONE
- Antibacterials: metabolism of ciclosporin inhibited by
- CLARITHROMYCIN and ERYTHROMYCIN (increased plasma concentration); metabolism of ciclosporin accelerated by
- RIFAMPICIN (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by
- SULFADIAZINE; increased risk of nephrotoxicity when ciclosporin given with • AMINOGLYCOSIDES, • POLYMYXINS,
- QUINOLONES, SULFONAMIDES or VANCOMYCIN; plasma concentration of ciclosporin possibly increased by

Ciclosporin

- · Antibacterials (continued)
- CHLORAMPHENICOL and TELITHROMYCIN; increased risk of myopathy when ciclosporin given with DAPTOMYCIN (preferably avoid concomitant use); avoidance of ciclosporin advised by manufacturer of FIDAXOMICIN; metabolism of ciclosporin possibly inhibited by MACROLIDES (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with TRIMETHOPRIM, also plasma concentration of ciclosporin reduced by *intravenous* trimethoprim
- Anticoagulants: ciclosporin possibly increases plasma concentration of ● DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use
- Antidepressants: plasma concentration of ciclosporin reduced by • ST JOHN'S WORT—avoid concomitant use
- Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of REPAGLINIDE
- Antiepileptics: metabolism of ciclosporin accelerated by
 CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL,
- PHENYTOIN and PRIMIDONE (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by OXCARBAZEPINE
- · Antifungals: metabolism of ciclosporin inhibited by
- FLUCONAZOLE, ITRACONAZOLE, KETOCONAZOLE, ● POSACONAZOLE and ● VORICONAZOLE (increased plasma concentration); metabolism of ciclosporin possibly inhibited by ● MICONAZOLE (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with
- AMPHOTERICIN; ciclosporin increases plasma concentration of CASPOFUNGIN (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by GRISEOFULVIN and TERBINAFINE; plasma concentration of ciclosporin possibly increased by MICAFUNGIN
- Antimalarials: plasma concentration of ciclosporin increased by • CHLOROQUINE and • HYDROXYCHLOROQUINE (increased risk of toxicity)
- Antimuscarinics: avoidance of ciclosporin advised by manufacturer of DARIFENACIN
- Antivirals: increased risk of nephrotoxicity when ciclosporin given with ACICLOVIR or VALACICLOVIR; plasma concentration of ciclosporin possibly increased by • ATAZANAVIR and
- RITONAVIR; plasma concentration of ciclosporin increased by
- BOCEPREVIR, FOSAMPRENAVIR and INDINAVIR; plasma concentration of ciclosporin possibly reduced by EFAVIRENZ; plasma concentration of both drugs increased when ciclosporin given with SAQUINAVIR; plasma concentration of both drugs increased when ciclosporin given with
- TELAPREVIR (reduce dose of ciclosporin)
- Beta-blockers: plasma concentration of ciclosporin increased by • CARVEDILOL
- Bile Acids: absorption of ciclosporin increased by
- URSODEOXYCHOLIC ACID
- Bosentan: ciclosporin increases plasma concentration of
 BOSENTAN (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Calcium-channel Blockers: combination of ciclosporin with
 ◆LERCANIDIPINE may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by ◆ DILTIAZEM, ◆ NICARDIPINE and
 ◆ VERAPAMIL; ciclosporin possibly increases plasma concentration of NIFEDIPINE (increased risk of toxicity including gingival hyperplasia)
- Cardiac Glycosides: ciclosporin increases plasma concentration of • DIGOXIN (increased risk of toxicity)
- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with • COLCHICINE suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- ► Colestilan: manufacturer of colestilan advises give ciclosporin at least 1 hour before or 3 hours after COLESTILAN
- Corticosteroids: plasma concentration of ciclosporin increased by high-dose • METHYLPREDNISOLONE (risk of convulsions); ciclosporin increases plasma concentration of PREDNISOLONE

Ciclosporin (continued)

- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with MELPHALAN; increased risk of neurotoxicity when ciclosporin given with DOXORUBICIN; ciclosporin increases plasma concentration of EPIRUBICIN and IDARUBICIN; ciclosporin reduces excretion of MITOXANTRONE (increased plasma concentration); risk of toxicity when ciclosporin given with METHOTREXATE; ciclosporin possibly increases the plasma concentration of AFATINIB─manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours; caution with ciclosporin advised by manufacturer of
 - CRIZOTINIB; ciclosporin increases plasma concentration of
- EVEROLIMUS (consider reducing the dose of everolimus consult everolimus product literature); plasma concentration of ciclosporin possibly increased by IMATINIB: *in vitro* studies suggest a possible interaction between ciclosporin and DOCETAXEL (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of ETOPOSIDE (increased risk of toxicity)
- Dexrazoxane: increased risk of immunosupression with ciclosporin advised by manufacturer of DEXRAZOXANE
- Diuretics: plasma concentration of ciclosporin possibly increased by ● ACETAZOLAMIDE; increased risk of hyperkalaemia when ciclosporin given with ● POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with THIAZIDES AND RELATED DIURETICS
- Grapefruit Juice: plasma concentration of ciclosporin increased by • GRAPEFRUIT JUICE (increased risk of toxicity)
- Hormone Antagonists: metabolism of ciclosporin inhibited by
 DANAZOL (increased plasma concentration); plasma concentration of ciclosporin reduced by LANREOTIDE and
 OCTREOTIDE; plasma concentration of ciclosporin possibly reduced by PASIREOTIDE
- Lenalidomide: ciclosporin possibly increases plasma concentration of • LENALIDOMIDE (increased risk of toxicity)
- Lipid-regulating Drugs: absorption of ciclosporin reduced by
 - COLESEVELAM; increased risk of renal impairment when ciclosporin given with BEZAFIBRATE or FENOFIBRATE; increased risk of myopathy when ciclosporin given with ● ATORVASTATIN (see under Atorvastatin, p. 179); increased risk of myopathy when ciclosporin given with ● FLUVASTATIN or ● PRAVASTATIN; increased risk of myopathy when ciclosporin given with
 - ROSUVASTATIN or SIMVASTATIN (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with EZETIMIBE; separating administration from ciclosporin by 12 hours advised by manufacturer of LOMITAPIDE
- Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with MANNITOL
- Metoclopramide: plasma concentration of ciclosporin increased by • METOCLOPRAMIDE
- Mifamurtide: avoidance of ciclosporin advised by manufacturer of MIFAMURTIDE
- Modafinil: plasma concentration of ciclosporin reduced by
 MODAFINIL
- Oestrogens: plasma concentration of ciclosporin possibly increased by OESTROGENS
- Orlistat: absorption of ciclosporin possibly reduced by
 ORLISTAT
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with • POTASSIUM SALTS
- Progestogens: plasma concentration of ciclosporin possibly increased by PROGESTOGENS
- Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with RANOLAZINE
- Sevelamer: plasma concentration of ciclosporin possibly reduced by SEVELAMER
- Sirolimus: ciclosporin increases plasma concentration of SIROLIMUS
- Sulfinpyrazone: plasma concentration of ciclosporin reduced by SULFINPYRAZONE
- Tacrolimus: plasma concentration of ciclosporin increased by
 TACROLIMUS (increased risk of nephrotoxicity)—avoid concomitant use

Ciclosporin (continued)

- Ticagrelor: ciclosporin increases plasma concentration of TICAGRELOR
- Vitamins: plasma concentration of ciclosporin possibly affected by VITAMIN E

Cilostazol

- · Anagrelide: avoidance of cilostazol advised by manufacturer of
- ANAGRELIDE
- Antibacterials: plasma concentration of cilostazol possibly increased by • CLARITHROMYCIN (see under Cilostazol, p. 206); plasma concentration of cilostazol increased by
- ERYTHROMYCIN (see under Cilostazol, p. 206)
- Antifungals: plasma concentration of cilostazol increased by
 KETOCONAZOLE (see under Cilostazol, p. 206); plasma
 - concentration of cilostazol possibly increased by

 ITRACONAZOLE (see under Cilostazol, p. 206)
- Antivirals: plasma concentration of cilostazol possibly increased by ● BOCEPREVIR, ● RITONAVIR and ● TELAPREVIR (see under Cilostazol, p. 206)
- Calcium-channel Blockers: plasma concentration of cilostazol increased by DILTIAZEM (consider reducing dose of cilostazol)
- Lipid-regulating Drugs: separating administration from cilostazol by 12 hours advised by manufacturer of LOMITAPIDE
- Ulcer-healing Drugs: plasma concentration of cilostazol increased by • OMEPRAZOLE (see under Cilostazol, p. 206)
 Cimetidine see Histamine H₂-antagonists

Cinacalcet

- Antifungals: metabolism of cinacalcet inhibited by KETOCONAZOLE (increased plasma concentration)
- Hormone Antagonists: cinacalcet possibly inhibits metabolism of • TAMOXIFEN to active metabolite (avoid concomitant use)

Cinnarizine see Antihistamines

Ciprofibrate see Fibrates

Ciprofloxacin see Quinolones

Cisatracurium see Muscle Relaxants

Cisplatin see Platinum Compounds

Citalopram see Antidepressants, SSRI

Cladribine

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of cladribine advised by manufacturer of
 AMIVIDINE

Clarithromycin see Macrolides

Clemastine see Antihistamines

Clindamycin

- Muscle Relaxants: clindamycin enhances effects of NON-DEPOLARISING MUSCLE RELAXANTS and ● SUXAMETHONIUM
- Parasympathomimetics: clindamycin antagonises effects of NEOSTIGMINE and PYRIDOSTIGMINE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Clobazam see Anxiolytics and Hypnotics

Clofazimine

- Antibacterials: possible increased risk of ventricular arrhythmias when clofazimine given with • BEDAQUILINE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Clomethiazole see Anxiolytics and Hypnotics

Clomipramine see Antidepressants, Tricyclic

Clonazepam see Anxiolytics and Hypnotics

Clonidine

- ACE Inhibitors: enhanced hypotensive effect when clonidine given with ACE INHIBITORS; previous treatment with clonidine possibly delays antihypertensive effect of CAPTOPRIL
- Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when clonidine given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when clonidine given with ALDESLEUKIN
- ► Alpha-blockers: enhanced hypotensive effect when clonidine given with ALPHA-BLOCKERS

Clonidine (continued)

- Anaesthetics, General: enhanced hypotensive effect when clonidine given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of clonidine antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIs; hypotensive effect of clonidine possibly antagonised by MIRTAZAPINE; hypotensive effect of clonidine antagonised by • TRICYCLICS, also increased risk of hypertension on clonidine withdrawal
- Antipsychotics: enhanced hypotensive effect when clonidine given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with • BETA-BLOCKERS (withdraw betablockers several days before slowly withdrawing clonidine)
- ► Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with CALCIUM-CHANNEL BLOCKERS
- Corticosteroids: hypotensive effect of clonidine antagonised by CORTICOSTEROIDS
- Cytotoxics: possible increased risk of bradycardia when clonidine given with CRIZOTINIB
- Diazoxide: enhanced hypotensive effect when clonidine given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when clonidine given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when clonidine given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
 Histamine: avoidance of clonidine advised by manufacturer of
- HISTAMINE

 Methyldopa: enhanced hypotensive effect when clonidine
- Methyldopa: enhanced hypotensive effect when clonidine given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when clonidine given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when clonidine given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when clonidine given with BACLOFEN or TIZANIDINE
 Nitrates: enhanced hypotensive effect when clonidine given
- with NITRATES
- Oestrogens: hypotensive effect of clonidine antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when clonidine given with ALPROSTADIL
- Sympathomimetics: possible risk of hypertension when clonidine given with ADRENALINE (EPINEPHRINE) or NORADRENALINE (NOREPINEPHRINE); serious adverse events reported with concomitant use of clonidine and
 - METHYLPHENIDATE (causality not established)
- Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Clopamide see Diuretics

Clopidogrel

- Analgesics: increased risk of bleeding when clopidogrel given with NSAIDs or ASPIRIN
- Antibacterials: antiplatelet effect of clopidogrel possibly reduced by ◆ CHLORAMPHENICOL, ◆ CIPROFLOXACIN and
- ERYTHROMYCIN
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with ● WARFARIN; antiplatelet action of clopidogrel enhances anticoagulant effect of ● COUMARINS and ● PHENINDIONE; increased risk of bleeding when clopidogrel given with HEPARINS
- Antidepressants: antiplatelet effect of clopidogrel possibly reduced by • FLUOXETINE, • FLUVOXAMINE and • MOCLOBEMIDE
- Antifungals: antiplatelet effect of clopidogrel possibly reduced by • FLUCONAZOLE, • ITRACONAZOLE, • KETOCONAZOLE and • VORICONAZOLE

Clopidogrel (continued)

- Antivirals: antiplatelet effect of clopidogrel possibly reduced by ETRAVIRINE
 Dinviridamole: increased risk of bleeding when clopidogrel
- Dipyridamole: increased risk of bleeding when clopidogrel given with DIPYRIDAMOLE
- Iloprost: increased risk of bleeding when clopidogrel given with ILOPROST
- Lipid-regulating Drugs: clopidogrel increases plasma concentration of ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature)
- Prasugrel: possible increased risk of bleeding when clopidogrel given with PRASUGREL
- Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by

 CIMETIDINE, LANSOPRAZOLE, PANTOPRAZOLE and RABEPRAZOLE; antiplatelet effect of clopidogrel reduced by

• ESOMEPRAZOLE and • OMEPRAZOLE Clozapine see Antipsychotics

Co-amoxiclay see Penicillins

Co-beneldopa

- ACE Inhibitors: enhanced hypotensive effect when cobeneldopa given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when co-beneldopa given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when cobeneldopa given with ALPHA-BLOCKERS
- Anaesthetics, General: increased risk of arrhythmias when cobeneldopa given with • VOLATILE LIQUID GENERAL ANAESTHETICS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when co-beneldopa given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- ► Antibacterials: effects of co-beneldopa possibly reduced by ISONIAZID
- Antidepressants: risk of hypertensive crisis when co-beneldopa given with MAOIS, avoid co-beneldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when cobeneldopa given with MOCLOBEMIDE
- Antiepileptics: effects of co-beneldopa possibly reduced by FOSPHENYTOIN and PHENYTOIN
- Antimuscarinics: absorption of co-beneldopa possibly reduced by ANTIMUSCARINICS
- Antipsychotics: effects of co-beneldopa antagonised by ANTIPSYCHOTICS; avoidance of co-beneldopa advised by manufacturer of AMISULPRIDE (antagonism of effect)
- Anxiolytics and Hypnotics: effects of co-beneldopa possibly antagonised by BENZODIAZEPINES
- Beta-blockers: enhanced hypotensive effect when cobeneldopa given with BETA-BLOCKERS
- Bupropion: increased risk of side-effects when co-beneldopa given with BUPROPION
- Calcium-channel Blockers: enhanced hypotensive effect when co-beneldopa given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when co-beneldopa
- given with CLONIDINE

 Diazoxide: enhanced hypotensive effect when co-beneldopa
- given with DIAZOXIDE

 Diuretics: enhanced hypotensive effect when co-beneldopa
- given with DIURETICS
- Dopaminergics: enhanced effects and increased toxicity of cobeneldopa when given with SELEGILINE (reduce dose of cobeneldopa)
- Iron Salts: absorption of co-beneldopa possibly reduced by oral IRON SALTS
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: enhanced hypotensive effect when co-beneldopa given with METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Moxonidine: enhanced hypotensive effect when co-beneldopa given with MOXONIDINE
- Muscle Relaxants: possible agitation, confusion and hallucinations when co-beneldopa given with BACLOFEN
- Nitrates: enhanced hypotensive effect when co-beneldopa given with NITRATES

Co-beneldopa (continued)

➤ Vasodilator Antihypertensives: enhanced hypotensive effect when co-beneldopa given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRIESIDE

Cohicistat

concentration of • ALFUZOSIN—manufacturer of cobicistat advises avoid concomitant use
• Anti-arrhythmics: cobicistat possibly increases plasma

• Alpha-blockers: cobicistat possibly increases plasma

- Anti-arrhythmics: cobicistat possibly increases plasma concentration of

 AMIODARONE—manufacturer of cobicistat advises avoid concomitant use
- Antibacterials: plasma concentration of cobicistat reduced by
 RIFABUTIN (adjust dose—consult product literature); plasma concentration of cobicistat possibly reduced by
 - RIFAMPICIN—manufacturer of cobicistat advises avoid concomitant use
- Antidepressants: plasma concentration of cobicistat possibly reduced by • ST JOHN'S WORT—manufacturer of cobicistat advises avoid concomitant use
- Antiepileptics: plasma concentration of cobicistat possibly reduced by ● CARBAMAZEPINE, ● FOSPHENYTOIN,
 ● PHENOBARBITAL, ● PHENYTOIN and ● PRIMIDONE—
- manufacturer of cobicistat advises avoid concomitant use
 Antifungals: cobicistat possibly increases plasma
- concentration of ITRACONAZOLE and KETOCONAZOLE manufacturer of cobicistat advises reduce dose of itraconazole and ketoconazole
- Antipsychotics: cobicistat possibly increases plasma concentration of • LURASIDONE—avoid concomitant use; cobicistat possibly increases plasma concentration of
- PIMOZIDE—manufacturer of cobicistat advises avoid concomitant use
- Antivirals: manufacturer of cobicistat advises avoid concomitant use with BOCEPREVIR; cobicistat possibly increases the plasma concentration of DACLATASVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); cobicistat possibly increases plasma concentration of
- MARAVIROC (reduce dose of maraviroc); avoidance of cobicistat advised by manufacturer of NEVIRAPINE; cobicistat possibly increases plasma concentration of ● SIMEPREVIR manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs reduced when cobicistat given with ● TIPRANAVIR (avoid concomitant use)
- Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with oral

 MIDAZOLAM
- Bosentan: manufacturer of cobicistat advises avoid concomitant use with BOSENTAN
- Cardiac Glycosides: cobicistat possibly increases plasma concentration of DIGOXIN—reduce initial dose of digoxin
- Cytotoxics: cobicistat possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Domperidone: possible increased risk of ventricular arrhythmias when cobicistat given with • DOMPERIDONE avoid concomitant use
- Ergot Alkaloids: cobicistat possibly increases plasma concentration of • ERGOT ALKALOIDS—manufacturer of cobicistat advises avoid concomitant use
- Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of ATORVASTATIN—manufacturer of cobicistat advises reduce dose of atorvastatin; manufacturer of cobicistat advises avoid concomitant use with ◆ SIMVASTATIN
- Oestrogens: cobicistat accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Progestogens: cobicistat increases plasma concentration of NORGESTIMATE
- Sildenafil: cobicistat possibly increases plasma concentration
 of SILDENAFIL—manufacturer of cobicistat advises avoid
 concomitant use of sildenafil for pulmonary arterial

Cobicistat

- Sildenafil (continued)
- hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
- Sympathomimetics, Beta₂: manufacturer of cobicistat advises avoid concomitant use with SALMETEROL
- Tadalafil: cobicistat possibly increases plasma concentration
 of TADALAFIL—manufacturer of cobicistat advises reduce
 dose of tadalafil (consult cobicistat product literature)
- Vardenafil: cobicistat possibly increases plasma concentration of ● VARDENAFIL—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)

Co-careldopa

- ACE Inhibitors: enhanced hypotensive effect when cocareldopa given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when co-careldopa given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when cocareldopa given with ALPHA-BLOCKERS
- Anaesthetics, General: increased risk of arrhythmias when cocareldopa given with • VOLATILE LIQUID GENERAL ANAESTHETICS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when co-careldopa given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: effects of co-careldopa possibly reduced by ISONIAZID
- Antidepressants: risk of hypertensive crisis when co-careldopa given with MAOIS, avoid co-careldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when cocareldopa given with MOCLOBEMIDE
- Antiepileptics: effects of co-careldopa possibly reduced by FOSPHENYTOIN and PHENYTOIN
- Antimuscarinics: absorption of co-careldopa possibly reduced by ANTIMUSCARINICS
- Antipsychotics: effects of co-careldopa antagonised by ANTIPSYCHOTICS; avoidance of co-careldopa advised by manufacturer of AMISULPRIDE (antagonism of effect)
- Anxiolytics and Hypnotics: effects of co-careldopa possibly antagonised by BENZODIAZEPINES
- Beta-blockers: enhanced hypotensive effect when cocareldopa given with BETA-BLOCKERS
- Bupropion: increased risk of side-effects when co-careldopa given with BUPROPION
- Calcium-channel Blockers: enhanced hypotensive effect when co-careldopa given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when co-careldopa given with CLONIDINE
- Diazoxide: enhanced hypotensive effect when co-careldopa given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when co-careldopa given with DIURETICS
- Dopaminergics: enhanced effects and increased toxicity of cocareldopa when given with SELEGILINE (reduce dose of cocareldopa)
- Iron Salts: absorption of co-careldopa possibly reduced by oral IRON SALTS
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: enhanced hypotensive effect when co-careldopa given with METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Moxonidine: enhanced hypotensive effect when co-careldopa given with MOXONIDINE
- Muscle Relaxants: possible agitation, confusion and hallucinations when co-careldopa given with BACLOFEN
- Nitrates: enhanced hypotensive effect when co-careldopa given with NITRATES
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when co-careldopa given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Codeine see Opioid Analgesics

Co-fluampicil see Penicillins

Colchicine

Colchicine (continued)

- Antibacterials: possible increased risk of colchicine toxicity when given with • AZITHROMYCIN, • CLARITHROMYCIN,
- ERYTHROMYCIN and TELITHROMYCIN—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antifungals: possible increased risk of colchicine toxicity when given with • ITRACONAZOLE and • KETOCONAZOLE—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with ATAZANAVIR, INDINAVIR, RITONAVIR and
 ▼ELAPREVIR—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with • DILTIAZEM and • VERAPAMIL suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiac Glycosides: possible increased risk of myopathy when colchicine given with • DIGOXIN
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ◆ CICLOSPORIN suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Grapefruit Juice: possible increased risk of colchicine toxicity when given with ● GRAPEFRUIT JUICE
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with ● FIBRATES or ● STATINS

Colecalciferol see Vitamins

Colesevelam

NOTE Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption $\frac{1}{2} \frac{1}{2} \frac{1}{$

- Antidiabetics: colesevelam reduces absorption of GLIBENCLAMIDE and GLIPIZIDE; colesevelam reduces absorption of GLIMEPIRIDE—manufacturer of glimepiride advises give at least 4 hours before colesevelam; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4-6 before CANAGLIFLOZIN
- Antiepileptics: colesevelam possibly reduces absorption of FOSPHENYTOIN and PHENYTOIN
- Ciclosporin: colesevelam reduces absorption of CICLOSPORIN
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce
- absorption of LOMITAPIDE (give at least 4 hours apart)

 Oestrogens: colesevelam reduces absorption of
- ETHINYLESTRADIOL
 Thyroid Hormones: colesevelam reduces absorption of

Colestilan

NOTE Other drugs should be taken at least 1 hour before or 3 hours after colestilan to reduce possible interference with absorption

- ► Ciclosporin: manufacturer of colestilan advises give CICLOSPORIN at least 1 hour before or 3 hours after colestilan
- Mycophenolate: manufacturer of colestilan advises give MYCOPHENOLATE at least 1 hour before or 3 hours after colestilan
- ► Tacrolimus: manufacturer of colestilan advises give
 TACROLIMUS at least 1 hour before or 3 hours after colestilan
- ► Thyroid Hormones: manufacturer of colestilan advises give LEVOTHYROXINE at least 1 hour before or 3 hours after colestilan

Colestinol

NOTE Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption

- Antibacterials: colestipol possibly reduces absorption of TETRACYCLINE
- Antidiabetics: manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before CANAGLIFLOZIN
- ▶ Bile Acids: colestipol possibly reduces absorption of BILE ACIDS
- Cardiac Glycosides: colestipol possibly reduces absorption of CARDIAC GLYCOSIDES
 Diuretics: colestipol reduces absorption of THIAZIDES AND
- Diuretics: colestipol reduces absorption of THIAZIDES AN RELATED DIURETICS (give at least 2 hours apart)

Colestipol (continued)

- ► Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of LOMITAPIDE (give at least 4 hours apart)
- ► Thyroid Hormones: colestipol reduces absorption of THYROID HORMONES

Colestyramine

- NOTE Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption
- Analgesics: colestyramine increases the excretion of MELOXICAM; colestyramine reduces absorption of PARACETAMOL
- ► Antibacterials: colestyramine possibly reduces absorption of TETRACYCLINE; colestyramine antagonises effects of *oral*
- Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of ● COUMARINS and ● PHENINDIONE
- Antidiabetics: colestyramine possibly enhances hypoglycaemic effect of ACARBOSE; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before CANAGLIFLOZIN
- Antiepileptics: colestyramine possibly reduces absorption of SODIUM VALPROATE and VALPROIC ACID
- Bile Acids: colestyramine possibly reduces absorption of BILE ACIDS
- Cardiac Glycosides: colestyramine possibly reduces absorption of CARDIAC GLYCOSIDES
- ▶ Diuretics: colestyramine reduces absorption of THIAZIDES AND RELATED DIURETICS (give at least 2 hours apart)
- Leflunomide: colestyramine significantly decreases effect of LEFLUNOMIDE (enhanced elimination)—avoid unless drug elimination desired
- ► Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of LOMITAPIDE (give at least 4 hours apart)
- Mycophenolate: colestyramine reduces absorption of MYCOPHENOLATE
- Raloxifene: colestyramine reduces absorption of RALOXIFENE (manufacturer of raloxifene advises avoid concomitant administration)
- ► Teriflunomide: colestyramine significantly decreases effect of TERIFLUNOMIDE (enhanced elimination)—avoid unless drug elimination desired
- Thyroid Hormones: colestyramine reduces absorption of THYROID HORMONES
- Vitamins: colestyramine possibly reduces absorption of CALCITRIOL (give at least 1 hour before or 4 to 6 hours after colestyramine)

Colistimethate Sodium see Polymyxins

Contraceptives, oral *see* Oestrogens and Progestogens **Corticosteroids**

- NOTE Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified
- ► ACE Inhibitors: corticosteroids antagonise hypotensive effect of ACE INHIBITORS
- Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS
- Aldesleukin: avoidance of corticosteroids advised by manufacturer of • ALDESLEUKIN
- Alpha-blockers: corticosteroids antagonise hypotensive effect of ALPHA-BLOCKERS
- of ALPHA-BLOCKERS

 Aminophylline: increased risk of hypokalaemia when corticosteroids given with AMINOPHYLLINE
- Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with NSAIDs; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with ASPIRIN, also corticosteroids reduce plasma concentration of salicylate
- Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- ▶ Antacids: absorption of deflazacort reduced by ANTACIDS
- Anthelmintics: dexamethasone increases plasma concentration of active metabolite of ALBENDAZOLE; continuous use of dexamethasone possibly reduces plasma concentration of PRAZIOUANTEL
- Antibacterials: plasma concentration of methylprednisolone possibly increased by CLARITHROMYCIN; metabolism of

Corticosteroids

- Antibacterials (continued)
 corticosteroids possibly inhibited by ERYTHROMYCIN;
 metabolism of methylprednisolone inhibited by
 ERYTHROMYCIN; corticosteroids possibly reduce plasma
 concentration of ISONIAZID; metabolism of corticosteroids
 accelerated by RIFAMYCINS (reduced effect)
- Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of ◆ COUMARINS (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of PHENINDIONE
- Antidiabetics: corticosteroids antagonise hypoglycaemic effect of ANTIDIABETICS
- · Antiepileptics: metabolism of corticosteroids accelerated by
 - ◆ CARBAMAZEPINE,
 ◆ FOSPHENYTOIN,
 ◆ PHENOBARBITAL,
 - PHENYTOIN and PRIMIDONE (reduced effect)
- Antifungals: metabolism of corticosteroids possibly inhibited by ITRACONAZOLE and KETOCONAZOLE; plasma concentration of active metabolite of ciclesonide increased by
 KETOCONAZOLE; plasma concentration of inhaled mometasone increased by KETOCONAZOLE; plasma concentration of inhaled and oral (and possibly also intranasal and rectal) budesonide increased by
 - ITRACONAZOLE and KETOCONAZOLE; inhaled fluticasone plasma concentration is possibly increased by KETOCONAZOLE; metabolism of methylprednisolone inhibited by KETOCONAZOLE; increased risk of hypokalaemia when corticosteroids given with AMPHOTERICIN—avoid concomitant use unless corticosteroids needed to control reactions; plasma concentration of inhaled fluticasone increased by ITRACONAZOLE; metabolism of methylprednisolone possibly inhibited by ITRACONAZOLE; dexamethasone possibly reduces plasma concentration of CASPOFUNGIN—consider increasing dose of caspofungin
- Antivirals: dexamethasone possibly reduces plasma concentration of DACLATASVIR and SIMEPREVIR—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; dexamethasone possibly reduces plasma concentration of INDINAVIR, LOPINAVIR, SAQUINAVIR and TELAPREVIR; avoidance of dexamethasone (except when given as a single dose) advised by manufacturer of RILPIVIRINE; plasma concentration of inhaled and intranasal fluticasone increased by RITONAVIR—increased risk of adrenal suppression; plasma concentration of budesonide (including inhaled, intranasal, and rectal budesonide) possibly increased by
- RITONAVIR—increased risk of adrenal suppression; plasma concentration of corticosteroids possibly increased by
- RITONAVIR—increased risk of adrenal suppression; plasma concentration of *inhaled* and *intranasal* budesonide and fluticasone possibly increased by TELAPREVIR
- Aprepitant: metabolism of dexamethasone and methylprednisolone inhibited by APREPITANT (reduce dose of dexamethasone and methylprednisolone)
- Beta-blockers: corticosteroids antagonise hypotensive effect of BETA-BLOCKERS
- ► Calcium Salts: corticosteroids reduce absorption of CALCIUM SALTS
- Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of CALCIUM-CHANNEL BLOCKERS; plasma concentration of methylprednisolone increased by DILTIAZEM
- Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with CARDIAC GLYCOSIDES
- Ciclosporin: high-dose methylprednisolone increases plasma concentration of ◆ CICLOSPORIN (risk of convulsions); plasma concentration of prednisolone increased by CICLOSPORIN
- ► Clonidine: corticosteroids antagonise hypotensive effect of CLONIDINE
- Cytotoxics: possible increased risk of hepatoxicity when dexamethasone given with high-dose METHOTREXATE; dexamethasone possibly decreases plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); dexamethasone possibly reduces plasma concentration of CABOZANTINIB—manufacturer of cabozantinib advises avoid concomitant use
- Diazoxide: corticosteroids antagonise hypotensive effect of DIAZOXIDE

Corticosteroids (continued)

- Diuretics: corticosteroids antagonise diuretic effect of DIURETICS; increased risk of hypokalaemia when corticosteroids given with ACETAZOLAMIDE, LOOP DIURETICS OF THIAZIDES AND RELATED DIURETICS
- Fosaprepitant: metabolism of dexamethasone and methylprednisolone inhibited by FOSAPREPITANT (reduce dose of dexamethasone and methylprednisolone)
- Grapefruit Juice: plasma concentration of oral budesonide increased by • GRAPEFRUIT JUICE—avoid concurrent use or separate administration by as much as possible and consider reducing oral budesonide dose
- Histamine: avoidance of corticosteroids advised by manufacturer of HISTAMINE
- Methyldopa: corticosteroids antagonise hypotensive effect of METHYLDOPA
- Mifamurtide: avoidance of corticosteroids advised by manufacturer of MIFAMURTIDE
- Mifepristone: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after MIFEPRISTONE
- Moxonidine: corticosteroids antagonise hypotensive effect of MOXONIDINE
- Muscle Relaxants: corticosteroids possibly antagonise effects of PANCURONIUM and VECURONIUM
- Nitrates: corticosteroids antagonise hypotensive effect of NITRATES
- Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing OESTROGENS
- ► Sodium Benzoate: corticosteroids possibly reduce effects of SODIUM BENZOATE
- ► Sodium Phenylbutyrate: corticosteroids possibly reduce effects of SODIUM PHENYLBUTYRATE

 ► Somatropin: corticosteroids may inhibit growth-promoting
- Somatopin: Colucoscerolas may fillibit growth-promoting effect of Somatropin
 Sympathomimetics: metabolism of dexamethasone accelerated
- by EPHEDRINE

 Sympathomimetics, Beta₂: increased risk of hypokalaemia when
- Sympathomimetics, Beta₂: increased risk of hypokalaemia when corticosteroids given with high doses of BETA₂
 SYMPATHOMIMETICS
- Theophylline: increased risk of hypokalaemia when corticosteroids given with THEOPHYLLINE
- Vaccines: high doses of corticosteroids impair immune response to • VACCINES—avoid concomitant use with live vaccines
- Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of HYDRALAZINE, MINOXIDIL and SODIUM NITROPRUSSIDE

Couragins Couragins

- NOTE Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control.
- Allopurinol: anticoagulant effect of coumarins possibly enhanced by ALLOPURINOL
- Analgesics: anticoagulant effect of coumarins possibly enhanced by • NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous • DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
 - KETOROLAC (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by
- TRAMADOL; increased risk of bleeding when coumarins given with ASPIRIN (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of PARACETAMOL
- Anthelmintics: anticoagulant effect of coumarins possibly enhanced by IVERMECTIN; anticoagulant effect of warfarin possibly enhanced by • LEVAMISOLE

Coumarins (continued)

- Anti-arrhythmics: metabolism of coumarins inhibited by
 AMIODARONE (enhanced anticoagulant effect); anticoagulant effect of warfarin may be enhanced or reduced by DISOPYRAMIDE; anticoagulant effect of coumarins possibly enhanced by DRONEDARONE; anticoagulant effect of coumarins enhanced by PROPAFENONE
- Antibacterials: experience in anticoagulant clinics suggests
 that INR possibly altered when coumarins are given with
 NEOMYCIN (given for local action on gut); anticoagulant
 effect of coumarins possibly enhanced by ◆AZITHROMYCIN,
 ◆AZTREONAM, ◆CEPHALOSPORINS, CIPROFLOXACIN,
 LEVOFLOXACIN, ◆TETRACYCLINES, TIGECYCLINE and
 TRIMETHOPRIM; anticoagulant effect of coumarins enhanced
 - by CHLORAMPHENICOL, CLARITHROMYCIN, ERYTHROMYCIN, • METRONIDAZOLE, • NALIDIXIC ACID, • NORFLOXACIN,
- OFLOXACIN and SULFONAMIDES; plasma concentration of warfarin possibly increased by ORITAVANCIN; an interaction between coumarins and broad-spectrum PENICILLINS has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of coumarins accelerated by ● RIFAMYCINS (reduced anticoagulant effect)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● APIXABAN, ● DABIGATRAN and
 RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: anticoagulant effect of warfarin possibly enhanced by ◆ VENLAFAXINE; anticoagulant effect of warfarin may be enhanced or reduced by TRAZODONE; anticoagulant effect of coumarins possibly enhanced by ◆ SSRIS; anticoagulant effect of coumarins reduced by ◆ ST JOHN'S WORT (avoid concomitant use); anticoagulant effect of warfarin enhanced by MIRTAZAPINE; anticoagulant effect of coumarins may be enhanced or reduced by ◆ TRICYCLICS
- Antidiabetics: anticoagulant effect of warfarin possibly enhanced by EXENATIDE; coumarins possibly enhance hypoglycaemic effect of ◆SULFONYLUREAS, also possible changes to anticoagulant effect
- Antiepileptics: metabolism of coumarins accelerated by
 CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (reduced anticoagulant effect); plasma concentration of warfarin reduced by ESLICARBAZEPINE; metabolism of coumarins accelerated by FOSPHENYTOIN and PHENYTOIN (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by SODIUM VALPROATE and VALPROIC ACID
- Antifungals: anticoagulant effect of coumarins enhanced by
- FLUCONAZOLE, ITRACONAZOLE, KETOCONAZOLE and ● VORICONAZOLE; anticoagulant effect of coumarish enhanced
- Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by PROGUANIL; plasma concentration of both drugs increased when warfarin given with QUININF
- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by ATAZANAVIR, ● NEVIRAPINE and ● RITONAVIR; plasma concentration of coumarins possibly affected by ● EFAVIRENZ; anticoagulant effect of coumarins may be enhanced or reduced by FOSAMPRENAVIR; anticoagulant effect of coumarins possibly enhanced by ● RITONAVIR; anticoagulant effect of warfarin possibly enhanced by SAQUINAVIR; plasma concentration of warfarin possibly affected by ● TELAPREVIR
- Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by CHLORAL
- Aprepitant: anticoagulant effect of warfarin possibly reduced by APREPITANT
- Azathioprine: anticoagulant effect of coumarins possibly reduced by • AZATHIOPRINE
- Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of BOSENTAN

Coumarins (continued)

- Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of • CLOPIDOGREL; avoidance of warfarin advised by manufacturer of • CLOPIDOGREL
- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by

 CORTICOSTEROIDS (high-dose corticosteroids enhance anticoagulant effect)
- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by • CRANBERRY JUICE—avoid concomitant use
- Cytotoxics: anticoagulant effect of coumarins possibly enhanced by ● ETOPOSIDE, ● IFOSFAMIDE and ● SORAFENIB; anticoagulant effect of coumarins enhanced by
 - CAPECITABINE, FLUOROURACIL and TEGAFUR; anticoagulant effect of warfarin possibly enhanced by GEFITINIB, GEMCITABINE and VEMURAFENIB; anticoagulant effect of coumarins possibly reduced by MERCAPTOPURINE and
 - MITOTANE; plasma concentration of warfarin reduced by DABRAFENIB; increased risk of bleeding when coumarins given with FELOTINIB; avoidance of coumarins advised by manufacturer of IBRUTINIB; replacement of warfarin with a heparin advised by manufacturer of IMATINIB (possibility of enhanced warfarin effect); increased risk of bleeding when warfarin given with REGORAFENIB
- Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of • DIPYRIDAMOLE
- Disulfiram: anticoagulant effect of coumarins enhanced by
 DISULFIRAM
- Dopaminergics: anticoagulant effect of warfarin enhanced by
 ENTACAPONE
- Fosaprepitant: anticoagulant effect of warfarin possibly reduced by FOSAPREPITANT
- Glucosamine: anticoagulant effect of warfarin enhanced by
 GLUCOSAMINE (avoid concomitant use)
- Hormone Antagonists: anticoagulant effect of coumarins
 possibly enhanced by BICALUTAMIDE and ◆ TOREMIFENE;
 metabolism of coumarins inhibited by ◆ DANAZOL (enhanced
 anticoagulant effect); plasma concentration of coumarins
 possibly reduced by ◆ ENZALUTAMIDE; anticoagulant effect of
 coumarins enhanced by ◆ FLUTAMIDE and ◆ TAMOXIFEN
- ► Iloprost: anticoagulant effect of coumarins possibly enhanced by ILOPROST
- ► Lactulose: anticoagulant effect of coumarins possibly enhanced by LACTULOSE
- ► Leflunomide: anticoagulant effect of warfarin possibly enhanced by LEFLUNOMIDE
- Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by ZAFIRLUKAST
- Levocarnitine: anticoagulant effect of coumarins possibly enhanced by LEVOCARNITINE
- Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by ◆COLESTYRAMINE; anticoagulant effect of warfarin may be transiently reduced by ATORYASTATIN; anticoagulant effect of coumarins enhanced by
- FIBRATES and FLUVASTATIN; anticoagulant effect of coumarins possibly enhanced by EZETIMIBE and
- ROSUVASTATIN; anticoagulant effect of coumarins can be enhanced by SIMVASTATIN; anticoagulant effect of warfarin possibly enhanced by LOMITAPIDE
- Memantine: anticoagulant effect of warfarin possibly enhanced by MEMANTINE
- Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by OESTROGENS
- enhanced or reduced by OESTROGENS
 Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of ORLISTAT
- Prasugrel: possible increased risk of bleeding when coumarins given with PRASUGREL
- Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by PROGESTOGENS
- Raloxifene: anticoagulant effect of coumarins antagonised by RALOXIFENE
- Retinoids: anticoagulant effect of coumarins possibly reduced by • ACITRETIN
- Sulfinpyrazone: anticoagulant effect of coumarins enhanced by • SULFINPYRAZONE

Coumarins (continued)

- Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by • METHYLPHENIDATE
- Testolactone: anticoagulant effect of coumarins enhanced by
 TESTOLACTONE
- Testosterone: anticoagulant effect of coumarins enhanced by
 TESTOSTERONE
- Thyroid Hormones: anticoagulant effect of coumarins enhanced by THYROID HORMONES
- Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by UBIDECARENONE
- Ulcer-healing Drugs: metabolism of coumarins inhibited by
 ○CIMETIDINE (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by ESOMEPRAZOLE and OMEPRAZOLE; anticoagulant effect of coumarins might be enhanced by PANTOPRAZOLE; absorption of coumarins possibly reduced by SUCRALFATE (reduced anticoagulant effect)
- Vaccines: anticoagulant effect of warfarin possibly enhanced by INFLUENZA VACCINE
- Vitamins: anticoagulant effect of coumarins possibly enhanced by ● VITAMIN E; anticoagulant effect of coumarins antagonised by ● VITAMIN K

Cranberry Juice

- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of • COUMARINS—avoid concomitant use
 Crizotinib
- Analgesics: manufacturer of crizotinib advises caution with
 ALFENTANIL and FENTANYL
- Antibacterials: plasma concentration of crizotinib possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by RIFABUTIN—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by • RIFAMPICIN—manufacturer of crizotinib advises avoid concomitant use
- Antidepressants: plasma concentration of crizotinib possibly reduced by ST JOHN'S WORT—manufacturer of crizotinib advises avoid concomitant use
- Antiepileptics: plasma concentration of crizotinib possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of crizotinib advises avoid concomitant use
- Antifungals: plasma concentration of crizotinib increased by
 KETOCONAZOLE—avoid concomitant use; plasma concentration of crizotinib possibly increased by
- Antimalarials: possible increased risk of bradycardia when crizotinib given with MFFLOQUINE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with
- Antivirals: plasma concentration of crizotinib possibly increased by ● ATAZAMAVIR, ● INDINAVIR, ● RITONAVIR and ● SAQUINAVIR—manufacturer of crizotinib advises avoid concomitant use
- Beta-blockers: possible increased risk of bradycardia when crizotinib given with BETA-BLOCKERS
- Calcium-channel Blockers: possible increased risk of bradycardia when crizotinib given with DILTIAZEM or VERAPAMIL
- Cardiac Glycosides: possible increased risk of bradycardia when crizotinib given with DIGOXIN
- Ciclosporin: manufacturer of crizotinib advises caution with
 CICLOSPORIN
- Clonidine: possible increased risk of bradycardia when crizotinib given with CLONIDINE
- Cytotoxics: crizotinib possibly increases the plasma concentration of ●IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Ergot Alkaloids: manufacturer of crizotinib advises caution with FRGOT ALKALOIDS

Crizotinib (continued)

- Grapefruit Juice: plasma concentration of crizotinib possibly increased by • GRAPEFRUIT JUICE—manufacturer of crizotinib advises avoid concomitant use
- . Oestrogens: manufacturer of crizotinib advises contraceptive effect of • OESTROGENS possibly reduced
- Parasympathomimetics: possible increased risk of bradycardia when crizotinib given with PILOCARPINE
- · Progestogens: manufacturer of crizotinib advises
- contraceptive effect of PROGESTOGENS possibly reduced • Sirolimus: manufacturer of crizotinib advises caution with
- Tacrolimus: manufacturer of crizotinib advises caution with TACROLIMUS

Cyclizine see Antihistamines

Cyclopenthiazide see Diuretics

Cyclopentolate see Antimuscarinics

Cyclophosphamide

- Antifungals: side-effects of cyclophosphamide possibly increased by FLUCONAZOLE and ITRACONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: cyclophosphamide possibly reduces absorption of DIGOXIN tablets
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with • PENTOSTATIN—avoid concomitant use
- Muscle Relaxants: cyclophosphamide enhances effects of SIIXAMETHONIIIM

Cvcloserine

- Alcohol: increased risk of convulsions when cycloserine given with • ALCOHOL
- Antibacterials: increased risk of CNS toxicity when cycloserine given with ISONIAZID
- ▶ Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Cyproheptadine see Antihistamines

Cytarabine

- Antifungals: cytarabine possibly reduces plasma concentration of FLUCYTOSINE
- · Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: cytarabine possibly reduces absorption of **DIGOXIN** tablets
- Cytotoxics: intracellular concentration of cytarabine increased by Fludarabine

Cytotoxics see individual drugs

Dabigatran

- · Analgesics: possible increased risk of bleeding when dabigatran given with . NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous
 - DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with . KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: plasma concentration of dabigatran increased by • AMIODARONE (see under Dabigatran Etexilate, p. 117); plasma concentration of dabigatran increased by
 - DRONEDARONE—avoid concomitant use
- Antibacterials: possible increased risk of bleeding when dabigatran given with CLARITHROMYCIN; plasma concentration of dabigatran reduced by . RIFAMPICIN-manufacturer of dabigatran advises avoid concomitant use
- · Anticoagulants: increased risk of haemorrhage when dabigatran given with other • ANTICOAGULANTS (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with • APIXABAN and • RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: possible increased risk of bleeding when dabigatran given with • SSRI-RELATED ANTIDEPRESSANTS or
 - SSRIS; plasma concentration of dabigatran possibly reduced

Dabigatran

- Antidepressants (continued) by ST JOHN'S WORT-manufacturer of dabigatran advises avoid concomitant use
- Antiepileptics: plasma concentration of dabigatran possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOINmanufacturer of dabigatran advises avoid concomitant use
- Antifungals: plasma concentration of dabigatran increased by • KETOCONAZOLE—avoid concomitant use; manufacturer of dabigatran advises avoid concomitant use with ITRACONAZOLE
- Antivirals: plasma concentration of dabigatran possibly increased by RILPIVIRINE and TELAPREVIR
- Calcium-channel Blockers: plasma concentration of dabigatran possibly increased by • VERAPAMIL (see under Dabigatran Etexilate, p. 117)
- Ciclosporin: plasma concentration of dabigatran possibly increased by • CICLOSPORIN—manufacturer of dabigatran advises avoid concomitant use
- Sulfinpyrazone: possible increased risk of bleeding when dabigatran given with • SULFINPYRAZONE
- Tacrolimus: plasma concentration of dabigatran possibly increased by • TACROLIMUS—manufacturer of dabigatran advises avoid concomitant use
- · Ticagrelor: plasma concentration of dabigatran increased by TICAGRELOR
- Ulipristal: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after ULIPRISTAL

Dahrafenih

- Antibacterials: manufacturer of dabrafenib advises avoid concomitant use with RIFAMPICIN
- Anticoagulants: dabrafenib reduces plasma concentration of
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with ST JOHN'S WORT
- Antiepileptics: manufacturer of dabrafenib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of dabrafenib increased by KETOCONAZOI E
- · Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- ▶ Lipid-regulating Drugs: plasma concentration of dabrafenib increased by GEMFIBROZIL
- Oestrogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing • OESTROGENS possibly reduced (alternative contraceptive recommended)
- Progestogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing • PROGESTOGENS possibly reduced (alternative contraceptive recommended)
- Ulcer-healing Drugs: manufacturer of dabrafenib advises avoid concomitant use with PROTON PUMP INHIBITORS (plasma concentration of dabrafenib possibly reduced)

- · Aldesleukin: avoidance of dacarbazine advised by manufacturer of • ALDESLEUKIN
- Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)

Daclatasvir

- · Anti-arrhythmics: possible increased risk of bradycardia when daclatasvir (with sofosbuvir) given with • AMIODARONE—see under Amiodarone, p. 88
- Antibacterials: plasma concentration of daclatasvir possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN—reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of daclatasvir possibly reduced by
 - RIFABUTIN—manufacturer of daclatasvir advises avoid concomitant use; plasma concentration of daclatasvir reduced by • RIFAMPICIN—avoid concomitant use
- Antidepressants: plasma concentration of daclatasvir possibly reduced by ST JOHN'S WORT—manufacturer of daclatasvir advises avoid concomitant use · Antiepileptics: plasma concentration of daclatasvir possibly
 - reduced by CARBAMAZEPINE, FOSPHENYTOIN,
- OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and

Daclatasvir

- Antiepileptics (continued)
- PRIMIDONE—manufacturer of daclatasvir advises avoid concomitant use
- Antifungals: plasma concentration of daclatasvir increased by
 KETOCONAZOLE—reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of daclatasvir possibly increased by © ITRACONAZOLE, © POSACONAZOLE and
 VORICONAZOLE—reduce dose of daclatasvir (see under Daclatasvir, p. 544)
- Antivirals: plasma concentration of daclatasvir increased by
 ATAZANAVIR and TELAPREVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of daclatasvir possibly increased by BOCEPREVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); manufacturer of daclatasvir advises avoid concomitant use with DARUNAVIR and LOPINAVIR (plasma concentration of daclatasvir possibly increased); plasma concentration of daclatasvir reduced by
 EFAVIRENZ—increase dose of daclatasvir (see under Daclatasvir, p. 544); manufacturer of daclatasvir advises avoid concomitant use with ETRAVIRINE and NEVIRAPINE (plasma concentration of daclatasvir possibly reduced)
- Cardiac Glycosides: daclatasvir increases plasma concentration of ● DIGOXIN
- Cobicistat: plasma concentration of daclatasvir possibly increased by ◆ COBICISTAT—reduce dose of daclatasvir (see under Daclatasvir, p. 544)
- Corticosteroids: plasma concentration of daclatasvir possibly reduced by DEXAMETHASONE—manufacturer of daclatasvir advises avoid concomitant use
- Lipid-regulating Drugs: daclatasvir increases plasma concentration of ROSUVASTATIN

Dactinomycin

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vitamins: dactinomycin possibly reduces effects of ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL and VITAMIN D

Dairy Products

- Antibacterials: dairy products reduce absorption of CIPROFLOXACIN and NORFLOXACIN; dairy products reduce absorption of TETRACYCLINES (except doxycycline and minocycline)
- Cytotoxics: dairy products possibly reduce plasma concentration of MERCAPTOPURINE—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products
- ► Eltrombopag: dairy products possibly reduce absorption of ELTROMBOPAG (give at least 4 hours apart)

Dalteparin see Heparins

Danaparoid

- - \bullet KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● APIXABAN, ● DABIGATRAN and ● RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to

maintain catheter patency)

- Anticoagulants: danazol inhibits metabolism of COUMARINS (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of
- CARBAMAZEPINE (increased risk of toxicity)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with • SIMVASTATIN—avoid concomitant use
- Tacrolimus: danazol possibly increases plasma concentration of TACROLIMUS

Dantrolene see Muscle Relaxants

Dapagliflozin see Antidiabetics

Dapoxetine

- Alcohol: increased sedative effect when dapoxetine given with
 ALCOHOL
- Analgesics: possible increased risk of serotonergic effects
 when dapoxetine given with TRAMADOL (manufacturer of
 dapoxetine advises tramadol should not be started until 1
 week after stopping dapoxetine, avoid dapoxetine for 2 weeks
 after stopping tramadol)
- Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with CLARITHROMYCIN and ERYTHROMYCIN (see under Dapoxetine, p. 703); manufacturer of dapoxetine advises avoid concomitant use with
 - TELITHROMYCIN (increased risk of toxicity)
- Antidepressants: possible increased risk of serotonergic effects when dapoxetine given with

 SSRIS,

 ST JOHN'S WORT,
 - DULOXETINE, ●TRICYCLICS and VENLAFAXINE (manufacturer of dapoxetine advises SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine); increased risk of serotonergic effects when dapoxetine given with MAOIS (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- Antifungals: plasma concentration of dapoxetine increased by

 KETOCONAZOLE—manufacturer of dapoxetine advises avoid concomitant use; manufacturer of dapoxetine advises dose reduction when dapoxetine given with FLUCONAZOLE (see under Dapoxetine, p. 703); manufacturer of dapoxetine advises avoid concomitant use with ITRACONAZOLE (increased risk of toxicity)
- Antivirals: manufacturer of dapoxetine advises avoid concomitant use with • ATAZANAVIR, • RITONAVIR and
- SAQUINAVIR (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with FOSAMPRENAVIR (see under Dapoxetine, p. 703)
- Aprepitant: manufacturer of dapoxetine advises dose reduction when dapoxetine given with APREPITANT (see under Dapoxetine, p. 703)
- Calcium-channel Blockers: manufacturer of dapoxetine advises dose reduction when dapoxetine given with DILTIAZEM and VERAPAMIL (see under Dapoxetine, p. 703)
- 5HT₁-receptor Agonists: possible increased risk of serotonergic effects when dapoxetine given with • 5HT₁ AGONISTS (manufacturer of dapoxetine advises 5HT₁ agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT₁ agonists)
- Lithium: possible increased risk of serotonergic effects when dapoxetine given with • LITHIUM (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with SILDENAFIL
- Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with TADALAFIL
- Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with VARDENAFIL

Dapsone

- Antibacterials: plasma concentration of dapsone reduced by RIFAMYCINS; plasma concentration of both drugs may increase when dapsone given with TRIMETHOPRIM
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with • SAQUINAVIR—avoid concomitant use
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Daptomycin

- Ciclosporin: increased risk of myopathy when daptomycin given with • CICLOSPORIN (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with ● FIBRATES or ● STATINS (preferably avoid concomitant use)

Daptomycin (continued)

 Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Darifenacin see Antimuscarinics

Darunavir

- Anti-arrhythmics: darunavir possibly increases plasma concentration of LIDOCAINE—avoid concomitant use
- Antibacterials: darunavir increases plasma concentration of
- RIFABUTIN (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by RIFAMPICIN—avoid concomitant use
- Anticoagulants: avoidance of darunavir advised by manufacturer of APIXABAN and RIVAROXABAN
- Antidepressants: darunavir possibly reduces plasma concentration of PAROXETINE and SERTRALINE; plasma concentration of darunavir reduced by • ST JOHN'S WORT avoid concomitant use
- Antiepileptics: plasma concentration of darunavir possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of both drugs increased when darunavir given with KETOCONAZOLE
- Antimalarials: plasma concentration of lumefantrine increased when darunavir given with ARTEMETHER WITH LUMEFANTRINE; darunavir possibly increases plasma concentration of
 QUINNIE (increased risk of toxicity)
- Antipsychotics: darunavir possibly increases plasma concentration of ◆ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); darunavir possibly increases plasma concentration of
- QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- · Antivirals: avoid concomitant use of darunavir with
- BOCEPREVIR or TELAPREVIR; avoidance of darunavir advised by manufacturer of DACLATASVIR (plasma concentration of daclatasvir possibly increased); manufacturer of darunavir advises take DIDANOSINE 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by
- EFAVIRENZ (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with INDINAVIR; plasma concentration of darunavir reduced by LOPINAVIR, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); increased risk of rash when darunavir given with RALTEGRAVIR; plasma concentration of darunavir reduced by SAQUINAVIR; plasma concentration of both drugs increased when darunavir given with SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use
- Cytotoxics: darunavir possibly increases the plasma concentration of ● BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; darunavir possibly increases plasma concentration of
- EVEROLIMUS—manufacturer of everolimus advises avoid concomitant use; darunavir possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Ergot Alkaloids: increased risk of ergotism when darunavir given with • ERGOT ALKALOIDS—manufacturer of darunavir advises avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy
 when darunavir given with ATORVASTATIN; darunavir possibly
 increases plasma concentration of PRAVASTATIN; darunavir
 increases plasma concentration of ROSUVASTATIN adjust
 dose of rosuvastatin (consult product literature); avoidance
 of darunavir advised by manufacturer of LOMITAPIDE
 (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of darunavir possibly reduced by
 ORLISTAT
- Ranolazine: darunavir possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use

Dasatini

 Antibacterials: manufacturer of dasatinib advises avoid concomitant use with CLARITHROMYCIN, ERYTHROMYCIN and

Dasatinib

- Antibacterials (continued)
- TELITHROMYCIN (plasma concentration of dasatinib possibly increased); metabolism of dasatinib accelerated by
- RIFAMPICIN (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: manufacturer of dasatinib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (plasma concentration of dasatinib possibly reduced)
- Antifungals: plasma concentration of dasatinib possibly increased by KETOCONAZOLE; manufacturer of dasatinib advises avoid concomitant use with ITRACONAZOLE (plasma concentration of dasatinib possibly increased)
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of dasatinib advised by manufacturer of
 BOCEPREVIR; manufacturer of dasatinib advises avoid concomitant use with RITONAVIR (plasma concentration of dasatinib possibly increased)
- Grapefruit Juice: manufacturer of dasatinib advises avoid concomitant use with GRAPEFRUIT JUICE (plasma concentration of dasatinib possibly increased)
- Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of SIMVASTATIN
- Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by FAMOTIDINE

Decitabine

• Antipsychotics: avoid concomitant use of cytotoxics with

• CLOZAPINE (increased risk of agranulocytosis)

Deferasiro

- Aminophylline: deferasirox increases plasma concentration of
 AMINOPHYLLINE (consider reducing dose of aminophylline)
- Antacids: absorption of deferasirox possibly reduced by ANTACIDS containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
- Antibacterials: plasma concentration of deferasirox reduced by RIFAMPICIN
- Antidiabetics: deferasirox increases plasma concentration of REPAGLINIDE
- Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with CLOZAPINE
- Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of MIDAZOLAM
- Muscle Relaxants: manufacturer of deferasirox advises avoid concomitant use with TIZANIDINE
- Theophylline: deferasirox increases plasma concentration of
 THEOPHYLLINE (consider reducing dose of theophylline)

Deferiprone

 Antacids: absorption of deferiprone possibly reduced by ANTACIDS containing aluminium (manufacturer of deferiprone advises avoid concomitant use)

Deflazacort see Corticosteroids

Delamanid

- Analgesics: increased risk of ventricular arrhythmias when delamanid given with

 METHADONE
- Anti-arrhythmics: increased risk of ventricular arrhythmias when delamanid given with ● AMIODARONE or ● DISOPYRAMIDE
- Antibacterials: possible increased risk of ventricular arrhythmias when delamanid given with ● CLARITHROMYCIN and ● ERYTHROMYCIN; increased risk of ventricular arrhythmias when delamanid given with ● MOXIFLOXACIN; plasma concentration of delamanid reduced by ● RIFAMPICIN; delamanid increases plasma concentration of ETHAMBUTOL
- Antidepressants: possible increased risk of ventricular arrhythmias when delamanid given with • TRICYCLICS that prolong the QT interval
- Antiepileptics: manufacturer of delamanid advises avoid concomitant use with CARBAMAZEPINE
- Antipsychotics: increased risk of ventricular arrhythmias when delamanid given with ● DROPERIDOL, ● HALOPERIDOL or ● PIMOZIDE; increased risk of ventricular arrhythmias when delamanid given with ● PHENOTHIAZINES that prolong the QT interval

Delamanid (continued)

- Antivirals: plasma concentration of delamanid increased by LOPINAVIR and RITONAVIR; increased risk of ventricular arrhythmias when delamanid given with SAQUINAVIR
- Beta-blockers: increased risk of ventricular arrhythmias when delamanid given with • SOTALOL
- VINDESINE and VINORELBINE
- Domperidone: possible increased risk of ventricular arrhythmias when delamanid given with • DOMPERIDONE
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when delamanid given with • PENTAMIDINE ISETIONATE
- ► Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Demeclocycline see Tetracyclines

Desferrioxamine

 Antipsychotics: avoidance of desferrioxamine advised by manufacturer of LEVOMEPROMAZINE; manufacturer of desferrioxamine advises avoid concomitant use with PROCHLORPERAZINE

Desflurane *see* Anaesthetics, General **Desloratadine** *see* Antihistamines

Desmopressin

- ► Analgesics: effects of desmopressin enhanced by INDOMETACIN
- Loperamide: plasma concentration of oral desmopressin increased by LOPERAMIDE

Desogestrel see Progestogens

Dexamethasone see Corticosteroids

Dexamfetamine see Sympathomimetics

Dexibuprofen see NSAIDs

Dexketoprofen see NSAIDs

Dexrazoxane

- Antiepileptics: dexrazoxane possibly reduces absorption of
- FOSPHENYTOIN and PHENYTOIN
- Ciclosporin: manufacturer of dexrazoxane advises increased risk of immunosuppression with CICLOSPORIN
- Tacrolimus: manufacturer of dexrazoxane advises increased risk of immunosuppression with TACROLIMUS
- Vaccines: risk of generalised infections when dexrazoxane given with live • VACCINES—avoid concomitant use

Dextromethorphan see Opioid Analgesics

Dextropropoxyphene see Opioid Analgesics

Diamorphine see Opioid Analgesics

Diazepam see Anxiolytics and Hypnotics Diazoxide

- ► ACE Inhibitors: enhanced hypotensive effect when diazoxide given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when diazoxide given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when diazoxide given with ALDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when diazoxide given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when diazoxide given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of diazoxide antagonised by NSAIDS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when diazoxide given with MAOIS or TRICYCLIC-RELATED ANTIDEPRESSANTS
- Antidiabetics: diazoxide antagonises hypoglycaemic effect of ANTIDIABETICS
- Antiepileptics: diazoxide reduces plasma concentration of FOSPHENYTOIN and PHENYTOIN, also effect of diazoxide may be reduced
- Antipsychotics: enhanced hypotensive effect when diazoxide given with PHENOTHIAZINES

Diazoxide (continued)

- Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when diazoxide given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with CALCIUM-CHANNEL BLOCKERS
- ► Clonidine: enhanced hypotensive effect when diazoxide given with CLONIDINE
- Corticosteroids: hypotensive effect of diazoxide antagonised by CORTICOSTEROIDS
- Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when diazoxide given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Methyldopa: enhanced hypotensive effect when diazoxide given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when diazoxide given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when diazoxide given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when diazoxide given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when diazoxide given with NITRATES
- Prostaglandins: enhanced hypotensive effect when diazoxide given with ALPROSTADIL
- Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Diclofenac see NSAIDs

Dicycloverine see Antimuscarinics

Didanosine

NOTE Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart

- · Allopurinol: plasma concentration of didanosine increased by
- ALLOPURINOL (risk of toxicity)—avoid concomitant use
- Analgesics: plasma concentration of didanosine possibly reduced by METHADONE
- Antibacterials: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after NORFLOXACIN
- Antivirals: didanosine tablets reduce absorption of ATAZANAVIR (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after DARUNAVIR; plasma concentration of didanosine possibly increased by GANCICLOVIR and VALGANCICLOVIR; didanosine tablets reduce absorption of INDINAVIR (give at least 1 hour apart); increased risk of side-effects when didanosine given with • RIBAVIRINavoid concomitant use; manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after RILPIVIRINE; manufacturer of ritonavir advises didanosine and RITONAVIR should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with • STAVUDINE; plasma concentration of didanosine increased by • TENOFOVIR (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by TIPRANAVIRmanufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart
- Cytotoxics: increased risk of toxicity when didanosine given with • HYDROXYCARBAMIDE—avoid concomitant use
- Orlistat: absorption of didanosine possibly reduced by
 ORLISTAT

Dienogest see Progestogens

Diethylcarbamazine

 Antacids: excretion of diethylcarbamazine increased by SODIUM BICARBONATE

Digoxin see Cardiac Glycosides

Dihydrocodeine see Opioid Analgesics

Dihydrotachysterol see Vitamins

Diltiazem see Calcium-channel Blockers

Dimethyl sulfoxide

Analgesics: avoid concomitant use of dimethyl sulfoxide with
 SULINDAC

Dinoprostone see Prostaglandins

Diphenoxylate see Opioid Analgesics Diphtheria Vaccines see Vaccines Dipipanone see Opioid Analgesics

Dipyridamole

- Antacids: absorption of dipyridamole possibly reduced by ANTACIDS
- Anti-arrhythmics: dipyridamole enhances and extends effect of
 ADENOSINE (important risk of toxicity)—reduce dose of adenosine, see p. 87
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of • COUMARINS and • PHENINDIONE; dipyridamole enhances anticoagulant effect of HEPARINS
- Clopidogrel: increased risk of bleeding when dipyridamole given with CLOPIDOGREL
- Cytotoxics: dipyridamole possibly reduces effects of FLUDARABINE

Disopyramide

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE or ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when antiarrhythmics given with other ◆ANTi-ARRHYTHMICS; increased risk of ventricular arrhythmias when disopyramide given with
 ◆AMIODARONE or ◆ DRONEDARONE—avoid concomitant use
- Antibacterials: plasma concentration of disopyramide possibly increased by AZITHROMYCIN (increased risk of toxicity); plasma concentration of disopyramide possibly increased by
- CLARITHROMYCIN (increased risk of ventricular arrhythmias); plasma concentration of disopyramide increased by
- ERYTHROMYCIN (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with
- MOXIFLOXACIN—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with
- DELAMANID; metabolism of disopyramide accelerated by
 RIFAMYCINS (reduced plasma concentration); possible increased risk of ventricular arrhythmias when disopyramide
- given with TELITHROMYCIN

 Anticoagulants: disopyramide may enhance or reduce anticoagulant effect of WARFARIN
- Antidepressants: avoidance of disopyramide advised by manufacturer of ● CITALOPRAM and ● ESCITALOPRAM (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with ● TRICYCLICS
- Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of GLICLAZIDE, INSULIN and METFORMIN
- Antiepileptics: plasma concentration of disopyramide reduced by FOSPHENYTOIN and PHENYTOIN; metabolism of disopyramide accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)
- Antifungals: increased risk of ventricular arrhythmias when disopyramide given with • KETOCONAZOLE—avoid concomitant use; avoidance of disopyramide advised by manufacturer of • ITRACONAZOLE
- Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with • MIZOLASTINE—avoid concomitant use
- Antimalarials: avoidance of disopyramide advised by manufacturer of ● ARTEMETHER WITH LUMEFANTRINE (risk of ventricular arrhythmias); avoidance of disopyramide advised by manufacturer of ● ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antimuscarinics: increased risk of antimuscarinic side-effects when disopyramide given with ANTIMUSCARINICS; increased risk of ventricular arrhythmias when disopyramide given with
 TOLIFERDINE
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
- ANTIPSYCHOTICS that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with
- AMISULPRIDE, DROPERIDOL, PIMOZIDE or
- ZUCLOPENTHINOL—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with HALOPERIDOL—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with

PHENOTHIAZINES or ● SULPIRIDE

Disopyramide (continued)

- Antivirals: plasma concentration of disopyramide possibly increased by ●RITONAVIR (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with ●SAQUINAVIR—avoid concomitant use; avoidance of disopyramide advised by manufacturer of ●TELAPREVIR (risk of ventricular arrhythmias)
- Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with ● ATOMOXETINE
- Beta-blockers: increased myocardial depression when antiarrhythmics given with
 BETA-BLOCKERS; increased risk of ventricular arrhythmias when disopyramide given with
 SOTALOL—avoid concomitant use
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with
 VERAPAMIL
- Cytotoxics: possible increased risk of ventricular arrhythmias when disopyramide given with BOSUTINIB; possible increased risk of ventricular arrhythmias when disopyramide given with VANDETANIB—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with ARSENIC TRIOXIDE
- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with ● ACETAZOLAMIDE, ● LOOP DIURETICS or ● THIAZIDES AND RELATED DIURETICS
- Fingolimod: possible increased risk of bradycardia when disopyramide given with • FINGOLIMOD
- Ivabradine: increased risk of ventricular arrhythmias when disopyramide given with • IVABRADINE
- Nitrates: disopyramide reduces effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)
- Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when disopyramide given with
 PENTAMIDINE ISETIONATE
- Ranolazine: avoidance of disopyramide advised by manufacturer of • RANOLAZINE
- Sildenafil: manufacturer of disopyramide advises avoid concomitant use with SILDENAFIL (risk of ventricular arrhythmias)
- Tadalafil: manufacturer of disopyramide advises avoid concomitant use with TADALAFIL (risk of ventricular arrhythmias)
- Vardenafil: manufacturer of disopyramide advises avoid concomitant use with VARDENAFIL (risk of ventricular arrhythmias)

Disulfiram

- ► Alcohol: disulfiram reaction when disulfiram given with
- Aminophylline: disulfiram inhibits metabolism of AMINOPHYLLINE (increased risk of toxicity)
- Antibacterials: psychotic reaction reported when disulfiram given with METRONIDAZOLE; CNS effects of disulfiram possibly increased by ISONIAZID
- Anticoagulants: disulfiram enhances anticoagulant effect of
 COUMARINS
- Antidepressants: increased disulfiram reaction with alcohol reported with concomitant AMITRIPTYLINE; disulfiram inhibits metabolism of TRICYCLICS (increased plasma concentration)
- Antiepileptics: disulfiram inhibits metabolism of
- FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Anxiolytics and Hypnotics: disulfiram increases risk of TEMAZEPAM toxicity; disulfiram inhibits metabolism of BENZODIAZEPINES (increased sedative effects)
- Paraldehyde: risk of toxicity when disulfiram given with
 PARALDEHYDE
- ► Theophylline: disulfiram inhibits metabolism of THEOPHYLLINE (increased risk of toxicity)

Diuretics

NOTE Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind NOTE Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind

Diuretics (continued)

- ACE Inhibitors: enhanced hypotensive effect when diuretics given with ACE INHIBITORS; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when diuretics given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when diuretics given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when diuretics given with ALDESLEUKIN
- Aliskiren: plasma concentration of furosemide reduced by ALISKIREN; increased risk of hyperkalaemia when potassiumsparing diuretics and aldosterone antagonists given with ALISKIPEN
- Allopurinol: increased risk of hypersensitivity when thiazides and related diuretics given with ALLOPURINOL especially in renal impairment
- Alpha-blockers: enhanced hypotensive effect when diuretics given with

 ALPHA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Aminophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with AMINOPHYLLINE
- Anaesthetics, General: enhanced hypotensive effect when diuretics given with GENERAL ANAESTHETICS
- Analgesics: diuretics increase risk of nephrotoxicity of NSAIDs, also antagonism of diuretic effect; diuretic effect of potassium canrenoate possibly antagonised by NSAIDs; possible increased risk of hyperkalaemia when potassiumsparing diuretics and aldosterone antagonists given with NSAIDs; furosemide possibly increases the excretion of ACEMETACIN; effects of diuretics antagonised by INDOMETACIN and KETOROLAC; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with INDOMETACIN; occasional reports of reduced renal function when triamterene given with • INDOMETACIN—avoid concomitant use; increased risk of toxicity when acetazolamide given with high-dose . ASPIRIN; diuretic effect of spironolactone antagonised by ASPIRIN; possible increased risk of toxicity when loop diuretics given with high-dose ASPIRIN (also possible reduced effect of loop diuretics)
- Angiotensin-II Receptor Antagonists: enhanced hypotensive
 effect when diuretics given with ANGIOTENSIN-II RECEPTOR
 ANTAGONISTS; increased risk of hyperkalaemia when
 potassium-sparing diuretics and aldosterone antagonists
 given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with AMIODARONE; plasma concentration of eplerenone increased by AMIODARONE (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with DISOPYRAMIDE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with FLECANIDE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of LIDOCAINE
- Antibacterials: plasma concentration of eplerenone increased by ● CLARITHROMYCIN and ● TELITHROMYCIN—avoid concomitant use; plasma concentration of eplerenone increased by ERYTHROMYCIN (reduce dose of eplerenone); plasma concentration of eplerenone reduced by
- RIFAMPICIN—avoid concomitant use; avoidance of diuretics advised by manufacturer of LYMECYCLINE; increased risk of otoxicity when loop diuretics given with AMINOGLYCOSIDES,
- OUDXICHY WHEN TOOP INTEREES given with *AMINOGEVENDES, *POLYMYXINS OF *VANCOMYCIN; acetazolamide antagonises effects of *METHENAMINE; possible increased risk of hyperkalaemia when spironolactone given with TRIMETHOPRIM; increased risk of hyperkalaemia when eplerenone given with TRIMETHOPRIM
- Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with REBOXETINE; enhanced hypotensive effect when diuretics

Diuretics

- Antidepressants (continued)
 given with MADIS; plasma concentration of eplerenone
 reduced by STJOHN'S WORT—avoid concomitant use;
 increased risk of postural hypotension when diuretics given
 with TRICYCLICS
- Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of ANTIDIABETICS; diuretic effect of diuretics possibly enhanced by CANAGLIFLOZIN; avoidance of loop diuretics advised by manufacturer of CANAGLIFLOZIN; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by DAPAGLIFLOZIN
- Antiepileptics: plasma concentration of eplerenone reduced by
 - CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL,
- PHENYTOIN and PRIMIDONE—avoid concomitant use; increased risk of hyponatraemia when diuretics given with CARBAMAZEPINE; acetazolamide increases plasma concentration of CARBAMAZEPINE; effects of furosemide antagonised by FOSPHENYTOIN and PHENYTOIN; acetazolamide possibly increases plasma concentration of FOSPHENYTOIN and PHENYTOIN; increased risk of osteomalacia when carbonic anhydrase inhibitors given with FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN or PRIMIDONE; hydrochlorothiazide possibly increases plasma concentration of TOPIRAMATE; avoidance of carbonic anhydrase inhibitors in children advised by manufacturer of ZONISAMIDE
- Antifungals: plasma concentration of eplerenone increased by
 ■ITRACONAZOLE and KETOCONAZOLE—avoid concomitant use; increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with AMPHOTERICIN; hydrochlorothiazide increases plasma concentration of FLUCONAZOLE; plasma concentration of eplerenone increased by FLUCONAZOLE (reduce dose of eplerenone)
- Antipsychotics: hypokalaemia caused by diuretics increases
 risk of ventricular arrhythmias with AMISULPRIDE; enhanced
 hypotensive effect when diuretics given with
 PHENOTHIAZINES; hypokalaemia caused by diuretics increases
 risk of ventricular arrhythmias with PIMOZIDE (avoid
 concomitant use)
- Antivirals: plasma concentration of eplerenone increased by • RITONAVIR—avoid concomitant use; plasma concentration of eplerenone increased by SAQUINAVIR (reduce dose of enlerenone)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when diuretics given with ANXIOLYTICS AND HYPNOTICS; administration of parenteral furosemide with CHLORAL may displace thyroid hormone from binding sites
- Atomoxetine: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with • ATOMOXETINE
- Calcium Salts: increased risk of hypercalcaemia when thiazides and related diuretics given with CALCIUM SALTS
- Calcium-channel Blockers: enhanced hypotensive effect when diuretics given with CALCIUM-CHANNEL BLOCKERS; plasma concentration of eplerenone increased by DILTIAZEM and VERAPAMIL (reduce dose of eplerenone)
- Cardiac Glycosides: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ● CARDIAC GLYCOSIDES; spironolactone increases plasma concentration of ● DIGOXIN; potassium canrenoate possibly increases plasma concentration of DIGOXIN
- Ciclosporin: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with CICLOSPORIN; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ◆ CICLOSPORIN; acetazolamide possibly increases plasma concentration of ◆ CICLOSPORIN
- Clonidine: enhanced hypotensive effect when diuretics given with CLONIDINE
- Corticosteroids: diuretic effect of diuretics antagonised by CORTICOSTEROIDS; increased risk of hypokalaemia when

Diuratics

- Corticosteroids (continued)
- acetazolamide, loop diuretics or thiazides and related diuretics given with CORTICOSTEROIDS
- Cytotoxics: alkaline urine due to acetazolamide increases exceretion of METHOTREXATE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with
- ARSENIC TRIOXIDE; avoidance of spironolactone advised by manufacturer of MITOTANE (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with PLATINUM COMPOUNDS
- ► Diazoxide: enhanced hypotensive and hyperglycaemic effects when diuretics given with DIAZOXIDE
- Diuretics: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with ACETAZOLAMIDE; profound diuresis possible when metolazone given with FUROSEMIDE; increased risk of hypokalaemia when thiazides and related diuretics given with LOOP DIURETICS
- Dopaminergics: enhanced hypotensive effect when diuretics given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with TOREMIFENE
- Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by COLESTIPOL and COLESTYRAMINE (give at least 2 hours apart)
- Lithium: loop diuretics and thiazides and related diuretics reduce excretion of ● LITHIUM (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of ● LITHIUM (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of ● LITHIUM
- Methyldopa: enhanced hypotensive effect when diuretics given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when diuretics given with MOXISYLYTE
- ► Moxonidine: enhanced hypotensive effect when diuretics given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when diuretics given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when diuretics given with NITRATES
- Oestrogens: diuretic effect of diuretics antagonised by OESTROGENS
- Potassium Salts: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with

 POTASSIUM SALTS
- Progestogens: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with DROSPIRENONE (monitor serum potassium during first cycle)
- Prostaglandins: enhanced hypotensive effect when diuretics given with ALPROSTADIL
- Sympathomimetics, Beta₂: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of BETA,SYMPATHOMIMETICS
- Tacrolimus: increased risk of hyperkalaemia when potassiumsparing diuretics and aldosterone antagonists given with
- TACROLIMUS
- Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with THEOPHYLLINE
- Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE
- Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL OF VITAMIN D

Diuretics, Loop see Diuretics

Diuretics, Potassium-sparing and Aldosterone Antagonists see Diuretics

Diuretics, Thiazide and related *see* Diuretics **Dobutamine** *see* Sympathomimetics

Docetaxel

- Antibacterials: plasma concentration of docetaxel possibly increased by © CLARITHROMYCIN and © TELITHROMYCIN manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Antifungals: in vitro studies suggest a possible interaction between docetaxel and KETOCONAZOLE (consult docetaxel product literature); plasma concentration of docetaxel possibly increased by ●ITRACONAZOLE and ●VORICONAZOLE manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of docetaxel possibly increased by INDINAVIR, RITONAVIR and SAQUINAVIR manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Ciclosporin: in vitro studies suggest a possible interaction between docetaxel and CICLOSPORIN (consult docetaxel product literature)
- Cytotoxics: possible increased risk of neutropenia when docetaxel given with LAPATINIB; plasma concentration of docetaxel increased by SORAFENIB

Dolutegravir

- Antacids: absorption of dolutegravir reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTS—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts
- Antibacterials: plasma concentration of dolutegravir reduced by RIFAMPICIN (see under Dolutegravir, p. 557)
- Antidepressants: manufacturer of dolutegravir advises avoid concomitant use with ST JOHN'S WORT
- Antiepileptics: manufacturer of dolutegravir advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antivirals: plasma concentration of dolutegravir reduced by
 ETAVIRENZ, ETRAVIRINE and TIPRANAVIR (see under Dolutegravir, p. 557); plasma concentration of dolutegravir reduced by FOSAMPRENAVIR; plasma concentration of dolutegravir possibly reduced by NEVIRAPINE (see under Dolutegravir, p. 557)
- Calcium Salts: absorption of dolutegravir reduced by CALCIUM SALTS—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts
- Fron Salts: absorption of dolutegravir reduced by oral IRON SALTS—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral iron salts

Domperidone

- Analgesics: effects of domperidone on gastro-intestinal activity antagonised by OPIOID ANALGESICS
- Antibacterials: possible increased risk of ventricular arrhythmias when domperidone given with ● CLARITHROMYCIN or ● TELITHROMYCIN—avoid concomitant use; plasma concentration of domperidone increased by ● ERYTHROMYCIN (increased risk of ventricular arrhythmias—avoid concomitant use); possible increased risk of ventricular arrhythmias when domperidone given with ● DELAMANID
- Antifungals: avoidance of domperidone advised by manufacturer of ●KETOCONAZOLE (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when domperidone given with ●ITRACONAZOLE or ●VORICONAZOLE—avoid concomitant use
- Antimalarials: avoidance of domperidone advised by manufacturer of • ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antimuscarinics: effects of domperidone on gastro-intestinal activity antagonised by ANTIMUSCARINICS
- Antivirals: possible increased risk of ventricular arrhythmias when domperidone given with • BOCEPREVIR, • RITONAVIR,
 - SAQUINAVIR or TELAPREVIR—avoid concomitant use
- Cobicistat: possible increased risk of ventricular arrhythmias when domperidone given with • COBICISTAT—avoid concomitant use
- Cytotoxics: avoidance of domperidone advised by manufacturer of

 BOSUTINIB (risk of ventricular arrhythmias)

Domperidone (continued)

 Dopaminergics: domperidone possibly antagonises hypoprolactinaemic effects of BROMOCRIPTINE and CAREBOOLINE

Donepezil see Parasympathomimetics

Dopamine see Sympathomimetics

Dopaminergics see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone

Dopexamine see Sympathomimetics

Dorzolamide see Diuretics

Dosulepin see Antidepressants, Tricyclic

Doxapram

- ► Aminophylline: increased CNS stimulation when doxapram given with AMINOPHYLLINE
- Anaesthetics, General: increased risk of arrhythmias when doxapram given with • VOLATILE LIQUID GENERAL ANAESTHETICS (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
- ▶ Antidepressants: effects of doxapram enhanced by MAOIS
- Sympathomimetics: increased risk of hypertension when doxapram given with SYMPATHOMIMETICS
- ► Theophylline: increased CNS stimulation when doxapram given with THEOPHYLLINE

Doxazosin see Alpha-blockers

Doxepin see Antidepressants, Tricyclic

Doxorubicin

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- ► Antivirals: doxorubicin possibly inhibits effects of STAVUDINE
- Calcium-channel Blockers: plasma concentration of doxorubicin possibly increased by VERAPAMIL
- Cardiac Glycosides: doxorubicin possibly reduces absorption of DIGOXIN tablets
- Ciclosporin: increased risk of neurotoxicity when doxorubicin given with • CICLOSPORIN
- Cytotoxics: plasma concentration of doxorubicin increased by SORAFENIB
- Ulcer-healing Drugs: plasma concentration of doxorubicin reduced by CIMETIDINE
- Vaccines: risk of generalised infections when doxorubicin given with live
 VACCINES—avoid concomitant use

Doxycycline see Tetracyclines

Dronedarone

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE OF ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when antiarrhythmics given with other ◆ ANTI-ARRHYTHMICS; increased risk of ventricular arrhythmias when dronedarone given with
- AMIODARONE or DISOPYRAMIDE—avoid concomitant use
- Anticoagulants: dronedarone possibly enhances anticoagulant
 effect of ○COUMARINS and ○PHENINDIONE; dronedarone
 increases plasma concentration of ○DABIGATRAN—avoid
 concomitant use; avoidance of dronedarone advised by
 manufacturer of RIVAROXABAN
- Antidepressants: avoidance of dronedarone advised by manufacturer of ◆ CITALOPRAM and ◆ ESCITALOPRAM (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly reduced by ◆ ST JOHN'S WORT—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with ◆ TRICYCLICS (risk of ventricular arrhythmias)

Dronedarone (continued)

- Antiepileptics: plasma concentration of dronedarone possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN,
- ◆ PHENOBARBITAL, ◆ PHENYTOIN and ◆ PRIMIDONE—avoid concomitant use
- Antifungals: plasma concentration of dronedarone increased by • KETOCONAZOLE—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with
 - ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
 - ANTIPSYCHOTICS that prolong the QT interval; manufacturer of dronedarone advises avoid concomitant use with
 - PHENOTHIAZINES (risk of ventricular arrhythmias)
- Antivirals: manufacturer of dronedarone advises avoid concomitant use with • RITONAVIR; increased risk of ventricular arrhythmias when dronedarone given with
 - SAOUINAVIR—avoid concomitant use
- Beta-blockers: increased myocardial depression when antiarrhythmics given with • BETA-BLOCKERS; dronedarone possibly increases plasma concentration of METOPROLOL and PROPRANOLOL; increased risk of ventricular arrhythmias when dronedarone given with • SOTALOL—avoid concomitant use

- Cytotoxics: dronedarone possibly increases the plasma concentration of ● BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; dronedarone possibly increases the plasma concentration of
 - IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Fingolimod: possible increased risk of bradycardia when dronedarone given with • FINGOLIMOD
- Grapefruit Juice: plasma concentration of dronedarone increased by • GRAPEFRUIT JUICE—avoid concomitant use
- Lipid-regulating Drugs: dronedarone possibly increases plasma concentration of ATORVASTATIN; dronedarone increases plasma concentration of ●ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when dronedarone given with ●SIMVASTATIN; avoidance of dronedarone advised by manufacturer of ●LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Sirolimus: manufacturer of dronedarone advises caution with SIROLIMUS
- ► Tacrolimus: manufacturer of dronedarone advises caution with TACROLIMUS

Droperidol see Antipsychotics

Drospirenone see Progestogens

Duloxetine

- Analgesics: possible increased serotonergic effects when SSRIrelated antidepressants given with FENTANYL; possible increased serotonergic effects when duloxetine given with PETHIDINE or TRAMADOL
- Antibacterials: metabolism of duloxetine inhibited by
- CIPROFLOXACIN—avoid concomitant use
- Anticoagulants: possible increased risk of bleeding when SSRIrelated antidepressants given with • DABIGATRAN
- Antidepressants: metabolism of duloxetine inhibited by
- FLUVOXAMINE—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIS, ST JOHN'S WORT, AMITRIPTYLINE, CLOMIPRAMINE, MOCLOBEMIDE OF VENLAFAXINE; duloxetine should not be started until 2 weeks after stopping MAOIS, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start MOCLOBEMIDE for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and
 ARTENIMOL WITH PIPERAQUINE

Duloxetine (continued)

- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Dapoxetine: possible increased risk of serotonergic effects
 when duloxetine given with DAPOXETINE (manufacturer of
 dapoxetine advises duloxetine should not be started until 1
 week after stopping dapoxetine, avoid dapoxetine for 2 weeks
 after stopping duloxetine)
- 5HT₁-receptor Agonists: possible increased serotonergic effects when duloxetine given with 5HT₁ AGONISTS
- 5HT₃-receptor Antagonists: possible increased serotonergic effects when SSRI-related antidepressants given with 5HT₃ ANTAGONISTS
- Methylthioninium: risk of CNS toxicity when SSRI-related antidepressants given with ● METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Dutasteride

 Calcium-channel Blockers: plasma concentration of dutasteride increased by DILTIAZEM and VERAPAMIL

Dydrogesterone see Progestogens

Efavirenz

- Analgesics: efavirenz reduces plasma concentration of METHADONE
- Antibacterials: efavirenz reduces plasma concentration of CLARITHROMYCIN, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of RIFABUTIN—increase dose of rifabutin; plasma concentration of efavirenz reduced by RIFAMPICIN—increase dose of efavirenz; efavirenz possibly reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use
- Antidepressants: plasma concentration of efavirenz reduced by
- ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with CARBAMAZEPINE
- Antifungals: efavirenz reduces plasma concentration of ITRACONAZOLE, → KETOCONAZOLE and → POSACONAZOLE; efavirenz reduces plasma concentration of → VORICONAZOLE, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of CASPOFUNGIN consider increasing dose of caspofungin
- Antimalarials: efavirenz reduces plasma concentration of
 ARTEMETHER WITH LUMEFANTRINE; efavirenz possibly affects plasma concentration of PROGUANIL
- Antipsychotics: efavirenz possibly reduces plasma concentration of ● ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of ● PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of
 ATAZANAVIR (plasma concentration of atazanavir reduced);
 efavirenz reduces the plasma concentration of
 DACLATASVIR—increase dose of daclatasvir (see under
 - Daclatasvir, p. 544); efavirenz reduces plasma concentration of DARUNAVIR (adjust dose—consult product literature); efavirenz reduces the plasma concentration of
- DOLUTEGRAVIR (see under Dolutegravir, p. 557); avoidance of efavirenz advised by manufacturer of ELVITEGRAVIR; efavirenz possibly reduces plasma concentration of
- ETRAVIRINE—avoid concomitant use; efavirenz reduces plasma concentration of INDINAVIR and SIMEPREVIR; efavirenz reduces plasma concentration of LOPINAVIR—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of MARAVIROC—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by NEVIRAPINE—avoid concomitant use; toxicity of efavirenz increased by RITONAVIR, monitor liver function tests —manufacturer of Atripla® advises avoid concomitant use with high-dose ritonavir; efavirenz significantly reduces

Efavirenz

telaprevir

- Antivirals (continued)
 plasma concentration of SAQUINAVIR; efavirenz reduces
 plasma concentration of TELAPREVIR—increase dose of
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with • MIDAZOLAM—avoid concomitant
- Atovaquone: efavirenz reduces plasma concentration of
- ATOVAQUONE—avoid concomitant use
- Avanafil: efavirenz possibly reduces plasma concentration of AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Bupropion: efavirenz accelerates metabolism of BUPROPION (reduced plasma concentration)
- Calcium-channel Blockers: efavirenz reduces plasma concentration of DILTIAZEM
- Ciclosporin: efavirenz possibly reduces plasma concentration of ◆ CICLOSPORIN
- Cytotoxics: efavirenz possibly reduces plasma concentration of
 BOSUTINIB—manufacturer of bosutinib advises avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when efavirenz given with • ERGOT ALKALOIDS—avoid concomitant use
- ► Grapefruit Juice: plasma concentration of efavirenz possibly increased by GRAPEFRUIT JUICE
- ► Lipid-regulating Drugs: efavirenz reduces plasma concentration of ATORYASTATIN, PRAYASTATIN and SIMVASTATIN
- Orlistat: absorption of efavirenz possibly reduced by
 ORLISTAT
- Progestogens: efavirenz possibly reduces contraceptive effect of • PROGESTOGENS
- Tacrolimus: efavirenz possibly affects plasma concentration of
 TACROLIMUS

Eletriptan see 5HT₁-receptor Agonists (under HT) **Eltrombopag**

- Antacids: absorption of eltrombopag reduced by ANTACIDS (give at least 4 hours apart)
- Antivirals: plasma concentration of eltrombopag possibly reduced by LOPINAVIR
- Calcium Salts: absorption of eltrombopag possibly reduced by CALCIUM SALTS (give at least 4 hours apart)
- Dairy Products: absorption of eltrombopag possibly reduced by DAIRY PRODUCTS (give at least 4 hours apart)
- ► Iron Salts: absorption of eltrombopag possibly reduced by *oral* IRON SALTS (give at least 4 hours apart)
- Lipid-regulating Drugs: eltrombopag increases plasma concentration of ● ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature)
- Selenium: absorption of eltrombopag possibly reduced by SELENIUM (give at least 4 hours apart)
- Zinc: absorption of eltrombopag possibly reduced by ZINC (give at least 4 hours apart)

Elvitegravir

- Antacids: absorption of elvitegravir reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTS (give at least 4 hours apart)
- Antibacterials: plasma concentration of elvitegravir reduced by
 RIFABUTIN also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elvitegravir advises avoid concomitant use with
 RIFAMPICIN
- Antidepressants: manufacturer of elvitegravir advises avoid concomitant use with • ST JOHN'S WORT
- Antiepileptics: manufacturer of elvitegravir advises avoid concomitant use with ● CARBAMAZEPINE, ● FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antivirals: plasma concentration of elvitegravir increased by
 ATAZANAVIR and .LOPINAVIR boosted with ritonavir (reduce dose of elvitegravir); manufacturer of elvitegravir advises avoid concomitant use with EFAVIRENZ and NEVIRAPINE
- Bosentan: manufacturer of elvitegravir advises avoid concomitant use with BOSENTAN
- Orlistat: absorption of elvitegravir possibly reduced by
 ORLISTAT

Elvitegravir (continued)

 Progestogens: elvitegravir increases plasma concentration of NORGESTIMATE

Empagliflozin see Antidiabetics

Emtricitabine

- Antivirals: manufacturer of emtricitabine advises avoid concomitant use with LAMIVUDINE
- Orlistat: absorption of emtricitabine possibly reduced by
 ORLISTAT

Enalapril see ACE Inhibitors

Enfuvirtide

Orlistat: absorption of enfuvirtide possibly reduced by

Enoxaparin see Heparins

Enoximone see Phosphodiesterase Inhibitors

Entacapone

- Anticoagulants: entacapone enhances anticoagulant effect of
 WARFARIN
- Antidepressants: manufacturer of entacapone advises caution with MOCLOBEMIDE, TRICYCLICS and VENLAFAXINE; avoid concomitant use of entacapone with non-selective • MAOIS
- Dopaminergics: entacapone possibly enhances effects of APOMORPHINE; entacapone possibly reduces plasma concentration of RASAGILINE; manufacturer of entacapone advises max. dose of 10 mg SELEGILINE if used concomitantly
- Iron Salts: absorption of entacapone reduced by oral IRON SALTS
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: entacapone possibly enhances effects of METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Sympathomimetics: entacapone possibly enhances effects of ADRENALINE (EPINEPHRINE), DOBUTAMINE, DOPAMINE and NORADRENALINE (NOREPINEPHRINE)

Enteral Foods

- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of ◆ COUMARINS and ◆ PHENINDIONE
- Antiepileptics: enteral feeds possibly reduce absorption of FOSPHENYTOIN and PHENYTOIN

Enzalutamide

- Antibacterials: manufacturer of enzalutamide advises avoid concomitant use with RIFAMPICIN
- Anticoagulants: enzalutamide possibly reduces plasma concentration of • COUMARINS
- Lipid-regulating Drugs: plasma concentration of enzalutamide increased by GEMFIBROZIL—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide

Ephedrine see Sympathomimetics

Epinephrine

NOTE Epinephrine interactions as for adrenaline, see under sympathomimetics

Epirubicin

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of epirubicin increased by
 CICLOSPORIN
- \bullet Ulcer-healing Drugs: plasma concentration of epirubicin increased by \bullet CIMETIDINE

Eplerenone see Diuretics

Eprosartan see Angiotensin-II Receptor Antagonists **Eptifibatide**

 Iloprost: increased risk of bleeding when eptifibatide given with ILOPROST

Ergocalciferol see Vitamins

Ergometrine see Ergot Alkaloids

Ergot Alkaloids

 Antibacterials: increased risk of ergotism when ergometrine given with ● CLARITHROMYCIN or ● ERYTHROMYCIN—avoid concomitant use; increased risk of ergotism when ergotamine given with ● MACROLIDES or ● TELITHROMYCIN—avoid concomitant use; increased risk of ergotism when ergotamine given with TETRACYCLINES

Ergot Alkaloids (continued)

- Antidepressants: possible risk of hypertension when ergotamine given with REBOXETINE
- Antifungals: avoidance of ergot alkaloids advised by
 manufacturer of KETOCONAZOLE; avoidance of ergometrine
 advised by manufacturer of IFRACONAZOLE (increased risk of
 ergotism); increased risk of ergotism when ergometrine given
 with VORICONAZOLE—avoid concomitant use; increased risk
 of ergotism when ergotamine given with IMIDAZOLES or
 TRIAZOLES—avoid concomitant use
- Antipsychotics: plasma concentration of ergot alkaloids possibly increased by LURASIDONE (increased risk of toxicity)
- Antivirals: plasma concentration of ergot alkaloids possibly increased by ATAZANAVIR—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of
- BOCEPREVIR and TELAPREVIR; increased risk of ergotism when ergot alkaloids given with DARUNAVIR—manufacturer of darunavir advises avoid concomitant use; increased risk of ergotism when ergot alkaloids given with EFAVIRENZ—avoid concomitant use; increased risk of ergotism when ergotamine given with FOSAMPRENAVIR, INDINAVIR, RITONAVIR or
- SAQUINAVIR—avoid concomitant use; increased risk of ergotism when ergometrine given with INDINAVIR or
- RITONAVIR—avoid concomitant use
- Beta-blockers: increased peripheral vasoconstriction when ergotamine given with BETA-BLOCKERS
- Cobicistat: plasma concentration of ergot alkaloids possibly increased by

 COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: caution with ergot alkaloids advised by manufacturer of ● CRIZOTINIB; avoidance of ergotamine advised by manufacturer of IDELALISIB
- 5HT₁-receptor Agonists: increased risk of vasospasm when ergotamine given with ALMOTRIPTAN, RIZATRIPTAN,
 - SUMATRIPTAN or ZOLMITRIPTAN (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with ELETRIPTAN, er → RARATRIPTAN (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)
- Sympathomimetics: increased risk of ergotism when ergotamine given with SYMPATHOMIMETICS
- Ticagrelor: plasma concentration of ergot alkaloids possibly increased by • TICAGRELOR
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine given with ◆ CIMETIDINE—avoid concomitant use Ergotamine see Ergot Alkaloids

Eribulin

- Antibacterials: plasma concentration of eribulin possibly reduced by RIFAMPICIN
- Antidepressants: plasma concentration of eribulin possibly reduced by ST JOHN'S WORT
- Antiepileptics: plasma concentration of eribulin possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)

Erlotinib

- Analgesics: increased risk of bleeding when erlotinib given with

 NSAIDS
- Antacids: plasma concentration of erlotinib possibly reduced by

 ANTACIDS—give antacids at least 4 hours before or 2 hours after erlotinib
- ► Antibacterials: plasma concentration of erlotinib increased by CIPROFLOXACIN; metabolism of erlotinib accelerated by RIFAMPICIN (reduced plasma concentration)
- Anticoagulants: increased risk of bleeding when erlotinib given with • COUMARINS
- Antifungals: metabolism of erlotinib inhibited by KETOCONAZOLE (increased plasma concentration)
- · Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of erlotinib advised by manufacturer of
- BOCEPREVIR

Erlotinib (continued)

- Cytotoxics: plasma concentration of erlotinib possibly increased by CAPECITABINE
- · Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with ● CIMETIDINE, ● ESOMEPRAZOLE,
- FAMOTIDINE, LANSOPRAZOLE, NIZATIDINE, PANTOPRAZOLE and • RABEPRAZOLE; plasma concentration of erlotinib reduced by • RANITIDINE—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by • OMEPRAZOLEmanufacturer of erlotinib advises avoid concomitant use

Ertapenem

- Antiepileptics: carbapenems reduce plasma concentration of • SODIUM VALPROATE and • VALPROIC ACID—avoid concomitant
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Erythromycin see Macrolides

Escitalopram see Antidepressants, SSRI

Eslicarbazepine

- Anticoagulants: eslicarbazepine reduces plasma concentration of WARFARIN
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered): anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of eslicarbazepine possibly reduced by CARBAMAZEPINE but risk of side-effects increased; plasma concentration of eslicarbazepine reduced by FOSPHENYTOIN and PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin increased; manufacturer of eslicarbazepine advises avoid concomitant use with OXCARBAZEPINE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by . MEFLOQUINE
- · Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Lipid-regulating Drugs: eslicarbazepine reduces plasma concentration of ROSUVASTATIN; eslicarbazepine reduces plasma concentration of SIMVASTATIN—consider increasing dose of simvastatin
- Oestrogens: eslicarbazepine accelerates metabolism of • OESTROGENS (reduced contraceptive effect with combined
- oral contraceptives, contraceptive patches, and vaginal rings-see Contraceptive Interactions in BNF) • Orlistat: possible increased risk of convulsions when
- antiepileptics given with ORLISTAT • Progestogens: eslicarbazepine accelerates metabolism of
- PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception-see

Esmolol see Beta-blockers

Contraceptive Interactions in BNF) Esomeprazole see Proton Pump Inhibitors

Estradiol see Oestrogens

Estramustine

- Antacids: absorption of estramustine possibly reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTSmanufacturer of estramustine advises avoid concomitant administration
- · Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- · Bisphosphonates: plasma concentration of estramustine increased by • SODIUM CLODRONATE
- Calcium Salts: absorption of estramustine reduced by CALCIUM SALTS (manufacturer of estramustine advises avoid concomitant administration)

Estriol see Oestrogens

Estrone see Oestrogens

Etanercent

- Abatacept: avoid concomitant use of etanercept with
- ΔΒΔΤΔCΕΡΤ

Etanercept (continued)

- · Anakinra: avoid concomitant use of etanercept with
- · Vaccines: risk of generalised infections when etanercept given with live • VACCINES—avoid concomitant use

- Antibacterials: plasma concentration of ethambutol increased by DELAMANID
- ▶ Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Ethinylestradiol see Oestrogens

Ethosuximide

- Antibacterials: metabolism of ethosuximide inhibited by • ISONIAZID (increased plasma concentration and risk of
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- · Antiepileptics: plasma concentration of ethosuximide possibly reduced by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE: plasma concentration of ethosuximide possibly reduced by
- FOSPHENYTOIN and PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by SODIUM VALPROATE and VALPROIC ACID
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by . MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- · Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Etodolac see NSAIDs

Etomidate see Anaesthetics, General

Etonogestrel see Progestogens

Etonoside

- Anticoagulants: etoposide possibly enhances anticoagulant effect of • COUMARINS
- Antiepileptics: plasma concentration of etoposide possibly reduced by FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of etoposide increased by KETOCONAZOLE
- · Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Atoyaquone: plasma concentration of etoposide possibly increased by ATOVAQUONE
- Ciclosporin: plasma concentration of etoposide possibly increased by CICLOSPORIN (increased risk of toxicity)

Etoricoxib see NSAIDs

Etravirine

- Antibacterials: etravirine reduces plasma concentration of
- CLARITHROMYCIN (but concentration of an active metabolite increased), also plasma concentration of etravirine increased; plasma concentration of both drugs reduced when etravirine given with • RIFABUTIN; manufacturer of etravirine advises avoid concomitant use with RIFAMPICIN; etravirine possibly reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use
- Antidepressants: manufacturer of etravirine advises avoid concomitant use with ST JOHN'S WORT
- Antiepileptics: manufacturer of etravirine advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN. PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antimalarials: etravirine reduces plasma concentration of ARTEMETHER WITH LUMEFANTRINE
- Antivirals: effects of both drugs possibly reduced when etravirine given with BOCEPREVIR; avoidance of etravirine advised by manufacturer of DACLATASVIR (plasma concentration of daclatasvir possibly reduced); etravirine reduces the plasma concentration of • DOLUTEGRAVIR (see under Dolutegravir, p. 557); plasma concentration of etravirine possibly reduced by • EFAVIRENZ and • NEVIRAPINE—

Etravirine

• Antivirals (continued)

avoid concomitant use; etravirine increases plasma concentration of • FOSAMPRENAVIR (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of • INDINAVIR—avoid concomitant use; etravirine possibly reduces plasma concentration of MARAVIROC; avoidance of etravirine advised by manufacturer of SIMEPREVIR; plasma concentration of etravirine reduced by

- TIPRANAVIR, also plasma concentration of tipranavir increased (avoid concomitant use)
- Cardiac Glycosides: etravirine increases plasma concentration of DIGOXIN
- Clopidogrel: etravirine possibly reduces antiplatelet effect of
 CLOPIDOGREL
- Cytotoxics: etravirine possibly reduces plasma concentration of • BOSUTINIB—manufacturer of bosutinib advises avoid concomitant use
- Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of ATORVASTATIN
- Orlistat: absorption of etravirine possibly reduced by
 ORLISTAT
- Sildenafil: etravirine reduces plasma concentration of SILDENAFIL

Everolimus

- ACE Inhibitors: increased risk of angioedema when everolimus given with • ACE INHIBITORS
- Antibacterials: plasma concentration of everolimus possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by
- ERYTHROMYCIN (consider reducing the dose of everolimus consult everolimus product literature); plasma concentration of everolimus reduced by RIFAMPICIN (avoid concomitant use or consider increasing the dose of everolimus —consult everolimus product literature)
- Antidepressants: plasma concentration of everolimus possibly reduced by ST JOHN'S WORT—manufacturer of everolimus advises avoid concomitant use
- Antifungals: plasma concentration of everolimus increased by
 ★ETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of everolimus possibly increased by ITRACONAZOLE, POSACONAZOLE and
- VORICONAZOLE—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by ◆ ATAZANAVIR, ◆ DARUNAVIR, ◆ INDINAVIR,
- RITONAVIR and SAQUINAVIR—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with ● VERAPAMIL (consider reducing the dose of everolimus —consult everolimus product literature)
- Ciclosporin: plasma concentration of everolimus increased by
 CICLOSPORIN (consider reducing the dose of everolimus consult everolimus product literature)
- Cytotoxics: plasma concentration of everolimus increased by
 IMATINIB (consider reducing the dose of everolimus consult everolimus product literature)
- ► Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with GRAPEFRUIT JUICE

xemestane

 Antibacterials: plasma concentration of exemestane possibly reduced by RIFAMPICIN

Exenatide see Antidiabetics

Ezetimibe

- Anticoagulants: ezetimibe possibly enhances anticoagulant effect of COUMARINS
- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with ◆ CICLOSPORIN
- Lipid-regulating Drugs: ezetimibe increases plasma concentration of ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); increased risk of cholelithiasis

Ezetimihe

 Lipid-regulating Drugs (continued) and gallbladder disease when ezetimibe given with FIBRATES—discontinue if suspected

Famotidine see Histamine H2-antagonists

Fampridine

 Ulcer-healing Drugs: manufacturer of fampridine advises avoid concomitant use with • CIMETIDINE

Februsostat

- Azathioprine: manufacturer of febuxostat advises avoid concomitant use with • AZATHIOPRINE
- Cytotoxics: manufacturer of febuxostat advises avoid concomitant use with ● MERCAPTOPURINE

Felodipine see Calcium-channel Blockers

Fenofibrate see Fibrates

Fenoprofen see NSAIDs

Fentanyl see Opioid Analgesics Ferrous Fumarate see Iron salts

Ferrous Gluconate see Iron salts

Ferrous Sulfate see Iron salts
Fesoterodine see Antimuscarinics

Fexofenadine see Antihistamines

Fibrates

- Antibacterials: increased risk of myopathy when fibrates given with • DAPTOMYCIN (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of
 COUMARINS and PHENINDIONE
- Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with INSULIN OT SULFONYLIREAS; gemfibrozil possibly enhances hypoglycaemic effect of NATEGLINIDE; increased risk of severe hypoglycaemia when gemfibrozil given with • REPAGLINIDE—avoid concomitant use
- Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with CICLOSPORIN
- Colchicine: possible increased risk of myopathy when fibrates given with • COLCHICINE
- Cytotoxics: gemfibrozil increases plasma concentration of DABRAFENIB; gemfibrozil increases plasma concentration of
 - BEXAROTENE—avoid concomitant use
- Hormone Antagonists: gemfibrozil increases plasma concentration of ●ENZALUTAMIDE—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide
- Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of MONTELUKAST
- Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with ATORVASTATIN, OFLUVASTATIN or PRAVASTATIN (preferably avoid concomitant use); increased risk of myopathy when fibrates given with ROSUVASTATIN (see under Rosuvastatin, p. 180); possible increased risk of myopathy when bezafibrate given with SIMVASTATIN (see under Simvastatin, p. 181); possible increased risk of myopathy when ciprofibrate given with SIMVASTATIN (see under Simvastatin, p. 181); increased risk of myopathy when gemfibrozil given with SIMVASTATIN (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with EZETIMIBE—discontinue if suspected; increased risk of myopathy when fibrates given with STATINS; reduce maximum dose of fenofibrate when given with STATINS—see under Fenofibrate, p. 175

Fidaxomicin

- Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with AMIODARONE and DRONEDARONE
- Antibacterials: manufacturer of fidaxomicin advises avoid concomitant use with CLARITHROMYCIN and ERYTHROMYCIN
- Antifungals: manufacturer of fidaxomicin advises avoid concomitant use with KETOCONAZOLE
- Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with VERAPAMIL
- Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with CICLOSPORIN
- ▶ Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Filgrastim

► Cytotoxics: neutropenia possibly exacerbated when filgrastim given with CAPECITABINE, FLUOROURACIL OF TEGAFUR

Fingolimod

- Anti-arrhythmics: possible increased risk of bradycardia when fingolimod given with • AMIODARONE, • DISOPYRAMIDE or • DRONEDARONE
- Antidepressants: plasma concentration of fingolimod possibly reduced by ST JOHN'S WORT—manufacturer of fingolimod advises avoid concomitant use
- ► Antiepileptics: plasma concentration of fingolimod reduced by CARBAMAZEPINE
- Antifungals: plasma concentration of fingolimod increased by
- KETOCONAZOLE
 Beta-blockers: possible increased risk of bradycardia when
- fingolimod given with BETA-BLOCKERS
 Calcium-channel Blockers: possible increased risk of
- Calcium-channel Biockers: possible increased risk of bradycardia when fingolimod given with • DILTIAZEM or
 VERAPAMIL

Flavoxate see Antimuscarinics

Flecainide

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE or ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when antiarrhythmics given with other ● ANTI-ARRHYTHMICS; plasma concentration of flecainide increased by ● AMIODARONE (halve dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by FLUOXETINE; increased risk of ventricular arrhythmias when flecainide given with • TRICYCLICS
- Antihistamines: increased risk of ventricular arrhythmias when flecainide given with • MIZOLASTINE—avoid concomitant use
- AntimalariaIs: avoidance of flecainide advised by manufacturer of ● ARTEMETHER WITH LUMEFANTRINE (risk of ventricular arrhythmias); plasma concentration of flecainide increased by ● QUININE
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with • TOLTERODINE
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
- ANTIPSYCHOTICS that prolong the QT interval; increased risk of arrhythmias when flecainide given with CLOZAPINE
- Antivirals: plasma concentration of flecainide possibly increased by FOSAMPRENAVIR, INDINAVIR, LOPINAVIR and RITONAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with SAQUINAVIR—avoid concomitant use; caution with flecainide advised by manufacturer of
- TELAPREVIR (risk of ventricular arrhythmias)
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with • BETA-BLOCKERS; increased myocardial depression when anti-arrhythmics given with • BETA-BLOCKERS
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with
 VERAPAMIL
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with ● ACETAZOLAMIDE, ● LOOP DIURETICS or ● THIAZIDES AND RELATED DIURETICS
- Ulcer-healing Drugs: metabolism of flecainide inhibited by CIMETIDINE (increased plasma concentration)

Flucloxacillin see Penicillins

Fluconazole see Antifungals, Triazole

Flucytosine

- Antifungals: renal excretion of flucytosine decreased and cellular uptake increased by AMPHOTERICIN (toxicity possibly increased)
- Cytotoxics: plasma concentration of flucytosine possibly reduced by CYTARABINE

Fludarabine

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: fludarabine increases intracellular concentration of CYTARABINE; increased pulmonary toxicity when

Fludarabine

- Cytotoxics (continued) fludarabine given with • PENTOSTATIN (unacceptably high incidence of fatalities)
- Dipyridamole: effects of fludarabine possibly reduced by DIPYRIDAMOLE

Fludrocortisone see Corticosteroids

Fluorides

 Calcium Salts: absorption of fluorides reduced by CALCIUM SALTS

Fluorouracil

- Antibacterials: metabolism of fluorouracil inhibited by METRONIDAZOLE (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of
 COUMARINS
- Antiepileptics: fluorouracil possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)

 Filozofier and the property of the propert
- Filgrastim: neutropenia possibly exacerbated when fluorouracil given with FILGRASTIM
- Folates: toxicity of fluorouracil increased by FOLIC ACID—avoid concomitant use
- Lipegfilgrastim: neutropenia possibly exacerbated when fluorouracil given with LIPEGFILGRASTIM
- Pegfilgrastim: neutropenia possibly exacerbated when fluorouracil given with PEGFILGRASTIM
- Temoporfin: increased skin photosensitivity when topical fluorouracil used with • TEMOPORFIN
- Ulcer-healing Drugs: metabolism of fluorouracil inhibited by CIMETIDINE (increased plasma concentration)

Fluoxetine see Antidepressants, SSRI Flupentixol see Antipsychotics

Fluphenazine see Antipsychotics

Flurazepam see Anxiolytics and Hypnotics

Flurbiprofen see NSAIDs

Flutamide

Anticoagulants: flutamide enhances anticoagulant effect of
 COUMARINS

Fluticasone see Corticosteroids

Fluvastatin see Statins Fluvoxamine see Antidepressants, SSRI

Folates

- Aminosalicylates: absorption of folic acid possibly reduced by SULFASALAZINE
- Antacids: absorption of folic acid possibly reduced by ANTACIDS (manufacturer of folic acid advises give at least 2 hours apart)
- ► Antiepileptics: folates possibly reduce plasma concentration of FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Cytotoxics: folic acid increases toxicity of CAPECITABINE,
 FLUOROURACIL and TEGAFUR—avoid concomitant use;
 avoidance of folates advised by manufacturer of
 RALTITREXED

Folic Acid see Folates

Folinic Acid see Folates

Fondaparinux

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous • DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
- KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with • APIXABAN, • DABIGATRAN and
 RIVAROXABAN (avoid concomitant use except when

switching with other anticoagulants or using heparin to maintain catheter patency)

Formoterol see Sympathomimetics, Beta₂

Fosamprenavir

NOTE Fosamprenavir is a prodrug of amprenavir

- ► Analgesics: fosamprenavir reduces plasma concentration of
- Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of ◆ AMIODARONE, ◆ FLECAINIDE and
 - PROPAFENONE (increased risk of ventricular arrhythmias—

Fosamprenavir

- Anti-arrhythmics (continued) avoid concomitant use); fosamprenavir possibly increases plasma concentration of ● LIDOCAINE—avoid concomitant use
- Antibacterials: fosamprenavir increases plasma concentration
 of RIFABUTIN (reduce dose of rifabutin); plasma
 concentration of fosamprenavir significantly reduced by
 RIFAMPICIN—avoid concomitant use; avoidance of
 concomitant fosamprenavir in severe renal and hepatic
 impairment advised by manufacturer of TELITHROMYCIN
- Anticoagulants: avoidance of fosamprenavir advised by manufacturer of APIXABAN and RIVAROXABAN; fosamprenavir may enhance or reduce anticoagulant effect of COUMARINS
- Antidepressants: plasma concentration of fosamprenavir reduced by • ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of fosamprenavir possibly reduced by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE
- Antifungals: fosamprenavir increases plasma concentration of KETOCONAZOLE (also plasma concentration of fosamprenavir possibly increased); plasma concentration of both drugs may increase when fosamprenavir given with ITRACONAZOLE; fosamprenavir possibly reduces plasma concentration of POSACONAZOLE
- Antimalarials: caution with fosamprenavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; fosamprenavir possibly increases plasma concentration of QUINNE (increased risk of toxicity)
- Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of DARIFENACIN and TOLTERODINE
- Antipsychotics: fosamprenavir possibly increases plasma concentration of ● ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); fosamprenavir increases plasma concentration of ● PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of ● QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturer of fosamprenavir advises avoid concomitant use with • BOCEPREVIR and • RALTEGRAVIR; fosamprenavir reduces plasma concentration of
- DOLUTEGRAVIR; plasma concentration of fosamprenavir increased by ETRAVIRINE (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by LOPINAVIR, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir reduced by
- MARAVIROC—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by NEVIRAPINE—avoid unboosted fosamprenavir; manufacturers advise avoid concomitant use of fosamprenavir with ● TELAPREVIR; plasma concentration of fosamprenavir reduced by ● TIPRANAVIR
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Avanafil: fosamprenavir possibly increases plasma concentration of
 AVANAFIL—see under Avanafil, p. 698
- Ciclosporin: fosamprenavir increases plasma concentration of
 CICLOSPORIN
- Cytotoxics: fosamprenavir possibly increases the plasma concentration of ● BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosamprenavir possibly increases the plasma concentration of ● IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- ▶ Dapoxetine: manufacturer of dapoxetine advises dose reduction when fosamprenavir given with DAPOXETINE (see under Dapoxetine, p. 703)
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with • ERGOTAMINE—avoid concomitant
- Lipid-regulating Drugs: possible increased risk of myopathy
 when fosamprenavir given with ATORVASTATIN; possible
 increased risk of myopathy when fosamprenavir given with
 ROSUVASTATIN—manufacturer of rosuvastatin advises avoid
 concomitant use; possible increased risk of myopathy when
 fosamprenavir given with
 SIMVASTATIN—avoid concomitant

Fosamprenavir

- Lipid-regulating Drugs (continued)
 use; avoidance of fosamprenavir advised by manufacturer of

 LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of fosamprenavir possibly reduced by
 ORLISTAT
- Ranolazine: fosamprenavir possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: fosamprenavir possibly increases plasma concentration of SILDENAFIL
- Tacrolimus: fosamprenavir increases plasma concentration of
 TACROLIMUS
- ► Tadalafil: fosamprenavir possibly increases plasma concentration of TADALAFIL
- Vardenafil: fosamprenavir possibly increases plasma concentration of VARDENAFIL

Fosaprepitant

- Antibacterials: plasma concentration of fosaprepitant possibly increased by CLARITHROMYCIN and TELITHROMYCIN; plasma concentration of fosaprepitant reduced by RIFAMPICIN
- Anticoagulants: fosaprepitant possibly reduces anticoagulant effect of WARFARIN
- Antidepressants: manufacturer of fosaprepitant advises avoid concomitant use with

 ST JOHN'S WORT
- Antidiabetics: fosaprepitant reduces plasma concentration of
 TOLBUTAMIDE
- Antiepileptics: plasma concentration of fosaprepitant possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of fosaprepitant increased by KETOCONAZOLE
- Antipsychotics: manufacturer of fosaprepitant advises avoid concomitant use with • PIMOZIDE
- Antivirals: plasma concentration of fosaprepitant possibly increased by RITONAVIR
- Anxiolytics and Hypnotics: fosaprepitant increases plasma concentration of MIDAZOLAM (risk of prolonged sedation)
- Avanafil: fosaprepitant possibly increases plasma concentration of AVANAFIL
- ► Calcium-channel Blockers: plasma concentration of both drugs may increase when fosaprepitant given with DILTIAZEM
- ► Corticosteroids: fosaprepitant inhibits metabolism of DEXAMETHASONE and METHYLPREDNISOLONE (reduce dose of dexamethasone and methylprednisolone)
- Cytotoxics: fosaprepitant possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosaprepitant possibly increases plasma concentration of IBRUTINIB
- Lipid-regulating Drugs: separating administration from fosaprepitant by 12 hours advised by manufacturer of LOMITAPIDE
- Oestrogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing • OESTROGENS (alternative contraception recommended)
- Progestogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing
- PROGESTOGENS (alternative contraception recommended)

Foscarnet

 Pentamidine Isetionate: increased risk of hypocalcaemia when foscarnet given with parenteral
 PENTAMIDINE ISETIONATE
 Fosfamycin

Metoclopramide: plasma concentration of fosfomycin reduced

by METOCLOPRAMIDE

Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Fosinopril see ACE Inhibitors

Fosphenytoin

- Alcohol: plasma concentration of fosphenytoin possibly reduced by chronic heavy consumption of ALCOHOL
- Aminophylline: plasma concentration of both drugs reduced when fosphenytoin given with AMINOPHYLLINE
- Analgesics: excretion of fosphenytoin possibly reduced by ACEMETACIN (increased risk of toxicity); fosphenytoin possibly

Fosphenytoin

- Analgesics (continued)
 - accelerates metabolism of FENTANYL (reduced effect); fosphenytoin accelerates metabolism of METHADDNE (reduced effect and risk of withdrawal effects); fosphenytoin possibly increases risk of PETHIDINE toxicity; effects of fosphenytoin enhanced by ASPIRIN; fosphenytoin possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- Antacids: absorption of fosphenytoin reduced by ANTACIDS
- Anthelmintics: fosphenytoin reduces plasma concentration of
- Anti-arrhythmics: metabolism of fosphenytoin inhibited by
 AMIODARONE (increased plasma concentration);
 fosphenytoin reduces plasma concentration of DISOPYRAMIDE;
 fosphenytoin possibly reduces plasma concentration of
 DRONEDARONE—avoid concomitant use
- Antibacterials: metabolism of fosphenytoin inhibited by CLARITHROMYCIN (increased plasma concentration); metabolism of fosphenytoin possibly inhibited by METRONIDAZOLE (increased plasma concentration); plasma concentration of fosphenytoin increased or decreased by CIPROFLOXACIN; fosphenytoin accelerates metabolism of DOXYCYCLINE (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of ● BEDAQUILINE manufacturer of bedaquilline advises avoid concomitant use; plasma concentration of fosphenytoin increased by ● CHLORAMPHENICOL (increased risk of toxicity); metabolism of
- CHLORAMPHENICOL (increased risk of toxicity); metabolism of fosphenytoin possibly inhibited by ISONIAZID (increased risk of toxicity); metabolism of fosphenytoin accelerated by
- RIFAMYCINS (reduced plasma concentration); plasma concentration of fosphenytoin possibly increased by SULFONAMIDES; fosphenytoin reduces plasma concentration of TELITHROMYCIN (avoid during and for 2 weeks after fosphenytoin); plasma concentration of fosphenytoin increased by TRIMETHOPRIM (also increased antifolate effect)
- Anticoagulants: fosphenytoin possibly reduces plasma concentration of ● APIXABAN; fosphenytoin accelerates metabolism of ● COUMARINS (possibility of reduced anticoagulant effect, but enhancement also reported); fosphenytoin possibly reduces plasma concentration of DABIGATRAM—manufacturer of dabigatran advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of ● RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: plasma concentration of fosphenytoin increased by FLUOKETINE and FLUVOXAMINE; fosphenytoin reduces plasma concentration of MIANSERIN, MIRTAZAPINE and PAROXETINE; plasma concentration of fosphenytoin possibly increased by SERTRALINE, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered); plasma concentration of fosphenytoin possibly reduced by ST JOHN'S WORT—avoid concomitant use; fosphenytoin possibly reduces plasma concentration of TRICYCLICS
- Antidiabetics: plasma concentration of fosphenytoin transiently increased by TOLBUTAMIDE (possibility of toxicity)
- Haisefuly increased by TotButamic plossibility of Loxicity)
 Antiepileptics: plasma concentration of both drugs often
 reduced when fosphenytoin given with CARBAMAZEPINE, also
 plasma concentration of fosphenytoin may be increased;
 fosphenytoin reduces plasma concentration of
 ESLICARBAZEPINE, also plasma concentration of fosphenytoin
 increased; plasma concentration of fosphenytoin possibly
 increased by ETHOSUNIMIDE, also plasma concentration of
 ethosus/mide possibly reduced; fosphenytoin reduces plasma
 concentration of LAMOTRIGINE, TIAGABINE and ZONISAMIDE;
 plasma concentration of fosphenytoin increased by
 OXCARBAZEPINE, also plasma concentration of an active
 metabolite of oxcarbazepine reduced; fosphenytoin reduces

Fosphenytoin

- · Antiepileptics (continued)
- plasma concentration of PERAMPANEL (see under Perampanel, p. 398); fosphenytoin often increases plasma concentration of PHENOBARBITAL and PRIMIDONE, plasma concentration of fosphenytoin often reduced but may be increased; fosphenytoin possibly reduces plasma concentration of RETIGABINE; fosphenytoin possibly reduces plasma concentration of RUFINAMIDE, also plasma concentration of fosphenytoin possibly increased; plasma concentration of fosphenytoin increased or possibly reduced when given with SODIUM VALPROATE and VALPROIC ACID, also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of fosphenytoin increased by • STIRIPENTOL; plasma concentration of fosphenytoin increased by • TOPIRAMATE (also plasma concentration of topiramate reduced); plasma concentration of fosphenytoin reduced by VIGABATRIN
- Antifungals: fosphenytoin reduces plasma concentration of • KETOCONAZOLE and • POSACONAZOLE; anticonvulsant effect of fosphenytoin enhanced by • MICONAZOLE (plasma concentration of fosphenytoin increased); plasma concentration of fosphenytoin increased by • FLUCONAZOLE (consider reducing dose of fosphenytoin); fosphenytoin reduces plasma concentration of • ITRACONAZOLE—avoid concomitant use; plasma concentration of fosphenytoin increased by • VORICONAZOLE, also fosphenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for fosphenytoin toxicity); fosphenytoin possibly reduces plasma concentration of CASPOFUNGIN—consider increasing dose of caspofungin
- Antimalarials: avoidance of fosphenytoin advised by manufacturer of ARTENIMOL WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE; anticonvulsant effect of fosphenytoin antagonised by
 PYRIMETHAMINE, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered); fosphenytoin reduces plasma concentration of HALOPERIDOL; plasma concentration of fosphenytoin possibly increased or decreased by CHLORPROMAZINE; fosphenytoin possibly reduces plasma concentration of ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); fosphenytoin accelerates metabolism of CLOZAPINE and QUETIAPINE (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of LURASIDONE— avoid concomitant use
- fosphenytoin increased or decreased by ZIDOVUDINE

 Anxiolytics and Hypnotics: fosphenytoin often reduces plasma concentration of CLONAZEPAM; plasma concentration of fosphenytoin increased or decreased by DIAZEPAM; plasma concentration of fosphenytoin possibly increased or

fosphenytoin possibly affected; plasma concentration of

 Aprepitant: fosphenytoin possibly reduces plasma concentration of APREPITANT

decreased by BENZODIAZEPINES

- Bupropion: fosphenytoin reduces plasma concentration of BUPROPION
- ► Caffeine citrate: fosphenytoin reduces plasma concentration of CAFFEINE CITRATE

Fosphenytoin (continued)

- Calcium-channel Blockers: fosphenytoin reduces effects of FELODIPINE and VERAPAMIL; avoidance of fosphenytoin advised by manufacturer of ISRADIPINE; avoidance of fosphenytoin advised by manufacturer of NIMODIPINE (plasma concentration of nimodipine possibly reduced); plasma concentration of fosphenytoin increased by ● DILTIAZEM but also effect of diltiazem reduced
- Cannabis Extract: fosphenytoin possibly reduces plasma concentration of CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Cardiac Glycosides: fosphenytoin possibly reduces plasma concentration of DIGOXIN
- Ciclosporin: fosphenytoin accelerates metabolism of
 CICLOSPORIN (reduced plasma concentration)
- Cobicistat: fosphenytoin possibly reduces plasma concentration of ◆ COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: fosphenytoin accelerates metabolism of
 CORTICOSTEROIDS (reduced effect)
- Cytotoxics: fosphenytoin possibly reduces plasma concentration of BUSULFAN, ERIBULIN and ETOPOSIDE; metabolism of fosphenytoin possibly inhibited by CAPECITABINE, FLUOROURACIL and TEGAFUR (increased risk of toxicity); fosphenytoin increases antifolate effect of METHOTREXATE; plasma concentration of fosphenytoin possibly reduced by CISPLATIN; fosphenytoin possibly decreases plasma concentration of ANTINIB (increase dose of axitinib—consult axitinib product literature); fosphenytoin possibly reduces plasma concentration of BORTEZOMIB,
- BOSUTINIB, CRIZOTINIB, IBRUTINIB, IDELALISIB and PONATINIB—manufacturer of bortezomib, bosutinib, crizotinib, ibrutinib, idelalisib and ponatinib advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of CABOZANTINIB—avoid concomitant use; avoidance of fosphenytoin advised by manufacturer of
- CABAZITAXEL, DABRAFENIB, GEFITINIB, LAPATINIB and VEMURAFENIB; avoidance of fosphenytoin advised by manufacturer of DASATINIB and VISMODEGIB (plasma concentration of dasatinib and vismodegib possibly reduced); fosphenytoin reduces plasma concentration of IMATINIB— avoid concomitant use; fosphenytoin reduces plasma concentration of IRINOTECAN and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when fosphenytoin given with PROCARBAZINE
- Dexrazoxane: absorption of fosphenytoin possibly reduced by
 DEXRAZOXANE
- Diazoxide: plasma concentration of fosphenytoin reduced by DIAZOXIDE, also effect of diazoxide may be reduced
- Disulfiram: metabolism of fosphenytoin inhibited by
 DISULFIRAM (increased risk of toxicity)
- Diuretics: plasma concentration of fosphenytoin possibly increased by ● ACETAZOLAMIDE; fosphenytoin antagonises effects of FUROSEMIDE; fosphenytoin reduces plasma concentration of ● EPLERENONE—avoid concomitant use; increased risk of osteomalacia when fosphenytoin given with CARBONIC ANHYDRASE INHIBITORS
- Dopaminergics: fosphenytoin possibly reduces effects of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA
- Enteral Foods: absorption of fosphenytoin possibly reduced by ENTERAL FEEDS
- Folates: plasma concentration of fosphenytoin possibly reduced by FOLATES
- ► Fosaprepitant: fosphenytoin possibly reduces plasma concentration of FOSAPREPITANT
- Hormone Antagonists: fosphenytoin possibly reduces plasma concentration of ◆ABIRATERONE—manufacturer of abiraterone advises avoid concomitant use; fosphenytoin possibly accelerates metabolism of TOREMIFENE
- 5HT₃-receptor Antagonists: fosphenytoin accelerates metabolism of ONDANSETRON (reduced effect)
- Ivacaftor: fosphenytoin possibly reduces plasma concentration of • IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use

Fosphenytoin (continued)

- Leflunomide: plasma concentration of fosphenytoin possibly increased by LEFLUNOMIDE
- Lipid-regulating Drugs: absorption of fosphenytoin possibly reduced by COLESEVELAM; combination of fosphenytoin with FLUVASTATIN may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when fosphenytoin given with LITHIUM without increased plasma concentration of lithium
- Macitentan: avoidance of fosphenytoin advised by manufacturer of MACITENTAN
- Modafinil: plasma concentration of fosphenytoin possibly increased by MODAFINIL
- Oestrogens: fosphenytoin accelerates metabolism of
 OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Progestogens: fosphenytoin accelerates metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)
- ► Roflumilast: fosphenytoin possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sulfinpyrazone: plasma concentration of fosphenytoin increased by • SULFINPYRAZONE
- Sympathomimetics: plasma concentration of fosphenytoin increased by METHYLPHENIDATE
- Tacrolimus: fosphenytoin reduces plasma concentration of TACROLIMUS, also plasma concentration of fosphenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when fosphenytoin given with • THEOPHYLLINE
- Thyroid Hormones: fosphenytoin accelerates metabolism of THYROID HORMONES (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin possibly increased
- ► Tibolone: fosphenytoin accelerates metabolism of TIBOLONE
- Ticagrelor: fosphenytoin possibly reduces plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: metabolism of fosphenytoin inhibited by
- ◆ CIMETIDINE (increased plasma concentration); effects of fosphenytoin enhanced by ◆ ESOMEPRAZOLE; effects of fosphenytoin possibly enhanced by OMEPRAZOLE; absorption of fosphenytoin reduced by ◆ SUCRALFATE
- Ulipristal: avoidance of fosphenytoin advised by manufacturer of • ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vaccines: effects of fosphenytoin enhanced by INFLUENZA VACCINE
- Vitamins: fosphenytoin possibly increases requirements for ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL OR VITAMIN D

Frovatriptan see 5HT₁-receptor Agonists (under HT) Furosemide see Diuretics

Fusidic Acid

- Antivirals: plasma concentration of both drugs increased when fusidic acid given with • RITONAVIR—avoid concomitant use; plasma concentration of both drugs may increase when fusidic acid given with SAQUINAVIR
- Lipid-regulating Drugs: risk of myopathy and rhabdomyolysis when fusidic acid given with • STATINS—avoid concomitant use and for 7 days after last fusidic acid dose
- Sugammadex: fusidic acid possibly reduces response to SUGAMMADEX

Fusidic Acid (continued)

 Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Gabapentin

- Analgesics: bioavailability of gabapentin increased by MORPHINE
- Antacids: absorption of gabapentin reduced by ANTACIDS
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ● TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● SSRIS and ● TRICYCLICS (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE

Galantamine see Parasympathomimetics

Ganciclovir

- NOTE Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Antibacterials: increased risk of convulsions when ganciclovir given with • IMIPENEM WITH CILASTATIN
- Antivirals: ganciclovir possibly increases plasma concentration of DIDANOSINE; profound myelosuppression when ganciclovir given with • ZIDOVUDINE (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
- Mycophenolate: plasma concentration of ganciclovir possibly increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with TACROLIMUS

Gefitinib

- Antibacterials: plasma concentration of gefitinib reduced by
- RIFAMPICIN—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of • WARFARIN
- Antidepressants: manufacturer of gefitinib advises avoid concomitant use with ST JOHN'S WORT
- Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- ► Antifungals: plasma concentration of gefitinib increased by ITRACONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of gefitinib advised by manufacturer of
 BOCEPREVIR
- Ulcer-healing Drugs: plasma concentration of gefitinib reduced by • RANITIDINE

Gemcitabine

- Anticoagulants: gemcitabine possibly enhances anticoagulant effect of WARFARIN
- · Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)

Gemeprost see Prostaglandins

Gemfibrozil see Fibrates

Gentamicin see Aminoglycosides

Gestodene see Progestogens

Glibenclamide see Antidiabetics

Gliclazide see Antidiabetics

Glimepiride see Antidiabetics

Glipizide see Antidiabetics

Glucosamine

- Anticoagulants: glucosamine enhances anticoagulant effect of
- WARFARIN (avoid concomitant use)

Glyceryl Trinitrate see Nitrates

Glycopyrronium see Antimuscarinics

Golimumab

- Abatacept: avoid concomitant use of golimumab with
- ABATACEPT

Golimumab (continued)

- Anakinra: avoid concomitant use of golimumab with
 ANAKINRA
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use
 Granisetron see 5HT₃-receptor Antagonists (under HT)

Grapefruit Juice

- Aliskiren: grapefruit juice reduces plasma concentration of
- ALISKIREN—avoid concomitant use
- Anthelmintics: grapefruit juice increases plasma concentration of active metabolite of ALBENDAZOLE; grapefruit juice increases plasma concentration of PRAZIQUANTEL
- Anti-arrhythmics: grapefruit juice increases plasma concentration of AMIODARONE; grapefruit juice increases plasma concentration of • DRONEDARONE—avoid concomitant use
- Antidepressants: grapefruit juice possibly increases plasma concentration of SERTRALINE
- Antihistamines: grapefruit juice reduces plasma concentration of BILASTINE
- Antimalarials: grapefruit juice possibly increases plasma concentration of ARTEMETHER WITH LUMEFANTRINE; avoidance of grapefruit juice advised by manufacturer of ARTENIMOL WITH PIPERAQUINE
- Antipsychotics: avoidance of grapefruit juice advised by manufacturer of LURASIDONE and PIMOZIDE; grapefruit juice possibly increases plasma concentration of ● QUETIAPINE manufacturer of quetiapine advises avoid concomitant use
- Antivirals: grapefruit juice possibly increases plasma concentration of EFAVIRENZ
- Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of oral MIDAZOLAM; grapefruit juice increases plasma concentration of BUSPIRONE
- Avanafil: grapefruit juice possibly increases plasma concentration of AVANAFIL— manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of AMLODIPINE; grapefruit juice increases plasma concentration of FELODIPINE, ISRADIPINE, LACIDIPINE, LERCANIDIPINE, NICARDIPINE, NIFEDIPINE, NIMODIPINE and VERAPAMIL
- Ciclosporin: grapefruit juice increases plasma concentration of
 CICLOSPORIN (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of
 - COLCHICINE toxicity
- Corticosteroids: grapefruit juice increases plasma concentration of oral • BUDESONIDE—avoid concurrent use or separate administration by as much as possible and consider reducing oral budesonide dose
- Cytotoxics: grapefruit juice possibly increases plasma concentration of AXITINIB, CABOZANTINIB and PONATINIB; grapefruit juice possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; grapefruit juice possibly increases plasma concentration of CRIZOTINIB and VINFLUNINE—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of DASATINIB (plasma concentration of dasatinib possibly increased); avoidance of grapefruit juice advised by manufacturer of EVEROLIMUS, IBRUTINIB,
- LAPATINIB, NILOTINIB and PAZOPANIB
- Ivabradine: grapefruit juice increases plasma concentration of IVABRADINE
- Ivacaftor: grapefruit juice possibly increases plasma concentration of IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of ATORVASTATIN; grapefruit juice increases plasma concentration of ● SIMVASTATIN—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of LOMITAPIDE
- Pirfenidone: avoidance of grapefruit juice advised by manufacturer of PIRFENIDONE

Grapefruit Juice (continued)

- Ranolazine: grapefruit juice possibly increases plasma concentration of ◆ RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of SILDENAFIL
- Sirolimus: grapefruit juice increases plasma concentration of
 SIROLIMUS—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of
 TACROLIMUS
- Tadalafil: grapefruit juice possibly increases plasma concentration of TADALAFIL
- Tolvaptan: grapefruit juice increases plasma concentration of
- TOLVAPTAN—avoid concomitant use
- Ulipristal: avoidance of grapefruit juice advised by manufacturer of low-dose ULIPRISTAL
- Vardenafil: grapefruit juice possibly increases plasma concentration of • VARDENAFIL—avoid concomitant use
 Griseofulvin
- ▶ Alcohol: griseofulvin possibly enhances effects of ALCOHOL
- Anticoagulants: griseofulvin reduces anticoagulant effect of
 COUMARINS
- Antiepileptics: absorption of griseofulvin reduced by PHENOBARBITAL and PRIMIDONE (reduced effect)
- Ciclosporin: griseofulvin possibly reduces plasma concentration of CICLOSPORIN
- Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with OESTROGENS
- Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with PROGESTOGENS

Guanethidine see Adrenergic Neurone Blockers

Haemophilus Vaccine see Vaccines

Haloperidol see Antipsychotics

Heparin see Heparins

Heparins

- ACE Inhibitors: increased risk of hyperkalaemia when heparins given with ACE INHIBITORS
- Aliskiren: increased risk of hyperkalaemia when heparins given with ALISKIREN
- Analgesics: possible increased risk of bleeding when heparins given with NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous © DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
 - KETOROLAC (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with △ APIXABAN, ◆ DABIGATRAN and
 RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Clopidogrel: increased risk of bleeding when heparins given with CLOPIDOGREL
- Dipyridamole: anticoagulant effect of heparins enhanced by DIPYRIDAMOLE
- Iloprost: anticoagulant effect of heparins possibly enhanced by ILOPROST
- Nitrates: anticoagulant effect of heparins reduced by infusion of • GLYCERYL TRINITRATE

Hepatitis Vaccines see Vaccines

Histamine

- Antidepressants: manufacturer of histamine advises avoid concomitant use with MAOIs; effects of histamine theoretically antagonised by TRICYCLICS—manufacturer of histamine advises avoid concomitant use
- Antihistamines: effects of histamine theoretically antagonised by ANTIHISTAMINES—manufacturer of histamine advises avoid concomitant use

Histamine (continued)

- Antimalarials: manufacturer of histamine advises avoid concomitant use with ANTIMALARIALS
- Antipsychotics: effects of histamine theoretically antagonised by ANTIPSYCHOTICS—manufacturer of histamine advises avoid concomitant use
- Atovaquone: manufacturer of histamine advises avoid concomitant use with ATOVAQUONE
- Clonidine: manufacturer of histamine advises avoid concomitant use with CLONIDINE
- Corticosteroids: manufacturer of histamine advises avoid concomitant use with CORTICOSTEROIDS
- ▶ Ulcer-healing Drugs: effects of histamine theoretically antagonised by HISTAMINE H₂-ANTAGONISTS—manufacturer of histamine advises avoid concomitant use

Histamine H2-antagonists

- Alpha-blockers: cimetidine and ranitidine antagonise effects of
 TOLATOLINE
- Aminophylline: cimetidine inhibits metabolism of
- AMINOPHYLLINE (increased plasma concentration)
- Analgesics: cimetidine inhibits metabolism of OPIOID ANALGESICS (increased plasma concentration)
- Anthelmintics: cimetidine possibly enhances effects of ALBENDAZOLE; cimetidine possibly inhibits metabolism of MEBENDAZOLE (increased plasma concentration); cimetidine increases plasma concentration of PRAZIQUANTEL
- Anti-arrhythmics: cimetidine increases plasma concentration
 of AMIODARONE and PROPAFENONE; cimetidine inhibits
 metabolism of FLECAINIDE (increased plasma concentration);
 cimetidine increases plasma concentration of LIDOCAINE
 (increased risk of toxicity)
- Antibacterials: cimetidine increases plasma concentration of ERYTHROMYCIN (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of METRONIDAZOLE (increased plasma concentration); metabolism of cimetidine accelerated by RIFAMPICIN (reduced plasma concentration)
- Anticoagulants: cimetidine inhibits metabolism of COUMARINS (enhanced anticoagulant effect)
- Antidepressants: cimetidine increases plasma concentration of CITALOPRAM, ESCITALOPRAM, MIRTAZAPINE and SERTRALINE; cimetidine inhibits metabolism of AMITRIPTYLINE, DOXEPIN, IMIPRAMINE and NORTRIPTYLINE (increased plasma concentration); cimetidine increases plasma concentration of MOCLOBEMIDE (halve dose of moclobemide); cimetidine possibly increases plasma concentration of TRICYCLICS
- Antidiabetics: cimetidine reduces excretion of METFORMIN (increased plasma concentration); cimetidine enhances hypoglycaemic effect of SULFONYLUREAS
- Antiepileptics: cimetidine inhibits metabolism of
 CARBAMAZEPINE, FOSPHENYTOIN, PHENYTOIN, SODIUM
 VALPROATE and VALPROIC ACID (increased plasma concentration)
- Antifungals: histamine H₂-antagonists reduce absorption of ITRACONAZOLE and KETOCONAZOLE; cimetidine reduces plasma concentration of ● POSACONAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; famotidine, nizatidine and ranitidine possibly reduce plasma concentration of ● POSACONAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; cimetidine increases plasma concentration of TERBINAFINE
- Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of LORATADINE; cimetidine increases plasma concentration of HYDROXYZINE
- Antimalarials: avoidance of cimetidine advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; cimetidine inhibits metabolism of CHLOROQUINE, HYDROXYCHLOROQUINE and QUININE (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of ANTIPSYCHOTICS, CHLORPROMAZINE and CLOZAPINE
- Antivirals: manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with ATAZANAVIR—consult atazanavir product literature; famotidine and ranitidine reduce the plasma concentration of • ATAZANAVIR (adjust doses of both drugs—consult atazanavir product literature); famotidine increases plasma

Histamine H2-antagonists

- Antivirals (continued)
- concentration of RAITEGRAVIR; avoidance of histamine H₂antagonists for 12 hours before or 4 hours after RILPIVIRINE
 advised by manufacturer of rilpivirine—consult product
 literature; cimetidine possibly increases plasma
 concentration of \$AQUINAVIR
- Anxiolytics and Hypnotics: cimetidine inhibits metabolism of BENZODIAZEPINES, CLOMETHIAZOLE and ZALEPLON (increased plasma concentration); cimetidine increases plasma concentration of MELATONIN
- Beta-blockers: cimetidine increases plasma concentration of LABETALOL, METOPROLOL and PROPRANOLOL; cimetidine possibly increases plasma concentration of oral TIMOLOL
- Caffeine citrate: cimetidine increases plasma concentration of CAFFEINE CITRATE
- Calcium-channel Blockers: cimetidine possibly inhibits metabolism of CALCIUM-CHANNEL BLOCKERS (increased plasma concentration); cimetidine increases plasma concentration of ISRADIPINE (halve dose of isradipine)
- Clopidogrel: cimetidine possibly reduces antiplatelet effect of
 CLOPIDOGREI
- Cytotoxics: cimetidine possibly enhances myelosuppressive
 effects of CARMUSTINE and LOMUSTINE; cimetidine reduces
 plasma concentration of DOXORUBICIN; cimetidine increases
 plasma concentration of EPIRUBICIN; cimetidine inhibits
 metabolism of CAPECITABINE, FLUOROURACIL and TEGAFUR
 (increased plasma concentration); famotidine possibly
 reduces plasma concentration of DASATINIB; avoidance of
 cimetidine, famotidine and nizatidine advised by
 manufacturer of ERLOTINIB; ranitidine reduces plasma
 concentration of ERLOTINIB—manufacturer of erlotinib
 advises give at least 2 hours before or 10 hours after
 ranitidine; ranitidine reduces plasma concentration of
 - GEFITINIB; histamine H_2 -antagonists possibly reduce absorption of LAPATINIB; histamine H_2 -antagonists possibly reduce absorption of PAZOPANIB—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H_2 -antagonists
- Dopaminergics: cimetidine reduces excretion of PRAMIPEXOLE (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with ERGOTAMINE—avoid concomitant use
- Fampridine: avoidance of cimetidine advised by manufacturer of ● FAMPRIDINE
- Histamine: histamine H₂-antagonists theoretically antagonise effects of HISTAMINE—manufacturer of histamine advises avoid concomitant use
- ► Hormone Antagonists: absorption of cimetidine possibly delayed by OCTREOTIDE
- ► 5HT₁-receptor Agonists: cimetidine inhibits metabolism of ZOLMITRIPTAN (reduce dose of zolmitriptan)
- Lipid-regulating Drugs: separating administration from cimetidine and ranitidine by 12 hours advised by manufacturer of LOMITAPIDE
- Roflumilast: cimetidine inhibits the metabolism of ROFLUMILAST
- Sildenafil: cimetidine increases plasma concentration of SILDENAFIL—consider reducing dose of sildenafil for erectile dysfunction
- Sympathomimetics: cimetidine possibly inhibits metabolism of DOBUTAMINE
- Theophylline: cimetidine inhibits metabolism of
- THEOPHYLLINE (increased plasma concentration)
- Thyroid Hormones: cimetidine reduces absorption of LEVOTHYROXINE

Homatropine see Antimuscarinics

Hormone Antagonists see Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flutamide, Lanreotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

5HT₁-receptor Agonists

- Antibacterials: plasma concentration of eletriptan increased by

5HT₁-receptor Agonists

- Antibacterials (continued) avoid concomitant use; metabolism of zolmitriptan possibly inhibited by QUINOLONES (reduce dose of zolmitriptan)
- Antidepressants: increased risk of CNS toxicity when 5HT₁
 agonists given with CITALOPRAM (manufacturer of
 citalopram advises avoid concomitant use); increased risk of
 CNS toxicity when sumatriptan given with CITALOPRAM,
 - ESCITALOPRAM, FLUOXETINE, FLUVOXAMINE or
- ◆ PAROXETINE; metabolism of frovatriptan inhibited by FLUVOXAMINE; metabolism of zolmitriptan possibly inhibited by FLUVOXAMINE (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with SERTRALINE; possible increased serotonergic effects when 5HT₁ agonists given with DULOXETINE or VENLAFAXINE; risk of CNS toxicity when rizatriptan or sumatriptan given with ◆ MAOIS (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when zolmitriptan given with ◆ MAOIS or
- MOCLOBEMIDE (reduce dose of zolmitriptan); risk of CNS toxicity when rizatriptan or sumatriptan given with
- MOCLOBEMIDE (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); possible increased serotonergic effects when naratriptan given with SSRIs; increased serotonergic effects when 5HT₁ agonists given with ● ST JOHN'S WORT avoid concomitant use
- Antivirals: plasma concentration of eletriptan increased by
 INDINAVIR and RITONAVIR (risk of toxicity)—avoid concomitant use
- Beta-blockers: plasma concentration of rizatriptan increased by PROPRANOLOL (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Dapoxetine: possible increased risk of serotonergic effects
 when 5HT, agonists given with DAPOXETINE (manufacturer
 of dapoxetine advises 5HT, agonists should not be started
 until 1 week after stopping dapoxetine, avoid dapoxetine for
 2 weeks after stopping 5HT, agonists)
- Dopaminergics: avoidance of 5HT₁agonists advised by manufacturer of SELEGILINE
- Lithium: possible risk of toxicity when sumatriptan given with LITHIUM
- Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by CIMETIDINE (reduce dose of zolmitriptan)

5HT₃-receptor Antagonists

- Analgesics: ondansetron possibly antagonises effects of TRAMADOL
- Antibacterials: metabolism of ondansetron accelerated by RIFAMPICIN (reduced effect)
- Antidepressants: possible increased serotonergic effects when 5HT₃ antagonists given with SSRI-RELATED ANTIDEPRESSANTS or SSRIS
- Antiepileptics: metabolism of ondansetron accelerated by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN (reduced effect)
- Cytotoxics: increased risk of ventricular arrhythmias when ondansetron given with • VANDETANIB—avoid concomitant use
- Dopaminergics: possible increased hypotensive effect when ondansetron given with • APOMORPHINE—avoid concomitant use

Human papillomavirus Vaccine *see* Vaccines **Hydralazine** *see* Vasodilator Antihypertensives

Hydrochlorothiazide see Diuretics

Hydrocortisone *see* Corticosteroids **Hydroflumethiazide** *see* Diuretics

Hydromorphone see Opioid Analgesics

Hydrotalcite see Antacids

Hydroxocobalamin

► Antibacterials: response to hydroxocobalamin reduced by CHLORAMPHENICOL

Hydroxycarbamide

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: increased risk of toxicity when hydroxycarbamide given with • DIDANOSINE and • STAVUDINE—avoid concomitant use

Hydroxychloroquine

- Adsorbents: absorption of hydroxychloroquine reduced by
- Agalsidase Alfa and Beta: hydroxychloroquine possibly inhibits effects of AGALSIDASE ALFA AND BETA (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antacids: absorption of hydroxychloroquine reduced by ANTACIDS
- Anti-arrhythmics: increased risk of ventricular arrhythmias when hydroxychloroquine given with • AMIODARONE—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when hydroxychloroquine given with • MOXIFLOXACIN—avoid concomitant use
- Antimalarials: avoidance of antimalarials advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; increased risk of convulsions when hydroxychloroquine given with
- Antipsychotics: increased risk of ventricular arrhythmias when hydroxychloroquine given with • DROPERIDOL—avoid concomitant use
- Cardiac Glycosides: hydroxychloroquine possibly increases plasma concentration of ● DIGOXIN
- Ciclosporin: hydroxychloroquine increases plasma concentration of ◆ CICLOSPORIN (increased risk of toxicity)
- Cytotoxics: possible increased risk of ventricular arrhythmias when hydroxychloroquine given with • BOSUTINIB
- ► Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- ► Lanthanum: absorption of hydroxychloroquine possibly reduced by LANTHANUM (give at least 2 hours apart)
- ► Laronidase: hydroxychloroquine possibly inhibits effects of LARONIDASE (manufacturer of laronidase advises avoid concomitant use)
- ► Parasympathomimetics: hydroxychloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of NEOSTIGMINE and PYRIDOSTIGMINE
- Ulcer-healing Drugs: metabolism of hydroxychloroquine inhibited by CIMETIDINE (increased plasma concentration)
- ► Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see

under Typhoid Vaccine in BNF Hvdroxyzine see Antihistamines

Hyoscine see Antimuscarinics

Ibandronic Acid see Bisphosphonates

Ibrutinib

- Anti-arrhythmics: plasma concentration of ibrutinib possibly increased by AMIODARONE and DRONEDARONE—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Antibacterials: plasma concentration of ibrutinib possibly increased by • CIPROFLOXACIN, • CLARITHROMYCIN,
- ERYTHROMYCIN and TELITHROMYCIN—reduce dose of ibrutinib (see under Ibrutinib, p. 809); plasma concentration of ibrutinib reduced by RIFAMPICIN—avoid concomitant use
- Anticoagulants: manufacturer of ibrutinib advises avoid concomitant use with COUMARINS and PHENINDIONE
- Antidepressants: plasma concentration of ibrutinib possibly reduced by • ST JOHN'S WORT—manufacturer of ibrutinib advises avoid concomitant use
- Antiepileptics: plasma concentration of ibrutinib possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN and

Ibrutinib

- · Antiepileptics (continued)
 - PHENYTOIN—manufacturer of ibrutinib advises avoid concomitant use
- Antifungals: plasma concentration of ibrutinib increased by

 KETOCONAZOLE—reduce dose of ibrutinib (see under lbrutinib, p. 809); plasma concentration of ibrutinib possibly increased by
 FLUCONAZOLE,
 ITRACONAZOLE and
 - VORICONAZOLE—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of ibrutinib possibly increased by • ATAZANAVIR, • DARUNAVIR, • FOSAMPRENAVIR,
- INDINAVIR, RITONAVIR and SAQUINAVIR—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
 Aprepitant: plasma concentration of ibrutinib possibly
- increased by APREPITANT—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
 Calcium-channel Blockers: plasma concentration of ibrutinib
- possibly increased by DILTIAZEM and VERAPAMIL—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Cardiac Glycosides: manufacturer of ibrutinib advises give DIGOXIN at least 6 hours before or after ibrutinib
- Cobicistat: plasma concentration of ibrutinib possibly increased by COBICISTAT—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Cytotoxics: plasma concentration of ibrutinib possibly increased by ● CRIZOTINIB and ● IMATINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- ► Fosaprepitant: plasma concentration of ibrutinib possibly increased by FOSAPREPITANT
- ► Grapefruit Juice: manufacturer of ibrutinib advises avoid concomitant use with GRAPEFRUIT JUICE
- Vitamins: manufacturer of ibrutinib advises avoid concomitant use with VITAMIN E

Ibuprofen see NSAIDs

Idarubicin

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of idarubicin increased by
 CICLOSPORIN

Idelalisib

- Alpha-blockers: manufacturer of idelalisib advises avoid concomitant use with ALFUZOSIN
- Anti-arrhythmics: manufacturer of idelalisib advises avoid concomitant use with AMIODARONE
- Antibacterials: plasma concentration of idelalisib reduced by
 RIFAMPICIN—avoid concomitant use
- Antidepressants: plasma concentration of idelalisib possibly reduced by • ST JOHN'S WORT—manufacturer of idelalisib advises avoid concomitant use
- Antiepileptics: plasma concentration of idelalisib possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN and
- PHENYTOIN—manufacturer of idelalisib advises avoid concomitant use
- Antifungals: plasma concentration of idelalisib increased by KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis); manufacturer of idealisib advises avoid concomitant use with PIMOZIDE and OUETIAPINE
- Anxiolytics and Hypnotics: manufacturer of idelalisib advises avoid concomitant use of oral MIDAZOLAM
- Ergot Alkaloids: manufacturer of idelalisib advises avoid concomitant use with ERGOTAMINE
- Lipid-regulating Drugs: manufacturer of idelalisib advises avoid concomitant use with SIMVASTATIN
- Sildenafil: manufacturer of idelalisib advises avoid concomitant use of SILDENAFIL for pulmonary arterial hypertension
- Sympathomimetics, Beta₂: manufacturer of idelalisib advises avoid concomitant use with SALMETEROL

Ifosfamide

 Anticoagulants: ifosfamide possibly enhances anticoagulant effect of • COUMARINS

Ifosfamide (continued)

- ► Antifungals: metabolism of ifosfamide inhibited by KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: increased risk of otoxicity when ifosfamide given with CISPLATIN

Hoprost

- Analgesics: increased risk of bleeding when iloprost given with NSAIDs or ASPIRIN
- Anticoagulants: iloprost possibly enhances anticoagulant effect of COUMARINS and HEPARINS; increased risk of bleeding when iloprost given with PHENINDIONE
- Clopidogrel: increased risk of bleeding when iloprost given with CLOPIDOGREL
- Eptifibatide: increased risk of bleeding when iloprost given with EPTIFIBATIDE
- ► Tirofiban: increased risk of bleeding when iloprost given with TIROFIBAN

Imatinib

- Analgesics: manufacturer of imatinib advises caution with PARACETAMOL
- Antibacterials: plasma concentration of imatinib reduced by
 RIFAMPICIN—avoid concomitant use
- Anticoagulants: manufacturer of imatinib advises replacement of WARFARIN with a heparin (possibility of enhanced warfarin effect)
- Antidepressants: plasma concentration of imatinib reduced by
 ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of imatinib reduced by
- CARBAMAZEPINE, FOSPHENYTOIN, OXCARBAZEPINE and
- PHENYTOIN—avoid concomitant use
- Antifungals: plasma concentration of imatinib increased by KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of imatinib advised by manufacturer of
 BOCEPREVIR
- Ciclosporin: imatinib possibly increases plasma concentration of CICLOSPORIN
- Cytotoxics: imatinib possibly increases the plasma concentration of ●BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; imatinib increases plasma concentration of ●EVEROLIMUS (consider reducing the dose of everolimus —consult everolimus product literature); imatinib possibly increases the plasma concentration of ●IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809)
- Lipid-regulating Drugs: imatinib increases plasma concentration of SIMVASTATIN
- Tacrolimus: imatinib increases plasma concentration of TACROLIMUS
- Thyroid Hormones: imatinib possibly reduces plasma concentration of LEVOTHYROXINE

Imidapril see ACE Inhibitors

Imipenem with Cilastatin

- Antiepileptics: carbapenems reduce plasma concentration of
 SODIUM VALPROATE and VALPROIC ACID—avoid concomitant
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Imipramine see Antidepressants, Tricyclic

Immunoglobulins

- Vaccines: anti-d immunoglobulins and normal immunoglobulin might impair immune response to BCG VACCINE—give BCG vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to
 - MMR VACCINE—give MMR vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to live

Immunoglobulins

- · Vaccines (continued)
- INFLUENZA VACCINE—give live influenza vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to ORAL TYPHOID VACCINE—give oral typhoid vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to oral ● POLIOMYELITIS VACCINE—give oral poliomyelitis vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to • ROTAVIRUS VACCINE—give rotavirus vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to • SMALLPOX VACCINE—give smallpox vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to ● VARICELLA-ZOSTER VACCINE—give varicella-zoster vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to ● YELLOW FEVER VACCINE—give yellow fever vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin

Indacaterol see Sympathomimetics, Beta₂

Indapamide see Diuretics

Indinavir

- Aldesleukin: plasma concentration of indinavir possibly increased by ALDESLEUKIN
- Anti-arrhythmics: indinavir possibly increases plasma concentration of ◆AMIODARONE—avoid concomitant use; indinavir possibly increases plasma concentration of ◆FLECAINIDE (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of

 RIFABUTIN, also plasma concentration of indinavir decreased (reduce dose of rifabutin and increase dose of indinavir); metabolism of indinavir accelerated by • RIFAMPICIN (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of • TELITHROMYCIN
- Anticoagulants: avoidance of indinavir advised by manufacturer of APIXABAN and RIVAROXABAN
- Antidepressants: plasma concentration of indinavir reduced by
 ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by ● CARBAMAZEPINE, ● FOSPHENYTOIN and
 ● PHENYTOIN, also plasma concentration of carbamazepine, fosphenytoin and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by
 ● PHENDBARBITAL and ● PRIMIDONE
- Antifungals: plasma concentration of indinavir increased by
 ITRACONAZOLE and KETOCONAZOLE (consider reducing dose of indinavir)
- Antimalarials: caution with indinavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; indinavir possibly increases plasma concentration of ● QUININE (increased risk of toxicity)
- Antimuscarinics: avoidance of indinavir advised by manufacturer of DARIFENACIN and TOLTERODINE; manufacturer of fesoterodine advises dose reduction when indinavir given with FESOTERODINE—consult fesoterodine product literature
- Antipsychotics: indinavir possibly increases plasma concentration of ● ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); indinavir possibly increases plasma concentration of ● LURASIDONE—avoid concomitant use; indinavir possibly increases plasma concentration of ● PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); indinavir possibly increases plasma concentration of

Indinavir

- · Antipsychotics (continued)
- QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of indinavir with
 ATAZANAVIR; plasma concentration of both drugs increased when indinavir given with DARUNAVIR; absorption of indinavir reduced by DIDANOSINE tablets (give at least 1 hour apart); plasma concentration of indinavir reduced by EFAVIRENZ and NEVIRAPINE; plasma concentration of indinavir possibly reduced by ●ETRAVIRINE—avoid concomitant use; indinavir increases plasma concentration of ●MARAVIROC (consider reducing dose of maraviroc); plasma concentration of indinavir increased by RITONAVIR; indinavir increases plasma concentration of \$400 km = 10 km
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with ALPRAZOLAM—avoid concomitant use; indinavir possibly increases plasma concentration of
 MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Atovaquone: plasma concentration of indinavir possibly reduced by ATOVAQUONE
- Avanafil: indinavir possibly increases plasma concentration of
 AVANAFIL—manufacturer of avanafil advises avoid
 concomitant use
- Bosentan: plasma concentration of indinavir possibly reduced by BOSENTAN
- Ciclosporin: indinavir increases plasma concentration of
 CICLOSPORIN
- Colchicine: indinavir possibly increases risk of COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of indinavir possibly reduced by DEXAMETHASONE
- CRIZOTINIB and EVEROLIMUS manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases the plasma concentration of IBRUTINIB— reduce dose of ibrutinib (see under Ibrutinib, p. 809); indinavir possibly increases plasma concentration of
- PAZOPANIB (reduce dose of pazopanib); indinavir possibly increases plasma concentration of PONATINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when indinavir given with RUXOLITINIB—consult ruxolitinib product literature; indinavir possibly increases plasma concentration of DOCETAKEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing department dose.
- Ergot Alkaloids: increased risk of ergotism when indinavir given with ● ERGOMETRINE or ● ERGOTAMINE—avoid concomitant use
- 5HT₁-receptor Agonists: indinavir increases plasma concentration of ● ELETRIPTAN (risk of toxicity)—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy
 when indinavir given with ATORVASTATIN; possible increased
 risk of myopathy when indinavir given with

 ROSUVASTATIN—
 manufacturer of rosuvastatin advises avoid concomitant use;
 increased risk of myopathy when indinavir given with
- SIMVASTATIN (avoid concomitant use); avoidance of indinavir advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of indinavir possibly reduced by
 ORLISTAT
- Ranolazine: indinavir possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: indinavir increases plasma concentration of
 SILDENAFIL—reduce initial dose of sildenafil

Indinavir (continued)

- Tadalafil: indinavir possibly increases plasma concentration of TADALAFIL
- Vardenafil: indinavir increases plasma concentration of
- VARDENAFIL—avoid concomitant use
 Indometacin see NSAIDs

Indoramin see Alpha-blockers

Infliximah

- Abatacept: avoid concomitant use of infliximab with
 ABATACEPT
- Anakinra: avoid concomitant use of infliximab with
 - ANAKINRA
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Influenza Vaccine see Vaccines Insulin see Antidiabetics

Interferon Alfa see Interferons Interferon Gamma see Interferons

Interferons

- Aminophylline: interferon alfa and peginterferon alfa inhibit metabolism of • AMINOPHYLLINE (consider reducing dose of aminophylline)
- Antivirals: caution with peginterferon alfa advised by manufacturer of ADEFOVIR; increased risk of peripheral neuropathy when interferon alfa and peginterferon alfa given with • TELBIVUDINE
- Theophylline: interferon alfa and peginterferon alfa inhibit metabolism of • THEOPHYLLINE (consider reducing dose of theophylline)
- Vaccines: manufacturer of interferon gamma advises avoid concomitant use with VACCINES

Ipilimumab

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- ► Cytotoxics: manufacturer of ipilimumab advises avoid
- concomitant use with VEMURAFENIB

 Vaccines: risk of generalised infections when monoclonal

antibodies given with live • VACCINES—avoid concomitant use lpratropium see Antimuscarinics

Irbesartan see Angiotensin-II Receptor Antagonists

- Antidepressants: metabolism of irinotecan accelerated by ST JOHN'S WORT (reduced plasma concentration—avoid concomitant use)
- ► Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of irinotecan reduced by
 KETOCONAZOLE (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; increased risk of toxicity when irinotecan given with ITRACONAZOLE—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: metabolism of irinotecan possibly inhibited by
- ATAZANAVIR (increased risk of toxicity)
- Cytotoxics: plasma concentration of active metabolite of irinotecan increased by ● LAPATINIB—consider reducing dose of irinotecan; plasma concentration of irinotecan increased by REGORAFENIB; plasma concentration of irinotecan possibly increased by SORAFENIB

Iron Salts

- Antacids: absorption of oral iron salts reduced by ORAL MAGNESIUM SALTS (as magnesium trisilicate)
- Antibacterials: oral iron salts reduce absorption of CIPROFLOXACIN, LEVOFLOXACIN, MOXIFLOXACIN and OFLOXACIN; oral iron salts reduce absorption of NORFLOXACIN (give at least 2 hours apart); oral iron salts reduce absorption of TETRACYCLINES, also absorption of oral iron salts reduced by tetracyclines
- Antivirals: oral iron salts reduce absoption of DOLUTEGRAVIR manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral iron salts

Iron Salts (continued)

- Bisphosphonates: oral iron salts reduce absorption of BISPHOSPHONATES
- Calcium Salts: absorption of oral iron salts reduced by CALCIUM SALTS
- Dopaminergics: oral iron salts possibly reduce absorption of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA; oral iron salts reduce absorption of ENTACAPONE
- Eltrombopag: oral iron salts possibly reduce absorption of ELTROMBOPAG (give at least 4 hours apart)
- Methyldopa: oral iron salts antagonise hypotensive effect of METHYLDOPA
- Mycophenolate: oral iron salts reduce absorption of MYCOPHENOLATE
- Penicillamine: oral iron salts reduce absorption of PENICILLAMINE
- Thyroid Hormones: oral iron salts reduce absorption of LEVOTHYROXINE (give at least 2 hours apart)
- ► Trientine: absorption of *oral* iron salts reduced by TRIENTINE
 ► Zinc: *oral* iron salts reduce absorption of ZINC, also absorption

of *oral* iron salts reduced by zinc **Isocarboxazid** *see* MAOIs

Isoflurane see Anaesthetics, General

Isometheptene see Sympathomimetics

Isoniazid

- Aminophylline: isoniazid possibly increases plasma concentration of AMINOPHYLLINE
- Anaesthetics, General: increased risk of hepatotoxicity when isoniazid given with ISOFLURANE
- Analgesics: avoidance of isoniazid advised by manufacturer of PETHIDINE
- ▶ Antacids: absorption of isoniazid reduced by ANTACIDS
- Antibacterials: increased risk of hepatotoxicity when isoniazid given with • RIFAMPICIN; increased risk of CNS toxicity when isoniazid given with CYCLOSERINE
- Antiepileptics: isoniazid increases plasma concentration of
 - CARBAMAZEPINE (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of
- ETHOSUXIMIDE (increased plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antifungals: isoniazid possibly reduces plasma concentration of KETOCONAZOLE
- Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of DIAZEPAM
- Corticosteroids: plasma concentration of isoniazid possibly reduced by CORTICOSTEROIDS
- Disulfiram: isoniazid possibly increases CNS effects of DISULFIRAM
- Dopaminergics: isoniazid possibly reduces effects of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA
- ▶ Lipid-regulating Drugs: separating administration from isoniazid by 12 hours advised by manufacturer of LOMITAPIDE
- Theophylline: isoniazid possibly increases plasma concentration of THEOPHYLLINE
- ▶ Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Isosorbide Dinitrate see Nitrates

Isosorbide Mononitrate see Nitrates

Isotretinoin see Retinoids

Isradipine see Calcium-channel Blockers

Itraconazole see Antifungals, Triazole

Ivabradine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with ● AMIODARONE or ● DISOPYRAMIDE
- Antibacterials: plasma concentration of ivabradine possibly increased by CLARITHROMYCIN and TELITHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with ERYTHROMYCIN—avoid concomitant use
- ► Antidepressants: plasma concentration of ivabradine reduced by ST JOHN'S WORT—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by
 KETOCONAZOLE—avoid concomitant use; plasma
- concentration of ivabradine increased by FLUCONAZOLE—

Ivabradine

- Antifungals (continued)
 - reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by ITRACONAZOLE—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with • MEFLOQUINE
- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with • PIMOZIDE
- Antivirals: plasma concentration of ivabradine possibly increased by • RITONAVIR—avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with • SOTALOL
- Calcium-channel Blockers: plasma concentration of ivabradine increased by ● DILTIAZEM and ● VERAPAMIL—avoid concomitant use
- Grapefruit Juice: plasma concentration of ivabradine increased by GRAPEFRUIT JUICE
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when ivabradine given with • PENTAMIDINE ISETIONATE

Ivacaftor

- Antibacterials: plasma concentration of ivacaftor possibly increased by ● CLARITHROMYCIN, ● ERYTHROMYCIN and
 - TELITHROMYCIN (see under Ivacaftor, p. 257); plasma concentration of ivacaftor possibly reduced by ● RIFABUTIN manufacturer of ivacaftor advises avoid concomitant use; plasma concentration of ivacaftor reduced by ● RIFAMPICIN manufacturer of ivacaftor advises avoid concomitant use
- Antidepressants: plasma concentration of ivacaftor possibly reduced by • ST JOHN'S WORT—manufacturer of ivacaftor advises avoid concomitant use
- Antiepileptics: plasma concentration of ivacaftor possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN,
 - PHENOBARBITAL, PHENYTOIN and PRIMIDONE manufacturer of ivacaftor advises avoid concomitant use
- Antifungals: plasma concentration of ivacaftor increased by
 ►FLUCONAZOLE and KETOCONAZOLE (see under Ivacaftor, p. 257); plasma concentration of ivacaftor possibly increased by
 ■ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE (see
- under Ivacaftor, p. 257)

 Anxiolytics and Hypnotics: ivacaftor increases plasma concentration of MIDAZOLAM
- Cardiac Glycosides: ivacaftor increases plasma concentration of DIGOXIN
- Grapefruit Juice: plasma concentration of ivacaftor possibly increased by GRAPEFRUIT JUICE—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: separating administration from ivacaftor by 12 hours advised by manufacturer of LOMITAPIDE

Ivermectin

- Anthelmintics: plasma concentration of ivermectin possibly increased by LEVAMISOLE
- Anticoagulants: ivermectin possibly enhances anticoagulant effect of COUMARINS

Japanese Encephalitis Vaccine see Vaccines

Kaolin

- Analgesics: kaolin possibly reduces absorption of ASPIRIN
- Antibacterials: kaolin possibly reduces absorption of TETRACYCLINES
- Antimalarials: kaolin reduces absorption of CHLOROQUINE and HYDROXYCHLOROQUINE
- Antipsychotics: kaolin possibly reduces absorption of PHENOTHIAZINES

Ketamine see Anaesthetics, General

Ketoconazole see Antifungals, Imidazole

Ketoprofen see NSAIDs

Ketorolac see NSAIDs

Ketotifen *see* Antihistamines **Labetalol** *see* Beta-blockers

Lacidipine see Calcium-channel Blockers

Lacosamide

 Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered);

Lacosamide

- · Antidepressants (continued) anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

> Anticoagulants: lactulose possibly enhances anticoagulant effect of COUMARINS

Lamivudine

- > Antibacterials: plasma concentration of lamivudine increased by TRIMETHOPRIM (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine
- Cytotoxics: manufacturer of lamivudine advises avoid concomitant use with ● CLADRIBINE
- Orlistat: absorption of lamivudine possibly reduced by ORLISTAT

Lamotrigine

- · Antibacterials: plasma concentration of lamotrigine reduced by • RIFAMPICIN
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of lamotrigine often reduced by CARBAMAZEPINE, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE; plasma concentration of lamotrigine increased by • SODIUM VALPROATE and • VALPROIC ACID (increased risk of toxicity-reduce lamotrigine dose)
- · Antimalarials: anticonvulsant effect of antiepileptics antagonised by . MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold
- Antivirals: plasma concentration of lamotrigine possibly reduced by RITONAVIR
- Oestrogens: plasma concentration of lamotrigine reduced by • OESTROGENS—consider increasing dose of lamotrigine
- · Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- ▶ Progestogens: plasma concentration of lamotrigine possibly increased by DESOGESTREL

Lanreotide

- Antidiabetics: lanreotide possibly reduces requirements for ANTIDIABETICS
- ▶ Ciclosporin: lanreotide reduces plasma concentration of CICLOSPORIN

Lansoprazole see Proton Pump Inhibitors

- Antibacterials: lanthanum possibly reduces absorption of QUINOLONES (give at least 2 hours before or 4 hours after lanthanum)
- » Antifungals: lanthanum possibly reduces absorption of KETOCONAZOLE (give at least 2 hours apart)
- Antimalarials: lanthanum possibly reduces absorption of CHLOROQUINE and HYDROXYCHLOROQUINE (give at least 2 hours
- Thyroid Hormones: lanthanum reduces absorption of LEVOTHYROXINE (give at least 2 hours apart)

Lapatinib

· Antibacterials: manufacturer of lapatinib advises avoid concomitant use with ● RIFABUTIN, ● RIFAMPICIN and

TELITHROMYCIN

Lapatinib (continued)

- · Antidepressants: manufacturer of lapatinib advises avoid concomitant use with • ST JOHN'S WORT
- · Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with ● REPAGLINIDE
- · Antiepileptics: plasma concentration of lapatinib reduced by • CARBAMAZEPINE—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with • FOSPHENYTOIN and • PHENYTOIN
- · Antifungals: plasma concentration of lapatinib increased by KETOCONAZOLE—avoid concomitant use: manufacturer of lapatinib advises avoid concomitant use with • ITRACONAZOLE, POSACONAZOLE and ● VORICONAZOLE
- · Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with • PIMOZIDE
- Antivirals: avoidance of lapatinib advised by manufacturer of BOCEPREVIR; manufacturer of lapatinib advises avoid concomitant use with • RITONAVIR and • SAQUINAVIR
- Cytotoxics: lapatinib increases plasma concentration of PAZOPANIB; possible increased risk of neutropenia when lapatinib given with DOCETAXEL; increased risk of neutropenia when lapatinib given with • PACLITAXEL; lapatinib increases plasma concentration of active metabolite of ● IRINOTECAN consider reducing dose of irinotecan
- Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with • GRAPEFRUIT JUICE
- ▶ Lipid-regulating Drugs: separating administration from lapatinib by 12 hours advised by manufacturer of LOMITAPIDE
- Ulcer-healing Drugs: absorption of lapatinib possibly reduced by HISTAMINE H2-ANTAGONISTS and PROTON PUMP INHIBITORS

Laronidase

Antimalarials: effects of laronidase possibly inhibited by CHLOROQUINE and HYDROXYCHLOROQUINE (manufacturer of laronidase advises avoid concomitant use)

Leflunomide

- NOTE Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
- Antibacterials: plasma concentration of active metabolite of leflunomide possibly increased by RIFAMPICIN
- Anticoagulants: leflunomide possibly enhances anticoagulant effect of WARFARIN
- » Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of TOLBUTAMIDE
- Antiepileptics: leflunomide possibly increases plasma
- concentration of FOSPHENYTOIN and PHENYTOIN · Cytotoxics: risk of toxicity when leflunomide given with
 - METHOTREX ATE
- Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by COLESTYRAMINE (enhanced elimination)—avoid unless drug elimination desired
- Vaccines: risk of generalised infections when leflunomide given with live • VACCINES—avoid concomitant use

Lenalidomide

- Antibacterials: plasma concentration of lenalidomide possibly increased by • CLARITHROMYCIN (increased risk of toxicity)
- · Antifungals: plasma concentration of lenalidomide possibly increased by • ITRACONAZOLE and • KETOCONAZOLE (increased risk of toxicity)
- · Calcium-channel Blockers: plasma concentration of lenalidomide possibly increased by • VERAPAMIL (increased risk of toxicity)
- ▶ Cardiac Glycosides: lenalidomide possibly increases plasma concentration of DIGOXIN
- Ciclosporin: plasma concentration of lenalidomide possibly increased by . CICLOSPORIN (increased risk of toxicity)

Lercanidipine see Calcium-channel Blockers

Leukotriene Receptor Antagonists

- Aminophylline: zafirlukast possibly increases plasma concentration of AMINOPHYLLINE, also plasma concentration of zafirlukast reduced
- Analgesics: plasma concentration of zafirlukast increased by
- Antibacterials: plasma concentration of zafirlukast reduced by **ERYTHROMYCIN**

Leukotriene Receptor Antagonists (continued)

- Anticoagulants: zafirlukast enhances anticoagulant effect of WARFARIN
- ► Antiepileptics: plasma concentration of montelukast reduced by PHENOBARBITAL and PRIMIDONE
- Antifungals: plasma concentration of zafirlukast increased by FLUCONAZOLE
- Lipid-regulating Drugs: plasma concentration of montelukast increased by GEMFIBROZIL
- ▶ Theophylline: zafirlukast possibly increases plasma concentration of THEOPHYLLINE, also plasma concentration of zafirlukast reduced

Levamisole

- Alcohol: possibility of disulfiram-like reaction when levamisole given with ALCOHOL
- Anthelmintics: plasma concentration of both drugs possibly reduced when levamisole given with ALBENDAZOLE; levamisole possibly increases plasma concentration of IVERMECTIN
- Anticoagulants: levamisole possibly enhances anticoagulant effect of • WARFARIN
- Antiepileptics: levamisole possibly increases plasma concentration of FOSPHENYTOIN and PHENYTOIN

Levetiracetan

- Antidepressants: anticonvulsant effect of antiepileptics
 possibly antagonised by MAOIs and TRICYCLIC-RELATED
 ANTIDEPRESSANTS (convulsive threshold lowered);
 anticonvulsant effect of antiepileptics antagonised by SSRIS
 and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: levetiracetam possibly increases risk of CARBAMAZEPINE toxicity
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Levobunolol see Beta-blockers

Levobupivacaine

 Anti-arrhythmics: increased myocardial depression when levobupivacaine given with ANTI-ARRHYTHMICS

Levocarnitine

 Anticoagulants: levocarnitine possibly enhances anticoagulant effect of COUMARINS

Levocetirizine see Antihistamines

Levodopa

- ACE Inhibitors: enhanced hypotensive effect when levodopa given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when levodopa given with ALPHA-BLOCKERS
- Anaesthetics, General: increased risk of arrhythmias when levodopa given with • VOLATILE LIQUID GENERAL ANAESTHETICS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- ► Antibacterials: effects of levodopa possibly reduced by
- Antidepressants: risk of hypertensive crisis when levodopa given with • MAOIs, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with MOCLOBEMIDE
- Antiepileptics: effects of levodopa possibly reduced by FOSPHENYTOIN and PHENYTOIN
- Antimuscarinics: absorption of levodopa possibly reduced by ANTIMUSCARINICS
- Antipsychotics: effects of levodopa antagonised by ANTIPSYCHOTICS; avoidance of levodopa advised by manufacturer of AMISULPRIDE (antagonism of effect)
- Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by BENZODIAZEPINES
- Beta-blockers: enhanced hypotensive effect when levodopa given with BETA-BLOCKERS

Levodopa (continued)

- Bupropion: increased risk of side-effects when levodopa given with BUPROPION
- Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when levodopa given with CLONIDINE
- Diazoxide: enhanced hypotensive effect when levodopa given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when levodopa given with DIURETICS
- ► Dopaminergics: enhanced effects and increased toxicity of levodopa when given with SELEGILINE (reduce dose of levodopa)
- ▶ Iron Salts: absorption of levodopa possibly reduced by *oral* IRON SALTS
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: enhanced hypotensive effect when levodopa given with METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Moxonidine: enhanced hypotensive effect when levodopa given with MOXONIDINE
- Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with BACLOFEN
- ► Nitrates: enhanced hypotensive effect when levodopa given with NITRATES
- Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE
- ▶ Vitamins: effects of levodopa reduced by PYRIDOXINE when given without dopa-decarboxylase inhibitor

Levofloxacin see Quinolones

Levofolinic Acid see Folates

Levomepromazine see Antipsychotics

Levonorgestrel see Progestogens

Levothyroxine *see* Thyroid Hormones **Lidocaine**

NOTE Interactions less likely when lidocaine used topically

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE OR ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when antiarrhythmics given with other • ANTI-ARRHYTHMICS
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
 - ANTIPSYCHOTICS that prolong the QT interval
- Antivirals: plasma concentration of lidocaine possibly increased by ● ATAZANAVIR and LOPINAVIR; plasma concentration of lidocaine possibly increased by DARUNAVIR and ● FOSAMPRENAVIR—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with
- SAQUINAVIR—avoid concomitant use; caution with intravenous lidocaine advised by manufacturer of TELAPREVIR
- Beta-blockers: increased myocardial depression when antiarrhythmics given with • BETA-BLOCKERS; possible increased risk of lidocaine toxicity when given with NADOLOL; increased risk of lidocaine toxicity when given with • PROPRANOLOL
- Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with SUXAMETHONIUM
- Ulcer-healing Drugs: plasma concentration of lidocaine increased by • CIMETIDINE (increased risk of toxicity)

Linagliptin see Antidiabetics

Linezolid

NOTE Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs

- Antibacterials: plasma concentration of linezolid reduced by RIFAMPICIN (possible therapeutic failure of linezolid)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Liothyronine see Thyroid Hormones

Lipegfilgrastim

 Cytotoxics: neutropenia possibly exacerbated when lipegfilgrastim given with CAPECITABINE, FLUOROURACIL or TEGAFIIR

Lipid-regulating Drugs see Colesevelam, Colestipol, Colestyramine, Ezetimibe, Fibrates, Lomitapide, Nicotinic Acid, and Statins

Liraglutide see Antidiabetics

Lisdexamfetamine *see* Sympathomimetics **Lisinopril** *see* ACE Inhibitors

Lithium

- ACE Inhibitors: excretion of lithium reduced by ACE INHIBITORS (increased plasma concentration)
- Aminophylline: excretion of lithium increased by AMINOPHYLLINE (reduced plasma concentration)
- Analgesics: excretion of lithium reduced by NSAIDS (increased risk of toxicity); excretion of lithium reduced by ● KETOROLAC (increased risk of toxicity)—avoid concomitant
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by ANGIOTENSIN-II RECEPTOR ANTAGONISTS (increased plasma concentration)
- Antacids: excretion of lithium increased by SODIUM BICARBONATE (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of • AMIODARONE (risk of ventricular arrhythmias)
- Antibacterials: increased risk of lithium toxicity when given with METRONIDAZOLE
- Antiepileptics: neurotoxicity may occur when lithium given with CARBAMAZEPINE, FOSPHENYTOIN or PHENYTOIN without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by TOPIRAMATE
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with CLOZAPINE, FLUPENTIXOL, HALOPERIDOL, PHENOTHIAZINES,
 RISPERIDONE OF ZUCLOPENTHIXOL; possible risk of toxicity when lithium given with OLANZAPINE! lithium possibly
 - when lithium given with OLANZAPINE; lithium possibly increases extrapyramidal side-effects of QUETIAPINE; increased risk of extrapyramidal side-effects when lithium given with SULPIRIDE
- Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with CLONAZEPAM
- Calcium-channel Blockers: neurotoxicity may occur when lithium given with DILTIAZEM or VERAPAMIL without increased plasma concentration of lithium
- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with • ARSENIC TRIOXIDE
- Dapoxetine: possible increased risk of serotonergic effects
 when lithium given with DAPOXETINE (manufacturer of
 dapoxetine advises lithium should not be started until 1 week
 after stopping dapoxetine, avoid dapoxetine for 2 weeks after
 stopping lithium)
- Diuretics: excretion of lithium increased by
 ACETAZOLAMIDE; excretion of lithium reduced by
 LOOP DIURETICS and
- THIAZIDES AND RELATED DIURETICS (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS (increased plasma concentration and risk of toxicity)
- ► 5HT₁-receptor Agonists: possible risk of toxicity when lithium given with SUMATRIPTAN
- Methyldopa: neurotoxicity may occur when lithium given with
 METHYLDOPA without increased plasma concentration of
 lithium
- Muscle Relaxants: lithium enhances effects of MUSCLE RELAXANTS; hyperkinesis caused by lithium possibly aggravated by BACLOFEN
- Parasympathomimetics: lithium antagonises effects of NEOSTIGMINE

Lithium (continued)

► Theophylline: excretion of lithium increased by THEOPHYLLINE (reduced plasma concentration)

Lixisenatide see Antidiabetics

Lofepramine see Antidepressants, Tricyclic Lofexidine

- ► Alcohol: increased sedative effect when lofexidine given with
- Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with ANXIOLYTICS AND HYPNOTICS

Lomitapide

- Alcohol: manufacturer of lomitapide advises avoid concomitant use with ALCOHOL
- Antibacterials: manufacturer of lomitapide advises separating administration from AZITHROMYCIN and ISONIAZID by 12 hours; manufacturer of lomitapide advises avoid concomitant use with ● CLARITHROMYCIN, ● ERYTHROMYCIN and ■ TELITHROMYCIN (plasma concentration of lomitapide possibly increased)
- Anticoagulants: Iomitapide possibly enhances anticoagulant effect of WARFARIN
- Antidepressants: manufacturer of lomitapide advises separating administration from FLUOXETINE and FLUVOXAMINE by 12 hours
- Antidiabetics: manufacturer of lomitapide advises separating administration from LINAGLIPTIN by 12 hours
- Antifungals: plasma concentration of lomitapide increased by
 KETOCONAZOLE—avoid concomitant use; manufacturer of lomitapide advises avoid concomitant use with TRIAZOLES (plasma concentration of lomitapide possibly increased)
- Antivirals: manufacturer of lomitapide advises avoid concomitant use with • DARUNAVIR, • FOSAMPRENAVIR, • INDINAVIR, • LOPINAVIR, • RITONAVIR, • SAQUINAVIR,
- TELAPREVIR and TIPRANAVIR (plasma concentration of lomitapide possibly increased)
- Anxiolytics and Hypnotics: manufacturer of lomitapide advises separating administration from ALPRAZOLAM by 12 hours
- Calcium-channel Blockers: manufacturer of lomitapide advises separating administration from AMLODIPINE and LACIDIPINE by 12 hours; manufacturer of lomitapide advises avoid concomitant use with • DILTIAZEM and • VERAPAMIL (plasma concentration of lomitapide possibly increased)
- Ciclosporin: manufacturer of lomitapide advises separating administration from CICLOSPORIN by 12 hours
- Cilostazol: manufacturer of lomitapide advises separating administration from CILOSTAZOL by 12 hours
- Cytotoxics: manufacturer of lomitapide advises separating administration from LAPATINIB, NILOTINIB and PAZOPANIB by
- Fosaprepitant: manufacturer of lomitapide advises separating administration from FOSAPREPITANT by 12 hours
- Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with GRAPEFRUIT JUICE
- Hormone Antagonists: manufacturer of lomitapide advises separating administration from BICALUTAMIDE by 12 hours
- Ivacaftor: manufacturer of lomitapide advises separating administration from IVACAFTOR by 12 hours
- Lipid-regulating Drugs: lomitapide increases plasma concentration of ATORVASTATIN—manufacturer of lomitapide advises reduce dose of atorvastatin by half or separate administration by 12 hours; lomitapide increases plasma concentration of ◆ SIMVASTATIN (see under Simvastatin, p. 181); absorption of lomitapide possibly reduced by BILE ACID SEQUESTRANTS (give at least 4 hours apart)
- Oestrogens: manufacturer of lomitapide advises separating administration from OESTROGENS by 12 hours
- ▶ Ranolazine: manufacturer of lomitapide advises separating administration from RANOLAZINE by 12 hours
- Tacrolimus: manufacturer of lomitapide advises separating administration from TACROLIMUS by 12 hours
- ► Ticagrelor: manufacturer of lomitapide advises separating administration from TICAGRELOR by 12 hours

Lomitapide (continued)

- Tolvaptan: manufacturer of lomitapide advises separating administration from TOLVAPTAN by 12 hours
- Ulcer-healing Drugs: manufacturer of lomitapide advises separating administration from CIMETIDINE and RANITIDINE by 12 hours

Lomustine

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by CIMETIDINE

Loperamide

Desmopressin: loperamide increases plasma concentration of oral DESMOPRESSIN

NOTE In combination with ritonavir as *Kaletra*® (ritonavir is present to inhibit lopinavir metabolism and increase plasmalopinavir concentration)-see also Ritonavir

- · Anti-arrhythmics: lopinavir possibly increases plasma concentration of • FLECAINIDE (increased risk of ventricular arrhythmias-avoid concomitant use); lopinavir possibly increases plasma concentration of LIDOCAINE
- Antibacterials: plasma concentration of lopinavir reduced by RIFAMPICIN—avoid concomitant use: lopinavir increases plasma concentration of DELAMANID; avoidance of concomitant lopinavir in severe renal and hepatic
- impairment advised by manufacturer of TELITHROMYCIN Anticoagulants: avoidance of lopinavir advised by manufacturer of APIXABAN; manufacturers advise avoid concomitant use of lopinavir with RIVAROXABAN
- Antidepressants: plasma concentration of lopinavir reduced by
- ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, • PHENOBARBITAL, PHENYTOIN and • PRIMIDONE
- Antihistamines: lopinavir possibly increases plasma concentration of CHLORPHENAMINE
- Antimalarials: caution with lopinavir advised by manufacturer of artemether with lumefantrine
- Antimuscarinics: avoidance of lopinavir advised by manufacturer of DARIFENACIN and TOLTERODINE
- · Antipsychotics: lopinavir possibly increases plasma concentration of • ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of
- QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- · Antivirals: manufacturers advise avoid concomitant use of lopinavir with • BOCEPREVIR and • TELAPREVIR; avoidance of lopinavir advised by manufacturer of DACLATASVIR (plasma concentration of daclatasvir possibly increased); lopinavir reduces plasma concentration of • DARUNAVIR, also plasma concentration of lopinavir increased (avoid concomitant use); plasma concentration of lopinavir reduced by
- EFAVIRENZ—consider increasing dose of lopinavir; lopinavir boosted with ritonavir increases plasma concentration of
- ELVITEGRAVIR (reduce dose of elvitegravir); lopinavir reduces plasma concentration of FOSAMPRENAVIR, effect on lopinavir plasma concentration not predictable-avoid concomitant use; lopinavir increases plasma concentration of • MARAVIROC (consider reducing dose of maraviroc); plasma concentration of lopinavir possibly reduced by • NEVIRAPINE—consider increasing dose of lopinavir; increased risk of ventricular arrhythmias when lopinavir given with . SAQUINAVIR-avoid concomitant use: lopinavir increases plasma concentration of TENOFOVIR; plasma concentration of lopinavir reduced by
- TIPRANAVIR
- . Bosentan: lopinavir increases plasma concentration of BOSENTAN (consider reducing dose of bosentan)
- Corticosteroids: plasma concentration of lopinavir possibly reduced by DEXAMETHASONE
- Cytotoxics: manufacturer of ruxolitinib advises dose reduction when lopinavir given with • RUXOLITINIB—consult ruxolitinib product literature
- Eltrombopag: lopinavir possibly reduces plasma concentration of eltrombopag

Lopinavir (continued)

- Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with ATORVASTATIN; lopinavir increases plasma concentration of • ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); possible increased risk of myopathy when lopinavir given with • SIMVASTATINavoid concomitant use; avoidance of lopinavir advised by manufacturer of • LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- · Orlistat: absorption of lopinavir possibly reduced by
 - ORLISTAT
- Ranolazine: lopinavir possibly increases plasma concentration of • RANOLAZINE-manufacturer of ranolazine advises avoid concomitant use
- Sirolimus: lopinavir possibly increases plasma concentration of SIROLIMUS
- Sympathomimetics, Beta2: manufacturer of lopinavir advises avoid concomitant use with SALMETEROL

Loprazolam see Anxiolytics and Hypnotics

Loratadine see Antihistamines

Lorazepam see Anxiolytics and Hypnotics Lormetazepam see Anxiolytics and Hypnotics

Losartan see Angiotensin-II Receptor Antagonists

Lurasidone see Antipsychotics

Lymecycline see Tetracyclines

Macitentan

- Antibacterials: plasma concentration of macitentan reduced by • RIFAMPICIN—avoid concomitant use
- Antidepressants: manufacturer of macitentan advises avoid concomitant use with ST JOHN'S WORT
- Antiepileptics: manufacturer of macitentan advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN
- Antifungals: plasma concentration of macitentan increased by KETOCONAZOLE

Macrogols

NOTE Some manufacturers suggest taking other oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption

Macrolides

NOTE See also Telithromycin

NOTE Interactions do not apply to small amounts of erythromycin used topically

- · Aminophylline: clarithromycin possibly increases plasma concentration of AMINOPHYLLINE; erythromycin increases plasma concentration of • AMINOPHYLLINE (also aminophylline may reduce absorption of oral erythromycin)
- » Analgesics: erythromycin increases plasma concentration of ALFENTANIL; clarithromycin possibly increases plasma concentration of FENTANYL
- Antacids: absorption of azithromycin reduced by ANTACIDS
- Anti-arrhythmics: increased risk of ventricular arrhythmias when parenteral erythromycin given with • AMIODARONE avoid concomitant use; azithromycin possibly increases plasma concentration of • DISOPYRAMIDE (increased risk of toxicity); erythromycin increases plasma concentration of • DISOPYRAMIDE (increased risk of toxicity); clarithromycin possibly increases plasma concentration of • DISOPYRAMIDE (increased risk of ventricular arrhythmias); avoidance of clarithromycin advised by manufacturer of • DRONEDARONE (risk of ventricular arrhythmias); erythromycin increases plasma concentration of • DRONEDARONE (increased risk of ventricular arrhythmias—avoid concomitant use)
- · Antibacterials: increased risk of ventricular arrhythmias when parenteral erythromycin given with • MOXIFLOXACIN—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with • RIFABUTIN; clarithromycin increases plasma concentration of • RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of
- RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); clarithromycin and erythromycin possibly increase plasma concentration of BEDAQUILINE—avoid concomitant use if clarithromycin and erythromycin given for more than 14 days; possible increased risk of ventricular arrhythmias

Macrolides

- · Antibacterials (continued)
- when clarithromycin and erythromycin given with

 DELAMANID; avoidance of clarithromycin and erythromycin advised by manufacturer of FIDAXOMICIN; plasma concentration of clarithromycin reduced by RIFAMYCINS
- Anticoagulants: avoidance of clarithromycin advised by manufacturer of APIXABAN; clarithromycin and erythromycin enhance anticoagulant effect of ● COUMARINS; azithromycin possibly enhances anticoagulant effect of ● COUMARINS; possible increased risk of bleeding when clarithromycin given with DABIGATRAN
- Antidepressants: avoidance of macrolides advised by manufacturer of • REBOXETINE; avoidance of intravenous erythromycin advised by manufacturer of • CITALOPRAM and • ESCITALOPRAM (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of TRAZODDE
- ► Antidiabetics: clarithromycin enhances effects of REPAGLINIDE
- Antiepileptics: clarithromycin increases plasma concentration
 of © CARBAMAZEPINE (consider reducing dose of
 carbamazepine); erythromycin increases plasma
 concentration of © CARBAMAZEPINE; clarithromycin inhibits
 metabolism of FOSPHENYTOIN and PHENYTOIN (increased
 plasma concentration); erythromycin possibly inhibits
 metabolism of SODIUM VALPROATE and VALPROIC ACID
 (increased plasma concentration)
- Antifungals: avoidance of concomitant clarithromycin in severe renal imapirment advised by manufacturer of
 KETOCONAZOLE; avoidance of erythromycin advised by manufacturer of FLUCONAZOLE; clarithromycin increases plasma concentration of ITRACONAZOLE
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of LORATADINE; macrolides possibly inhibit metabolism of
 MIZOLASTINE (avoid concomitant use); erythromycin inhibits metabolism of ◆ MIZOLASTINE—avoid concomitant use
- Antimalarials: avoidance of macrolides advised by
 manufacturer of ◆ ARTEMETHER WITH LUMEFANTRINE; avoidance
 of macrolides advised by manufacturer of ◆ ARTENIMOL WITH
 PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antimuscarinics: erythromycin possibly increases plasma concentration of DARIFENACIN; manufacturer of fesoterodine advises dose reduction when clarithromycin given with FESOTERODINE—consult fesoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of TOLIFERODINE
- Antipsychotics: avoidance of macrolides advised by manufacturer of ◆DROPERIDOL (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with ◆ZUCLOPENTHIXOL—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ◆AMISULPRIDE—avoid concomitant use; erythromycin possibly increases plasma concentration of ◆CLOZAPINE (possible increased risk of convulsions); clarithromycin possibly increases plasma concentration of ◆LURASIDONE—avoid concomitant use; erythromycin possibly increases the plasma concentration of ◆LURASIDONE (see under Lurasidone, p. 315); increased risk of ventricular arrhythmias when clarithromycin given with ◆PIMOZIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when clarithromycin given with
 - PIMOZIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with
 PIMOZIDE—avoid concomitant use; clarithromycin possibly
 - increases plasma concentration of QUETIAPINE—
 manufacturer of quetiapine advises avoid concomitant use;
 erythromycin increases plasma concentration of
 QUETIAPINE—manufacturer of quetiapine advises avoid
 - QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when parenteral erythromycin given with • SULPIRIDE
- Antivirals: plasma concentration of both drugs increased when clarithromycin given with ATAZANAVIR; clarithromycin possibly increases the plasma concentration of
 DACLATASVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of clarithromycin reduced by EFAVIRENZ, also plasma concentration of active

Macrolides

· Antivirals (continued)

- metabolite of clarithromycin increased; plasma concentration of clarithromycin reduced by ETRAVIRINE and NEVIRAPINE (but concentration of an active metabolite increased), also plasma concentration of etravirine and nevirapine increased; clarithromycin possibly increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of RILPIVIRINE (plasma concentration of rilpivirine possibly increased); plasma concentration of azithromycin and erythromycin possibly increased by RITONAVIR; plasma concentration of clarithromycin increased by RITONAVIR (reduce dose of clarithromycin in renal impairment); increased risk of ventricular arrhythmias when erythromycin given with
- SAQUINAVIR—avoid concomitant use; plasma concentration of both drugs possibly increased when clarithromycin given with SAQUINAVIR and TELAPREVIR (increased risk of ventricular arrhythmias); plasma concentration of both drugs increased when erythromycin given with SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use; clarithromycin possibly increases plasma concentration of
- SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs possibly increased when erythromycin given with
 TELAPREVIR (increased risk of ventricular arrhythmias); plasma concentration of clarithromycin increased by
- •TIPRANAVIR (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of ZIDOVUDINE (give at least 2 hours apart)
- Anxiolytics and Hypnotics: clarithromycin and erythromycin inhibit metabolism of • MIDAZOLAM (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of BUSPIRONE (reduce dose of buspirone); erythromycin inhibits the metabolism of ZOPICIONE
- Aprepitant: clarithromycin possibly increases plasma concentration of APREPITANT
- Atomoxetine: increased risk of ventricular arrhythmias when parenteral erythromycin given with • ATOMOXETINE
- Avanafil: clarithromycin possibly increases plasma concentration of ● AVANAFIL—manufacturer of avanafil advises avoid concomitant use; erythromycin increases plasma concentration of ● AVANAFIL—see under Avanafil, p. 698
- Calcium-channel Blockers: clarithromycin and erythromycin possibly inhibit metabolism of ● CALCIUM-CHANNEL BLOCKERS (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of LERCANIDIPINE
- Cardiac Glycosides: macrolides increase plasma concentration of DIGOXIN (increased risk of toxicity)
- Ciclosporin: macrolides possibly inhibit metabolism of
- CICLOSPORIN (increased plasma concentration);
- clarithromycin and erythromycin inhibit metabolism of
 CICLOSPORIN (increased plasma concentration)

(see under Cilostazol, p. 206)

- Cilostazol: clarithromycin possibly increases plasma concentration of CILOSTAZOL (see under Cilostazol, p. 206); erythromycin increases plasma concentration of CILOSTAZOL
- Clopidogrel: erythromycin possibly reduces antiplatelet effect of • CLOPIDOGREL
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of ● COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: erythromycin possibly inhibits metabolism of CORTICOSTEROIDS; erythromycin inhibits the metabolism of METHYLPREDNISOLONE; clarithromycin possibly increases plasma concentration of METHYLPREDNISOLONE
- Cytotoxics: erythromycin possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; clarithromycin and erythromycin possibly increase plasma concentration of AXITINIB (reduce dose of axitinib—consult

Macrolides

- Cytotoxics (continued)
- axitinib product literature); clarithromycin and erythromycin possibly increase the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin and erythromycin possibly increase plasma concentration of CABOZANTINIB; clarithromycin possibly increases plasma concentration of
- CRIZOTINIB and EVEROLIMUS—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of clarithromycin and erythromycin advised by manufacturer of DASATINIB (plasma concentration of dasatinib possibly increased); erythromycin increases plasma concentration of
- e EVEROLIMUS (consider reducing the dose of everolimus consult everolimus product literature); clarithromycin and erythromycin possibly increase the plasma concentration of
- ●IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of clarithromycin advised by manufacturer of ●NILOTINIB; clarithromycin possibly increases plasma concentration of ●PAZOPANIB (reduce dose of pazopanib); clarithromycin possibly increases plasma concentration of PONATINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with
- RUXOLITINIB—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when parenteral erythromycin given with VANDETANIB—avoid concomitant use; clarithromycin possibly increases the plasma concentration of CABAZITAXEL—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; clarithromycin possibly increases plasma concentration of
- DOCETAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of ventricular arrhythmias when erythromycin given with ARSENIC TRIOXIDE; erythromycin increases toxicity of VINBLASTINE—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with
- VINORELBINE
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with DAPOXETINE (see under Dapoxetine, p. 703)
- Diuretics: clarithromycin increases plasma concentration of
 EPLERENONE—avoid concomitant use; erythromycin increases plasma concentration of EPLERENONE (reduce dose of eplerenone)
- Domperidone: possible increased risk of ventricular arrhythmias when clarithromycin given with
- DOMPERIDONE—avoid concomitant use; erythromycin increases plasma concentration of DOMPERIDONE (increased risk of ventricular arrhythmias—avoid concomitant use)
- Dopaminergics: erythromycin increases plasma concentration of BROMOCRIPTINE and CABERGOLINE (increased risk of toxicity); macrolides possibly increase plasma concentration of BROMOCRIPTINE and CABERGOLINE (increased risk of toxicity)
- Ergot Alkaloids: increased risk of ergotism when clarithromycin or erythromycin given with • ERGOMETRINE avoid concomitant use; increased risk of ergotism when macrolides given with • ERGOTAMINE—avoid concomitant use
- ► Fosaprepitant: clarithromycin possibly increases plasma concentration of FOSAPREPITANT
- 5HT₁-receptor Agonists: clarithromycin and erythromycin increase plasma concentration of • ELETRIPTAN (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of IVABRADINE—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with IVABRADINE—avoid concomitant use
- Ivacaftor: clarithromycin and erythromycin possibly increase plasma concentration of • IVACAFTOR (see under Ivacaftor, p. 257)
- Lenalidomide: clarithromycin possibly increases plasma concentration of ● LENALIDOMIDE (increased risk of toxicity)
- Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of ZAFIRLUKAST
- Lipid-regulating Drugs: clarithromycin increases plasma concentration of ● ATORVASTATIN and PRAVASTATIN; possible

Macrolides

- Lipid-regulating Drugs (continued)
- increased risk of myopathy when erythromycin given with ATORVASTATIN; erythromycin increases plasma concentration of PRAVASTATIN; rythromycin reduces plasma concentration of ROSUVASTATIN; increased risk of myopathy when clarithromycin or erythromycin given with SIMVASTATIN (avoid concomitant use); separating administration from azithromycin by 12 hours advised by manufacturer of LOMITAPIDE; avoidance of clarithromycin and erythromycin advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Mirabegron: when given with clarithromycin avoid or reduce dose of MIRABEGRON in hepatic or renal impairment—see Mirabegron, p. 671
- Oestrogens: erythromycin increases plasma concentration of ESTRADIOL
- Parasympathomimetics: erythromycin increases plasma concentration of GALANTAMINE
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with
 PENTAMIDINE ISETIONATE
- Progestogens: erythromycin increases plasma concentration of DIENOGEST
- Ranolazine: clarithromycin possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: clarithromycin increases the plasma concentration
 of SILDENAFIL—consider reducing initial dose of sildenafil
 for erectile dysfunction or reduce sildenafil dose frequency to
 once daily for pulmonary hypertension; erythromycin
 increases plasma concentration of SILDENAFIL—reduce initial
 dose of sildenafil for erectile dysfunction or reduce sildenafil
 dose frequency to twice daily for pulmonary hypertension
- Sirolimus: clarithromycin increases plasma concentration of
 SIROLIMUS—avoid concomitant use; plasma concentration
 of both drugs increased when erythromycin given with
 SIROLIMUS
- Tacrolimus: clarithromycin and erythromycin increase plasma concentration of • TACROLIMUS
- Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of TADALAFIL
- Theophylline: clarithromycin possibly increases plasma concentration of THEOPHYLLINE; erythromycin increases plasma concentration of ● THEOPHYLLINE (also theophylline may reduce absorption of oral erythromycin)
- Ticagrelor: clarithromycin possibly increases plasma concentration of ●TICAGRELOR—manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: plasma concentration of erythromycin increased by CIMETIDINE (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with OMEPRAZOLE
- Ulipristal: avoidance of clarithromycin advised by manufacturer of low-dose ULIPRISTAL; erythromycin increases plasma concentration of low-dose ULIPRISTAL—manufacturer of low-dose ulipristal advises avoid concomitant use
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF
- Vardenafil: clarithromycin possibly increases plasma concentration of VARDENAFIL (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of VARDENAFIL (reduce dose of vardenafil)

Magnesium (parenteral)

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and

 NIFEDIPINE
 in pre-eclampsia
- ▶ Muscle Relaxants: parenteral magnesium enhances effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM

Magnesium Salts (oral) see Antacids

Mannitol

Antibacterials: avoidance of mannitol advised by manufacturer of TOBRAMYCIN

Mannitol (continued)

 Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with CICLOSPORIN

MAO

NOTE For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor

- ► ACE Inhibitors: MAOIs possibly enhance hypotensive effect of ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: MAOIs interact with tyramine found in some beverages containing • ALCOHOL and some dealcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect
- Alpha₂-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of APRACLONIDINE and BRIMONIDINE
- Alpha-blockers: avoidance of MAOIs advised by manufacturer of INDORAMIN; enhanced hypotensive effect when MAOIs given with ALPHA-BLOCKERS
- Analgesics: possible increased serotonergic effects when MAOIs given with FENTANYL; CNS excitation or depression (hypertension or hypotension) when MAOIs given with
 ▶PETHIDINE—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with
 ▶TRAMADOL—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of ◆NEFOPAM; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with ◆OPIOID ANALGESICS—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs
- Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- · Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with • REBOXETINE (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start • CITALOPRAM, • ESCITALOPRAM, • FLUVOXAMINE, • PAROXETINE or • SERTRALINE for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start . FLUOXETINE for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start • DULOXETINE for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with • VENLAFAXINE (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other . MAOIS (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start • MOCLOBEMIDE for at least 1 week; MAOIs increase CNS effects of • SSRIS (risk of serious toxicity); after stopping MAOIs do not start • MIRTAZAPINE for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start . TRICYCLIC-RELATED ANTIDEPRESSANTS for 2 weeks, also MAOIs should not be started until at least 1-2 weeks after stopping tricyclicrelated antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with • TRICYCLICS. tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1-2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine)
- Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of ANTIDIABETICS; MAOIs enhance hypoglycaemic effect of INSULIN, METFORMIN and SULFONYLUREAS
- Antiepileptics: MAOIs possibly antagonise anticonvulsant effect of ANTIEPILEPTICS (convulsive threshold lowered);

ΜΔΟΙς

- Antiepileptics (continued) avoidance for 2 weeks after stopping MAOIs advised by manufacturer of ◆ CARBAMAZEPINE, also antagonism of anticonvulsant effect
- Antihistamines: avoidance of MAOIs advised by manufacturer of HYDROXYZINE; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of PROMETHAZINE; increased antimuscarinic and sedative effects when MAOIs given with ANTIHISTAMINES
- Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and
 • ARTENIMOL WITH PIPERAQUINE
- Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with ANTIMUSCARINICS
- Antipsychotics: CNS effects of MAOIs possibly increased by
 CLOZAPINE
- Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of BUSPIRONE; manufacturer of tranylcypromine advises avoid • BUSPIRONE for 14 days after stopping tranylcypromine
- Atomoxetine: after stopping MAOIs do not start ATOMOXETINE for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with ATOMOXETINE
 Beta-blockers: enhanced hypotensive effect when MAOIs given with BETA-BLOCKERS
- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of • BUPROPION
- MAOIs advised by manufacturer of BUPROPION

 ► Calcium-channel Blockers: enhanced hypotensive effect when
- MAOIs given with CALCIUM-CHANNEL BLOCKERS

 Clonidine: enhanced hypotensive effect when MAOIs given with CLONIDINE
- Dapoxetine: increased risk of serotonergic effects when MAOIs given with • DAPOXETINE (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- Diazoxide: enhanced hypotensive effect when MAOIs given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when MAOIs given with DIURETICS
- Dopaminergics: risk of hypertensive crisis when MAOIs given with ◆ CO-BENELDOPA, ◆ CO-CARELDOPA or ◆ LEVODOPA, avoid co-beneldopa, co-careldopa or levodopa for at least 2 weeks after stopping MAOIs; avoid concomitant use of non-selective MAOIs with ◆ ENTACAPONE; risk of hypertensive crisis when MAOIs given with ◆ RASAGILINE, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with ◆ SELEGILINE manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with TOLCAPONE
- ▶ Doxapram: MAOIs enhance effects of DOXAPRAM
- Histamine: avoidance of MAOIs advised by manufacturer of HISTAMINE
- 5HT₁-receptor Agonists: risk of CNS toxicity when MAOIs given
 with RIZATRIPTAN or SUMATRIPTAN (avoid rizatriptan or
 sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity
 when MAOIs given with ZOLMITRIPTAN (reduce dose of
 zolmitriptan)
- Methyldopa: avoidance of MAOIs advised by manufacturer of
 METHYLDOPA
- Moxonidine: enhanced hypotensive effect when MAOIs given with MOXONIDINE
- Muscle Relaxants: phenelzine enhances effects of SUXAMETHONIUM
- Nicorandil: enhanced hypotensive effect when MAOIs given with NICORANDIL
- Nitrates: enhanced hypotensive effect when MAOIs given with NITRATES
- Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of PHOLCODINE
- Sympathomimetics: risk of hypertensive crisis when MAOIs given with ● ADRENALINE (EPINEPHRINE), ● DOBUTAMINE,
- DOPAMINE, ◆ NORADRENALINE (NOREPINEPHRINE) or
- XYLOMETAZOLINE; risk of hypertensive crisis when MAOIs given with DEXAMFETAMINE, EPHEDRINE, ISOMETHEPTENE,

MAOIC

- Sympathomimetics (continued)
 - LISDEXAMFETAMINE, METARAMINOL, METHYLPHENIDATE,
 - PHENYLEPHRINE OF PSEUDOEPHEDRINE, avoid dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with OXYMETAZOLINE, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs.
- Tetrabenazine: risk of CNS toxicity when MAOIs given with
 TETRABENAZINE (avoid tetrabenazine for 2 weeks after
- TETRABENAZINE (avoid tetrabenazine for 2 weeks after MAOIs)
- Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

MAOIs, reversible see Moclobemide

Maraviroc

- Antibacterials: plasma concentration of maraviroc possibly increased by ● CLARITHROMYCIN and ● TELITHROMYCIN (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by ● RIFAMPICIN—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by • ST JOHN'S WORT—avoid concomitant use
- Antifungals: plasma concentration of maraviroc increased by
- KETOCONAZOLE (consider reducing dose of maraviroc)
 Antivirals: plasma concentration of maraviroc increased by
- LOPINAVIR, SAQUINAVIR and TELAPREVIR (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by EFAVIRENZ—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by EFRAVIRINE; maraviroc reduces plasma concentration of FOSAMPRENAVIR—avoid concomitant use; plasma concentration of maraviroc increased by RITONAVIR
- Cobicistat: plasma concentration of maraviroc possibly increased by • COBICISTAT (reduce dose of maraviroc)
- Orlistat: absorption of maraviroc possibly reduced by
- ORLISTAT

Mebendazole

 Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by CIMETIDINE (increased plasma concentration)

Medroxyprogesterone see Progestogens

$\textbf{Mefenamic Acid} \ \ \textit{see} \ \text{NSAIDs}$

Mefloquine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with • AMIODARONE—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with • MOXIFLOXACIN—avoid concomitant use; plasma concentration of mefloquine reduced by
- RIFAMPICIN—avoid concomitant use
- Antiepileptics: mefloquine antagonises anticonvulsant effect of • ANTIEPILEPTICS
- Antifungals: plasma concentration of mefloquine increased by KETOCONAZOLE
- Antimalarials: avoidance of antimalarials advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE; increased risk of convulsions when mefloquine given with
 - CHLOROQUINE or HYDROXYCHLOROQUINE; increased risk of convulsions when mefloquine given with ● QUININE (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with ● HALOPERIDOL avoid concomitant use; avoidance of mefloquine advised by manufacturer of AMISULPRIDE; increased risk of ventricular arrhythmias when mefloquine given with ● PIMOZIDE—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with ● RISPERIDONE
- ► Antivirals: mefloquine possibly reduces plasma concentration of RITONAVIR

Mefloquine (continued)

- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with • ATOMOXETINE
- ▶ Beta-blockers: increased risk of bradycardia when mefloquine given with BETA-BLOCKERS
- Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with CALCIUM-CHANNEL BLOCKERS
- Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with DIGOXIN
- Cytotoxics: possible increased risk of bradycardia when mefloquine given with CRIZOTINIB
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with ● IVABRADINE
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Megestrol see Progestogens

Melatonin see Anxiolytics and Hypnotics

Meloxicam see NSAIDs

Melphalan

- Antibacterials: increased risk of melphalan toxicity when given with NALIDIXIC ACID
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: melphalan possibly reduces absorption of DIGOXIN tablets
- Ciclosporin: increased risk of nephrotoxicity when melphalan given with • CICLOSPORIN

Memantine

- Anaesthetics, General: increased risk of CNS toxicity when memantine given with • KETAMINE (manufacturer of memantine advises avoid concomitant use)
- Analgesics: increased risk of CNS toxicity when memantine given with • DEXTROMETHORPHAN (manufacturer of memantine advises avoid concomitant use)
- Anticoagulants: memantine possibly enhances anticoagulant effect of WARFARIN
- Antimuscarinics: memantine possibly enhances effects of ANTIMUSCARINICS
- Antipsychotics: memantine possibly reduces effects of ANTIPSYCHOTICS
- Dopaminergics: memantine possibly enhances effects of DOPAMINERGICS and SELEGILINE; increased risk of CNS toxicity when memantine given with ● AMANTADINE (manufacturer of memantine advises avoid concomitant use)
- Muscle Relaxants: memantine possibly modifies effects of BACLOFEN and DANTROLENE

Meningococcal Vaccines see Vaccines

Mepacrine

 Antimalarials: mepacrine increases plasma concentration of PRIMAQUINE (increased risk of toxicity)

Meprobamate see Anxiolytics and Hypnotics

Meptazinol see Opioid Analgesics

Mercaptopurine

- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with ● SULFAMETHOXAZOLE (as cotrimoxazole); increased risk of haematological toxicity when mercaptopurine given with ● TRIMETHOPRIM (also with cotrimoxazole)
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Dairy Products: plasma concentration of mercaptopurine possibly reduced by DAIRY PRODUCTS—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products
- Febuxostat: avoidance of mercaptopurine advised by manufacturer of • FEBUXOSTAT

Meropenem

- Antiepileptics: carbapenems reduce plasma concentration of
 SODIUM VALPROATE and ◆ VALPROIC ACID—avoid concomitant
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Mestranol see Oestrogens

Metaraminol see Sympathomimetics

Metformin see Antidiabetics

Methadone see Opioid Analgesics

Methenamine

- Antacids: avoid concomitant use of methenamine with ANTACIDS
- Antibacterials: increased risk of crystalluria when methenamine given with • SULFONAMIDES
- Diuretics: effects of methenamine antagonised by
- ACETAZOLAMIDE
- Potassium Salts: avoid concomitant use of methenamine with POTASSIUM CITRATE
- ► Sodium Citrate: avoid concomitant use of methenamine with SODIUM CITRATE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Methocarbamol see Muscle Relaxants

Methotrexate

- Aminophylline: methotrexate possibly increases plasma concentration of AMINOPHYLLINE
- Anaesthetics, General: antifolate effect of methotrexate increased by • NITROUS OXIDE—avoid concomitant use
- Analgesics: excretion of methotrexate probably reduced by
 NSAIDS (increased risk of toxicity); excretion of
 - methotrexate reduced by ASPIRIN, DICLOFENAC,
 IBUPROFEN, INDOMETACIN, KETOPROFEN, MELOXICAM and
 - NAPROXEN (increased risk of toxicity)
- Antibacterials: absorption of methotrexate possibly reduced by NEOMYCIN; excretion of methotrexate possibly reduced by CIPROFLOXACIN (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with
- SULFAMETHOXAZOLE (as co-trimoxazole); increased risk of methotrexate toxicity when given with DOXYCYCLINE, SULFONAMIDES OR TETRACYCLINE; excretion of methotrexate reduced by PENICILLINS (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with
- TRIMETHOPRIM (also with co-trimoxazole)
- Antiepileptics: antifolate effect of methotrexate increased by FOSPHENYTOIN and PHENYTOIN
- Antimalarials: antifolate effect of methotrexate increased by
- PYRIMETHAMINE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: methotrexate possibly reduces absorption of DIGOXIN tablets
- Ciclosporin: risk of toxicity when methotrexate given with
 CICLOSPORIN
- Corticosteroids: possible increased risk of hepatoxicity when high-dose methotrexate given with DEXAMETHASONE
- Cytotoxics: increased pulmonary toxicity when methotrexate given with • CISPLATIN
- Diuretics: excretion of methotrexate increased by alkaline urine due to ACETAZOLAMIDE
- Leflunomide: risk of toxicity when methotrexate given with
 Ifflunomide
- Retinoids: plasma concentration of methotrexate increased by
 ACITRETIN (also increased risk of hepatotoxicity)—avoid
- concomitant use
- Theophylline: methotrexate possibly increases plasma concentration of THEOPHYLLINE
- Ulcer-healing Drugs: excretion of methotrexate possibly reduced by PROTON PUMP INHIBITORS (increased risk of toxicity)

Methyldopa

- ACE Inhibitors: enhanced hypotensive effect when methyldopa given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with ADRENERGIC NEURONE BLOCKERS

Methyldopa (continued)

- ► Alcohol: enhanced hypotensive effect when methyldopa given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when methyldopa given with ALDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when methyldopa given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when methyldopa given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of methyldopa antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with • MAOIS
- Antipsychotics: enhanced hypotensive effect when methyldopa given with ANTIPSYCHOTICS (also increased risk of extrapyramidal effects)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when methyldopa given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when methyldopa given with CLONIDINE
- Corticosteroids: hypotensive effect of methyldopa antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when methyldopa given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when methyldopa given with DIURETICS
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of DOPAMINERGICS; increased risk of extrapyramidal side-effects when methyldopa given with AMANTADINE; enhanced hypotensive effect when methyldopa given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA; effects of methyldopa possibly enhanced by ENTACAPONE
- Iron Salts: hypotensive effect of methyldopa antagonised by oral IRON SALTS
- Lithium: neurotoxicity may occur when methyldopa given with • LITHIUM without increased plasma concentration of lithium
- Moxisylyte: enhanced hypotensive effect when methyldopa given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when methyldopa given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when methyldopa given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when methyldopa given with NITRATES
- Oestrogens: hypotensive effect of methyldopa antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when methyldopa given with ALPROSTADIL
- Sympathomimetics, Beta₂: acute hypotension reported when methyldopa given with infusion of • SALBUTAMOL
- Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Methylphenidate see Sympathomimetics

Methylprednisolone see Corticosteroids Methylthioninium

- Antidepressants: risk of CNS toxicity when methylthioninium given with • SSRI-RELATED ANTIDEPRESSANTS, • SSRIS and
 • CLOMIPRAMINE—avoid concomitant use (if avoidance not
- occommendation and the state of the state of
- Anxiolytics and Hypnotics: possible risk of CNS toxicity when methylthioninium given with • BUSPIRONE—avoid concomitant use (if avoidance not possible, use lowest

Methylthioninium

- Anxiolytics and Hypnotics (continued) possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Bupropion: possible risk of CNS toxicity when methylthioninium given with • BUPROPION—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Metoclopramide

- Alcohol: metoclopramide possibly increases absorption of ALCOHOL
- ► Anaesthetics, General: metoclopramide enhances effects of
- Analgesics: metoclopramide increases rate of absorption of ASPIRIN (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by OPIOID ANALGESICS; metoclopramide increases rate of absorption of PARACETAMOL
- Antibacterials: metoclopramide reduces plasma concentration
 of FOSFOMYCIN
- Antidepressants: CNS toxicity reported when metoclopramide given with SSRIS
- Antimuscarinics: effects of metoclopramide on gastrointestinal activity antagonised by ANTIMUSCARINICS
- Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with ANTIPSYCHOTICS
- Atovaquone: metoclopramide reduces plasma concentration of ATOVAQUONE—avoid concomitant use
- Ciclosporin: metoclopramide increases plasma concentration of ● CICLOSPORIN
- ► Dopaminergics: metoclopramide antagonises hypoprolactinaemic effects of BROMOCRIPTINE and CABERGOLINE; metoclopramide antagonises antiparkinsonian effect of PERGOLIDE; avoidance of metoclopramide advised by manufacturer of ROPINIROLE and ROTIGOTINE (antagonism of effect)
- Muscle Relaxants: metoclopramide enhances effects of SUXAMETHONIUM
- ► Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with TETRABENAZINE

Metolazone see Diuretics

Metoprolol see Beta-blockers

Metronidazole

- ${\tt NOTE}$ Interactions do not apply to topical metronidazole preparations
- Alcohol: disulfiram-like reaction when metronidazole given with ALCOHOL
- Anticoagulants: metronidazole enhances anticoagulant effect of • COUMARINS
- Antiepileptics: metronidazole possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased plasma concentration); metabolism of metronidazole accelerated by PHENOBARBITAL and PRIMIDONE (reduced effect)
- Cytotoxics: metronidazole increases plasma concentration of
 BUSULFAN (increased risk of toxicity); metronidazole
- BUSULFAN (Increased risk of toxicity), metronidazole inhibits metabolism of CAPECITABINE, FLUOROURACIL and TEGAFUR (increased toxicity)
- Disulfiram: psychotic reaction reported when metronidazole given with DISULFIRAM
- ▶ Lithium: metronidazole increases risk of LITHIUM toxicity
- Mycophenolate: metronidazole possibly reduces bioavailability of MYCOPHENOLATE
- Ulcer-healing Drugs: metabolism of metronidazole inhibited by CIMETIDINE (increased plasma concentration)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Micafungin Micafungin

- Antifungals: micafungin possibly increases plasma concentration of AMPHOTERICIN; micafungin increases plasma concentration of ITRACONAZOLE (consider reducing dose of itraconazole)
- ► Calcium-channel Blockers: micafungin increases plasma concentration of NIFEDIPINE

Micafungin (continued)

- Ciclosporin: micafungin possibly increases plasma concentration of CICLOSPORIN
- Sirolimus: micafungin increases plasma concentration of SIROLIMUS

Miconazole see Antifungals, Imidazole

Midazolam see Anxiolytics and Hypnotics Mifamurtide

- Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of NSAIDs
- Ciclosporin: manufacturer of mifamurtide advises avoid concomitant use with CICLOSPORIN
- Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with CORTICOSTEROIDS
- Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with TACROLIMUS

Mifepristone

 Corticosteroids: mifepristone may reduce effect of CORTICOSTEROIDS (including inhaled corticosteroids) for 3–4 days

Milrinone see Phosphodiesterase Inhibitors

Minocycline see Tetracyclines

Minoxidil see Vasodilator Antihypertensives

Mirabegron

- Antibacterials: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with CLARITHROMYCIN—see Mirabegron, p. 671
- Antifungals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with ITRACONAZOLE and KETOCONAZOLE—see Mirabegron, p. 671
- Antivirals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with RITONAVIR—see
 Mirabegron, p. 671
- Beta-blockers: mirabegron increases plasma concentration of METOPROLOL
- Cardiac Glycosides: mirabegron increases plasma concentration of DIGOXIN—reduce initial dose of digoxin

Mirtazapine

- \bullet Alcohol: increased sedative effect when mirtazapine given with \bullet ALCOHOL
- Analgesics: possible increased serotonergic effects when mirtazapine given with TRAMADOL
- Anticoagulants: mirtazapine enhances anticoagulant effect of WARFARIN
- Antidepressants: possible increased serotonergic effects when
 mirtazapine given with FLUOXETINE, FLUVOXAMINE or
 VENLAFAXINE; mirtazapine should not be started until 2 weeks
 after stopping MAOIS, also MAOIs should not be started
 until at least 2 weeks after stopping mirtazapine; after
 stopping mirtazapine do not start MOCLOBEMIDE for at least
 1 week
- Antiepileptics: plasma concentration of mirtazapine reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN
- Antifungals: plasma concentration of mirtazapine increased by KETOCONAZOLE
- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE and ARTENIMOL WITH PIPERAQUINE
- Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with ANXIOLYTICS AND HYPNOTICS
- ► Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- ► Clonidine: mirtazapine possibly antagonises hypotensive effect of CLONIDINE
- Methylthioninium: possible risk of CNS toxicity when mirtazapine given with • METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Ulcer-healing Drugs: plasma concentration of mirtazapine increased by CIMETIDINE

Mitomycin

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)

Mitotane

- · Anticoagulants: mitotane possibly reduces anticoagulant effect of • COLIMARINS
- Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Diuretics: manufacturer of mitotane advises avoid concomitant use of SPIRONOLACTONE (antagonism of effect)

Mitoxantrone

- Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- ▶ Ciclosporin: excretion of mitoxantrone reduced by CICLOSPORIN (increased plasma concentration)

Mivacurium see Muscle Relaxants

Mizolastine see Antihistamines

MMR Vaccine see Vaccines

Moclobemide

- · Analgesics: possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with DEXTROMETHORPHAN or ● PETHIDINE—avoid concomitant use; possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with • OPIOID ANALGESICS—manufacturer of moclobemide advises consider reducing dose of opioid analgesics
- Antidepressants: moclobemide should not be started for at least 1 week after stopping . MAOIS, . SSRI-RELATED ANTIDEPRESSANTS, • CITALOPRAM, • FLUVOXAMINE,
- MIRTAZAPINE, PAROXETINE, SERTRALINE, TRICYCLIC-RELATED ANTIDEPRESSANTS or • TRICYCLICS; increased risk of CNS toxicity when moclobemide given with • ESCITALOPRAM, preferably avoid concomitant use; moclobemide should not be started until 5 weeks after stopping • FLUOXETINE; possible increased serotonergic effects when moclobemide given with DIII OXETINE
- · Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and ARTENIMOL WITH PIPERAOUINE
- > Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Bupropion: avoidance of moclobemide advised by manufacturer of • BUPROPION
- Clopidogrel: moclobemide possibly reduces antiplatelet effect of • CLOPIDOGREI
- Dopaminergics: increased risk of side-effects when moclobemide given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA; caution with moclobemide advised by manufacturer of ENTACAPONE; avoid concomitant use of moclobemide with • SELEGILINE
- 5HT1-receptor Agonists: risk of CNS toxicity when moclobemide given with • RIZATRIPTAN or • SUMATRIPTAN (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with • ZOLMITRIPTAN (reduce dose of zolmitriptan)
- · Sympathomimetics: risk of hypertensive crisis when moclobemide given with • SYMPATHOMIMETICS
- Ulcer-healing Drugs: plasma concentration of moclobemide increased by CIMETIDINE (halve dose of moclobemide)

- Antiepileptics: modafinil possibly increases plasma concentration of FOSPHENYTOIN and PHENYTOIN
- Ciclosporin: modafinil reduces plasma concentration of CICLOSPORIN
- Cytotoxics: modafinil possibly reduces plasma concentration of • BOSUTINIB-manufacturer of bosutinib advises avoid concomitant use
- Oestrogens: modafinil accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings-see Contraceptive Interactions in BNF)

Moexipril see ACE Inhibitors Mometasone see Corticosteroids

Monohactams see Aztreonam

Monoclonal antibodies see individual drugs

Montelukast see Leukotriene Receptor Antagonists

Morphine see Opioid Analgesics Moxifloxacin see Quinolones

Moxisvlyte

given with CLONIDINE

- ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxisylyte given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with • ALPHA-BLOCKERS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Beta-blockers: possible severe postural hypotension when moxisylyte given with . BETA-BLOCKERS
- ▶ Calcium-channel Blockers: enhanced hypotensive effect when
- moxisylyte given with CALCIUM-CHANNEL BLOCKERS Clonidine: enhanced hypotensive effect when moxisylyte
- Diazoxide: enhanced hypotensive effect when moxisylyte given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when moxisylyte given with DIURETICS
- Methyldopa: enhanced hypotensive effect when moxisylyte given with METHYLDOPA
- Moxonidine: enhanced hypotensive effect when moxisylyte given with MOXONIDINE
- Nitrates: enhanced hypotensive effect when moxisylyte given with NITRATES
- Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Moxonidine

- ACE Inhibitors: enhanced hypotensive effect when moxonidine given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when moxonidine given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when moxonidine given with ALDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when moxonidine given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when moxonidine given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of moxonidine antagonised by
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- > Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIs; hypotensive effect of moxonidine possibly antagonised by TRICYCLICS
- (manufacturer of moxonidine advises avoid concomitant use) Antipsychotics: enhanced hypotensive effect when moxonidine given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with ANXIOLYTICS AND HYPNOTICS; sedative effects possibly increased when moxonidine given with BENZODIAZEPINES
- ▶ Beta-blockers: enhanced hypotensive effect when moxonidine given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when moxonidine given with CLONIDINE
- Corticosteroids: hypotensive effect of moxonidine antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when moxonidine given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when moxonidine given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when moxonidine given with CO-BENELDOPA, CO-CARELDOPA or
- Methyldopa: enhanced hypotensive effect when moxonidine given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when moxonidine given with MOXISYLYTE

Moxonidine (continued)

- Muscle Relaxants: enhanced hypotensive effect when moxonidine given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when moxonidine given with NITRATES
- Oestrogens: hypotensive effect of moxonidine antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when moxonidine given with ALPROSTADIL
- Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Muscle Relaxants

- ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with ALCOHOL
- Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with ALPHA-BLOCKERS
- Anaesthetics, General: effects of atracurium enhanced by KETAMINE; increased risk of myocardial depression and bradycardia when suxamethonium given with ● PROPOFOL; effects of non-depolarising muscle relaxants and suxamethonium enhanced by VOLATILE LIQUID GENERAL ANAESTHETICS
- Analgesics: excretion of baclofen possibly reduced by NSAIDS (increased risk of toxicity); excretion of baclofen reduced by IBUPROFEN (increased risk of toxicity); increased sedative effect when baclofen given with FENTANYL or MORPHINE
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with LIDOCAINE
- Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by PIPERACILLIN; plasma concentration of tizanidine increased by CIPROFLOXACIN (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by NORFLOXACIN (increased risk of toxicity); plasma concentration of tizanidine possibly reduced by RIFAMPICIN; effects of non-depolarising muscle relaxants and suxamethonium enhanced by AMINOGLYCOSIDES; effects of non-depolarising muscle relaxants and suxamethonium enhanced by CLINDAMYCIN; effects of non-depolarising muscle relaxants and suxamethonium enhanced by CLINDAMYCIN; effects of non-depolarising muscle relaxants and suxamethonium enhanced by
 - POLYMYXINS; effects of suxamethonium enhanced by
 - VANCOMYCIN
- Antidepressants: plasma concentration of tizanidine increased by • FLUVOXAMINE (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by PHENELZINE; muscle relaxant effect of baclofen enhanced by TRICYCLICS
- Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by CARBAMAZEPINE (accelerated recovery from neuromuscular blockade); effects of nondepolarising muscle relaxants reduced by long-term use of
- FOSPHENYTOIN and PHENYTOIN (but effects of nondepolarising muscle relaxants might be increased by *acute* use of fosphenytoin and phenytoin)
- Antimalarials: effects of suxamethonium possibly enhanced by QUININE
- Antipsychotics: effects of suxamethonium possibly enhanced by PROMAZINE
- Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when baclofen given with BETA-BLOCKERS; possible enhanced hypotensive effect and bradycardia when tizanidine given with BETA-BLOCKERS; effects of muscle relaxants enhanced by PROPRANOLOL
- Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with CALCIUM-CHANNEL BLOCKERS;

Muscle Relaxants

Calcium-channel Blockers (continued)

effects of non-depolarising muscle relaxants possibly enhanced by CALCIUM-CHANNEL BLOCKERS; possible increased risk of ventricular arrhythmias when intravenous dantrolene given with DILTIAZEM—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by VERAPAMIL; avoidance of intravenous dantrolene advised by manufacturer of VERAPAMIL

- Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with CARDIAC GLYCOSIDES; risk of ventricular arrhythmias when suxamethonium given with CARDIAC GLYCOSIDES
- Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with CLONIDINE
- Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by CORTICOSTEROIDS
- Cytotoxics: effects of suxamethonium enhanced by CYCLOPHOSPHAMIDE and THIOTEPA
- Deferasirox: avoidance of tizanidine advised by manufacturer of DEFERASIROX
- Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with DIURETICS
- Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- ► Lithium: effects of muscle relaxants enhanced by LITHIUM; baclofen possibly aggravates hyperkinesis caused by LITHIUM
- Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by PARENTERAL MAGNESIUM
- Memantine: effects of baclofen and dantrolene possibly modified by MEMANTINE
- Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with METHYLDOPA
- ► Metoclopramide: effects of suxamethonium enhanced by
- Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with MOXONIDINE
- Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with NITRATES
- Oestrogens: plasma concentration of tizanidine possibly increased by OESTROGENS (increased risk of toxicity)
- Parasympathonimetics: effects of non-depolarising muscle relaxants possibly antagonised by DONEPEZIL; effects of suxamethonium possibly enhanced by DONEPEZIL; effects of suxamethonium enhanced by GALANTAMINE, NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE; effects of non-depolarising muscle relaxants antagonised by NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE
- Progestogens: plasma concentration of tizanidine possibly increased by PROGESTOGENS (increased risk of toxicity)
- ► Sympathomimetics, Beta₂: effects of suxamethonium enhanced by BAMBUTEROL
- Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with HYDRALAZINE; enhanced hypotensive effect when baclofen or tizanidine given with MINOXIDIL; enhanced hypotensive effect when baclofen or tizanidine given with SODIUM NITROPRUSSIDE

Muscle Relaxants, depolarising see Muscle Relaxants
Muscle Relaxants, non-depolarising see Muscle Relaxants
Mycophenolate

- ▶ Antacids: absorption of mycophenolate reduced by ANTACIDS
- Antibacterials: bioavailability of mycophenolate possibly reduced by METRONIDAZOLE and NORFLOXACIN; plasma concentration of mycophenolate possibly reduced by CO-AMOXICLAV; plasma concentration of active metabolite of mycophenolate reduced by ◆ RIFAMPICIN
- Antivirals: mycophenolate increases plasma concentration of ACICLOVIR and VALACICLOVIR, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of

Mycophenolate

Antivirals (continued)

GANCICLOVIR and VALGANCICLOVIR, also plasma concentration of inactive metabolite of mycophenolate possibly increased

- Colestilan: manufacturer of colestilan advises give mycophenolate at least 1 hour before or 3 hours after COLESTILAN
- ► Iron Salts: absorption of mycophenolate reduced by *oral* IRON SALTS
- ► Lipid-regulating Drugs: absorption of mycophenolate reduced by COLESTYRAMINE
- Sevelamer: plasma concentration of mycophenolate possibly reduced by SEVELAMER

Nabumetone see NSAIDs

Nadolol see Beta-blockers

Nalidixic Acid see Quinolones

Nalmefene

 Analgesics: manufacturer of nalmefene advises avoid concomitant use with OPIOID ANALGESICS

Nandrolone see Anabolic Steroids

Naproxen see NSAIDs

Naratriptan see 5HT₁-receptor Agonists (under HT) Natalizumub

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Nateglinide see Antidiabetics

Nebivolol see Beta-blockers

Nefopam

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with • MAOIS; side-effects possibly increased when nefopam given with TRICYCLICS
- Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with ANTIMUSCARINICS

Neomycin see Aminoglycosides

Neostigmine see Parasympathomimetics

Nevirapine

- Analgesics: nevirapine possibly reduces plasma concentration of METHADONE
- Antibacterials: nevirapine reduces plasma concentration of CLARITHROMYCIN (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of RIFABUTIN; plasma concentration of nevirapine reduced by © RIFAMPICIN—avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of

 WARFARIN
- Antidepressants: plasma concentration of nevirapine reduced by • ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of nevirapine reduced by CARBAMAZEPINE
- Antifungals: nevirapine reduces plasma concentration of

 KETOCONAZOLE—avoid concomitant use; plasma concentration of nevirapine increased by FLUCONAZOLE; nevirapine possibly reduces plasma concentration of CASPOFUNGIN and ITRACONAZOLE—consider increasing dose of caspofungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of ◆ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)
- Antivirals: nevirapine possibly reduces plasma concentration of ATAZANAVIR and ETRAVIRINE—avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with BOCEPREVIR and RILPIVIRINE; avoidance of nevirapine advised by manufacturer of DACLATASVIR (plasma concentration of daclatasvir possibly reduced); nevirapine possibly reduces the plasma concentration of DOLUTEGRAVIR (see under Dolutegravir, p. 557); nevirapine reduces plasma concentration of EFAVIRENZ—avoid concomitant use; avoidance of nevirapine advised by manufacturer of ELVITEGRAVIR; nevirapine possibly reduces plasma concentration of FOSAMPRENAVIR—avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of prosamprenavires plasma concentration of

Nevirapine

• Antivirals (continued)

INDINAVIR; nevirapine possibly reduces plasma concentration of • LOPINAVIR and TELAPREVIR—consider increasing dose of lopinavir and telaprevir; nevirapine possibly reduces plasma concentration of • SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use; increased risk of granulocytopenia when nevirapine given with • ZIDOVUDINE

- Cobicistat: manufacturer of nevirapine advises avoid concomitant use with COBICISTAT
- Oestrogens: nevirapine accelerates metabolism of
- OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orlistat: absorption of nevirapine possibly reduced by
 ORLISTAT
- · Progestogens: nevirapine accelerates metabolism of
 - PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)

Nicardipine see Calcium-channel Blockers

Nicorandil

- ► Alcohol: hypotensive effect of nicorandil possibly enhanced by
- Antidepressants: enhanced hypotensive effect when nicorandil given with MAOIs; hypotensive effect of nicorandil possibly enhanced by TRICYCLICS
- Avanafil: hypotensive effect of nicorandil significantly enhanced by • AVANAFIL (avoid concomitant use)
- Sildenafil: hypotensive effect of nicorandil significantly enhanced by • SILDENAFIL (avoid concomitant use)
- Tadalafil: hypotensive effect of nicorandil significantly enhanced by • TADALAFIL (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nicorandil given with • VARDENAFIL—avoid concomitant use
- ► Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Nicotine

Anti-arrhythmics: nicotine possibly enhances effects of ADENOSINE

Nicotinic Acid

 Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with • STATINS (applies to lipid regulating doses of nicotinic acid)

Nifedipine see Calcium-channel Blockers Nilotinib

- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with ● CLARITHROMYCIN and ● TELITHROMYCIN; plasma concentration of nilotinib reduced by ● RIFAMPICIN avoid concomitant use
- Antifungals: plasma concentration of nilotinib increased by
 KETOCONAZOLE—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with ITRACONAZOLE and VORICONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of nilotinib advised by manufacturer of
 BOCEPREVIR: plasma concentration of nilotinib possibly
- increased by RITONAVIR—manufacturer of nilotinib advises avoid concomitant use
- Anxiolytics and Hypnotics: nilotinib increases plasma concentration of MIDAZOLAM
- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with • GRAPEFRUIT JUICE
- ► Lipid-regulating Drugs: separating administration from nilotinib by 12 hours advised by manufacturer of LOMITAPIDE

Nimodipine see Calcium-channel Blockers

Nintedanib

- Antibacterials: plasma concentration of nintedanib reduced by
 RIFAMPICIN—avoid concomitant use
- Antifungals: plasma concentration of nintedanib increased by
 KETOCONAZOLE

Nitrates

- ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when nitrates given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when nitrates given with ALDESLEUKIN Alpha-blockers: enhanced hypotensive effect when nitrates
- given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when nitrates given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of nitrates antagonised by
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with ANGIOTENSIN-II RECEPTOR
- Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by DISOPYRAMIDE (failure to dissolve under tongue owing to dry mouth)
- · Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of ● HEPARINS
- Antidepressants: enhanced hypotensive effect when nitrates given with MAOIS; effects of sublingual tablets of nitrates possibly reduced by TRICYCLIC-RELATED ANTIDEPRESSANTS (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by TRICYCLICS (failure to dissolve under tongue owing to dry mouth)
- Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by ANTIMUSCARINICS (failure to dissolve under tongue owing to dry mouth)
- Antipsychotics: enhanced hypotensive effect when nitrates given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with ANXIOLYTICS AND HYPNOTICS
- · Avanafil: hypotensive effect of nitrates significantly enhanced by • AVANAFIL (avoid concomitant use)
- Beta-blockers: enhanced hypotensive effect when nitrates given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with CALCIUM-CHANNEL BLOCKERS
- ▶ Clonidine: enhanced hypotensive effect when nitrates given with CLONIDINE
- Corticosteroids: hypotensive effect of nitrates antagonised by CORTICOSTEROIDS
- » Diazoxide: enhanced hypotensive effect when nitrates given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when nitrates given with DUIRFTICS
- Dopaminergics: enhanced hypotensive effect when nitrates given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Methyldopa: enhanced hypotensive effect when nitrates given WITH METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when nitrates given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when nitrates given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when nitrates given with BACLOFEN or TIZANIDINE
- Oestrogens: hypotensive effect of nitrates antagonised by **OESTROGENS**
- Prostaglandins: enhanced hypotensive effect when nitrates given with ALPROSTADIL
- · Riociguat: possible enhanced hypotensive effect when nitrates given with • RIOCIGUAT—avoid concomitant use
- Sildenafil: hypotensive effect of nitrates significantly enhanced by • SILDENAFIL (avoid concomitant use)
- · Tadalafil: hypotensive effect of nitrates significantly enhanced by • TADALAFIL (avoid concomitant use)
- · Vardenafil: possible increased hypotensive effect when nitrates given with • VARDENAFIL—avoid concomitant use
- Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRIISSIDE

Nitrazepam see Anxiolytics and Hypnotics

Nitrofurantoin

- Antacids: absorption of nitrofurantoin reduced by ORAL MAGNESIUM SALTS (as magnesium trisilicate)
- Antibacterials: nitrofurantoin possibly antagonises effects of NALIDIXIC ACID
- Sulfinpyrazone: excretion of nitrofurantoin reduced by SULFINPYRAZONE (increased risk of toxicity)
- ▶ Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Nitroimidazoles see Metronidazole and Tinidazole

Nitrous Oxide see Anaesthetics, General

Nizatidine see Histamine H2-antagonists

Nomegestrol see Progestogens

Noradrenaline (norepinephrine) see Sympathomimetics

Norelgestromin see Progestogens Norepinephrine

NOTE Norepinephrine interactions as for noradrenaline, see under sympathomimetics

Norethisterone see Progestogens

Norfloxacin see Quinolones

Norgestimate see Progestogens

Norgestrel see Progestogens

Normal Immunoglobulin see Immunoglobulins Nortriptyline see Antidepressants, Tricyclic **NSAIDs**

NOTE See also Aspirin. Interactions do not generally apply to topical NSAIDs

- ACE Inhibitors: increased risk of renal impairment when NSAIDs given with ACE INHIBITORS, also hypotensive effect
- Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers
- Aliskiren: NSAIDs possibly antagonise hypotensive effect of
- Alpha-blockers: NSAIDs antagonise hypotensive effect of ALPHA-BLOCKERS
- Analgesics: avoid concomitant use of NSAIDs with NSAIDS or ASPIRIN (increased side-effects); avoid concomitant use of NSAIDs with • KETOROLAC (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of ASPIRIN
- Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS, also hypotensive effect antagonised
- Antacids: absorption of acemetacin possibly reduced by ANTACIDS
- · Antibacterials: indometacin possibly increases plasma concentration of AMIKACIN and GENTAMICIN in neonates; plasma concentration of celecoxib, diclofenac and etoricoxib reduced by RIFAMPICIN; possible increased risk of convulsions when NSAIDs given with • QUINOLONES
- · Anticoagulants: increased risk of haemorrhage when intravenous diclofenac given with . ANTICOAGULANTS (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with
- ANTICOAGULANTS (avoid concomitant use, including lowdose heparins); NSAIDs possibly enhance anticoagulant effect of • COUMARINS and • PHENINDIONE; possible increased risk of bleeding when NSAIDs given with . DABIGATRAN or **HEPARINS**
- · Antidepressants: increased risk of bleeding when NSAIDs given with • SSRIS or • VENLAFAXINE
- · Antidiabetics: NSAIDs possibly enhance effects of SULFONYLUREAS
- Antiepileptics: acemetacin possibly reduces excretion of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antifungals: plasma concentration of parecoxib increased by FLUCONAZOLE (reduce dose of parecoxib); plasma concentration of celecoxib increased by FLUCONAZOLE (halve dose of celecoxib); plasma concentration of flurbiprofen and ibuprofen increased by FLUCONAZOLE; plasma concentration of diclofenac and ibuprofen increased by VORICONAZOLE
- Antipsychotics: possible severe drowsiness when acemetacin or indometacin given with HALOPERIDOL

NSAIDs (continued)

- Antivirals: plasma concentration of piroxicam increased by RITONAVIR (risk of toxicity)—avoid concomitant use; plasma concentration of NSAIDs possibly increased by RITONAVIR; increased risk of haematological toxicity when NSAIDs given with ZIDOVUDINE
- Beta-blockers: NSAIDs antagonise hypotensive effect of BETA-BLOCKERS
- Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of CALCIUM-CHANNEL BLOCKERS
- Cardiac Glycosides: NSAIDs possibly increase plasma concentration of CARDIAC GLYCOSIDES, also possible exacerbation of heart failure and reduction of renal function
- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with CICLOSPORIN; plasma concentration of diclofenac increased by CICLOSPORIN (halve dose of diclofenac)
- ► Clonidine: NSAIDs antagonise hypotensive effect of CLONIDINE
- Clopidogrel: increased risk of bleeding when NSAIDs given with CLOPIDOGREL
- ► Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with CORTICOSTEROIDS
- Cytotoxics: NSAIDs probably reduce excretion of
 METHOTREXATE (increased risk of toxicity); diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of METHOTREXATE (increased risk of toxicity); NSAIDs possibly reduce renal excretion of PEMETREXED—consult product literature; increased risk of bleeding when NSAIDs given with ERLOTINIB; avoidance of mefenamic acid advised by manufacturer of REGORAFENIB
- ▶ Desmopressin: indometacin enhances effects of DESMOPRESSIN
- ▶ Diazoxide: NSAIDs antagonise hypotensive effect of DIAZOXIDE
- Dimethyl sulfoxide: avoid concomitant use of sulindac with
 DIMETHYL SULFOXIDE
- Diuretics: risk of nephrotoxicity of NSAIDs increased by DIURETICS, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of DIURETICS; excretion of acemetacin possibly increased by FUROSEMIDE; NSAIDs possibly antagonise diuretic effect of POTASSIUM CANRENOATE; occasional reports of reduced renal function when indometacin given with ●TRIAMTERENE—avoid concomitant use; possible increased risk of hyperkalaemia when NSAIDs given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS; increased risk of hyperkalaemia when indometacin given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Iloprost: increased risk of bleeding when NSAIDs given with ILOPROST
- Lipid-regulating Drugs: excretion of meloxicam increased by COLESTYRAMINE
- Lithium: NSAIDs reduce excretion of LITHIUM (increased risk of toxicity); ketorolac reduces excretion of ● LITHIUM (increased risk of toxicity)—avoid concomitant use
- ► Methyldopa: NSAIDs antagonise hypotensive effect of
- Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of MIFAMURTIDE
- Moxonidine: NSAIDs antagonise hypotensive effect of MOXONIDINE
- Muscle Relaxants: ibuprofen reduces excretion of BACLOFEN (increased risk of toxicity); NSAIDs possibly reduce excretion of BACLOFEN (increased risk of toxicity)
- Nitrates: NSAIDs antagonise hypotensive effect of NITRATES
- Oestrogens: etoricoxib increases plasma concentration of ETHINYLESTRADIOL
- Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with PENICILLAMINE
- Pentoxifylline: possible increased risk of bleeding when NSAIDs given with PENTOXIFYLLINE; increased risk of bleeding when ketorolac given with OPENTOXIFYLLINE (avoid concomitant use)
- Prasugrel: possible increased risk of bleeding when NSAIDs given with PRASUGREL
- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with TACROLIMUS; increased risk of nephrotoxicity when ibuprofen given with • TACROLIMUS

NSAIDs (continued)

- Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of HYDRALAZINE, MINOXIDIL and SODIUM NITROPRUSSIDE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

 Octreotide

Antidiabetics: octreotide possibly reduces requirements for

- ANTIDIABETICS
 Ciclosporin: octreotide reduces plasma concentration of
- CICLOSPORIN
 Dopaminergics: octreotide increases plasma concentration of
- Ulcer-healing Drugs: octreotide possibly delays absorption of CIMETIDINE

Oestrogens

BROMOCRIPTINE

- ► ACE Inhibitors: oestrogens antagonise hypotensive effect of ACE INHIBITORS
- Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: oestrogens antagonise hypotensive effect of ALPHA-BLOCKERS
- Aminophylline: oestrogens increase plasma concentration of AMINOPHYLLINE (consider reducing dose of aminophylline)
- Analgesics: plasma concentration of ethinylestradiol increased by ETORICOXIB
- Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: plasma concentration of estradiol increased by ERYTHROMYCIN; metabolism of oestrogens accelerated by • RIFAMYCIN5 (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of COUMARINS; oestrogens antagonise anticoagulant effect of PHENINDIONE
- Antidepressants: contraceptive effect of oestrogens reduced by
 STJOHN'S WORT (avoid concomitant use); oestrogens antagonise antidepressant effect of TRICYCLICS (but sideeffects of tricyclics possibly increased due to increased plasma concentration)
- Antidiabetics: oestrogens antagonise hypoglycaemic effect of ANTIDIABETICS
- · Antiepileptics: metabolism of oestrogens accelerated by
- ◆ CARBAMAZEPINE, ◆ ESLICARBAZEPINE, ◆ FOSPHENYTOIN,
- OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN, PRIMIDONE,
- RUFINAMIDE and TOPIRAMATE (reduced contraceptive effect
 with combined oral contraceptives, contraceptive patches,
 and vaginal rings—see Contraceptive Interactions in BNF);
 oestrogens reduce plasma concentration of LAMOTRIGINE—
 consider increasing dose of lamotrigine; ethinylestradiol
 possibly reduces plasma concentration of SODIUM VALPROATE
 and VALPROIC ACID
- Antifungals: oestrogens increase plasma concentration of VORICONAZOLE; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with GRISEOFULVIN; anecdotal reports of contraceptive failure when oestrogens given with IMIDAZOLES; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with TERBINAFINE
- Antivirals: plasma concentration of ethinylestradiol increased by ATAZANAVIR; metabolism of oestrogens accelerated by
- NEVIRAPINE and RITONAVIR (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF); plasma concentration of ethinylestradiol possibly reduced by TELAPREVIR—manufacturer of telaprevir advises additional contraceptive precautions
- Anxiolytics and Hypnotics: oestrogens possibly increase plasma concentration of CHLORDIAZEPOXIDE, DIAZEPAM and NITRAZEPAM; oestrogens possibly reduce plasma concentration of LORAZEPAM, OXAZEPAM and TEMAZEPAM; oestrogens increase plasma concentration of MELATONIN

Oestrogens (continued)

- Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with
 APREPITANT (alternative contraception recommended)
- Beta-blockers: oestrogens antagonise hypotensive effect of BETA-BLOCKERS
- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with
- BOSENTAN (alternative contraception recommended)
 Calcium-channel Blockers: oestrogens antagonise hypotensive effect of CALCIUM-CHANNEL BLOCKERS
- Ciclosporin: oestrogens possibly increase plasma concentration of CICLOSPORIN
- Clonidine: oestrogens antagonise hypotensive effect of
- Cobicistat: metabolism of oestrogens accelerated by
- COBICISTAT (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- ► Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of CORTICOSTEROIDS
- Cytotoxics: possible reduction in contraceptive effect of oestrogens advised by manufacturer of ● CRIZOTINIB and
- VEMURAFENIB; possible reduced contraceptive effect of hormonal contraceptives containing oestrogens advised by manufacturer of

 DABRAFENIB (alternative contraception recommended)
- ▶ Diuretics: oestrogens antagonise diuretic effect of DIURETICS
- Dopaminergics: oestrogens increase plasma concentration of ROPINIROLE; oestrogens increase plasma concentration of
- SELEGILINE—manufacturer of selegiline advises avoid concomitant use
- Fosaprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with
- FOSAPREPITANT (alternative contraception recommended)
- Lipid-regulating Drugs: absorption of ethinylestradiol reduced by COLESEVELAM; plasma concentration of ethinylestradiol increased by ATORVASTATIN and ROSUVASTATIN; separating administration from oestrogens by 12 hours advised by manufacturer of LOMITAPIDE
- Methyldopa: oestrogens antagonise hypotensive effect of METHYLDOPA
- Modafinil: metabolism of oestrogens accelerated by
- MODAFINIL (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Moxonidine: oestrogens antagonise hypotensive effect of MOXONIDINE
- Muscle Relaxants: oestrogens possibly increase plasma concentration of TIZANIDINE (increased risk of toxicity)
- Nitrates: oestrogens antagonise hypotensive effect of NITRATES
- Somatropin: oestrogens (when used as oral replacement
- therapy) may increase dose requirements of SOMATROPIN

 Tacrolimus: ethinylestradiol possibly increases plasma
- concentration of TACROLIMUS

 Teriflunomide: plasma concentration of ethinylestradiol increased by TERIFLUNOMIDE
- ► Theophylline: oestrogens increase plasma concentration of THEOPHYLLINE (consider reducing dose of theophylline)
- ► Thyroid Hormones: oestrogens may increase requirements for THYROID HORMONES in hypothyroidism
- Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of HYDRALAZINE, MINOXIDIL and SODIUM NITROPRUSSIDE

Oestrogens, conjugated see Oestrogens

Ofatumumab

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use
 Ofloxacin see Quinolones

Olanzapine see Antipsychotics

Olmesartan see Angiotensin-II Receptor Antagonists
Olodaterol see Sympathomimetics, Beta₂
Omeprazole see Proton Pump Inhibitors

Ondansetron *see* 5HT₃-receptor Antagonists (under HT) **Opioid Analgesics**

- Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with ALCOHOL
- Anaesthetics, General: fentanyl inhibits metabolism of ETOMIDATE (consider reducing dose of etomidate); opioid analgesics possibly enhance effects of INTRAVENOUS GENERAL ANAESTHETICS and VOLATILE LIQUID GENERAL ANAESTHETICS
- Analgesics: avoidance of buprenorphine advised by manufacturer of FENTANYL; manufacturer of fentanyl advises avoid concomitant use with PENTAZOCINE
- Antibacterials: plasma concentration of fentanyl possibly increased by CLARITHROMYCIN; plasma concentration of alfentanil increased by ERYTHROMYCIN; metabolism of alfentanil, codeine, fentanyl, methadone and morphine accelerated by RIFAMPICIN (reduced effect); metabolism of oxycodone possibly accelerated by RIFAMPICIN; increased risk of ventricular arrhythmias when methadone given with
 DELAMANID; manufacturer of pethidine advises avoid concomitant use with ISONIAZID; metabolism of oxycodone inhibited by TELITHROMYCIN; possible increased risk of ventricular arrhythmias when methadone given with
 TELITHROMYCIN
- Anticoagulants: tramadol enhances anticoagulant effect of
 COUMARINS
- Antidepressants: plasma concentration of methadone possibly increased by FLUOXETINE, FLUVOXAMINE, PAROXETINE and SERTRALINE; possible increased serotonergic effects when pethidine or tramadol given with DULOXETINE; possible increased serotonergic effects when tramadol given with MIRTAZAPINE or VENLAFAXINE; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with . MAOIS—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when tramadol given with ● MAOIS—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when pethidine given with MAOIS—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects when fentanyl given with MAOIS, SSRI-RELATED ANTIDEPRESSANTS or SSRIS; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with • MOCLOBEMIDE—manufacturer of moclobemide advises consider reducing dose of opioid analgesics; possible CNS excitation or depression (hypertension or hypotension) when dextromethorphan or pethidine given with • MOCLOBEMIDE—avoid concomitant use; increased risk of CNS toxicity when tramadol given with • SSRIS or • TRICYCLICS; plasma concentration of methadone possibly reduced by ST JOHN'S WORT; sedative effects possibly increased when opioid analgesics given with TRICYCLICS
- Antiepileptics: effects of tramadol reduced by CARBAMAZEPINE; plasma concentration of methadone reduced by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE; metabolism of fentanyl possibly accelerated by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN (reduced effect); dextropropoxyphene enhances effects of CARBAMAZEPINE; metabolism of methadone accelerated by FOSPHENYTOIN and PHENYTOIN (reduced effect and risk of withdrawal effects); possible increased risk of pethidine toxicity when given with FOSPHENYTOIN and PHENYTOIN; morphine increases bioavailability of GABAPENTIN
- Antifungals: metabolism of buprenorphine inhibited by
 KETOCONAZOLE (reduce dose of buprenorphine); possible increased risk of ventricular arrhythmias when methadone given with KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of oxycodone increased by ITRACONAZOLE, KETOCONAZOLE and VORICONAZOLE; metabolism of alfentanil inhibited by FLUCONAZOLE (risk of prolonged or delayed respiratory depression); plasma concentration of methadone increased by FLUCONAZOLE; metabolism of alfentanil possibly inhibited by ITRACONAZOLE; plasma concentration of methadone

Opioid Analgesics

- Antifungals (continued)
 possibly increased by ITRACONAZOLE (increased risk of
 ventricular arrhythmias); plasma concentration of alfentanil
 and methadone increased by VORICONAZOLE (consider
 reducing dose of alfentanil and methadone); plasma
 concentration of fentanyl possibly increased by TRIAZOLES
- Antihistamines: sedative effects possibly increased when opioid analgesics given with • SEDATING ANTIHISTAMINES
- Antimalarials: avoidance of methadone advised by manufacturer of • ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antimuscarinics: possible increased risk of antimuscarinic side-effects when codeine given with ANTIMUSCARINICS
- Antivirals: plasma concentration of methadone possibly reduced by ABACAVIR, NEVIRAPINE and RILPIVIRINE; plasma concentration of methadone possibly affected by BOCEPREVIR; possible increased risk of prolonged sedation and respiratory depression when buprenorphine given with BOCEPREVIR; methadone possibly reduces plasma concentration of DIDANOSINE; plasma concentration of methadone reduced by EFAVIRENZ, FOSAMPRENAVIR and RITONAVIR; plasma concentration of buprenorphine possibly increased by RITONAVIR; plasma concentration of alfentanil and fentanyl increased by . RITONAVIR; plasma concentration of pethidine reduced by • RITONAVIR, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use): plasma concentration of morphine possibly reduced by RITONAVIR; plasma concentration of dextropropoxyphene increased by • RITONAVIR (risk of toxicity)—avoid concomitant use; increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with • SAQUINAVIRavoid concomitant use; caution with methadone advised by manufacturer of • TELAPREVIR (risk of ventricular arrhythmias); buprenorphine possibly reduces plasma concentration of TIPRANAVIR; methadone possibly increases plasma concentration of ZIDOVUDINE
- Anxiolytics and Hypnotics: increased sedative effect when opioid analgesics given with ANXIOLYTICS AND HYPNOTICS; fentanyl possibly inhibits metabolism of MIDAZOLAM
- Atomoxetine: increased risk of ventricular arrhythmias when methadone given with • ATOMOXETINE; possible increased risk of convulsions when tramadol given with ATOMOXETINE
- Beta-blockers: morphine possibly increases plasma concentration of ESMOLOL
- ► Calcium-channel Blockers: metabolism of alfentanil inhibited by DILTIAZEM (risk of prolonged or delayed respiratory depression)
- Cytotoxics: possible increased risk of ventricular arrhythmias when methadone given with • BOSUTINIB; caution with alfentanil and fentanyl advised by manufacturer of
 CRIZOTINIB; possible increased risk of ventricular
- arrhythmias when methadone given with VANDETANIB—avoid concomitant use
- Dapoxetine: possible increased risk of serotonergic effects when tramadol given with DAPOXETINE (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Domperidone: opioid analgesics antagonise effects of DOMPERIDONE on gastro-intestinal activity
- Dopaminergics: avoid concomitant use of dextromethorphan with ◆ RASAGILINE; risk of CNS toxicity when pethidine given with ◆ RASAGILINE (avoid pethidine for 2 weeks after rasagiline); avoidance of opioid analgesics advised by manufacturer of SELEGILINE; hyperpyrexia and CNS toxicity reported when pethidine given with ◆ SELEGILINE (avoid concomitant use)

Opioid Analgesics (continued)

- Hormone Antagonists: plasma concentration of dextromethorphan increased by ABIRATERONE
- SHT₃-receptor Antagonists: effects of tramadol possibly antagonised by ONDANSETRON
 Memantine: increased risk of CNS toxicity when
- dextromethorphan given with MEMANTINE (manufacturer of memantine advises avoid concomitant use)

 Moteorphide arrived anglesian appropriate of feets of
- Metoclopramide: opioid analgesics antagonise effects of METOCLOPRAMIDE on gastro-intestinal activity
- Muscle Relaxants: increased sedative effect when fentanyl or morphine given with BACLOFEN
- Nalmefene: avoidance of opioid analgesics advised by manufacturer of

 NALMEFENE
- Sodium Oxybate: opioid analgesics enhance effects of SODIUM OXYBATE (avoid concomitant use)
- Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by CIMETIDINE (increased plasma concentration)

Oritavancin

- Anticoagulants: oritavancin possibly increases plasma concentration of WARFARIN
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Orlietat

- Anti-arrhythmics: orlistat possibly reduces plasma concentration of AMIODARONE
- Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of COUMARINS
- Antidiabetics: manufacturer of orlistat advises avoid concomitant use with ACARBOSE
- Antiepileptics: possible increased risk of convulsions when orlistat given with • ANTIEPILEPTICS
- Antivirals: orlistat possibly reduces absorption of ABACAVIR,
 - ATAZANAVIR, DARUNAVIR, DIDANOSINE, EFAVIRENZ,
 - $\bullet \; \mathsf{ELVITEGRAVIR}, \bullet \; \mathsf{EMTRICITABINE}, \bullet \; \mathsf{ENFUVIRTIDE}, \bullet \; \mathsf{ETRAVIRINE}, \\$
- FOSAMPRENAVIR, INDINAVIR, LAMIVUDINE, LOPINAVIR,
- MARAVIROC, NEVIRAPINE, RALTEGRAVIR, RILPIVIRINE,
- RITONAVIR, SAQUINAVIR, STAVUDINE, TENOFOVIR,
- ◆ TIPRANAVIR and ◆ ZIDOVUDINE
- Ciclosporin: orlistat possibly reduces absorption of
 CICLOSPORIN
- Thyroid Hormones: possible increased risk of hypothyroidism when orlistat given with LEVOTHYROXINE

Orphenadrine see Antimuscarinics

Oxaliplatin see Platinum Compounds

Oxandrolone see Anabolic Steroids
Oxazepam see Anxiolytics and Hypnotics

Oxcarbazepine

- Antidepressants: anticonvulsant effect of antiepileptics
 possibly antagonised by MAOIs and ●TRICYCLIC-RELATED
 ANTIDEPRESSANTS (convulsive threshold lowered);
 anticonvulsant effect of antiepileptics antagonised by SSRIS
 and ●TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of CARBAMAZEPINE (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; avoidance of oxcarbazepine advised by manufacturer of ESLICARBAZEPINE; oxcarbazepine increases plasma concentration of FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE, also plasma concentration of an active metabolite of oxcarbazepine reduced; oxcarbazepine reduces plasma concentration of
- PERAMPANEL (see under Perampanel, p. 398); plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by SODIUM VALPROATE and VALPROIC ACID
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Antivirals: oxcarbazepine possibly reduces plasma concentration of ● DACLATASVIR and ● SIMEPREVIR manufacturer of daclatasvir and simeprevir advises avoid concomitant use; avoidance of oxcarbazepine advised by

Oxcarbazepine

- Antivirals (continued)
 - manufacturer of DOLUTEGRAVIR and SOFOSBUVIR; avoidance of oxcarbazepine advised by manufacturer of RILPIVIRINE (plasma concentration of rilpivirine possibly reduced)
- Ciclosporin: oxcarbazepine possibly reduces plasma concentration of CICLOSPORIN
- ullet Clopidogrel: oxcarbazepine possibly reduces antiplatelet effect of ullet CLOPIDOGREL
- Cytotoxics: oxcarbazepine reduces plasma concentration of
- IMATINIB—avoid concomitant use
- Oestrogens: oxcarbazepine accelerates metabolism of
- OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Progestogens: oxcarbazepine accelerates metabolism of
- PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)

Oxprenolol see Beta-blockers

Oxybutynin see Antimuscarinics

Oxycodone see Opioid Analgesics

Oxymetazoline see Sympathomimetics
Oxytetracycline see Tetracyclines

Oxytocin

- Anaesthetics, General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with VOLATILE LIQUID GENERAL ANAESTHETICS
- Prostaglandins: uterotonic effect of oxytocin potentiated by PROSTAGLANDINS
- Sympathomimetics: risk of hypertension when oxytocin given with vasoconstrictor SYMPATHOMIMETICS (due to enhanced vasopressor effect)

Paclitaxel

- Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of paclitaxel increased by RITONAVIR
- Cytotoxics: increased risk of neutropenia when paclitaxel given with • LAPATINIB

Paliperidone see Antipsychotics

Pamidronate Disodium see Bisphosphonates

Pancreati

 Antidiabetics: pancreatin antagonises hypoglycaemic effect of ACARBOSE

Pancuronium see Muscle Relaxants

Panitumumab

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Pantoprazole see Proton Pump Inhibitors

Papaveretum see Opioid Analgesics

Paracetamol

- Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of COUMARINS
- ► Antidiabetics: absorption of paracetamol possibly reduced when given 1 to 4 hours after LIXISENATIDE
- Antiepileptics: metabolism of paracetamol possibly accelerated by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (also isolated reports of hepatotoxicity)
- Antifungals: avoidance of paracetamol advised by manufacturer of KETOCONAZOLE
- Cytotoxics: paracetamol possibly inhibits metabolism of intravenous BUSULFAN (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of IMATINIB
- Lipid-regulating Drugs: absorption of paracetamol reduced by COLESTYRAMINE
- Metoclopramide: rate of absorption of paracetamol increased by METOCLOPRAMIDE

Paraldehyde

- Alcohol: increased sedative effect when paraldehyde given with • ALCOHOL
- Disulfiram: risk of toxicity when paraldehyde given with
 DISULFIRAM

Parasympathomimetics

- Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by PROPAFENONE
- POLYMYXINS
- Antidepressants: plasma concentration of galantamine increased by PAROXETINE
- Antifungals: plasma concentration of galantamine increased by KETOCONAZOLE
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for CHLORQQUINE to increase symptoms of myasthenia gravis; effects of neostigmine and pyridostigmine may be diminished because of potential for HYDROXYCHLORQQUINE to increase symptoms of myasthenia gravis
- Antimuscarinics: effects of parasympathomimetics antagonised by ANTIMUSCARINICS
- Beta-blockers: increased risk of arrhythmias when pilocarpine given with BETA-BLOCKERS; effects of neostigmine and pyridostigmine antagonised by PROPRANOLOL
- Cytotoxics: possible increased risk of bradycardia when pilocarpine given with CRIZOTINIB
- ▶ Lithium: effects of neostigmine antagonised by LITHIUM
- Muscle Relaxants: donepezil possibly enhances effects of SUXAMETHONIUM; galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of SUXAMETHONIUM; neostigmine, pyridostigmine and rivastigmine antagonise effects of NON-DEPOLARISING MUSCLE RELAXANTS; donepezil possibly antagonises effects of NON-DEPOLARISING MUSCLE RELAXANTS

Parecoxib see NSAIDs

Paricalcitol see Vitamins

Paroxetine see Antidepressants, SSRI

Pasireotide

- Antidiabetics: pasireotide possibly reduces requirements for ANTIDIABETICS
- Antifungals: avoidance of pasireotide advised by manufacturer of KETOCONAZOLE
- Antimuscarinics: possible increased risk of bradycardia when pasireotide given with IPRATROPIUM or OXYBUTYNIN
- Beta-blockers: possible increased risk of bradycardia when pasireotide given with CARTEOLOL, METOPROLOL, PROPRANOLOL or SOTALOL
- Calcium-channel Blockers: possible increased risk of bradycardia when pasireotide given with DILTIAZEM or VERAPAMIL
- Ciclosporin: pasireotide possibly reduces plasma concentration of CICLOSPORIN

Pazopanib

- Antibacterials: plasma concentration of pazopanib possibly increased by ◆ CLARITHROMYCIN and ◆ TELITHROMYCIN (reduce dose of pazopanib); plasma concentration of pazopanib possibly reduced by ◆ RIFAMPICIN
- Antifungals: plasma concentration of pazopanib increased by
 KETOCONAZOLE (reduce dose of pazopanib); plasma concentration of pazopanib possibly increased by
- ITRACONAZOLE and VORICONAZOLE (reduce dose of pazopanib)
 Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
 Antivirals: plasma concentration of pazopanib possibly increased by ATAZANAVIR, INDINAVIR and RITONAVIR (reduce dose of pazopanib); avoidance of pazopanib advised by manufacturer of BOCEPREVIR; increased risk of ventricular arrhythmias when pazopanib given with
- SAQUINAVIR—avoid concomitant use

Pazopanib (continued)

- Cytotoxics: plasma concentration of pazopanib increased by LAPATINIB
- Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with • GRAPEFRUIT JUICE
- Lipid-regulating Drugs: separating administration from pazopanib by 12 hours advised by manufacturer of LOMITAPIDE
- Ulcer-healing Drugs: absorption of pazopanib possibly reduced by HISTAMINE Hz-ANTAGONISTS—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine Hz-antagonists; absorption of pazopanib possibly reduced by PROTON PUMP INHIBITORS—manufacturer of pazopanib advises give at the same time as proton pump inhibitors

Pegfilgrastim

 Cytotoxics: neutropenia possibly exacerbated when pegfilgrastim given with CAPECITABINE, FLUOROURACIL or TEGAFUR

Peginterferon Alfa see Interferons

Pemetrexed

- Analgesics: renal excretion of pemetrexed possibly reduced by NSAIDs and ASPIRIN—consult product literature
- Antimalarials: antifolate effect of pemetrexed increased by
 PYRIMETHAMINE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)

Penicillamine

- Analgesics: possible increased risk of nephrotoxicity when penicillamine given with NSAIDs
- Antacids: absorption of penicillamine reduced by ANTACIDS
- Antipsychotics: avoid concomitant use of penicillamine with
 CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: penicillamine possibly reduces plasma concentration of DIGOXIN
- ► Iron Salts: absorption of penicillamine reduced by *oral* IRON SALTS
- Sodium Aurothiomalate: manufacturer of penicillamine advises avoid concomitant use with SODIUM AUROTHIOMALATE (increased risk of toxicity)
- Zinc: penicillamine reduces absorption of ZINC, also absorption of penicillamine reduced by zinc

Penicillins

- Allopurinol: increased risk of rash when amoxicillin, ampicillin or co-amoxiclay given with ALLOPURINOL
- Antibacterials: absorption of phenoxymethylpenicillin reduced by NEOMYCIN; effects of penicillins possibly antagonised by TETRACYCLINES
- Anticoagulants: an interaction between broad-spectrum penicillins and COUMARINS and PHENINDIONE has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered
- Antiepileptics: manufacturer of pivmecillinam advises avoid concomitant use with • SODIUM VALPROATE and • VALPROIC ACID
- Cytotoxics: penicillins reduce excretion of METHOTREXATE (increased risk of toxicity)
- Muscle Relaxants: piperacillin enhances effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM
- Mycophenolate: co-amoxiclav possibly reduces plasma concentration of MYCOPHENOLATE
- Sulfinpyrazone: excretion of penicillins reduced by SULFINPYRAZONE
- ▶ Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Pentamidine Isetionate

- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with parenteral
- ERYTHROMYCIN; increased risk of ventricular arrhythmias when pentamidine isetionate given with MOXIFLOXACIN—

Pentamidine Isetionate

- Antibacterials (continued) avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with
- DELAMANID; possible increased risk of ventricular arrhythmias when parenteral pentamidine isetionate given with • TELITHROMYCIN
- Antidepressants: avoidance of pentamidine isetionate advised by manufacturer of ● CITALOPRAM and ● ESCITALOPRAM (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when pentamidine isetionate given with
 ● TRICYCLICS
- ► Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with AMPHOTERICIN
- Antimalarials: avoidance of pentamidine isetionate advised by manufacturer of ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when
 pentamidine isetionate given with ●AMISULPRIDE or
 ●DROPERIDOL—avoid concomitant use; increased risk of
 ventricular arrhythmias when pentamidine isetionate given
 with ●PHENOTHIAZINES
- Antivirals: increased risk of hypocalcaemia when parenteral pentamidine isetionate given with *FOSCARNET; increased risk of ventricular arrhythmias when pentamidine isetionate given with *SAQUINAVIR—avoid concomitant use
- Cytotoxics: possible increased risk of ventricular arrhythmias when pentamidine isetionate given with • VANDETANIB—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with ● IVABRADINE

Pentazocine see Opioid Analgesics

Pentostatin

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: increased toxicity when pentostatin given with high-dose ◆CYCLOPHOSPHAMIDE—avoid concomitant use; increased pulmonary toxicity when pentostatin given with
 FLUDARABIME (unacceptably high incidence of fatalities)

Pentoxifylline

- Aminophylline: pentoxifylline increases plasma concentration of AMINOPHYLLINE
- Analgesics: possible increased risk of bleeding when pentoxifylline given with NSAIDS; increased risk of bleeding when pentoxifylline given with

 KETOROLAC (avoid concomitant use)
- ► Theophylline: pentoxifylline increases plasma concentration of THEOPHYLLINE

Perampanel

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ● TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● SSRIS and ● TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of perampanel reduced by ● CARBAMAZEPINE, ● FOSPHENYTOIN, ● OXCARBAZEPINE and ● PHENYTOIN (see under Perampanel, p. 398); plasma concentration of perampanel reduced by TOPIRAMATE
- Antifungals: plasma concentration of perampanel increased by KETOCONAZOLE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Anxiolytics and Hypnotics: perampanel reduces plasma concentration of MIDAZOLAM
- Progestogens: perampanel accelerates metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see
 Contraceptive Interactions in BNF)

Pergolide

- Antipsychotics: effects of pergolide antagonised by ANTIPSYCHOTICS
- Memantine: effects of dopaminergics possibly enhanced by
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Metoclopramide: antiparkinsonian effect of pergolide antagonised by METOCLOPRAMIDE

Pericyazine see Antipsychotics

Perindopril see ACE Inhibitors

Perphenazine see Antipsychotics

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- · Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Pethidine see Opioid Analgesics

Phenelzine see MAOIs

Phenindione

NOTE Change in patient's clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant

- · Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of • ALCOHOL
- · Anabolic Steroids: anticoagulant effect of phenindione enhanced by • ANABOLIC STEROIDS
- · Analgesics: anticoagulant effect of phenindione possibly enhanced by . NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous . DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
- KETOROLAC (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with • ASPIRIN (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by • AMIODARONE (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by • DRONEDARONE
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with
- NEOMYCIN (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by LEVOFLOXACIN and • TETRACYCLINES; an interaction between phenindione and broad-spectrum PENICILLINS has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of phenindione possibly inhibited by SULFONAMIDES
- · Anticoagulants: increased risk of haemorrhage when other anticoagulants given with . APIXABAN, . DABIGATRAN and • RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- · Antivirals: anticoagulant effect of phenindione possibly enhanced by • RITONAVIR
- · Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of • CLOPIDOGREL
- Corticosteroids: anticoagulant effect of phenindione may be enhanced or reduced by CORTICOSTEROIDS
- Cytotoxics: avoidance of phenindione advised by manufacturer of IBRUTINIB
- Dipyridamole: anticoagulant effect of phenindione enhanced due to antiplatelet action of • DIPYRIDAMOLE
- Enteral Foods: anticoagulant effect of phenindione antagonised by vitamin K (present in some • ENTERAL FEEDS) Iloprost: increased risk of bleeding when phenindione given with ILOPROST
- · Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by • COLESTYRAMINE; anticoagulant effect of phenindione possibly enhanced by • ROSUVASTATIN; anticoagulant effect of phenindione

enhanced by • FIBRATES

Phenindione (continued)

- Oestrogens: anticoagulant effect of phenindione antagonised by • OESTROGENS
- Prasugrel: possible increased risk of bleeding when phenindione given with PRASUGREL
- Progestogens: anticoagulant effect of phenindione antagonised by . PROGESTOGENS
- Testolactone: anticoagulant effect of phenindione enhanced by • TESTOLACTONE
- Testosterone: anticoagulant effect of phenindione enhanced by • TESTOSTERONE
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by • THYROID HORMONES
- Vitamins: anticoagulant effect of phenindione antagonised by • VITAMIN K

Phenobarbital

- Alcohol: increased sedative effect when phenobarbital given with ALCOHOL
- · Aminophylline: phenobarbital accelerates metabolism of • AMINOPHYLLINE (reduced effect)
- Analgesics: phenobarbital reduces plasma concentration of METHADONE; phenobarbital possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- · Anthelmintics: phenobarbital reduces plasma concentration of ALBENDAZOLE and ● PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections
- Anti-arrhythmics: phenobarbital accelerates metabolism of DISOPYRAMIDE (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of • DRONEDARONE avoid concomitant use; phenobarbital possibly accelerates metabolism of PROPAFENONE
- Antibacterials: phenobarbital accelerates metabolism of METRONIDAZOLE (reduced effect); phenobarbital possibly reduces plasma concentration of RIFAMPICIN; phenobarbital accelerates metabolism of DOXYCYCLINE (reduced plasma concentration); phenobarbital possibly accelerates metabolism of • CHLORAMPHENICOL (reduced plasma concentration); phenobarbital reduces plasma concentration of • TELITHROMYCIN (avoid during and for 2 weeks after phenobarbital)
- · Anticoagulants: phenobarbital possibly reduces plasma concentration of • APIXABAN; phenobarbital accelerates metabolism of • COUMARINS (reduced anticoagulant effect): phenobarbital possibly reduces plasma concentration of • RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: phenobarbital possibly reduces plasma concentration of REBOXETINE; phenobarbital reduces plasma concentration of PAROXETINE; phenobarbital accelerates metabolism of • MIANSERIN (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered); plasma concentration of phenobarbital possibly reduced by • ST JOHN'S WORT—avoid concomitant use; phenobarbital possibly accelerates metabolism of • TRICYCLICS (reduced plasma concentration)
- · Antiepileptics: plasma concentration of phenobarbital possibly increased by CARBAMAZEPINE; phenobarbital possibly reduces plasma concentration of ETHOSUXIMIDE, RUFINAMIDE and TOPIRAMATE; plasma concentration of phenobarbital often increased by FOSPHENYTOIN and PHENYTOIN, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; phenobarbital reduces plasma concentration of LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of phenobarbital increased by OXCARBAZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital increased by SODIUM VALPROATE and VALPROIC ACID (also plasma concentration of sodium valproate and valproic acid reduced); plasma concentration of phenobarbital increased by • STIRIPENTOL
- · Antifungals: phenobarbital possibly reduces plasma concentration of ITRACONAZOLE and ● POSACONAZOLE;

Phenobarbital

- · Antifungals (continued)
 - phenobarbital possibly reduces plasma concentration of
 VORICONAZOLE—avoid concomitant use; phenobarbital reduces absorption of GRISEOFULVIN (reduced effect)
- Antimalarials: avoidance of phenobarbital advised by manufacturer of ARTENIMOL WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered); phenobarbital accelerates metabolism of HALOPERIDOL (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with CHLORPROMAZINE; phenobarbital possibly reduces plasma concentration of ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenobarbital possibly reduces plasma concentration of CLOZAPINE; phenobarbital possibly reduces plasma concentration of LURASIDONE—avoid concomitant use
- Antivirals: phenobarbital possibly reduces plasma concentration of ABACAVIR, DARUNAVIR, FOSAMPRENAVIR,
 INDINAVIR, LOPINAVIR and SAQUINAVIR; avoidance of phenobarbital advised by manufacturer of BOCEPREVIR and
 RILPIVIRINE (plasma concentration of boceprevir and rilpivirine possibly reduced); phenobarbital possibly reduces plasma concentration of DACLATASVIR and SIMEPREVIR manufacturer of daclatasvir and simeprevir advises avoid concomitant use; avoidance of phenobarbital advised by

manufacturer of DOLUTEGRAVIR, • ELVITEGRAVIR, ETRAVIRINE,

- SOFOSBUVIR and TELAPREVIR

 Anxiolytics and Hypnotics: increased sedative effect when phenobarbital given with ANXIOLYTICS AND HYPNOTICS; phenobarbital often reduces plasma concentration of CLONAZEPAM
- Aprepitant: phenobarbital possibly reduces plasma concentration of APREPITANT
- Avanafil: phenobarbital possibly reduces plasma concentration of AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: phenobarbital possibly reduces plasma concentration of PROPRANOLOL
- Caffeine citrate: effects of phenobarbital possibly antagonised by CAFFEINE CITRATE
- Calcium-channel Blockers: phenobarbital probably reduces
 effects of CALCIUM-CHANNEL BLOCKERS; avoidance of
 phenobarbital advised by manufacturer of ISRADIPINE;
 avoidance of phenobarbital advised by manufacturer of
 NIMODIPINE (plasma concentration of nimodipine reduced)
- Cannabis Extract: phenobarbital possibly reduces plasma concentration of ● CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Ciclosporin: phenobarbital accelerates metabolism of
- CICLOSPORIN (reduced plasma concentration)
- Cobicistat: phenobarbital possibly reduces plasma concentration of ◆ COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: phenobarbital accelerates metabolism of
 CORTICOSTEROIDS (reduced effect)
- Cytotoxics: phenobarbital possibly decreases plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); phenobarbital possibly reduces plasma concentration of BORTEZOMIB, BOSUTINIB, CRIZOTINIB and PONATINIB—manufacturer of bortezomib, bosutinib, crizotinib and ponatinib advises avoid concomitant use; phenobarbital possibly reduces plasma concentration of CABOZANTINIB—avoid concomitant use; avoidance of phenobarbital advised by manufacturer of CABAZITAXEL, DABRAFENIB and GEFITINIB; avoidance of phenobarbital advised by manufacturer of DASATINIB and VANDETANIB (plasma concentration of dasatinib and vandetanib possibly reduced); phenobarbital possibly reduces plasma

concentration of ETOPOSIDE; phenobarbital reduces plasma

manufacturer of procarbazine advises possible increased risk

concentration of IRINOTECAN and its active metabolite;

Phenobarbital

ANHYDRASE INHIBITORS

- Cytotoxics (continued)
 of hypersensitivity reactions when phenobarbital given with
 PROCARBAZINE
- Diuretics: phenobarbital reduces plasma concentration of
 EPLERENONE—avoid concomitant use; increased risk of
 osteomalacia when phenobarbital given with CARBONIC
- Folates: plasma concentration of phenobarbital possibly reduced by FOLATES
- Fosaprepitant: phenobarbital possibly reduces plasma concentration of FOSAPREPITANT
- Hormone Antagonists: phenobarbital possibly reduces plasma concentration of ● ABIRATERONE—manufacturer of abiraterone advises avoid concomitant use; phenobarbital accelerates metabolism of TOREMIFENE (reduced plasma concentration)
- Ivacaftor: phenobarbital possibly reduces plasma concentration of • IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use
- Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of MONTELUKAST
- Oestrogens: phenobarbital accelerates metabolism of
 OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Progestogens: phenobarbital accelerates metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see
 Contraceptive Interactions in BNF)
- Roflumilast: phenobarbital possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sodium Oxybate: avoidance of phenobarbital advised by manufacturer of SODIUM OXYBATE
- Sympathomimetics: plasma concentration of phenobarbital possibly increased by METHYLPHENIDATE
- Tacrolimus: phenobarbital reduces plasma concentration of
- Theophylline: phenobarbital accelerates metabolism of
 THEOPHYLLINE (reduced effect)
- ► Thyroid Hormones: phenobarbital accelerates metabolism of THYROID HORMONES (may increase requirements for thyroid hormones in hypothyroidism)
- Ticagrelor: phenobarbital possibly reduces plasma concentration of TICAGRELOR
- Ulipristal: avoidance of phenobarbital advised by manufacturer of • ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vitamins: phenobarbital possibly increases requirements for ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D

Phenothiazines see Antipsychotics Phenoxybenzamine see Alpha-blockers Phenoxymethylpenicillin see Penicillins Phentolamine see Alpha-blockers Phenylephrine see Sympathomimetics

Phenytoin

- Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of ALCOHOL
- Aminophylline: plasma concentration of both drugs reduced when phenytoin given with • AMINOPHYLLINE
- Analgesics: excretion of phenytoin possibly reduced by ACEMETACIN (increased risk of toxicity); phenytoin possibly accelerates metabolism of FENTANYL (reduced effect); phenytoin accelerates metabolism of METHADONE (reduced effect and risk of withdrawal effects); phenytoin possibly increases risk of • PETHIDINE toxicity; effects of phenytoin enhanced by ASPIRIN; phenytoin possibly accelerates

Phenytoin

- Analgesics (continued) metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- ► Antacids: absorption of phenytoin reduced by ANTACIDS
- Anthelmintics: phenytoin reduces plasma concentration of
 ◆ ALBENDAZOLE and ◆ PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections; plasma concentration of phenytoin possibly increased by LEVAMISOLE
- Anti-arrhythmics: metabolism of phenytoin inhibited by
 AMIODARONE (increased plasma concentration); phenytoin reduces plasma concentration of DISOPYRAMIDE; phenytoin possibly reduces plasma concentration of DRONEDARONE—avoid concomitant use
- Antibacterials: metabolism of phenytoin inhibited by CLARITHROWICIN (increased plasma concentration); metabolism of phenytoin possibly inhibited by METRONIDAZOLE (increased plasma concentration); plasma concentration of phenytoin increased or decreased by CIPROFLOXACIN; phenytoin accelerates metabolism of DOXYCYCLINE (reduced plasma concentration); phenytoin possibly reduces plasma concentration of • BEDAQUILINE manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of phenytoin increased by
 - CHLORAMPHENICOL (increased risk of toxicity); metabolism of phenytoin possibly inhibited by ISONIAZID (increased risk of toxicity); metabolism of phenytoin accelerated by
 - RIFAMYCINS (reduced plasma concentration); plasma concentration of phenytoin possibly increased by SULFONAMIDES; phenytoin reduces plasma concentration of
 - TELITHROMYCIN (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by
- TRIMETHOPRIM (also increased antifolate effect)
- Anticoagulants: phenytoin possibly reduces plasma concentration of ◆ APIXABAN; phenytoin accelerates metabolism of ◆ COUMARINS (possibility of reduced anticoagulant effect, but enhancement also reported); phenytoin possibly reduces plasma concentration of DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use; phenytoin possibly reduces plasma concentration of ◆ RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: plasma concentration of phenytoin increased by FLUOXETINE and FLUVOXAMINE; phenytoin reduces plasma concentration of MIANSERIN, MIRTAZAPINE and PAROXETINE; plasma concentration of phenytoin possibly increased by SETRALINE, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered); plasma concentration of phenytoin possibly reduced by ST JOHN'S WORT—avoid concomitant use; phenytoin possibly reduces plasma concentration of TRICYCLICS
 Antidiabetics: plasma concentration of phenytoin transiently
- Antidiabetics: plasma concentration of phenytoin transiently increased by TOLBUTAMIDE (possibility of toxicity)
- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with CARBAMAZEPINE, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of ESLICARBAZEPINE, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by
 ETHOSUXIMIDE, also plasma concentration of ethosuximide
- PENOSDAMBLE, AISO PLASIBLE CONCENTRATION OF CHORSMAINE PROSSIBLY REQUEST, SAND PLASMA CONCENTRATION OF CONCENTRATION OF CONCENTRATION OF LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of phenytoin increased by OXCARBAZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin reduces plasma concentration of ●PERAMPANEL (see under Perampanel, p. 398); phenytoin often increases plasma concentration of PHENOBARBITAL and PRIMIDONE, plasma concentration of Phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of RETIGABINE;

Phenytoin

Antiepileptics (continued)

phenytoin possibly reduces plasma concentration of RUFINAMIDE, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased or possibly reduced when given with SODIUM VALPROATE and VALPROIC ACID, also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of phenytoin increased by • STIRIPENTOL; plasma concentration of phenytoin increased by • TOPIRAMATE (also plasma concentration of phenytoin reduced by VIGABATRIN

- Antifungals: phenytoin reduces plasma concentration of

 ★ETOCONAZOLE and ◆ POSACONAZOLE; anticonvulsant effect of phenytoin enhanced by ◆ MicONAZOLE (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by ◆ FLUCONAZOLE (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of ◆ ITRACONAZOLE—avoid concomitant use; plasma concentration of phenytoin increased by ◆ VORICONAZOLE, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of CASPOFUNGIN—consider increasing dose of caspofungin
- Antimalarials: avoidance of phenytoin advised by manufacturer of ARTENIMOL WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE; anticonvulsant effect of phenytoin antagonised by
 PYRIMETHAMINE, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ◆ ANTIPSYCHOTICS (convulsive threshold lowered); phenytoin reduces plasma concentration of HALOPERIDOL; plasma concentration of phenytoin possibly increased or decreased by CHLORPROMAZINE; phenytoin possibly reduces plasma concentration of ◆ ARPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenytoin accelerates metabolism of CLOZAPINE and QUETIAPINE (reduced plasma concentration); phenytoin possibly reduces plasma concentration of ◆ LURASIDONE—avoid concomitant use
- Antivirals: phenytoin possibly reduces plasma concentration of ABACAVIR, DARUNAVIR, LOPINAVIR and SAQUINAVIR; avoidance of phenytoin advised by manufacturer of • BOCEPREVIR and • RILPIVIRINE (plasma concentration of boceprevir and rilpivirine possibly reduced); phenytoin possibly reduces plasma concentration of • DACLATASVIR and • SIMEPREVIR-manufacturer of daclatasvir and simeprevir advises avoid concomitant use; avoidance of phenytoin advised by manufacturer of DOLUTEGRAVIR, • ELVITEGRAVIR, ETRAVIRINE, SOFOSBUVIR and • TELAPREVIR; phenytoin possibly reduces plasma concentration of • INDINAVIR, also plasma concentration of phenytoin possibly increased; phenytoin possibly reduces plasma concentration of RITONAVIR, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by ZIDOVUDINE
- Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of CLOMAZEPAM; plasma concentration of phenytoin increased or decreased by DIAZEPAM; plasma concentration of phenytoin possibly increased or decreased by BENZODIAZEPINES
- Aprepitant: phenytoin possibly reduces plasma concentration of APREPITANT
- Bupropion: phenytoin reduces plasma concentration of BUPROPION
- Caffeine citrate: phenytoin reduces plasma concentration of CAFFEINE CITRATE
- Calcium-channel Blockers: phenytoin reduces effects of FELODIPINE and VERAPAMIL; avoidance of phenytoin advised by manufacturer of ISRADIPINE; avoidance of phenytoin advised by manufacturer of NIMODIPINE (plasma concentration of nimodipine possibly reduced); plasma

Phenytoin

- Calcium-channel Blockers (continued) concentration of phenytoin increased by ● DILTIAZEM but also effect of diltiazem reduced
- Cannabis Extract: phenytoin possibly reduces plasma concentration of ● CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Cardiac Glycosides: phenytoin possibly reduces plasma concentration of DIGOXIN
- Ciclosporin: phenytoin accelerates metabolism of
- CICLOSPORIN (reduced plasma concentration)
- Cobicistat: phenytoin possibly reduces plasma concentration of • COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: phenytoin accelerates metabolism of
 CORTICOSTEROIDS (reduced effect)
- Cytotoxics: phenytoin possibly reduces plasma concentration
 of BUSULFAN, ERIBULIN and ETOPOSIDE; metabolism of
 phenytoin possibly inhibited by CAPECITABINE, FLUORGURACIL
 and TEGAFUR (increased risk of toxicity); phenytoin increases
 antifolate effect of METHOTREXATE; plasma concentration of
 phenytoin possibly reduced by CISPLATIN; phenytoin possibly
 decreases plasma concentration of AXITINIB (increase dose of
 axitinib—consult axitinib product literature); phenytoin
 possibly reduces plasma concentration of BORTEZOMIB,
- BOSUTINIB, CRIZOTINIB, IBRUTINIB, IDELALISIB and PONATINIB—manufacturer of bortezomib, bosutinib, crizotinib, ibrutinib, idelalisib and ponatinib advises avoid concomitant use; phenytoin possibly reduces plasma concentration of CABOZANTINIB—avoid concomitant use; avoidance of phenytoin advised by manufacturer of
- PROCARBAZINE

 Dexrazoxane: absorption of phenytoin possibly reduced by
- Diazoxide: plasma concentration of phenytoin reduced by DIAZOXIDE, also effect of diazoxide may be reduced
- . Disulfiram: metabolism of phenytoin inhibited by
- DISULFIRAM (increased risk of toxicity)

DEXRAZOXANE

- Diuretics: plasma concentration of phenytoin possibly increased by • ACETAZOLAMIDE; phenytoin antagonises effects of FUROSEMIDE; phenytoin reduces plasma concentration of
- EPLERENONE—avoid concomitant use; increased risk of osteomalacia when phenytoin given with CARBONIC ANHYDRASE INHIBITORS
- ► Dopaminergics: phenytoin possibly reduces effects of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA
- Enteral Foods: absorption of phenytoin possibly reduced by ENTERAL FEEDS
- Folates: plasma concentration of phenytoin possibly reduced by FOLATES
- Fosaprepitant: phenytoin possibly reduces plasma concentration of FOSAPREPITANT
- Hormone Antagonists: phenytoin possibly reduces plasma concentration of ● ABIRATERONE—manufacturer of abiraterone advises avoid concomitant use; phenytoin possibly accelerates metabolism of TOREMIFENE
- 5HT₃-receptor Antagonists: phenytoin accelerates metabolism of ONDANSETRON (reduced effect)
- Ivacaftor: phenytoin possibly reduces plasma concentration of
 IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use
- Leflunomide: plasma concentration of phenytoin possibly increased by LEFLUNOMIDE
- Lipid-regulating Drugs: absorption of phenytoin possibly reduced by COLESEVELAM; combination of phenytoin with FLUVASTATIN may increase plasma concentration of either drug (or both)

Phenytoin (continued)

- Lithium: neurotoxicity may occur when phenytoin given with LITHIUM without increased plasma concentration of lithium
- Macitentan: avoidance of phenytoin advised by manufacturer of MACITENTAN
- Modafinil: plasma concentration of phenytoin possibly increased by MODAFINIL
- Muscle Relaxants: long-term use of phenytoin reduces effects of
 NON-DEPOLARISING MUSCLE RELAXANTS (but acute use of phenytoin might increase effects of non-depolarising muscle relaxants)
- Oestrogens: phenytoin accelerates metabolism of
 OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Progestogens: phenytoin accelerates metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see
 Contraceptive Interactions in BNF)
- Roflumilast: phenytoin possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sulfinpyrazone: plasma concentration of phenytoin increased by SulFinpyrazone
- Sympathomimetics: plasma concentration of phenytoin increased by METHYLPHENIDATE
- ► Tacrolimus: phenytoin reduces plasma concentration of TACROLIMUS, also plasma concentration of phenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when phenytoin given with THEOPHYLLINE
- Thyroid Hormones: phenytoin accelerates metabolism of THYROID HORMONES (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
- ▶ Tibolone: phenytoin accelerates metabolism of TIBOLONE
- Ticagrelor: phenytoin possibly reduces plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: metabolism of phenytoin inhibited by
 CIMETIDINE (increased plasma concentration); effects of phenytoin enhanced by ESOMEPRAZOLE; effects of phenytoin possibly enhanced by OMEPRAZOLE; absorption of phenytoin reduced by SUCRALFATE
- Ulipristal: avoidance of phenytoin advised by manufacturer of
 ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vaccines: effects of phenytoin enhanced by INFLUENZA VACCINE
- Vitamins: phenytoin possibly increases requirements for ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D

Pholcodine

 Antidepressants: manufacturer of pholcodine advises avoid for 2 weeks after stopping MAOIs

Phosphodiesterase Type-3 Inhibitors

 Anagrelide: avoidance of enoximone and milrinone advised by manufacturer of ● ANAGRELIDE

Pilocarpine see Parasympathomimetics

Pimozide see Antipsychotics

Pindolol see Beta-blockers

Pioglitazone see Antidiabetics

Piperacillin see Penicillins

Piperaquine see Artenimol with Piperaquine

Pipotiazine see Antipsychotics

Pirfenidone

- Antibacterials: plasma concentration of pirfenidone increased by • CIPROFLOXACIN—see under Pirfenidone, p. 260
- Antidepressants: plasma concentration of pirfenidone increased by • FLUVOXAMINE—manufacturer of pirfenidone advises avoid concomitant use
- ► Grapefruit Juice: manufacturer of pirfenidone advises avoid concomitant use with GRAPEFRUIT JUICE

Piroxicam see NSAIDs

Pivmecillinam see Penicillins

Pixantrone

- Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when pixantrone given with live • VACCINES—avoid concomitant use

Pizotifen

 Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of ADRENERGIC NEURONE BLOCKERS

Platinum Compounds

- Aldesleukin: avoidance of cisplatin advised by manufacturer of
 ALDESLEUKIN
- Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with
- AMINOGLYCOSIDES or POLYMYXINS; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with CAPREOMYCIN; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with VANCOMYCIN
- Antiepileptics: cisplatin possibly reduces plasma concentration of FOSPHENYTOIN and PHENYTOIN
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: increased risk of otoxicity when cisplatin given with IFOSFAMIDE; increased pulmonary toxicity when cisplatin given with • BLEOMYCIN and • METHOTREXATE
- Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with DIURETICS

Pneumococcal Vaccine see Vaccines

Poliomyelitis Vaccine see Vaccines

Polymyxins

- Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with AMINOGLYCOSIDES; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with CAPREOMYCIN; increased risk of nephrotoxicity when polymyxins given with VANCOMYCIN; increased risk of nephrotoxicity and totoxicity when colistimethate sodium given with VANCOMYCIN
- Antifungals: increased risk of nephrotoxicity when polymyxins given with AMPHOTERICIN
- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with • CICLOSPORIN
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with • PLATINUM COMPOUNDS
- Diuretics: increased risk of otoxicity when polymyxins given with • LOOP DIURETICS
- · Parasympathomimetics: polymyxins antagonise effects of
- NEOSTIGMINE and PYRIDOSTIGMINE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Polysaccharide-iron Complex see Iron salts

Polystyrene Sulfonate Resins

- Antacids: risk of intestinal obstruction when polystyrene sulfonate resins given with ALUMINIUM HYDROXIDE; risk of metabolic alkalosis when polystyrene sulfonate resins given with ORAL MAGNESIUM SALTS
- Thyroid Hormones: polystyrene sulfonate resins reduce absorption of LEVOTHYROXINE

Pomalidomide

 Antidepressants: plasma concentration of pomalidomide increased by • FLUVOXAMINE

Ponatinih

 Antibacterials: plasma concentration of ponatinib possibly increased by CLARITHROMYCIN and TELITHROMYCIN—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); plasma concentration of ponatinib possibly reduced by RIFABUTIN—manufacturer of ponatinib advises avoid concomitant use; plasma concentration of ponatinib reduced by • RIFAMPICIN—manufacturer of ponatinib advises avoid concomitant use

Ponatinib (continued)

- Antidepressants: plasma concentration of ponatinib possibly reduced by ST JOHN'S WORT—manufacturer of ponatinib advises avoid concomitant use
- Antiepileptics: plasma concentration of ponatinib possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of ponatinib advises avoid concomitant use
- Antifungals: plasma concentration of ponatinib increased by KETOCONAZOLE; plasma concentration of ponatinib possibly increased by ITRACONAZOLE and VORICONAZOLE—consider reducing initial dose of ponatinib (see under Ponatinib, n. 814)
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of ponatinib possibly increased by INDINAVIR, RITONAVIR and SAQUINAVIR—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814)
- ▶ Grapefruit Juice: plasma concentration of ponatinib possibly increased by GRAPEFRUIT JUICE

Posaconazole *see* Antifungals, Triazole **Potassium Canrenoate** *see* Diuretics

Potassium Aminobenzoate

 Antibacterials: potassium aminobenzoate inhibits effects of SULFONAMIDES

Potassium Bicarbonate see Potassium Salts

Potassium Chloride see Potassium Salts

Potassium Citrate see Potassium Salts

Potassium Salts

NOTE Includes salt substitutes

- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with • ACE INHIBITORS
- Aliskiren: increased risk of hyperkalaemia when potassium salts given with ALISKIREN
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with
- ANGIOTENSIN-II RECEPTOR ANTAGONISTS
 Antibacterials: avoid concomitant use of potassium citrate
- with METHENAMINE

 Ciclosporin: increased risk of hyperkalaemia when potassium salts given with CICLOSPORIN
- Diuretics: increased risk of hyperkalaemia when potassium salts given with ● POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Tacrolimus: increased risk of hyperkalaemia when potassium salts given with ● TACROLIMUS
- Ulcer-healing Drugs: avoidance of potassium citrate advised by manufacturer of SUCRALFATE

Pramipexole

- Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of ANTIPSYCHOTICS (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Ulcer-healing Drugs: excretion of pramipexole reduced by CIMETIDINE (increased plasma concentration)

Prasugrel

- Analgesics: possible increased risk of bleeding when prasugrel given with $\ensuremath{\mathsf{NSAIDs}}$
- Anticoagulants: possible increased risk of bleeding when prasugrel given with COUMARINS OF PHENINDIONE
- Clopidogrel: possible increased risk of bleeding when prasugrel given with CLOPIDOGREL

Pravastatin see Statins

Praziquantel

- Antibacterials: plasma concentration of praziquantel reduced by

 RIFAMPICIN—avoid concomitant use
- Antiepileptics: plasma concentration of praziquantel reduced by ● CARBAMAZEPINE, ● FOSPHENYTOIN, ● PHENOBARBITAL,
 - PHENYTOIN and PRIMIDONE—consider increasing
- praziquantel dose when given for systemic infections

 Antifungals: plasma concentration of praziquantel increased by KETOCONAZOLE

Praziguantel (continued)

- Antimalarials: plasma concentration of praziquantel reduced by • CHLOROQUINE—consider increasing praziquantel dose when given for systemic infections
- Corticosteroids: plasma concentration of praziquantel possibly reduced by continuous use of DEXAMETHASONE
- Grapefruit Juice: plasma concentration of praziquantel increased by GRAPEFRUIT JUICE
- Ulcer-healing Drugs: plasma concentration of praziquantel increased by CIMETIDINE

Prazosin see Alpha-blockers

Prednisolone see Corticosteroids **Prednisone** see Corticosteroids

Pregabalin

- Antidepressants: anticonvulsant effect of antiepileptics
 possibly antagonised by MAOIs and •TRICYCLIC-RELATED
 ANTIDEPRESSANTS (convulsive threshold lowered);
 anticonvulsant effect of antiepileptics antagonised by •SSRIS
 and •TRICYCLICS (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Prilocaine

- Anti-arrhythmics: increased myocardial depression when prilocaine given with ANTI-ARRHYTHMICS
- Antibacterials: increased risk of methaemoglobinaemia when prilocaine given with SULFONAMIDES

Primaguine

- Antimalarials: avoidance of antimalarials advised by manufacturer of ◆ ARTEMETHER WITH LUMEFANTRINE
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Mepacrine: plasma concentration of primaquine increased by MEPACRINE (increased risk of toxicity)
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Primidone

- ► Alcohol: increased sedative effect when primidone given with
- Aminophylline: primidone accelerates metabolism of
 AMINOPHYLLINE (reduced effect)
- ► Analgesics: primidone reduces plasma concentration of METHADONE; primidone possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- Anthelmintics: primidone reduces plasma concentration of
 ALBENDAZOLE and PRAZIQUANTEL —consider increasing albendazole and praziquantel dose when given for systemic infections
- Anti-arrhythmics: primidone accelerates metabolism of DISOPYRAMIDE (reduced plasma concentration); primidone possibly reduces plasma concentration of ◆ DRONEDARONE avoid concomitant use; primidone possibly accelerates metabolism of PROPAFENONE
- Antibacterials: primidone accelerates metabolism of METRONIDAZOLE (reduced effect); primidone possibly reduces plasma concentration of RIFAMPICIN; primidone accelerates metabolism of DOXYCYCLINE (reduced plasma concentration); primidone possibly accelerates metabolism of
- CHLORAMPHENICOL (reduced plasma concentration); primidone reduces plasma concentration of • TELITHROMYCIN (avoid during and for 2 weeks after primidone)
- Anticoagulants: primidone possibly reduces plasma concentration of ● APIXABAN; primidone accelerates metabolism of ● COUMARINS (reduced anticoagulant effect); primidone possibly reduces plasma concentration of
- RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: primidone possibly reduces plasma concentration of REBOXETINE; primidone reduces plasma concentration of PAROXETINE; primidone accelerates metabolism of • MIANSERIN (reduced plasma concentration);

Primidone

- Antidepressants (continued)
 anticonvulsant effect of antiepileptics possibly antagonised
 by MAOIS and TRICYCLIC-RELATED ANTIDEPRESSANTS
 (convulsive threshold lowered); anticonvulsant effect of
 antiepileptics antagonised by SSRIS and TRICYCLICS
 (convulsive threshold lowered); plasma concentration of
 primidone possibly reduced by ST JOHN'S WORT—avoid
 concomitant use; primidone possibly accelerates metabolism
 of TRICYCLICS (reduced plasma concentration)
- Antiepileptics: plasma concentration of primidone possibly increased by CARBAMAZEPINE; primidone possibly reduces plasma concentration of ETHOSUXIMIDE, RUFINAMIDE and TOPIRAMATE; plasma concentration of primidone often increased by FOSPHENYTOIN and PHENYTOIN, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; primidone reduces plasma concentration of LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of primidone increased by OXCARBAZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of primidone increased by SODIUM VALPROATE and VALPROIC ACID (also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of primidone increased by STIRIPENTOL
- Antifungals: primidone possibly reduces plasma concentration
 of ITRACONAZOLE and POSACONAZOLE; primidone possibly
 reduces plasma concentration of VORICONAZOLE—avoid
 concomitant use; primidone reduces absorption of
 GRISEOFULVIN (reduced effect)
- Antimalarials: avoidance of primidone advised by manufacturer of ARTENIMOL WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by ● MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ◆ANTIPSYCHOTICS (convulsive threshold lowered); primidone accelerates metabolism of HALOPERIDOL (reduced plasma concentration); plasma concentration of both drugs reduced when primidone given with CHLORPROMAZINE; primidone possibly reduces plasma concentration of ◆ARPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); primidone possibly reduces plasma concentration of CLOZAPINE; primidone possibly reduces plasma concentration of ◆LURASIDONE—avoid concomitant use
- Antivirals: primidone possibly reduces plasma concentration of ABACAVIR, DARUNAVIR, FOSAMPRENAVIR, • INDINAVIR,
- LOPINAVIR and SAQUINAVIR; avoidance of primidone advised by manufacturer of BOCEPREVIR and RILEPIVIRINE (plasma concentration of boceprevir and rilpivirine possibly reduced); primidone possibly reduces plasma concentration of DACLATASVIR and SIMEPREVIR manufacturer of daclatasvir and simeprevir advises avoid concomitant use; avoidance of primidone advised by manufacturer of DOLUTEGRAVIR, ELVITEGRAVIR, ETRAVIRINE, SOFOSBUVIR and TELAPREVIR
- Anxiolytics and Hypnotics: increased sedative effect when primidone given with ANXIOLYTICS AND HYPNOTICS; primidone often reduces plasma concentration of CLONAZEPAM
- Aprepitant: primidone possibly reduces plasma concentration of APREPITANT
- Avanafil: primidone possibly reduces plasma concentration of AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: primidone possibly reduces plasma concentration of PROPRANOLOL
- Caffeine citrate: effects of primidone possibly antagonised by CAFFEINE CITRATE
- Calcium-channel Blockers: primidone probably reduces effects
 of ◆ CALCIUM-CHANNEL BLOCKERS; avoidance of primidone
 advised by manufacturer of ISRADIPINE; avoidance of
 primidone advised by manufacturer of ◆ NIMODIPINE (plasma
 concentration of nimodipine reduced)
- Cannabis Extract: primidone possibly reduces plasma concentration of CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use

Primidone (continued)

PROCARBAZINE

- · Ciclosporin: primidone accelerates metabolism of
- CICLOSPORIN (reduced plasma concentration)
- Corticosteroids: primidone accelerates metabolism of
 - CORTICOSTEROIDS (reduced effect)
- Cytotoxics: primidone possibly decreases plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); primidone possibly reduces plasma concentration of BORTEZOMIB, BOSUTINIB, CRIZOTINIB and PONATINIB—manufacturer of bortezomib, bosutinib, crizotinib and ponatinib advises avoid concomitant use; primidone possibly reduces plasma concentration of
- Diuretics: primidone reduces plasma concentration of
 EPLERENONE—avoid concomitant use; increased risk of osteomalacia when primidone given with CARBONIC ANHYDRASE INHIBITORS
- Folates: plasma concentration of primidone possibly reduced by FOLATES
- Fosaprepitant: primidone possibly reduces plasma concentration of FOSAPREPITANT
- Hormone Antagonists: primidone possibly reduces plasma concentration of

 ABIRATERONE—manufacturer of abiraterone advises avoid concomitant use; primidone accelerates metabolism of TOREMIFENE (reduced plasma concentration)
- Ivacaftor: primidone possibly reduces plasma concentration of
 IVACAFTOR—manufacturer of ivacaftor advises avoid
- concomitant use
- Leukotriene Receptor Antagonists: primidone reduces plasma concentration of MONTELUKAST
- Oestrogens: primidone accelerates metabolism of
 OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Progestogens: primidone accelerates metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives.
- oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)
- Roflumilast: primidone possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sodium Oxybate: avoidance of primidone advised by manufacturer of SODIUM OXYBATE
- Sympathomimetics: plasma concentration of primidone possibly increased by METHYLPHENIDATE
- Tacrolimus: primidone reduces plasma concentration of
 TACROLIMUS
- Theophylline: primidone accelerates metabolism of
- THEOPHYLLINE (reduced effect)
- ► Thyroid Hormones: primidone accelerates metabolism of THYROID HORMONES (may increase requirements for thyroid hormones in hypothyroidism)
- Ticagrelor: primidone possibly reduces plasma concentration of TICAGRELOR
- Ulipristal: avoidance of primidone advised by manufacturer of
 ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)

Primidone (continued)

 Vitamins: primidone possibly increases requirements for ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL OR VITAMIN D

Procarbazine

- Alcohol: disulfiram-like reaction when procarbazine given with ALCOHOL
- Antiepileptics: manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when given with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: procarbazine possibly reduces absorption of DIGOXIN tablets

Prochlorperazine see Antipsychotics

Procyclidine see Antimuscarinics

Progesterone see Progestogens Progestogens

- Antibacterials: plasma concentration of dienogest increased by ERYTHROMYCIN; metabolism of progestogens accelerated by or RIFAMYCINS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)
- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of COUMARINS; progestogens antagonise anticoagulant effect of ● PHENINDIONE
- Antidepressants: contraceptive effect of progestogens reduced by • ST JOHN'S WORT (avoid concomitant use)
- Antidiabetics: progestogens antagonise hypoglycaemic effect of ANTIDIABETICS
- Antiepileptics: metabolism of progestogens accelerated by
 CARBAMAZEPINE, ESLICARBAZEPINE, FOSPHENYTOIN,
- OXCARBAZEPINE, PERAMPANEL, PHENOBARBITAL,
- PHENYTOIN, PRIMIDONE, RUFINAMIDE and TOPIRAMATE (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF); desogestrel possibly increases plasma concentration of LAMOTRIGINE
- Antifungals: progestogens possibly increase plasma concentration of VORICONAZOLE; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with GRISEOFULVIN; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with TERBINAFINE
- Antivirals: plasma concentration of norethisterone increased by ATAZANAVIR; plasma concentration of drospirenone increased by BOCEPREVIR (increased risk of toxicity); contraceptive effect of progestogens possibly reduced by
 - EFAVIRENZ; plasma concentration of norgestimate increased by ELVITEGRAVIR; metabolism of progestogens accelerated by
- NEVIRAPINE (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)
- Anxiolytics and Hypnotics: progestogens possibly increase plasma concentration of CHLORDIAZEPOXIDE, DIAZEPAM and NITRAZEPAM; progestogens possibly reduce plasma concentration of LORAZEPAM, OXAZEPAM and TEMAZEPAM
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with
 APREPITANT (alternative contraception recommended)
- Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with
- BOSENTAN (alternative contraception recommended)
 Ciclosporin: progestogens possibly increase plasma
- concentration of CICLOSPORIN

 Cobicistat: plasma concentration of norgestimate increased by
 COBICISTAT

Progestogens (continued)

- Cytotoxics: possible reduction in contraceptive effect of progestogens advised by manufacturer of ● CRIZOTINIB and
 ● VEMURAFENIB; possible reduced contraceptive effect of hormonal contraceptives containing progestogens advised by manufacturer of ● DABRAFENIB (alternative contraception recommended)
- Diuretics: risk of hyperkalaemia when drospirenone given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS (monitor serum potassium during first cycle)
- Dopaminergics: progestogens increase plasma concentration of • SELEGILINE—manufacturer of selegiline advises avoid concomitant use
- Fosaprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with
 FOSAPREPITANT (alternative contraception recommended)
- Lipid-regulating Drugs: plasma concentration of norethisterone increased by ATORVASTATIN; plasma concentration of active metabolite of norgestimate increased by ROSUVASTATIN; plasma concentration of norgestrel increased by ROSUVASTATIN
- Muscle Relaxants: progestogens possibly increase plasma concentration of TIZANIDINE (increased risk of toxicity)
- Sugammadex: plasma concentration of progestogens possibly reduced by Sugammadex—manufacturer of sugammadex advises additional contraceptive precautions
- ► Teriflunomide: plasma concentration of levonorgestrel increased by TERIFLUNOMIDE
- Ulipristal: contraceptive effect of progestogens possibly reduced by • ULIPRISTAL

Proguanil

- Antacids: absorption of proguanil reduced by ORAL MAGNESIUM SALTS (as magnesium trisilicate)
- Anticoagulants: isolated reports that proguanil may enhance anticoagulant effect of WARFARIN
- Antimalarials: avoidance of antimalarials advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; increased antifolate effect when proguanil given with PYRIMETHAMINE
- Antivirals: plasma concentration of proguanil possibly affected by EFAVIRENZ
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- ► Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Promazine see Antipsychotics

Promethazine see Antihistamines

Propafenone

- ► Aminophylline: propafenone increases plasma concentration of AMINOPHYLLINE
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE OR ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when antiarrhythmics given with other • ANTI-ARRHYTHMICS
- Antibacterials: metabolism of propafenone accelerated by
 RIFAMPICIN (reduced effect)
- Anticoagulants: propafenone enhances anticoagulant effect of
 COLIMARINS
- Antidepressants: metabolism of propafenone possibly inhibited by FLUOXETINE and PAROXETINE; increased risk of arrhythmias when propafenone given with • TRICYCLICS
- Antiepileptics: metabolism of propafenone possibly accelerated by PHENOBARBITAL and PRIMIDONE
- Antihistamines: avoidance of propafenone advised by manufacturer of MIZOLASTINE (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
 ANTIPSYCHOTICS that prolong the QT interval
- Antivirals: plasma concentration of propafenone possibly increased by ● FOSAMPRENAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by ● RITONAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with ● SAQUINAVIR—avoid concomitant use; caution with

Propafenone

- Antivirals (continued) propafenone advised by manufacturer of • TELAPREVIR (risk of ventricular arrhythmias)
- Beta-blockers: increased myocardial depression when antiarrhythmics given with • BETA-BLOCKERS; propafenone increases plasma concentration of METOPROLOL and PROPRANDLOL
- Cardiac Glycosides: propafenone increases plasma concentration of ● DIGOXIN (halve dose of digoxin)
- Ciclosporin: propafenone possibly increases plasma concentration of CICLOSPORIN
- Parasympathomimetics: propafenone possibly antagonises effects of NEOSTIGMINE and PYRIDOSTIGMINE
- ► Theophylline: propafenone increases plasma concentration of THEOPHYLLINE
- Ulcer-healing Drugs: plasma concentration of propafenone increased by • CIMETIDINE

Propantheline see Antimuscarinics Propiverine see Antimuscarinics Propofol see Anaesthetics, General Propranolol see Beta-blockers

Prostaglandins

- ACE Inhibitors: enhanced hypotensive effect when alprostadil given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when alprostadil given with ALPHA-BLOCKERS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Beta-blockers: enhanced hypotensive effect when alprostadil given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when alprostadil given with CLONIDINE
- Diazoxide: enhanced hypotensive effect when alprostadil given with DIAZOXIDE
- ▶ Diuretics: enhanced hypotensive effect when alprostadil given with DURFTICS
- Methyldopa: enhanced hypotensive effect when alprostadil given with METHYLDOPA
- Moxonidine: enhanced hypotensive effect when alprostadil given with MOXONIDINE
- Nitrates: enhanced hypotensive effect when alprostadil given with NITRATES
- Oxytocin: prostaglandins potentiate uterotonic effect of
- Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Protein Kinase Inhibitors see individual drugs Proton Pump Inhibitors

- Antacids: absorption of lansoprazole possibly reduced by
- Antibacterials: plasma concentration of both drugs increased when omeprazole given with CLARITHROMYCIN
- Anticoagulants: pantoprazole might enhance the anticoagulant effect of COUMARINS; esomeprazole and omeprazole possibly enhance anticoagulant effect of COUMARINS
- Antidepressants: omeprazole increases plasma concentration of ESCITALOPRAM; plasma concentration of lansoprazole possibly increased by FLUYOXAMINE; plasma concentration of omeprazole possibly reduced by STJOHN'S WORT
- Antiepileptics: omeprazole possibly enhances effects of FOSPHENYTOIN and PHENYTOIN; esomeprazole enhances effects of • FOSPHENYTOIN and • PHENYTOIN
- Antifungals: proton pump inhibitors reduce absorption of ITRACONAZOLE and KETOCONAZOLE; esomeprazole reduces plasma concentration of ◆ POSACONAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole

Proton Pump Inhibitors

- Antifungals (continued)
- possibly reduce plasma concentration of POSACONAZOLE—manufacturer of posaconazole *suspension* advises avoid concomitant use; plasma concentration of esomeprazole possibly increased by VORICONAZOLE; plasma concentration of omeprazole increased by VORICONAZOLE (consider reducing dose of omeprazole)
- Antipsychotics: omeprazole possibly reduces plasma concentration of CLOZAPINE
- Antivirals: proton pump inhibitors reduce plasma concentration of ATAZAMAVIR—avoid or adjust dose of both drugs (consult product literature); omeprazole increases plasma concentration of RALTEGRAVIR; avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of RILPIVIRINE (plasma concentration of rilpivirine possibly reduced); omeprazole reduces plasma concentration of RILPIVIRINE—avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly increase plasma concentration of
 - SAQUINAVIR—manufacturer of saquinavir advises avoid concomitant use; omeprazole increases plasma concentration of SAQUINAVIR—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by TIPRANAVIR
- Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of DIAZEPAM (increased plasma concentration)
- Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of DIGOXIN
- Ciclosporin: omeprazole possibly affects plasma concentration of CICLOSPORIN
- Cilostazol: omeprazole increases plasma concentration of
 CILOSTAZOL (see under Cilostazol, p. 206)
- Clopidogrel: esomeprazole and omeprazole reduce antiplatelet effect of • CLOPIDOGREL; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of CLOPIDOGREL
- Cytotoxics: proton pump inhibitors possibly reduce excretion
 of METHOTREXATE (increased risk of toxicity); lansoprazole
 reduces plasma concentration of BOSUTINIS; avoidance of
 proton pump inhibitors advised by manufacturer of
 DABRAFENIB (plasma concentration of dabrafenib possibly
 reduced); avoidance of esomeprazole, lansoprazole,
 pantoprazole and rabeprazole advised by manufacturer of
- ERLOTINIB; omeprazole reduces plasma concentration of ● ERLOTINIB—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of LAPATINIB; proton pump inhibitors possibly reduce absorption of PAZOPANIB—manufacturer of pazopanib
- advises give at the same time as proton pump inhibitors

 Tacrolimus: omeprazole possibly increases plasma
 concentration of TACROLIMUS
- Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by SUCRALFATE

Pseudoephedrine see Sympathomimetics

Pyrazinamide

- Sulfinpyrazone: pyrazinamide antagonises effects of SULFINPYRAZONE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Pyridostigmine see Parasympathomimetics

Pyridoxine see Vitamins

Pyrimethamine

- Antibacterials: increased antifolate effect when pyrimethamine given with ◆ SULFONAMIDES Or ◆ TRIMETHOPRIM
- Antiepileptics: pyrimethamine antagonises anticonvulsant effect of ● FOSPHENYTOIN and ● PHENYTOIN, also increased antifolate effect
- Antimalarials: avoidance of antimalarials advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE; increased antifolate effect when pyrimethamine given with PROGUANIL
- Antivirals: increased antifolate effect when pyrimethamine given with ZIDOVUDINE

Pyrimethamine (continued)

- Cytotoxics: pyrimethamine increases antifolate effect of
 METHOTREXATE and PEMETREXED
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Quetiapine see Antipsychotics

Quinagolide

- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA

Quinapril see ACE Inhibitors

Duinine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with ● AMIODARONE—avoid concomitant use; quinine increases plasma concentration of ● FLECAINIDE
- Antibacterials: increased risk of ventricular arrhythmias when quinine given with • MOXIFLOXACIN—avoid concomitant use; plasma concentration of quinine reduced by • RIFAMPICIN
- Anticoagulants: plasma concentration of both drugs increased when quinine given with WARFARIN
- Antidepressants: possible increased risk of ventricular arrhythmias when quinine given with • CITALOPRAM or
 ESCITALOPRAM—avoid concomitant use
- Antimalarials: avoidance of antimalarials advised by
 manufacturer of ARTEMETHER WITH LUMEFANTRINE; increased
 risk of ventricular arrhythmias when quinine given with
 ARTEMETHER WITH LUMEFANTRINE; increased risk of
 convulsions when quinine given with MEFLOQUINE (but
 should not prevent the use of intravenous quinine in severe
 cases)
- Antipsychotics: increased risk of ventricular arrhythmias when quinine given with • DROPERIDOL or • PIMOZIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with • HALOPERIDOL—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with • RISPERIDONE
- Antivirals: plasma concentration of quinine possibly increased by OATAZANAVIR, OARUNAVIR, FOSAMPREMAVIR, OINDINAVIR and TIPRANAVIR (increased risk of toxicity); plasma concentration of quinine increased by RITONAVIR (increased risk of toxicity); increased risk of ventricular arrhythmias when quinine given with SAQUINAVIR—avoid concomitant use
- Cardiac Glycosides: quinine increases plasma concentration of
 DIGOXIN
- Dopaminergics: quinine possibly increases plasma concentration of AMANTADINE
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Muscle Relaxants: quinine possibly enhances effects of SUXAMETHONIUM
- ► Ulcer-healing Drugs: metabolism of quinine inhibited by CIMETIDINE (increased plasma concentration)
- ► Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Quinolones

- Aminophylline: possible increased risk of convulsions when quinolones given with • AMINOPHYLLINE; ciprofloxacin and norfloxacin increase plasma concentration of
 - AMINOPHYLLINE
- Analgesics: possible increased risk of convulsions when quinolones given with
 NSAIDS
- Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by ANTACIDS
- Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with
 - AMIODARONE—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with
 DISOPYRAMIDE—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with parenteral • ERYTHROMYCIN—avoid concomitant use; ciprofloxacin possibly increases plasma

Ouinolones

- Antibacterials (continued)
 - concentration of BEDAQUILINE—avoid concomitant use if ciprofloxacin given for more than 14 days; avoidance of moxifloxacin advised by manufacturer of BEDAQUILINE; increased risk of ventricular arrhythmias when moxifloxacin given with DELAMANID; effects of nalidixic acid possibly antagonised by NITROFURANTOIN; possible increased risk of ventricular arrhythmias when moxifloxacin given with
- TELITHROMYCIN
- Anticoagulants: nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of • COUMARINS; ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of COUMARINS; levofloxacin possibly enhances anticoagulant effect of PHENINDIONE
- Antidepressants: avoidance of moxifloxacin advised by
 manufacturer of ◆ CITALOPRAM and ◆ ESCITALOPRAM (risk of
 ventricular arrhythmias); ciprofloxacin inhibits metabolism
 of ◆ DULOXETINE—avoid concomitant use; avoidance of
 ciprofloxacin advised by manufacturer of ◆ AGOMELATINE;
 increased risk of ventricular arrhythmias when moxifloxacin
 given with ◆ TRICYCLICS—avoid concomitant use
- Antidiabetics: norfloxacin possibly enhances effects of GLIBENCLAMIDE
- Antiepileptics: ciprofloxacin increases or decreases plasma concentration of FOSPHENYTOIN and PHENYTOIN
- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with • MIZOLASTINE—avoid concomitant
- Antimalarials: avoidance of quinolones advised by
 manufacturer of ◆ ARTEMETHER WITH LUMEFANTRINE; avoidance
 of moxifloxacin advised by manufacturer of ◆ ARTEMIMOL WITH
 PIPERAQUINE (possible risk of ventricular arrhythmias);
 increased risk of ventricular arrhythmias when moxifloxacin
 given with ◆ CHLOROQUINE, HYDROXYCHLOROQUINE,
 MEFLOQUINE or ◆ QUININE—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when
 moxifloxacin given with BENPERIDOL —manufacturer of
 benperidol advises avoid concomitant use; increased risk of
 ventricular arrhythmias when moxifloxacin given with
- ◆ DROPERIDOL, ◆ HALOPERIDOL, ◆ PHENOTHIAZINES, ◆ PIMOZIDE or ◆ ZUCLOPENTHIXOL—avoid concomitant use; ciprofloxacin increases plasma concentration of CLOZAPINE; ciprofloxacin possibly increases plasma concentration of OLANZAPINE
- Antivirals: manufacturer of norfloxacin advises give DIDANOSINE at least 2 hours before or after norfloxacin; increased risk of ventricular arrhythmias when moxifloxacin given with • SAQUINAVIR—avoid concomitant use
- Anxiolytics and Hypnotics: avoidance of ciprofloxacin advised by manufacturer of ZOLPIDEM
- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with • ATOMOXETINE
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with • SOTALOL—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by CALCIUM
 CALCIUM
- Ciclosporin: increased risk of nephrotoxicity when quinolones given with • CICLOSPORIN
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of ● CLOPIDOGREL
- Cytotoxics: nalidixic acid increases risk of MELPHALAN toxicity; ciprofloxacin possibly reduces excretion of METHOTREXATE (increased risk of toxicity); possible increased risk of
- ventricular arrhythmias when moxifloxacin given with

 BOSUTINIB; ciprofloxacin possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ciprofloxacin increases plasma concentration of ERLOTINIB; ciprofloxacin possibly increases the plasma concentration of
- elbrutinib reduce dose of ibrutinib (see under ibrutinib, p. 809); possible increased risk of ventricular arrhythmias when moxifloxacin given with ◆ VANDETANIB—avoid concomitant use; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with ◆ ARSENIC TRIONIE

Quinolones (continued)

- Dairy Products: absorption of ciprofloxacin and norfloxacin reduced by DAIRY PRODUCTS
- Dopaminergics: ciprofloxacin increases plasma concentration of RASAGILINE; ciprofloxacin inhibits metabolism of ROPINIROLE (increased plasma concentration)
- SHT₁-receptor Agonists: quinolones possibly inhibit metabolism of ZOLMITRIPTAN (reduce dose of zolmitriptan)
- Iron Salts: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by oral IRON SALTS; absorption of norfloxacin reduced by oral IRON SALTS (give at least 2 hours apart)
- Lanthanum: absorption of quinolones possibly reduced by LANTHANUM (give at least 2 hours before or 4 hours after lanthanum)
- Muscle Relaxants: ciprofloxacin increases plasma concentration of ● TIZANIDINE (increased risk of toxicity) avoid concomitant use; norfloxacin possibly increases plasma concentration of TIZANIDINE (increased risk of toxicity)
- Mycophenolate: norfloxacin possibly reduces bioavailability of MYCOPHENOLATE
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when moxifloxacin given with • PENTAMIDINE ISETIONATE—avoid concomitant use
- Pirfenidone: ciprofloxacin increases plasma concentration of
 PIRFENIDONE—see under Pirfenidone, p. 260
- Sevelamer: bioavailability of ciprofloxacin reduced by
- Strontium Ranelate: absorption of quinolones reduced by STRONTIUM RANELATE (manufacturer of strontium ranelate advises avoid concomitant use)
- Theophylline: possible increased risk of convulsions when quinolones given with ● THEOPHYLLINE; ciprofloxacin and norfloxacin increase plasma concentration of ● THEOPHYLLINE
- Ulcer-healing Drugs: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by SUCRALFATE; absorption of norfloxacin reduced by SUCRALFATE (give at least 2 hours apart)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF
- Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by ZINC; absorption of norfloxacin reduced by ZINC (give at least 2 hours apart)

Rabeprazole see Proton Pump Inhibitors

Rabies Vaccine see Vaccines

Raloxifene

- Anticoagulants: raloxifene antagonises anticoagulant effect of COLIMARINS
- Lipid-regulating Drugs: absorption of raloxifene reduced by COLESTYRAMINE (manufacturer of raloxifene advises avoid concomitant administration)

Raltegravir

- Antacids: plasma concentration of raltegravir reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTS manufacturer of raltegravir advises avoid concomitant use
- Antibacterials: plasma concentration of raltegravir reduced by
- RIFAMPICIN—consider increasing dose of raltegravir
- Antivirals: increased risk of rash when raltegravir given with DARUNAVIR; avoidance of raltegravir advised by manufacturer of • FOSAMPRENAVIR
- Orlistat: absorption of raltegravir possibly reduced by
 ORLISTAT
- Ulcer-healing Drugs: plasma concentration of raltegravir increased by FAMOTIDINE and OMEPRAZOLE

Raltitr

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Folates: manufacturer of raltitrexed advises avoid concomitant use with • FOLATES

Ramipril see ACE Inhibitors

Ranitidine see Histamine H₂-antagonists

Anti-arrhythmics: manufacturer of ranolazine advises avoid concomitant use with
 DISOPYRAMIDE

Ranolazine (continued)

- Antibacterials: plasma concentration of ranolazine possibly increased by ● CLARITHROMYCIN and ● TELITHROMYCIN manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by
- RIFAMPICIN—manufacturer of ranolazine advises avoid concomitant use
- Antidepressants: plasma concentration of ranolazine increased by PAROXETINE
- Antifungals: plasma concentration of ranolazine increased by
- KETOCONAZOLE—avoid concomitant use; plasma concentration of ranolazine possibly increased by
- ITRACONAZOLE,
 POSACONAZOLE and
 VORICONAZOLE manufacturer of ranolazine advises avoid concomitant use
- Antivirals: plasma concentration of ranolazine possibly increased by • ATAZANAVIR, • DARUNAVIR, • FOSAMPRENAVIR,
- INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR and
 TIPRANAVIR—manufacturer of ranolazine advises avoid concomitant use
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with • SOTALOL
- Calcium-channel Blockers: plasma concentration of ranolazine increased by DILTIAZEM and VERAPAMIL (consider reducing dose of ranolazine)
- Cardiac Glycosides: ranolazine increases plasma concentration of DIGOXIN
- Ciclosporin: plasma concentration of both drugs may increase when ranolazine given with CICLOSPORIN
- Grapefruit Juice: plasma concentration of ranolazine possibly increased by • GRAPEFRUIT JUICE—manufacturer of ranolazine advises avoid concomitant use
- Lipid-regulating Drugs: ranolazine increases plasma concentration of ◆ SIMVASTATIN (see under Simvastatin, p. 181); separating administration from ranolazine by 12 hours advised by manufacturer of LOMITAPIDE
- Tacrolimus: ranolazine increases plasma concentration of
 TACROLIMUS

Rasagiline

NOTE Rasagiline is a MAO-B inhibitor

- Analgesics: avoid concomitant use of rasagiline with
- DEXTROMETHORPHAN; risk of CNS toxicity when rasagiline given with PETHIDINE (avoid pethidine for 2 weeks after rasagiline)
- Antibacterials: plasma concentration of rasagiline increased by CIPROFLOXACIN
- Antidepressants: after stopping rasagiline do not start
- FLUOXETINE for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start → FLUVOXAMINE for 2 weeks; risk of hypertensive crisis when rasagiline given with MAOIS, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with SSRIS or TRICYCLICS
- Dopaminergics: plasma concentration of rasagiline possibly reduced by ENTACAPONE
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Sympathomimetics: avoid concomitant use of rasagiline with
 Sympathomimetics

Reboxetine

- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with • MACROLIDES
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with • FLUVOXAMINE; increased risk of hypertension and CNS excitation when reboxetine given with
 - MAOIS (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)
- Antiepileptics: plasma concentration of reboxetine possibly reduced by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE
- Antifungals: manufacturer of reboxetine advises avoid concomitant use with ● IMIDAZOLES and ● TRIAZOLES

Reboxetine (continued)

- ARTENIMOL WITH PIPERAQUINE
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Diuretics: possible increased risk of hypokalaemia when reboxetine given with LOOP DIURETICS or THIAZIDES AND RELATED DIURETICS
- ► Ergot Alkaloids: possible risk of hypertension when reboxetine given with ERGOTAMINE

Regorafenib

- Analgesics: manufacturer of regorafenib advises avoid concomitant use with MEFENAMIC ACID
- Antibacterials: plasma concentration of regorafenib reduced by • RIFAMPICIN—manufacturer of regorafenib advises avoid concomitant use
- \bullet Anticoagulants: increased risk of bleeding when regorafenib given with \bullet WARFARIN
- Antifungals: plasma concentration of regorafenib increased by
 KETOCONAZOLE—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: regorafenib increases plasma concentration of IRINOTECAN

Remifentanil see Opioid Analgesics

Repaglinide see Antidiabetics

Retigabine

- Alcohol: increased risk of blurred vision when retigabine given with ALCOHOL
- Antidepressants: anticonvulsant effect of antiepileptics
 possibly antagonised by MAOIs and ◆TRICYCLIC-RELATED
 ANTIDEPRESSANTS (convulsive threshold lowered);
 anticonvulsant effect of antiepileptics antagonised by ◆SSRIS
 and ◆TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of retigabine possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Retinoid

- Alcohol: etretinate formed from acitretin in presence of
 ALCOHOL (increased risk of teratogenicity in women of
- Attoriot (increased risk of teratogericity in women of child-bearing potential)
 Antibacterials: possible increased risk of benign intracranial
- Antibacterials: possible increased risk of benign intracranial hypertension when retinoids given with • TETRACYCLINES (avoid concomitant use)
- \bullet Anticoagulants: a citretin possibly reduces anticoagulant effect of \bullet COUMARINS
- Antiepileptics: isotretinoin possibly reduces plasma concentration of CARBAMAZEPINE
- Antifungals: plasma concentration of alitretinoin increased by KETOCONAZOLE; possible increased risk of tretinoin toxicity when given with • FLUCONAZOLE, • KETOCONAZOLE and • VORICONAZOLE
- Cytotoxics: acitretin increases plasma concentration of
 METHOTREXATE (also increased risk of hepatotoxicity)—avoid concomitant use
- Lipid-regulating Drugs: alitretinoin reduces plasma concentration of SIMVASTATIN
- Vitamins: risk of hypervitaminosis A when retinoids given with VITAMIN A—avoid concomitant use

Ribavirin

- Azathioprine: ribavirin possibly enhances myelosuppressive effects of ◆ AZATHIOPRINE

Rifabutin see Rifamycins Rifampicin see Rifamycins Rifamycins

NOTE Interactions do not apply to rifaximin

- ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of IMIDAPRIL (reduced antihypertensive effect)
- Aliskiren: rifampicin reduces plasma concentration of ALISKIREN
- Ambrisentan: rifampicin possibly increases plasma concentration of AMBRISENTAN
- Aminophylline: rifampicin accelerates metabolism of AMINOPHYLLINE (reduced plasma concentration)
- Analgesics: rifampicin reduces plasma concentration of CELECOXIB, DICLOFENAC and ETORICOXIB; rifampicin accelerates metabolism of ALFENTANIL, CODEINE, FENTANYL, METHADONE and MORPHINE (reduced effect); rifampicin possibly accelerates metabolism of OXYCODONE
- Angiotensin-II Receptor Antagonists: rifampicin reduces plasma concentration of LOSARTAN and its active metabolite
- ▶ Antacids: absorption of rifampicin reduced by ANTACIDS
- Anthelmintics: rifampicin reduces plasma concentration of
 PRAZIQUANTEL—avoid concomitant use
- Anti-arrhythmics: rifamycins accelerate metabolism of
 DISOPYRAMIDE (reduced plasma concentration); rifampicin reduces plasma concentration of DRONEDARONE—avoid concomitant use; rifampicin accelerates metabolism of
 PROPAFEMONE (reduced effect)
- Antibacterials: increased risk of side-effects including neutropenia when rifabutin given with • AZITHROMYCIN; rifamycins reduce plasma concentration of CLARITHROMYCIN and DAPSONE; plasma concentration of rifabutin increased by • CLARITHROMYCIN (increased risk of toxicity-reduce rifabutin dose); plasma concentration of rifabutin possibly increased by • ERYTHROMYCIN (increased risk of toxicity-reduce rifabutin dose); rifampicin possibly reduces plasma concentration of TINIDAZOLE and TRIMETHOPRIM; rifampicin reduces plasma concentration of DOXYCYCLINE-consider increasing dose of doxycycline; rifabutin possibly reduces plasma concentration of BEDAOUILINE—manufacturer of bedaquiline advises avoid concomitant use; rifampicin reduces plasma concentration of • BEDAQUILINEmanufacturer of bedaquiline advises avoid concomitant use; rifampicin accelerates metabolism of CHLORAMPHENICOL (reduced plasma concentration); rifampicin reduces plasma concentration of • DELAMANID; increased risk of hepatotoxicity when rifampicin given with • ISONIAZID; rifampicin reduces plasma concentration of LINEZOLID (possible therapeutic failure of linezolid); rifampicin reduces plasma concentration of • TELITHROMYCIN (avoid during and for 2 weeks after rifampicin)
- Anticoagulants: rifampicin possibly reduces plasma concentration of ● APIXABAN—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; rifamycins accelerate metabolism of ● COUMARINS (reduced anticoagulant effect); rifampicin reduces plasma concentration of ● DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use; rifampicin reduces plasma concentration of ● RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antiepileptics: rifabutin reduces plasma concentration of
 CARBAMAZEPINE; rifamycins accelerate metabolism of
 FOSPHENYTOIN and PHENYTOIN (reduced plasma concentration); rifampicin reduces plasma concentration of
 LAMOTRIGINE; plasma concentration of rifampicin possibly reduced by PHENOBARBITAL and PRIMIDONE

Rifamycins (continued)

Antifungals: rifampicin accelerates metabolism of
 KETOCONAZOLE (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole;

plasma concentration of rifabutin increased by

- FLUCONAZOLE (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of FLUCONAZOLE (reduced plasma concentration); rifabutin and rifampicin reduce plasma concentration of ITRACONAZOLE—manufacturer of itraconazole advises avoid concomitant use
- manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by
- POSACONAZOLE (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of
 POSACONAZOLE and TERBINAFINE; plasma concentration of
 rifabutin increased by VORICONAZOLE, also rifabutin reduces
 plasma concentration of voriconazole (increase dose of
 voriconazole and also monitor for rifabutin toxicity);
 rifampicin reduces plasma concentration of VORICONAZOLE—
 avoid concomitant use; rifampicin initially increases and
 then reduces plasma concentration of CASPOFUNGIN (consider
 increasing dose of caspofungin); plasma concentration of
 rifabutin possibly increased by TRIAZOLES (increased risk of
 uveitis—reduce rifabutin dose)
- Antihistamines: rifampicin possibly reduces effects of FEXOFENADINE
- Antimalarials: avoidance of rifampicin advised by manufacturer of ARTENIMOL WITH PIPERAQUINE; rifampicin reduces plasma concentration of ◆ MEFLOQUINE—avoid concomitant use; rifampicin reduces plasma concentration of ◆ OUININE
- Antimuscarinics: rifampicin reduces plasma concentration of active metabolite of FESOTERODINE
- Antipsychotics: rifampicin accelerates metabolism of
 HALOPERIDOL (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of
 ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product
 literatury, rifampicin possibly reduces plasma concentration
- the dose of aripiprazole—consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of CLOZAPINE; rifampicin reduces plasma concentration of LURASIDONE—avoid concomitant use

 Antivirals: rifampicin possibly reduces plasma concentration
- TIPRANAVIR (reduce dose of rifabutin); rifampicin reduces plasma concentration of ATAZANAVIR, DACLATASVIR, LOPINAVIR, NEVIRAPINE and RILPIVIRINE—avoid concomitant use; avoidance of rifampicin advised by manufacturer of BOCEPREVIR (plasma concentration of boceprevir possibly reduced); rifabutin possibly reduces plasma concentration of DACLATASVIR and SIMEPREVIR—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; rifampicin significantly reduces plasma concentration of DARUNAVIR, FOSAMPRENAVIR and
- TELAPREVIR—avoid concomitant use; rifampicin reduces the plasma concentration of DOLUTEGRAVIR (see under Dolutegravir, p. 557); rifampicin reduces plasma concentration of FFAVIRENZ—increase dose of efavirenz; plasma concentration of rifabutin reduced by EFAVIRENZ—increase dose of rifabutin; avoidance of rifampicin advised by manufacturer of ELVITEGRAVIR, ETRAVIRINE, SOFOSBUVIR and ZIDOVUDINE; rifabutin reduces plasma concentration of
- ELVITEGRAVIR also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; plasma concentration of both drugs reduced when rifabutin given with ETRAVIRINE; rifampicin accelerates metabolism of INDINAVIR (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by INDINAVIR, also plasma concentration of indinavir decreased (reduce dose of rifabutin and increase dose of indinavir); rifampicin reduces plasma concentration of MARAVIROC and RALTEGRAVIR—consider increasing dose
- indinavir decreased (reduce dose of rifabutin and increase dose of indinavir); rifampicin reduces plasma concentration of MARAVIROC and RALTEGRAVIR—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin possibly increased by NEVIRAPINE; rifabutin decreases plasma concentration of RILPIVIRINE (increase dose of rilpivirine—consult rilpivirine product literature);

Rifamycins

- Antivirals (continued)
- plasma concentration of rifabutin increased by RITONAVIR (increased risk of toxicity—reduce rifabutin dose); rifampicin reduces plasma concentration of RITONAVIR; rifampicin significantly reduces plasma concentration of SAQUINAVIR, also risk of hepatotoxicity—avoid concomitant use; plasma concentration of rifabutin increased by SAQUINAVIR (also plasma concentration of saquinavir reduced)—reduce rifabutin dose; rifampicin reduces plasma concentration of
- SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use; avoidance of rifabutin advised by manufacturer of SOFOSBUVIR and TELAPREVIR; rifampicin possibly reduces plasma concentration of TIPRANAVIR— avoid concomitant use
- Anxiolytics and Hypnotics: rifampicin accelerates metabolism of DIAZEPAM and ZALEPLON (reduced plasma concentration); rifampicin possibly accelerates metabolism of BENZODIAZEPINES (reduced plasma concentration); rifampicin possibly accelerates metabolism of BUSPIRONE; rifampicin accelerates metabolism of SUSPIRONE; rifampicin accelerates metabolism of FOLIPIDEM (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of ZOPICLONE
 Argenizat, rifampicin reduces plasma concentration of SOPICLONE
- Aprepitant: rifampicin reduces plasma concentration of APREPITANT
- Atovaquone: avoidance of concomitant rifabutin advised by manufacturer of ATOVAQUONE (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of
- ATOVAQUONE (and concentration of rifampicin increased)
 avoid concomitant use
- Avanafil: rifampicin possibly reduces plasma concentration of AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: rifampicin accelerates metabolism of BISOPROLOL and PROPRANOLOL (plasma concentration significantly reduced); rifampicin reduces plasma concentration of CARVEDILOL, CELIPROLOL and METOPROLOL; rifampicin possibly reduces plasma concentration of oral TIMOLOL
- Bosentan: rifampicin reduces plasma concentration of
- BOSENTAN—avoid concomitant use
- Calcium-channel Blockers: rifampicin possibly reduces plasma concentration of FELODIPINE; rifampicin possibly accelerates metabolism of ● ISRADIPINE and ● NICARDIPINE (possible significantly reduced plasma concentration); rifampicin accelerates metabolism of ● DILTIAZEM, ● NIFEDIPINE,
- NIMODIPINE and VERAPAMIL (plasma concentration significantly reduced)
- Cannabis Extract: rifampicin reduces plasma concentration of
 CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Cardiac Glycosides: rifampicin possibly reduces plasma concentration of DIGOXIN
- Ciclosporin: rifampicin accelerates metabolism of
- CICLOSPORIN (reduced plasma concentration)
- Cobicistat: rifabutin reduces plasma concentration of
 COBICISTAT (adjust dose—consult product literature);
 rifampicin possibly reduces plasma concentration of
- COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: rifamycins accelerate metabolism of
 CORTICOSTEROIDS (reduced effect)
- Cytotoxics: rifampicin possibly reduces effects of BRENTUXIMAB VEDOTIN; rifampicin reduces plasma concentration of AFATINIB, RUXOLITINIB, SORAFENIB and TRABECTEDIN; rifabutin possibly decreases plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); rifampicin decreases plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); rifabutin possibly reduces plasma concentration of BOSUTINIB, CRIZOTINIB and PONATINIB—manufacturer of bosutinib, crizotinib and ponatinib advises avoid concomitant use; rifampicin reduces plasma concentration of BORTEZOMIB, BOSUTINIB, CABAZITAXEL, CRIZOTINIB,
 - ullet PONATINIB, ullet REGORAFENIB and ullet VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib,

Rifamycins

- Cytotoxics (continued)
 - regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of CABOZANTINIB,
- GEFITINIB, IBRUTINIB, IDELALISIB, IMATINIB and
 NILOTINIB—avoid concomitant use; avoidance of rifampicin
- NICHINEMATOR CONCOUNTAINT USE, A VOLUNTEE OF INTERPRET
 advised by manufacturer of DABRAFENIB, LAPATINIB and VEMURAFENIB; rifampicin accelerates metabolism of
 DASATINIB (reduced plasma concentration—avoid concomitant use); rifampicin accelerates metabolism of ERLOTINIB and SUNITINIB (reduced plasma concentration); rifampicin reduces plasma concentration of EVEROLIMUS (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature);
- avoidance of rifabutin advised by manufacturer of

 CABAZITAXEL, LAPATINIB and VEMURAFENIB; rifampicin
 possibly reduces plasma concentration of ERIBULIN and

 PAZOPANIB; rifampicin reduces plasma concentration of
- active metabolite of TEMSIROLIMUS—avoid concomitant use; rifampicin possibly reduces plasma concentration of
 VINFLUNINE—manufacturer of vinflunine advises avoid
- VINFLUNINE—manufacturer of vinflunine advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of • VISMODEGIB (plasma concentration of vismodegib possibly reduced)
- Deferasirox: rifampicin reduces plasma concentration of DEFERASIROX
- Diuretics: rifampicin reduces plasma concentration of
- EPLERENONE—avoid concomitant use
- ► Fosaprepitant: rifampicin reduces plasma concentration of FOSAPREPITANT
- ◆ Hormone Antagonists: rifabutin possibly reduces plasma concentration of ◆ ABIRATERONE—manufacturer of abiraterone advises avoid concomitant use; rifampicin reduces plasma concentration of ◆ ABIRATERONE manufacturer of abiraterone advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of ENZALUTAMIDE; rifampicin possibly reduces plasma concentration of EXEMESTANE; rifampicin accelerates metabolism of TAMOXIFEN (reduced plasma concentration)
- SHT₃-receptor Antagonists: rifampicin accelerates metabolism of ONDANSETRON (reduced effect)
- Ivacaftor: rifabutin possibly reduces plasma concentration of
 IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use; rifampicin reduces plasma concentration of
 IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use
- Leflunomide: rifampicin possibly increases plasma concentration of active metabolite of LEFLUNOMIDE
- Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of ATORVASTATIN and SIMVASTATIN; rifampicin accelerates metabolism of FLUVASTATIN (reduced effect)
- Macitentan: rifampicin reduces plasma concentration of
 MACITENTAN—avoid concomitant use
- Muscle Relaxants: rifampicin possibly reduces plasma concentration of TIZANIDINE
- Mycophenolate: rifampicin reduces plasma concentration of active metabolite of • MYCOPHENOLATE
- Nintedanib: rifampicin reduces plasma concentration of
 NINTEDANIB—avoid concomitant use
- Oestrogens: rifamycins accelerate metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Progestogens: rifamycins accelerate metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see
- Ranolazine: rifampicin reduces plasma concentration of
 RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use

Contraceptive Interactions in BNF)

- Roflumilast: rifampicin inhibits effects of
 ROFLUMILAST
 (manufacturer of roflumilast advises avoid concomitant use)
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of • SIROLIMUS—avoid concomitant use

Rifamycins (continued)

- Tacrolimus: rifabutin possibly reduces plasma concentration of TACROLIMUS; rifampicin reduces plasma concentration of
- Tadalafil: rifampicin reduces plasma concentration of • TADALAFIL - manufacturer of tadalafil advises avoid concomitant use
- ▶ Teriflunomide: rifampicin reduces plasma concentration of **TERIFLUNOMIDE**
- Theophylline: rifampicin accelerates metabolism of THEOPHYLLINE (reduced plasma concentration)
- ▶ Thyroid Hormones: rifampicin accelerates metabolism of LEVOTHYROXINE (may increase requirements for levothyroxine in hypothyroidism)
- ▶ Tibolone: rifampicin accelerates metabolism of TIBOLONE (reduced plasma concentration)
- Ticagrelor: rifampicin reduces plasma concentration of TICAGRELOR
- > Tolvaptan: rifampicin reduces plasma concentration of TOLVAPTAN
- ▶ Ulcer-healing Drugs: rifampicin accelerates metabolism of CIMETIDINE (reduced plasma concentration)
- Ulipristal: avoidance of rifampicin advised by manufacturer of ULIPRISTAL (contraceptive effect of ulipristal possibly
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Rilnivirine

- Analgesics: rilpivirine possibly reduces plasma concentration of METHADONE
- ▶ Antacids: manufacturer of rilpivirine advises give ANTACIDS 2 hours before or 4 hours after rilpivirine
- Antibacterials: manufacturer of rilpivirine advises avoid concomitant use with ● CLARITHROMYCIN and ● ERYTHROMYCIN (plasma concentration of rilpivirine possibly increased); plasma concentration of rilpivirine decreased by • RIFABUTIN (increase dose of rilpivirine-consult rilpivirine product literature); plasma concentration of rilpivirine reduced by • RIFAMPICIN—avoid concomitant use
- Anticoagulants: rilpivirine possibly increases plasma concentration of DABIGATRAN
- · Antidepressants: manufacturer of rilpivirine advises avoid concomitant use with • ST JOHN'S WORT (plasma concentration of rilpivirine possibly reduced)
- Antiepileptics: manufacturer of rilpivirine advises avoid concomitant use with • CARBAMAZEPINE, • FOSPHENYTOIN,
- OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and
- PRIMIDONE (plasma concentration of rilpivirine possibly
- ▶ Antivirals: manufacturer of rilpivirine advises give DIDANOSINE 2 hours before or 4 hours after rilpivirine; avoidance of rilpivirine advised by manufacturer of NEVIRAPINE
- ▶ Calcium Salts: manufacturer of rilpivirine advises give CALCIUM SALTS 2 hours before or 4 hours after rilpivirine
- · Corticosteroids: manufacturer of rilpivirine advises avoid concomitant use with • DEXAMETHASONE (except when given as a single dose)
- Orlistat: absorption of rilpivirine possibly reduced by
- · Ulcer-healing Drugs: manufacturer of rilpivirine advises avoid concomitant use with ESOMEPRAZOLE, LANSOPRAZOLE, PANTOPRAZOLE and RABEPRAZOLE (plasma concentration of rilpivirine possibly reduced); plasma concentration of rilpivirine reduced by • OMEPRAZOLE—avoid concomitant use; manufacturer of rilpivirine advises avoid HISTAMINE H2-ANTAGONISTS for 12 hours before or 4 hours after rilpivirine consult product literature

Riociguat

- Antacids: absorption of riociguat reduced by ANTACIDS (give at least 2 hours before or 1 hour after riociguat)
- Antifungals: manufacturer of riociguat advises avoid concomitant use with ITRACONAZOLE, KETOCONAZOLE and VORICONAZOLE
- Antivirals: manufacturer of riociguat advises avoid concomitant use with RITONAVIR

Riociguat (continued)

- Avanafil: possible enhanced hypotensive effect when riociguat given with • AVANAFIL—avoid concomitant use
- Bosentan: plasma concentration of riociguat reduced by
- Nitrates: possible enhanced hypotensive effect when riociguat given with . NITRATES-avoid concomitant use Sildenafil: enhanced hypotensive effect when riociguat given
- with . SILDENAFIL avoid concomitant use • Tadalafil: possible enhanced hypotensive effect when
- riociguat given with TADALAFIL—avoid concomitant use
- Vardenafil: possible enhanced hypotensive effect when riociguat given with • VARDENAFIL—avoid concomitant use Risedronate Sodium see Bisphosphonates

Risperidone see Antipsychotics **Pitonavir**

· Alpha-blockers: ritonavir possibly increases plasma concentration of ● ALFUZOSIN—avoid concomitant use

- Aminophylline: ritonavir accelerates metabolism of
- AMINOPHYLLINE (reduced plasma concentration)
- Analgesics: ritonavir possibly increases plasma concentration of NSAIDs and BUPRENORPHINE; ritonavir increases plasma concentration of • DEXTROPROPOXYPHENE and • PIROXICAM (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of • ALFENTANIL and • FENTANYL; ritonavir reduces plasma concentration of METHADONE; ritonavir possibly reduces plasma concentration of MORPHINE; ritonavir reduces plasma concentration of • PETHIDINE, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
- · Anthelmintics: ritonavir possibly reduces plasma concentration of active metabolite of • ALBENDAZOLEconsider increasing albendazole dose when given for systemic infections
- · Anti-arrhythmics: ritonavir increases plasma concentration of • AMIODARONE and • PROPAFENONE (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of • DISOPYRAMIDE (increased risk of toxicity); avoidance of ritonavir advised by manufacturer of • DRONEDARONE; ritonavir possibly increases plasma concentration of • FLECAINIDE (increased risk of ventricular arrhythmias-avoid concomitant use)
- · Antibacterials: ritonavir possibly increases plasma concentration of AZITHROMYCIN and ERYTHROMYCIN; ritonavir increases plasma concentration of • CLARITHROMYCIN (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of • RIFABUTIN (increased risk of toxicity-reduce rifabutin dose); plasma concentration of ritonavir reduced by RIFAMPICIN; ritonavir possibly increases plasma concentration of BEDAQUILINE-avoid concomitant use if ritonavir given for more than 14 days; ritonavir increases plasma concentration of DELAMANID; plasma concentration of both drugs increased when ritonavir given with • FUSIDIC ACID-avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of • TELITHROMYCIN
- Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of • WARFARIN; avoidance of ritonavir advised by manufacturer of APIXABAN; ritonavir possibly enhances anticoagulant effect of • COUMARINS and • PHENINDIONE; ritonavir increases plasma concentration of ● RIVAROXABAN avoid concomitant use
- Antidepressants: ritonavir possibly reduces plasma concentration of PAROXETINE; ritonavir increases plasma concentration of • TRAZODONE (increased risk of toxicity); ritonavir possibly increases plasma concentration of • SSRIS and • TRICYCLICS; plasma concentration of ritonavir reduced by • ST JOHN'S WORT—avoid concomitant use
- Antidiabetics: ritonavir possibly increases plasma concentration of TOLBUTAMIDE
- · Antiepileptics: ritonavir possibly increases plasma concentration of • CARBAMAZEPINE; plasma concentration of ritonavir possibly reduced by FOSPHENYTOIN and PHENYTOIN. also plasma concentration of fosphenytoin and phenytoin possibly affected; ritonavir possibly reduces plasma

Ditonavir

- Antiepileptics (continued) concentration of LAMOTRIGINE, SODIUM VALPROATE and VALPROIC ACID
- Antifungals: ritonavir increases plasma concentration of
- KETOCONAZOLE (reduce dose of ketoconazole); plasma concentration of ritonavir increased by FLUCONAZOLE; combination of ritonavir with ITRACONAZOLE may increase plasma concentration of either drug (or both); ritonavir reduces plasma concentration of VORICONAZOLE—avoid concomitant use
- Antihistamines: ritonavir possibly increases plasma concentration of NON-SEDATING ANTIHISTAMINES
- Antimalarials: caution with ritonavir advised by manufacturer
 of ARTEMETHER WITH LUMEFANTRINE; plasma concentration of
 ritonavir possibly reduced by MEFLOQUINE; ritonavir increases
 plasma concentration of @ QUININE (increased risk of toxicity)
- Antimuscarinics: avoidance of ritonavir advised by
 manufacturer of DARIFENACIN and TOLTERODINE; manufacturer
 of fesoterodine advises dose reduction when ritonavir given
 with FESOTERODINE—consult fesoterodine product literature;
 ritonavir possibly increases plasma concentration of
 SOLIFENACIN—see under Solifenacin, p. 670
- Antipsychotics: ritonavir possibly increases plasma concentration of ◆ ANTIPSYCHOTICS; ritonavir possibly increases plasma concentration of ◆ ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of ritonavir advises avoid concomitant use with
- CLOZAPINE (increased risk of toxicity); ritonavir possibly increases plasma concentration of LURASIDONE—avoid concomitant use; ritonavir reduces plasma concentration of OLANZAPINE—consider increasing dose of olanzapine; ritonavir increases plasma concentration of PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of both drugs reduced when
 ritonavir given with ◆BOCEPREVIR; manufacturer of ritonavir
 advises ritonavir and DIDANOSINE should be taken 2.5 hours
 apart; ritonavir increases the toxicity of ◆EFAVIRENZ, monitor
 liver function tests —manufacturer of Atripla ® advises avoid
 concomitant use with high-dose ritonavir; ritonavir increases
 plasma concentration of INDINAVIR, MARAVIROC and
 - SAQUINAVIR; ritonavir increases plasma concentration of
 SIMEPREVIR—manufacturer of simeprevir advises avoid
- concomitant use; ritonavir possibly reduces plasma concentration of TELAPREVIR
- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of ● ANXIOLYTICS AND HYPNOTICS; ritonavir possibly increases plasma concentration of ● ALPRAZOLAM,
 ● DIAZEPAM, ● FLURAZEPAM and ● ZOLPIDEM (risk of extreme
- sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of

 MIDAZOLAM (risk of prolonged sedation—avoid concomitan
- MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of BUSPIRONE (increased risk of toxicity)
- Aprepitant: ritonavir possibly increases plasma concentration of APREPITANT
- Atovaquone: ritonavir possibly reduces plasma concentration of ATOVAQUONE—manufacturer of atovaquone advises avoid concomitant use
- Avanafil: ritonavir significantly increases plasma concentration of ● AVANAFIL—avoid concomitant use
- Bosentan: ritonavir increases plasma concentration of
 BOSENTAN (consider reducing dose of bosentan)
- ► Bupropion: ritonavir reduces plasma concentration of BUPROPION
- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of ● CALCIUM-CHANNEL BLOCKERS; avoidance of ritonavir advised by manufacturer of LERCANIDIPINE
- Cardiac Glycosides: ritonavir possibly increases plasma concentration of DIGOXIN
- Ciclosporin: ritonavir possibly increases plasma concentration of ◆ CICLOSPORIN

Ritonavir (continued)

- Cilostazol: ritonavir possibly increases plasma concentration of CILOSTAZOL (see under Cilostazol, p. 206)
- Colchicine: ritonavir possibly increases risk of COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ritonavir possibly increases plasma concentration of ◆ CORTICOSTEROIDS—increased risk of adrenal supression; ritonavir possibly increases plasma concentration of ◆ BUDESONIDE (including inhaled, intranasal, and rectal budesonide)—increased risk of adrenal suppresion; ritonavir increases plasma concentration of inhaled and intranasal ◆ FLUTICASONE—increased risk of adrenal suppression
- Cytotoxics: ritonavir increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of AXITINIB (reduce dose of axitinib—consult axitinib product literature); ritonavir possibly increases the plasma concentration of
 - BOSUTINIB and CABAZITAXEL—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of CABOZANTINIB and VINBLASTINE; ritonavir possibly increases plasma concentration of
 - CRIZOTINIB, EVEROLIMUS, NILOTINIB and VINFLUNINE manufacturer of crizotinib, everolimus, nilotinib and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of DASATINIB (plasma concentration of dasatinib possibly increased); ritonavir possibly increases the plasma concentration of ● IBRUTINIB reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of ritonavir advised by manufacturer of
 - LAPATINIB; ritonavir possibly increases plasma concentration of PAZOPANIB (reduce dose of pazopanib); ritonavir possibly increases plasma concentration of PONATINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when ritonavir given with RUXOLITINIB—consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of DOCETAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; ritonavir increases plasma concentration of PACLITAXEL
- Dapoxetine: avoidance of ritonavir advised by manufacturer of
 DAPOXETINE (increased risk of toxicity)
- Diuretics: ritonavir increases plasma concentration of
 EPLERENONE—avoid concomitant use
- Domperidone: possible increased risk of ventricular arrhythmias when ritonavir given with • DOMPERIDONE—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when ritonavir given with ● ERGOMETRINE or ● ERGOTAMINE—avoid concomitant use
- Fosaprepitant: ritonavir possibly increases plasma concentration of FOSAPREPITANT
- 5HT₁-receptor Agonists: ritonavir increases plasma concentration of • ELETRIPTAN (risk of toxicity)—avoid concomitant use
- Ivabradine: ritonavir possibly increases plasma concentration of • IVABRADINE—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy
 when ritonavir given with ATORVASTATIN; possible increased
 risk of myopathy when ritonavir given with ROSUVASTATIN—
 manufacturer of rosuvastatin advises avoid concomitant use;
 increased risk of myopathy when ritonavir given with
- SIMVASTATIN (avoid concomitant use); avoidance of ritonavir advised by manufacturer of ◆LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Mirabegron: when given with ritonavir avoid or reduce dose of MIRABEGRON in hepatic or renal impairment—see Mirabegron, p. 671
- Oestrogens: ritonavir accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)

Ritonavir (continued)

- Orlistat: absorption of ritonavir possibly reduced by ORLISTAT
- Ranolazine: ritonavir possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Riociguat: avoidance of ritonavir advised by manufacturer of RIOCIGUAT
- Sildenafil: ritonavir significantly increases plasma
- concentration of SILDENAFIL—avoid concomitant use
 ► Sympathomimetics: ritonavir possibly increases plasma concentration of DEXAMFETAMINE
- ► Sympathomimetics, Beta₂: manufacturer of ritonavir advises avoid concomitant use with SALMETEROL
- Tacrolimus: ritonavir possibly increases plasma concentration of Tacrolimus
- Tadalafil: ritonavir increases plasma concentration of
- TADALAFIL manufacturer of tadalafil advises avoid concomitant use
- Theophylline: ritonavir accelerates metabolism of
- THEOPHYLLINE (reduced plasma concentration)
 Ticagrelor: ritonavir possibly increases plasma concentration
- Itagreior: ritonavir possibly increases plasma concentration of • TICAGRELOR—manufacturer of ticagrelor advises avoid concomitant use
- Ulipristal: avoidance of ritonavir advised by manufacturer of
 ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vardenafil: ritonavir increases plasma concentration of
 VARDENAFIL—avoid concomitant use

Rituxima

- Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Rivaroxaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous • DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with • KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: manufacturer of rivaroxaban advises avoid concomitant use with DRONEDARONE
- Antibacterials: plasma concentration of rivaroxaban reduced by • RIFAMPICIN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Anticoagulants: increased risk of haemorrhage when rivaroxaban given with other ● ANTICOAGULANTS (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with ● APIXABAN and ● DABIGATRAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of rivaroxaban possibly reduced by • ST JOHN'S WORT—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antiepileptics: plasma concentration of rivaroxaban possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN,
- PHENOBARBITAL,
 PHENYTOIN and
 PRIMIDONE—
 manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antifungals: plasma concentration of rivaroxaban increased by
 KETOCONAZOLE—avoid concomitant use; manufacturer of rivaroxaban advises avoid concomitant use with
 ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with ATAZAMAVIR, DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, SAQUINAVIR and TIPRANAVIR; manufacturers advise avoid concomitant use of rivaroxaban with LOPINAVIR; plasma concentration of rivaroxaban increased by ● RITONAVIR—avoid concomitant use
- Cobicistat: anticoagulant effect of rivaroxaban possibly enhanced by • COBICISTAT—avoid concomitant use

Rivastigmine see Parasympathomimetics

Rizatriptan see 5HT₁-receptor Agonists (under HT)
Rocuronium see Muscle Relaxants

Roflumilast

- Aminophylline: manufacturer of roflumilast advises avoid concomitant use with AMINOPHYLLINE
- Antibacterials: effects of roflumilast inhibited by

 RIFAMPICIN
 (manufacturer of roflumilast advises avoid concomitant use)
- Antidepressants: metabolism of roflumilast inhibited by FLUVOXAMINE
- Antiepileptics: effects of roflumilast possibly inhibited by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (manufacturer of roflumilast advises avoid concomitant use)
- Theophylline: manufacturer of roflumilast advises avoid concomitant use with THEOPHYLLINE
- Ulcer-healing Drugs: metabolism of roflumilast inhibited by CIMETIDINE

Ropinirole

- Antibacterials: metabolism of ropinirole inhibited by CIPROFLOXACIN (increased plasma concentration)
- Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of ANTIPSYCHOTICS (antagonism of effect)
- ► Memantine: effects of dopaminergics possibly enhanced by
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of METOCLOPRAMIDE (antagonism of effect)
- Oestrogens: plasma concentration of ropinirole increased by OESTROGENS

Ropivacaine

- Anti-arrhythmics: increased myocardial depression when ropivacaine given with ANTI-ARRHYTHMICS
- Antidepressants: metabolism of ropivacaine inhibited by FLUVOXAMINE—avoid prolonged administration of ropivacaine

Rosuvastatin see Statins Rotavirus Vaccine see Vaccines

Rotigotine

- Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of ANTIPSYCHOTICS (antagonism of effect)
- ► Memantine: effects of dopaminergics possibly enhanced by
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of METOCLOPRAMIDE (antagonism of effect)

Rufinamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and ◆ TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ◆ SSRIS and ◆ TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with CARBAMAZEPINE; plasma concentration of rufinamide possibly reduced by FOSPHENYTOIN and PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of rufinamide possibly reduced by PHENOBARBITAL and PRIMIDONE; plasma concentration of rufinamide possibly increased by SODIUM VALPROATE and VALPROIC ACID (reduce dose of rufinamide)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Oestrogens: rufinamide accelerates metabolism of
 OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Progestogens: rufinamide accelerates metabolism of
 PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives,

Rufinamide

- Progestogens (continued)
 - contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)

Ruxolitinib

- Antibacterials: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with • CLARITHROMYCIN and
- TELITHROMYCIN—consult ruxolitinib product literature;
 plasma concentration of ruxolitinib reduced by RIFAMPICIN
- Antifungals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with • FLUCONAZOLE.
 - ITRACONAZOLE, KETOCONAZOLE, POSACONAZOLE and • VORICONAZOLE—consult ruxolitinib product literature
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with ● BOCEPREVIR, ● INDINAVIR,

St John's Wort

- Aminophylline: St John's wort possibly reduces plasma concentration of AMINOPHYLLINE
- Analgesics: St John's wort possibly reduces plasma concentration of METHADONE
- Anti-arrhythmics: St John's wort possibly reduces plasma concentration of • DRONEDARONE—avoid concomitant use
- Antibacterials: St John's wort possibly reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use; St John's wort reduces plasma concentration of TELITHROMYCIN (avoid during and for 2 weeks after St John's wort)
- Anticoagulants: St John's wort possibly reduces plasma concentration of APIXABAN—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; St John's wort reduces anticoagulant effect of COUMARINS (avoid concomitant use); St John's wort possibly reduces plasma concentration of DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use; St John's wort possibly reduces plasma concentration of RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: possible increased serotonergic effects when St John's wort given with DULOXETINE OF VENLAFAXINE; St John's wort reduces plasma concentration of AMITRIPTYLINE; increased serotonergic effects when St John's wort given with
 SSRIS—avoid concomitant use
- Antiepileptics: St John's wort possibly reduces plasma concentration of CARBAMAZEPINE; St John's wort possibly reduces plasma concentration of ●FOSPHENYTOIN,
- PHENOBARBITAL, PHENYTOIN and PRIMIDONE—avoid concomitant use
- Antifungals: St John's wort reduces plasma concentration of
- VORICONAZOLE—avoid concomitant use
- ARTENIMOL WITH PIPERAQUINE
- Antipsychotics: St John's wort possibly reduces plasma concentration of ◆ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); St John's wort possibly reduces plasma concentration of ◆LURASIDONE—avoid concomitant use
- Antivirals: St John's wort reduces plasma concentration of
 ATAZANAVIR, DARUNAVIR, EFAVIRENZ, FOSAMPRENAVIR,
- INDINAVIR, LOPINAVIR, NEVIRAPINE, RITONAVIR and
- SAQUINAVIR—avoid concomitant use; St John's wort possibly
- SAQUINAVIR—avoid concomitant use; St John's wort possibly reduces plasma concentration of DACLATASVIR and
 SIMEPREVIR—manufacturer of daclatasvir and simeprevir
- advises avoid concomitant use; avoidance of St John's wort advised by manufacturer of DOLUTEGRAVIR, © ELVITEGRAVIR, ETRAVIRINE, SOFOSBUVIR and © TELAPREVIR; St John's wort possibly reduces plasma concentration of © MARAVIROC and
- TIPRANAVIR—avoid concomitant use; avoidance of St John's

St John's Wort

- Antivirals (continued) wort advised by manufacturer of ● RILPIVIRINE (plasma concentration of rilpivirine possibly reduced)
- Anxiolytics and Hypnotics: St John's wort possibly reduces plasma concentration of oral MIDAZOLAM
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Calcium-channel Blockers: St John's wort possibly reduces plasma concentration of AMLODIPINE and FELODIPINE; St John's wort reduces plasma concentration of NIFEDIPINE; St John's wort significantly reduces plasma concentration of
 VERAPAMII
- Cannabis Extract: St John's wort possibly reduces plasma concentration of

 — CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Cardiac Glycosides: St John's wort reduces plasma concentration of ◆ DIGOXIN—avoid concomitant use
- Ciclosporin: St John's wort reduces plasma concentration of
 CICLOSPORIN—avoid concomitant use
- Cobicistat: St John's wort possibly reduces plasma concentration of
 COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: St John's wort possibly reduces plasma concentration of AXITINIB—consider increasing dose of axitinib; St John's wort possibly reduces plasma concentration of BORTEZOMIB, BOSUTINIB, CABOZANTINIB, CRIZOTINIB, EVEROLIMUS, IBRUTINIB, IDELALISIB, PONATINIB and VINFLUNINE—manufacturer of bortezomib, bosutinib, cabozantinib, crizotinib, everolimus, ibrutinib, idelalisib, ponatinib and vinflunine advises avoid concomitant use; avoidance of St John's wort advised by manufacturer of CABAZITAXEL, DABRAFENIB, GEFITINIB, LAPATINIB and
 - VEMURAFENIB; St John's wort reduces plasma concentration of

 IMATINIB—avoid concomitant use; avoidance of St John's
 wort advised by manufacturer of VANDETANIB and

 VISMODEGIB (plasma concentration of vandetanib and
- vismodegib possibly reduced); St John's wort possibly reduces plasma concentration of ERIBULIN; St John's wort accelerates metabolism of Open ININOTECAN (reduced plasma concentration—avoid concomitant use)

 Danoxetine: possible increased risk of serotonergic effects
- when St John's wort given with DAPOXETINE (manufacturer of dapoxetine advises St John's wort should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping St John's wort)
- Diuretics: St John's wort reduces plasma concentration of
- EPLERENONE—avoid concomitant use
- ► Fingolimod: St John's wort possibly reduces plasma concentration of FINGOLIMOD—manufacturer of fingolimod advises avoid concomitant use
- Fosaprepitant: avoidance of St John's wort advised by manufacturer of • FOSAPREPITANT
- ◆ Hormone Antagonists: St John's wort possibly reduces plasma concentration of ◆ ABIRATERONE—manufacturer of abiraterone advises avoid concomitant use
- 5HT₁-receptor Agonists: increased serotonergic effects when St John's wort given with • 5HT₁ AGONISTS—avoid concomitant use
- ► Ivabradine: St John's wort reduces plasma concentration of IVABRADINE—avoid concomitant use
- Ivacaftor: St John's wort possibly reduces plasma concentration of ● IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: St John's wort reduces plasma concentration of SIMVASTATIN
- Macitentan: avoidance of St John's wort advised by manufacturer of MACITENTAN
- Oestrogens: St John's wort reduces contraceptive effect of
 OESTROGENS (avoid concomitant use)
- Progestogens: St John's wort reduces contraceptive effect of
 PROGESTOGENS (avoid concomitant use)
- Tacrolimus: St John's wort reduces plasma concentration of
- TACROLIMUS—avoid concomitant use

St John's Wort (continued)

- ► Theophylline: St John's wort possibly reduces plasma concentration of THEOPHYLLINE
- Ulcer-healing Drugs: St John's wort possibly reduces plasma concentration of OMEPRAZOLE
- Ulipristal: avoidance of St John's wort advised by manufacturer of • ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)

Salbutamol see Sympathomimetics, Beta₂ **Salmeterol** see Sympathomimetics, Beta₂

Saguinavir

- Analgesics: increased risk of ventricular arrhythmias when saquinavir given with • ALFENTANIL, • FENTANYL or
 - METHADONE—avoid concomitant use
- Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir given with • AMIODARONE, • DISOPYRAMIDE,
 - DRONEDARONE, FLECAINIDE, LIDOCAINE OR
 - PROPAFENONE—avoid concomitant use
- Antibacterials: plasma concentration of both drugs possibly increased when saquinavir given with ◆CLARITHROMYCIN (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir given with
- DAPSONE, ERYTHROMYCIN Or MOXIFLOXACIN—avoid concomitant use; saquinavir increases plasma concentration of RIFABUTIN (also plasma concentration of saquinavir reduced)—reduce rifabutin dose; plasma concentration of saquinavir significantly reduced by RIFAMPICIN, also risk of hepatotoxicity—avoid concomitant use; increased risk of ventricular arrhythmias when saquinavir given with
- DELAMANID; plasma concentration of both drugs may increase when saquinavir given with FUSIDIC ACID; avoidance of saquinavir advised by manufacturer of • TELITHROMYCIN (risk of ventricular arrhythmias)
- Anticoagulants: saquinavir possibly enhances anticoagulant effect of WARFARIN; avoidance of saquinavir advised by manufacturer of APIXABAN and RIVAROXABAN
- Antidepressants: increased risk of ventricular arrhythmias when saquinavir given with ● TRAZODONE OF ● TRICYCLICS avoid concomitant use; plasma concentration of saquinavir reduced by ● ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of saquinavir possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, ● PHENOBARBITAL, PHENYTOIN and ● PRIMIDONE
- Antifungals: plasma concentration of saquinavir increased by
 KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of saquinavir possibly increased by IMIDAZOLES and TRNAZOLES
- Antihistamines: increased risk of ventricular arrhythmias when saquinavir given with • MIZOLASTINE—avoid concomitant use
- Antimalariais: caution with saquinavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; avoidance of saquinavir advised by manufacturer of ◆ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir given with ◆ QUININE—avoid concomitant use
- Antimuscarinics: avoidance of saquinavir advised by manufacturer of DARHEMACIN and TOLTERODINE; manufacturer of fesoterodine advises dose reduction when saquinavir given with FESOTERODINE—consult fesoterodine product literature
- Antipsychotics: increased risk of ventricular arrhythmias when saquinavir given with CLOZAPINE, HALOPERIDOL or
 PHENOTHIAZINES—avoid concomitant use; saquinavir possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); saquinavir possibly increases plasma concentration of LURASIDONE—avoid concomitant use; saquinavir possibly increases plasma concentration of
 PIMOZIDE (increased risk of ventricular arrhythmias—avoid
 - PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir possibly increases plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: increased risk of ventricular arrhythmias when saquinavir given with • ATAZAMAVIR OR
 • LOPINAVIR—avoid concomitant use; saquinavir reduces plasma concentration of DARUMAVIR; plasma concentration of saquinavir significantly

Saguinavir

- Antivirals (continued)
- reduced by EFAVIRENZ; plasma concentration of saquinavir increased by INDINAVIR and RITONAVIR; saquinavir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); plasma concentration of saquinavir reduced by TIPRANAVIR
- Avanafil: saquinavir possibly increases plasma concentration of ◆ AVANAFIL — manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with • SOTALOL—avoid concomitant use
- Corticosteroids: plasma concentration of saquinavir possibly reduced by DEXAMETHASONE
- Cytotoxics: saquinavir possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours; saquinavir possibly increases plasma concentration of AXITINIB (reduce dose of axitinib—consult axitinib product literature); saquinavir possibly increases the plasma concentration of BOSUTINIB and CABAZITAXEL—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly increases plasma concentration of CRIZOTINIB and EVEROLIMUS—manufacturer of crizotinib and everolimus advises avoid concomitant use; saquinavir possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of saquinavir advised by manufacturer of
 - LAPATINIB; increased risk of ventricular arrhythmias when saquinavir given with PAZOPANIB—avoid concomitant use; saquinavir possibly increases plasma concentration of PONATINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when saquinavir given with RUXOLITINIB—consult ruxolitinib product literature; saquinavir possibly increases plasma concentration of DOCETAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Dapoxetine: avoidance of saquinavir advised by manufacturer of • DAPOXETINE (increased risk of toxicity)
- ► Diuretics: saquinavir increases plasma concentration of EPLERENONE (reduce dose of eplerenone)
- Domperidone: possible increased risk of ventricular arrhythmias when saquinavir given with • DOMPERIDONE avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when saquinavir given with • ERGOTAMINE—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with ATORVASTATIN; possible increased risk of myopathy when saquinavir given with
 - ROSUVASTATIN—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with SIMVASTATIN (avoid concomitant use); avoidance of saquinavir advised by manufacturer of
 - LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of saquinavir possibly reduced by
 ORLISTAT
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when saquinavir given with • PENTAMIDINE ISETIONATE—avoid concomitant use
- Ranolazine: saquinavir possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: increased risk of ventricular arrhythmias when saquinavir given with • SILDENAFIL—avoid concomitant use
- · Tacrolimus: saquinavir increases plasma concentration of
 - TACROLIMUS (consider reducing dose of tacrolimus)
- Tadalafil: increased risk of ventricular arrhythmias when saquinavir given with • TADALAFIL—avoid concomitant use

Saguinavir (continued)

- · Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by CIMETIDINE; plasma concentration of saguinavir possibly increased by • ESOMEPRAZOLE,
 - LANSOPRAZOLE, PANTOPRAZOLE and RABEPRAZOLE manufacturer of saguinavir advises avoid concomitant use; plasma concentration of saquinavir increased by
 - OMEPRAZOLE—manufacturer of saquinavir advises avoid
- · Vardenafil: increased risk of ventricular arrhythmias when saguinavir given with • VARDENAFIL—avoid concomitant use Saxagliptin see Antidiabetics

Selegiline

- NOTE Selegiline is a MAO-B inhibitor
- Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with • PETHIDINE (avoid concomitant use); manufacturer of selegiline advises avoid concomitant use with opioid analgesics
- · Antidepressants: manufacturer of selegiline advises avoid concomitant use with CITALOPRAM and ESCITALOPRAM; increased risk of hypertension and CNS excitation when selegiline given with • FLUOXETINE (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with • FLUVOXAMINE, • SERTRALINE Or • VENLAFAXINE (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with • PAROXETINE (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with . MAOISmanufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with • MOCLOBEMIDE; CNS toxicity reported when selegiline given with • TRICYCLICS
- Dopaminergics: selegiline enhances effects and increases toxicity of CO-BENELDOPA, CO-CARELDOPA or LEVODOPA (reduce dose of co-beneldopa, co-careldopa or levodopa); max. dose of 10 mg selegiline advised by manufacturer of ENTACAPONE if used concomitantly
- 5HT₁-receptor Agonists: manufacturer of selegiline advises avoid concomitant use with 5HT, AGONISTS
- Memantine: effects of dopaminergics and selegiline possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- · Oestrogens: plasma concentration of selegiline increased by • OESTROGENS—manufacturer of selegiline advises avoid
- · Progestogens: plasma concentration of selegiline increased by • PROGESTOGENS—manufacturer of selegiline advises avoid concomitant use
- · Sympathomimetics: manufacturer of selegiline advises avoid concomitant use with SYMPATHOMIMETICS; risk of hypertensive crisis when selegiline given with • DOPAMINE

Selenium

- Eltrombopag: selenium possibly reduces absorption of ELTROMBOPAG (give at least 4 hours apart)
- Vitamins: absorption of selenium possibly reduced by ASCORBIC ACID (give at least 4 hours apart)

Sertraline see Antidepressants, SSRI

- Antibacterials: sevelamer reduces bioavailability of CIPROFLOXACIN
- Ciclosporin: sevelamer possibly reduces plasma concentration of CICLOSPORIN
- Mycophenolate: sevelamer possibly reduces plasma concentration of MYCOPHENOLATE
- Tacrolimus: sevelamer possibly reduces plasma concentration of tacrolimus
- Thyroid Hormones: sevelamer possibly reduces absorption of

Sevelamer (continued)

▶ Vitamins: sevelamer reduces absorption of CALCITRIOL (give at least 1 hour before or 3 hours after sevelamer)

Sevoflurane see Anaesthetics, General

- Alpha-blockers: enhanced hypotensive effect when sildenafil given with • ALPHA-BLOCKERS (avoid alpha-blockers for 4 hours after sildenafil)—when patient is stable on the alpha blocker initiate sildenafil at the lowest possible dose
- Anti-arrhythmics: avoidance of sildenafil advised by manufacturer of DISOPYRAMIDE (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of sildenafil increased by CLARITHROMYCIN—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; plasma concentration of sildenafil increased by ERYTHROMYCINreduce initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to twice daily for pulmonary hypertension; plasma concentration of sildenafil possibly increased by • TELITHROMYCIN—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension
- Antifungals: plasma concentration of sildenafil increased by • KETOCONAZOLE—reduce initial dose of sildenafil for erectile dysfunction and avoid concomitant use of sildenafil for pulmonary hypertension; plasma concentration of sildenafil increased by ITRACONAZOLE—reduce initial dose of sildenafil
- · Antivirals: side-effects of sildenafil possibly increased by • ATAZANAVIR; plasma concentration of sildenafil reduced by ETRAVIRINE; plasma concentration of sildenafil possibly increased by FOSAMPRENAVIR; plasma concentration of sildenafil increased by • INDINAVIR—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by • RITONAVIR—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with • SAQUINAVIR—avoid concomitant use; avoidance of sildenafil
- advised by manufacturer of . TELAPREVIR; avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of TIPRANAVIR
- Bosentan: plasma concentration of sildenafil reduced by BOSENTAN, also plasma concentration of bosentan increased
- Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with AMLODIPINE
- Cobicistat: plasma concentration of sildenafil possibly increased by • COBICISTAT—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction-consult cobicistat product literature
- Cytotoxics: avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of IDELALISIB
- Dapoxetine: avoidance of sildenafil advised by manufacturer of DAPOXETINE
- Grapefruit Juice: plasma concentration of sildenafil possibly increased by GRAPEFRUIT JUICE
- Nicorandil: sildenafil significantly enhances hypotensive effect of • NICORANDIL (avoid concomitant use)
- · Nitrates: sildenafil significantly enhances hypotensive effect of • NITRATES (avoid concomitant use)
- Riociguat: enhanced hypotensive effect when sildenafil given with . RIOCIGUAT-avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of sildenafil increased by CIMETIDINE—consider reducing dose of sildenafil for erectile dysfunction

Siltuximah

- Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- · Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use Simenrevir

- · Anti-arrhythmics: possible increased risk of bradycardia when simeprevir (with sofosbuvir) given with • AMIODARONE—see under Amiodarone, p. 88
- Antibacterials: plasma concentration of simeprevir possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN—

Simeprevir

- · Antibacterials (continued)
 - manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs increased when simeprevir given with • ERYTHROMYCIN-manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir possibly reduced by RIFABUTINmanufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir reduced by
 - RIFAMPICIN—manufacturer of simeprevir advises avoid concomitant use
- Antidepressants: plasma concentration of simeprevir possibly reduced by • ST JOHN'S WORT-manufacturer of simeprevir advises avoid concomitant use
- Antiepileptics: plasma concentration of simeprevir possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN,
 - OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and • PRIMIDONE—manufacturer of simeprevir advises avoid
- concomitant use · Antifungals: manufacturer of simeprevir advises avoid concomitant use with • KETOCONAZOLE; plasma concentration
- of simeprevir possibly increased by FLUCONAZOLE, • ITRACONAZOLE, • POSACONAZOLE and • VORICONAZOLE—
- manufacturer of simeprevir advises avoid concomitant use • Antivirals: plasma concentration of both drugs increased when simeprevir given with . DARUNAVIR-manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir reduced by EFAVIRENZ; manufacturer of simeprevir advises avoid concomitant use with ETRAVIRINE; plasma concentration of simeprevir possibly reduced by • NEVIRAPINE—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir increased by • RITONAVIR—manufacturer of simeprevir advises avoid concomitant use
- Anxiolytics and Hypnotics: simeprevir increases plasma concentration of oral MIDAZOLAM
- Cardiac Glycosides: simeprevir increases plasma concentration
- Cobicistat: plasma concentration of simeprevir possibly increased by • COBICISTAT—manufacturer of simeprevir advises avoid concomitant use
- Corticosteroids: plasma concentration of simeprevir possibly reduced by DEXAMETHASONE-manufacturer of simeprevir advises avoid concomitant use
- ▶ Lipid-regulating Drugs: simeprevir increases plasma concentration of ATORVASTATIN, ROSUVASTATIN and SIMVASTATIN (consider reducing dose of atorvastatin, rosuvastatin and simvastatin)

Simvastatin see Statins

Sirolimus

- Anti-arrhythmics: caution with sirolimus advised by manufacturer of DRONEDARONE
- · Antibacterials: plasma concentration of sirolimus increased by ◆ CLARITHROMYCIN and ◆ TELITHROMYCIN—avoid concomitant use: plasma concentration of both drugs increased when sirolimus given with • ERYTHROMYCIN; plasma concentration of sirolimus reduced by • RIFABUTIN and • RIFAMPICIN—avoid concomitant use
- · Antifungals: plasma concentration of sirolimus increased by • ITRACONAZOLE, • KETOCONAZOLE and • VORICONAZOLE—avoid concomitant use; plasma concentration of sirolimus increased by MICAFUNGIN and • MICONAZOLE; plasma concentration of sirolimus possibly increased by FLUCONAZOLE and POSACONAZOLE
- Antivirals: plasma concentration of sirolimus possibly increased by • ATAZANAVIR and LOPINAVIR; plasma concentration of sirolimus increased by • BOCEPREVIR (increased risk of toxicity-reduce sirolimus dose); plasma concentration of both drugs increased when sirolimus given with • TELAPREVIR (reduce dose of sirolimus)
- Calcium-channel Blockers: plasma concentration of sirolimus possibly increased by NICARDIPINE; plasma concentration of sirolimus increased by • DILTIAZEM; plasma concentration of both drugs increased when sirolimus given with • VERAPAMIL

Sirolimus (continued)

- Ciclosporin: plasma concentration of sirolimus increased by CICLOSPORIN
- . Cytotoxics: caution with sirolimus advised by manufacturer of CRIZOTINIB
- Grapefruit Juice: plasma concentration of sirolimus increased by • GRAPEFRUIT JUICE—avoid concomitant use

Sitagliptin see Antidiabetics Smallpox Vaccine see Vaccines

Sodium Aurothiomalate

- · ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with • ACE INHIBITORS
- Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of PENICILLAMINE (increased risk of toxicity)

- Antiepileptics: effects of sodium benzoate possibly reduced by SODIUM VALPROATE and VALPROIC ACID
- Antipsychotics: effects of sodium benzoate possibly reduced by HALOPERIDOL
- Corticosteroids: effects of sodium benzoate possibly reduced by CORTICOSTEROIDS

Sodium Bicarbonate see Antacids

Sodium Citrate

- Antibacterials: avoid concomitant use of sodium citrate with METHENAMINE
- Ulcer-healing Drugs: avoidance of sodium citrate advised by manufacturer of SUCRALFATE

Sodium Clodronate see Bisphosphonates

Sodium Ferredate see Iron salts

Sodium Nitroprusside see Vasodilator Antihypertensives

Sodium Oxybate

- Analgesics: effects of sodium oxybate enhanced by OPIOID ANALGESICS (avoid concomitant use)
- Antidepressants: increased risk of side-effects when sodium oxybate given with TRICYCLICS
- · Antiepileptics: manufacturer of sodium oxybate advises avoid concomitant use with PHENOBARBITAL and PRIMIDONE; plasma concentration of sodium oxybate increased by . SODIUM VALPROATE and • VALPROIC ACID (see under Sodium Oxybate, p. 425)
- Antipsychotics: effects of sodium oxybate possibly enhanced by antipsychotics
- · Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by • BENZODIAZEPINES (avoid concomitant use)

Sodium Phenylbutyrate

- Antiepileptics: effects of sodium phenylbutyrate possibly reduced by SODIUM VALPROATE and VALPROIC ACID
- Antipsychotics: effects of sodium phenylbutyrate possibly reduced by HALOPERIDOL
- Corticosteroids: effects of sodium phenylbutyrate possibly reduced by CORTICOSTEROIDS

Sodium Stibogluconate

• Antifungals: possible increased risk of arrhythmias when sodium stibogluconate given before • AMPHOTERICINmanufacturer of sodium stibogluconate advises giving 14 days apart

Sodium Valproate

- ► Analgesics: effects of sodium valproate enhanced by ASPIRIN
- Antibacterials: metabolism of sodium valproate possibly inhibited by ERYTHROMYCIN (increased plasma concentration); avoidance of sodium valproate advised by manufacturer of
 - PIVMECILLINAM; plasma concentration of sodium valproate reduced by • CARBAPENEMS—avoid concomitant use
- Anticoagulants: sodium valproate possibly enhances anticoagulant effect of COUMARINS
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered): anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of sodium valproate reduced by CARBAMAZEPINE, also plasma concentration of active metabolite of carbamazepine increased; sodium valproate possibly increases plasma concentration of ETHOSUXIMIDE; sodium valproate increases or possibly

Sodium Valproate

- Antiepileptics (continued)
 - decreases plasma concentration of FOSPHENYTOIN and PHENYTOIN, also plasma concentration of sodium valproate reduced; sodium valproate increases plasma concentration of
- LAMOTRIGINE (increased risk of toxicity—reduce lamotrigine dose); sodium valproate sometimes reduces plasma concentration of an active metabolite of OXCARBAZEPINE; sodium valproate increases plasma concentration of PHENOBARBITAL and PRIMIDONE (also plasma concentration of sodium valproate reduced); sodium valproate possibly increases plasma concentration of RUE-INAMIDE (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when sodium valproate given with TOPIRAMATE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● ANTIPSYCHOTICS (convulsive threshold lowered); sodium valproate possibly increases or decreases plasma concentration of CLOZAPINE; increased risk of sideeffects including neutropenia when sodium valproate given with ● OLANZAPINE
- Antivirals: plasma concentration of sodium valproate possibly reduced by RITONAVIR; sodium valproate possibly increases plasma concentration of ZIDOVUDINE (increased risk of toxicity)
- Anxiolytics and Hypnotics: plasma concentration of sodium valproate possibly increased by CLOBAZAM; increased risk of side-effects when sodium valproate given with CLONAZEPAM; sodium valproate possibly increases plasma concentration of DIAZEPAM and LORAZEPAM
- Bupropion: sodium valproate inhibits the metabolism of BUPROPION
- Cytotoxics: sodium valproate increases plasma concentration of TEMOZOLOMIDE
- Lipid-regulating Drugs: absorption of sodium valproate possibly reduced by COLESTYRAMINE
- Oestrogens: plasma concentration of sodium valproate possibly reduced by ETHINYLESTRADIOL
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Sodium Benzoate: sodium valproate possibly reduces effects of SODIUM BENZOATE
- Sodium Oxybate: sodium valproate increases the plasma concentration of ◆SODIUM OXYBATE (see under Sodium Oxybate, p. 425)
- Sodium Phenylbutyrate: sodium valproate possibly reduces effects of SODIUM PHENYLBUTYRATE
- Ulcer-healing Drugs: metabolism of sodium valproate inhibited by • CIMETIDINE (increased plasma concentration)

Sofosbuvir

- Anti-arrhythmics: possible increased risk of bradycardia when sofosbuvir given with • AMIODARONE—see under Amiodarone, p. 88
- Antibacterials: manufacturer of sofosbuvir advises avoid concomitant use with RIFABUTIN and RIFAMPICIN
- Antidepressants: manufacturer of sofosbuvir advises avoid concomitant use with ST JOHN'S WORT
- Antiepileptics: manufacturer of sofosbuvir advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and PRIMIDONE

Solifenacin see Antimuscarinics

Somatropin

- ► Corticosteroids: growth-promoting effect of somatropin may be inhibited by CORTICOSTEROIDS
- Oestrogens: increased doses of somatropin may be needed when given with OESTROGENS (when used as oral replacement therapy)

Sorafenib

- ► Antibacterials: bioavailability of sorafenib reduced by NEOMYCIN; plasma concentration of sorafenib reduced by RIFAMPICIN
- Anticoagulants: sorafenib possibly enhances anticoagulant effect of • COUMARINS

Sorafenib (continued)

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- CLOZAPINE (Increased risk of agranulocytosis)
- Antivirals: avoidance of sorafenib advised by manufacturer of
 BOCEPREVIR
- Cytotoxics: sorafenib increases plasma concentration of DOCETAXEL and DOXORUBICIN; sorafenib possibly increases plasma concentration of IRINOTECAN

Sotalol see Beta-blockers

Spironolactone see Diuretics

Statins

- ► Antacids: absorption of rosuvastatin reduced by ANTACIDS
- Anti-arrhythmics: increased risk of myopathy when simvastatin given with AMMODARONE (see under Simvastatin, p. 181); plasma concentration of rosuvastatin increased by
 DRONEDARONE—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when simvastatin given with DRONEDARONE; plasma concentration of atorvastatin possibly increased by DRONEDARONE
- Antibacterials: plasma concentration of atorvastatin and pravastatin increased by • CLARITHROMYCIN; increased risk of myopathy when simvastatin given with • CLARITHROMYCIN, • ERYTHROMYCIN or • TELITHROMYCIN (avoid concomitant use); plasma concentration of rosuvastatin reduced by ERYTHROMYCIN: possible increased risk of myopathy when atorvastatin given with ERYTHROMYCIN; plasma concentration of pravastatin increased by ERYTHROMYCIN; plasma concentration of atorvastatin and simvastatin possibly reduced by RIFAMPICIN; metabolism of fluvastatin accelerated by RIFAMPICIN (reduced effect); increased risk of myopathy when statins given with • DAPTOMYCIN (preferably avoid concomitant use); risk of myopathy and rhabdomyolysis when stating given with • FUSIDIC ACID—avoid concomitant use and for 7 days after last fusidic acid dose; increased risk of myopathy when atorvastatin given with • TELITHROMYCIN (avoid concomitant use); possible increased risk of myopathy when pravastatin given with TELITHROMYCIN
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of WARFARIN; rosuvastatin possibly enhances anticoagulant effect of • COUMARINS and
- PHENINDIONE; simvastatin can enhance the anticoagulant effect of COUMARINS; fluvastatin enhances anticoagulant effect of ◆ COUMARINS
- ► Antidepressants: plasma concentration of simvastatin reduced
- Antidiabetics: fluvastatin possibly increases plasma concentration of GLIBENCLAMIDE
- Antiepileptics: plasma concentration of simvastatin reduced by
 CARBAMAZEPINE and ESLICARBAZEPINE—consider increasing dose of simvastatin; plasma concentration of rosuvastatin reduced by ESLICARBAZEPINE; combination of fluvastatin with FOSPHENYTOIN or PHENYTOIN may increase plasma concentration of either drug (or both)
- Antifungals: possible increased risk of myopathy when atorvastatin given with • KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; increased risk of myopathy when simvastatin given with • ITRACONAZOLE,
 - KETOCONAZOLE Or POSACONAZOLE (avoid concomitant use); possible increased risk of myopathy when simvastatin given with FLUCONAZOLE or MICONAZOLE; possible increased risk of myopathy when atorvastatin given with FLUCONAZOLE or IMDAZOLES; plasma concentration of fluvastatin increased by FLUCONAZOLE—possible increased risk of myopathy; plasma concentration of rosuvastatin increased by ITRACONAZOLE—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atorvastatin given with
- ITRACONAZOLE,
 POSACONAZOLE or
 VORICONAZOLE;
 increased risk of myopathy when simvastatin given with
 VORICONAZOLE
- Antivirals: possible increased risk of myopathy when atorvastatin or pravastatin given with ATAZANAVIR; plasma concentration of rosuvastatin increased by ATAZANAVIR,
 DARUNAVIR, LOPINAVIR and TIPRANAVIR—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when simvastatin given with ATAZANAVIR,

Ctating

- · Antivirals (continued)
- INDINAVIR, RITONAVIR or SAQUINAVIR (avoid concomitant use); plasma concentration of pravastatin increased by BOCEPREVIR; plasma concentration of atorvastatin increased by BOCEPREVIR (reduce dose of atorvastatin); manufacturers advise avoid concomitant use of simvastatin with
- BOCEPREVIR and TELAPREVIR; plasma concentration of rosuvastatin increased by DACLATASVIR; plasma concentration of pravastatin possibly increased by DARUNAVIR; possible increased risk of myopathy when atorvastatin given with DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR or SAQUINAVIR; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by EFAVIRENE; plasma concentration of atorvastatin possibly reduced by ETRAVIRINE; possible increased risk of myopathy when rosuvastatin given
- with FOSAMPRENAVIR, INDINAVIR, RITONAVIR and
 SAQUINAVIR—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when simvastatin given with FOSAMPRENAVIR or LOPINAVIR— avoid concomitant use; plasma concentration of atorvastatin, rosuvastatin and simvastatin increased by SIMEPREVIR (consider reducing dose of atorvastatin, rosuvastatin and simvastatin); avoidance of atorvastatin advised by manufacturer of TELAPREVIR; plasma concentration of simvastatin possibly increased by TIPRANAVIR—avoid concomitant use; increased risk of myopathy when

atorvastatin given with • TIPRANAVIR (see under Atorvastatin,

- p. 179)
 Anxiolytics and Hypnotics: atorvastatin possibly increases plasma concentration of MIDAZOLAM
- Bosentan: plasma concentration of simvastatin reduced by
- Calcium-channel Blockers: possible increased risk of myopathy
 when simvastatin given with ◆ AMLODIPINE and ◆ DILTIAZEM
 (see under Simvastatin, p. 181); plasma concentration of
 atorvastatin increased by DILTIAZEM—possible increased risk
 of myopathy; increased risk of myopathy when simvastatin
 given with ◆ VERAPAMIL (see under Simvastatin, p. 181);
 atorvastatin increases plasma concentration of ◆ VERAPAMIL,
 also possible increased risk of myopathy (consider reducing
 dose of atorvastatin)
- Cardiac Glycosides: atorvastatin possibly increases plasma concentration of DIGOXIN
- Ciclosporin: increased risk of myopathy when rosuvastatin or simvastatin given with CICLOSPORIN (avoid concomitant use); increased risk of myopathy when atorvastatin given with CICLOSPORIN (see under Atorvastatin, p. 179); increased risk of myopathy when fluvastatin or pravastatin given with CICLOSPORIN
- Clopidogrel: plasma concentration of rosuvastatin increased by • CLOPIDOGREL—adjust dose of rosuvastatin (consult product literature)
- Cobicistat: plasma concentration of atorvastatin possibly increased by COBICISTAT—manufacturer of cobicistat advises reduce dose of atorvastatin; avoidance of simvastatin advised by manufacturer of ◆ COBICISTAT
- \bullet Colchicine: possible increased risk of myopathy when statins given with \bullet COLCHICINE
- Cytotoxics: plasma concentration of simvastatin possibly increased by DASATINIB; avoidance of simvastatin advised by manufacturer of IDELALISIB; plasma concentration of simvastatin increased by IMATINIB
- Eltrombopag: plasma concentration of rosuvastatin increased by • ELTROMBOPAG—adjust dose of rosuvastatin (consult product literature)
- Grapefruit Juice: plasma concentration of atorvastatin possibly increased by GRAPEFRUIT JUICE; plasma concentration of simvastatin increased by GRAPEFRUIT JUICE—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with • DANAZOL—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when simvastatin given with • BEZAFIBRATE (see under Simvastatin, p. 181); possible increased risk of myopathy

Stating

- Lipid-regulating Drugs (continued) when simvastatin given with • CIPROFIBRATE (see under Simvastatin, p. 181); when given with statins reduce maximum dose of FENOFIBRATE—see under Fenofibrate, p. 175; increased risk of myopathy when atorvastatin, fluvastatin or pravastatin given with • GEMFIBROZIL (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with . GEMFIBROZIL (avoid concomitant use); plasma concentration of rosuvastatin increased by • EZETIMIBE—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when statins given with . FIBRATES; increased risk of myopathy when rosuvastatin given with . FIBRATES (see under Rosuvastatin, p. 180); plasma concentration of simvastatin increased by • LOMITAPIDE (see under Simvastatin, p. 181); plasma concentration of atorvastatin increased by LOMITAPIDE—manufacturer of lomitapide advises reduce dose of atorvastatin by half or separate administration by 12 hours; increased risk of myopathy when statins given with
- NICOTINIC ACID (applies to lipid regulating doses of nicotinic acid)
- Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ETHINYLESTRADIOL
- Progestogens: atorvastatin increases plasma concentration of NORETHISTERONE; rosuvastatin increases plasma concentration of active metabolite of NORGESTIMATE; rosuvastatin increases plasma concentration of NORGESTREL
- Ranolazine: plasma concentration of simvastatin increased by
 RANOLAZINE (see under Simvastatin, p. 181)
- Retinoids: plasma concentration of simvastatin reduced by ALITRETINOIN
- Teriflunomide: plasma concentration of rosuvastatin increased by • TERIFLUNOMIDE (consider reducing dose of rosuvastatin)
- Ticagrelor: plasma concentration of simvastatin increased by
 TICAGRELOR (increased risk of toxicity)

Stavudine

- Antivirals: increased risk of side-effects when stavudine given
 with DIDANOSINE; increased risk of toxicity when stavudine
 given with RIBAVIRIN; effects of stavudine possibly inhibited
 by ZIDOVUDINE (manufacturers advise avoid concomitant
 IISE)
- Cytotoxics: effects of stavudine possibly inhibited by DOXORUBICIN; increased risk of toxicity when stavudine given with • HYDROXYCARBAMIDE—avoid concomitant use
- Orlistat: absorption of stavudine possibly reduced by
 ORLISTAT

Stiripentol

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ◆TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ◆SSRIS and ◆TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: stiripentol increases plasma concentration of
 - CARBAMAZEPINE, ◆ FOSPHENYTOIN, ◆ PHENOBARBITAL,
 ◆ PHENYTOIN and ◆ PRIMIDONE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Anxiolytics and Hypnotics: stiripentol increases plasma concentration of CLOBAZAM
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Streptomycin see Aminoglycosides

Strontium Ranelate

► Antibacterials: strontium ranelate reduces absorption of QUINOLONES and TETRACYCLINES (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate

- Aminophylline: sucralfate possibly reduces absorption of AMINOPHYLLINE (give at least 2 hours apart)
- Antibacterials: sucralfate reduces absorption of CIPROFLOXACIN, LEVOFLOXACIN, MOXIFLOXACIN, OFLOXACIN and TETRACYCLINES;

Sucralfato

Antibacterials (continued)

sucralfate reduces absorption of ${\tt NORFLOXACIN}$ (give at least 2 hours apart)

- Anticoagulants: sucralfate possibly reduces absorption of
 COUMARINS (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of FOSPHENYTOIN and ● PHENYTOIN
- ► Antifungals: sucralfate reduces absorption of KETOCONAZOLE
- Antipsychotics: sucralfate reduces absorption of SULPIRIDE
 Cardiac Glycosides: sucralfate possibly reduces absorption of
- CARDIAC GLYCOSIDES

 Potassium Salts: manufacturer of sucralfate advises avoid
- concomitant use with POTASSIUM CITRATE

 Sodium Citrate: manufacturer of sucralfate advises avoid
- concomitant use with SODIUM CITRATE

 Theophylline: sucralfate possibly reduces absorption of
- THEOPHYLLINE (give at least 2 hours apart)

 Thyroid Hormones: sucralfate reduces absorption of
- LEVOTHYROXINE

 Ulcer-healing Drugs: sucralfate possibly reduces absorption of LANSOPRAZOLE

Sugammadex

- Antibacterials: response to sugammadex possibly reduced by FUSIDIC ACID
- Progestogens: sugammadex possibly reduces plasma concentration of PROGESTOGENS—manufacturer of sugammadex advises additional contraceptive precautions Sulfadiazine see Sulfonamides

Sulfadoxine see Sulfonamides

Sulfamethoxazole see Sulfonamides

Sulfasalazine

- Cardiac Glycosides: sulfasalazine possibly reduces absorption of DIGOXIN
- Folates: sulfasalazine possibly reduces absorption of FOLIC ACID

Sulfinpyrazone

- Aminophylline: sulfinpyrazone reduces plasma concentration of AMINOPHYLLINE
- ▶ Analgesics: effects of sulfinpyrazone antagonised by ASPIRIN
- Antibacterials: sulfinpyrazone reduces excretion of NITROFURANTOIN (increased risk of toxicity); sulfinpyrazone reduces excretion of PENICILLINS; effects of sulfinpyrazone antagonised by PYRAZINAMIDE
- Anticoagulants: increased risk of bleeding when sulfinpyrazone given with APIXABAN; sulfinpyrazone enhances anticoagulant effect of COUMARINS; possible increased risk of bleeding when sulfinpyrazone given with DABIGATRAN
- Antidiabetics: sulfinpyrazone enhances effects of
- SULFONYLUREAS
- Antiepileptics: sulfinpyrazone increases plasma concentration of ● FOSPHENYTOIN and ● PHENYTOIN
- Calcium-channel Blockers: sulfinpyrazone reduces plasma concentration of VERAPAMIL
- Ciclosporin: sulfinpyrazone reduces plasma concentration of
 CICLOSPORIN
- ► Theophylline: sulfinpyrazone reduces plasma concentration of THEOPHYLLINE

Sulfonamides

- ► Anaesthetics, General: sulfonamides enhance effects of THIOPENTAL
- Anaesthetics, Local: effects of sulfonamides possibly inhibited by © CHLOROPROCAINE (manufacturer of chloroprocaine advises avoid concomitant use); increased risk of methaemoglobinaemia when sulfonamides given with PRILOCAINE
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with AMIODARONE—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
- Antibacterials: increased risk of crystalluria when sulfonamides given with • METHENAMINE

Sulfonamides (continued)

- Anticoagulants: sulfonamides enhance anticoagulant effect of
 COUMARINS; sulfonamides possibly inhibit metabolism of
 PHENINDIONE
- Antidiabetics: sulfonamides rarely enhance the effects of SULFONYLUREAS
- Antiepileptics: sulfonamides possibly increase plasma concentration of FOSPHENYTOIN and PHENYTOIN
- Antimalarials: increased antifolate effect when sulfonamides given with • PYRIMETHAMINE
- Antipsychotics: avoid concomitant use of sulfonamides with
 CLOZAPINE (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with
 AZATHIOPRINE
- Ciclosporin: increased risk of nephrotoxicity when sulfonamides given with ● CICLOSPORIN; sulfadiazine possibly reduces plasma concentration of ● CICLOSPORIN
- Cytotoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with
- MERCAPTOPURINE or METHOTREXATE; sulfonamides increase risk of METHOTREXATE toxicity
- Potassium Aminobenzoate: effects of sulfonamides inhibited by POTASSIUM AMINOBENZOATE
- ▶ Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Sulfonylureas see Antidiabetics

Sulindac see NSAIDs

Sulpiride see Antipsychotics

Sumatriptan see 5HT₁-receptor Agonists (under HT) **Sunitinib**

- Antibacterials: metabolism of sunitinib accelerated by RIFAMPICIN (reduced plasma concentration)
- Antifungals: metabolism of sunitinib inhibited by KETOCONAZOLE (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytotoxics with
 - CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of sunitinib advised by manufacturer of
 BOCEPREVIR

Suxamethonium see Muscle Relaxants

Sympathomimetics

- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypotensive effect of ◆ ADRENERGIC REURONE BLOCKERS; dexamfetamine and lisdexamfetamine antagonise hypotensive effect of ◆ GUANETHIDINE; increased risk of hypertension when adrenaline (epinephrine) given with ◆ GUANETHIDINE
- Alcohol: effects of methylphenidate possibly enhanced by ALCOHOL
- Alpha₂-adrenoceptor Stimulants: avoidance of sympathomimetics advised by manufacturer of APRACLONIDINE
- Alpha-blockers: avoid concomitant use of adrenaline (epinephrine) or dopamine with ● TOLAZOLINE
- Aminophylline: avoidance of ephedrine in children advised by manufacturer of AMINOPHYLLINE
- Anaesthetics, General: avoidance of sympathomimetics advised by manufacturer of ● ISOFLURANE (risk of ventricular arrhythmias); increased risk of arrhythmias when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with
- ◆VOLATILE LIQUID GENERAL ANAESTHETICS; increased risk of hypertension when methylphenidate given with
 ◆VOLATILE LIQUID GENERAL ANAESTHETICS
- ► Antacids: absorption of pseudoephedrine possibly increased by ALUMINIUM HYDROXIDE
- Anticoagulants: methylphenidate possibly enhances anticoagulant effect of • COUMARINS
- Antidepressants: risk of hypertensive crisis when adrenaline (epinephrine), dobutamine, dopamine, noradrenaline (norepinephrine) or xylometazoline given with • MAOIS; risk of hypertensive crisis when dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol,

Sympathomimetics

- · Antidepressants (continued) methylphenidate, phenylephrine or pseudoephedrine given with • MAOIS, avoid dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when oxymetazoline given with . MAOIS, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when sympathomimetics given with • MOCLOBEMIDE; methylphenidate possibly inhibits metabolism of SSRIs and TRICYCLICS; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with • TRICYCLICS (but local anaesthetics with adrenaline appear to be safe); increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) or phenylephrine given with TRICYCLICS
- Antiepileptics: methylphenidate increases plasma concentration of FOSPHENYTOIN and PHENYTOIN; methylphenidate possibly increases plasma concentration of PHENOBARBITAL and PRIMIDONE
- Antipsychotics: hypertensive effect of sympathomimetics antagonised by ANTIPSYCHOTICS; effects of lisdexamfetamine possibly reduced by CHLORPROMAZINE; dexamfetamine possibly antagonises antipsychotic effects of CHLORPROMAZINE; methylphenidate possibly increases sideeffects of RISPERIDONE
- Antivirals: plasma concentration of dexamfetamine possibly increased by RITONAVIR
- · Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with noncardioselective • BETA-BLOCKERS, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective • BETA-BLOCKERS; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective • BETA-BLOCKERS
- Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with CLONIDINE; serious adverse events reported with concomitant use of methylphenidate and • CLONIDINE (causality not established)
- ▶ Corticosteroids: ephedrine accelerates metabolism of DEXAMETHASONE
- Dopaminergics: risk of toxicity when isometheptene given with • BROMOCRIPTINE; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by ENTACAPONE; avoid concomitant use of sympathomimetics with • RASAGILINE; avoidance of sympathomimetics advised by manufacturer of SELEGILINE; risk of hypertensive crisis when dopamine given with SELEGILINE
- Doxapram: increased risk of hypertension when
- sympathomimetics given with DOXAPRAM
- Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with ERGOTAMINE
- Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with OXYTOCIN (due to enhanced vasopressor effect)
- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by • DOPEXAMINE; dopexamine possibly enhances effects of ● NORADRENALINE (NOREPINEPHRINE)
- Theophylline: avoidance of ephedrine in children advised by manufacturer of THEOPHYLLINE
- Ulcer-healing Drugs: metabolism of dobutamine possibly inhibited by CIMETIDINE

Sympathomimetics, Beta₂

- Aminophylline: increased risk of hypokalaemia when high doses of beta2 sympathomimetics given with AMINOPHYLLINE
- Antifungals: plasma concentration of olodaterol increased by KETOCONAZOLE; metabolism of salmeterol inhibited by
- KETOCONAZOLE (increased plasma concentration)
- · Antivirals: avoidance of salmeterol advised by manufacturer of LOPINAVIR, RITONAVIR and TIPRANAVIR; avoidance of

Sympathomimetics, Beta,

- · Antivirals (continued) salmeterol advised by manufacturer of • TELAPREVIR (risk of ventricular arrhythmias)
- Atomoxetine: Increased risk of cardiovascular side-effects when parenteral salbutamol given with ATOMOXETINE
 - Cardiac Glycosides: salbutamol possibly reduces plasma concentration of DIGOXIN
- Cobicistat: avoidance of salmeterol advised by manufacturer of COBICISTAT
- Corticosteroids: increased risk of hypokalaemia when high doses of beta₂ sympathomimetics given with CORTICOSTEROIDS ▶ Cytotoxics: avoidance of salmeterol advised by manufacturer
- Diuretics: increased risk of hypokalaemia when high doses of beta₂ sympathomimetics given with ACETAZOLAMIDE, LOOP **DIURETICS OF THIAZIDES AND RELATED DIURETICS**
- Methyldopa: acute hypotension reported when infusion of salbutamol given with . METHYLDOPA
- Muscle Relaxants: bambuterol enhances effects of SHXAMETHONIUM
- > Theophylline: increased risk of hypokalaemia when high doses of beta₂ sympathomimetics given with THEOPHYLLINE

- NOTE Interactions do not generally apply to tacrolimus used topically; risk of facial flushing and skin irritation with topical tacrolimus on consumption of alcohol
- Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with NSAIDs; increased risk of nephrotoxicity when tacrolimus given with . IBUPROFEN
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when tacrolimus given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: caution with tacrolimus advised by manufacturer of DRONEDARONE
- Antibacterials: plasma concentration of tacrolimus increased by • CLARITHROMYCIN and • ERYTHROMYCIN; plasma concentration of tacrolimus possibly reduced by RIFABUTIN; plasma concentration of tacrolimus reduced by • RIFAMPICIN; increased risk of nephrotoxicity when tacrolimus given with
- AMINOGLYCOSIDES; plasma concentration of tacrolimus possibly increased by . CHLORAMPHENICOL and • TELITHROMYCIN; possible increased risk of nephrotoxicity when tacrolimus given with VANCOMYCIN
- · Anticoagulants: tacrolimus possibly increases plasma concentration of • DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use
- Antidepressants: plasma concentration of tacrolimus reduced by • ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of tacrolimus reduced by FOSPHENYTOIN and PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of tacrolimus reduced by • PHENOBARBITAL and PRIMIDONE
- · Antifungals: plasma concentration of tacrolimus increased by FLUCONAZOLE, ● ITRACONAZOLE, ● KETOCONAZOLE,
- POSACONAZOLE and VORICONAZOLE (consider reducing dose of tacrolimus); plasma concentration of tacrolimus possibly increased by • MICONAZOLE oral gel; increased risk of nephrotoxicity when tacrolimus given with • AMPHOTERICIN; plasma concentration of tacrolimus reduced by CASPOFUNGIN
- Antipsychotics: avoidance of tacrolimus advised by manufacturer of • DROPERIDOL (risk of ventricular arrhythmias)
- Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with ACICLOVIR, GANCICLOVIR, VALACICLOVIR or VALGANCICLOVIR; plasma concentration of tacrolimus possibly increased by • ATAZANAVIR and • RITONAVIR; plasma concentration of tacrolimus increased by . BOCEPREVIR (reduce dose of tacrolimus); plasma concentration of tacrolimus possibly affected by . EFAVIRENZ; plasma concentration of tacrolimus increased by • FOSAMPRENAVIR; plasma concentration of tacrolimus increased by
 - SAQUINAVIR (consider reducing dose of tacrolimus); plasma

Tacrolimus

- Antivirals (continued)
 - concentration of both drugs increased when tacrolimus given with TELAPREVIR (reduce dose of tacrolimus)
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by FELODIPINE and VERAPAMIL; plasma concentration of tacrolimus increased by ● DILTIAZEM, NICARDIPINE and ● NIFEDIPINE
- Ciclosporin: tacrolimus increases plasma concentration of
 CICLOSPORIN (increased risk of nephrotoxicity)—avoid concomitant use
- Colestilan: manufacturer of colestilan advises give tacrolimus at least 1 hour before or 3 hours after COLESTILAN
- Cytotoxics: tacrolimus possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours; caution with tacrolimus advised by manufacturer of
 - CRIZOTINIB; plasma concentration of tacrolimus increased by IMATINIB
- Dexrazoxane: increased risk of immunosupression with tacrolimus advised by manufacturer of DEXRAZOXANE
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with • POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Grapefruit Juice: plasma concentration of tacrolimus increased by • GRAPEFRUIT JUICE
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by DANAZOL
- ► Lipid-regulating Drugs: separating administration from tacrolimus by 12 hours advised by manufacturer of LOMITAPIDE
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of MIFAMURTIDE
- Oestrogens: plasma concentration of tacrolimus possibly increased by ETHINYLESTRADIOL
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with • POTASSIUM SALTS
- Ranolazine: plasma concentration of tacrolimus increased by
 RANOLAZINE
- Sevelamer: plasma concentration of tacrolimus possibly reduced by SEVELAMER
- Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by OMEPRAZOLE

Tadalafi

- Alpha-blockers: enhanced hypotensive effect when tadalafil given with • DOXAZOSIN—manufacturer of tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with • ALPHA-BLOCKERS—when patient is stable on the alpha blocker initiate tadalafil at the lowest possible dose
- Anti-arrhythmics: avoidance of tadalafil advised by manufacturer of DISOPYRAMIDE (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of tadalafil possibly increased by CLARITHROMYCIN and ERYTHROMYCIN; plasma concentration of tadalafil reduced by • RIFAMPICIN manufacturer of tadalafil advises avoid concomitant use
- Antifungals: tadalafil concentration is increased by

 KETOCONAZOLE—avoid concomitant use of tadalafil for pulmonary hypertension; plasma concentration of tadalafil possibly increased by ITRACONAZOLE
- Antivirals: plasma concentration of tadalafil possibly increased by FOSAMPRENAVIR and INDINAVIR; plasma concentration of tadalafil increased by RITONAVIR— manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with SAQUINAVIR—avoid concomitant use; avoidance of high doses of tadalafil advised by manufacturer of TELAPREVIR— consult product literature
- Bosentan: plasma concentration of tadalafil reduced by BOSENTAN
- Cobicistat: plasma concentration of tadalafil possibly increased by

 COBICISTAT—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
- Dapoxetine: avoidance of tadalafil advised by manufacturer of DAPOXETINE

Tadalafil (continued)

- ► Grapefruit Juice: plasma concentration of tadalafil possibly increased by GRAPEFRUIT JUICE
- Nicorandil: tadalafil significantly enhances hypotensive effect of ● NICORANDIL (avoid concomitant use)
- Nitrates: tadalafil significantly enhances hypotensive effect of
 NITRATES (avoid concomitant use)
- NITRATES (avoid concomitant use)
 Riociguat: possible enhanced hypotensive effect when
- RIOCIGUAT: possible enhanced hypotensive effect when tadalafil given with RIOCIGUAT—avoid concomitant use

 Tamoxifen
- Antibacterials: metabolism of tamoxifen accelerated by RIFAMPICIN (reduced plasma concentration)
- Anticoagulants: tamoxifen enhances anticoagulant effect of
 COUMARINS
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by • FLUOXETINE and • PAROXETINE (avoid concomitant use)
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of • DROPERIDOL (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by • BUPROPION (avoid concomitant use)
- Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by • CINACALCET (avoid concomitant use)

Tamsulosin see Alpha-blockers

Tapentadol see Opioid Analgesics **Taxanes** see Cabazitaxel, Docetaxel, and Paclitaxel

Tegafur► Antibacterials: metabolism of tegafur inhibited by

- METRONIDAZOLE (increased toxicity)

 Anticoagulants: tegafur enhances anticoagulant effect of

 COLIMARIAS
- ► Antiepileptics: tegafur possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Filgrastim: neutropenia possibly exacerbated when tegafur given with FILGRASTIM
- Folates: toxicity of tegafur increased by FOLIC ACID—avoid concomitant use
- Lipegfilgrastim: neutropenia possibly exacerbated when tegafur given with LIPEGFILGRASTIM
- Pegfilgrastim: neutropenia possibly exacerbated when tegafur given with PEGFILGRASTIM
- Ülcer-healing Drugs: metabolism of tegafur inhibited by CIMETIDINE (increased plasma concentration)

Teicoplanin

 Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Telaprevir

- Analgesics: manufacturer of telaprevir advises caution with
 METHADONE (risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of telaprevir advises avoid concomitant use with ◆AMIODARONE and ◆DISOPRAMIDE (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with ◆FLECAINIDE and ◆PROPAFENONE (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with intravenous LIDOCAINE
- Antibacterials: plasma concentration of both drugs possibly increased when telaprevir given with • CLARITHROMYCIN,
 ERYTHROMYCIN and • TELITHROMYCIN (increased risk of
- ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with RIFABUTIN; plasma concentration of telaprevir significantly reduced by
- RIFAMPICIN—avoid concomitant use
- Anticoagulants: telaprevir possibly affects plasma concentration of • WARFARIN; avoidance of telaprevir advised by manufacturer of APIXABAN; telaprevir possibly increases plasma concentration of DABIGATRAN
- Antidepressants: telaprevir possibly increases plasma concentration of TRAZODONE; manufacturer of telaprevir advises avoid concomitant use with • ST JOHN'S WORT

Telaprevir (continued)

- Antidiabetics: telaprevir increases plasma concentration of METFORMIN (consider reducing dose of metformin)
- Antiepileptics: manufacturer of telaprevir advises avoid concomitant use with • CARBAMAZEPINE, • FOSPHENYTOIN,
 PHENOBARBITAL, • PHENYTOIN and • PRIMIDONE
- Antifungals: plasma concentration of both drugs possibly increased when telaprevir given with KETOCONAZOLE (increased risk of ventricular arrhythmias)—reduce dose of ketoconazole; telaprevir possibly increases plasma concentration of ITRACONAZOLE; telaprevir possibly increases plasma concentration of ● POSACONAZOLE (increased risk of ventricular arrhythmias); telaprevir possibly affects plasma concentration of ● VORICONAZOLE (possible increased risk of ventricular arrhythmias)
- Antipsychotics: telaprevir possibly increases plasma concentration of ● LURASIDONE—avoid concomitant use; manufacturer of telaprevir advises avoid concomitant use with ● PIMOZIDE; telaprevir possibly increases plasma concentration of ● QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of telaprevir possibly reduced by ATAZANAVIR, also plasma concentration of atazanavir possibly increased; telaprevir increases the plasma concentration of • DACLATASVIR-reduce dose of daclatasvir (see under Daclatasvir, p. 544); avoid concomitant use of telaprevir with . DARUNAVIR; plasma concentration of telaprevir reduced by • EFAVIRENZ-increase dose of telaprevir; manufacturers advise avoid concomitant use of telaprevir with • FOSAMPRENAVIR and • LOPINAVIR; telaprevir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); plasma concentration of telaprevir possibly reduced by NEVIRAPINE—consider increasing dose of telaprevir; plasma concentration of telaprevir possibly reduced by RITONAVIR; telaprevir increases plasma concentration of TENOFOVIR; avoidance of telaprevir advised by manufacturer of TIPRANAVIR
- Anxiolytics and Hypnotics: telaprevir possibly increases plasma concentration of

 MIDAZOLAM (risk of prolonged sedation avoid concomitant use of oral midazolam)
- Beta-blockers: manufacturer of telaprevir advises avoid concomitant use with • SOTALOL (risk of ventricular arrhythmias)
- Bosentan: plasma concentration of telaprevir possibly reduced by BOSENTAN, also plasma concentration of bosentan possibly increased
- ► Calcium-channel Blockers: telaprevir increases plasma concentration of AMLODIPINE (consider reducing dose of amlodipine); manufacturer of telaprevir advises caution with DILTIAZEM, FELODIPINE, NICARDIPINE, NIFEDIPINE and VERAPAMIL
- ► Cardiac Glycosides: telaprevir increases plasma concentration of DIGOXIN
- Ciclosporin: plasma concentration of both drugs increased when telaprevir given with • CICLOSPORIN (reduce dose of ciclosporin)
- Cilostazol: telaprevir possibly increases plasma concentration of ◆ CILOSTAZOL (see under Cilostazol, p. 206)
- Colchicine: telaprevir possibly increases risk of COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: telaprevir possibly increases plasma concentration of inhaled and intranasal BUDESONIDE and FLUTICASONE; plasma concentration of telaprevir possibly reduced by DEXAMETHASONE
- Cytotoxics: telaprevir possibly increases the plasma concentration of ● BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with ● RUXOLITINIB—consult ruxolitinib product literature
- Domperidone: possible increased risk of ventricular arrhythmias when telaprevir given with • DOMPERIDONE avoid concomitant use
- Ergot Alkaloids: manufacturer of telaprevir advises avoid concomitant use with • ERGOT ALKALOIDS

Telaprevir (continued)

- Lipid-regulating Drugs: manufacturer of telaprevir advises avoid concomitant use with • ATORVASTATIN; manufacturers advise avoid concomitant use of telaprevir with
- SIMVASTATIN; avoidance of telaprevir advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Oestrogens: telaprevir possibly reduces plasma concentration of ● ETHINYLESTRADIOL—manufacturer of telaprevir advises additional contraceptive precautions
- Sildenafil: manufacturer of telaprevir advises avoid concomitant use with • SILDENAFIL
- Sirolimus: plasma concentration of both drugs increased when telaprevir given with • SIROLIMUS (reduce dose of sirolimus)
- Sympathomimetics, Beta₂: manufacturer of telaprevir advises avoid concomitant use with • SALMETEROL (risk of ventricular arrhythmias)
- Tacrolimus: plasma concentration of both drugs increased when telaprevir given with • TACROLIMUS (reduce dose of tacrolimus)
- Tadalafil: manufacturer of telaprevir advises avoid concomitant use with high doses of • TADALAFIL—consult product literature
- Vardenafil: manufacturer of telaprevir advises avoid concomitant use with • VARDENAFIL

Telavancin

 Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Telbivudine

 Interferons: increased risk of peripheral neuropathy when telbivudine given with • INTERFERON ALFA and
 • PEGINTERFERON ALFA

Telithromycin

- Analgesics: possible increased risk of ventricular arrhythmias when telithromycin given with • METHADONE; telithromycin inhibits the metabolism of OXYCODONE
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when telithromycin given with ◆ AMIODARONE and ◆ DISOPYRAMIDE; increased risk of ventricular arrhythmias when telithromycin given with ◆ DRONEDARONE—avoid concomitant use
- Antibacterials: possible increased risk of ventricular arrhythmias when telithromycin given with • MOXIFLOXACIN; plasma concentration of telithromycin reduced by
- RIFAMPICIN (avoid during and for 2 weeks after rifampicin)
- Anticoagulants: avoidance of telithromycin advised by manufacturer of APIXABAN
- Antidepressants: possible increased risk of ventricular arrhythmias when telithromycin given with ● CITALOPRAM and
 ●TRICYCLICS; plasma concentration of telithromycin reduced by ● ST JOHN'S WORT (avoid during and for 2 weeks after St John's wort)
- Antiepileptics: plasma concentration of telithromycin reduced by • CARBAMAZEPINE, • FOSPHENYTOIN, • PHENOBARBITAL,
- PHENYTOIN and PRIMIDONE (avoid during and for 2 weeks after carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone)
- Antifungals: plasma concentration of telithromycin increased by • KETOCONAZOLE—avoid in severe renal and hepatic impairment
- Antimuscarinics: manufacturer of fesoterodine advises dose reduction when telithromycin given with FESOTERODINE consult fesoterodine product literature
- Antipsychotics: possible increased risk of ventricular arrhythmias when telithromycin given with
- Antivirals: manufacturer of telithromycin advises avoid concomitant use with ATAZANAVIR, FOSAMPRENAVIR,
 ●INDINAVIR, LOPINAVIR, RITONAVIR and TIPRANAVIR in severe renal and hepatic impairment; telithromycin possibly increases the plasma concentration of DACLATASVIR—reduce

Telithromycin

- · Antivirals (continued)
 - dose of daclatasvir (see under Daclatasvir, p. 544); telithromycin possibly increases plasma concentration of
 - MARAVIROC (consider reducing dose of maraviroc);
 manufacturer of telithromycin advises avoid concomitant use with SAQUINAVIR (risk of ventricular arrhythmias);
 telithromycin possibly increases plasma concentration of
 - SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs possibly increased when telithromycin given with
- TELAPREVIR (increased risk of ventricular arrhythmias)
- Anxiolytics and Hypnotics: telithromycin inhibits metabolism of
 MIDAZOLAM (increased plasma concentration with increased sedation)
- Aprepitant: telithromycin possibly increases plasma concentration of APREPITANT
- Avanafil: telithromycin possibly increases plasma concentration of • AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: telithromycin possibly inhibits metabolism of • CALCIUM-CHANNEL BLOCKERS (increased risk of side-effects)
- Cardiac Glycosides: telithromycin possibly increases plasma concentration of DIGOXIN
- Ciclosporin: telithromycin possibly increases plasma concentration of ◆ CICLOSPORIN
- Colchicine: telithromycin possibly increases risk of
- COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: telithromycin possibly increases plasma concentration of AXITINIB (reduce dose of axitinib—consult axitinib product literature); telithromycin possibly increases the plasma concentration of BOSUTINIB and CABAZITAXEL—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; telithromycin possibly increases plasma concentration of
 - CRIZOTINIB and EVEROLIMUS—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of DASATINIB (plasma concentration of dasatinib possibly increased); telithromycin possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of telithromycin advised by manufacturer of
 - LAPATINIB and NILOTINIB; telithromycin possibly increases plasma concentration of PAZOPANIB (reduce dose of pazopanib); telithromycin possibly increases plasma concentration of PONATINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when telithromycin given with RUXOLITINIB—consult ruxolitinib product literature; telithromycin possibly increases plasma concentration of DOCETAXEL—manufacturer of docetaxel advises avoid
- concomitant use or consider reducing docetaxel dose
- Dapoxetine: avoidance of telithromycin advised by manufacturer of ● DAPOXETINE (increased risk of toxicity)
- Diuretics: telithromycin increases plasma concentration of
- EPLERENONE—avoid concomitant use
- Domperidone: possible increased risk of ventricular arrhythmias when telithromycin given with • DOMPERIDONE avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when telithromycin given with • ERGOTAMINE—avoid concomitant use
- ► Fosaprepitant: telithromycin possibly increases plasma concentration of FOSAPREPITANT
- Ivabradine: telithromycin possibly increases plasma concentration of ● IVABRADINE—avoid concomitant use
- Ivacaftor: telithromycin possibly increases plasma concentration of ●IVACAFTOR (see under Ivacaftor, p. 257)
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with ◆ ATORVASTATIN or ◆ SIMVASTATIN (avoid concomitant use); possible increased risk of myopathy when telithromycin given with PRAVASTATIN; avoidance of telithromycin advised by manufacturer of ◆ LOMITAPIDE (plasma concentration of lomitapide possibly increased)

Telithromycin (continued)

- Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when telithromycin given with parenteral
 - PENTAMIDINE ISETIONATE
- Ranolazine: telithromycin possibly increases plasma concentration of ● RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: telithromycin possibly increases plasma concentration of ● SILDENAFIL—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension
- Sirolimus: telithromycin increases plasma concentration of
 SIROLIMUS—avoid concomitant use
- Tacrolimus: telithromycin possibly increases plasma concentration of • TACROLIMUS
- Ulipristal: avoidance of telithromycin advised by manufacturer of low-dose ULIPRISTAL
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Telmisartan see Angiotensin-II Receptor Antagonists

Temazepam see Anxiolytics and Hypnotics

Temocillin see Penicillins Temoporfin

 Cytotoxics: increased skin photosensitivity when temoporfin given with topical • FLUOROURACIL

Temozolomide

- Antiepileptics: plasma concentration of temozolomide increased by SODIUM VALPROATE and VALPROIC ACID
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)

Temsirolimus

NOTE The main active metabolite of temsirolimus is sirolimus—see also interactions of sirolimus and consult product literature

- Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by • RIFAMPICIN—avoid concomitant use
- Antifungals: plasma concentration of active metabolite of temsirolimus increased by KETOCONAZOLE—avoid concomitant use; manufacturer of temsirolimus advises avoid concomitant use with ITRACONAZOLE (plasma concentration of temsirolimus possibly increased)
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)

Tenofovir

- Antivirals: manufacturer of tenofovir advises avoid concomitant use with ADEFOVIR; tenofovir reduces plasma concentration of ATAZANAVIR, also plasma concentration of tenofovir possibly increased; tenofovir increases plasma concentration of ● DIDANOSINE (increased risk of toxicity) avoid concomitant use; plasma concentration of tenofovir increased by LOPINAVIR and TELAPREVIR
- Orlistat: absorption of tenofovir possibly reduced by
 ORLISTAT

Tenoxicam see NSAIDs

Terazosin see Alpha-blockers

Terbinafine

- Antibacterials: plasma concentration of terbinafine reduced by
 RIFAMPICIN
- Antidepressants: terbinafine possibly increases plasma concentration of PAROXETINE and TRICYCLICS
- ► Antifungals: terbinafine increases plasma concentration of
- Ciclosporin: terbinafine possibly reduces plasma concentration of CicLOSPORIN
- Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with OESTROGENS (when used for contracention)
- Progestogens: occasional reports of breakthrough bleeding when terbinafine given with PROGESTOGENS (when used for contraception)
- Ulcer-healing Drugs: plasma concentration of terbinafine increased by CIMETIDINE

Terbutaline see Sympathomimetics, Beta₂

Teriflunomide

- Antibacterials: teriflunomide increases plasma concentration of CEFACLOR; plasma concentration of teriflunomide reduced by RIFAMPICIN
- Antidiabetics: teriflunomide increases plasma concentration of REPAGLINIDE
- Lipid-regulating Drugs: the effect of teriflunomide is significantly decreased by COLESTYRAMNE (enhanced elimination)—avoid unless drug elimination desired; teriflunomide increases plasma concentration of
- ROSUVASTATIN (consider reducing dose of rosuvastatin)
- Oestrogens: teriflunomide increases plasma concentration of ETHINYLESTRADIOL
- Progestogens: teriflunomide increases plasma concentration of LEVONORGESTREL
- Vaccines: risk of generalised infections when teriflunomide given with live • VACCINES—avoid concomitant use

Testolactone

Anticoagulants: testolactone enhances anticoagulant effect of
 COUMARINS and ● PHENINDIONE

Testosterone

- Anticoagulants: testosterone enhances anticoagulant effect of
 COUMARINS and PHENINDIONE
- Antidiabetics: testosterone possibly enhances hypoglycaemic effect of ANTIDIABETICS

Tetrabenazine

- Antidepressants: risk of CNS toxicity when tetrabenazine given with • MAOIS (avoid tetrabenazine for 2 weeks after MAOIs)
- Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with ANTIPSYCHOTICS
- Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with AMANTADINE
- Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with METOCLOPRAMIDE

Tetracosactide see Corticosteroids

Tetracycline see Tetracyclines

Tetracyclines

tetracyclines

- ACE Inhibitors: absorption of tetracyclines reduced by QUINAPRIL tablets (quinapril tablets contain magnesium carbonate)
- Adsorbents: absorption of tetracyclines possibly reduced by KAOLIN
- ► Antacids: absorption of tetracyclines reduced by ANTACIDS
- Antibacterials: plasma concentration of doxycycline reduced by RIFAMPICIN—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of PENICILLINS
- Anticoagulants: tetracyclines possibly enhance anticoagulant effect of ◆ COUMARINS and ◆ PHENINDIONE
- Antidiabetics: tetracyclines possibly enhance hypoglycaemic effect of SULFONYLUREAS
- Antiepileptics: metabolism of doxycycline accelerated by CARBAMAZEPINE (reduced effect); metabolism of doxycycline accelerated by FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (reduced plasma concentration)
- ► Atovaquone: tetracycline reduces plasma concentration of
- Calcium Salts: absorption of tetracycline reduced by CALCIUM
- Cytotoxics: doxycycline or tetracycline increase risk of
- METHOTREXATE toxicity

 Dairy Products: absorption of tetracyclines (except doxycycline)
- and minocycline) reduced by DAIRY PRODUCTS

 Diuretics: manufacturer of lymecycline advises avoid
- concomitant use with DIURETICS

 Ergot Alkaloids: increased risk of ergotism when tetracyclines
- given with ERGOTAMINE

 Iron Salts: absorption of tetracyclines reduced by *oral* IRON SALTS, also absorption of *oral* iron salts reduced by
- ► Lipid-regulating Drugs: absorption of tetracycline possibly reduced by COLESTIPOL and COLESTYRAMINE
- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with • RETINOIDS (avoid concomitant use)

Tetracyclines (continued)

- Strontium Ranelate: absorption of tetracyclines reduced by STRONTIUM RANELATE (manufacturer of strontium ranelate advises avoid concomitant use)
- Ulcer-healing Drugs: absorption of tetracyclines reduced by SUCRALFATE and TRIPOTASSIUM DICITRATOBISMUTHATE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF
- Zinc: absorption of tetracyclines reduced by ZINC, also absorption of zinc reduced by tetracyclines

Theophylline

- Allopurinol: plasma concentration of theophylline possibly increased by ALLOPURINOL
- Anaesthetics, General: increased risk of convulsions when theophylline given with KETAMINE
- Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of ADENOSINE—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine; plasma concentration of theophylline increased by PROPAFENONE
- Antibacterials: plasma concentration of theophylline possibly increased by CLARITHROMYCIN and ISONIAZID; plasma concentration of theophylline increased by • ERYTHROMYCIN (also theophylline may reduce absorption of oral erythromycin); plasma concentration of theophylline increased by • CIPROFLOXACIN and • NORFLOXACIN; metabolism of theophylline accelerated by RIFAMPICIN (reduced plasma concentration); possible increased risk of convulsions when theophylline given with • QUINOLONES
- Antidepressants: plasma concentration of theophylline increased by • FLUVOXAMINE (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by ST JOHN'S WORT
- Antiepileptics: metabolism of theophylline accelerated by CARBAMAZEPINE, ● PHENOBARBITAL and ● PRIMIDONE (reduced effect); plasma concentration of both drugs reduced when theophylline given with ● FOSPHENYTOIN and ● PHENYTOIN
- Antifungals: plasma concentration of theophylline possibly increased by ● FLUCONAZOLE and ● KETOCONAZOLE
- Antivirals: plasma concentration of theophylline possibly increased by ACICLOVIR and VALACICLOVIR; metabolism of theophylline accelerated by RITONAVIR (reduced plasma concentration)
- Anxiolytics and Hypnotics: theophylline possibly reduces effects of BENZODIAZEPINES
- Caffeine citrate: avoidance of theophylline advised by manufacturer of CAFFEINE CITRATE
- Calcium-channel Blockers: plasma concentration of theophylline possibly increased by ● CALCIUM-CHANNEL BLOCKERS (enhanced effect); plasma concentration of theophylline increased by DILTIAZEM; plasma concentration of theophylline increased by ● VERAPAMIL (enhanced effect)
- Corticosteroids: increased risk of hypokalaemia when theophylline given with CORTICOSTEROIDS
- Cytotoxics: plasma concentration of theophylline possibly increased by METHOTREXATE
- Deferasirox: plasma concentration of theophylline increased by • DEFERASIROX (consider reducing dose of theophylline)
- Disulfiram: metabolism of theophylline inhibited by DISULFIRAM (increased risk of toxicity)
- Diuretics: increased risk of hypokalaemia when theophylline given with ACETAZOLAMIDE, LOOP DIURETICS OF THIAZIDES AND RELATED DIURETICS
- Doxapram: increased CNS stimulation when theophylline given with DOXAPRAM
- Interferons: metabolism of theophylline inhibited by
 INTERFERON ALFA and PEGINTERFERON ALFA (consider
- INTERFERON ALFA and PEGINTERFERON ALFA (consider reducing dose of theophylline)
 Leukotriene Receptor Antagonists: plasma concentration of
- theophylline possibly increased by ZAFIRLUKAST, also plasma concentration of zafirlukast reduced

 Lithium: theophylline increases excretion of LITHIUM (reduced
- plasma concentration)

 Oestrogens: plasma concentration of theophylline increased
- Oestrogens: plasma concentration of theophylline increased by OESTROGENS (consider reducing dose of theophylline)

Theophylline (continued)

- Pentoxifylline: plasma concentration of theophylline increased by PENTOXIFYLLINE
- Roflumilast: avoidance of theophylline advised by manufacturer of ROFLUMILAST
- Sulfinpyrazone: plasma concentration of theophylline reduced by SULFINPYRAZONE
- Sýmpathomimetics: manufacturer of theophylline advises avoid concomitant use with EPHEDRINE in children
- Sympathomimetics, Beta₂: increased risk of hypokalaemia when theophylline given with high doses of BETA₂
 SYMPATHOMIMETICS
- Ulcer-healing Drugs: metabolism of theophylline inhibited by
 CIMETIDINE (increased plasma concentration); absorption of theophylline possibly reduced by SUCRALFATE (give at least 2
- hours apart)

 > Vaccines: plasma concentration of theophylline possibly

increased by INFLUENZA VACCINE **Thiazolidinediones** see Antidiabetics

Thiopental see Anaesthetics, General

Thiotepa

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- ► Muscle Relaxants: thiotepa enhances effects of SUXAMETHONIUM

Thioxanthenes see Antipsychotics

- Thyroid Hormones
- Antacids: absorption of levothyroxine possibly reduced by ANTACIDS
- Anti-arrhythmics: serum concentrations of thyroid hormones can be affected by AMIODARONE—monitor thyroid function closely
- Antibacterials: metabolism of levothyroxine accelerated by RIFAMPICIN (may increase requirements for levothyroxine in hypothyroidism)
- Anticoagulants: thyroid hormones enhance anticoagulant effect of ● COUMARINS and ● PHENINDIONE
- Antidepressants: thyroid hormones enhance effects of AMITRIPTYLINE and IMIPRAMINE; thyroid hormones possibly enhance effects of TRICYCLICS
- Antiepileptics: metabolism of thyroid hormones accelerated by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by FOSPHENYTOIN and PHENYTOIN (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin
- and phenytoin possibly increased

 Beta-blockers: levothyroxine accelerates metabolism of PROPRANOLOL
- Calcium Salts: absorption of levothyroxine reduced by CALCIUM
- Colestilan: manufacturer of colestilan advises give levothyroxine at least 1 hour before or 3 hours after COLESTILAN
- Cytotoxics: plasma concentration of levothyroxine possibly reduced by IMATINIB
- From Salts: absorption of levothyroxine reduced by oral IRON SALTS (give at least 2 hours apart)
- ► Lanthanum: absorption of levothyroxine reduced by LANTHANUM (give at least 2 hours apart)
- Lipid-regulating Drugs: absorption of levothyroxine reduced by COLESEVELAM; absorption of thyroid hormones reduced by COLESTIPOL and COLESTYRAMINE
- Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by OESTROGENS
- Orlistat: possible increased risk of hypothyroidism when levothyroxine given with ORLISTAT
- Polystyrene Sulfonate Resins: absorption of levothyroxine reduced by POLYSTYRENE SULFONATE RESINS
- Sevelamer: absorption of levothyroxine possibly reduced by SEVELAMER
- Ulcer-healing Drugs: absorption of levothyroxine reduced by CIMETIDINE and SUCRALFATE

Tiagabin

 Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and • TRICYCLIC-RELATED

Tiagabine

- Antidepressants (continued)
 - ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of tiagabine reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Tiaprofenic Acid see NSAIDs

Tibolone

- Antibacterials: metabolism of tibolone accelerated by RIFAMPICIN (reduced plasma concentration)
- ► Antiepileptics: metabolism of tibolone accelerated by CARBAMAZEPINE (reduced plasma concentration); metabolism of tibolone accelerated by FOSPHENYTOIN and PHENYTOIN

Ticagrelor

- Antibacterials: plasma concentration of ticagrelor possibly increased by • CLARITHROMYCIN—manufacturer of ticagrelor advises avoid concomitant use; plasma concentration of ticagrelor possibly increased by ERYTHROMYCIN; plasma concentration of ticagrelor reduced by • RIFAMPICIN
- Anticoagulants: ticagrelor increases plasma concentration of
 DABIGATRAN
- Antidepressants: possible increased risk of bleeding when ticagrelor given with CITALOPRAM, PAROXETINE OF SERTRALINE
- Antiepileptics: plasma concentration of ticagrelor possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of ticagrelor increased by
 KETOCONAZOLE—manufacturer of ticagrelor advises avoid concomitant use
- Antivirals: plasma concentration of ticagrelor possibly increased by • ATAZANAVIR and • RITONAVIR—manufacturer of ticagrelor advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of ticagrelor increased by DILTIAZEM
- Cardiac Glycosides: ticagrelor increases plasma concentration of • DIGOXIN
- Ciclosporin: plasma concentration of ticagrelor increased by CICLOSPORIN
- Ergot Alkaloids: ticagrelor possibly increases plasma concentration of ● ERGOT ALKALOIDS
- Lipid-regulating Drugs: ticagrelor increases plasma concentration of ● SIMVASTATIN (increased risk of toxicity); separating administration from ticagrelor by 12 hours advised by manufacturer of LOMITAPIDE

Ticarcillin see Penicillins

Tick-borne Encephalitis Vaccine see Vaccines

Tigecycline

- Anticoagulants: tigecycline possibly enhances anticoagulant effect of COUMARINS
- ► Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Timolol see Beta-blockers

Tinidazole

- ► Alcohol: possibility of disulfiram-like reaction when tinidazole given with ALCOHOL
- Antibacterials: plasma concentration of tinidazole possibly reduced by RIFAMPICIN
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Tinzaparin see Heparins

Tioguanine

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when tioguanine given with BUSULFAN

Tiotropium see Antimuscarinics

Tipranavir

- Analgesics: plasma concentration of tipranavir possibly reduced by BUPRENORPHINE
- Antacids: absorption of tipranavir reduced by ANTACIDS (give at least 2 hours apart)
- Antibacterials: tipranavir increases plasma concentration of • CLARITHROMYCIN (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of ● RIFABUTIN (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by • RIFAMPICIN—avoid concomitant use; avoidance of
 - concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of • TELITHROMYCIN
- Anticoagulants: avoidance of tipranavir advised by manufacturer of APIXABAN and RIVAROXABAN
- · Antidepressants: plasma concentration of tipranavir possibly reduced by • ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of tipranavir possibly reduced by CARBAMAZEPINE
- Antifungals: plasma concentration of tipranavir increased by FLUCONAZOLE
- · Antimalarials: caution with tipranavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; tipranavir possibly increases plasma concentration of • QUININE (increased risk of toxicity)
- Antimuscarinics: avoidance of tipranavir advised by manufacturer of DARIFENACIN
- Antipsychotics: tipranavir possibly increases plasma concentration of • ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); tipranavir possibly increases plasma concentration of
- QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: tipranavir reduces plasma concentration of
- ABACAVIR, FOSAMPRENAVIR, LOPINAVIR, SAQUINAVIR and • ZIDOVUDINE; plasma concentration of tipranavir increased by ATAZANAVIR (also plasma concentration of atazanavir reduced); manufacturer of tipranavir advises avoid concomitant use with BOCEPREVIR and TELAPREVIR; tipranavir reduces plasma concentration of DIDANOSINE—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart; tipranavir reduces the plasma concentration of • DOLUTEGRAVIR (see under Dolutegravir, p. 557); tipranavir reduces plasma concentration of • ETRAVIRINE, also plasma concentration of tipranavir increased (avoid concomitant use)
- Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with • METOPROLOL for heart failure
- Bosentan: manufacturer of tipranavir advises avoid concomitant use with BOSENTAN
- Cobicistat: plasma concentration of both drugs reduced when tipranavir given with • COBICISTAT (avoid concomitant use)
- · Lipid-regulating Drugs: increased risk of myopathy when tipranavir given with • ATORVASTATIN (see under Atorvastatin, p. 179); tipranavir increases plasma concentration of
- ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); tipranavir possibly increases plasma concentration of ● SIMVASTATIN—avoid concomitant use: avoidance of tipranavir advised by manufacturer of
- LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- · Orlistat: absorption of tipranavir possibly reduced by
- Ranolazine: tipranavir possibly increases plasma concentration of ● RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: manufacturer of tipranavir advises avoid concomitant use of SILDENAFIL for pulmonary arterial hypertension
- ▶ Sympathomimetics, Beta₂: manufacturer of tipranavir advises avoid concomitant use with SALMETEROL
- · Ulcer-healing Drugs: tipranavir reduces plasma concentration of • ESOMEPRAZOLE and • OMEPRAZOLE
- Vardenafil: manufacturer of tipranavir advises caution with VARDENAFII

Tipranavir (continued)

Vitamins: increased risk of bleeding when tipranavir given with high doses of VITAMIN E

▶ Iloprost: increased risk of bleeding when tirofiban given with ILOPROST

Tizanidine see Muscle Relaxants

Tobramycin see Aminoglycosides

Tocilizumah

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- · Vaccines: risk of generalised infections when monoclonal antibodies given with live . VACCINES—avoid concomitant use

Tolazoline see Alpha-blockers Tolbutamide see Antidiabetics

Tolcapone

- Antidepressants: avoid concomitant use of tolcapone with MAOIS
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA

Tolfenamic Acid see NSAIDs

Tolterodine see Antimuscarinics

Tolvaptan

- Antibacterials: plasma concentration of tolvaptan reduced by RIFAMPICIN
- Antifungals: plasma concentration of tolvaptan increased by KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use
- ▶ Cardiac Glycosides: tolvaptan increases plasma concentration of DIGOXIN (increased risk of toxicity)
- · Grapefruit Juice: plasma concentration of tolvaptan increased by • GRAPEFRUIT JUICE—avoid concomitant use
- Lipid-regulating Drugs: separating administration from tolvaptan by 12 hours advised by manufacturer of LOMITAPIDE
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- Antidiabetics: topiramate possibly increases plasma concentration of METFORMIN; topiramate possibly reduces plasma concentration of GLIBENCLAMIDE
- Antiepileptics: plasma concentration of topiramate often reduced by CARBAMAZEPINE; topiramate increases plasma concentration of ● FOSPHENYTOIN and ● PHENYTOIN (also plasma concentration of topiramate reduced); topiramate reduces plasma concentration of PERAMPANEL; plasma concentration of topiramate possibly reduced by PHENOBARBITAL and PRIMIDONE; hyperammonaemia and CNS toxicity reported when topiramate given with SODIUM VALPROATE and VALPROIC ACID
- · Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Diuretics: plasma concentration of topiramate possibly increased by HYDROCHLOROTHIAZIDE
- ▶ Lithium: topiramate possibly affects plasma concentration of
- · Oestrogens: topiramate accelerates metabolism of
- OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings-see Contraceptive Interactions in BNF)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Progestogens: topiramate accelerates metabolism of
- PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception-see Contraceptive Interactions in BNF)

Torasemide see Diuretics

Toremifene

- Anticoagulants: toremifene possibly enhances anticoagulant effect of • COUMARINS
- Antiepileptics: metabolism of toremifene possibly accelerated by CARBAMAZEPINE (reduced plasma concentration); metabolism of toremifene possibly accelerated by FOSPHENYTOIN and PHENYTOIN; metabolism of toremifene accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)
- Cytotoxics: possible increased risk of ventricular arrhythmias when toremifene given with • VANDETANIB—avoid concomitant use
- Diuretics: increased risk of hypercalcaemia when toremifene given with THIAZIDES AND RELATED DIURETICS

Trabectedin

- Alcohol: manufacturer of trabectedin advises avoid concomitant use with • ALCOHOL
- Antibacterials: plasma concentration of trabectedin reduced by
 RIFAMPICIN
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when trabectedin given with live VACCINES—avoid concomitant use

Tramadol see Opioid Analgesics **Trandolapril** see ACE Inhibitors

Tranylcypromine see MAOIs

Trastuzumah

- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Trazodone see Antidepressants, Tricyclic (related)

Tretinoin see Retinoids

Triamcinolone see Corticosteroids

Triamterene see Diuretics

Trientine

- ▶ Iron Salts: trientine reduces absorption of oral IRON SALTS
- Zinc: trientine reduces absorption of ZINC, also absorption of trientine reduced by zinc

Trifluoperazine see Antipsychotics

Trihexyphenidyl see Antimuscarinics

Trimethoprim

- ► ACE Inhibitors: possible increased risk of hyperkalaemia when trimethoprim given with ACE INHIBITORS
- Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimethoprim given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with AMIODARONE—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
- Antibacterials: plasma concentration of trimethoprim possibly reduced by RIFAMPICIN; plasma concentration of both drugs may increase when trimethoprim given with DAPSONE
- Anticoagulants: trimethoprim possibly enhances anticoagulant effect of COUMARINS
- Antidiabetics: trimethoprim possibly enhances hypoglycaemic effect of REPAGLINIDE—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of SULFONYLUREAS
- Antiepileptics: trimethoprim increases plasma concentration of ● FOSPHENYTOIN and ● PHENYTOIN (also increased antifolate effect)
- Antimalarials: increased antifolate effect when trimethoprim given with • PYRIMETHAMINE
- Antivirals: trimethoprim (as co-trimoxazole) increases plasma concentration of LAMIVUDINE—avoid concomitant use of high-dose co-trimoxazole
- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with
 AZATHIOPRINE
- Cardiac Glycosides: trimethoprim possibly increases plasma concentration of DIGOXIN

Trimethoprim (continued)

- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with • CICLOSPORIN, also plasma concentration of ciclosporin reduced by intravenous trimethoprim
- Cytotoxics: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with
 - MERCAPTOPURINE Or METHOTREXATE
- Diuretics: increased risk of hyperkalaemia when trimethoprim given with EPLERENONE; possible increased risk of hyperkalaemia when trimethoprim given with SPIRONOLACTONE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Trimipramine see Antidepressants, Tricyclic

Tripotassium Dicitratobismuthate

 Antibacterials: tripotassium dicitratobismuthate reduces absorption of TETRACYCLINES

Tropicamide *see* Antimuscarinics **Trospium** *see* Antimuscarinics

Typhoid Vaccine (oral) see Vaccines

Typhoid Vaccine (parenteral) see Vaccines

Ubidecarenone

 Anticoagulants: ubidecarenone may enhance or reduce anticoagulant effect of WARFARIN

Ulcer-healing Drugs see Histamine H_2 -antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate

Ulipristal

- Antibacterials: manufacturer of low-dose ulipristal advises avoid concomitant use with CLARITHROMYCIN and TELITHROMYCIN; plasma concentration of low-dose ulipristal increased by ERYTHROMYCIN—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with • RIFAMPICIN (contraceptive effect of ulipristal possibly reduced)
- Anticoagulants: manufacturer of ulipristal advises give DABIGATRAN at least 1.5 hours before or after ulipristal
- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with • ST JOHN'S WORT (contraceptive effect of ulipristal possibly reduced)
- Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with ● CARBAMAZEPINE, ● FOSPHENYTOIN,
 ● PHENOBARBITAL, ● PHENYTOIN and ● PRIMIDONE (contraceptive effect of ulipristal possibly reduced)
- Antifungals: plasma concentration of low-dose ulipristal increased by KETOCONAZOLE—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with ITRACONAZOLE
- Antihistamines: manufacturer of ulipristal advises give FEXOFENADINE at least 1.5 hours before or after ulipristal
- Antivirals: manufacturer of ulipristal advises avoid concomitant use with • RITONAVIR (contraceptive effect of ulipristal possibly reduced)
- Calcium-channel Blockers: manufacturer of low-dose ulipristal advises avoid concomitant use with VERAPAMIL
- Cardiac Glycosides: manufacturer of ulipristal advises give DIGOXIN at least 1.5 hours before or after ulipristal
- ► Grapefruit Juice: manufacturer of low-dose ulipristal advises avoid concomitant use with GRAPEFRUIT JUICE
- Progestogens: ulipristal possibly reduces contraceptive effect of • PROGESTOGENS

Umeclidinium see Antimuscarinics

Ursodeoxycholic Acid see Bile Acids

Ustekinumab

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use
- Abatacept: risk of generalised infections when live vaccines given with • ABATACEPT—avoid concomitant use
- Aminophylline: influenza vaccine possibly increases plasma concentration of AMINOPHYLLINE

Vaccines (continued)

- Anakinra: risk of generalised infections when live vaccines given with • ANAKINRA—avoid concomitant use
- Antibacterials: oral typhoid vaccine inactivated by ANTIBACTERIALS—see under Typhoid Vaccine in BNF
- Anticoagulants: influenza vaccine possibly enhances anticoagulant effect of WARFARIN
- Antiepileptics: influenza vaccine enhances effects of FOSPHENYTOIN and PHENYTOIN
- Antimalarials: oral typhoid vaccine inactivated by ANTIMALARIALS—see under Typhoid Vaccine in BNF
- Corticosteroids: immune response to vaccines impaired by high doses of ◆ CORTICOSTEROIDS—avoid concomitant use with live vaccines
- Cytotoxics: risk of generalised infections when live vaccines given with DOXORUBICIN, MONOCLONAL ANTIBODIES,
- PIXANTRONE or TRABECTEDIN—avoid concomitant use
- Dexrazoxane: risk of generalised infections when live vaccines given with • DEXRAZOXANE—avoid concomitant use
- Etanercept: risk of generalised infections when live vaccines given with • ETANERCEPT—avoid concomitant use
- · Immunoglobulins: impaired immune response to oral poliomyelitis vaccine might occur with • ANTI-D IMMUNOGLOBULINS and • NORMAL IMMUNOGLOBULIN—give oral poliomyelitis vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; impaired immune response to BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine might occur with • ANTI-D IMMUNOGLOBULINS—give BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins; impaired immune response to live influenza vaccine might occur with . ANTI-D IMMUNOGLOBULINS and • NORMAL IMMUNOGLOBULIN—give live influenza vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; impaired immune response to BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine might occur with . NORMAL IMMUNOGLOBULIN—give BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and vellow fever vaccine at least 3 weeks before or 3 months after normal immunoglobulin
- ► Interferons: avoidance of vaccines advised by manufacturer of INTERFERON GAMMA
- Leflunomide: risk of generalised infections when live vaccines given with • LEFLUNOMIDE—avoid concomitant use
- Teriflunomide: risk of generalised infections when live vaccines given with • TERIFLUNOMIDE—avoid concomitant use
- ► Theophylline: influenza vaccine possibly increases plasma concentration of THEOPHYLLINE

Valaciclovi

- Aminophylline: valaciclovir possibly increases plasma concentration of AMINOPHYLLINE
- Ciclosporin: increased risk of nephrotoxicity when valaciclovir given with CICLOSPORIN
- Mycophenolate: plasma concentration of valaciclovir increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate increased
- ► Tacrolimus: possible increased risk of nephrotoxicity when valaciclovir given with TACROLIMUS
- Theophylline: valaciclovir possibly increases plasma concentration of THEOPHYLLINE

Valganciclovir

- Antibacterials: increased risk of convulsions when valganciclovir given with ● IMIPENEM WITH CILASTATIN
- Antivirals: valganciclovir possibly increases plasma concentration of DIDANOSINE; profound myelosuppression when valganciclovir given with ● ZIDOVUDINE (if possible avoid concomitant administration, particularly during initial valganciclovir therapy)
- Mycophenolate: plasma concentration of valganciclovir possibly increased by MYCOPHENOLATE, also plasma

Valganciclovir

- Mycophenolate (continued) concentration of inactive metabolite of mycophenolate possibly increased
- Tacrolimus: possible increased risk of nephrotoxicity when valganciclovir given with TACROLIMUS

Valproic Acid

- ► Analgesics: effects of valproic acid enhanced by ASPIRIN
- Antibacterials: metabolism of valproic acid possibly inhibited by ERYTHROMYCIN (increased plasma concentration); avoidance of valproic acid advised by manufacturer of
 - PIVMECILLINAM; plasma concentration of valproic acid reduced by CARBAPENEMS—avoid concomitant use
- Anticoagulants: valproic acid possibly enhances anticoagulant effect of COUMARINS
- Antidepressants: anticonvulsant effect of antiepileptics
 possibly antagonised by MAOIs and •TRICYCLIC-RELATED
 ANTIDEPRESSANTS (convulsive threshold lowered);
 anticonvulsant effect of antiepileptics antagonised by SSRIS
 and •TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of valproic acid reduced by CARBAMAZEPINE, also plasma concentration of active metabolite of carbamazepine increased; valproic acid possibly increases plasma concentration of ETHOSUXIMIDE; valproic acid increases or possibly decreases plasma concentration of FOSPHENYTOIN and PHENYTOIN, also plasma concentration of valproic acid reduced; valproic acid increases plasma concentration of • LAMOTRIGINE (increased risk of toxicity-reduce lamotrigine dose); valproic acid sometimes reduces plasma concentration of an active metabolite of OXCARBAZEPINE; valproic acid increases plasma concentration of PHENOBARBITAL and PRIMIDONE (also plasma concentration of valproic acid reduced); valproic acid possibly increases plasma concentration of RUFINAMIDE (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when valproic acid given with TOPIRAMATE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ◆ANTIPSYCHOTICS (convulsive threshold lowered); valproic acid possibly increases or decreases plasma concentration of CLOZAPINE; increased risk of sideeffects including neutropenia when valproic acid given with
- OLANZAPINE
- Antivirals: plasma concentration of valproic acid possibly reduced by RITONAVIR; valproic acid possibly increases plasma concentration of ZIDOVUDINE (increased risk of toxicity)
- Anxiolytics and Hypnotics: plasma concentration of valproic acid possibly increased by CLOBAZAM; increased risk of sideeffects when valproic acid given with CLONAZEPAM; valproic acid possibly increases plasma concentration of DIAZEPAM and LORAZEPAM
- ▶ Bupropion: valproic acid inhibits the metabolism of BUPROPION
- Cytotoxics: valproic acid increases plasma concentration of TEMOZOLOMIDE
- Lipid-regulating Drugs: absorption of valproic acid possibly reduced by COLESTYRAMINE
- Oestrogens: plasma concentration of valproic acid possibly reduced by ETHINYLESTRADIOL
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Sodium Benzoate: valproic acid possibly reduces effects of SODIUM BENZOATE
- Sodium Oxybate: valproic acid increases the plasma concentration of SODIUM OXYBATE (see under Sodium Oxybate, p. 425)
- Sodium Phenylbutyrate: valproic acid possibly reduces effects of SODIUM PHENYLBUTYRATE
- Ulcer-healing Drugs: metabolism of valproic acid inhibited by
- CIMETIDINE (increased plasma concentration)

Valsartan see Angiotensin-II Receptor Antagonists

 Anaesthetics, General: hypersensitivity-like reactions can occur when intravenous vancomycin given with GENERAL ANAESTHETICS

Vancomycin (continued)

- Antifungals: possible increased risk of nephrotoxicity when vancomycin given with AMPHOTERICIN
- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with ● CICLOSPORIN
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with CISPLATIN
- Diuretics: increased risk of otoxicity when vancomycin given with • LOOP DIURETICS
- Lipid-regulating Drugs: effects of oral vancomycin antagonised by COLESTYRAMINE
- Muscle Relaxants: vancomycin enhances effects of
- SUXAMETHONIUM
- Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with TACROLIMUS
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Vandetanib

- Analgesics: possible increased risk of ventricular arrhythmias when vandetanib given with • METHADONE—avoid concomitant use
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when vandetanib given with • AMIODARONE or
 - DISOPYRAMIDE—avoid concomitant use
- Antibacterials: possible increased risk of ventricular arrhythmias when vandetanib given with parenteral
 - ERYTHROMYCIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when vandetanib given with
 MOXIFLOXACIN—avoid concomitant use; plasma
- concentration of vandetanib reduced by RIFAMPICIN—
 manufacturer of vandetanib advises avoid concomitant use
- Antidepressants: manufacturer of vandetanib advises avoid concomitant use with ST JOHN'S WORT (plasma concentration of vandetanib possibly reduced)
- Antidiabetics: vandetanib possibly increases plasma concentration of METFORMIN (consider reducing dose of metformin)
- Antiepileptics: manufacturer of vandetanib advises avoid concomitant use with CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (plasma concentration of vandetanib possibly reduced)
- Antihistamines: possible increased risk of ventricular arrhythmias when vandetanib given with • MIZOLASTINE avoid concomitant use
- Antimalarials: possible increased risk of ventricular arrhythmias when vandetanib given with
 ◆ ARTEMETHER WITH LUMEFANTRINE—avoid concomitant use
- Antipsychotics: possible increased risk of ventricular arrhythmias when vandetanib given with • AMISULPRIDE,
 - CHLORPROMAZINE, HALOPERIDOL, PIMOZIDE, SULPIRIDE OF
- ZUCLOPENTHIXOL—avoid concomitant use; avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- Beta-blockers: possible increased risk of ventricular arrhythmias when vandetanib given with ● SOTALOL—avoid concomitant use
- Cardiac Glycosides: vandetanib increases plasma concentration of DIGOXIN—possible increased risk of bradycardia
- Cytotoxics: possible increased risk of ventricular arrhythmias when vandetanib given with • ARSENIC TRIOXIDE—avoid concomitant use
- Hormone Antagonists: possible increased risk of ventricular arrhythmias when vandetanib given with • TOREMIFENE avoid concomitant use
- 5HT₃-receptor Antagonists: increased risk of ventricular arrhythmias when vandetanib given with ● ONDANSETRON avoid concomitant use
- Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when vandetanib given with • PENTAMIDINE ISETIONATE—avoid concomitant use

Vardenafil

- Alpha-blockers: enhanced hypotensive effect when vardenafil given with ALPHA-BLOCKERS—when patient is stable on the alpha blocker initiate vardenafil at the lowest possible dose separate doses by 6 hours (except with tamsulosin)
- Anti-arrhythmics: avoidance of vardenafil advised by manufacturer of DISOPYRAMIDE (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of vardenafil possibly increased by CLARITHROMYCIN (consider reducing initial dose of vardenafil); plasma concentration of vardenafil increased by ERYTHROMYCIN (reduce dose of vardenafil)
- Antifungals: plasma concentration of vardenafil increased by
 KETOCONAZOLE—avoid concomitant use; plasma concentration of vardenafil possibly increased by
 ITRACONAZOLE—avoid concomitant use
- Antivirals: plasma concentration of vardenafil possibly increased by FOSAMPRENAVIR; plasma concentration of vardenafil increased by ●INDINAVIR and ●RITONAVIR—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with ●SAQUINAVIR—avoid concomitant use; avoidance of vardenafil advised by manufacturer of
 - TELAPREVIR; caution with vardenafil advised by manufacturer of TIPRANAVIR
- Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with NIFEDIPINE
- Cobicistat: plasma concentration of vardenafil possibly increased by • COBICISTAT—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)
- Dapoxetine: avoidance of vardenafil advised by manufacturer of DAPOXETINE
- Grapefruit Juice: plasma concentration of vardenafil possibly increased by • GRAPEFRUIT JUICE—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when
- vardenafil given with NICORANDIL—avoid concomitant use
 Nitrates: possible increased hypotensive effect when
- vardenafil given with NITRATES—avoid concomitant use
 Riociguat: possible enhanced hypotensive effect when

vardenafil given with RIOCIGUAT—avoid concomitant use Varicella-zoster Vaccine see Vaccines Vasodilator Antihypertensives

- ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALDESLEUKIN
- ► Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with
- Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MAOIs; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with TRICYCLIC-RELATED ANTIDEPRESSANTS
- Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with BETA-BLOCKERS

Vasodilator Antihypertensives (continued)

- ► Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CLONIDINE
- Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CO-BENELDOPA; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CO-CARELDOPA; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with LEVODOPA
- Methyldopa: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with BACLOFEN; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with TIZANIDINE
- Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with NICORANDIL
- Nitrates: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with NITRATES
- Oestrogens: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALPROSTADIL
- Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with MINOXIDIL or SODIUM NITROPRUSSIDE; enhanced hypotensive effect when minoxidil given with SODIUM NITROPRUSSIDE

Vecuronium see Muscle Relaxants

Vedolizumab

- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Vemurafenib

- Antibacterials: manufacturer of vemurafenib advises avoid concomitant use with RIFABUTIN and RIFAMPICIN
- Anticoagulants: vemurafenib possibly enhances anticoagulant effect of • WARFARIN
- Antidepressants: manufacturer of vemurafenib advises avoid concomitant use with ST JOHN'S WORT
- ► Antiepileptics: manufacturer of vemurafenib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN and
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZAPINE (increased risk of agranulocytosis)
- ► Cytotoxics: avoidance of vemurafenib advised by manufacturer of IPILIMIMAB
- Oestrogens: manufacturer of vemurafenib advises contraceptive effect of • OESTROGENS possibly reduced
- Progestogens: manufacturer of vemurafenib advises contraceptive effect of ● PROGESTOGENS possibly reduced

Venlafaxine

- Analgesics: increased risk of bleeding when venlafaxine given
 with ◆NSAIDS or ◆ASPIRIN; possible increased serotonergic
 effects when SSRI-related antidepressants given with
 FENTANYL; possible increased serotonergic effects when
 venlafaxine given with TRAMADOL
- Anticoagulants: venlafaxine possibly enhances anticoagulant effect of • WARFARIN; possible increased risk of bleeding when SSRI-related antidepressants given with • DABIGATRAN

Venlafaxine (continued)

- Antidepressants: possible increased serotonergic effects when venlafaxine given with ST JOHN'S WORT, DULOXETINE Or MIRTAZAPINE; enhanced CNS effects and toxicity when venlafaxine given with ● MAOIS (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRIrelated antidepressants do not start ● MOCLOBEMIDE for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and • ARTENIMOL WITH PIPERAQUINE
- Antipsychotics: venlafaxine increases plasma concentration of HALOPERIDOL
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Dapoxetine: possible increased risk of serotonergic effects when venlafaxine given with DAPOXETINE (manufacturer of dapoxetine advises venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping venlafaxine)
- Dopaminergics: caution with venlafaxine advised by manufacturer of ENTACAPONE; increased risk of hypertension and CNS excitation when venlafaxine given with ● SELEGILINE (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)
- > 5HT₁-receptor Agonists: possible increased serotonergic effects when venlafaxine given with 5HT₁ AGONISTS
- 5HT₃-receptor Antagonists: possible increased serotonergic effects when SSRI-related antidepressants given with 5HT₃ ANTAGONISTS
- Lithium: possible increased serotonergic effects when venlafaxine given with LITHIUM
- Methylthioninium: risk of CNS toxicity when SSRI-related antidepressants given with ● METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Verapamil see Calcium-channel Blockers Vigabatrin

- Antidepressants: anticonvulsant effect of antiepileptics
 possibly antagonised by MAOIs and ●TRICYCLIC-RELATED
 ANTIDEPRESSANTS (convulsive threshold lowered);
 anticonvulsant effect of antiepileptics antagonised by SSRIS
 and ●TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: vigabatrin reduces plasma concentration of FOSPHENYTOIN and PHENYTOIN
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Vilanterol see Sympathomimetics, Beta₂ **Vildagliptin** see Antidiabetics

Vinblastine

- Aldesleukin: avoidance of vinblastine advised by manufacturer of • ALDESLEUKIN
- Antibacterials: toxicity of vinblastine increased by
- ERYTHROMYCIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when vinblastine given with
 DELAMANID
- Antifungals: possible increased risk of vinblastine toxicity
 when given with ITRACONAZOLE; metabolism of vinblastine
 possibly inhibited by POSACONAZOLE (increased risk of
 neurotoxicity)
- Antimalarials: avoidance of vinblastine advised by manufacturer of • ARTENIMOL WITH PIPERAQUINE
- Antipsychotics: avoid concomitant use of cytotoxics with
 CLOZADNUS (in presented with of agreement a retoric)
 - CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinblastine possibly increased by RITONAVIR

Vincristine

- Antibacterials: possible increased risk of ventricular arrhythmias when vincristine given with • DELAMANID
- Antifungals: increased risk of vincristine toxicity when given with • ITRACONAZOLE; metabolism of vincristine possibly inhibited by • POSACONAZOLE (increased risk of neurotoxicity)
- · Antimalarials: avoidance of vincristine advised by manufacturer of • ARTENIMOL WITH PIPERAQUINE
- · Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by NIFEDIPINE
- ▶ Cardiac Glycosides: vincristine possibly reduces absorption of **DIGOXIN** tablets

Vindesine

- · Antibacterials: possible increased risk of ventricular arrhythmias when vindesine given with . DELAMANID
- · Antifungals: possible increased risk of vindesine toxicity when given with • ITRACONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)

- Antibacterials: plasma concentration of vinflunine possibly reduced by • RIFAMPICIN—manufacturer of vinflunine advises avoid concomitant use; increased risk of ventricular arrhythmias when vinflunine given with • DELAMANID
- Antidepressants: plasma concentration of vinflunine possibly reduced by • ST JOHN'S WORT—manufacturer of vinflunine advises avoid concomitant use
- Antifungals: plasma concentration of vinflunine increased by • KETOCONAZOLE—manufacturer of vinflunine advises avoid concomitant use; possible increased risk of vinflunine toxicity when given with • ITRACONAZOLE
- Antimalarials: avoidance of vinflunine advised by manufacturer of ● ARTENIMOL WITH PIPERAQUINE
- · Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinflunine possibly increased by • RITONAVIR—manufacturer of vinflunine advises avoid concomitant use
- ▶ Grapefruit Juice: plasma concentration of vinflunine possibly increased by GRAPEFRUIT JUICE—manufacturer of vinflunine advises avoid concomitant use

- Antibacterials: possible increased risk of neutropenia when vinorelbine given with • CLARITHROMYCIN; possible increased risk of ventricular arrhythmias when vinorelbine given with DELAMANID
- · Antifungals: possible increased risk of vinorelbine toxicity when given with • ITRACONAZOLE
- Antimalarials: avoidance of vinorelbine advised by manufacturer of • ARTENIMOL WITH PIPERAOUINE
- · Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)

reduced)

- · Antibacterials: manufacturer of vismodegib advises avoid concomitant use with • RIFAMPICIN (plasma concentration of vismodegib possibly reduced)
- · Antidepressants: manufacturer of vismodegib advises avoid concomitant use with • ST JOHN'S WORT (plasma concentration of vismodegib possibly reduced)
- Antiepileptics: manufacturer of vismodegib advises avoid concomitant use with ● CARBAMAZEPINE, ● FOSPHENYTOIN and PHENYTOIN (plasma concentration of vismodegib possibly
- Antipsychotics: avoid concomitant use of cytotoxics with
- CLOZAPINE (increased risk of agranulocytosis)

Vitamin A see Vitamins

Vitamin D see Vitamins Vitamin E see Vitamins

Vitamin K (Phytomenadione) see Vitamins

 Antibacterials: absorption of vitamin A possibly reduced by NEOMYCIN

Vitamins (continued)

- Anticoagulants: vitamin E possibly enhances anticoagulant effect of • COUMARINS; vitamin K antagonises anticoagulant effect of • COUMARINS and • PHENINDIONE
- Antiepileptics: alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with CARBAMAZEPINE; alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with FOSPHENYTOIN: alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with PHENOBARBITAL; alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with PHENYTOIN; alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with PRIMIDONE
- Antifungals: plasma concentration of paricalcitol possibly increased by KETOCONAZOLE; effects of alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol and vitamin D possibly reduced by MICONAZOLE
- Antivirals: increased risk of bleeding when high doses of vitamin E given with TIPRANAVIR
- Ciclosporin: vitamin E possibly affects plasma concentration of CICLOSPORIN
- Cytotoxics: effects of alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol and vitamin D possibly reduced by DACTINOMYCIN; avoidance of vitamin E advised by manufacturer of IBRUTINIB
- Diuretics: increased risk of hypercalcaemia when alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D given with THIAZIDES AND RELATED
- Dopaminergics: pyridoxine reduces effects of LEVODOPA when given without dopa-decarboxylase inhibitor
- Lipid-regulating Drugs: absorption of calcitriol possibly reduced by COLESTYRAMINE (give at least 1 hour before or 4 to 6 hours after colestyramine)
- Retinoids: risk of hypervitaminosis A when vitamin A given with • RETINOIDS—avoid concomitant use
- Selenium: ascorbic acid possibly reduces absorption of SELENIUM (give at least 4 hours apart)
- ► Sevelamer: absorption of calcitriol reduced by SEVELAMER (give at least 1 hour before or 3 hours after sevelamer)

Voriconazole see Antifungals, Triazole Warfarin see Coumarins

Wasp Venom Extracts

• ACE Inhibitors: possible severe anaphylactoid reaction when wasp venom extracts given with • ACE INHIBITORS

Xipamide see Diuretics

Xylometazoline see Sympathomimetics

Yellow Fever Vaccine see Vaccines

Zafirlukast see Leukotriene Receptor Antagonists

Zaleplon see Anxiolytics and Hypnotics

- NOTE Increased risk of toxicity with nephrotoxic and myelosuppressive drugs-for further details consult product literature
- Analgesics: increased risk of haematological toxicity when zidovudine given with NSAIDs; plasma concentration of zidovudine possibly increased by METHADONE
- Antibacterials: absorption of zidovudine reduced by CLARITHROMYCIN tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with RIFAMPICIN
- Antiepileptics: zidovudine increases or decreases plasma concentration of FOSPHENYTOIN and PHENYTOIN; plasma concentration of zidovudine possibly increased by SODIUM VALPROATE and VALPROIC ACID (increased risk of toxicity)
- Antifungals: plasma concentration of zidovudine increased by • FLUCONAZOLE (increased risk of toxicity)
- Antimalarials: increased antifolate effect when zidovudine given with PYRIMETHAMINE

Zidovudine (continued)

- Antivirals: profound myelosuppression when zidovudine given with ● GANCICLOVIR or ● VALGANCICLOVIR (if possible avoid concomitant administration, particularly during initial ganciclovir or valganciclovir therapy); increased risk of granulocytopenia when zidovudine given with ● NEVIRAPINE; increased risk of anaemia when zidovudine given with
 - RIBAVIRIN—avoid concomitant use; zidovudine possibly inhibits effects of STAVUDINE (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by TIPRANAVIR

 TIPRANAVIR

 TIPRANAVIR

 TIPRANAVIR
- Atovaquone: plasma concentration of zidovudine increased by ATOVAQUONE (increased risk of toxicity)
- Orlistat: absorption of zidovudine possibly reduced by
 ORLISTAT

• ORLISTA Zinc

- Antibacterials: zinc reduces absorption of CIPROFLOXACIN, LEVOFLOXACIN, MOXIFLOXACIN and OFLOXACIN; zinc reduces absorption of NORFLOXACIN (give at least 2 hours apart); zinc reduces absorption of TETRACYCLINES, also absorption of zinc reduced by tetracyclines
- ▶ Calcium Salts: absorption of zinc reduced by CALCIUM SALTS
- Eltrombopag: zinc possibly reduces absorption of ELTROMBOPAG (give at least 4 hours apart)
- Iron Salts: absorption of zinc reduced by oral IRON SALTS, also absorption of oral iron salts reduced by zinc
- Penicillamine: absorption of zinc reduced by PENICILLAMINE, also absorption of penicillamine reduced by zinc
- ► Trientine: absorption of zinc reduced by TRIENTINE, also absorption of trientine reduced by zinc

Zoledronic Acid see Bisphosphonates

Zolmitriptan see 5HT₁-receptor Agonists (under HT)

Zolpidem see Anxiolytics and Hypnotics

Zonisamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ◆TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ◆SSRIS and ◆TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of zonisamide reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEFLOQUINE
- Diuretics: manufacturer of zonisamide advises avoid concomitant use with CARBONIC ANHYDRASE INHIBITORS in children
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT

Zopiclone see Anxiolytics and Hypnotics

Zuclopenthixol see Antipsychotics

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

Information

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)

All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain

Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements

For most enteral feeds and nutritional supplements, the main source of **carbohydrate** is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of **protein** or **amino acids** are included with each product entry. The **fat** or **oil** content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table,

below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of **vitamins**, **minerals**, and **trace elements**—the manufacturer's product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin. The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values

Nutritional values of products vary with flavour and pack size—consult product literature.

Other conditions for which ACBS products can be prescribed

This is a list of clinical conditions for which the ACBS has approved toilet preparations.

Birthmarks

Dermatitis

Eczema and Pruritis

Aveeno® Bath Oil; Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)

Covermark® classic foundation and finishing powder; Dermablend® Ultra corrective foundation; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).

Disinfectants (antiseptics)

May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygenic

Dry mouth (xerostomia)

For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca

AS Saliva Orthana®; Biotène Oralbalance®; BioXtra®; Glandosane®; Saliveze®

Photodermatoses (skin protection in)

Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra;

Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50

Standard ACBS Indications

Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula.

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour				
Fresubin [®] 1500 Complete (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13 g (sugars 0.9 g)	3.4 g	1.5 g	Gluten-free Residual lactose Contains fish oil	Standard, p. 1261 except bowel fistula and pre-operative preparation of malnourished patients. Not suitable for child under 2 years	Fresubin 1500 Complete liquid: 1.5 litre = £13.14				
Fresubin [®] Original (Fresenius Kabi Ltd)	Liquid (sip or tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 3.5 g)	3.4 g	Nil	Gluten-free Residual lactose Contains fish gelatin Feed in flexible pack contains fish oil and fish gelatin	Standard, p. 1261	Fresubin Original liquid: blackcurrant, chocolate, nut, peach, vanilla 200 ml = £2.12; unflavoured 500 ml = £4.12; 1000 ml = £8.17; 1500 ml = £12.26				
Fresubin [®] Original Fibre (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13 g (sugars 0.9 g)	3.4 g	1.5 g	Gluten-free Residual lactose Contains fish oil	Standard, p. 1261 except bowel fistula and pre-operative preparation of malnourished patients. Not suitable for child under 2 years	Fresubin Original Fibre liquid: 500 ml = £4.67; 1000 ml = £9.32				
Jevity [®] (Abbott Laboratories Ltd)	Liquid (tube feed) per 100 mL	449 kJ (107 kcal)	4 g caseinates	14.1 g (sugars 470 mg)	3.47 g	1.76g	Gluten-free Residual lactose	Standard, p. 1261 except bowel fistula. Not suitable for child under 2 years	Jevity liquid: 500 ml = £4.87; 1000 ml = £9.16; 1500 ml = £13.75				
Novasource [®] GI Control (Nestlé)	Liquid (tube feed) per 100 mL	444 kJ (106 kcal kcal)	4.1 g cows' milk	14.4 g (sugars 500 mg)	3.5 g (MCT 40 %)	2.2 g	Gluten-free Residual lactose	Standard, p. 1261	Novasource liquid: 500 ml = £5.43				
Nutrison [®] (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose	Standard, p. 1261	Nutrison liquid: 500 ml = £4.83; 500 ml = £4.35; 1000 ml = £8.48; 1500 ml = £12.70				
Nutrison [®] Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	1.5 g	Gluten-free Residual lactose	Standard, p. 1261 except bowel fistula	Nutrison Multi Fibre liquid: $500 \text{ ml} = £4.90; 500 \text{ ml} = £5.22; 1000 \text{ ml} = £9.81; 1500 \text{ ml} = £14.71$				
Osmolite [®] (Abbott Laboratories Ltd)	Liquid (tube feed) per 100 mL	424 kJ (100 kcal)	4 g caseinates soy isolate	13.6 g (sugars 630 mg)	3.4 g	Nil	Gluten-free Residual lactose	Standard, p. 1261	Osmolite liquid: 500 ml = £4.19; 1000 ml = £7.87; 1500 ml = £11.81				
SOYA PROTEIN FORM	IULA												
Fresubin [®] Soya Fibre (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g soya protein	13.3 g (sugars 4.1 g)	3.6 g	2g	Gluten-free Lactose-free Contains fish oil	Standard, p. 1261; also cows' milk protein intolerance, lactose intolerance	Fresubin Soya Fibre liquid: 500 ml = £4.83				
Nutrison [®] Soya (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g soy isolate	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose Milk protein-free	Standard, p. 1261; also cows' milk protein and lactose intolerance	Nutrison Soya liquid: 500 ml = £5.21; 1000 ml = £10.43				
Nutrison [®] Soya Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g soy isolate	12.3 g (sugars 700 mg)	3.9 g	1.5 g	Gluten-free Residual lactose Milk protein-free	Standard, p. 1261 except bowel fistula; also cows' milk protein and lactose intolerance	Nutrison Soya Multi Fibre liquid: 1.5 litre = £17.35				

PEPTIDE-BASED FOR	MULA								
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nutrison Peptisorb [®] (Nutricia Ltd)	Liquid (tube feed) per 100 mL	425 kJ (100 kcal)	4 g whey protein hydrolysate	17.6 g (sugars 1.7 g)	1.7 g (MCT 47 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Nutrison Peptisorb liquid: 500 ml = £7.59; 500 ml = £6.92; 1000 ml = £13.69
Peptamen [®] (Nestle Health Science)	Liquid (sip or tube feed) per 100 mL	420 kJ (100 kcal)	4 g whey peptides	12.7 g (sugars 480 mg)	3.7 g (MCT 70 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Peptamen liquid: vanilla 800 ml = £11.85; unflavoured 500 ml = £6.66; 1000 ml = £12.50
Survimed [®] OPD (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4.5 g whey protein hydrolysate	14.3 g (sugars 1.1 g)	2.8 g (MCT 51 %)	0.1 g	Gluten-free Residual lactose Contains fish oil	Standard, p. 1261; also growth failure	Survimed OPD: liquid 500 ml = £6.88 800 ml = £12.64 1000 ml = £13.77 HN liquid 500 ml = £6.63

Nil

Enteral feeds: Less than 1 kcal/mL and less than 5 g protein/100 mL

AMINO ACID FORMULA (ESSENTIAL AND NON-ESSENTIAL AMINO ACIDS)

Elemental 028® Extra Liquid (sin feed) 360 kJ

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

(Nutricia Ltd)	per 100 mL	(86 kcal)	(protein equivalent)	(sugars 4.7 g)	(MCT 35 %)	
	Standard dilution (20 %) of powder (sip or tube feed)	374 kJ (89 kcal)	2.5 g (protein equivalent)	11.8 g (sugars 1.1 g)	3.5 g (MCT 35 %)	Nil

Powder provides protein equivalent 12.5 g, carbohydrate 59 g, fat 17.45 g, energy 1871 kJ (443 kcal)/100 g

25 g

Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL

Enteral feeds: 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

Nutritional supplements for metabolic diseases

Glutaric aciduria (type 1)

GA1 Anamix® Infant

Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

GA Gel®

► Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months-10 years. GEL, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements.

GA gel oral powder 24g sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £210.12

XLYS, Low TRY, Maxamaid®

Nutritional supplement for the dietary management of type 1 glutaric aciduria.

POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.

XLYS LOW TRY Maxamaid powder (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £96.40

XLYS, TRY Glutaridon[®]

Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements.
POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g.

XLYS TRY Glutaridon powder (Nutricia Ltd)

500 gram (ACBS) · NHS indicative price = £182.61

Glycogen storage disease

Corn flour and corn starch

For glycogen storage disease

Glycosade®

 A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years.

POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g.

Glycosade oral powder 60g sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £110.44

Homocystinuria or hypermethioninaemia

HCU Anamix[®] Infant

Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

HCU Anamix Infant powder (Nutricia Ltd) 400 gram (ACBS) • NHS indicative price = £38.18

HCU cooler® 15

A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years with homocystinuria. LIQUID, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.

HCU orange cooler 15 liquid (Vitaflo International Ltd) 130 ml (ACBS) • NHS indicative price = £11.09

HCU Express® 15

▶ A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements.

HCU express **15** oral powder **25g** sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £326.30

XMTVI Maxamaid powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £96.40

XMTVI Maxamum®

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia. POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements.

XMTVI Maxamum powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £154.52

Other inborn errors of metabolism

Cystine500®

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from

POWDER, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 63 kJ (15 kcal)/4 g

DocOmega[®]

Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth. POWDER, protein (cows' milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals

DocOmega oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £38.64

EAA® Supplement

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years.

POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.

EAA Supplement oral powder 12.5g sachets (Vitaflo International Ltd)

50 sachet (ACBS) · NHS indicative price = £201.42

Isoleucine50®

Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Isoleucine50 oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £53.38

KevOmega[®]

 Nutritional supplement for the dietary management of inborn errors of metabolism.

POWDER, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g.

KeyOmega oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) ⋅ NHS indicative price = £39.50

Leucine100®

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g

Leucine100 oral powder sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £53.38

Low protein drink

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.

POWDER, protein (cows' milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose.

Milupa LP drink (Nutricia Ltd)

400 gram (ACBS) · NHS indicative price = £9.06

Phenylalanine50®

 Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.
 POWDER, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Phenylalanine50 oral powder sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = $\pounds 51.83$

ProZero[®]

A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.

LIQUID, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

ProZero liquid (Vitaflo International Ltd)

250 ml (ACBS) • NHS indicative price = £1.42 | 1000 ml (ACBS) • NHS indicative price = £5.68

Tyrosine1000®

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4-g sachet.

Tyrosine1000 oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £4.89

Valine50®

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Valine50 oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £53.38

Phenylketonuria

Add-Ins®

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years. POWDER, protein equivalent (containing essential and nonessential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements.

Add Ins oral powder 18.2g sachets (Nutricia Ltd)

60 sachet (ACBS) • NHS indicative price = £368.40

Easiphen®

► Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years. LIQUID, protein equivalent (containing essential and nonessential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

Easiphen liquid (Nutricia Ltd)

250 ml (ACBS) · NHS indicative price = £9.47

Lophlex[®]

► Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements.

Lophlex powder 27.8g sachets (Nutricia Ltd)

berry, orange, unflavoured 30 sachet (ACBS) \cdot NHS indicative price = £284.40

Loprofin[®] PKU Drink

 Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults.
 LIQUID, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL.

Loprofin PKU drink (Nutricia Ltd)

200 ml (ACBS) · NHS indicative price = £0.74

Loprofin® Sno-Pro

► Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism.

LIQUID, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose.

Loprofin SNO-PRO drink (Nutricia Ltd)

200 ml (ACBS) · NHS indicative price = £1.23

Milupa PKU 2-prima®

Nutritional supplement for the dietary management of phenylketonuria in children 1-8 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements.

Milupa PKU 2 Prima powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £153.73

Milupa PKU 2-secunda®

▶ Nutritional supplement for the dietary management of phenylketonuria in children 9-15 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements.

Milupa PKU 2 Secunda powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £179.34

Milupa PKU 3-advanta®

 Nutritional supplement for the dietary management of phenylketonuria in children over 15 years.
 POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements.

Milupa PKU 3 Advanta powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £179.34

Phlexy-10® Exchange System

 Nutritional supplement for the dietary management of phenylketonuria.

CAPSULES, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule.

Phlexy-10 500mg capsules (Nutricia Ltd)

200 capsule (ACBS) NHS indicative price = £42.00 DRINK MIX, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet.

Phlexy-10 drink (Nutricia Ltd)

mix apple & blackcurrant, mix citrus burst, mix tropical surprise 600 gram (ACBS) • NHS indicative price = £126.00 TABLETS, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet.

tablets (Nutricia Ltd)

75 tablet (ACBS) • NHS indicative price = £27.00

Phlexy-Vits®

 For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities.
 POWDER, vitamins, minerals, and trace elements

Phlexy-Vits (Nutricia Ltd)

powder 210 gram (ACBS) - NHS indicative price = £70.20

Phlexy-Vits (Nutricia Ltd)

tablets 180 tablet (ACBS) • NHS indicative price = £79.20

PK Aid 4[®]

Nutritional supplement for the dietary management of phenylketonuria in children and adults.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (354 kcal)/100 g.

PK Aid 4 powder (Nutricia Ltd)

500 gram (ACBS) · NHS indicative price = £140.37

PKU Anamix[®] Infant

Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL

PKU Anamix Infant powder (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £34.70

PKU Anamix[®] Junior

Nutritional supplement for the dietary management of phenylketonuria in children 1−10 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 kJ (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements

PKU Anamix Junior powder (Nutricia Ltd)

chocolate, neutral 870 gram (ACBS) • NHS indicative price = £123.90 | 1080 gram (ACBS) • NHS indicative price = £123.90

PKU Anamix[®] Junior LQ

▶ Nutritional supplement for the dietary supplement of phenyketonuria in children 1–10 years.

LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

PKU Anamix Junior LQ liquid (Nutricia Ltd)

berry, orange 125 ml (ACBS) · NHS indicative price = £5.51

PKU cooler10®

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements.

PKU (Vitaflo International Ltd)

orange cooler 10 liquid, purple cooler 10 liquid, red cooler 10 liquid, white cooler 10 liquid 87 ml (ACBS) \cdot NHS indicative price = £4.51

PKU cooler15®

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements.

PKU (Vitaflo International Ltd)

orange cooler 15 liquid, purple cooler 15 liquid, red cooler 15 liquid, white cooler 15 liquid 130 ml (ACBS) \cdot NHS indicative price = £6.72

PKU cooler20®

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements.

PKU (Vitaflo International Ltd)

orange cooler 20 liquid, purple cooler 20 liquid, red cooler 20 liquid, white cooler 20 liquid 174 ml (ACBS) \cdot NHS indicative price = £9.02

PKU express15®

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 293 kJ (70 kcal)/25 g, with vitamins, minerals, and trace elements

PKU express 15 powder (Vitaflo International Ltd) lemon, orange, tropical, unflavoured 750 gram (ACBS) \cdot NHS indicative price = £197.82

PKU express20®

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 3.3 g, energy 389 kJ (93 kcal)/34 g, with vitamins, minerals, and trace elements.

PKU express 20 powder (Vitaflo International Ltd) lemon, orange, tropical, unflavoured 1020 gram (ACBS) \cdot NHS indicative price = £255.58

PKU gel

▶ For use as part of the low-protein dietary management of phenylketonuria in children 1–10 years

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24 g, with vitamins, minerals, and trace elements.

PKU gel powder (Vitaflo International Ltd)

orange, raspberry, unflavoured 720 gram (ACBS) - NHS indicative price = £136.86

PKU Lophlex® LQ 10

► Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women.

LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements.

PKU Lophlex LQ 10 liquid juicy (Nutricia Ltd)

berries, orange 62.5 ml (ACBS) • NHS indicative price = £5.08

PKU Lophlex® LO 20

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women.

LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements.

XP Maxamum oral powder 50g sachets (Nutricia Ltd) orange, unflavoured 30 sachet (ACBS) \cdot NHS indicative price = £264.45

XP Maxamum powder (Nutricia Ltd)

orange, unflavoured 500 gram (ACBS) • NHS indicative price = £88.20

Tyrosinaemia

Methionine-free TYR Anamix® Infant

Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69

TYR Anamix Infant methionine free powder (Nutricia Ltd) 400 gram (ACBS) • NHS indicative price = £38.18

TYR Anamix[®] Infant

► Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

TYR Anamix Infant (Nutricia Ltd)

methionine free powder, powder 400 gram (ACBS) \cdot NHS indicative price = £38.18

TYR Anamix[®] Junior

▶ Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements.

TYR Anamix Junior oral powder 29g sachets (Nutricia Ltd) 30 sachet (ACBS) \cdot NHS indicative price = £202.50

TYR Anamix® Junior LQ

Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see), type II, and type III, in children over 1 year. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g,carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals and trace elements.

TYR Anamix Junior LQ liquid (Nutricia Ltd) 125 ml (ACBS) • NHS indicative price = £8.85

TYR cooler® 15

Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults. LIQUID, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.

TYR orange cooler 15 liquid (Vitaflo International Ltd) 130 ml (ACBS) ⋅ NHS indicative price = £11.09

TYR red cooler (Vitaflo International Ltd)
15 liquid 130 ml (ACBS) • NHS indicative price = £11.09

TYR express15[®]

Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults. POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements.

TYR express 15 oral powder 25g sachets (Vitaflo International Ltd) 30 sachet (ACBS) \cdot NHS indicative price = £326.30

TYR express20®

Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years. POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. TYR express 20 oral powder 34g sachets (Vitaflo International Ltd) 30 sachet (ACBS) \cdot NHS indicative price = £421.57 TYR Gel®

 Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.
 GEL, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals and trace elements.

TYR gel oral powder 24g sachets (Vitaflo International Ltd) 30 sachet (ACBS) • NHS indicative price = £210.07

TYR Lophlex® LQ 20

Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

TYR Lophlex LQ 20 liquid (Nutricia Ltd)

125 ml (ACBS) • NHS indicative price = £15.75

XPHEN TYR Maxamaid®

 Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.

XPHEN TYR Maxamaid powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £96.40

XPHEN TYR Tyrosidon®

 Nutritional supplement for the management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XPHEN TYR Tyrosidon Free AA Mix powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £182.61

XPTM Tyrosidon®

 Nutritional supplement for the dietary management of tyrosinaemia type I in children and adults where plasmamethionine concentrations are above normal.
 POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XPTM Tyrosidon powder (Nutricia Ltd) 500 gram (ACBS) • NHS indicative price = £91.31

Appendix 3

Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels

Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discolouration of urine or stools by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs

Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard.... days after opening' and 'Do not use after....', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eyedrops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF 61 (March 2011), a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Lahels

- 1 Warning: This medicine may make you sleepy To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.
- Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses. In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient's doctor.

Side-effects unrelated to drowsiness that may affect a patient's ability to drive or operate machinery safely include *blurred vision*, *dizziness*, *or nausea*. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and dealcoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary. Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

To be used with label 25 on *preparations coated to resist gastric acid* (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs).

Also to be used on *preparations that contain a drug whose* withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to ston

To be used on *preparations where a course of treatment* should be completed to reduce the incidence of relapse or failure of treatment

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

To be used particularly on *preparations containing anticoagulants, lithium, and oral corticosteroids.* The appropriate treatment card should be given to the patient and any necessary explanations given.
This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds

To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine

To be used on *preparations containing sulfinpyrazone* whose activity is reduced by aspirin. Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless

To be used on *preparations that may cause the patient's urine to turn an unusual colour.* These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine

To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening

To be used on *glyceryl trinitrate tablets* to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than... in 24 hours

To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.

It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than... in 24 hours. Also, do not take more than... in any one week

To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol

To be used on *preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night.* On the rare occasions when hypnotics are prescribed

for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an *alternative to the label 2 wording* (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night.

It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.

21 Take with or just after food, or a meal

To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food. Patients should be advised that a small amount of food is sufficient.

22 Take 30 to 60 minutes before food

To be used on some preparations whose absorption is thereby improved.

Most oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food

To be used on *oral antibacterials whose absorption may be* reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine

To be used on *preparations that should be sucked or chewed*. The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or crush

To be used on preparations that are enteric-coated or designed for modified-release.

Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole. Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue

To be used on *preparations designed for sublingual use*. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water

To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only

To be used on *external preparations* that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours

To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis. The dose form should be specified, e.g. tablets or capsules.

This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well

To be used on all containers of dispensed *preparations* containing paracetamol.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine

To be used on containers of dispensed *preparations* containing aspirin when the name on the label does not include the word 'aspirin'.

The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are: cleansing, removal of debris; granulation, vascularisation; epithelialisation. The ideal dressing for moist wound healing needs to ensure that the wound remains: moist with exudate, but not macerated; free of clinical infection and excessive slough; free of toxic chemicals, particles or fibres; at the optimum temperature for healing; undisturbed by the need for frequent changes; at the optimum pH value. As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease). Advanced wound dressings, p. 1297 are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginates, foams). Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water. Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough

wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris. There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see Buyers' Guide: Advanced wound dressings (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing. Prices quoted in Appendix 4 are basic NHS net prices; for further information see Prices in the BNF. The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

Basic wound contact dressings

Low adherence dressings

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings.

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only

Wound contact material for different types of wounds

Note In each section of this table the dressings are listed in order of increasing absorbency.			

partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorbency of the

Some wound contact (primary) dressings require a secondary dressing

dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to interfere with absorption; dressings with 'normal loading' (such as Jelonet[®]) have been used for skin graft transfer.

Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

Knitted polyester primary dressing

Atrauman

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides

Atrauman dressing (Paul Hartmann Ltd) 10cm x 20cm = £0.63, 20cm x 30cm = £1.72, 5cm x 5cm = £0.27, 7.5cm x 10cm = £0.28

Knitted viscose primary dressing

N-A Dressing

Warp knitted fabric manufactured from a bright viscose monofilament.

N-A dressing (Systagenix Wound Management Ltd) $19cm \times 9.5cm = £0.67$, $9.5cm \times 9.5cm = £0.35$

N-A Ultra

Warp knitted fabric manufactured from a bright viscose monofilament.

N-A Ultra dressing (Systagenix Wound Management Ltd) 19cm x 9.5cm = £0.63, 9.5cm x 9.5cm = £0.33

Profore

Warp knitted fabric manufactured from a bright viscose monofilament.

 $\begin{array}{l} \textbf{Profore} \; (\text{Smith \& Nephew Healthcare Ltd}) \; wound \; contact \; layer \; 14cm \\ x \; 20cm = \pounds 0.32 \end{array}$

Tricotex

Warp knitted fabric manufactured from a bright viscose monofilament.

Tricotex dressing (Smith & Nephew Healthcare Ltd) $9.5cm \times 9.5cm = £0.34$

Paraffin Gauze Dressing

Cuticell

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

Cuticell (BSN medical Ltd) Classic dressing 10cm x 10cm = £0.29

Jelonet

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

Jelonet dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm = £0.41

Neotulle

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

Neotulle (Neomedic Ltd) dressing 10cm x 10cm = £0.29

Paragauze

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

Paragauze (C D Medical Ltd) dressing 10cm x 10cm = £0.28

Paranet

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

Paranet (Synergy Health Plc) dressing 10cm x 10cm = £0.25

Absorbent dressings

Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

Absorbent cellulose dressing

CelluDress

Absorbent Cellulose Dressing with Fluid Repellent Backing Cellubress dressing (Medicareplus International Ltd) $10cm \times 10cm = 0.19$, $10cm \times 15cm = 0.20$, $10cm \times 20cm = 0.22$, $15cm \times 20cm = 0.20$, $10cm \times 20cm \times 20cm = 0.20$, $10cm \times 20cm \times 20c$

Eclypse

Absorbent Cellulose Dressing with Fluid Repellent Backing Eclypse (Advancis Medical) Boot dressing 60cm x 70cm = £13.78, dressing 15cm x 15cm = £0.97, 20cm x 30cm = £2.14, 60cm x 40cm = £8.15.

Exu-Dry

Absorbent Cellulose Dressing with Fluid Repellent Backing Exu-Dry dressing (Smith & Nephew Healthcare Ltd) 10cm x 15cm = £1.12, 15cm x 23cm = £2.29, 23cm x 38cm = £5.32

Mesorb

Cellulose wadding pad with gauze wound contact layer and non-woven repellent backing

Mesorb dressing (Molnlycke Health Care Ltd) $10cm \times 10cm = £0.62$, $10cm \times 15cm = £0.81$, $10cm \times 20cm = £1.00$, $15cm \times 20cm = £1.42$, $20cm \times 25cm = £2.24$, $20cm \times 30cm = £2.54$

Telfa Max

Absorbent Cellulose Dressing with Fluid Repellent Backing

Zetuvit

Absorbent Cellulose Dressing with Fluid Repellent Backing; sterile or non-sterile

Zetuvit E (Paul Hartmann Ltd) non-sterile dressing 10cm x 10cm = £0.07, 10cm x 20cm = £0.09, 20cm x 20cm = £0.14, 20cm x 40cm = £0.27, sterile dressing 10cm x 10cm = £0.21, 10cm x 20cm = £0.25, 20cm x 20cm = £0.39, 20cm x 40cm = £1.10,

Absorbent perforated dressing

Adpore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Adpore dressing (Medicareplus International Ltd) $10 \text{cm} \times 10 \text{cm} = \text{£}0.10$, $10 \text{cm} \times 15 \text{cm} = \text{£}0.16$, $10 \text{cm} \times 20 \text{cm} = \text{£}0.30$, $10 \text{cm} \times 25 \text{cm} = \text{£}0.34$, $10 \text{cm} \times 30 \text{cm} = \text{£}0.42$, $10 \text{cm} \times 35 \text{cm} = \text{£}0.50$, $7 \text{cm} \times 8 \text{cm} = \text{£}0.08$

Cosmopore E

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cosmopor E dressing (Paul Hartmann Ltd) 10cm x 20cm = £0.45, 10cm x 25cm = £0.56, 10cm x 35cm = £0.78, 5cm x 7.2cm = £0.08, 8cm x 10cm = £0.17, 8cm x 15cm = £0.28

Cutiplast Steril

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cutiplast Steril dressing (Smith & Nephew Healthcare Ltd) 10cm x 20cm = £0.31, 10cm x 25cm = £0.32, 10cm x 30cm = £0.42, 8cm x 10cm = £0.11, 8cm x 15cm = £0.24

Leukome

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Leukomed dressing (BSN medical Ltd) 10 cm x 20 cm = £0.43, 10 cm x 25 cm = £0.48, <math>10 cm x 30 cm = £0.62, 10 cm x 35 cm = £0.72, 5 cm x 7.2 cm = £0.09, 8 cm x 10 cm = £0.18, 8 cm x 15 cm = £0.32

Medipore + Pad

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Medipore + Pads dressing (3M Health Care Ltd) 10cm x 10cm = £0.15, 10cm x 15cm = £0.25, 10cm x 20cm = £0.37, 10cm x 25cm = £0.46, 10cm x 35cm = £0.64, 5cm x 7.2cm = £0.07

Medisafe

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Medisafe dressing (Neomedic Ltd) 6cm x 8cm = £0.08, 8cm x 10cm = £0.13, 8cm x 12cm = £0.23, 9cm x 15cm = £0.29, 9cm x 20cm = £0.34, 9cm x 25cm = £0.36

Mepore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Mepore dressing (Molnlycke Health Care Ltd) 10cm x 11cm = £0.22, 11cm x 15cm = £0.36, 7cm x 8cm = £0.11, 9cm x 20cm = £0.44, 9cm x 25cm = £0.61, 9cm x 30cm = £0.70, 9cm x 35cm = £0.76

PremierPore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

PremierPore dressing (Shermond) 10cm x 10cm = £0.12, 10cm x 15cm = £0.18, 10cm x 20cm = £0.32, 10cm x 25cm = £0.36, 10cm x 30cm = £0.45, 10cm x 35cm = £0.52, 5cm x 7cm = £0.05

Primapore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Primapore dressing (Smith & Nephew Healthcare Ltd) 10cm x 20cm = £0.43, 10cm x 25cm = £0.50, 10cm x 30cm = £0.62, 10cm x 35cm = £0.96, 6cm x 8.3cm = £0.18, 8cm x 10cm = £0.19, 8cm x 15cm = £0.13

Softpore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Softpore dressing (Richardson Healthcare Ltd) 10cm x 10cm = £0.13, 10cm x 15cm = £0.20, 10cm x 20cm = £0.35, 10cm x 25cm = £0.40, 10cm x 30cm = £0.49, 10cm x 35cm = £0.58, 6cm x 7cm = £0.06

Sterifix

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Sterifix dressing (Paul Hartmann Ltd) 10cm x 14cm = £0.58, 5cm x 7cm = £0.20, 7cm x 10cm = £0.32

Telfa Island

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Telfa Island dressing (Aria Medical Ltd) 10cm x 12.5cm = £0.27, 10cm x 20cm = £0.35, 10cm x 25.5cm = £0.45, 10cm x 35cm = £0.62, 5cm x 10cm = £0.08

Absorbent perforated plastic film faced dressing

Absopa

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Absopad dressing (Medicareplus International Ltd) 10cm x 10cm = £0.13, 20cm x 10cm = £0.28

Askina Pad

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Askina (B.Braun Medical Ltd) Pad dressing 10cm x 10cm = £0.21

Melolin

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Melolin dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm = £0.27, 20cm x 10cm = £0.53, 5cm x 5cm = £0.17

Low-adherence primary dressing consisting of 3 layersperforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Skintact dressing (Robinson Healthcare) 10cm x 10cm = £0.17, 20cm $x 10cm = £0.34, 5cm \times 5cm = £0.10$

Low-adherence primary dressing consisting of 3 layersperforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Solvaline N dressing (Lohmann & Rauscher (UK) Ltd) 10cm x 10cm = £0.18, 20cm x 10cm = £0.35, 5cm x 5cm = £0.10

Low-adherence primary dressing consisting of 3 layers perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Telfa dressing (Aria Medical Ltd) 10cm x 7.5cm = £0.16, 15cm x $7.5cm = £0.18, 20cm \times 7.5cm = £0.29, 7.5cm \times 5cm = £0.12$

Super absorbent cellulose and polymer primary dressina

Curea P1

Super absorbent cellulose and polymer primary dressing. Curea P1 dressing (Charles S. Bullen Stomacare Ltd) 10cm x 10cm square = £2.13, 10cm x 20cm rectangular = £3.61, 10cm x 30cm rectangular = £5.16, 12cm x 12cm square = £2.62, 20cm x 20cm square = £6.83, 20cm x 30cm rectangular = £9.94, 7.5cm x 7.5cm square = £1.70

Curea P2

Super absorbent cellulose and polymer primary dressing (non-adherent)

Curea P2 dressing (Charles S. Bullen Stomacare Ltd) 10cm x 20cm rectangular = £4.45, $11cm \times 11cm$ square = £2.45, $20cm \times 20cm$ square = £7.75, 20cm x 30cm rectangular = £10.50

Super absorbent cellulose and polymer primary dressing Cutisorb Ultra dressing (BSN medical Ltd) 10cm x 10cm square = £2.13, 10cm x 20cm rectangular = £3.56, 20cm x 20cm square = £6.68, 20cm x 30cm rectangular = £10.06

DryMax Extra

Super absorbent cellulose and polymer primary dressing DryMax Extra dressing (Aspen Medical Europe Ltd) 10cm x 10cm square = £1.84, 10cm x 20cm rectangular = £2.43, 20cm x 20cm square = £4.28, 20cm x 30cm rectangular = £4.89

ELECT Superabsorber

Super absorbent cellulose and polymer primary dressing ELECT Superabsorber dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £0.95, 10cm x 20cm rectangular = £1.12, 20cm x 20cm square = £2.00, 20cm x 30cm rectangular = £2.52

Super absorbent cellulose primary dressing

Zetuvit Plus dressing (Paul Hartmann Ltd) 10cm x 10cm = £0.63, $10\text{cm} \times 20\text{cm} = £0.87$, $15\text{cm} \times 20\text{cm} = £1.00$, $20\text{cm} \times 25\text{cm} = £1.37$, 20cm x 40cm = £2.11

Super absorbent hydroconductive dressing

Drawtex

Super absorbent hydroconductive dressing with absorbent, cross-action structures of viscose, polyester and cotton Drawtex dressing (Martindale Pharmaceuticals Ltd) 10cm x 1.3m = £16.00, $10 \text{cm} \times 10 \text{cm} = £2.24$, $10 \text{cm} \times 1 \text{m} = £16.00$, $15 \text{cm} \times 20 \text{cm} =$ £6.00, $20 \text{cm} \times 1 \text{m} = £25.00$, $20 \text{cm} \times 20 \text{cm} = £6.98$, $5 \text{cm} \times 5 \text{cm} =$ £0.95, 7.5cm x 1m = £15.50, 7.5cm x 7.5cm = £1.77

Advanced wound dressings

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy.

Hydrogel sheets have a fixed structure and limited fluidhandling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

Hydrogel application (amorphous)

ActivHeal Hydrogel

Hydrogel containing guar gum and propylene glycol ActivHeal (Advanced Medical Solutions Ltd) Hydrogel dressing = £1.41

Hydrogel containing modified starch copolymer AquaForm (Aspen Medical Europe Ltd) Hydrogel dressing = £2.02

Askina Gel

Hydrogel containing modified starch and glycerol Askina (B.Braun Medical Ltd) Gel dressing = £2.00

Cutimed

Hydrogel

Cutimed (BSN medical Ltd) Gel dressing = £2.99

Flexigran

Hydrogel containing modified starch and glycerol Flexigran (A1 Pharmaceuticals) Gel dressing = £1.90

GranuGel

Hydrogel containing carboxymethylcellulose, pectin and propylene glycol

GranuGEL (ConvaTec Ltd) Hydrocolloid Gel dressing = £2.32

Intrasite Gel

Hydrogel containing modified carmellose polymer and propylene glycol

IntraSite (Smith & Nephew Healthcare Ltd) Gel dressing = £3.57

Hydrogel containing alginate and propylene glycol Nu-Gel (Systagenix Wound Management Ltd) dressing = £2.09

Purilon Gel

Hydrogel containing carboxymethylcellulose and calcium alginate

Purilon (Coloplast Ltd) Gel dressing = £2.26

Hydrogel sheet dressings

ActiFormCool

Hydrogel dressing

ActiFormCool sheet (Activa Healthcare Ltd) 10cm x 10cm square = £2.63, 10cm x 15cm rectangular = £3.79, 20cm x 20cm square = £7.93, 5cm x 6.5cm rectangular = £1.79

Aquaflo

Hydrogel dressing

Aquaflo (Covidien (UK) Commercial Ltd) sheet 7.5cm discs = £2.60

Hydrogel dressing (without adhesive border) Coolie (Zeroderma Ltd) sheet 7cm discs = £1.96

Hydrogel dressing (without adhesive border) Gel FX sheet 1 (Synergy Health Plc) 0cm x 10cm square = £1.60, 5cm x 15cm square = £3.20

Geliperm Hydrogel sheets

Geliperm (Geistlich Sons Ltd) sheet 10cm x 10cm square = £2.53

Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film Hydrosorb sheet (Paul Hartmann Ltd) 10cm x 10cm square = £2.24, $20\text{cm} \times 20\text{cm}$ square = £6.71, $5\text{cm} \times 7.5\text{cm}$ rectangular = £1.56

Hydrosorb Comfort

Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film (with adhesive border, waterproof)

Hydrosorb Comfort sheet (Paul Hartmann Ltd) 12.5cm x 12.5cm square = £3.58, 4.5cm x 6.5cm rectangular = £1.85, 7.5cm x 10cm rectangular = £2.46

Intrasite Conformable

Soft non-woven dressing impregnated with Intrasite gel Intrasite Conformable dressing 10cm x (Smith & Nephew Healthcare Ltd) 10cm square = £1.80, 20cm rectangular = £2.42, 40cm rectangular = £4.33

Novogel

Glycerol-based hydrogel sheets (standard or thin)

Novogel sheet (Ford Medical Associates Ltd) 10cm x 10cm square = £3.18, 15cm x 20cm rectangular = £6.07, 20cm x 40cm rectangular = £11.56, 30cm x 30cm (0.15cm thickness) square = £12.71, (0.30cm thickness) square = £13.47, 5cm x 7.5cm rectangular = £1.99, 7.5cm diameter circular = £2.89,

SanoSkin NET

Hydrogel sheet (without adhesive border)
SanoSkin (Ideal Medical Solutions Ltd) NET sheet 8.5cm x 12cm rectangular = £2.28

Vacunet

Non-adherent, hydrogel coated polyester net dressing Vacunet dressing 10cm x 1 (Pro-Tex Capillary Dressings Ltd) 10cm square = £1.93, 5cm rectangular = £2.86

Sodium hyaluronate dressings

The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound.

Hyiodine® should be used with caution in thyroid disorders.

Hyiodine

Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution

Hyiodine (H & R Healthcare Ltd) dressing = £35.00

Vapour-permeable films and membranes

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers. Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

Non-woven fabric dressing with viscose-rayon pad.

For intravenous and subcutaneous catheter sites Niko (Unomedical Ltd) Fix dressing 7cm x 8.5cm = £0.19

Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

Askina Derm

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Askina Derm dressing (B.Braun Medical Ltd) $10 \text{cm} \times 12 \text{cm} = £1.08$, $10 \text{cm} \times 20 \text{cm} = £2.05$, $15 \text{cm} \times 20 \text{cm} = £2.49$, $20 \text{cm} \times 30 \text{cm} = £4.44$, $6 \text{cm} \times 7 \text{cm} = £0.37$

Bioclusive

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Bioclusive (Systagenix Wound Management Ltd) dressing 10.2cm x 12.7cm = £1.54

C-View

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces C-View dressing (Aspen Medical Europe Ltd) 10cm x 12cm = £1.02, 12cm x 12cm = £1.09, 15cm x 20cm = £2.36, 6cm x 7cm = £0.38

roccfilm

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Dressfilm dressing (St Georges Medical Ltd) 12cm x 12cm = £0.93, 15cm x 20cm = £1.90, 6cm x 7cm = £0.30

Hvdrofilm

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Hydrofilm dressing (Paul Hartmann Ltd) 10cm x 12.5cm = £0.42, 10cm x 15cm = £0.52, 10cm x 25cm = £0.86, 15cm x 20cm = £0.86, 20cm x 30cm = £1.60, 6cm x 7cm = £0.22

Hypafix Transparent

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Hypafix Transparent (BSN medical Ltd) dressing 10cm x 2m = £8.71

Leukomed T

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Leukomed T dressing (BSN medical Ltd) 10cm x 12.5cm = £1.01, 11cm x 14cm = £1.23, 15cm x 20cm = £2.35, 15cm x 25cm = £2.51, 7.2cm x 5cm = £0.37, 8cm x 10cm = £0.69

Mepitel Film

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Mepitel Film dressing (Molnlycke Health Care Ltd) 10.5cm x 12cm = £1.31, 10.5cm x 25cm = £2.55, 15.5cm x 20cm = £3.24, 6.5cm x 7cm = £0.49

Mepore Film

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Mepore Film dressing (Molnlycke Health Care Ltd) $10 \text{cm} \times 12 \text{cm} = £1.23$, $10 \text{cm} \times 25 \text{cm} = £2.39$, $15 \text{cm} \times 20 \text{cm} = £3.04$, $6 \text{cm} \times 7 \text{cm} = £0.46$

OpSite Flexifix

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Opsite Flexifix dressing (Smith & Nephew Healthcare Ltd) $10\text{cm} \times 1\text{m} = £6.57$, $5\text{cm} \times 1\text{m} = £3.89$

OpSite Flexigrid

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces OpSite Flexigrid dressing (Smith & Nephew Healthcare Ltd) 12cm x 12cm = £1.12, 15cm x 20cm = £2.84, 6cm x 7cm = £0.40

Polyskin II

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Kendall Film dressing (Aria Medical Ltd) JCCm x 12cm = £1.03, 10cm x 20cm = £2.04, 15cm x 20cm = £2.35, 20cm x 25cm = £4.11, 4cm x 4cm = £0.36, 5cm x 7cm = £0.40

ProtectFilm

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

ProtectFilm dressing (Wallace, Cameron & Company Ltd) 10cm x 12cm

= £0.20, 15cm x 20cm = £0.40, 6cm x 7cm = £0.11

Suprasorb F

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Suprasorb F dressing (Lohmann & Rauscher (UK) Ltd) 10cm x 12cm =

£0.80, 15cm x 20cm = £2.50, 5cm x 7cm = £0.33 **Tegaderm**

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Film dressing (3M Health Care Ltd) $12cm \times 12cm = £1.11$, $15cm \times 20cm = £2.41$, $6cm \times 7cm = £0.39$

Tegaderm diamond

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Tegaderm Diamond dressing (3M Health Care Ltd) 10cm x 12cm = £1.21, 6cm x 7cm = £0.45

Vacuskin

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Vacuskin dressing (Pro-Tex Capillary Dressings Ltd) 10cm x 12cm = £1.06, 10cm x 25cm = £2.06, 6cm x 7cm = £0.40

Vellafilm

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces Vellafilm dressing 1 (Advancis Medical) 2cm x 12cm = £1.10, 2cm x 35cm = £2.75. 5cm x 20cm = £2.10

Vapour-permeable Adhesive Film Dressing with absorbent pad Adpore Ultra

Film dressing with adsorbent pad

Adpore Ultra dressing (Medicareplus International Ltd) 10cm x 10cm = £0.14, 10cm x 15cm = £0.22, 10cm x 20cm = £0.33, 10cm x 25cm = £0.35, 10cm x 30cm = £0.52, 7cm x 8cm = £0.12

Alldress

Film dressing with adsorbent pad

Alldress dressing 1 (Molnlycke Health Care Ltd) 0cm x 10cm = £0.95, 5cm x 15cm = £2.07, 5cm x 20cm = £2.56

C-View Post-Op

Film dressing with adsorbent pad

C-View Post-Op dressing (Aspen Medical Europe Ltd) $10cm \times 12cm = £1.10$, $10cm \times 25cm = £1.60$, $10cm \times 35cm = £2.60$, $6cm \times 7cm = £0.40$

Clearpore

Film dressing with adsorbent pad

Clearpore dressing (Richardson Healthcare Ltd) 10cm x 10cm = £0.20, 10cm x 15cm = £0.24, 10cm x 20cm = £0.36, 10cm x 25cm = £0.40, 10cm x 30cm = £0.65, 6cm x 10cm = £0.15, 6cm x 7cm = £0.12

Hydrofilm Plus

Film dressing with adsorbent pad

Hydrofilm Plus dressing (Paul Hartmann Ltd) 10cm x 20cm = £0.45, 10cm x 25cm = £0.60, 10cm x 30cm = £0.68, 7.2cm x 5cm = £0.18, 9cm x 10cm = £0.27, 9cm x 15cm = £0.30

Leukomed T Plus

Film dressing with adsorbent pad

Leukomed T plus dressing (BSN medical Ltd) 10cm x 20cm = £1.34, 10cm x 25cm = £1.50, 10cm x 30cm = £2.51, 10cm x 35cm = £3.04, 7.2cm x 5cm = £0.27, 8cm x 10cm = £0.53, 8cm x 15cm = £0.80

Mepore Film & Pad

Film dressing with adsorbent pad

Mepore Film & Pad dressing (Molnlycke Health Care Ltd) 4cm \times 5cm = £0.24, 5cm \times 7cm = £0.24, 9cm \times 10cm = £0.62, 9cm \times 15cm = £0.92, 9cm \times 20cm = £1.36, 9cm \times 25cm = £1.50, 9cm \times 30cm = £2.00, 9cm \times 35cm = £2.49

Mepore Ultra

Film dressing with adsorbent pad

Mepore Ultra dressing (Molnlycke Health Care Ltd) 10cm x 11cm = £0.79, 11cm x 15cm = £1.17, 7cm x 8cm = £0.40, 9cm x 20cm = £1.51, 9cm x 25cm = £1.67, 9cm x 30cm = £2.75

OpSite Plus

Film dressing with adsorbent pad

OpSite Plus dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.19, 10cm x 20cm = £2.01, 10cm x 35cm = £3.33, 6.5cm x 5cm = £0.32, 8.5cm x 9.5cm = £0.88

OpSite Post-op

Film dressing with adsorbent pad

OpSite Post-Op dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.17, 10cm x 20cm = £1.97, 10cm x 25cm = £2.48, 10cm x 30cm = £2.94, 10cm x 35cm = £3.27, 8.5cm x 15.5cm = £1.19, 8.5cm x 9.5cm = £0.86

Pharmapore-PU

Film dressing with adsorbent pad

Pharmapore-PU dressing (Wallace, Cameron & Company Ltd) 10cm x 25cm = £0.38, 10cm x 30cm = £0.58, 8.5cm x 15.5cm = £0.20

PremierPore VP

Film dressing with adsorbent pad

PremierPore VP dressing (Shermond) 10cm x 10cm = £0.16, 10cm x 15cm = £0.24, 10cm x 20cm = £0.36, 10cm x 25cm = £0.38, 10cm x 30cm = £0.57, 10cm x 35cm = £0.69, 5cm x 7cm = £0.13

Tegadern

Film dressing with adsorbent pad

Tegaderm + Pad dressing (3M Health Care Ltd) 5cm x 7cm = £0.26, 9cm x 10cm = £0.65, 9cm x 15cm = £0.95, 9cm x 20cm = £1.40, 9cm x 25cm = £1.57, 9cm x 35cm = £2.60

Tegaderm Absorbent Clear

Film dressing with clear acrylic polymer oval-shaped pad or rectangular-shaped pad

Tegaderm Absorbent Clear Acrylic dressing (3M Health Care Ltd)
11.1cm x 12.7cm oval = £4.11, 14.2cm x 15.8cm oval = £5.78,
14.9cm x 15.2cm rectangular = £8.66, 16.8cm x 19cm sacral =
£10.37, 20cm x 20.3cm rectangular = £13.91, 7.6cm x 9.5cm oval =
£3.17

Vapour-permeable transparent film dressing with adhesive foam border.

Central Gard

For intravenous and subcutaneous catheter sites

Central Gard dressing 16cm x (Unomedical Ltd) 7cm = £0.94, 8.8cm = £1.03

Easl-\

For intravenous and subcutaneous catheter sites EasI-V (ConvaTec Ltd) dressing 7cm x 7.5cm = £0.38

Vapour-permeable transparent, adhesive film dressing. **Hvdrofilm I.V. Control**

For intravenous and subcutaneous catheter sites

Hydrofilm (Paul Hartmann Ltd) I.V. Control dressing 7cm x 9cm =

£0.31

IV3000

For intravenous and subcutaneous catheter sites $_{\mbox{V3000}}$ dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.39, 5cm x 6cm = £0.42, 6cm x 7cm = £0.55, 7cm x 9cm = £0.73, 9cm x 12cm = £1.44

Mepore IV

For intravenous and subcutaneous catheter sites

Mepore IV dressing (Molnlycke Health Care Ltd) 10cm x 11cm = £1.06,
5cm x 5.5cm = £0.31, 8cm x 9cm = £0.40

Pharmapore-PU IV

For intravenous and subcutaneous catheter sites

Pharmapore-PU-I.V dressing (Wallace, Cameron & Company Ltd) 6cm x

7cm = £0.08, 7cm x 8.5cm = £0.07, 7cm x 9cm = £0.17

Tegaderm IV

For intravenous and subcutaneous catheter sites Tegaderm IV dressing with securing tapes (3M Health Care Ltd) 10cm \times 15.5cm = £1.67, 7cm \times 8.5cm = £0.59, 8.5cm \times 10.5cm = £1.16

Soft polymer dressings

Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used. Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes. Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface. For silicone keloid dressings see p. 1309.

Cellulose dressings

Sorbion Sachet Border

Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border sorbion sachet border dressing (H & R Healthcare Ltd) 10cm x 10cm square = £2.95, 15cm x 15cm square = £4.49, 25cm x 15cm rectangular = 56.99

Sorbion Sachet EXTRA

Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope

sorbion sachet EXTRA dressing (H & R Healthcare Ltd) 10cm x 10cm = £2.25, 20cm x 10cm = £3.73, 20cm x 20cm = £7.00, 30cm x 20cm = £9.99, 5cm x 5cm = £1.45, 7.5cm x 7.5cm = £1.78

Sorbion Sachet Multi Star

Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope

sorbion sachet multi star dressing (H & R Healthcare Ltd) 14cm x 14cm = £4.89, 8cm x 8cm = £2.99

Sorbion Sachet S Drainage

Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope ('v' shaped dressing) sorbion (H & R Healthcare Ltd) sachet S drainage dressing 10cm x 10cm = £2.64

Suprasorb X

Biosynthetic cellulose fibre dressing

Suprasorb X dressing (Lohmann & Rauscher (UK) Ltd) 14cm x 20cm rectangular = £8.38, 2cm x 21cm rope = £6.51, 5cm x 5cm square = £2.03, 9cm x 9cm square = £4.23

With absorbant pad

Advazorb Border

Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border

Advazorb Border dressing (Advancis Medical) $10 \text{cm} \times 10 \text{cm} = £2.10$, $10 \text{cm} \times 20 \text{cm} = £2.90$, $10 \text{cm} \times 30 \text{cm} = £4.25$, $12.5 \text{cm} \times 12.5 \text{cm} = £2.58$, $15 \text{cm} \times 15 \text{cm} = £3.15$, $20 \text{cm} \times 20 \text{cm} = £5.46$, $7.5 \text{cm} \times 7.5 \text{cm} = £1.19$

Advazorb Border Lite

Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border

Advazorb Border Lite dressing (Advancis Medical) $10 \text{cm} \times 10 \text{cm} = £1.89, 10 \text{cm} \times 20 \text{cm} = £2.61, 10 \text{cm} \times 30 \text{cm} = £3.83, 12.5 \text{cm} \times 12.5 \text{cm} = £2.32, 15 \text{cm} \times 15 \text{cm} = £2.84, 20 \text{cm} \times 20 \text{cm} = £4.91, 7.5 \text{cm} \times 7.5 \text{cm} = £1.07$

Advazorb Silfix

Soft silicone wound contact dressing with polyurethane foam film backing

Advazorb Silfix dressing (Advancis Medical) $10cm \times 10cm = £1.85$, $10cm \times 20cm = £3.18$, $12.5cm \times 12.5cm = £2.59$, $15cm \times 15cm = £3.36$, $20cm \times 20cm = £4.98$, $7.5cm \times 7.5cm = £0.99$

Advazorb Silfix Lite

Soft silicone wound contact dressing with polyurethane foam film backing

Advazorb Silfix Lite dressing (Advancis Medical) 10cm x 10cm = \pounds 1.67, 10cm x 20cm = \pounds 2.86, 12.5cm x 12.5cm = \pounds 2.33, 15cm x 15cm = \pounds 3.02, 20cm x 20cm = \pounds 4.48, 7.5cm x 7.5cm = \pounds 0.89

Allevyn Gentle

Soft gel wound contact dressing, with polyurethane foam film backing

Allevyn Gentle dressing (Smith & Nephew Healthcare Ltd) $10cm \times 10cm = £2.49$, $10cm \times 20cm = £4.01$, $15cm \times 15cm = £4.18$, $20cm \times 20cm = £6.68$. $5cm \times 5cm = £1.26$

Allevyn Gentle Border

Silicone gel wound contact dressing, with polyurethane foam film backing

Allevyn Gentle Border (Smith & Nephew Healthcare Ltd) Heel dressing 23cm x 23.2cm = £9.59, dressing 10cm x 10cm = £2.18, 12.5cm x 12.5cm = £2.67, 17.5cm x 17.5cm = £5.26, 7.5cm x 7.5cm = £1.48

Allevyn Gentle Border Lite

Silicone gel wound contact dressing, with polyurethane foam film backing

Allevyn Gentle Border Lite dressing (Smith & Nephew Healthcare Ltd) $10 \text{cm} \times 10 \text{cm} = £2.15$, $15 \text{cm} \times 15 \text{cm} = £3.79$, $5.5 \text{cm} \times 12 \text{cm} = £1.84$, $5 \text{cm} \times 5 \text{cm} = £0.89$, $8 \text{cm} \times 15 \text{cm} = £3.41$

Allevyn Life

Soft silicone wound contact dressing, with central mesh screen, polyurethane foam film backing and adhesive border Allevyn Life dressing (Smith & Nephew Healthcare Ltd) 10.3cm x 10.3cm = £1.68, 12.9cm x 12.9cm = £2.47, 15.4cm x 15.4cm = £3.02, 21cm x 21cm = £5.95

Cutimed Siltec

Soft silicone wound contact dressing, with polyurethane foam film backing

Cutimed Siltec (BSN medical Ltd) Heel dressing 16cm x 24cm = £7.15, Sacrum dressing 17.5cm x 17.5cm = £4.55, 23cm x 23cm = £7.29, dressing 10cm x 10cm = £2.46, 10cm x 20cm = £4.06, 15cm x 15cm = £4.59, 20cm x 20cm = £6.97, 5cm x 6cm = £1.31,

Cutimed Siltec B

Soft silicone wound contact dressing, with polyurethane foam film backing, with adhesive border, for lightly to moderately exuding wounds

Cutimed Siltec B dressing (BSN medical Ltd) 12.5cm x 12.5cm = £3.24, 15cm x 15cm = £4.98, 17.5cm x 17.5cm = £5.25, 22.5cm x 22.5cm = £8.47, 7.5cm x 7.5cm = £1.53

Cutimed Siltec I

Soft silicone wound contact dressing, with polyurethane foam film backing, for lightly to moderately exuding wounds

Cutimed Siltec L dressing (BSN medical Ltd) $10cm \times 10cm = £2.12$, $15cm \times 15cm = £3.48$, $5cm \times 6cm = £1.05$

Eclypse Adherent

Soft silicone wound contact layer with absorbent pad and film backing

Eclypse Adherent dressing (Advancis Medical) $10 \text{cm} \times 10 \text{cm} = £2.99$, $10 \text{cm} \times 20 \text{cm} = £3.75$, $15 \text{cm} \times 15 \text{cm} = £4.99$, $20 \text{cm} \times 30 \text{cm} = £9.99$, $17 \text{cm} \times 19 \text{cm} \text{sacral} = £3.76$, $22 \text{cm} \times 23 \text{cm} \text{sacral} = £6.23$,

Flivasorb

Absorbent polymer dressing with non-adherent wound contact layer

Flivasorb dressing (Lohmann & Rauscher (UK) Ltd) 10cm x 10cm square = £0.88, 10cm x 20cm rectangular = £1.05, 20cm x 20cm square = £1.86, 20cm x 30cm rectangular = £2.35

Flivasorb Adhesive

Absorbent polymer dressing with non-adherent wound contact layer and adhesive border

Flivasorb Adhesive dressing 1 (Lohmann & Rauscher (UK) Ltd) $2cm \times 12cm \text{ square} = £3.32, 5cm \times 15cm \text{ square} = £4.54$

Menilex

Absorbent soft silicone dressing with polyurethane foam film backing

Mepilex (Molnlycke Health Care Ltd) Heel dressing $13 \text{cm} \times 20 \text{cm} = £5.41$, $15 \text{cm} \times 22 \text{cm} = £6.22$, XT dressing $10 \text{cm} \times 11 \text{cm} = £2.66$, $11 \text{cm} \times 20 \text{cm} = £4.89$, $15 \text{cm} \times 16 \text{cm} = £4.82$, $20 \text{cm} \times 21 \text{cm} = £7.28$, dressing $5 \text{cm} \times 5 \text{cm} = £1.21$,

Mepilex Border

Absorbent soft silicone dressing with polyurethane foam film backing and adhesive border

Mepilex Border (Molnlycke Health Care Ltd) Heel dressing 18.5cm x 24cm = £6.63, Sacrum dressing 18cm x 18cm = £4.85, 23cm x 23cm = £7.91, dressing 10cm x 12.5cm = £2.72, 10cm x 20cm = £3.69, 10cm x 30cm = £5.55, 15cm x 17.5cm = £4.74, 17cm x 20cm = £6.07.

Mepilex Border Lite

Thin absorbent soft silicone dressing with polyurethane foam film backing and adhesive border

Mepilex Border Lite dressing (Molnlycke Health Care Ltd) $10\text{cm} \times 10\text{cm} = £2.53$, $15\text{cm} \times 15\text{cm} = £4.13$, $4\text{cm} \times 5\text{cm} = £0.92$, $5\text{cm} \times 12.5\text{cm} = £2.01$, $7.5\text{cm} \times 7.5\text{cm} = £1.39$

Mepilex Lite

Thin absorbent soft silicone dressing with polyurethane foam film backing

Mepilex Lite dressing (Molnlycke Health Care Ltd) $10 \text{cm} \times 10 \text{cm} = £2.17$, $15 \text{cm} \times 15 \text{cm} = £4.22$, $20 \text{cm} \times 50 \text{cm} = £26.66$, $6 \text{cm} \times 8.5 \text{cm} = £1.03$

Meniley Transfer

Soft silicone exudate transfer dressing

Mepilex Transfer dressing (Molnlycke Health Care Ltd) 10cm x 12cm = £3.51, 15cm x 20cm = £10.64, 20cm x 50cm = £27.20, 7.5cm x 8 5cm = £2 23

Sorbion Sana

Non-adherent polyethylene wound contact dressing with absorbent core

sorbion sana gentle dressing (H & R Healthcare Ltd) 12cm x 12cm = £2.49, 12cm x 22cm = £4.49, 22cm x 22cm = £7.99, 8.5cm x 8.5cm = £1.99

Urgotul Duo

Non-adherent soft polymer wound contact dressing with absorbent pad

UrgotulDuo dressing (Urgo Ltd) 10cm x 12cm = £3.81, 15cm x 20cm = £8.85, 5cm x 10cm = £2.46

Without absorbant pad

Adaptic Touch

Non-adherent soft silicone wound contact dressing Adaptic Touch dressing (Systagenix Wound Management Ltd) 12.7cm x 15cm = £4.65, 20cm x 32cm = £12.50, 5cm x 7.6cm = £1.13, 7.6cm x 11cm = £2.25

Askina SilNet

Soft silicone-coated wound contact dressing
Askina SilNet dressing (8.Braun Medical Ltd) 10cm x 18cm = £4.98,
20cm x 30cm = £12.20, 5cm x 7.5cm = £1.13, 7.5cm x 10cm = £2.28

Mepitel

Soft silicone, semi-transparent wound contact dressing **Mepitel dressing** (Molnlycke Health Care Ltd) 12cm x 15cm = £6.45, 5cm x 7cm = £1.59, 8cm x 10cm = £3.19

Mepitel One

Soft silicone, thin, transparent wound contact dressing Mepitel One dressing (Molnlycke Health Care Ltd) 13cm x 15cm = £6.45, 24cm x 27.5cm = £17.38, 6cm x 7cm = £1.59, 9cm x 10cm = £3.19

Physiotulle

Non-adherent soft polymer wound contact dressing Physiotulle dressing 1 (Coloplast Ltd) 0cm x 10cm = £2.25, 5cm x 20cm = £6.86

Silflex

Soft silicone-coated polyester wound contact dressing Silflex dressing (Advancis Medical) 12cm x 15cm = £4.58, 20cm x 30cm = £11.79, 35cm x 60cm = £39.54, 5cm x 7cm = £1.11, 8cm x 10cm = £2.27

Silon-TSR

Soft silicone polymer wound contact dressing

Silon-TSR dressing (Bio Med Sciences) $13cm \times 13cm = £3.52$, $13cm \times 25cm = £5.47$, $28cm \times 30cm = £7.37$

Sobion Contact

Non-adherent soft polymer wound contact dressing sorbion contact dressing (H & R Healthcare Ltd) 10cm x 10cm = £1.99, 10cm x 20cm = £3.99, 20cm x 20cm = £6.99, 20cm x 30cm = £9.99, 7.5cm x 7.5cm = £1.49

Tegaderm Contact

Non-adherent soft polymer wound contact dressing Tegaderm Contact dressing (3M Health Care Ltd) 20cm x 25cm = £10.86, 7.5cm x 10cm = £2.27, 7.5cm x 20cm = £4.46

Urgotul

Non-adherent soft polymer wound contact dressing Urgotul dressing (Urgo Ltd) 10cm x 10cm = £3.06, 10cm x 40cm = £10.29, 15cm x 15cm = £6.50, 15cm x 20cm = £8.66, 20cm x 30cm = £13.92, 5cm x 5cm = £1.53

Hydrocolloid dressings

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation. Hydrocolloid-fibrous dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorptive and suitable for moderately to heavily exuding wounds.

Hydrocolloid-fibrous dressings

Aquacel

Soft non-woven pad containing hydrocolloid-fibres Aquacel (ConvaTec Ltd) Ribbon dressing 1cm x 45cm = £1.83, 2cm x 45cm = £2.44, 1fscm x 10cm square = £2.41, 15cm x 15cm square = £4.53, 4cm x 10cm rectangular = £1.30, 4cm x 20cm rectangular = £1.91, 4cm x 30cm rectangular = £2.88, 5cm x 5cm square = £1.01,

Aquacel Foam

Soft non-woven pad containing hydrocolloid-fibres with foam layer; with or without adhesive border Aquacel Foam dressing (ConvaTec Ltd) adhesive $10 \text{cm} \times 10 \text{cm} = £2.14, 12.5 \text{cm} \times 12.5 \text{cm} = £2.65, 17.5 \text{cm} \times 17.5 \text{cm} = £5.30, 19.8 \text{cm} \times 14 \text{cm} \text{ heel} = £5.43, 20 \text{cm} \times 16.9 \text{cm} \text{ sacral} = £4.87, 21 \text{cm} \times 21 \text{cm} = £7.76, 25 \text{cm} \times 30 \text{cm} = £10.05, 8 \text{cm} \times 8 \text{cm} = £1.38, non-adhesive} 10 \text{cm} \times 10 \text{cm} = £2.53, 15 \text{cm} \times 15 \text{cm} = £4.25, 15 \text{cm} \times 20 \text{cm} = £5.81, 20 \text{cm} \times 20 \text{cm} = £6.94.$

UrgoClean Pad

Pad, hydrocolloid fibres coated with soft-adherent lipo-colloidal wound contact layer

UrgoClean Pad dressing (Urgo Ltd) 10cm x 10cm square = £2.11, 20cm x 15cm rectangular = £3.96, 6cm x 6cm square = £0.95

UrgoClean Rope

Rope, non-woven rope containing hydrocolloid fibres UrgoClean rope dressing (Urgo Ltd) 2.5cm x 40cm = £2.37, 5cm x 40cm = £3.14

Versiva XC, non-adhesive

Hydrocolloid gelling foam dressing; with or without adhesive border

Versiva XC dressing (ConvaTec Ltd) 10cm x 10cm square = £2.50, 11cm x 11cm square = £2.44, 14cm x 14cm square = £3.36, 15cm x 15cm square = £4.50, 19cm x 19cm square = £5.37, 20cm x 20cm square = £6.73, 21cm x 25cm sacral = £6.40, 22cm x 22cm square = £5.97, 7.5cm x 7.5cm square = £1.47

Polyurethan matrix dressing

Cutinova Hydro

Polyurethane matrix with absorbent particles and waterproof polyurethane film

Cutinova Hydro dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £2.53, 15cm x 20cm rectangular = £5.36, 5cm x 6cm rectangular = £1.26

With adhesive border

Biatain Super

Semi-permeable hydrocolloid dressing; without adhesive border

Biatain Super dressing (adhesive) (Coloplast Ltd) 10cm x 10cm square = £2.16, 12.5cm x 12.5cm square = £3.57, 12cm x 20cm rectangular = £3.58, 15cm x 15cm square = £4.30, 20cm x 20cm square = £6.71

Granuflex Bordered

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film Granuflex Bordered dressing (ConvaTec Ltd) 10cm x 10cm square = £3.32, 10cm x 13cm triangular = £3.91, 15cm x 15cm square = £6.33, 15cm x 18cm triangular = £6.10, 6cm x 6cm square = £1.75

Hydrocoll Border

Hydrocolloid dressing with adhesive border and absorbent wound contact pad

Hydrocoll Border (bevelled edge) dressing (Paul Hartmann Ltd) 10cm x 10cm square = £2.41, 12cm x 18cm sacral = £3.60, 15cm x 15cm square = £4.53, 5cm x 5cm square = £1.01, 7.5cm x 7.5cm square = £1.65, 8cm x 12cm concave = £2.12

Tegaderm Hydrocolloid

Hydrocolloid dressing with adhesive border; normal or thin Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing 10cm x 12cm oval = £1.55, 13cm x 15cm oval = £2.89, dressing 10cm x 12cm oval = £2.33, 13cm x 15cm oval = £4.34, 17.1cm x 16.1cm sacral = £4.85,

Ultec Pro

Semi-permeable hydrocolloid dressing with adhesive border **Ultec Pro dressing (adhesive)** (Covidien (UK) Commercial Ltd) 15cm x 18cm sacral = £3.30, 19.5cm x 23cm sacral = £4.98, 21cm x 21cm square = £4.67

Without adhesive border

ActivHeal Hydrocolloid

Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, with or without polyurethane foam later

Askina Biofilm Transparent

Semi-permeable, polyurethane film dressing with hydrocolloid adhesive

Askina Biofilm Transparent dressing (B.Braun Medical Ltd) 10cm x 10cm square = £1.07, 20cm x 20cm square = £3.15

Riatain Suner

Semi-permeable, hydrocolloid film dressing without adhesive border

Biatain Super dressing (non-adhesive) (Coloplast Ltd) $10 \text{cm} \times 10 \text{cm}$ square = £2.16, 12.5cm $\times 12.5 \text{cm}$ square = £3.57, $12 \text{cm} \times 20 \text{cm}$ rectangular = £3.58, $15 \text{cm} \times 15 \text{cm}$ square = £4.30, $20 \text{cm} \times 20 \text{cm}$ square = £6.71

Comfeel Plus Contour

Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Contour dressing (Coloplast Ltd) 6cm x 8cm = £2.19, 9cm x 11cm = £3.81

Comfeel Plus Pressure Relieving

Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Pressure Relieving dressing (Coloplast Ltd) 10cm diameter circular = £4.59, 15cm diameter circular = £6.91, 7cm diameter circular = £3.43

Comfeel Plus Transparent

Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Transparent dressing (Coloplast Ltd) 10cm x 10cm square = £1.26, 15cm x 15cm square = £3.30, 15cm x 20cm

rectangular = £3.35, $20 \text{cm} \times 20 \text{cm}$ square = £3.37, $5 \text{cm} \times 15 \text{cm}$ rectangular = £1.57, $5 \text{cm} \times 25 \text{cm}$ rectangular = £2.55, $5 \text{cm} \times 7 \text{cm}$ rectangular = £0.66, $9 \text{cm} \times 14 \text{cm}$ rectangular = £2.41, $9 \text{cm} \times 25 \text{cm}$ rectangular = £3.42

Comfeel Plus Ulcer

Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Ulcer (bevelled edge) dressing (Coloplast Ltd) 10cm x 10cm square = £2.42, 18cm x 20cm triangular = £5.65, 20cm x 20cm square = £7.47, 4cm x 6cm rectangular = £0.95

DuoDERM Extra Thin

Semi-permeable hydrocolloid dressing

DuoDERM Extra Thin dressing (ConvaTec Ltd) $10 \text{cm} \times 10 \text{cm}$ square = £1.31, 15cm x 15cm square = £2.84, 5cm x 10cm rectangular = £0.76, 7.5cm x 7.5cm square = £0.79, 9cm x 15cm rectangular = £1.76, 9cm x 25cm rectangular = £2.81, 9cm x 35cm rectangular = £3.93

DuoDERM Signal

Semi-permeable hydrocolloid dressing with 'Time to change' indicator

DuoDERM Signal dressing (ConvaTec Ltd) 10cm x 10cm square = £2.12, 11cm x 19cm oval = £3.22, 14cm x 14cm square = £3.71, 18.5cm x 19.5cm heel = £5.19, 20cm x 20cm square = £7.38, 22.5cm x 20cm sacral = £6.07

Flexigran

Semi-permeable hydrocolloid dressing without adhesive border: normal or thin

Flexigran (A1 Pharmaceuticals) Thin dressing 10cm x 10cm square = £1.08, dressing 10cm x 10cm square = £2.19

Granufle

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethan film Granuffex (modified) dressing (ConvaTec Ltd) 10cm x 10cm square = £2.78, 15cm x 15cm square = £5.28, 15cm x 20cm rectangular = £5.72, 20cm x 20cm square = £7.95

Hydrocoll Basic

Hydrocolloid dressing with absorbent wound contact pad Hydrocoll (Paul Hartmann Ltd) Basic dressing 10cm x 10cm square = £2.45

Hydrocoll Thin Film

Thin hydrocolloid dressing with absorbent wound contact pad

Hydrocoll Thin Film dressing (Paul Hartmann Ltd) 10cm x 10cm square = £1.15, 15cm x 15cm square = £2.59, 7.5cm x 7.5cm square = £0.70

Nu-Derm

Semi-permeable hydrocolloid dressing (normal and thin) Nu-Derm dressing (Systagenix Wound Management Ltd) 10cm x 10cm square = £1.56, 15cm x 15cm square = £3.18, 15cm x 18cm sacral = £4.45, 20cm x 20cm square = £6.36, 5cm x 5cm square = £0.85, 8cm x 12cm heel/elbow = £3.18, thin 10cm x 10cm square = £1.06

Tegaderm Hydrocolloid

Hydrocolloid dressing without adhesive border; normal and thin

Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing 10cm x 10cm square = £1.55, dressing 10cm x 10cm square = £2.37, 15cm x 15cm square = £4.59,

Ultec Pro

Semi-permeable hydrocolloid dressing; without adhesive border

Ultec Pro dressing (Covidien (UK) Commercial Ltd) 10cm x 10cm square = £2.28, 15cm x 15cm square = £4.44, 20cm x 20cm square = £6.69

Foam dressings

Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic filmbacking, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisturesensitive film backing with variable permeability dependant on the level of exudate.

Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handing capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing ibuprofen is available and may be useful for treating painful exuding wounds.

Cavi Caro

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity

Cavi-Care (Smith & Nephew Healthcare Ltd) dressing = £19.67

Polyurethane Foam Dressing

Cutimed Cavity

Cutimed Cavity dressing (BSN medical Ltd) $10cm \times 10cm = £3.09$, $15cm \times 15cm = £4.64$, $5cm \times 6cm = £1.86$

Kondal

Kendall Foam dressing (Aria Medical Ltd) $10 \text{cm} \times 10 \text{cm}$ square = £1.06, $10 \text{cm} \times 20 \text{cm}$ rectangular = £2.05, $12.5 \text{cm} \times 12.5 \text{cm}$ square = £1.80, $15 \text{cm} \times 15 \text{cm}$ square = £2.60, $20 \text{cm} \times 20 \text{cm}$ square = £3.01, $5 \text{cm} \times 5 \text{cm}$ square = £0.71, $7.5 \text{cm} \times 7.5 \text{cm}$ square = £1.21, $8.5 \text{cm} \times 7.5 \text{cm}$ rectangular (fenestrated) = £0.91

Polyurethane Foam Film Dressing with Adhesive Border ActivHeal Foam Adhesive

ActivHeal Foam Adhesive dressing (Advanced Medical Solutions Ltd) 10cm x 10cm square = £1.63, 12.5cm x 12.5cm square = £1.68, 15cm x 15cm square = £2.15, 20cm x 20cm square = £4.50, 7.5cm x 7.5cm square = £1.68

Allevyn Adhesive

Allevyn Adhesive dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £2.17, 12.5cm x 12.5cm square = £2.66, 12.5cm x 22.5cm rectangular = £4.14, 17.5cm x 17.5cm square = £5.25, 17cm x 17cm anatomically shaped sacral = £3.94, 22.5cm x 22.5cm square = £7.64, 22cm x 22cm anatomically shaped sacral = £5.68, 7.5cm x 7.5cm square = £1.48

Allevyn Plus Adhesive

Allevyn Plus Adhesive dressing (Smith & Nephew Healthcare Ltd) 12.5cm x 12.5cm square = £3.34, 12.5cm x 22.5cm rectangular = £5.91, 17.5cm x 17.5cm square = £6.44, 17cm x 17cm anatomically shaped sacral = £4.87, 22cm x 22cm anatomically shaped sacral = £7.04

Biatain Adhesive

Biatain Adhesive dressing (Coloplast Ltd) 10cm x 10cm square = £1.74, 12.5cm x 12.5cm square = £2.54, 17cm diameter contour = £4.94, 18cm x 18cm square = £5.13, 18cm x 28cm rectangular = £7.60, 19cm x 20cm heel = £5.13, 23cm x 23cm sacral = £4.39

Biatain Silicone

Biatain Silicone dressing (Coloplast Ltd) 7.5cm x 7.5cm = £1.45, 10cm x 10cm = £2.13, 12.5cm x 12.5cm = £2.60, 15cm x 15cm = £3.86, 17.5cm x 17.5cm = £5.13

Kendall Island

Kendall Foam Island dressing (Aria Medical Ltd) 10cm x 10cm square = £1.54, 15cm x 15cm square = £2.90, 20cm x 20cm square = £5.46

PermaFoam

Alginate dressings

Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate.

Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue.

Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

ActivHeal Alginate

Calcium sodium alginate dressing

ActivHeal Alginate dressing (Advanced Medical Solutions Ltd) $10cm \times 10cm = £1.15$, $10cm \times 20cm = £2.83$, $5cm \times 5cm = £0.59$

ActivHeal Aquafiber

Non-woven, calcium sodium alginate dressing ActivHeal Aquafiber (Advanced Medical Solutions Ltd) Rope dressing 2cm x 42cm = £1.81, dressing 10cm x 10cm = £1.80, 15cm x 15cm = £3.40, 5cm x 5cm = £0.76,

Calcium alginate dressing

Tegaderm Alginate dressing (3M Health Care Ltd) 10cm x 10cm = £1.72, 2cm x 30.4cm = £2.87, 5cm x 5cm = £0.81

Urgosork

Alginate and carboxymethylcellulose dressing without adhesive border

Urgosorb (Urgo Ltd) Pad dressing $10 \text{cm} \times 10 \text{cm} = £2.10$, $10 \text{cm} \times 20 \text{cm} = £3.85$, $5 \text{cm} \times 5 \text{cm} = £0.87$, Rope dressing 30 cm = £2.75,

Capillary-action dressings

Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer. The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary.

Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

Advadraw

Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers Advadraw dressing (Advancis Medical) 10cm x 10cm = £0.88, 10cm x 15cm = £1.19, 15cm x 20cm = £1.57, 5cm x 7.5cm = £0.57

Advadraw Spiral

Advadraw (Advancis Medical) Spiral dressing 0.5cm x 40cm = £0.82

Cerdak Aerocloth

Non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing

Cerdak Aerocloth dressing 5cm x (Apollo Medical Products Ltd) 10cm = £1.94, 5cm = £1.37

Cerdak Aerofilm

Non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing Cerdak Aerofilm dressing 5cm x (Apollo Medical Products Ltd) 10cm = £2.07, 5cm = £1.51

Cerdak Basic

Non-adhesive wound contact sachet containing ceramic spheres

Cerdak Basic dressing (Apollo Medical Products Ltd) 10cm x 10cm = £1.56, 10cm x 15cm = £2.08, 5cm x 5cm = £0.70

umar Lite

Sumar Lite dressing (Lantor (UK) Ltd) 10cm x 10cm = £1.59, 10cm x 15cm = £2.12, $5cm \times 5cm = £0.93$

Sumar Max

Sumar Max dressing (Lantor (UK) Ltd) 10cm x 10cm = £1.61, 10cm x 15cm = £2.15, 5cm x 5cm = £0.95

Sumar Spiral

Sumar (Lantor (UK) Ltd) Spiral dressing 0.5cm x 40cm = £1.57

Vacute

Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer

Vacutex dressing (Pro-Tex Capillary Dressings Ltd) 10cm x 10cm = £1.66, 10cm x 15cm = £2.23, 10cm x 20cm = £2.68, 15cm x 20cm = £3.14, 20cm x 20cm = £4.28, 5cm x 5cm = £0.94

Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes.

Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

Askina Carbosorb

Activated charcoal and non-woven viscose rayon dressing Askina Carbosorb dressing 10cm x (B.Braun Medical Ltd) 10cm = £2.88, 20cm = £5.56

CarboFLEX

Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer CarboFlex dressing (ConvaTec Ltd) 10cm x 10cm = £3.18, $15cm \times 20cm = £7.23$, $8cm \times 15cm \text{ oval} = £3.82$,

Carbopad VO

Activated charcoal non-absorbent dressing Carbopad VC dressing 10cm x (Synergy Health Plc) 10cm = £1.62, 20cm = £2.19

CliniSorb Odour Control Dressings

Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating

CliniSorb dressing 1 (CliniMed Ltd) 0cm x 10cm = £1.88, 0cm x 20cm = £2.50, 5cm x 25cm = £4.03

Sorbsan Plus Carbon

Alginate dressing with activated carbon

Sorbsan Plus Carbon dressing (Aspen Medical Europe Ltd) $10cm \ x$ 15cm = £4.96, $10cm \ x$ 20cm = £5.94, $15cm \ x$ 20cm = £6.84, $7.5cm \ x$ 10cm = £2.56

Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials.

For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound

surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing.

Medical grade honey below, has antimicrobial and antiinflammatory properties. Dressings impregnated with iodine below, can be used to treat clinically infected wounds. Dressings containing silver p. 1307, should be used only when clinical signs or symptoms of infection are present. Dressings containing other antimicrobials p. 1308 such as polihexanide (polyhexamethylene biguanide) or dialkylcarbamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

Honey

Medical grade honey has antimicrobial and antiinflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings. For Activon Tulle®, where no size is stated by the prescriber the 5 cm size is to be supplied. Medihoney® Antimicrobial Wound Gel is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult.

MelMax

Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis

MelMax dressing (CliniMed Ltd) 5cm x 6cm rectangular = £4.82, 8cm x 10cm rectangular = £9.90, 8cm x 20cm rectangular = £19.79

Melladerm Plus Tulle

Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in a basis containing polyethylene glycol

Melladerm (SanoMed Manufacturing BV) Plus Tulle dressing 10cm x 10cm = £2.10

Cadexomer-iodine, like povidone-iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomer absorbs wound exudate and encourages de-sloughing. Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in

the presence of moisture and oxygen. Povidone-iodine fabric dressing is a knitted viscose dressing with povidone-iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate.

Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use.

Iodoflex® and Iodosorb® are used for the treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment. They are contra-indicated in patients receiving lithium, in thyroid disorders, in pregnancy and breast feeding, and in children; they should be used with caution in patients with severe renal impairment or history of thyroid disorder.

Iodozyme[®] is an antimicrobial dressing used for lightly to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.

Oxyzyme[®]is used for non-infected, dry to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.

Povidone-iodine Fabric Dressing is used as a wound contact layer for abrasions and superficial burns. It is contraindicated in patients with severe renal impairment and in women who are pregnant or breast-feeding; it should be used with caution in patients with thyroid disease and in children under 6 months.

Iodoflex Paste

Iodine 0.9% as cadexomer-iodine in a paste basis with gauze backing

Iodosorb Ointment

Iodine 0.9% as cadexomer—iodine in an ointment basis Iodosorb (Smith & Nephew Healthcare Ltd) ointment dressing = £9.03

Indosorh Powde

Iodine 0.9% as cadexomer—iodine microbeads, 3-g sachet Iodosorb (Smith & Nephew Healthcare Ltd) powder dressing sachets = £1.93

Iodozyme Hydrogel

Hydrogel (two-component dressing containing glucose oxidase and iodide ions)

Iodozyme dressing (Archimed Llp) 10cm x 10cm square = £12.50, 6.5cm x 5cm rectangular = £7.50

Oxyzyme Hydrogel

Hydrogel (two-component dressing containing glucose oxidase and iodide ions)

Oxyzyme dressing (Archimed Llp) 10cm x 10cm square = £10.00, 6.5cm x 5cm rectangular = £6.00

Povidone-iodine fabric dressing

Inadine

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10% Inadine dressing (Systagenix Wound Management Ltd) 5cm x 5cm = £0.33. 9.5cm x 9.5cm = £0.49

Silver

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also notes above). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing.

Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration (see p. 1010). The use of silver sulfadiazine-impregnated dressings is contraindicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver

sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).

Alginate dressings

Acticoat Absorbent

Calcium alginate dressing with a silver coated antimicrobial barrier

Acticoat Absorbent (Smith & Nephew Healthcare Ltd) cavity dressing 2cm x 30cm = £12.87, dressing 10cm x 12.5cm rectangular = £12.79, 5cm x 5cm square = £5.33,

lgisite Ag

Calcium alginate dressing, with silver

Algisite Ag dressing (Smith & Nephew Healthcare Ltd) $10cm \times 10cm = £4.12$, $10cm \times 20cm = £7.57$, 2g = £5.69, $5cm \times 5cm = £1.65$

Askina Calgitrol Ag

Calcium alginate and silver alginate dressing with polyurethane foam backing

Askina Calgitrol Ag dressing (B.Braun Medical Ltd) 10cm x 10cm square = £3.21, 15cm x 15cm square = £6.21, 20cm x 20cm square = £14.48

Askina Calgitrol Thin

Calcium alginate and silver alginate matrix, for use with absorptive secondary dressings

Askina Calgitrol Thin dressing (B.Braun Medical Ltd) 10cm x 10cm square = £4.06, 15cm x 15cm square = £9.12, 20cm x 20cm square = £16.11, 5cm x 5cm square = £1.96

Melgisorb Ag

Alginate and carboxymethylcellulose dressing, with ionic silver

Melgisorb Ag (Molnlycke Health Care Ltd) Cavity dressing $3cm \times 44cm = £4.47$, dressing $10cm \times 10cm = £3.59$, $15cm \times 15cm = £7.60$, $5cm \times 5cm = £1.79$,

Silvercel

Alginate and carboxymethylcellulose dressing impregnated with silver

Silvercel dressing (Systagenix Wound Management Ltd) 10cm x 20cm rectangular = £7.68, 11cm x 11cm square = £4.14, 2.5cm x 30.5cm rectangular = £4.45, 5cm x 5cm square = £1.68

Silvercel Non-adherent

Alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver Silvercel Non-Adherent (systagenix Wound Management Ltd) cavity dressing $2.5 \, \text{cm} \times 30.5 \, \text{cm} = £3.94$, dressing $10 \, \text{cm} \times 20 \, \text{cm}$ rectangular = £7.25, $11 \, \text{cm} \times 11 \, \text{cm}$ square = £3.89, $5 \, \text{cm} \times 5 \, \text{cm}$ square = £1.62,

Sorbsan Silver Flat

Calcium alginate fibre, highly absorbent, flat non-woven pads, with silver

Sorbsan Silver Flat dressing (Aspen Medical Europe Ltd) 10cm x 10cm = £3.97, 10cm x 20cm = £7.26, 5cm x 5cm = £1.57

Sorbsan Silver Plus

Calcium alginate dressing with absorbent backing, with silver

Sorbsan Silver Plus dressing (Aspen Medical Europe Ltd) 10 cm x 15 cm = £5.56, 10 cm x 20 cm = £6.77, 15 cm x 20 cm = £9.08, 7.5 cm x 10 cm = £3.35

Sorbsan Silver Plus SA

Calcium alginate dressing with absorbent backing and adhesive border, with silver

Sorbsan (Aspen Medical Europe Ltd) Silver Plus SA dressing 11.5cm x 14cm = £5.44

Sorbsan Silver Ribbon

With silver

Sorbsan (Aspen Medical Europe Ltd) Silver Ribbon dressing 1g = £4.15

Sorbsan Silver Surgical Packing

With silver

Sorbsan (Aspen Medical Europe Ltd) Silver Packing dressing 2g = £5.76

Suprasorb A + Ag

Calcium alginate dressing, with silver

Suprasorb A + Ag (Lohmann & Rauscher (UK) Ltd) dressing 10cm x 10cm = £4.07, 10cm x 20cm = £7.52, 5cm x 5cm = £1.62, rope dressing 2g = £6.02,

Tegaderm Alginate Ag

Calcium alginate and carboxymethylcellulose dressing, with silver

Tegaderm Alginate Ag dressing (3M Health Care Ltd) $10cm \times 10cm = £3.24$, $3cm \times 30cm = £3.70$, $5cm \times 5cm = £1.39$

Urgosorb Silver

Alginate and carboxymethylcellulose dressing, impregnated with silver

Urgosorb Silver (Urgo Ltd) Rope dressing 2.5 cm x 30 cm = £3.65, dressing 10 cm x 10 cm = £3.63, 10 cm x 20 cm = £6.85, 5 cm x 5 cm = £1.52

Foam dressings

Acticoat Moisture Control

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer Acticoat Moisture Control dressing (Smith & Nephew Healthcare Ltd) $10\text{cm} \times 10\text{cm}$ square = £16.70, $10\text{cm} \times 20\text{cm}$ rectangular = £32.55, $5\text{cm} \times 5\text{cm}$ square = £7.14

Allevyn Ag

Silver sulfadiazine impregnated polyurethane foam film dressing with or without adhesive border

Allevyn Åg (Smith & Nephew Healthcare Ltd) Adhesive dressing 10cm x 10cm square = £5.45, 12.5cm x 12.5cm square = £7.16, 17.5cm x 17.5cm square = £13.77, 17cm x 17cm sacral = £10.75, 22cm x 22cm sacral = £14.40, 7.5cm x 7.5cm square = £3.46, Heel Non-Adhesive dressing 10.5cm x 13.5cm = £10.66, Non-Adhesive dressing 10cm x 10cm square = £6.08, 15cm x 15cm square = £11.53, 20cm x 20cm square = £16.88, 5cm x 5cm square = £3.23,

Biatain Ag

Silver impregnated polyurethane foam film dressing, with or without adhesive border

Biatain Ag (Coloplast Ltd) cavity dressing $5 \text{cm x } 8 \text{cm} = \text{\pounds}4.01$, dressing 10 cm x 10 cm square $= \text{\pounds}8.04$, 10 cm x 20 cm rectangular $= \text{\pounds}14.78$, 12.5 cm x 12.5 cm square $= \text{\pounds}9.20$, 15 cm x 15 cm square $= \text{\pounds}16.14$, $18 \text{cm x } 18 \text{cm square} = \text{\pounds}18.45$, 19 cm x 20 cm heel $= \text{\pounds}18.20$, 20 cm x 20 cm square $= \text{\pounds}22.76$, 23 cm x 23 cm sacral $= \text{\pounds}19.34$, 5 cm x 7 cm rectangular $= \text{\pounds}3.30$,

PolvMem Silver

Silver impregnated polyurethane foam film dressing, with or without adhesive border

PolyMem Silver (Aspen Medical Europe Ltd) WIC dressing 8cm x 8cm = £7.05, dressing 10.8cm x 10.8cm square = £8.86, 12.7cm x 8.8cm oval = £5.60, 17cm x 19cm rectangular = £17.76, 5cm x 7.6cm oval = £2.27,

UrgoCell Silver

Non-adherent, polyurethane foam film dressing with silver in wound contact layer

UrgoCell Silver dressing (Urgo Ltd) $10cm \times 10cm = £5.86$, $15cm \times 20cm = £10.74$, $6cm \times 6cm = £4.26$

Hydrocolloid dressings

Aquacel Ag

Soft non-woven pad containing hydrocolloid fibres, (silver impregnated),

Aquacel Ag (ConvaTec Ltd) Ribbon dressing 1cm \times 45cm = £3.08, 2cm \times 45cm = £4.71, dressing 10cm \times 10cm square = £4.69, 15cm \times 15cm square = £8.82, 20cm \times 30cm rectangular = £21.89, 4cm \times 10cm rectangular = £2.85, 4cm \times 20cm rectangular = £3.72, 4cm \times 30cm rectangular = £5.57,

Physiotulle Ag

Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine

Physiotulle (Coloplast Ltd) dressing 10cm x 10cm = £2.25

Low adherence dressing

Acticoat

Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear)

Acticoat dressing (Smith & Nephew Healthcare Ltd) $10 \text{cm} \times 10 \text{cm}$ square = £8.52, $10 \text{cm} \times 20 \text{cm}$ rectangular = £13.33, $20 \text{cm} \times 40 \text{cm}$ rectangular = £45.60, $5 \text{cm} \times 5 \text{cm}$ square = £3.49

Acticoat 7

Five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear)

Acticoat 7 dressing (Smith & Nephew Healthcare Ltd) 10cm x 12.5cm rectangular = £18.07, 15cm x 15cm square = £32.48, 5cm x 5cm square = £6.07

Acticoat Flex 3

Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear)

Acticoat Flex 3 dressing (Smith & Nephew Healthcare Ltd) 10 cm x 10 cm square = £8.56, 10 cm x 20 cm rectangular = £13.37, 20 cm x 40 cm rectangular = £45.77, 5 cm x 5 cm square = £3.50

Acticoat Flex 7

Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear) Acticoat Flex 7 dressing (Smith & Nephew Healthcare Ltd) 10cm x 12.5cm rectangular = £18.14, 15cm x 15cm square = £32.61, 5cm x 5cm square = £6.09

Atrauman Ag

Non-adherent polyamide fabric impregnated with silver and neutral triglycerides

Atrauman Ag dressing (Paul Hartmann Ltd) $10cm \times 10cm = £1.25$, $10cm \times 20cm = £2.45$, $5cm \times 5cm = £0.51$

Soft polymer dressings Allevyn Ag Gentle

Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with or without adhesive border

Allevyn Ag Gentle (Smith & Nephew Healthcare Ltd) Border dressing 10cm x 10cm = £6.33, 12.5cm x 12.5cm = £8.14, 17.5cm x 17.5cm = £15.51, 7.5cm x 7.5cm = £4.21, dressing 10cm x 10cm = £6.15, 10cm x 20cm = £10.16, 15cm x 15cm = £11.44, 20cm x 20cm = £16.94, 5cm x 5cm = £3.30,

Mepilex Ag

Soft silicone wound contact dressing with polyurethane foam film backing, with silver, with or without adhesive border

Mepilex (Molnlycke Health Care Ltd) Ag dressing 10cm x 10cm = £6.12, 10cm x 20cm = £10.09, 15cm x 15cm = £11.36, 20cm x 20cm = £16.84, 20cm x 50cm = £63.20, Border Ag dressing 10cm x 12.5cm = £6.16, 10cm x 20cm = £8.97, 10cm x 30cm = £13.46, 15cm x 17.5cm = £11.31, 17cm x 20cm = £14.66, 7cm x 7.5cm = £3.41, Border Sacrum Ag dressing 18cm x 18cm = £11.83, 20cm x 20cm = £14.38, 23cm x 23cm = £18.89, Heel Ag dressing 13cm x 20cm = £12.78, 15cm x 22cm = £14.32,

Urgotul SSD

Non-adherent, soft polymer wound contact dressing, with silver sulfadiazine

Urgotul Silver

Non-adherent soft polymer wound contact dressing, with silver

Urgotul Silver dressing 1 (Urgo Ltd) 0cm x 12cm = £3.53, 5cm x 20cm = £9.61

With charcoal

Actisorb Silver 220

Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve Actisorb Silver 220 dressing (Systagenix Wound Management Ltd) $10.5 \text{cm} \times 10.5 \text{cm} = £2.58$, $10.5 \text{cm} \times 10.5 \text{cm} = £4.70$, $6.5 \text{cm} \times 9.5 \text{cm} = £1.64$

Other antimicrobials

Cutimed Siltec Sorbact

Polyurethane foam dressing with acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

Cutimed Siltec Sorbact dressing (BSN medical Ltd) 12.5cm x 12.5cm = £6.38, 15cm x 15cm = £7.91, 17.5cm x 17.5cm = £11.06, 22.5cm x 22.5cm = £16.83, 7.5cm x 7.5cm = £2.49, 17.5cm x 17.5cm sacral = £8.00, 23cm x 23cm sacral = £12.02,

Cutimed Sorbact

Low adherence acetate tissue impregnated with dialkylcarbamovl chloride; dressign pad, swabs, round swabs or ribbon gauze, cotton

Cutimed Sorbact (BSN medical Ltd) Ribbon dressing 2cm x 50cm = £4.00, 5cm x 200cm = £7.87, Round swab 3cm = £3.27, dressing pad 10cm x 10cm = £5.45, 10cm x 20cm = £8.49, 7cm x 9cm = £3.49, swab 4cm x 6cm = £1.63, 7cm x 9cm = £2.72,

Cutimed Sorbact Gel

Hydrogel dressing impregnated with dialkylcarbamoyl chloride

Cutimed Sorbact Gel dressing 7.5cm x (BSN medical Ltd) 15cm rectangular = £4.43, 7.5cm square = £2.63

Cutimed Sorbact Hydroactive

Non-adhesive gel dressing with hydropolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride Cutimed Sorbact Hydroactive dressing (BSN medical Ltd) 14cm x 14cm = £5.31, 14cm x 24cm = £8.52, 19cm x 19cm = £10.01, 24cm $x 24cm = £15.17, 7cm \times 8.5cm = £3.64$

Cutimed Sorbact Hydroactive B

Gel dressing with hydropolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border Cutimed Sorbact Hydroactive B dressing (BSN medical Ltd) $10cm\ x$ 10cm = £7.02, $10cm \times 20cm = £11.24$, $15cm \times 15cm = £13.21$, 20cm $x = £20.02, 5cm \times 6.5cm = £3.94$

Flaminal Forte gel

Alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds

Flaminal Hydro gel

Alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds

Kendall AMD

Foam dressing with polihexanide, without adhesive border Kendall AMD Antimicrobial foam dressing (Aria Medical Ltd) 10cm x 10cm square = £4.71, 10cm x 20cm rectangular = £8.92, 15cm x 15cm square = £8.92, 20cm x 20cm square = £13.07, 5cm x 5cm square = £2.50, 8.8cm x 7.5cm rectangular (fenestrated) = £4.23

Kendall AMD Plus

Foam dressing with polihexanide, without adhesive border Kendall AMD Antimicrobial Plus foam dressing (Aria Medical Ltd) 10cm x 10cm square = £4.94, 8.8cm x 7.5cm rectangular (fenestrated) = £4.43

Octenilin Wound gel

Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride

Prontosan Wound Gel

Hydrogel containing betaine surfactant and polihexanide

Suprasorb X + PHMB

Biosynthetic cellulose fibre dressing with polihexanide Suprasorb X + PHMB dressing (Lohmann & Rauscher (UK) Ltd) 14cm x 20cm rectangular = £11.53, 2cm x 21cm rope = £7.18, 5cm x 5cm square = £2.54, 9cm x 9cm square = £5.07

Telfa AMD

Low adherence absorbent perforated plastic film faced dressing with polihexanide

Telfa AMD dressing (Aria Medical Ltd) 10cm x 7.5cm = £0.18, 20cm x 7.5cm = £0.28

Telfa AMD Island

Low adherence dressing with adhesive border and absorbent pad, with polihexanide

Telfa AMD Island dressing 10cm x (Aria Medical Ltd) 12.5cm = £0.59. 20cm = £0.86, 25.5cm = £0.98, 35cm = £1.22

Chlorhexidine gauze dressing

Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate

Bactigras gauze dressing (Smith & Nephew Healthcare Ltd) 5cm x 5cm $= 28p, 10cm \times 10cm = 58p$

Irrigation fluids

Octenilin Wound irrigation solution

Aqueous solution containing glycerol, ethylhexylglycerin and octenidine hydrochloride

Prontosan Wound Irrigation Soultion

Aqueous solution containing betaine surfactant and polihexanide

Prontosan irrigation solution (B.Braun Medical Ltd) 350ml bottles = £4.75, 40ml unit dose = £14.12

Specialised dressings

Protease-modulating matrix dressings

Cadesorb Ointment

Cadesorb (Smith & Nephew Healthcare Ltd) ointment = £9.18

Catrix

Catrix dressing (Cranage Healthcare Ltd) sachets = £3.80

Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing Promogran dressing (Systagenix Wound Management Ltd) 123 square cm = £15.62, 28 square cm = £5.19

Promogran Prisma Matrix

Collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing

Promogran Prisma dressing (Systagenix Wound Management Ltd) 123 square cm = £17.98, 28 square cm = £6.31

Tegaderm Matrix

Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis Tegaderm Matrix dressing (3M Health Care Ltd) 5cm x 6cm = £4.98, $8cm \times 10cm = £10.23$

UrgoStart

Soft adherent polymer matrix containing nanooligosaccharide factor (NOSF), with polyurethane foam film

UrgoSTART dressing (Urgo Ltd) 10cm x 10cm = £6.07, 15cm x 20cm =£10.92, 6cm x 6cm =£4.39, 12cm x 19cm heel =£8.36,

UrgoStart Contact

Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF) UrgoSTART (Urgo Ltd) Contact dressing 5cm x 7cm = £2.96

Silicone keloid dressings

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

Silicone gel

Bapscarcare

Silicone gel

Bapscarcare (BAP Medical UK Ltd) gel = £17.00

Ciltech

Silicone gel

Ciltech (Su-Med International (UK) Ltd) gel = £50.00

Dermatix

Silicone gel Dermatix gel (Meda Pharmaceuticals Ltd) = £60.53

Kelo-cote IIV Silicone gel with SPF 30 UV protection Kelo-cote (Sinclair IS Pharma Plc) UV gel = £17.88

Kelo-cote gel

Silicone gel

Kelo-cote (Sinclair IS Pharma Plc) gel = £51.00

Kelo-cote spray

Silicone spray

Kelo-cote (Sinclair IS Pharma Plc) spray = £51.00

NewGel+E

Silicone gel with vitamin E

NewGel+E (Advantech Surgical Ltd) gel = £17.70

ScarSi

Silicone gel

ScarSil (Jobskin Ltd) gel = £15.19

Silgel STC-SE

Silicone gel

Silgel (Nagor Ltd) STC-SE gel = £19.00

Silicone sheets

Advasil Conform

Self-adhesive silicone gel sheet with polyurethane film backing

Advasil Conform sheet 1 (Advancis Medical) 10cm x 10cm square = £5.20, 5cm x 10cm rectangular = £9.17

Banscarcare T

Self-adhesive silicone gel sheet

Bapscarcare T sheet (BAP Medical UK Ltd) 10cm x 15cm rectangular = £9.00, 5cm x 30cm rectangular = £9.00, 5cm x 7cm rectangular

Cica-Care

Soft, self-adhesive, semi-occlusive silicone gel sheet with backing

Cica-Care sheet (Smith & Nephew Healthcare Ltd) 15cm x 12cm rectangular = £28.40, 6cm x 12cm rectangular = £14.57

Ciltech

Silicone gel sheet

Ciltech sheet 1 (Su-Med International (UK) Ltd) 10cm x 10cm square = £7.50, 0cm x 20cm rectangular = £12.50, 5cm x 15cm square = £14.00

Dermatix

Self-adhesive silicone gel sheet (clear- or fabric-backed) **Dermatix** (Meda Pharmaceuticals Ltd) Clear sheet 13cm x 13cm square = £15.79, 13cm x 25cm rectangular = £28.53, 20cm x 30cm rectangular = £51.97, 4cm x 13cm rectangular = £6.88, Fabric sheet 13cm x 13cm square = £15.79, 13cm x 25cm rectangular = £28.53, 20cm x 30cm rectangular = £51.97, 4cm x 13cm rectangular = £6.88, $\frac{1}{2}$

Mepiform

Self-adhesive silicone gel sheet with polyurethane film backing

Mepiform sheet (Molnlycke Health Care Ltd) 4cm x 31cm rectangular = £10.80, 5cm x 7cm rectangular = £3.42, 9cm x 18cm rectangular

= £13.37

Self-adhesive, transparent, silicone gel sheet Scar Fx sheet (Jobskin Ltd) 10cm x 20cm rectangular = £16.00, 22.5cm x 14.5cm shaped = £12.00, 25.5cm x 30.5cm rectangular = £60.00, 3.75cm x 22.5cm rectangular = £12.00, 7.5cm diameter shaped = £8.50

Silgel

Silicone gel sheet

Silgel sheet (Nagor Ltd) 10cm x 10cm square = £13.50, 10cm x 30cm rectangular = £31.50, 10cm x 5cm rectangular = £7.50, 15cm x 10cm rectangular = £19.50, 20cm x 20cm square = £40.00, 25cm x 15cm shaped = £21.12, 30cm x 5cm rectangular = £19.50, 40cm x 40cm square = £144.00, 46cm x 8.5cm shaped = £39.46, 5.5cm diameter shaped = £4.00

Adjunct dressings and appliances

Surgical absorbents

Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound, shedding of fibres, and the leakage of exudate ('strike through') with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings, p. 1305). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous p. 1301, foam p. 1302, or alginate p. 1304) layered into the cavity is often more suitable.

Cotton

Absorbent Cotton, BP

Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls

Absorbent (Robert Bailey & Son Plc) cotton BP 1988

Absorbent Cotton, Hospital Quality

As for absorbent cotton but lower quality materials, shorter staple length etc.

Absorbent (Robert Bailey & Son Plc) cotton hospital quality

Gauze and cotton tissue

Gamgee Tissue (blue)

Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2 Gamgee (Robinson Healthcare) tissue blue label

Gamgee Tissue (pink)

Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2 Gamgee (Robinson Healthcare) tissue pink label DT

Gauze and tissue

Absorbent Cotton Gauze, BP 1988

Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile

Absorbent (Robert Bailey & Son Plc) cotton BP 1988

Alvita (Alliance Healthcare (Distribution) Ltd) absorbent cotton BP 1988

Clini (CliniSupplies Ltd) absorbent cotton BP 1988 Vernaid (Synergy Health Plc) absorbent cotton BP 1988

Absorbent Cotton and Viscose Ribbon Gauze, BP 1988

Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile

Vernaid Fast Edge ribbon gauze sterile (Synergy Health Plc) 1.25cm, 2.5cm

Lint

Absorbent Lint, BPC

Cotton cloth of plain weave with nap raised on one side from warp yarns

Absorbent (Robinson Healthcare) lint

Alvita (Alliance Healthcare (Distribution) Ltd) absorbent lint BPC Clini (CliniSupplies Ltd) absorbent lint BPC

Pads

Drisorb

Absorbent Dressing Pads, Sterile

Drisorb (Synergy Health Plc) dressing pad 10cm x 20cm = £0.17

PremierPad

Absorbent Dressing Pads, Sterile

PremierPad dressing pad (Shermond) $10cm \times 20cm = £0.18$, $20cm \times 20cm = £0.25$

XuPad

Absorbent Dressing Pads, Sterile

Xupad dressing pad (Richardson Healthcare Ltd) 10cm x 20cm = £0.17, 20cm x 20cm = £0.28, 20cm x 40cm = £0.40

Wound drainage pouches

Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

Biotrol Draina S

Wound drainage pouch

Biotrol Draina S wound drainage bag (B.Braun Medical Ltd) large (Transparent) = £94.55, medium (Transparent) = £76.88, mini (Transparent) = £77.11

Biotrol Draina S Vision

Wound drainage pouch

Draina S Vision (B.Braun Medical Ltd) 100 wound drainage bag = £123.38, 50 wound drainage bag = £100.66, 75 wound drainage bag = £106.34

Eakin Access window

For use with Eakin pouches

Eakin (Pelican Healthcare Ltd) access window = £37.39

Eakin Wound pouch, bung closure

Wound pouch, bung closure

Eakin wound drainage bag with bung closure (Pelican Healthcare Ltd), large = £101.48, medium = £74.78, small = £53.41, and access window for horizontal wounds, extra large = £101.48, for horizontal wounds, extra large = £90.80, for vertical incision wounds, extra large = £90.80, wounds, extra large = £90.80.

Eakin Wound pouch, fold and tuck closure

Wound pouch, fold and tuck closure

Eakin wound drainage bag with fold and tuck closure, (Pelican Healthcare Ltd) large = £90.80, medium = £69.44, small = £48.07, extra large = £80.12,

Option Wound Manager

Wound drainage bag

Option wound manager bag (Oakmed Ltd) large = £158.71, medium = £133.16, small = £130.26, square = £138.95, extra small = £117.12

Option Wound Manager with access port

Wound drainage bag, with access port

Option wound manager bag with access port, (Oakmed Ltd) large = £169.65, medium = £138.95, small = £136.05, square = £144.74, extra small = £128.06

Option Wound Manager, cut to fit

Wound drainage bag, cut to fit

Option wound manager bag (Oakmed Ltd) large = £83.44, medium = £79.66, small = £71.91

Welland Fistula bag

Wound drainage bag, cut-to-fit

Welland (Welland Medical Ltd) Fistula wound drainage bag = £81.29

Physical debridement pads

DebriSoft[®] is a pad that is used for the debridement of superficial wounds containing loose slough and debris, and for the removal of hyperkeratosis from the skin. DebriSoft[®] must be fully moistened with a wound cleansing solution before use and is not appropriate for use as a wound dressing.

DebriSoft Pad

Polyester fibres with bound edges and knitted outer surface coated with polyacrylate

DebriSoft (Activa Healthcare Ltd) pad 10cm x 10cm = £6.39

Complex adjunct therapies

Topical negative pressure therapy

Accessories

Renasys

Soft port and connector

Renasys (Smith & Nephew Healthcare Ltd) Soft Port = £11.11, connector for use with soft port = £3.24

V.A.C

Drape, gel for canister, Sensa T.R.A.C. Pad SensaT.R.A.C. (KCI Medical Ltd) pad = £10.95

T.R.A.C. (KCI Medical Ltd) connector = £3.13

WoundASSIST (Huntleigh Healthcare Ltd) TNP canister = £20.30

Wound care accessories

Dressing packs

The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

Multiple Pack Dressing No. 1

Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded)

Vernaid (Synergy Health Plc) multiple pack dressing

Non-drug tariff specification sterile dressing packs **Dressit**

Vitrex gloves, large apron, disposable bag, paper towel, softswabs, adsorbent pad, sterile field

Dressit sterile dressing pack with (Richardson Healthcare Ltd) medium/large gloves = £0.60, small/medium gloves = £0.60

urse It

Contains latex-free, powder-free nitrile gloves, sterile laminated paper sheet, large apron, non-woven swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape

Nurse It sterile dressing pack with (Medicareplus International Ltd) medium/large gloves = £0.54, small/medium gloves = £0.54

Polyfield Nitrile Patient Pack

Contains powder-free nitrile gloves, laminate sheet, nonwoven swabs, towel, polythene disposable bag, apron Polyfield Nitrile Patient Pack with (Shermond) large gloves = £0.52, medium gloves = £0.52, small gloves = £0.52

Sterile Dressing Pack with Non-Woven Pads

(Drug Tariff specification 35). Contains non-woven fabric covered dressing pad, non-woven fabric swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper

Vernaid (Synergy Health Plc) sterile dressing pack with non-woven pads

Sterile dressing packs

Vernaid

(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper Vernaid (Synergy Health Plc) sterile dressing pack

Woven and fabric swabs

Gauze Swab, PB 1988

Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile or non-sterile

Alvita gauze swab 8ply (Alliance Healthcare (Distribution) Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

CS (CliniSupplies Ltd) gauze swab 8ply non-sterile 10cm x 10cm Clini gauze swab 8ply (CliniSupplies Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Gauze (Robert Bailey & Son Plc) swab 8ply non-sterile 10cm x 10cm MeCoBo gauze swab 8ply (MeCoBo Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Propax gauze (BSN medical Ltd) swab 8ply sterile 7.5cm x 7.5cm Sovereign (Waymade Healthcare Plc) gauze swab 8ply sterile 7.5cm x 7.5cm

 $\begin{array}{l} \textbf{Steraid} \text{ (Robert Bailey \& Son Plc) gauze swab 8ply sterile 7.5cm x} \\ \textbf{7.5cm} \end{array}$

Vernaid gauze swab 8ply (Synergy Health Plc) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Non-woven Fabric Swab

(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile or non-sterile

 $\pmb{\mathsf{CS}}$ (CliniSupplies Ltd) non-woven fabric swab 4ply non-sterile 10cm x 10cm

Clini non-woven fabric swab 4ply (CliniSupplies Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

CliniMed (CliniMed Ltd) non-woven fabric swab 4ply non-sterile 10cm x 10cm

MeCoBo (MeCoBo Ltd) non-woven fabric swab 4ply non-sterile 10cm x 10cm

Multisorb (BSN medical Ltd) non-woven fabric swab 4ply sterile 7.5cm x 7.5cm

Sofsorb non-woven fabric swab 4ply (Synergy Health Plc) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Softswab non-woven fabric swab 4ply (Richardson Healthcare Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Topper 8 non-woven fabric swab 4ply (Systagenix Wound Management Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Filmated gauze swabs

Cotfil

As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile

Cotfil (Synergy Health Plc) filmated gauze swab 8ply non-sterile $10\,\mathrm{cm} \times 10\,\mathrm{cm}$

Filmated non-woven Fabric Swab

Regal

(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile Regal (Systagenix Wound Management Ltd) filmated swab 8ply 10cm x 10cm

Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment.

Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

Occlusive adhesive tapes

Blenderm

(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with a polymericadhesive mass

Blenderm tape (3M Health Care Ltd) 2.5cm = £1.77, 5cm = £3.37

Sleek

(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with an adhesive mass

Leukoplast Sleek tape (BSN medical Ltd) 2.5cm, 5cm, 7.5cm

Permeable adhesive tapes

3m Kind Removal Silicone Tape

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape $\,$

3M Kind removal tape (3M Health Care Ltd) 2.5cm = £3.58, 5cm = £6.48

Chemifix

(Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988). Non-woven fabric with a polyacrylate adhesive

Chemifix tape (Medicareplus International Ltd) 10cm = £2.10, 2.5cm = £0.90, 5cm = £1.40

Chemipore

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Chemipore tape (Medicareplus International Ltd) 1.25cm = £0.27, 2.5cm = £0.70, 5cm = £0.95

Clinipore

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Clinipore tape (CliniSupplies Ltd) 1.25cm = £0.35, 2.5cm = £0.73, 5cm = £0.99

Elastoplast

(Elastic Adhesive Tape, BP 1988). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide

Tensoplast (BSN medical Ltd) elastic adhesive tape 2.5cm

Hynafix

(Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988). Non-woven fabric with a polyacrylate adhesive

Hypafix tape (BSN medical Ltd) 10cm = £4.63, 15cm = £6.86, 2.5cm = £1.67, 20cm = £9.10, 30cm = £13.15, 5cm = £2.65

Insil

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

Insil tape (Insight Medical Products Ltd) 2cm = £5.77, 4cm = £5.77

Leukofix

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Leukofix tape (BSN medical Ltd) 1.25cm = £0.55, 2.5cm = £0.89, 5cm

Leukopor

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Leukopor tape (BSN medical Ltd) 1.25cm = £0.49, 2.5cm = £0.76, 5cm = £1.34

Modinlact

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Mediplast tape (Neomedic Ltd) 1.25cm = £0.30, 2.5cm = £0.50

Mediplast

Fabric, plain weave, warp and weft of cotton and /or viscose, spread with an adhesive containing zinc oxide

Mediplast Zinc Oxide plaster (Neomedic Ltd) 1.25cm = £0.82, 2.5cm

=£1.19, 5cm =£1.99, 7.5cm =£2.99

Mofiv

(Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988). Non-woven fabric with a polyacrylate adhesive

Mefix tape (Molnlycke Health Care Ltd) 10cm = £2.89, 15cm = £3.94, 2.5cm = £1.02, 20cm = £5.04, 30cm = £7.24, 5cm = £1.81

Mepitad

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

Mepitac tape (Molnlycke Health Care Ltd) 2cm = £6.93, 4cm = £6.93

Micropore

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Micropore tape (3M Health Care Ltd) 1.25cm = £0.62, 2.5cm = £0.92, 5cm = £1.62

Omnifix

(Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988). Non-woven fabric with a polyacrylate adhesive

Omnifix tape (Paul Hartmann Ltd) 10cm = £4.04, 15cm = £5.97, 5cm = £2.40

OpSite Flexifix Gentle

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

OpSite Flexifix Gentle tape (Smith & Nephew Healthcare Ltd) 2.5cm = £10.20, 5cm = £19.13

Primafix

(Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988). Non-woven fabric with a polyacrylate adhesive

Primafix tape (Smith & Nephew Healthcare Ltd) 10cm = £2.32, 15cm = £3.43, 20cm = £4.22, 5cm = £1.58

Scanpor

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Scanpor tape (Bio-Diagnostics Ltd) 1.25cm = £0.55, 2.5cm = £0.92, 5cm = £1.75, 7.5cm = £2.56

iltape

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

Siltape (Advancis Medical) 2cm = £5.60, 4cm = £5.60

trappal

Fabric, plain weave, warp and weft of cotton and /or viscose, spread with an adhesive containing zinc oxide

Strappal adhesive tape (BSN medical Ltd) 2.5cm = £1.37, 5cm = £2.32, 7.5cm = £3.49

Transpore

(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Transpore tape (3M Health Care Ltd) 1.25cm = £0.52, 2.5cm = £0.84, 5cm = £1.48

Zinc Oxide Adhesive Tape, BP 1988

Fabric, plain weave, warp and weft of cotton and /or viscose, spread with an adhesive containing zinc oxide Fast Aid zinc oxide adhesive tape (Robinson Healthcare) 1.25cm, 2.5cm. 5.5cm. 7.5cm

Skin closure dressings

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive can be used for closure of minor skin wounds and for additional suture support.

Skin closure strips, sterile

Leukostrip

Drug Tariff specifies that these are specifically for personal administration by the prescriber

Leukostrip (Smith & Nephew Healthcare Ltd) skin closure strips $6.4mm \times 76mm = £6.28$

Omnistrip

Drug Tariff specifies that these are specifically for personal administration by the prescriber

Omnistrip (Paul Hartmann Ltd) skin closure strips sterile 6mm x 76mm = £24.11

Steri-stri

Drug Tariff specifies that these are specifically for personal administration by the prescriber

Steri-strip (3M Health Care Ltd) skin closure strips 6mm x 75mm = £8.77

Bandages

Non-extensible bandages

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive can be used for closure of minor skin wounds and for additional suture support.

Open-wove Bandage, Type 1 BP 1988

Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length
Clini open wove bandage Type 1 BP 1988 (CliniSupplies Ltd) 10cm x

5m, 2.5cm x 5m, 5cm x 5m, 7.5cm x 5m

Vernaid white open wove bandage (Synergy Health Plc) 10cm \times 5m, 2.5cm \times 5m, 5cm \times 5m, 7.5cm \times 5m

White open wove bandage (Robert Bailey & Son Plc) 10cm x 5m, 2.5cm x 5m, 5cm x 5m, 7.5cm x 5m

Triangular Calico Bandage, BP 1980

Unbleached calico right-angled triangle

Clini (CliniSupplies Ltd) triangular calico bandage BP 1980 90cm x 127cm

Triangular (BSN medical Ltd) calico bandage 90cm x 127cm

Light-weight conforming bandages

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming-stretch bandages (also termed contour bandages) is greater than that of cotton conforming bandages.

Acti-Wrap

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Acti-Wrap (cohesive/latex free) bandage (Activa Healthcare Ltd) 10cm x 4m = £0.80, 6cm x 4m = £0.46, 8cm x 4m = £0.68

Cotton Conforming Bandage, BP 1988

Cotton fabric, plain weave, treated to impart some elasticity to warp and weft

Easifix Crinx bandage (BSN medical Ltd) $10cm \times 3.5m = £1.02$, $15cm \times 3.5m = £1.39$, $5cm \times 3.5m = £0.83$

Easifix

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Easifix bandage (BSN medical Ltd) $10cm \times 4m = £0.50$, $15cm \times 4m = £0.85$, $5cm \times 4m = £0.35$, $7.5cm \times 4m = £0.42$

Facifix I

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched Easifix K bandage (BSN medical Ltd) 10cm x 4m = £0.18, 15cm x 4m = £0.32, 2.5cm x 4m = £0.10, 5cm x 4m = £0.11, 7.5cm x 4m = £0.16

Hospiform

Fabric, plain weave, warp of polyamide, weft of viscose **Hospiform bandage** (Paul Hartmann Ltd) $10\text{cm} \times 4\text{m} = £0.19$, $12\text{cm} \times 4\text{m} = £0.23$, $6\text{cm} \times 4\text{m} = £0.13$, $8\text{cm} \times 4\text{m} = £0.17$

K-Band

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched K-Band bandage (Urgo Ltd) 10cm x 4m = £0.28, 15cm x 4m = £0.49, 5cm x 4m = £0.20. 7cm x 4m = £0.26

Knit Fix

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched knit Fix bandage (Robert Bailey & Son Plc) $10\text{cm} \times 4\text{m} = £0.17$, $15\text{cm} \times 4\text{m} = £0.33$, $5\text{cm} \times 4\text{m} = £0.17$, $7\text{cm} \times 4\text{m} = £0.17$

Knit-Band

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched Knit-Band bandage (Clinisupplies Ltd) $10\text{cm} \times 4\text{m} = £0.17$, $15\text{cm} \times 4\text{m} = £0.30$, $5\text{cm} \times 4\text{m} = £0.10$, $7\text{cm} \times 4\text{m} = £0.15$

Kontour

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Kontour bandage (Easigrip Ltd) 10cm x 4m = £0.40, 15cm x 4m = £0.66, 5cm x 4m = £0.28, 7.5cm x 4m = £0.35

Mollelast

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Mollelast (Lohmann & Rauscher (UK) Ltd) bandage 4cm x 4m = £0.30

Peha-haft

Polyamide and Cellulose Contour Bandage, cohesive, latex-free

Peha-haft bandage (Paul Hartmann Ltd) 10cm x 4m = £0.76, 12cm x 4m = £0.90, 2.5cm x 4m = £0.73, 4cm x 4m = £0.47, 6cm x 4m = £0.56, 8cm x 4m = £0.66

PremierBand

Polyamide and Cellulose Contour Bandage PremierBand bandage (Shermond) $10cm \times 4m = £0.17$, $15cm \times 4m = £0.25$, $5cm \times 4m = £0.12$, $7.5cm \times 4m = £0.14$

Slinky

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Slinky bandage (Molnlycke Health Care Ltd) $10cm \times 4m = £0.71$, $15cm \times 4m = £1.02$, $7.5cm \times 4m = £0.59$

Stayform

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Stayform bandage (Robinson Healthcare) $10cm \times 4m = £0.40$, $15cm \times 4m = £0.68$, $5cm \times 4m = £0.29$, $7.5cm \times 4m = £0.36$

Tubular bandages and garments

Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

Compression hosiery reduces the recurrence of venous leg ulcers and should be considered for use after wound healing.

Silk clothing is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions.

Elasticated Surgical Tubular Stockinette, Foam padded is used for relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface.

For Elasticated Tubular Bandage, BP 1993, where no size stated by the prescriber, the 50 cm length should be supplied and width endorsed. Non-elasticated Cotton Stockinette, Bleached, BP 1988 Im lengths is used as basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage.

For Non-elasticated Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988, the Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage. It is used as protective dressings with tar-based and other steroid ointments.

Elasticated

Support bandages

Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see p. 1317.

CliniLite

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

CliniLite bandage (CliniSupplies Ltd) 10cm x 4.5m = £0.80, 15cm x 4.5m = £1.16, 5cm x 4.5m = £0.44, 7.5cm x 4.5m = £0.61

CliniPlus

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

CliniPlus (CliniSupplies Ltd) bandage 10cm x 8.7m = £1.80

Adhesive bandages

Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints: they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

Elastic Adhesive Bandage, BP 1993

Woven fabric, elastic in warp (crepe-twisted cotton threads). weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched Tensoplast bandage (BSN medical Ltd) 10cm x 4.5m, 5cm x 4.5m,

7.5cm x 4.5m

Cohesive bandages

Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

Cohesive extensible bandages

Cohan

Bandage

Coban (3M Health Care Ltd) self-adherent bandage 10cm x 6m = £2.93

K Press

Bandage

K Press bandage (Urgo Ltd) 10cm x 6.5m = £2.89, 10cm x 7.5m = £3.37, $12cm \times 7.5m = £4.25$, $8cm \times 7.5cm = £3.18$

Profore #4

Profore #4 (Smith & Nephew Healthcare Ltd) bandage 10cm x 2.5m = £3.23, latex free bandage $10cm \times 2.5m = £3.51$

Ultra Fast

Ultra (Robinson Healthcare) Fast cohesive bandage 10cm x 6.3m = £2.59

Compression bandages

High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline, p. 207 can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

High compression bandages

High Compression Bandage

Cotton, viscose, nylon, and Lycra extensible bandage, 3 m (unstretched)

K-ThreeC (Urgo Ltd) bandage 10cm x 3m = £2.81

SurePress (ConvaTec Ltd) bandage 10cm x 3m = £3.61

PEC High Compression Bandages

Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched

Velband

Padding

Velband (BSN medical Ltd) absorbent padding bandage 10cm x 4.5m = £0.72

Multi-layer compression bandaging

Multi-layer compression bandaging systems are an alternative to High Compression Bandages for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

Four layer systems

K-Four

Padding

K-Four

Medicated bandages

Zinc Paste Bandage has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution. Zinc paste bandages are also used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions. Zipzoc® can be used under appropriate compression bandages or hosiery in chronic venous insufficiency.

Steripaste

Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging) Excipients include polysorbate 80

Steripaste (Molnlycke Health Care Ltd) bandage 7.5cm x 6m = £3.24

Zinc Paste Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging Excipients: may include cetostearyl alcohol, hydroxybenzoates

Viscopaste (Smith & Nephew Healthcare Ltd) PB7 bandage 7.5cm x 6m = £3.63

Zinc Paste and Ichthammol Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging Excipients: may include cetostearyl alcohol Ichthopaste (Smith & Nephew Healthcare Ltd) bandage 7.5cm x 6m = £3.67

Medicated stocking

Zipzoc

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%

Zipzoc (Smith & Nephew Healthcare Ltd) stockings = £31.26

Compression hosiery and garments

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging. Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

Graduated Compression hosiery, Class 1 Light Support is used for superficial or early varices, varicosis during pregnancy.

Graduated Compression hosiery, Class 2 Medium Support is used for varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy. Graduated Compression hosiery, Class 3 Strong Support is used for gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis. Compression values for hosiery and lymphoedema garments Class 1: Compression hosiery (British standard) 14-17 mmHg, lymphoedema garments (European classification) 18-21 mmHg; Class 2 Compression hosiery (British standard) 18-24 mmHg, lymphoedema garments (European classification) 23-32 mmHg; Class 3 Compression hosiery (British standard) 25-35 mmHg, lymphoedema garments (European classification) 34-46 mmHg; Class 4 Compression hosiery (British standard)-not available, lymphoedema garments (European classification) 49-70 mmHg; Class 4 super Compression hosiery (British standard)—not available. lymphoedema garments (European classification) 60-90 mmHg.

Graduated compression hosiery

Class 1 Light Support

Hosiery, compression at ankle 14–17 mmHg, thigh length or

below knee with knitted in heel

Class 2 Light Support

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

Accessories

Suspender

Suspender, for thigh stockings

Anklets

Class 2 Medium Support

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure),

Class 3 Strong Support

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure),

Knee caps

Class 2 Medium Support

Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

Class 3 Strong Support

Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

Lymphoedema garments

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages.

A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) armsleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details. Note There are different compression values for lymphoedema garments and graduated compression hosiery, see above.

Dental Practitioners' Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed sugar-free versions, where available, are

Licensed alcohol-free mouthwashes, where available, are preferred.

Aciclovir Cream, BP

Aciclovir Oral Suspension, BP, 200 mg/5 mL

Aciclovir Tablets, BP, 200 mg

Aciclovir Tablets, BP, 800 mg

Amoxicillin Capsules, BP

Amoxicillin Oral Powder, DPF

Amoxicillin Oral Suspension, BP Artificial Saliva Gel, DPF

Artificial Saliva Oral Spray, DPF

Artificial Saliva Pastilles, DPF

Artificial Saliva Protective Spray, DPF

Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having

undergone, radiotherapy or sicca syndrome):

BioXtra® Gel Mouthspray BioXtra® Moisturising Gel

Glandosane®

Saliveze®

Artificial Saliva Substitute Spray, DPF

Aspirin Tablets, Dispersible, BP

Sodium Fluoride Toothpaste 1.1%, DPF

Sodium Fusidate Ointment, BP

Temazepam Oral Solution, BP

Temazepam Tablets, BP

Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations. For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF publications.

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF. Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder

amoxicillin (as trihydrate) 3 g sachet

Artificial Saliva Gel

(proprietary product: *Biotene Oralbalance*), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

Artificial Saliva Oral Spray

(proprietary product: *Xerotin*) consists of water, sorbitol, carnellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

Artificial Saliva Pastilles

(proprietary product: Salivix), consists of acacia, malic acid, and other ingredients

Artificial Saliva Protective Spray

(proprietary product: *Aquoral*) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame

Artificial Saliva Substitute Spray

(proprietary product: AS Saliva Orthana Spray) consists of mucin, methylparaben, benzalkonium chloride, EDTA, xylitol, peppermint oil, spearmint oil, mineral salts

Azithromycin Capsules

azithromycin 250 mg

Azithromycin Oral Suspension 200 mg/5 mL

azithromycin 200 mg/5 mL when reconstituted with water

Azithromycin Tablets

azithromycin 250 mg and 500 mg

Betamethasone Soluble Tablets 500 micrograms

betamethasone (as sodium phosphate) 500 micrograms

Chlorhexidine Oral Spray

(proprietary product: *Ĉorsodyl Oral Spray*), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension 125 mg/5 mL

clarithromycin 125 mg/5 mL when reconstituted with water

Clarithromycin Oral Suspension 250 mg/5 mL

clarithromycin 250 mg/5 mL when reconstituted with water

Doxycycline Tablets 20 mg

(proprietary product: *Periostat*), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg

fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL

(proprietary product: Diflucan), fluconazole 50 mg/ 5 mL when reconstituted with water

Lidocaine Spray 10%

(proprietary product: *Xylocaine Spray*), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Syrup 5 mg/5 mL

loratadine 5 mg/5 mL

Saliva Stimulating Tablets

(proprietary product: SST), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619%

(proprietary product: *Duraphat '2800 ppm' Toothpaste*), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1%

(proprietary product: *Duraphat '5000 ppm' Toothpaste*), sodium fluoride 1.1%

Nurse Prescribers' Formulary

Nurse Prescribers' Formulary for Community **Practitioners**

Nurse Prescribers' Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers' list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 1323.

Almond Oil Ear Drops, BP

Arachis Oil Enema, NPF

Appliances and Reagents (including Wound **Management Products**)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

Appliances (including Contraceptive Devices-where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form

FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff).

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at:

National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm

Health and Personal Social Services for Northern Ireland Drug Tariff:

www.dhsspsni.gov.uk/pas-tariff

Scottish Drug Tariff:

www.isdscotland.org/Healthtopics/Prescribing-and-Medicines/ Scottish-Drug-Tariff/

Details of NPF preparations

Preparations on the Nurse Prescribers' Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers' Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that nonproprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema

arachis oil 100%

Catheter Maintenance Solution, Sodium Chloride

(proprietary products: OptiFlo S; Uro-Tainer Sodium Chloride: Uriflex-S), sodium chloride 0.9%

Catheter Maintenance Solution, 'Solution G'

(proprietary products: OptiFlo G; Uro-Tainer Suby G; Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, 'Solution R'

(proprietary products: OptiFlo R; Uro-Tainer Solution R; Uriflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions

(proprietary products: ChloraPrep; Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution Chlorhexidine gluconate aqueous solutions (proprietary product: *Unisept*) chlorhexidine gluconate in

aqueous solution Co-danthramer Capsules Pom

co-danthramer 25/200 (dantron 25 mg, poloxamer '188'

Co-danthramer Capsules, Strong Pom

co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer '188'

Co-danthramer Oral Suspension PoM

(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong PoM

(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL)

Co-danthrusate Oral Suspension Pom

(proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams

(proprietary products: Conotrane Cream, dimeticone '350' 22%; Siopel Barrier Cream, dimeticone '1000' 10%), dimeticone 10-22%

Dimeticone Lotion

(proprietary product: Hedrin), dimeticone 4%

Docusate Enema

(proprietary product: Norgalax Micro-enema) docusate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment

liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound

(proprietary product: Movicol Liquid), macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound

(proprietary products: Laxido Orange, Molaxole, Movicol) macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/ sachet

Note: Amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet;

chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre

Macrogol Oral Powder, Compound, Half-strength (proprietary product: Movicol-Half), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions

(proprietary products: *Derbac-M Liquid*), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension Pom

(proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets Pom

(can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg (proprietary products: *Ovex, Vermox*)), mebendazole 100 mg

Mouthwash Solution-tablets

consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)) (proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 10 mg or 15 mg

Nicotine Lozenge

nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

Nicotine Medicated Chewing Gum

(proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg Nicotine Nasal Spray

(proprietary product: *NicAssist Nasal Spray*, *Nicorette Nasal Spray*), nicotine 500 micrograms/metered spray

Nicotine Oral Spray

(proprietary product: *Nicorette Quickmist*), nicotine 1 mg/metered spray

Nicotine Sublingual Tablets

(to be prescribed as either a starter pack (2 \times 15-tablet discs with dispenser) or refill pack (7 \times 15-tablet discs)) (proprietary product: *NicAssist Microtab*, *Nicorette Microtab*), nicotine (as a cyclodextrin complex) 2 mg

Nicotine Transdermal Patches

(prescriber should specify the brand to be dispensed) releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch) or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear)

Permethrin Cream

(proprietary product: *Lyclear Dermal Cream*), permethrin 5% **Senna Oral Solution**

(proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL $\,$

Senna and Ispaghula Granules

(proprietary product: *Manevac Granules*), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema

(proprietary products: *Micolette Micro-enema*; *Micralax Micro-enema*; *Relaxit Micro-enema*), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules

(proprietary products: *Dulcolax Perles*), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir

(proprietary products: *Dulcolax Liquid*), sodium picosulfate 5 mg/5 mL

Sterculia Granules

(proprietary product: Normacol Granules), sterculia 62%

Sterculia and Frangula Granules

(proprietary product: *Normacol Plus Granules*), sterculia 62%, frangula (standardised) 8%

Zinc Oxide and Dimeticone Spray

(proprietary product: *Sprilon*), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

Zinc Oxide Impregnated Medicated Bandage

(proprietary product: *Steripaste*), sterile cotton bandage impregnated with paste containing zinc oxide 15% Zinc Oxide Impregnated Medicated Stocking (proprietary product: *Zipzoc*), sterile rayon stocking

impregnated with ointment containing zinc oxide 20%

Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name. Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient's agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing of medicines.pdf).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

Nurses

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers' Formulary p. 1322 for Community Practitioners provides information on prescribing.

Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Index of proprietary manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'specialorder' manufacturers and specialist importing companies see 'Special-order manufacturers'.

Special-order Manufacturers

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdslke.

Licensed hospital manufacturing units also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about

commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

Adult Advanced Life Support Algorithm

During CPR

- · Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- · Give oxygen
- · Consider advance airway and capnography
- Continuous chest compressions when advanced airway in place
- Vascular access (intravenous, intraosseous)
- · Give adrenaline every 3-5 min
- · Correct reversible causes

Reversible causes

- Hypoxia
 ...
- Hypovolaemia
- · Hypo- / hyperkalaemia / metabolic
- Hypothermia
- · Thrombosis coronary or pulmonary
- Tamponade cardiac
 Toxins
- Tension pneumothorax

Medical emergencies in the community

Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown, advice on supporting care is not given. Where the patient's condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Acute coronary syndromes

► ANGINA: UNSTABLE

Aspirin dispersible tablets p. 104 (75 mg, 300 mg)

BY MOUTH (DISPERSED IN WATER OR CHEWED)

Adult: 300 mg

► PIUS

► EITHER Glyceryl trinitrate aerosol spray p. 190 (400 micrograms/metered dose)

SUBLINGUALLY

▶ Adult: 1-2 sprays, repeated as required

► OR Glyceryl trinitrate tablets p. 190 (300 micrograms, 500 micrograms, 600 micrograms)

Adult: 0.3–1 mg, repeated as required

► MYOCARDIAL INFARCTION: NON-ST-SEGMENT ELEVATION
Treat as for Angina: unstable

► MYOCARDIAL INFARCTION: ST-SEGMENT ELEVATION

Aspirin dispersible tablets p. 104 (75 mg, 300 mg)

BY MOUTH (DISPERSED IN WATER OR CHEWED)

Adult: 300 mg

Glyceryl trinitrate aerosol spray p. 190 (400 micrograms/metered dose)

SUBLINGUALLY

▶ Adult: 1-2 sprays, repeated as required

 OR Glyceryl trinitrate tablets p. 190 (300 micrograms, 500 micrograms, 600 micrograms)

UBLINGUALLY

▶ Adult: 0.3-1 mg, repeated as required

Metoclopramide hydrochloride injection p. 347 (5 mg/mL) BY INTRAVENOUS INJECTION

Adult (under 60 kg) 18-19 years: 5 mg

- Adult (over 60 kg) 18-19 years: 10 mg
- Adult over 10 years, 10 mg
- Adult over 19 years: 10 mg

Diamorphine hydrochloride injection p. 361 (5 mg powder for reconstitution)

BY SLOW INTRAVENOUS INJECTION (1-2 mg/minute)

- ▶ Adult: 5 mg followed by a further 2.5-5 mg if necessary
- Elderly or frail patients: reduce dose by half
- ► OR Morphine sulphate injection p. 367 (10 mg/mL)

BY SLOW INTRAVENOUS INJECTION (1-2 mg/minute)

Adult: 5-10 mg followed by a further 5-10 mg foll

 Adult: 5-10 mg followed by a further 5-10 mg if necessary

▶ Elderly or frail patients: reduce dose by half

Oxygen, if appropriate

Airways disease, obstructive

► ASTHMA: ACUTE

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise; failure to respond adequately **at any time** requires immediate transfer to hospital

► EITHER Salbutamol aerosol inhaler p. 222 (100 micrograms/metered inhalation)

BY AEROSOL INHALATION VIA LARGE-VOLUME SPACER (AND A CLOSE-FITTING FACE MASK IF CHILD UNDER 3 YEARS)

- Adult and child: 2-10 puffs each inhaled separately, repeated every 10-20 minutes or as necessary
- ► OR Salbutamol nebuliser solution p. 222 (1 mg/mL, 2 mg/mL)

 BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN

 NEBULISED IS AVAILABLE)
 - ► Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary
 - Child 5-11 years: 2.5-5 mg every 20-30 minutes or as necessary
 - Child 12-17 years: 5 mg every 20-30 minutes or as necessary
 - Adult: 5 mg every 20–30 minutes or as necessary
- ➤ OR Terbutaline sulfate nebuliser solution p. 225 (2.5 mg/mL) BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
 - Child 4 years and below: 5 mg every 20-30 minutes or as necessary
 - Child 5-11 years: 5-10 mg every 20-30 minutes or as necessary
 - Child 12-17 years: 10 mg every 20-30 minutes or as necessary
 - ▶ Adult: 10 mg every 20–30 minutes or as necessary
- ▶ PLUS (in all cases)
- ► EITHER Prednisolone tablets p. 585 (or prednisolone soluble tablets) (5 mg)

ву моитн

- Child 11 years and below: 1-2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
- ▶ Child 12-17 years: 40-50 mg once daily for at least 5 days
- ▶ Adult: 40–50 mg once daily for at least 5 days
- ► OR Hydrocortisone (preferably as sodium succinate) p. 583 BY INTRAVENOUS INJECTION
 - Child 17 years and below: 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:
 - ► Child 1 year and below: 25 mg
 - ▶ Child 2-4 years: 50 mg
 - Child 5-17 years: 100 mg
 - Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow **oxygen** should be given if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta**₂ **agonist** (as above) and give with

Ipratropium bromide nebuliser solution p. 217 (250 micrograms/mL)

BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)

- Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
- ► Child 12-17 years: 500 micrograms every 4–6 hours as necessary
- ▶ Adult: 500 micrograms every 4–6 hours as necessary

► CROUP

Dexamethasone oral solution p. 581 (2 mg/5 mL) BY MOUTH

► Child 1 month-2 years: 150 micrograms/kg as a single dose

Anaphylaxis

► ANAPHYLAXIS

Adrenaline/epinephrine injection p. 196 (1 mg/mL (1 in 1000))
BY INTRAMUSCULAR INJECTION

- Child 5 years and below: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
- Child 6-11 years: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
- Child 12-17 years: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal
- Adult: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow **oxygen** and **intravenous fluids** should be given as soon as available.

Chlorphenamine maleate injection p. 245

BY INTRAMUSCULAR OR INTRAVENOUS INJECTION may help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate) p. 583
BY INTRAVENOUS INJECTION has delayed action but should be given to severely affected patients to prevent further deterioration

Bacterial infection

► MENINGOCOCCAL DISEASE

Benzylpenicillin sodium injection p. 480 (600 mg, 1.2 g)
BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF
VENOUS ACCESS NOT AVAILABLE)

- ▶ Neonate: 300 mg
- ► Child 1 month-11 months: 300 mg
- ► Child 1-9 years: 600 mg
- ► Child 10-17 years: 1.2 g
- ▶ Adult: 1.2 g

Note A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

▶ OR if history of allergy to penicillin

Cefotaxime injection p. 457 (1 g)

BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)

- ▶ Neonate: 50 mg/kg
- ▶ Child 1 month-11 years: 50 mg/kg (max. 1 g)
- ▶ Child 12-17 years: 1 g
- ▶ Adult: 1 g

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.

 OR if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

Chloramphenicol injection p. 452 (1 g)

BY INTRAVENOUS INJECTION

- ▶ Child 1 month-17 years: 12.5-25 mg/kg
- Adult: 12.5–25 mg/kg

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer. See also Central nervous system infections, bacterial p. 444

Hypoglycaemia

► DIABETIC HYPOGLYCAEMIA

Glucose or sucrose

BY MOUTH

- Adult and child over 2 years: approx. 10–20 g (55–110 mL Lucozade® Energy Original or 100–200 mL Coca-Cola®—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary
- OR if hypoglycaemia unresponsive or if oral route cannot be used

Glucagon injection p. 618 (1 mg/mL)

BY SUBCUTANEOUS OR INTRAMUSCULAR INJECTION

- ▶ Child body-weight under 25 kg: 500 micrograms (0.5 mL)
- Child body-weight over 25 kg: 1 mg (1 mL)
- ▶ Adult: 1 mg (1 mL)
- OR if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

Glucose intravenous infusion p. 852 (10%)

BY INTRAVENOUS INJECTION INTO LARGE VEIN

► Child 1 month-17 years: 5 mL/kg (glucose 500 mg/kg)

Glucose intravenous infusion p. 852 (20%)

BY INTRAVENOUS INJECTION INTO LARGE VEIN

▶ Adult: 50 mL

Seizures

- ► CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES
- ► EITHER Diazepam rectal solution p. 267 (2 mg/mL, 4 mg/mL)
- Neonate: 1.25-2.5 mg, repeated once after 10-15 minutes if necessary
- ▶ Child 1 month-1 years: 5 mg, repeated once after 10–15 minutes if necessary
- ► Child 2-11 years: 5-10 mg, repeated once after 10-15 minutes if necessary
- ► Child 12-17 years: 10-20 mg, repeated once after 10-15 minutes if necessary
- Adult: 10–20 mg, repeated once after 10–15 minutes if necessary
- Elderly 65 years and over: 10 mg, repeated once after 10-15 minutes if necessary

OR Midazolam oromucosal solution p. 414

BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY

- Neonate: 300 micrograms/kg [unlicensed]
- Child 1-2 months: 300 micrograms/kg (max. 2.5 mg) [unlicensed]
- ▶ Child 3 months-11 months: 2.5 mg
- ► Child 1-4 years: 5 mg
- ▶ Child 5-9 years: 7.5 mg
- ▶ Child 10-17 years: 10 mg
- ▶ Adult: 10 mg [unlicensed]

Approximate Conversions and Units

Conversion of pounds to kilograms

lb	kg
1	0.45
2	0.91
3	1.36
4	1.81
5	2.27
6	2.72
7	3.18
8	3.63
9	4.08
10	4.54
11	4.99
12	5.44
13	5.90
14	6.35

Conversion of stones to kilograms

stones	kg
1	6.35
2	12.70
3	19.05
4	25.40
5	31.75
6	38.10
7	44.45
8	50.80
9	57.15
10	63.50
11	69.85
12	76.20
13	82.55
14	88.90
15	95.25

Conversion from millilitres to fluid ounces

mL	fl oz		
50	1.8		
100	3.5		
150	5.3		
200	7.0		
500	17.6		
1000	35.2		

Length

1 metre (m) = 1000 millimetres (mm)

1 centimetre (cm) = 10 mm

1 inch (in) = 25.4 mm

1 foot (ft) = 12 inches 12 inches = 304.8 mm

Mass

1 kilogram (kg) = 1000 grams (g) 1 gram (g) = 1000 milligrams (mg)

1 milligram (mg) = 1000 micrograms 1 microgram = 1000 nanograms 1 nanogram = 1000 picograms

Volume

1 litre = 1000 millilitres (mL)

1 millilitre (1 mL) = 1000 microlitres 1 pint ≈ 568 mL

Other units

1 kilocalorie (kcal) = 4186.8 joules (J)

1000 kilocalories (kcal) = 4.1868 megajoules (MJ) 1 megajoule (MJ) = 238.8 kilocalories (kcal) 1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)

1 kilopascal (kPa) = 7.5 mmHg (pressure)

Plasma-drug concentrations

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children: weight, height, and gender

The table below shows the **mean values** for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual's weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Ago	Waight (kg)	Hoight (cm)
Age	Weight (kg) Height (cm)	
Full-term neonate	3.5	51
1 month	4.3	55
2months	5.4	58
3 months	6.1	61
4 months	6.7	63
6 months	7.6	67
1 year	9	75
3 years	14	96
5 years	18	109
7 years	23	122
10 years	32	138
12 years	39	149
14 year-old boy	49	163
14 year-old girl	50	159
Adult male	68	176
Adult female	58	164

Recommended wording of cautionary and advisory labels

For details please see p. 1291

- 1 Warning: This medicine may make you sleepy
- Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
- 3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
- 4 Warning: Do not drink alcohol
- 5 Do not take indigestion remedies 2 hours before or after you take this medicine
- 6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
- 7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
- 8 Warning: Do not stop taking this medicine unless your doctor tells you to stop
- 9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
- 10 Warning: Read the additional information given with this medicine
- 11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
- 12 Do not take anything containing aspirin while taking this medicine
- 13 Dissolve or mix with water before taking
- 14 This medicine may colour your urine. This is harmless
- 15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
- 16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
- 17 Do not take more than... in 24 hours
- 18 Do not take more than... in 24 hours. Also, do not take more than... in any one week
- 19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
- 21 Take with or just after food, or a meal
- 22 Take 30 to 60 minutes before food
- 23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
- 24 Suck or chew this medicine
- 25 Swallow this medicine whole. Do not chew or crush
- 26 Dissolve this medicine under your tongue
- 27 Take with a full glass of water
- 28 Spread thinly on the affected skin only
- 29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
- 30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
- 32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine

Abbreviations and Symbols

Internationally recognised units and symbols are used in the BNF publications where possible.

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

= ante cibum (before food) a.c.

= his die (twice daily) h. d. o. d. = omni die (every day)

o. m. = omni mane (every morning) o. n. = omni nocte (every night) = post cibum (after food) p.c.

p. r. n. = pro re nata (when required)

q. d. s. = quater die sumendum (to be taken four times daily)

q. q. h. = quarta quaque hora (every four hours)

= immediately

t. d. s. = ter die sumendum (to be taken three times daily)

t.i.d. = ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102	Tartrazine
E211	Sodium Benzoate
E104	Quinoline Yellow
E223	Sodium Metabisulfite
E110	Sunset Yellow FCF
E320	Butylated Hydroxyanisole
E123	Amaranth
E321	Butylated Hydroxytoluene
E124	Ponceau 4R
E322	Lecithins
E127	Erythrosine BS
E420	Sorbitol
E132	Indigo Carmine
E421	Mannitol
E142	Green S
E422	Glycerol
E171	Titanium Dioxide
E901	Beeswax (white and yellow)
E172	Iron oxides, iron hydroxides
E1520	Propylene Glycol
E200	Sorbic Acid
