Access the BNF your way

The British National Formulary (BNF) and BNF for Children are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest prescribing advice.

You can be alerted to all the latest updates by signing up to the BNF eNewsletter at www.bnf.org/newsletter.

ONLINE

BNF on MedicinesComplete

Access BNF and BNF for Children on MedicinesComplete and receive the very latest drug information through monthly online updates.

BNF on FormularyComplete

Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and BNF for Children.

BNF on Evidence Search

Search the BNF and *BNF for Children* alongside other authoritative clinical and non-clinical evidence and best practice at http://evidence.nhs.uk from NICE.

MOBILE

BNF app – Stay up to date anywhere with the BNF app available for iOS, Android and Blackberry.

BNF eBook – Available as an ePDF via a range of suppliers. See www.pharmpress.com/bnf.

BNF on MedicinesComplete – Now mobile responsive.

PRINT

BNF subscription – if you prefer to access BNF in print, take advantage of our subscription option. We will send you the new BNF as soon as the book is published. One or two year packages (including or excluding BNFC) are available. Discounted pricing is also available on bulk sales.

NICE have altered their distribution arrangement for England, and eligible health professionals will now receive one free print copy of BNF a year - the September issue - to supplement online access. To buy your copy/ies of the March BNF direct, go to www.pharmpress.com/bnf.

How to purchase

Purchase direct from Pharmaceutical Press by visiting www.pharmpress.com/bnf

For enquiries about the BNF or BNFC in print, contact direct@macmillan.co.uk
Tel: +44 (0) 1256 302 699

For enquiries concerning MedicinesComplete, BNF on FormularyComplete, or bulk orders of the print edition, contact **pharmpress@rpharms.com**Tel: +44 (0) 20 7572 2266

Download mobile apps by visiting your appropriate app store. Available for iOS, Android and Blackberry

For pricing information please visit the website at www.pharmpress.com/bnf

For international sales contact your local sales agent. Contact details at www.pharmpress.com/agents

The BNF is available online through MedicinesComplete and as mobile apps; a PDA version is also available. In addition, BNF content can be integrated into a local formulary by using BNF on FormularyComplete; see www.bnf.org for details.

The BNF is also available on www.evidence.nhs.uk and eligible users can download smartphone apps from the relevant app stores.

Distribution of printed BNFs

In **England**, NICE purchases print editions of the BNF (September editions only) for distribution within the NHS. For details of who is eligible to receive a copy and further contact details, please refer to the NICE website: www.nice.org.uk/mpc/BritishNationalFormulary.jsp.

In **Scotland**, email: nss.psd-bnf@nhs.net

In **Wales**, contact NHS Wales Shared Services Partnership—Contractor Services:

Tel: 01792 607420

In Northern Ireland, email:

ni.bnf@hscni.net

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from Medicines Information Services.

Pharmaid

Numerous requests have been received from developing countries for BNFs. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old BNFs to certain Commonwealth countries. For more information on this scheme see www.

commonwealthpharmacy.org/about/projects/pharmaid/. If you would like to donate your copy email: admin@commonwealthpharmacy.org

Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group overseas the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers' Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers' product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF's recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services

It is **important** to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this update were:

K.W. Ah-See, M.N. Badminton, A.K. Bahl, P.R.J. Barnes, D. Bilton, S.L. Bloom, M.F. Bultitude, I.F. Burgess, D.J. Burn, C.E. Dearden, D.W. Denning, P.N. Durrington, D.A.C. Elliman, P. Emery, M.D. Feher, B.G. Gazzard, A.M. Geretti, N.I.L. Gittoes, P.I. Goadsby, M. Gupta, T.L. Hawkins, B.G. Higgins, S.P. Higgins, S.H.D. Jackson, A. Jones, D.M. Keeling, J.R. Kirwan, P.G. Kopelman, T.H. Lee, A. Lekkas, D.N.J. Lockwood, A.M. Lovering, M.G. Lucas, L. Luzzatto, P.D. Mason, D.A. McArthur, K.E.L. McColl, L.M. Melvin, E. Miller, R.M. Mirakian, P. Morrison, S.M.S. Nasser, C. Nelson-Piercy, J.M. Neuberger, D.J. Nutt, L.P. Ormerod, R. Patel, W.J. Penny, A.B. Provan, M.M. Ramsay, A.S.C. Rice, D.J. Rowbotham, J.W. Sander, J.A.T. Sandoe, M. Schacter, S.E. Slater, J. Soar, S.C.E. Sporton, M.D. Stewart, S. Thomas, J.P. Thompson, A.D. Weeks, A. Wilcock, A.P.R. Wilson, M.M. Yaqoob.

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists' Therapy & Guidelines Subcommittee, D.A. Buckley, M. Cork, E. Duarte Williams, M. Griffiths, T. Leslie, E. Mallon, P. McHenry, P. Hunasehally, I. Nasr, C. Saunders, V. Swale, S. Ungureanu, S. Wakelin, A. Brain (Secretariat), and M.F. Mohd Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Lalloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

The UK Ophthalmic Pharmacy Group have also provided valuable advice.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

BNF interactions are provided by C.L. Preston, S.L. Jones, H.K. Sandhu, and S. Sutton.

The BNF has valuable access to the Martindale data banks by courtesy of A. Brayfield and staff.

J. Macdonald and staff provided valuable technical assistance.

K.K. Cheema, M.E. Elnaeem, H.G. Hesketh, M. Khalid, and E. Laughton provided considerable assistance during the production of this update of the BNF.

Invaluable contributions to this new BNF structure were provided by E.Boaheng, C.F. Boyle, K.K. Cheema, J.C. Green, S. Jahangeer, A.R. Javed, P.D. Lee, S. Lynsdale, H.L. MacKenzie, C. McCahill, S. Murray, M. Muttur, S.K. Rai, J. Rueben, J.P. Smith, S. Warda, and A.L. Watkins.

How BNF publications are constructed

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual patients.

Information in the BNF has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts.

Hundreds of changes are made between print editions, and are published monthly in some digital formats. The most clinically significant updates are listed under Changes p. xv.

Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes doctors appointed by the BMJ Group, pharmacists appointed by the Royal Pharmaceutical Society, nursing and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers' Advisory Group

The Nurse Prescribers Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers' Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Editorial Team

BNF clinical writers have all worked as pharmacists and have a sound understanding of how drugs are used in clinical practice. Each clinical writer is responsible for editing, maintaining, and updating BNF content. During the publication cycle the clinical writers review information in the BNF against a variety of sources.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and then presented to the Joint Formulary Committee for consideration. Additionally, sections are regularly chosen for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect the current best practice.

Clinical writers prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking:

- advising on areas where the BNF diverges from summaries of product characteristics;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are routinely received for comment and for assimilation into the BNF.

Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics

The BNF receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seek independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers:
- careful validation of any areas of divergence of the BNF from the SPC before discussion by the Committee (in the light of supporting evidence);
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Expert advisers

The role of expert clinical advisers in providing the appropriate clinical context for all BNF information is discussed above.

Literature

Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

Systematic reviews

The BNF has access to various databases of systematic reviews (including the Cochrane Library and various web-

X BNF 70

based resources). These are used for answering specific queries, for reviewing existing text, and for constructing new text. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate RNF advice

Consensus guidelines

The advice in the BNF is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources

Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces *Martindale*: *The Complete Drug Reference*. The BNF has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Statutory information

The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

The BNF reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

Medicines and devices

NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in the BNF.

Comments from readers

Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry

Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF's presentation of the role of various drugs; this is yet another check on the balance of BNF's advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research

Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

Overview

The BNF is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

How to use the BNF

This edition of the BNF marks a fundamental change to the structure of the content. The changes have been made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For this print edition, the most notable changes include:

- Drug monographs where possible, all information that relates to a single drug is now contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug-class monographs where substantial amounts of information is common to all drugs within a drug class (e.g. macrolides, p. 469), a drug-class monograph has been created to contain the common information.
- Medicines categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF for Children, where drugs had different therapeutic uses in children.
- Appendix 4 the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions, p. 14.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This *How to Use the BNF* is key in introducing the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

Structure of the BNF

This new BNF broadly follows the high-level structure of previous editions:

Front matter, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations);

Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Respiratory disease, obstructive), with the treatment summaries first (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta₂-agonist bronchodilators) and then alphabetically within each classification (e.g. Aclidinium bromide, Glycopyrronium bromide, Ipratropium bromide).

Appendices, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturer's contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF

The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the *thumbnail*), alongside the chapter title. The top of the page includes the therapeutic use (the *running head*) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries; as well as the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types;

- an overview of delivering a drug to a particular body system (e.g. Skin conditions, management, p. 998),
- a comparison between a group or groups of drugs (e.g. Beta-adrenoceptor blocking drugs, p. 139).
- an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension, p. 121, or Malaria, prophylaxis, p. 528).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient's medical and drug history.

Monographs

Overview

In previous editions, a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems body systems. So, for example, codeine phosphate was found in chapter 1, for its antimotility effects and chapter 4 for its analgesic effects. However, the monograph in chapter 1 contained only the dose and some selected safety precautions.

In this new BNF all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate is now included in chapter 4. This

carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with previous editions, into the relevant chapters.

This means that the majority of drugs will still be placed in the same chapters and sections as previous editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

Nomenclature

Monograph titles follow the convention of recommended international non-proprietary names (rINNS), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. Ispaghula husk with senna, p. 54) or for drugs that are related to a class monograph (see Class monographs, below).

Indication and dose

User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore in this edition, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in previous editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In previous editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65th birthday, meaning that an age range of adult 18 to 64 is applicable to a patient from the day of their 18th birthday until the day before their 65th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight range of 35 to 59kg is

applicable to a patient as soon as they tip the scales at 35kg right up until, but not including, the point that the scales tip to 60kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

Other information relevant to Indication and dose
The dose panel also contains, where known, an indication
of pharmacokinetic considerations that may affect the
choice of dose, and dose equivalence information, which
may aid the selection of dose when switching between
drugs or preparations.

The BNF includes **unlicensed use** of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the 'off-label' use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

Minimising harm and drug safety

The drug chosen to treat a particular condition should minimise the patient's susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient's other diseases. To achieve this, the *Contra-indications, Cautions* and *Side-effects* of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient's quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia.

Clinically relevant *Side-effects* for drugs are included in the monographs or class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically. The frequency of side-effects follows the regulatory standard:

- Very common occurs more frequently than 1 in 10 administrations of a drug
- Common occurs between 1 in 10 and 1 in 100 administrations of a drug
- -Uncommon between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare occurs less than 1 in 10,000 administrations of a drug
- -Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions, when the information is included under *Allergy and cross sensitivity*.

The *Important safety advice* section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and

BNF 70 XIII

Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1 p. 1137, followed by details of drug interactions.

Use of drugs in specific patient populations

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under *Prescribing in Hepatic Impairment* p. 17, and *Prescribing in Renal Impairment* p. 17. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under *Hepatic impairment* and *Renal impairment* (e.g. fluconazole p. 518).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under *Prescribing in Pregnancy* p. 19 and *Prescribing in Breast-feeding* p. 19. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. asthma p. 210). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under *Pregnancy*, and *Breast-feeding* (e.g. fluconazole p. 518).

In this edition a new section, *Conception and contraception*, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1045) has been included.

Administration and monitoring

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir, p. 561). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A new *Directions for administration* section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl, p. 362).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The *Monitoring* section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline, p. 238). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin, p. 837), and this information is included in *Effects on laboratory tests*.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine, p. 137): these are covered under *Treatment cessation*.

Choice and supply

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see *Taking Medicines to Best Effect*, p. 1). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline, p. 496); this is shown in *Patient and carer advice*.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products may not be interchangeable e.g. Diltiazem, p. 149), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil, p. 698, or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride, p. 56).

Medicinal forms

In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient.

In previous editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations record. This information has now been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil), p. 40.

In the new BNF, the medicinal forms (formerly preparations) record provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement at the top of the monograph that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

Previously the BNF only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e. g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms (formerly Preparations) record. Details of these labels can be found in Appendix 3, p. 1291. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.

In the case of compound preparations, the prescribing information for all constituents should be taken into account

Prices in the BNF

Basic NHS net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Costeffective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs. uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (www.ppa.org.uk/systems/pcddbrowserv2_3new/browser.jsp). Prices have been calculated from the net cost used in pricing NHS prescriptions in June 2015 and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers. In Appendix 5 prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edt_intro.htm), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.dhsspsni.gov.uk/pas-tariff); prices in the different tariffs may vary.

Drug-class monographs

In previous editions of the BNF, information relating to a class of drug sharing the same properties (e.g. tetracyclines, p. 496), was contained within the prescribing notes. In this new edition, drug-class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag (e.g. Beta blockers, systemic, p. 140). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag (e.g. metoprolol, p. 144). Where the drug monographs run on from a class monograph no further cross referencing is given. However, occasionally, due to differences in the appearing use, the drug monograph may not directly follow the class monograph. In this situation the need to consider a class monograph is still indicated by a flag, but a cross reference is also provided to help navigate the user to the class monograph (e.g. sotalol, p. 93).

Other content

Nutrition

Appendix 2, p. 1260 includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Wound dressinas

A table on wound dressings in Appendix 4 (previously Appendix 5), p. 1294 allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix.

Advanced wound contact dressings have been classified in order of increasing absorbency.

Other useful information

Finding significant changes in the BNF

- Changes, p. xv, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently;
- Changes to the Dental Practitioners' Formulary, p. 27, are located at the end of the Dental List;
- —E-newsletter, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for enewsletters go to www.bnf.org.
- —An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cppe.ac.uk.

Using other sources for medicines information

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.

BNF 70 XV

Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

Significant changes

Significant changes made since release of data for the print edition of BNF 69 (March–September 2015):

Aceclofenac p. 916: updated cardiovascular advice—new contra-indications in certain established cardiovascular diseases [MHRA advice].

Apixaban p. 108 for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism [NICE guidance].

Axitinib p. 802 for treating advanced renal cell carcinoma after failure of prior systemic treatment [NICE guidance].

Codeine phosphate p. 360 for cough and cold: restricted use in children [MHRA advice].

Dabigatran etexilate p. 117 for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism [NICE guidance].

Diclofenac potassium p. 920, 12.5 mg tablets no longer available over the counter [MHRA advice].

Dimethyl fumarate p. 727: risk of lymphopenia and potential risk of progressive multifocal

leukoencephalopathy [MHRA advice].

Empagliflozin p. 610 in combination therapy for treating type 2 diabetes [NICE guidance].

Hydroxyzine hydrochloride p. 248: risk of QT interval prolongation and Torsade de Pointes [MHRA advice].

Infliximab p. 906, adalimumab p. 901 and golimumab p. 904 for treating moderately to severely active ulcerative colitis after the failure of conventional therapy [NICE guidance].

Obinutuzumab p. 739 in combination with chlorambucil for untreated chronic lymphocytic leukaemia [NICE guidance].

Ofatumumab p. 740 in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia [NICE guidance].

Omalizumab p. 235 for previously treated chronic spontaneous urticaria [NICE guidance].

Pomalidomide p. 797 for relapsed and refractory multiple myeloma previously treated with lenalidomide p. 796 and bortezomib p. 801 [NICE guidance].

Rivaroxaban p. 109 for preventing adverse outcomes after acute management of acute coronary syndrome [NICE guidance].

Rifaximin p. 495 for preventing episodes of overt hepatic encephalopathy {NICE guidance].

Simeprevir p. 548 in combination with peginterferon alfa p. 542 and ribavirin p. 545 for treating genotypes 1 and 4 chronic hepatitis C [NICE guidance].

Sofosbuvir p. 546 for treating chronic hepatits C [NICE guidance].

Ustekinumab p. 899 for treating active psoriatic arthritis [NICE guidance].

Dose changes

Changes in dose statements made since release of data for the print edition of BNF 69 (March–September 2015):

Eprosartan p. 133

Lisdexamfetamine mesilate p. 271 [dose in renal impairment]

Tetrastarch p. 854 [Volulyte®]

Tetrastarch p. 854 [Voluven®]

Tramadol hydrochloride p. 373 [oral dose for acute and chronic pain]

Classification changes

Classification changes made since release of data for the print edition of BNF 69 (March–September 2015):

New names

Name changes introduced since release of data for the print edition of BNF 69 (March–September 2015):

Deleted preparations

Preparations discontinued since release of data for the print edition of BNF 69 (March–September 2015):

Anafranil SR®

BindRen®

 $Brexidol^{@}$

Calcium-Sandoz[®] Calmurid HC[®]

Didronel®

Eporatio®

Fluarix ®

Froben®

Ortho-Gynest®

Penbritin® syrup

Pneumovax® II

Rienso®

Rupafin® Vantas®

Vistabel®

New preparations

New preparations included since release of data for the print edition of BNF 69 (March–September 2015)

Bydureon® pre-filled pen [exenatide p. 599]

DuoResp Spiromax® [budesonide with formoterol p. 229]

Envarsus® [tacrolimus p. 720]

Fostair NEXThaler® [beclometasone with formoterol p. 221]

Jaydess [®] [levonorgestrel p. 692]

Ketoconazole HRA® [ketoconazole p. 587]

Lonquex[®] [lipegfilgrastim p. 842] Salofalk[®] 1 g suppositories [mesalazine p. 34]

Guidance on prescribing

General guidance

Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy. when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Taking medicines to best effect

Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- · prescription not collected or not dispensed;
- · purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- patients' perception of the risk and severity of sideeffects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- · complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them ('concordance'). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient's acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician's instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Biosimilar medicines

A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and the biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed.

Biosimilar medicines have black triangle status at the time of initial marketing. It is important to report suspected

adverse reactions to biosimilar medicines using the Yellow Card Scheme. For biosimilar medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

Complementary and alternative medicine

An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John's wort). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles

In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles

Where non-proprietary ('generic') titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer's version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Nonproprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.

Proprietary titles

Names followed by the symbol® are or have been used as proprietary names in the United Kingdom, These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice

In general the doses, indications, cautions, contra-indications, and side-effects in the BNF reflect those in the manufacturers' data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from 'special-order' manufacturers or specialist importing companies.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF suggests a use (or route) that is outside the licensed indication of a product ('off-label' use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

Prescribing unlicensed medicines

Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber's professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient's carer that the prescribed medicine is unlicensed.

Oral syringes

An **oral syringe** is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The *5-mL spoon* is used for doses of 5 mL (or multiples thereof).

Important To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled 'Oral' or 'Enteral' in a large font size; it is the healthcare practitioner's responsibility to label the syringe with this information if the manufacturer has not done so.

Excipients

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as 'sugar-free' in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked 'sugar-free' since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on *selected preservatives* and *excipients* in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of *propylene glycol* in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 428 and metronidazole p. 475.

The *lactose* content in most medicines is too small to cause problems in most lactose-intolerant patients. However in

severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Important In the absence of information on excipients in the BNF and in the product literature (available at www. medicines.org.uk/emc), contact the manufacturer (see Index of Proprietary Manufacturers) if it is essential to check details.

Extemporaneous preparation

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

The BP direction that a preparation must be *freshly prepared* indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be *recently prepared* indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

Drugs and driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs-commonly abused drugs, including cannabis, cocaine, and ketamine p. 1110, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Amfetamines are also expected to be added to the legislation later in 2015. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride p. 332) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 340. However, the legislation provides a statutory "medical defence" for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine's patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/ collections/drug-driving.

Patents

In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters

Patent, their inclusion in this Formulary neither conveys. nor implies, licence to manufacture.

Health and safety

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home

Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable childresistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a childresistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted *medicines* by returning them to a supplier for destruction.

Labelling of prescribed medicines

There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the person dispensing the medicine:
- date of dispensing:
- name of the medicine:
- · directions for use of the medicine:
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words 'Keep out of the sight and reach of children';
- where applicable, the words 'Use this medicine only on vour skin'.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Non-proprietary names of compound preparations

Non-proprietary names of **compound preparations** which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix 'co-' should be retained. Special care should also be taken to avoid creating generic

names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.

EEA and Swiss prescriptions

Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing

authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

NICE and Scottish Medicines Consortium

Advice issued by the National Institute for Health and Care Excellence (NICE) is included in the BNF when relevant. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www. nice.org.uk and from www.scottishmedicines.org.uk.

Prescription writing

Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for **prescription-only medicines**. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² bodysurface area e.g. mg/m² where this would reduce error. The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber.
 In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg.
 Quantities of 1 gram or more should be written as 1 g etc.

Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g.
Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg.
When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL.
Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.

- 'Micrograms' and 'nanograms' should not be abbreviated. Similarly 'units' should not be abbreviated.
- The term 'millilitre' (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. (The use of capital 'L' in mL is a printing convention throughout the BNF; both 'mL' and 'ml' are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken 'as required' a minimum dose interval should be specified.

Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. '125 mg 3 times daily'); terms such as '5 mL' or '1 tablet' should be avoided except for compound preparations.

When doses other than multiples of 5 mL are prescribed for *oral liquid preparations* the dose-volume will be provided by means of an **oral syringe**, (except for preparations intended to be measured with a pipette). Suitable quantities:

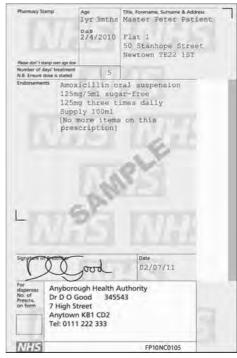

Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL

Adult Mixtures (10 mL dose), 200 or 300 mL

- Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer's pack)
- Eye Lotions, Gargles, and Mouthwashes, 200 mL

 The names of drugs and preparations should be written
- The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only; avoid creating generic titles for modified-release preparations).
- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated.
 - When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used, for details, see Inside Back Cover.

Sample prescription

Prescribing by dentists Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners' Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical

situation. There is no statutory requirement for the dentist to communicate with a patient's medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient's interest and such communication is to be encouraged.

Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

- 1 The computer must print out the date, the patient's surname, one forename, other initials, and address, and may also print out the patient's title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.
- The doctor's name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor's surgery address, reference number, and Primary Care Trust (PCT, Health Board in Scotland, Local Health Board in Wales.) are also necessary. In addition, the surgery telephone number should be printed.
- When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.
- 4 Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.
- 5 The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.
- The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.
- The BNF recommendations should be followed as listed above.
- 8 Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as 'as directed' and 'when required', the maximum daily dose should normally be specified.
- Numbers and codes used in the system for organising and retrieving data must never appear on the form.
- 10 Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.
- 11 A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as 'no more items on this prescription' may be added after the last item.

- Otherwise the doctor should delete the space
- 12 To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.
- 13 Handwritten alterations should only be made in exceptional circumstances-it is preferable to print out a new prescription. Any alterations must be made in the doctor's own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ♀, (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).
- 14 Prescriptions for controlled drugs can be printed from the computer, but the prescriber's signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).
- 15 The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient's name to appear at the top, but this should be preceded by 'confidential'.
- 16 În rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.
- 17 Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

- a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is
 - i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay:
 - ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
 - iii) as to the dose that it would be appropriate for the person to take:
- b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital p. 409, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
 - i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
 - ii) an oral contraceptive when a full cycle may be
 - iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
- c) that an entry shall be made by the pharmacist in the prescription book stating:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name and address of the patient;
 - iv) the nature of the emergency;
- d) that the container or package must be labelled to show:
 - i) the date of supply:
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name of the patient:
 - iv) the name and address of the pharmacy; v) the words 'Emergency supply';

 - vi) the words 'Keep out of the reach of children' (or similar warning):
- e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 409 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition). Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation.

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

- a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
- b) that the prescriber has undertaken to furnish a prescription within 72 hours:
- that the medicine is supplied in accordance with the directions of the prescriber requesting it;
- d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 409 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition): (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).
- e) that an entry shall be made in the prescription book stating:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength:
 - iii) the name and address of the practitioner requesting the emergency supply;
 - iv) the name and address of the patient:
 - v) the date on the prescription;
 - vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society's guidelines

- 1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
- 2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London Pharmaceutical Press, (always consult latest edition).

Controlled drugs and drug dependence

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

Class A includes: alfentanil p. 357, cocaine, diamorphine hydrochloride p. 361 (heroin), dipipanone hydrochloride, lysergide (LSD), methadone hydrochloride p. 436, methylenedioxymethamfetamine (MDMA, 'ecstasy'), morphine, opium, pethidine hydrochloride p. 372, phencyclidine, remifentanil p. 1108, and class B substances when prepared for injection.

Class B includes: oral amfetamines, barbiturates, cannabis, cannabis resin, codeine phosphate p. 360, ethylmorphine, glutethimide, ketamine p. 1110, nabilone p. 346, pentazocine p. 371 phenmetrazine, and pholcodine p. 259.

Class C includes: certain drugs related to the amfetamines such as benzfetamine and chlorphentermine, buprenorphine p. 434, diethylpropion, mazindol, meprobamate p. 265 pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 373, zaleplon p. 422, zolpidem tartrate p. 423, zopiclone p. 423, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatterm, and somatropin p. 642

The Misuse of Drugs Regulations 2001 (and subsequent amendments) define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

Schedule 1 includes drugs such as lysergide which is not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

Schedule 2 includes drugs such as diamorphine hydrochloride p. 361 (heroin), morphine p. 367, nabilone p. 346, remifentanil p. 1108, pethidine hydrochloride p. 372, secobarbital, glutethimide, the amfetamines, sodium oxybate and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

Schedule 3 includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine p. 434, diethylpropion, mazindol, meprobamate p. 265, midazolam p. 414, pentazocine p. 371, phentermine, temazepam p. 420, and tramadol hydrochloride p. 373. They are subject to the special prescription requirements (except for temazepam p. 420) and to the safe custody requirements (except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meprobamate p. 265, midazolam p. 414, pentazocine p. 371, phentermine, tramadol hydrochloride p. 373, or any stereoisomeric form or salts of the above). Records in registers do not need to

be kept (although there are requirements for the retention of invoices for 2 years).

Schedule 4 includes in Part I benzodiazepines (except temazepam p. 420 and midazolam p. 414, which are in Schedule 3), zaleplon p. 422, zolpidem tartrate p. 423, and zopiclone p. 423 which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 642. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

Schedule 5 includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Prescriptions

Preparations in Schedules 1, 2, 3, and 4 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for children using the following symbols:

CD1	for preparations in Schedule 1
CD2	for preparations in Schedule 2
CD3	for preparations in Schedule 3
CD4-1	for preparations in Schedule 4 (Part I)
CD4-2	for preparations in Schedule 4 (Part II)

The principal legal requirements relating to medical prescriptions are listed below.

Prescription requirements Prescriptions for Controlled Drugs that are subject to prescription requirements, (all preparations in Schedules 2 and 3, except temazepam p. 420), must be indelible, (a machine-written prescription is acceptable; the prescriber's signature must be handwritten), and must be signed by the prescriber, be dated, and specify the prescriber's address. The prescription must always state:

- the name and address of the patient;
- in the case of a preparation, the form, (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus or whether only one form is available), and where appropriate the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied:
- the dose (the instruction 'one as directed' constitutes a dose but 'as directed' does not);
- the words 'for dental treatment only' if issued by a dentist

A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (implementation date for *N. Ireland* not confirmed). Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and carers and delay in supplying the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription).

Instalments and 'repeats'

A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified. A total of 14 days' treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine p. 434, and diazepam p. 267 may be prescribed in England. In England, forms FP10(MDA) (blue) and FP10H(MDA) (blue) should be used. In Scotland, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In Wales a total of 14 days' treatment by instalment of any drug listed in Schedules 2-5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10(MDA) or form WP10HP(AD) should be used. Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Drug Misuse and Dependence: UK Guidelines on Clinical Management (2007), available at www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf. Prescriptions ordering 'repeats' on the same form are **not** permitted for Controlled Drugs in Schedules 2 or 3.

Private prescriptions

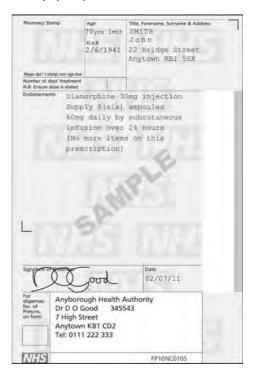

Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the *prescriber's identification number*. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Department of Health guidance

Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days' treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient's notes;
- the patient's identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.
 Further information is available at www.gov.uk/dh.

See sample prescription:

Dependence and misuse

The most serious drugs of addiction are cocaine,

diamorphine hydrochloride p. 361 (heroin), morphine

p. 367, and the synthetic opioids. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts. Despite marked reduction in the prescribing of amfetamines, there is concern that abuse of illicit amfetamine and related compounds is widespread. Benzodiazepines are commonly misused. However, the misuse of **barbiturates** is now uncommon, in line with declining medicinal use and consequent availability. Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. However, cannabis extract is licensed as a medicinal product. Lysergide (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-

There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine p. 1110 and gamma-hydroxybutyrate (sodium oxybate, GHB).

Supervised consumption

threatening.

Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment.

Prescribing drugs likely to cause dependence or misuse

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less ohvious
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect

prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs;
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

Travelling abroad

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at

www.gov.uk/controlled-drugs-licences-fees-andreturns or from the Home Office by contacting

licensing enquiry.aadu@homeoffice.gsi.gov.uk In cases of emergency, telephone (020) 7035 6330 Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient's name and address;
- the quantities of drugs to be carried:
- . the strength and form in which the drugs will be dispensed;
- the country or countries of destination;

 the dates of travel to and from the United Kingdom. Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, SW1P 4DF.

Alternatively, completed application forms can be emailed to dlcucommsofficer@homeoffice.gsi.gov.uk with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting. Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country's consulate in the UK.

Notification of patients receiving structured drug treatment for substance dependence

In **England**, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.nta.nhs.uk/ndtms.aspx.

Enquiries about NDTMS, and how to submit data, should initially be directed to:

Malcom Roxburgh, NTA Information Manager Tel: (020) 7972 1964 malcolm.roxburgh@nta-nhs.org.uk

In Scotland, doctors should report cases to the Substance Misuse Programme (SMP).

Tel: (0131) 275 6348

In Northern Ireland, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:

Dr Ian McMaster, C3 Castle Buildings Belfast BT4 3FQ Tel: (028) 9052 2421 Fax: (028) 9052 0718 ian.mcmaster@dhsspsni.gov.uk

Administrative contact:

Public Health Information & Research Branch Annex 2 Castle Building Belfast, BT4 3SO Tel: (028) 9052 2520

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement. In **Wales**, doctors should report cases where they are providing structured drug treatment for substance

dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substance.misuse-queries@wales.nhs.uk.

Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine hydrochloride p. 361, dipipanone (Diconal®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine hydrochloride p. 361, dipipanone, and cocaine for patients (including addicts) for relieving pain from organic disease or injury.

Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the BNF.

Send Yellow Cards to: FREEPOST YELLOW CARD (No other address details required). Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/ yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages. The following Yellow Card Centres can be contacted for further information:

YCCScotland@luht.scot.nhs.uk

The MHRA's database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

MHRA Drug Safety Update

Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.mhra.gov.uk/drugsafetyupdate.

Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/vellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/ vellowcard.

Prescription-event monitoring

In addition to the MHRA's Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit's educational material is available from www.dsru.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that all suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well

recognised, or if other drugs have been given at the same time

Established drugs and vaccines

Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including overthe-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are serious. medically significant, or result in harm. Serious reactions include those that are fatal, life-threatening, disabling, incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Medication errors

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices

Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF

The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers' literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness. In the product literature the frequency of side-effects is generally described as follows:

Description of the frequency of side-effects

Very common	greater than 1 in 10
Common	1 in 100 to 1 in 10
Uncommon [formerly 'less commonly' in BNF publications]	1 in 1000 to 1 in 100
Rare	1 in 10 000 to 1 in 1000
Very rare	less than 1 in 10 000

Special problems

Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 506 and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- warn the patient if serious adverse reactions are liable to occur.

Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient's medical practitioner may be necessary.

Oral mucosa Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in

Aspirin p. 104 tablets allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly essential oils, may sensitise the skin, but mucosal swelling is not usually prominent. The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 762. Other drugs capable of causing oral ulceration include ACE inhibitors, gold, nicorandil p. 185, NSAIDs, pancreatin p. 81, penicillamine p. 896, proguanil hydrochloride p. 539, and protease inhibitors. Erythema multiforme or Stevens-Johnson syndrome may follow the use of a wide range of drugs including antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs.

Lichenoid eruptions are associated with ACE inhibitors, NSAIDs methyldopa p. 138, chloroquine p. 536, oral antidiabetics, thiazide diuretics, and gold. Candidiasis can complicate treatment with antibacterials and immunosuppressants and is an occasional side-effect of corticosteroid inhalers.

Teeth and jaw *Brown staining* of the teeth frequently follows the use of chlorhexidine p. 989 mouthwash, spray or gel, but can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav p. 484 suspension. Intrinsic staining of the teeth is most commonly caused by tetracyclines. They will affect the teeth if given at any time from about the fourth month in utero until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey. Excessive ingestion of fluoride leads to dental fluorosis with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child's age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with cancer receiving bevacizumab p. 736 or sunitinib p. 817 may also be at risk of osteonecrosis of the jaw.

Periodontium Gingival overgrowth (gingival hyperplasia) is a side-effect of phenytoin p. 398 and sometimes of ciclosporin p. 717 or of nifedipine p. 154 (and some other calcium-channel blockers).

Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands The most common effect that drugs have on the salivary glands is to reduce flow (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly antimuscarinics (anticholinergics), antidepressants (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), alpha-blockers, antihistamines, antipsychotics, baclofen p. 914, bupropion hydrochloride p. 433, clonidine hydrochloride p. 137, 5HT agonists, opioids, and tizanidine p. 913. Excessive use of diuretics can also result in xerostomia. Some drugs (e.g. clozapine p. 313, neostigmine p. 912) can increase saliva production but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some antihypertensives (e.g. clonidine hydrochloride p. 137, methyldopa p. 138) and with vinca alkaloids. Swelling of the salivary glands can occur with iodides, antithyroid drugs, phenothiazines, and sulfonamides.

Taste There can be *decreased* taste acuity or *alteration* in taste sensation. Many drugs are implicated, including amiodarone hydrochloride p. 88, calcitonin, ACE inhibitors, carbimazole p. 664, clarithromycin p. 470, gold, griseofulvin p. 1012, lithium salts, metformin hydrochloride p. 594, metronidazole p. 475, penicillamine p. 896, phenindione p. 120, propafenone hydrochloride p. 92, protease inhibitors, terbinafine p. 514, and zopiclone p. 423.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the nonproprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre Medicines and Healthcare products Regulatory Agency 151 Buckingham Palace Road London SW1W 9SZ Tel: (020) 3080 6588 info@mhra.gsi.gov.uk

Guidance on intravenous infusions

Intravenous additives policies

A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any
 infusion container and the components should be
 compatible. Ready-prepared solutions should be used
 whenever possible. Drugs should not normally be added
 to blood products, mannitol, or sodium bicarbonate.
 Only specially formulated additives should be used with
 fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the
 patient's name, the name and quantity of additives, and
 the date and time of addition (and the new expiry date
 or time). Such additional labelling should not interfere
 with information on the manufacturer's label that is
 still valid. When possible, containers should be retained
 for a period after use in case they are needed for
 investigation.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of

drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

and aneigenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as $Vitlipid\ N^{\circ}$ may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

Method

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously. any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5). When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. Potassium chloride is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers: if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24-48 mL) of sodium chloride intravenous infusion (0.9%).

Information provided in the BNF

The BNF gives information about preparations given by three methods:

- · continuous infusion:
- intermittent infusion:
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted. Drugs that are both compatible and clinically suitable may be given by intermittent infusion in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes

Addition via the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided

that the preparation is compatible with the infusion fluid when given in this manner.

Drugs given by intravenous infusion The BNF includes information on addition of drugs to Glucose intravenous infusion 5 and 10%, and Sodium chloride intravenous infusion 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with Sodium chloride and glucose intravenous infusion. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

Prescribing for children

For detailed advice on medicines used for children, consult *BNF for Children*.

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be **avoided** in children because they are painful. Where possible, medicines for children should be prescribed

within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications ('off-label' use) is often necessary in paediatric practice.

Adverse drug reactions in children

Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are: • serious, medically significant or result in harm.

- Serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation:
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults:
- drugs may not have been extensively tested in children:
- many drugs are not specifically licensed for use in children and are used either 'off-label' or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit's Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the

NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an **oral syringe** will be supplied. Parents should be advised not to add any medicines to the infant's feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep **all** medicines out of reach of children.

Rare paediatric conditions

Information on substances such as *biotin* and *sodium benzoate* used in rare metabolic conditions is included in *BNF for Children*; further information can be obtained from:

Alder Hey Children's Hospital

Drug Information Centre Liverpool L12 2AP Tel: (0151) 252 5381

Great Ormond Street Hospital for Children

Pharmacy Great Ormond St London WC1N 3JH Tel: (020) 7405 9200

Dosage in children

Children's doses in the BNF are stated in the individual drug entries or a cross-reference is provided to *BNF for Children*. Doses are generally based on body-weight (in kilograms) or specific age ranges, e.g. first month (neonate), 1–5 years, 6–11 years, 12–17 years.

Dose calculation

Many children's doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child's dose); occasionally, the doses have been standardised by body surface area (in m²). These methods should be used rather than attempting to calculate a child's dose on the basis of doses used in adults. For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, dose should be calculated from an ideal weight, related to height and age.

Body surface area (BSA) estimates are sometimes preferable to body-weight for calculation of paediatric doses

since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to BNF for Children. Where the dose for children is not stated, prescribers should consult BNF for Children or seek advice from a medicines information centre.

Dose frequency

Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child's hedtime.

Where new or potentially toxic drugs are used, the manufacturers' recommended doses should be carefully

Prescribing in hepatic impairment

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

Impaired drug metabolism

Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired.

A few drugs, e.g. rifampicin p. 508 and fusidic acid p. 463, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive

Hypoproteinaemia

The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 398 and prednisolone p. 585.

Reduced clotting

Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin sodium p. 121 and phenindione p. 120.

Hepatic encephalopathy

In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

Fluid overload

Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

Hepatotoxic drugs

Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Prescribing in renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Principles of dose adjustment in renal impairment

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity. For many drugs with only minor or no dose-related sideeffects very precise modification of the dose regimen is

unnecessary and a simple scheme for dose reduction is sufficient. For more toxic drugs with a small safety margin or patients

at extremes of weight, dose regimens based on creatinine clearance should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted

according to clinical response and plasma-drug concentration.

Renal function declines with age; many elderly patients have renal impairment but, because of reduced muscle mass, this may not be indicated by a raised serum creatinine. It is wise to assume at least mild impairment of renal function when prescribing for the elderly. The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the halflife of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function.

Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced.

Dose recommendations are based on the severity of renal impairment.

Renal function is measured either in terms of estimated **glomerular filtration rate** (eGFR) calculated from a formula derived from the Modification of Diet in Renal Disease study ('MDRD formula' that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as **creatinine clearance** (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG).

Cockcroft and Gault Formula

Estimated Creatinine Clearance = (140 - Age) x Weight x Constant in mL/minute Serum creatinine

Age in years Weight in kilograms; use ideal body-weight Serum creatinine in micromol/litre Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a **rough guide** to drug dosing.

Important Renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m² and derived from the Modification of Diet in Renal Disease (MDRD) formula. However, published information on the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR).

The information on dosage adjustment in the BNF is expressed in terms of eGFR, rather than creatinine clearance, for most drugs (exceptions include toxic drugs and patients at extremes of weight). Although the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD 'formula') can be used to determine dosage adjustments in place of creatinine clearance. An individual's absolute glomerular filtration rate can be calculated from the eGFR as follows:

GFR Absolute = eGFR x (individual's body surface area/1.73)

Toxic drugs For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages in

addition to plasma-drug concentration and clinical response.

Patients at extremes of weight In patients at both extremes of weight (BMI of less than 18.5 kg/ $\rm m^2$ or greater than 30 kg/m²) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages. In the BNF, values for eGFR, creatinine clearance (for toxic drugs), or another measure of renal function are included where possible. However, where such values are not available, the BNF reflects the terms used in the published information.

Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:

,		
Degree of impairment	eGFR mL/minute/1.73 m ²	
Normal - Stage 1	More than 90 (with other evidence of kidney damage)	
Mild - Stage 2	60-89 (with other evidence of kidney damage)	
Moderate ¹ - Stage 3	30-59	
Severe - Stage 4	15-29	
Established renal failure - Stage 5	Less than 15	
 NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3A eGFR 45-59, Stage 3B eGFR 30-44 		

Dialysis

For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

Drug prescribing should be kept to the minimum in all patients with severe renal disease.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing **any** drug which requires dose modification. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Prescribing in pregnancy

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the *first trimester* drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery. Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development. The BNF and BNF for Children identifies drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in

maternal physiology but this is beyond the scope of the BNF and BNF for Children.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and BNF for

Important Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service.www.uktis.org. Tel: 0844 892 0909 (09.00-17:00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics):
- the nature of the effect of the drug on the infant

(pharmacodynamic properties of the drug in the infant). The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction. A clinical effect can occur in the infant if a

pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 180), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity. Some drugs inhibit the infant's sucking reflex (e.g. phenobarbital p. 409) while others can affect lactation

(e.g. bromocriptine p. 333).

The BNF identifies drugs:

- · that should be used with caution or are contraindicated in breast-feeding:
- that can be given to the mother during breastfeeding because they are present in milk in amounts which are too small to be harmful to the infant:
- that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding. this is indicated under the relevant drug in the BNF.

Important

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.

Prescribing in palliative care

Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain management in palliative care is focused on achieving

Pain

control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 354, NSAID), opioid (e.g. codeine phosphate p. 360 'weak', morphine p. 367 'strong') and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly. Paracetamol or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate or tramadol hydrochloride p. 373 can be considered for moderate pain. If these preparations do not control the pain then morphine is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine p. 434, transdermal fentanyl p. 362, hydromorphone hydrochloride p. 366, methadone hydrochloride p. 436, or oxycodone hydrochloride p. 369. should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological

Bone metastases In addition to the above approach, radiotherapy, **bisphosphonates**, and radioactive isotopes of strontium ranelate p. $626 \, (Metastron^{\circ})$ available from GE Healthcare) may be useful for pain due to bone metastases.

dependence (addiction).

Neuropathic pain Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 392 and pregabalin p. 400 are licensed for neuropathic pain. Ketamine p. 1110 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 947, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route Treatment with morphine p. 367 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified- release preparation 12-hourly, in addition to rescue doses.

If pain occurs between regular doses of morphine ('breakthrough pain'), an additional dose ('rescue dose') of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl p. 362 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures. Morphine immediate-release 30mg 4-hourly (or modifiedrelease 100 mg 12-hourly) is usually adequate for most patients; some patients require morphine immediaterelease up to 200mg 4-hourly (or modified-release 600 mg 12-hourly), occasionally more is needed. Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modifiedrelease preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 367. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 369 can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

Equivalent doses of opioid analgesics

This table is only an approximate guide (doses may not correspond with those given in clinical practice); patients should be carefully monitored after any change in medication and dose titration may be required

Analgesic	Route	Dose
Codeine	PO	100 mg
Diamorphine	IM, IV, SC	3 mg
Dihydrocodeine	P0	100 mg
Hydromorphone	P0	2 mg
Morphine	P0	10 mg
Morphine	IM, IV, SC	5 mg
Oxycodone	P0	6.6 mg
Tramadol	P0	100 mg

PO = by mouth: IM = intramuscular: IV = intravenous:

SC = subcutaneous

Parenteral route The equivalent parenteral dose of morphine p. 367 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 361 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine hydrochloride is about one-third of the oral dose of morphine.

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine hydrochloride, see table above of approximate equivalent doses of morphine and diamorphine hydrochloride. The infusion is discontinued when the first oral dose of morphine is given.

Rectal route Morphine p. 367 is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride suppositories p. 369 can be obtained on special order.

Transdermal route Transdermal preparations of fentanyl p. 362 and buprenorphine p. 434 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine p. 434 and fentanyl p. 362 (inappropriate use has caused fatalities). Immediate-release morphine can be given for breakthrough

The following 24-hour oral doses of morphine are considered to be approximately equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

morphine salt 12 mg daily	=	BuTrans [®] '5' patch	7-day patches
morphine salt 24 mg daily	=	BuTrans [®] '10' patch	7-day patches
morphine salt 48 mg daily	=	BuTrans [®] '20' patch	7-day patches
morphine salt 84 mg daily	=	Transtec® '35' patch	4-day patches
morphine salt 126 mg daily	=	<i>Transtec</i> ® '52.5' patch	4-day patches
morphine salt 168 mg daily	=	<i>Transtec</i> ® '70' patch	4-day patches

Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral

72-hour Fentanyl patches are approximately equivalent to the following 24-hour doses of oral morphine

morphine salt 30 mg daily	=	fentanyl '12' patch
morphine salt 60 mg daily	=	fentanyl '25' patch
morphine salt 120 mg daily	=	fentanyl '50' patch
morphine salt 180 mg daily	=	fentanyl '75' patch
morphine salt 240 mg daily	=	fentanyl '100' patch

Fentanyl equivalences in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate release opioid for only several weeks, see Transdermal Route above. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral

Symptom control

Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone p. 979 or dexamethasone p. 947.

Bowel colic and excessive respiratory secretions Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide p. 344, hyoscine butylbromide p. 73, or glycopyrronium bromide p. 1100. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid p. 95 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 95 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 196 can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver

disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K (see phytomenadione p. 889) should be considered.

Constipation Constipation is a common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer p. 52) or lactulose p. 47 solution with a senna p. 53 preparation should be used. Methylnaltrexone bromide p. 47 is licensed for the treatment of opioid-induced constipation.

Convulsions Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 398 or carbamazepine p. 387 should be considered. When oral medication is no longer possible, diazepam p. 267 given rectally, or phenobarbital p. 409 by injection is continued as prophylaxis. For the use of midazolam p. 414 by subcutaneous infusion using a continuous infusion device see below.

Dry mouth Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 997 or miconazole p. 997, alternatively, fluconazole p. 518 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

Dysphagia A corticosteroid such as dexamethasone p. 947 may help, temporarily, if there is an obstruction due to tumour. See also *Dry mouth*, above.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine p. 367 in carefully titrated doses. Diazepam p. 267 may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone p. 947, may also be helpful if there is bronchospasm or partial obstruction.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 475 is often required to reduce malodour but topical metronidazole is also used.

Gastro-intestinal pain The pain of bowel colic may be reduced by loperamide hydrochloride p. 56. Hyoscine hydrobromide may also be helpful, given sublingually as *Kwells* * tablets. Subcutaneous injections of hyoscine butylbromide p. 73, hyoscine hydrobromide p. 344, and glycopyrronium bromide p. 1100 can also be used to treat bowel colic.

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent and a prokinetic such as domperidone p. 346 before meals.

Hiccup Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent. If this fails, metoclopramide hydrochloride p. 347 by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen p. 914, or nifedipine p. 154, or chlorpromazine hydrochloride p. 304 can be tried.

Insomnia Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 420, may be useful.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 367. Methadone hydrochloride p. 436 linctus

should be avoided because it has a long duration of action and tends to accumulate.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 267 or baclofen p. 914.

Nausea and vomiting Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. A prokinetic antiemetic may be a preferred choice for first-line therapy.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 306 or metoclopramide hydrochloride p. 347. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide hydrochloride has a prokinetic action and

is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently. Haloperidol is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 343 is given by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness. Levomepromazine p. 345 is used as an antiemetic; it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 947 by mouth can be used as an adjunct. Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below. For the treatment of nausea and vomiting associated with cancer chemotherapy see Cytotoxic drugs p. 744.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of colestyramine p. 173).

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 947 and should be given before 6 p.m. to reduce the risk of insomnia.

Restlessness and confusion Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 306 or levomepromazine p. 345, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device. Levomepromazine is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).

Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:

- the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma
- there is malignant bowel obstruction in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube)
- occasionally when the patient *does not wish* to take regular medication by mouth.

Syringe driver rate settings Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

Bowel colic and excessive respiratory secretions Hyoscine hydrobromide p. 344 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation).

Hyoscine butylbromide p. 73 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide.

Glycopyrronium bromide p. 1100 may also be used to treat bowel colic or excessive respiratory secretions.

Confusion and restlessness Haloperidol p. 306 has little sedative effect.

Levomepromazine p. 345 has a sedative effect. Midazolam p. 414 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam is also used for myoclonus.

Convulsions If a patient has previously been receiving an antiepileptic drug *or* has a primary or secondary cerebral tumour *or* is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*.

Nausea and vomiting Haloperidol p. 306 and levomepromazine p. 345 can both be given as a subcutaneous infusion but sedation can limit the dose of levomepromazine.

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below)

metoclopramide hydrochloride p. 347 can cause skin reactions

Octreotide p. 789, which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion to reduce intestinal secretions and to reduce vomiting due to bowel obstruction.

Pain control Diamorphine hydrochloride p. 361 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table shows approximate equivalent doses of morphine p. 367 and diamorphine hydrochloride.

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 304, prochlorperazine p. 309, and diazepam p. 267 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 343 and levomepromazine p. 345 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 953) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by *subcutaneous infusion* in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections* or *physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation). The following can be mixed with *diamorphine*:

- Cyclizine, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- Dexamethasone, special care is needed to avoid precipitation of dexamethasone when preparing it.
- Haloperidol, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- Hyoscine butylbromide
- Hyoscine hydrobromide
- Levomepromazine
- Metoclopramide, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs *too quickly* check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed:
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

These equivalences are approximate only and should be adjusted according to response

MORPHINE		PARENTERAL DIAMORPHINE
Oral morphine sulfate	Subcutaneous infusion of morphine sulfate	Subcutaneous infusion of diamorphine hydrochloride
over 24 hours	over 24 hours	over 24 hours
30 mg	15 mg	10 mg
60 mg	30 mg	20 mg
90 mg	45 mg	30 mg
120 mg	60 mg	40 mg
180 mg	90 mg	60 mg
240 mg	120 mg	80 mg
360 mg	180 mg	120 mg
480 mg	240 mg	160 mg
600 mg	300 mg	200 mg
780 mg	390 mg	260 mg
960 mg	480 mg	320 mg
1200 mg	600 mg	400 mg

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection *subcutaneously*—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

Prescribing for the elderly

Old people, especially the very old, require special care and consideration from prescribers. Medicines for Older People, a component document of the National Service Framework for Older People (Department of Health. National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing

Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients' medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and lightheadedness when associated with social stress as in widowhood, loneliness, and family dispersal, In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

Form of medicine

Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing

In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity

The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics. benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

Pharmacokinetics

Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients.

The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 94) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract

infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions

Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquillisers) and postural hypotension and falls (with diuretics and many psychotropics).

Hypnotics

Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech. and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs

Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the increased susceptibility of the elderly to the sideeffects of NSAIDs the following recommendations are made:

- for osteoarthritis, soft-tissue lesions, and back pain, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick:
- for osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis, paracetamol p. 354 should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen p. 927 up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given:
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol p. 354;
- · do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary see. NSAID-associated ulcers under Peptic ulceration p. 61.

Other drugs

Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin p. 94. The usual maintenance dose of digoxin p. 94 in very old patients is 125 micrograms daily

(62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily.

Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 461, mianserin

hydrochloride p. 290) should be avoided unless there is no acceptable alternative.

The elderly generally require a lower maintenance dose of warfarin sodium p. 121 than younger adults; once again, the outcome of bleeding tends to be more serious.

Guidelines

Always consider whether a drug is indicated at all.

Limit range It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

Reduce dose Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 611) should be avoided altogether.

Review regularly Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

Simplify regimens Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

Explain clearly Write full instructions on every prescription (*including* repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like 'as directed'. Child-resistant containers may be unsuitable.

Repeats and disposal Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

Drugs and sport

UK Anti-Doping, the national body responsible for the UK's anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. An advice card listing examples of permitted and prohibited substances is available from:

UK Anti-doping Oceanic House 1a Cockspur Street London SW1Y 5BG Tel: (020) 7766 7350 information@ukad.org.uk www.ukad.org.uk

General Medical Council's advice Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual's performance in sport contravene the GMC's guidance, and such actions would usually raise a question of a doctor's continued registration. This does not preclude the provision of any care or treatment where the doctor's intention is to protect or improve the patient's health.

Prescribing in dental practice

Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF.

The following is a list of topics of particular relevance to

General guidance

Prescribing by dentists, see Prescription writing p. 4 Oral side-effects of drugs, see Adverse reactions to drugs p. 11

Medical emergencies in dental practice (below) Medical problems in dental practice p. 30

Drug management of dental and oral conditions Dental and orofacial pain, see Analgesics p. 352

Neuropathic pain p. 382

Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 352

Opioid analgesics, see Analgesics p. 352

Non-steroidal anti-inflammatory drugs p. 915

Oral infections

Bacterial infections, see Antibacterials, principles of therapy p. 438

Phenoxymethylpenicillin p. 481

Broad-spectrum penicillins (amoxicillin p. 482 and ampicillin p. 483)

Cephalosporins (cefalexin p. 456 and cefradine p. 458) Tetracyclines p. 496

Macrolides (clarithromycin p. 470, erythromycin p. 471 and azithromycin p. 955)

Clindamycin p. 467

Metronidazole p. 475

Fusidic acid p. 956

Fungal infections

Local treatment, Oropharyx infections, fungal p. 996 Systemic treatment, Antifungals, systemic use p. 512 Viral infections

Herpetic gingivostomatitis, local treatment, see

Herpes labialis

Anaesthetics, anxiolytics and hypnotics

Anaesthesia, sedation, and resuscitation in dental practice p. 1094

Hypnotics, see Hypnotics and anxiolytics p. 416 Sedation for dental procedures, see Hypnotics and anxiolytics p. 416

Local anaesthesia p. 1111

Oral ulceration and inflammation p. 992 Mouthwashes, gargles and dentifrices, see Mouthwashes and other preparations for oropharyngeal use p. 989

Dry mouth, see Treatment of dry mouth p. 987 Aromatic inhalations, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258

Nasal decongestants, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258

Dental Practitioners' Formulary p. 1320

Changes to Dental Practitioners' Formulary, see Dental Practitioners' Formulary p. 1320

Medical emergencies in dental practice

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also algorithm of the procedure for Cardiopulmonary resuscitation p. 195.

The drugs referred to in this section include:

Adrenaline/epinephrine Injection, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amps p. 196 Aspirin Dispersible Tablets 300 mg p. 104

Glucagon Injection, glucagon (as hydrochloride), 1-unit vial (with solvent) p. 618

Glucose (for administration by mouth) p. 852

Glyceryl trinitrate Spray p. 190

Midazolam Oromucosal Solution, midazolam 5 mg/mL p. 414

Oxygen

Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation p. 222

Adrenal insufficiency

Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see also Adrenal suppression for details of corticosteroids (systemic) p. 579 cover before dental surgical procedures under general anaesthesia).

Management

- Lay the patient flat
- Give oxygen
- · Transfer patient urgently to hospital

Anaphylaxis

A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

Symptoms and signs

- · Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

Management

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 196. This is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if

necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. **Oxygen** administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

Asthma

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient's short-acting beta2 agonist inhaler such as salbutamol 100 micrograms/puff p. 222; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, oxygen should be given with salbutamol 5 mg or terbutaline sulfate 10 mg p. 225 by nebuliser; if a nebuliser is unavailable, then 2-10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10-20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline/epinephrine p. 196 (as detailed under Anaphylaxis) should be given. Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient's medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

Cardiac emergencies

If there is a history of *angina* the patient will probably carry **glyceryl trinitrate** spray or tablets p. 190 (or **isosorbide dinitrate** tablets p. 191) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient's own medication. See also Coronary Artery Disease p. 29.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers p. 30. The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged.

Symptoms and signs of myocardial infarction

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

Initial management of myocardial infarction

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. **Oxygen** may be administered.

Sublingual glyceryl trinitrate p. 190 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin p. 104 in a single dose of

300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see Management of ST-Segment Elevation Myocardial Infarction p. 186.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 195.

Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

Management

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give **oxygen** to support respiration if necessary.

Do not attempt to restrain convulsive movements. After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway

After the convulsion the patient may be confused ('postictal confusion') and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred. Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Midazolam oromucosal solution p. 414 can be given by the buccal route in adults as a single dose of 10 mg [unlicensed]. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see Drugs used in status epilepticus (Epilepsy p. 383). Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

Hvpoglycaemia

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

Symptoms and signs

- Shaking and trembling
- Sweating

- · 'Pins and needles' in lips and tongue
- Palpitation
- Headache (occasionally)
- Double vision
- · Difficulty in concentration
- · Slurring of speech
- Confusion
- Change of behaviour: truculence
- Convulsions
- Unconsciousness

Management

Initially glucose 10-20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 55 mL, Coca- Cola® 100 mL, Ribena® Blackcurrant 19 mL (to be diluted), 2 teaspoons sugar, and also from 3 sugar lumps (Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia). If necessary this may be repeated in 10-15 minutes. If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, glucagon 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia

Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs

- Patient feels faint
- · Low blood pressure
- · Pallor and sweating

is caused by an oral antidiabetic drug.

- · Yawning and slow pulse
- Nausea and vomiting Dilated pupils
- Muscular twitching

Management

- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- · Loosen any tight clothing around the neck
- · Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes

Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.

Adrenal insufficiency or arrhythmias are other possible causes of syncope.

Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition.

If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient's general practitioner or hospital consultant.

Allergy

Patients should be asked about any history of allergy: those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk-it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis p. 242.

Arrhythmias

Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient's medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 420) may be useful in some instances for very anxious patients.

See also Cardiac emergencies and Dental Anaesthesia (Local anaesthesia p. 1111).

Cardiac prostheses

For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis p. 29. For advice on patients receiving anticoagulants, see Thromboembolic disease p. 30.

Coronary artery disease

Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient's medical practitioner before commencing treatment. See also Cardiac Emergencies p. 28. Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 106, or dipyridamole p. 107 should not be stopped routinely nor should the dose be altered before dental

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease

Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension

procedures

Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Local anaesthesia p. 1111).

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters

Infective endocarditis

While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine p. 989 mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteraemia Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- · need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of 'spontaneous' bacteraemia.

Postoperative care Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy

For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease (below).

Joint prostheses

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Pacemakers

Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer's literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

A Working Party of the British Society for Antimicrobial Chemotherapy does not recommend antibacterial prophylaxis for patients with pacemakers.

Thromboembolic disease

Patients receiving a heparin or an oral anticoagulant such as warfarin sodium p. 121, acenocoumarol p. 120 (nicoumalone), phenindione p. 120, apixaban p. 108, dabigatran etexilate p. 117 or rivaroxaban p. 109 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed. For a patient requiring long-term therapy with warfarin sodium, the patient's medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin sodium, the advice of the clinician responsible for the patient's anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are contra-indicated in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully. A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine p. 387, imidazole and triazole antifungals (including miconazole p. 1011), erythromycin p. 471, clarithromycin p. 470, and metronidazole p. 475; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction. common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin p. 483 or amoxicillin p. 482. Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/ alerts-and-directives/alerts/anticoagulant.

Liver disease

Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy. For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 17. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists.

For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 17. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester.

For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 19. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant. For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 19. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

1 Chronic bowel disorders

Chronic bowel disorders

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Clostridium difficile infection

Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin, amoxicillin, co-amoxiclav, second- and third-generation cephalosporins, clindamycin, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole p. 475, vancomycin p. 465, and fidaxomicin p. 468.

Diverticular disease

Diverticular disease is treated with a high-fibre diet, bran supplements, and bulk-forming drugs. Antispasmodics may provide symptomatic relief when colic is a problem. Antibacterials are used only when the diverticula in the intestinal wall become infected. Antimotility drugs which slow intestinal motility, e.g. codeine phosphate p. 360, diphenoxylate, and loperamide hydrochloride p. 56 could possibly exacerbate the symptoms of diverticular disease and are contra-indicated.

Irritable bowel syndrome

Irritable bowel syndrome can present with pain, constipation, or diarrhoea. In some patients there may be important psychological aggravating factors which respond to reassurance and possibly specific treatment e.g. with an antidepressant.

The **fibre** intake of patients with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. ispaghula husk p. 45, sterculia p. 46, or oats) is recommended; insoluble fibre (e.g. bran) may exacerbate symptoms and its use should be discouraged. A **laxative** can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred;

lactulose p. 47 may cause bloating. Linaclotide p. 40 is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. Stimulant laxatives should be avoided or used only occasionally. Loperamide hydrochloride p. 56 may relieve diarrhoea and antispasmodic drugs may relieve pain. Opioids with a central action, such as codeine phosphate p. 360, are better avoided because of the risk of dependence.

A tricyclic antidepressant can be used for abdominal pain or discomfort [unlicensed indication] in patients who have not responded to laxatives, loperamide hydrochloride p. 56, or antispasmodics. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Malabsorption syndromes

Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatin supplements.

See further information on foods for special diets (ACBS), see Borderline substances p. 1260.

1.1 Inflammatory bowel disease

Inflammatory bowel disease

Chronic inflammatory bowel diseases include *ulcerative colitis* and *Crohn's disease*. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide sodium p. 34, mesalazine p. 34, olsalazine sodium p. 37, and sulfasalazine p. 37), corticosteroids (hydrocortisone p. 583, beclometasone dipropionate p. 38, budesonide p. 38, and prednisolone p. 585), and drugs that affect the immune response are used in the treatment of inflammatory bowel disease.

Treatment of acute ulcerative colitis and Crohn's disease Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid is treated initially with local application of an aminosalicylate; alternatively, a local corticosteroid can be used but it is less effective. A combination of a local aminosalicylate and a local

1

corticosteroid can be used for proctitis that does not respond to a local aminosalicylate alone. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the proximal colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone for 4-8 weeks. Modified-release budesonide is licensed for Crohn's disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. Beclometasone dipropionate by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease or disease that is not responding to an oral corticosteroid requires hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone p. 583 or methylprednisolone p. 584); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous ciclosporin p. 717 [unlicensed indication]. Patients with unresponsive or chronically active Crohn's disease may benefit from azathioprine p. 716. mercaptopurine p. 762 [unlicensed indication], or onceweekly methotrexate p. 762 [unlicensed indication]; these drugs have a slower onset of action.

Infliximab p. 906 is licensed for the management of severe active Crohn's disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of

Adalimumab p. 901 is licensed for the treatment of severe active Crohn's disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them. For inducing remission, adalimumab can be used in combination with a corticosteroid, but it may be given alone if a corticosteroid is inappropriate or is not tolerated. Adalimumab may also be used for Crohn's disease in patients who have relapsed while taking infliximab or who cannot tolerate infliximab because of hypersensitivity reactions.

Golimumab p. 904 is licensed for the treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it.

Vedolizumab p. 39 is licensed for the treatment of moderate to severe active Crohn's disease and ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor.

Maintenance of remission of acute ulcerative colitis and Crohn's disease

Smoking cessation reduces the risk of relapse in Crohn's disease and should be encouraged. Aminosalicylates are efficacious in the maintenance of remission of ulcerative colitis, but there is no evidence of efficacy in the maintenance of remission of Crohn's disease. Corticosteroids are not suitable for maintenance treatment because of their side-effects. In resistant or frequently

relapsing cases either azathioprine p. 716 or

mercaptopurine p. 762 [unlicensed indication], given under close supervision may be helpful. Methotrexate p. 762 is tried in Crohn's disease if azathioprine or mercaptopurine cannot be used [unlicensed indication]. Maintenance therapy with infliximab p. 906 should be considered for patients with Crohn's disease or ulcerative colitis who respond to the initial induction course of infliximab; fixedinterval dosing is superior to intermittent dosing. Adalimumab p. 901 is licensed for maintenance therapy in Crohn's disease and ulcerative colitis. Golimumab p. 904 is licensed for maintenance therapy in ulcerative colitis.

Fistulating Crohn's disease

Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole p. 475 or ciprofloxacin p. 490 can improve symptoms of fistulating Crohn's disease but complete healing occurs rarely [unlicensed indication]. Metronidazole is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine p. 716 or mercaptopurine p. 762 is used as a second-line treatment for fistulating Crohn's disease and continued for maintenance [unlicensed indication]. Infliximab p. 906 is used for fistulating Crohn's disease refractory to conventional treatments: fixed-interval dosing is superior to intermittent dosing. Maintenance therapy with infliximab should be considered for patients who respond to the initial induction course of infliximab. Adalimumab p. 901 can be used if there is intolerance to infliximab p. 906 [unlicensed indication].

Adjunctive treatment of inflammatory bowel disease Due attention should be paid to diet; high-fibre or lowresidue diets should be used as appropriate.

Antimotility drugs such as codeine phosphate p. 360 and loperamide hydrochloride p. 56, and antispasmodic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. An osmotic laxative, such as a macrogol, may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine p. 173, which binds bile salts.

Drugs used in chronic bowel disorders

Aminosalicylates

Sulfasalazine p. 37 is a combination of 5-aminosalicylic acid ('5-ASA') and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes sideeffects. In the newer aminosalicylates, mesalazine p. 34 (5-aminosalicylic acid), balsalazide sodium p. 34 (a prodrug of 5-aminosalicylic acid) and olsalazine sodium p. 37 (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

Drugs affecting the immune response

Azathioprine p. 716, ciclosporin p. 717, mercaptopurine p. 762, and methotrexate p. 762 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 836 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate: alternative regimens may be used in some settings.

Cvtokine modulators

Infliximab p. 906, adalimumab p. 901, and golimumab p. 904 are monoclonal antibodies which inhibit the proinflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used

AMINOSALICYLATES

Aminosalicylates

- SIDE-EFFECTS
- ▶ Rare Acute pancreatitis · agranulocytosis · alopecia · aplastic anaemia · arthralgia · blood disorders · eosinophilia · fibrosing alveolitis · hepatitis · interstitial nephritis · leucopenia · lung disorders · lupus erythematosus like syndrome · methaemoglobinaemia · myalgia · myocarditis · nephrotic syndrome · neutropenia · pericarditis · peripheral neuropathy · renal dysfunction · skin reactions · Stevens-Johnson syndrome · thrombocytopenia
- Frequency not known Abdominal pain diarrhoea exacerbation of symptoms of colitis headache hypersensitivity reactions nausea rash urticaria vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Blood Disorders A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

- ALLERGY AND CROSS-SENSITIVITY Contraindicated in salicylate hypersensitivity.
- RENAL IMPAIRMENT Renal function should be monitored more frequently in renal impairment.
- MONITORING REQUIREMENTS Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.
- PATIENT AND CARER ADVICE

Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

Balsalazide sodium

INDICATIONS AND DOSE

Treatment of mild to moderate ulcerative colitis (acute attack)

ву моитн

 Adult: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

Maintenance of remission of ulcerative colitis

зү моитн

- Adult: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day
- CAUTIONS History of asthma
- SIDE-EFFECTS Cholelithiasis
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Diarrhoea may develop in the infant. Monitor breast-fed infants for diarrhoea.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

INDICATIONS AND DOSE

PENTASA® TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

MOLITH

 Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2−3 divided doses

Maintenance of remission of ulcerative colitis
BY MOUTH

► Adult: 2 g once daily

MEZAVANT® XL

Treatment of mild to moderate ulcerative colitis, acute attack

BY MOUTH

 Adult: 2.4 g once daily, increased if necessary to 4.8 g once daily, review treatment at 8 weeks

Maintenance of remission of ulcerative colitis

▶ Adult: 2.4 g once daily

ASACOL® MR 800MG TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

ву моитн

▶ Adult: 2.4-4.8 g daily in divided doses

Maintenance of remission of ulcerative colitis

ву моитн

 Adult: Up to 2.4 g once daily, alternatively up to 2.4 g daily in divided doses

Maintenance of remission of Crohn's ileo-colitis

► Adult: Up to 2.4 g daily in divided doses

ASACOL® MR 400MG TABLETS

Treatment of mild to moderate ulcerative colitis, acute

BY MOUTH

- ► Child 12-17 years: 800 mg 3 times a day
- Adult: 2.4 g daily in divided doses

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

BV MOLITH

- ► Child 12-17 years: 400-800 mg 3 times a day
- ► Adult: 1.2-2.4 g daily in divided doses

OCTASA®

Treatment of mild to moderate ulcerative colitis, acute attack

ву моштн

 Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g daily in divided doses, dose over 2.4 g daily in divided doses only

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

BY MOUTH

▶ Adult: 1.2-2.4 g once daily, alternatively daily in divided doses

SALOFALK® TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

ву моитн

- ► Child 5-17 years (body-weight up to 39 kg): 10-20 mg/kg 3 times a dav
- ► Child 5-17 years (body-weight 40 kg and above): 0.5-1 g 3 times a day
- ► Adult: 0.5-1 g 3 times a day

Maintenance of remission of ulcerative colitis

BY MOUTH

- Child 5-17 years (body-weight up to 39 kg): 7.5-15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day
- ► Adult: 500 mg 3 times a day

IPOCOL[®]

Treatment of mild to moderate ulcerative colitis, acute attack

BY MOUTH

Adult: 2.4 g daily in divided doses

Maintenance of remission of ulcerative colitis

BY MOUTH

► Adult: 1.2-2.4 g daily in divided doses

PENTASA® GRANULES

Treatment of mild to moderate ulcerative colitis, acute attack

ву моитн

- ► Child 5-17 years (body-weight up to 40 kg): 10-20 mg/kg 3 times a day
- ► Child 5-17 years (body-weight 41 kg and above): 1-2 g twice daily, total daily dose may alternatively be given in 3-4 divided doses
- Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2-4 divided doses

Maintenance of remission of ulcerative colitis

BY MOLITH

- Child 5-17 years (body-weight up to 40 kg): 7.5-15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5-17 years (body-weight 41 kg and above): 2 g once daily
- ► Adult: 2 g once daily

SALOFALK® GRANULES

Treatment of mild to moderate ulcerative colitis, acute attack

ву моштн

- ► Child 5-17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
- ► Child 5-17 years (body-weight 41 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
- ► Adult: 1.5-3 g once daily, dose preferably taken in the morning, alternatively 0.5-1 g 3 times a day

Maintenance of remission of ulcerative colitis

ву моитн

- Child 5-17 years (body-weight up to 40 kg): 7.5-15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5-17 years (body-weight 41 kg and above): 500 mg 3 times a day
- Adult: 500 mg 3 times a day

SALOFALK® RECTAL FOAM

Treatment of mild ulcerative colitis affecting sigmoid colon and rectum

BY RECTIIM

- ► Child 12-17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
- Adult: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

ASACOL® FOAM ENEMA

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the rectosigmoid region

► Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon

BY RECTUM

► Adult: 2 g once daily for 4–6 weeks, to be administered into the rectum

SALOFALK® SUPPOSITORIES

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon

BY RECTUM

► Adult: 0.5-1 g 2-3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum

BY RECTUM

► Adult: 1 g daily, preferably at bedtime, dose to be given using 1 g suppositories

ASACOL® SUPPOSITORIES

Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission

 Adult: 0.75-1.5 g daily in divided doses, last dose to be administered at bedtime

PENTASA® SUPPOSITORIES

Treatment of acute attack, ulcerative proctitis

BY RECTUM

- ► Child 15-17 years: 1 g daily for 2-4 weeks
- ► Adult: 1 g daily for 2-4 weeks

Maintenance, ulcerative proctitis

BY RECTUM

- ► Child 15-17 years: 1 g daily
- ► Adult: 1 g daily

PENTASA® RETENTION ENEMA

Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

BY RECTUM

 Adult: 1 g once daily, dose to be administered at hedtime

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

BY RECTUM

 Child 12-17 years: 1 g once daily, dose to be administered at bedtime

SALOFALK® ENEMA

Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

BY RECTUM

 Adult: 2 g once daily, dose to be administered at bedtime

• CAUTIONS Elderly · pulmonary disease

1

- INTERACTIONS The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol® MR tablets, *Ipocol*®, *Salofalk*® granules) suggest that preparations that lower stool pH (e.g. lactulose) may prevent the release of mesalazine.
- SIDE-EFFECTS
- ► Rare Dizziness
- ► Very rare Oligospermia (reversible)
- PREGNANCY Negligible quantities cross placenta.
- BREAST FEEDING Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk. Monitor breast-fed infant for diarrhoea.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Use with caution. Avoid if eGFR less than 20 mL/minute/1.73 m².
- DIRECTIONS FOR ADMINISTRATION

PENTASA® TABLETS

Tablets may be halved, quartered, or dispersed in water, but should not be chewed.

PENTASA® GRANULES

Granules should be placed on tongue and washed down with water or orange juice without chewing.

In children Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

SALOFALK® GRANULES

Granules should be placed on tongue and washed down with water without chewing.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of granule formulations of Salofalk® may include vanilla. There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.
- PATIENT AND CARER ADVICE If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms. Some products may require special administration advice; patients and carers should be informed.

Olsalazine sodium

INDICATIONS AND DOSE

Treatment of acute attack of mild ulcerative colitis

 Adult: 1 g daily in divided doses, doses to be taken after meals, then increased if necessary up to 3 g daily in divided doses (max. per dose 1 g), dose to be increased over 1 week

Maintenance of remission of mild ulcerative colitis BY MOUTH

 Adult: Maintenance 500 mg twice daily, dose to be taken after food

SIDE-EFFECTS

- ► Common or very common Watery diarrhoea
- ► Frequency not known Blurred vision palpitation photosensitivity pyrexia tachycardia
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Monitor breast-fed infants for diarrhoea
- RENAL IMPAIRMENT Use with caution; manufacturer advises avoid in significant impairment.
- DIRECTIONS FOR ADMINISTRATION Capsules can be opened and contents sprinkled on food.

INDICATIONS AND DOSE

Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn's disease

ву моитн

- ► Adult: 1-2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary
- Adult: 0.5-1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

Maintenance of remission of mild to moderate and severe ulcerative colitis

BY MOLITH

Adult: 500 mg 4 times a day

BY RECTUM

► Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

Active rheumatoid arthritis (administered on expert advice) BY MOUTH

 Adult: Initially 500 mg daily, increased in steps of 500 mg every 1 week, increased to 2-3 g daily in divided doses, enteric coated tablets to be administered

- CONTRA-INDICATIONS Child under 2 years of age
- CAUTIONS Acute porphyrias p. 864 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haematological toxicity · risk of hepatic toxicity · slow acetylator status
- INTERACTIONS → Appendix 1 (aminosalicylates).

SIDE-EFFECTS

- Common or very common Blood disorders · cough · dizziness · fever · Heinz body anaemia · insomnia · megaloblastic anaemia · proteinuria · pruritus · stomatitis · taste disturbances · tinnitus
- Uncommon Alopecia · convulsions · depression · dyspnoea · vasculitis
- ► Frequency not known Anaphylaxis · aseptic meningitis · ataxia · crystalluria · disturbances of smell · epidermal necrolysis · exfoliative dermatitis · gastro-intestinal intolerance · hallucinations · hypersensitivity reactions · leucopenia (especially in patients with rheumatoid arthritis) · loss of appetite · neutropenia (especially in patients with rheumatoid arthritis) · oligospermia · parotitis · photosensitivity · rashes · serum sickness · some soft contact lenses may be stained · thrombocytopenia (especially in patients with rheumatoid arthritis) · yelloworange discoloration of other body fluids · yellow-orange discoloration of skin · yellow-orange discoloration of urine

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side effects Upper gastro-intestinal side-effects common over 4 g daily.

Blood disorders Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

- PREGNANCY Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.
- BREAST FEEDING Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.

MONITORING REQUIREMENTS

- Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months
- Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
- Liver function Liver function tests should be performed at monthly intervals for first 3 months.
- PATIENT AND CARER ADVICE
 Contact lenses Some soft contact lenses may be stained.

MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)

Vedolizumah

• DRUG ACTION Vedolizumab is a monoclonal antibody that binds specifically to the $\alpha_4\beta_7$ integrin, which is preferentially expressed on gut homing T helper lymphocytes.

INDICATIONS AND DOSE

Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

BY INTRAVENOUS INFUSION

Adult: Initially 300 mg, then 300 mg after 2 weeks. followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature: review treatment if no response within 10 weeks of initial dose

Moderate to severe active Crohn's disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if no response is observed, an additional dose of 300 mg may be given 10 weeks after initial dose; if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose
- CONTRA-INDICATIONS Severe active infection
- CAUTIONS Controlled chronic severe infection history of recurring severe infection · previous treatment with natalizumab (wait at least 12 weeks between natalizumab

use and initiation of vedolizumab unless potential benefit outweighs risk) · previous treatment with rituximab

CAUTIONS, FURTHER INFORMATION

Risk of infection Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.

Patients should be brought up to date with current immunisation schedule before initiating treatment.

- INTERACTIONS → Appendix 1 (vedolizumab).
- SIDE-EFFECTS
- ► Common or very common Acne · arthralgia · back pain · constipation · cough · dyspepsia · eczema · erythema · flatulence · gastroenteritis · headache · hypertension · infections · malaise · muscle spasms · muscular weakness · nasal congestion · nausea · night sweats · oropharyngeal pain · paraesthesia · pharyngitis · pruritus · pyrexia · rash · upper respiratory tract infection
- **Uncommon** Folliculitis · oral candidiasis · vulvovaginal candidiasis
- ► Frequency not known Dizziness · infusion-related reactions · listeria meningitis · salmonella sepsis · tuberculosis

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions Infusion-related and hypersensitivity reactions have been reported. Patients should be observed continuously during each infusion for signs and symptoms of acute hypersensitivity reactions: they should also be observed for 2 hours after the initial two infusions, and for 1 hour after subsequent infusions. Discontinue treatment if a severe infusion-related or other severe reaction occurs and initiate appropriate treatment (e.g. adrenaline and antihistamines); if a mild to moderate infusion-related reaction occurs, interrupt infusion or reduce infusion rate and initiate appropriate treatment (if reaction subsides the infusion may be continued)—consider pretreatment with an antihistamine, hydrocortisone, and/or paracetamol prior to subsequent infusions in patients who experience mild to moderate infusion-related reactions.

- CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 18 weeks after treatment.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid-present in milk in animal studies.
- MONITORING REQUIREMENTS
- ► Monitor closely for infection before, during and after treatment—potential increased risk of opportunistic
- ▶ Monitor for new onset or worsening neurological signs and symptoms (withhold treatment if progressive multifocal leukoencephalopathy (PML) is suspected).
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Entyvio®), give intermittently in Sodium chloride 0.9%; allow vial to reach room temperature then reconstitute with 4.8 mL of water for injection (using a syringe with a 21-25 gauge needle); gently swirl vial for at least 15 seconds, do not shake vigorously or invert; allow to stand for up to 20 minutes (gently swirl vial if needed), leave for an additional 10 minutes if not dissolved; gently invert vial three times, withdraw 5 mL of reconstituted solution (using a syringe with a 21-25 gauge needle), and add to 250 mL of infusion fluid; gently mix and give over 30
- PATIENT AND CARER ADVICE Patients should be provided with a patient alert card.

GUANYLATE CYCLASE-C RECEPTOR AGONISTS

Linaclotide

INDICATIONS AND DOSE

Moderate to severe irritable bowel syndrome with constipation

BY MOUTH

- Adult: 290 micrograms once daily, review treatment if no response after 4 weeks
- CONTRA-INDICATIONS Gastro-intestinal obstruction inflammatory bowel disease
- CAUTIONS Predisposition to fluid and electrolyte disturbances
- SIDE-EFFECTS
- ► Common or very common Abdominal distension abdominal pain diarrhoea (if severe or prolonged, consider suspending treatment) dizziness flatulence
- Uncommon Decreased appetite · dehydration · hypokalaemia · orthostatic hypotension
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.
- PRESCRIBING AND DISPENSING INFORMATION Dispense capsules in original container (contains desiccant); discard any capsules remaining 18 weeks after opening.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2013) that linaclotide (Constella®) is accepted for restricted use within NHS Scotland for moderate to severe irritable bowel syndrome in patients whose condition has not responded adequately to all other treatments, or who are intolerant of them.

MEDICINAL FORMS

2.1 Bowel cleansing

Drugs used for Bowel cleansing not listed below;

Bisacodyl, p. 52 · Docusate sodium, p. 52 · Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride, p. 48 · Magnesium sulfate, p. 858 · Phosphate, p. 861 · Sodium picosulfate. p. 54

1

MAGNESIUM-CONTAINING DRUGS

Citric acid with magnesium carbonate (Formulated as a bowel cleansing preparation)

INDICATIONS AND DOSE

Bowel evacuation for surgery, colonoscopy or radiological examination

BY MOUTH

- Child 5-9 years: One-third of a sachet to be given at 8
 a.m. the day before the procedure and, one-third of a
 sachet to be given between 2 and 4 p.m. the day before
 the procedure
- ► Child 10-17 years: 0.5-1 sachet, given at 8 a.m. the day before the procedure and 0.5-1 sachet, given between 2 and 4 p.m. the day before the procedure
- Adult: 1 sachet, given 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients
- CONTRA-INDICATIONS Acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon
- CAUTIONS Children · colitis (avoid if acute severe colitis) · debilitated · elderly · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · impaired gag reflex or possibility of regurgitation or aspiration · patients with fluid and electrolyte disturbances

CAUTIONS, FURTHER INFORMATION

Adequate hydration should be maintained during treatment

• INTERACTIONS Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

SIDE-FFFFCTS

- ► Common or very common Abdominal distention abdominal pain nausea vomiting
- Uncommon Dehydration · dizziness · electrolyte disturbances · headache

SIDE-EFFECTS, FURTHER INFORMATION

Abdominal pain Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

- PREGNANCY Use with caution.
- BREAST FEEDING Use with caution.
- HEPATIC IMPAIRMENT Avoid in hepatic coma if risk of renal failure.

RENAL IMPAIRMENT

- ► In adults Avoid if eGFR less than 30 mL/minute/1.73 m²— risk of hypermagnesaemia.
- ► In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.
- MONITORING REQUIREMENTS Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.
- DIRECTIONS FOR ADMINISTRATION One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.
- PRESCRIBING AND DISPENSING INFORMATION
 Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid

produces a solution containing magnesium citrate with 118 mmol Mg²⁺. Flavours of oral powders may include lemon and lime.

 PATIENT AND CARER ADVICE Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber's advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

2.2 Constipation

Constipation

Before prescribing laxatives it is important to be sure that the patient *is* constipated and that the constipation is *not* secondary to an underlying undiagnosed complaint.

It is also important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people tend to consider themselves constipated if they do not have a bowel movement each day. A useful definition of constipation is the passage of hard stools less frequently than the patient's own normal pattern and this can be explained to the patient.

Misconceptions about bowel habits have led to excessive laxative use. Abuse may lead to hypokalaemia.

Thus, laxatives should generally be avoided except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in drug-induced constipation, for the expulsion of parasites after anthelmintic treatment, and to clear the alimentary tract before surgery and radiological procedures. Prolonged treatment of constipation is sometimes necessary.

Also see the prevention of opioid-induced constipation in palliative care.

The laxatives that follow have been divided into 5 main groups. This simple classification disguises the fact that some laxatives have a complex action.

Bulk-forming laxatives

Bulk-forming laxatives are of value if the diet is deficient in fibre. Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives can be used in the management of patients with colostomy, ileostomy, haemorrhoids, anal fissure, chronic diarrhoea associated with diverticular disease, irritable bowel syndrome, and as adjuncts in ulcerative colitis. Adequate fluid intake must be maintained to avoid intestinal obstruction. Unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or biscuits in appropriately increased quantities. Oat bran is also used.

Methylcellulose p. 45, ispaghula husk p. 45, and sterculia p. 46 are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

Stimulant laxatives

Stimulant laxatives include bisacodyl p. 52, sodium picosulfate p. 54, and members of the **anthraquinone** group, senna p. 53, co-danthramer p. 52 and co-danthrusate p. 51. The indications for co-danthramer and

co-danthrusate are limited by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as **cascara** (an anthraquinone) and **castor oil** are obsolete. Docusate sodium p. 52 probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia; however, prolonged use may be justifiable in some circumstances.

Glycerol p. 53 suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be **avoided** as their laxative action is unpredictable. Aloes, colocynth, and jalap should be **avoided** as they have a drastic purgative action.

The parasympathomimetics bethanechol chloride p. 676, neostigmine p. 912, and pyridostigmine bromide p. 912 enhance parasympathetic activity in the gut and increase intestinal motility. They are rarely used for their gastro-intestinal effects. Organic obstruction of the gut must first be excluded and they should not be used shortly after howel anastomosis.

Other stimulant laxatives

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be **avoided** as their laxative action is unpredictable. Aloes, colocynth, and jalap should be **avoided** as they have a drastic purgative action.

Faecal softeners

Liquid paraffin p. 49, the traditional lubricant, has disadvantages. Bulk laxatives and non-ionic surfactant 'wetting' agents e.g. docusate sodium p. 52 also have softening properties. Such drugs are useful for oral administration in the management of haemorrhoids and anal fissure; glycerol p. 53 is useful for rectal use.

Enemas containing arachis oil p. 51 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement.

Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with.

Lactulose p. 47 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy.

Macrogols are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Saline purgatives such as magnesium hydroxide p. 46 are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained. Magnesium salts, such as magnesium sulfate are useful where rapid bowel evacuation is required. **Sodium salts** should be avoided as they may give rise to sodium and water retention in susceptible individuals. **Phosphate enemas** are useful in bowel clearance before radiology, endoscopy, and surgery.

Other drugs used in constipation

Linaclotide p. 40 is a guanylate cyclase-C receptor agonist that is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. It increases intestinal fluid secretion and transit, and decreases visceral pain. It is metabolised within the gastro-

intestinal tract and is virtually undetectable in the plasma after therapeutic doses.

Lubiprostone p. 46 is a chloride-channel activator that is licensed for the treatment of chronic idiopathic constipation in adults whose condition has not responded adequately to lifestyle changes (including dietary changes).

Prucalopride p. 50 is a selective serotonin 5HT4-receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in women, when other laxatives have failed to provide an adequate response.

Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.

Pregnancy

If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose p. 47, can also be used. Bisacodyl p. 52 or senna p. 53 may be suitable, if a stimulant effect is necessary.

Constipation in children

Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In *infants*, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year of age with mild constipation, lactulose p. 47 can be used to soften the stool; either an oral preparation containing macrogols or, rarely, glycerol p. 53 suppositories can be used to clear faecal impaction. The infant should be referred to a hospital paediatric specialist if these measures fail.

The diet of *children over* 1 *year* of *age* should be reviewed to ensure that it includes an adequate intake of fibre and fluid. An osmotic laxative containing macrogols can also be used, particularly in children with chronic constipation; lactulose p. 47 is an alternative in children who cannot tolerate a macrogol. If there is an inadequate response to the osmotic laxative, a **stimulant laxative** can be added.

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing macrogols is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a stimulant **laxative** can be added. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate p. 677 enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a bowel cleansing preparation is an alternative. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses. In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of

1

months, according to response. Some children may require laxative therapy for several years.

Chronic constipation

For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort. Laxatives should be administered at a time that produces an effect that is likely to fit in with the child's toilet routine.

BULK FORMING LAXATIVES

Ispaghula husk

• DRUG ACTION Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

INDICATIONS AND DOSE

ISPAGEL® ORANGE

Constipation

ву моитн

- ► Child 6-11 years: 2.5-5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals

NICE technology appraisals (TAs)

Lubiprostone for treating chronic idiopathic constipation (July 2014) NICE TA318

Lubiprostone is recommended as an option for treating chronic idiopathic constipation for adults in whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and for whom invasive treatment for constipation is being considered. If treatment with lubiprostone is not effective after 2 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered. Lubiprostone should only be prescribed by a clinician with experience of treating chronic idiopathic constipation, after careful review of the patient's previous courses of laxative treatments, www.nice.rg.uk/TA318

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2014) that lubiprostone (Amitiza)® is **not** recommended for use within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 21

 Amitiza (Sucampo Pharma Europe Ltd) Lubiprostone 24 microgram Amitiza 24microgram capsules | 28 capsule [PoM] £29.68 | 56 capsule [PoM] £53.48

MAGNESIUM-CONTAINING DRUGS

Magnesium hydroxide

INDICATIONS AND DOSE

Constipation

ву моитн

- ▶ Adult: 30-45 mL as required, dose to be given mixed with water at bedtime
- CONTRA-INDICATIONS Acute gastro-intestinal conditions
- CAUTIONS Debilitated patients elderly
- INTERACTIONS → Appendix 1 (antacids).
- SIDE-EFFECTS Colic
- HEPATIC IMPAIRMENT Avoid in hepatic coma if risk of renal failure.
- RENAL IMPAIRMENT Avoid or reduce dose. Increased risk of toxicity in renal impairment.
- PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

MAGNESIUM HYDROXIDE (Non-proprietary) Magnesium hydroxide 83 mg per 1 ml Phillips' Milk of Magnesia 415mg/5ml oral suspension (sugar-free) | 200 ml GSL £3.22

Also available in combination with liquid paraffin, p. 49

OPIOID RECEPTOR ANTAGONISTS (PERIPHERAL)

Methylnaltrexone bromide

• DRUG ACTION Peripherally acting opioid-receptor antagonist which does not alter the central analgesic effect of opioids.

INDICATIONS AND DOSE

Adjunct to other laxatives in opioid-induced constipation in terminally ill patients, when response to other laxatives is inadequate

BY SUBCUTANEOUS INJECTION

- ► Adult (body-weight up to 38 kg): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- ▶ Adult (body-weight 38-62 kg): 8 mg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response: 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- Adult (body-weight 62-114 kg): 12 mg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- ▶ Adult (body-weight 115 kg and above): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day

PHARMACOKINETICS

May act with 30-60 minutes.

- CONTRA-INDICATIONS Acute surgical abdominal conditions · gastro-intestinal obstruction
- CAUTIONS Diverticular disease faecal impaction patients with colostomy · patients with peritoneal catheter

SIDE-EFFECTS

- ► Common or very common Abdominal pain · diarrhoea · dizziness · flatulence · hyperhidrosis · injection site reactions · nausea
- ▶ Frequency not known Gastro-intestinal perforation
- PREGNANCY Toxicity at high doses in animal studies manufacturer advises avoid unless essential.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk-present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe hepatic impairment—no information available.
- RENAL IMPAIRMENT If eGFR less than 30 mL/minute/1.73 m², reduce dose as follows: bodyweight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62-114 kg, 8 mg on alternate days; bodyweight over 114 kg, 75 micrograms/kg on alternate days.
- DIRECTIONS FOR ADMINISTRATION Rotate injection site.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

OSMOTIC LAXATIVES

Lactulose

INDICATIONS AND DOSE

Constipation

BY MOUTH

- ▶ Child 1-11 months: 2.5 mL twice daily, adjusted according to response
- ► Child 1-4 years: 2.5-10 mL twice daily, adjusted according to response
- ► Child 5-17 years: 5-20 mL twice daily, adjusted according to response
- ▶ Adult: Initially 15 mL twice daily, adjusted according to

Hepatic encephalopathy (portal systemic encephalopathy)

► Adult: Adjusted according to response to 30-50 mL 3 times a day, subsequently adjusted to produce 2-3 soft stools per day

PHARMACOKINETICS

Lactulose may take up to 48 hours to act.

UNLICENSED USE

- ▶ In children Not licensed for use in children for hepatic encephalopathy.
- In adults Lactulose doses in the BNF may differ from those in product literature.
- CONTRA-INDICATIONS Galactosaemia · intestinal obstruction
- CAUTIONS Lactose intolerance
- INTERACTIONS → Appendix 1 (lactulose).

Common or very common Abdominal discomfort · cramps · flatulence · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Nausea Nausea can be reduced by administration with water, fruit juice or meals.

- PREGNANCY Not known to be harmful.

MOVICOL-HALF®

Chronic constipation

ву моитн

- ► Child 12-17 years: 2-6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2-4 sachets daily
- ► Adult: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily

Faecal impaction

ву моитн

- Child 12-17 years: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day
- Adult: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day

UNLICENSED USE

MOVICOL-PAEDIATRIC®

Movicol ** *Paediatric* not licensed for use in faecal impaction in children under 5 years, or for chronic constipation in children under 2 years.

• CONTRA-INDICATIONS Crohn's disease · intestinal obstruction · intestinal perforation · paralytic ileus · severe inflammatory conditions of the intestinal tract · toxic megacolon · ulcerative colitis

MOVICOL-PAEDIATRIC®

Cardiovascular impairment · renal impairment.

• CAUTIONS Cardiovascular impairment (should not take more than 2. full-strength) each or A. half-strength)

more than 2 'full-strength' sachets or 4 'half-strength' sachets in any one hour) · discontinue if symptoms of fluid and electrolyte disturbance

MOVICOL-PAEDIATRIC®

Impaired consciousness (with high doses) · impaired gag reflex (with high doses) · reflux oesophagitis (with high doses)

- INTERACTIONS → Appendix 1 (macrogols).
- SIDE-EFFECTS Abdominal distention addominal pain flatulence nausea
- PREGNANCY Limited data, but manufacturer advises that it can be used.
- BREAST FEEDING Manufacturer advises that it can be used.
- DIRECTIONS FOR ADMINISTRATION Contents of each 'full strength' sachet of oral powder to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

MOVICOL® LIQUID

25 mL of oral concentrate to be diluted with half a glass (approx. 100 mL) of water. After dilution the solution should be discarded if unused after 24 hours.

MOVICOL-PAEDIATRIC®

Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

MOVICOL® ORAL POWDER

Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

MOVICOL-HALF®

Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution

the solution should be kept in a refrigerator and discarded if unused after 6 hours.

• PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include orange. Flavours of oral powder formulations may include chocolate, lime and lemon, or plain.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Movicol for constination www.medicinesforchildren.org.uk/movicol-for-constipation Patients or carers should be counselled on how to take the oral powder and oral solution.

PHOSPHATE-CONTAINING DRUGS

Sodium acid phosphate with sodium phosphate

INDICATIONS AND DOSE

Constipation (using Phosphates Enema BP Formula B) Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)

- ► Child 3-6 years: 45-65 mL once daily
- ▶ Child 7-11 years: 65-100 mL once daily
- ► Child 12-17 years: 100-128 mL once daily
- Adult: 128 mL daily

continued →

FLEET®PHOSPHO-SODA

Bowel evacuation before colonic surgery | Bowel evacuation before colonoscopy | Bowel evacuation before radiological examination

BY MOUTH

Adult: 45 mL twice daily, each dose must be diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water; timing of doses is dependent on the time of the procedure, for morning procedure, the first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure; for afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

PHARMACOKINETICS

Onset of action is within half to 6 hours of first dose. FLEET® READY-TO-USE ENEMA

Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery BY RECTUM

► Adult: 118 mL

CONTRA-INDICATIONS

- With oral use Acute severe colitis · ascites · congestive cardiac failure · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon
- ▶ With rectal use Conditions associated with increased colonic absorption • gastro-intestinal obstruction • inflammatory bowel disease

CAUTIONS

- With oral use Cardiac disease (avoid in congestive cardiac failure) · colitis (avoid if acute severe colitis) · elderly and debilitated patients · fluid and electrolyte disturbances · hypovolaemia (should be corrected before administration) · impaired gag reflex or possibility of regurgitation or aspiration
- With rectal use Ascites · congestive heart failure · elderly and debilitated patients · electrolyte disturbances · uncontrolled hypertension

INTERACTIONS

With oral use Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

• SIDE-EFFECTS

- ► Common or very common
- With oral use abdominal distention · abdominal pain (usually transient—reduced by taking more slowly) · nausea · vomiting
- ▶ Uncommon
- ▶ With oral use dehydration dizziness headache
- ► Frequency not known
- With oral use arrhythmias · asthenia · chest pain · electrolyte disturbances · renal failure
- ▶ With rectal use electrolyte disturbances local irritation
- PREGNANCY
- ▶ With oral use Caution.
- BREAST FEEDING
- ▶ With oral use Caution.
- HEPATIC IMPAIRMENT Use with caution in cirrhosis.
- RENAL IMPAIRMENT
- With oral use Avoid if eGFR less than 60 mL/minute/1.73 m².
- ▶ With rectal use Use with caution.

MONITORING REQUIREMENTS

 With oral use Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

DIRECTIONS FOR ADMINISTRATION

FLEET®PHOSPHO-SODA

Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. before afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose.

 PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.

PATIENT AND CARER ADVICE

FLEET®PHOSPHO-SODA

Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed. Patients or carers should be advised that adequate hydration should be maintained during treatment. Patients or carers should be given advice on administration of Fleet Phospho-soda ® oral solution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

SELECTIVE 5-HT₄ RECEPTOR AGONISTS

Prucalopride

 DRUG ACTION A selective serotonin 5HT₄-receptor agonist with prokinetic properties.

INDICATIONS AND DOSE

Chronic constipation in women when other laxatives fail to provide an adequate response

- ву моитн
- Adult: 2 mg once daily, review treatment if no response after 4 weeks
- ► Elderly: Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks
- CONTRA-INDICATIONS Crohn's disease · intestinal obstruction · intestinal perforation · severe inflammatory conditions of the intestinal tract · toxic megacolon · ulcerative colitis
- CAUTIONS History of arrhythmias · history of ischaemic heart disease · severe, unstable chronic illness

• INTERACTIONS Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

- ► Common or very common Abdominal pain · diarrhoea · dizziness · dyspepsia · fatigue · flatulence · gastrointestinal symptoms · headache · nausea · polyuria · rectal bleeding · vomiting
- ▶ Uncommon Anorexia fever palpitation tremor SIDE-EFFECTS. FURTHER INFORMATION Side-effects generally occur at the start of treatment and are usually transient.
- CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during treatment.
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises avoid-present in
- HEPATIC IMPAIRMENT In severe impairment, initially 1 mg once daily, increased if necessary to 2 mg once daily.
- RENAL IMPAIRMENT Max. 1 mg daily if eGFR less than 30 mL/minute/1.73 m².

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

> Prucalopride for the treatment of chronic constipation in women (December 2010) NICE TA211

Prucalopride is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient's previous courses of laxative treatments. www.nice.org.uk/TA211

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2010) that prucalopride (Resolor®) is not recommended for use within NHS Scotland because weaknesses in the clinical data prevent an assessment of its efficacy in the target population.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Resolor (Shire Pharmaceuticals Ltd) Prucalopride (as Prucalopride succinate) 1 mg Resolor 1mg tablets | 28 tablet PoM £38.69 DT price = £38.69 Prucalopride (as Prucalopride succinate) 2 mg Resolor 2mg tablets | 28 tablet PoM £59.52 DT price = £59.52

SOFTENING DRUGS

Arachis oil

INDICATIONS AND DOSE To soften impacted faeces

BY RECTIIM

▶ Adult: 130 mL as required

- CAUTIONS Hypersensitivity to soya · intestinal obstruction
- ALLERGY AND CROSS-SENSITIVITY Contraindicated if history of hypersensitivity to arachis oil or peanuts.
- DIRECTIONS FOR ADMINISTRATION Warm enema in warm water before use.

Co-danthrusate

INDICATIONS AND DOSE

Constipation in terminally ill patients

BY MOUTH USING CAPSULES

- ▶ Child 6-11 years: 1 capsule once daily, to be taken at
- ► Child 12-17 years: 1-3 capsules once daily, to be taken at night
- ▶ Adult: 1-3 capsules once daily, to be taken at night BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6-11 years: 5 mL once daily, to be taken at night
- ► Child 12-17 years: 5-15 mL once daily, to be taken at night
- ▶ Adult: 5-15 mL once daily, to be taken at night

Dose equivalence and conversion

Co-danthrusate suspension contains dantron 50 mg and docusate 60 mg per 5 mL.

Co-danthrusate capsules contain dantron 50 mg and docusate 60 mg per capsule.

- CONTRA-INDICATIONS Acute abdominal conditions (in children) · acute inflammatory bowel disease · acute surgical abdominal conditions (in adults) · intestinal obstruction · severe dehydration
- CAUTIONS Rodent studies indicate potential carcinogenic risk · excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation

CAUTIONS, FURTHER INFORMATION

Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies-risk of irritation and excoriation).

- SIDE-EFFECTS Abdominal cramp urine may be coloured
- PREGNANCY Manufacturers advise avoid—limited information available.
- BREAST FEEDING Manufacturer's advise avoid—no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Enema

STIMULANT LAXATIVES

Bisacodyl

INDICATIONS AND DOSE

Constipation

ву моитн

- Child 4-17 years: 5-20 mg once daily, adjusted according to response, dose to be taken at night
- ► Adult: 5-10 mg once dailyIncreased if necessary up to 20 mg once daily, dose to be taken at night

BY RECTUM

- ► Child 2-17 years: 5-10 mg once daily, adjusted according to response
- Adult: 10 mg once daily, dose to be taken in the morning

Bowel clearance before radiological procedures and surgery INITIALLY BY MOUTH

 Adult: 10 mg twice daily, does to be taken in the morning and evening on the day before procedure and (by rectum) 10 mg, to be administered 1-2 hours before procedure the following day

PHARMACOKINETICS

Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

- CONTRA-INDICATIONS Acute abdominal conditions (in children) - acute inflammatory bowel disease - acute surgical abdominal conditions (in adults) - intestinal obstruction - severe dehydration
- CAUTIONS Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · risk of electrolyte imbalance with prolonged use (in children)
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Abdominal cramp · colitis · nausea · vomiting

- With rectal use Local irritation
- PREGNANCY May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, enema, suppository

Gastro-resistant tablet

Brands may include Dulco-Lax tablets and suppositories.

Co-danthramer

INDICATIONS AND DOSE

Constipation in terminally ill patients (standard strength capsules)

BY MOUTH USING CAPSULES

- ► Child 6-11 years: 1 capsule once daily, dose should be taken at night
- ► Child 12-17 years: 1-2 capsules once daily, dose should be taken at night
- Adult: 1-2 capsules once daily, dose should be taken at night

Constipation in terminally ill patients (strong capsules)

BY MOUTH USING CAPSULES

- ► Child 12-17 years: 1-2 capsules once daily, dose should be given at night
- Adult: 1-2 capsules once daily, dose should be given at night

Constipation in terminally ill patients (standard strength suspension)

BY MOUTH USING ORAL SUSPENSION

- ► Child 2-11 years: 2.5-5 mL once daily, dose should be taken at night
- ► Child 12-17 years: 5-10 mL once daily, dose should be taken at night
- ► Adult: 5-10 mL once daily, dose should be taken at night

Constipation in terminally ill patients (strong suspension) BY MOUTH USING ORAL SUSPENSION

- Child 12-17 years: 5 mL once daily, dose should be taken at night
- ► Adult: 5 mL once daily, dose should be taken at night Dose equivalence and conversion

Co-danthramer (standard strength) capsules contain dantron 25 mg with poloxamer '188' 200 mg per capsule. Co-danthramer (standard strength) oral suspension contains dantron 25 mg with poloxamer '188' 200 mg per 5 mL.

Co-danthramer **strong** capsules contain dantron 37.5 mg with poloxamer '188' 500 mg.

Co-danthramer **strong** oral suspension contains dantron 75 mg with poloxamer '188' 1 g per 5 mL.

Co-danthramer suspension 5 mL = one co-danthramer capsule, **but** strong co-danthramer suspension 5 mL = two strong co-danthramer capsules.

- CONTRA-INDICATIONS Acute abdominal conditions (in children) acute inflammatory bowel disease acute surgical abdominal conditions (in adults) intestinal obstruction severe dehydration
- CAUTIONS Rodent studies indicate potential carcinogenic risk · excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation

CAUTIONS, FURTHER INFORMATION

Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).

- SIDE-EFFECTS Abdominal cramp urine may be coloured red
- PREGNANCY Manufacturers advise avoid—limited information available.
- BREAST FEEDING Manufacturer's advise avoid—no information available

3 Diarrhoea

Acute diarrhoea

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. **Oral rehydration preparations** are used in the prevention or reversal of fluid and electrolyte depletion. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

Antimotility drugs

Antimotility drugs relieve symptoms of acute diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults; fluid and electrolyte replacement may be necessary in case of dehydration. However, antimotility drugs are **not** recommended for acute diarrhoea in young children.

Antimotility drugs prolong the duration of intestinal transit by binding to opioid receptors in the gastrointestinal tract. Loperamide hydrochloride p. 56 does not cross the blood-brain barrier readily. Antimotility drugs have a role in the management of uncomplicated acute diarrhoea in adults but not in young children. However, in severe cases, fluid and electrolyte replacement are of primary importance.

Antimotility drugs have a role in Inflammatory bowel disease p. 32 and in Stoma care p. 83.

Loperamide hydrochloride p. 56 can be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

Antispasmodics

Antispasmodics are occasionally of value in treating abdominal cramp associated with diarrhoea but they should **not** be used for primary treatment. Antispasmodics and antiemetics should be **avoided** in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

Antibacterial drugs

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment.

Ciprofloxacin p. 490 is occasionally used for prophylaxis against travellers' diarrhoea, but routine use is **not** recommended. Lactobacillus preparations have not been shown to be effective.

Adsorbents and bulk-forming drugs

Adsorbents such as kaolin p. 57 are **not** recommended for *acute diarrhoeas*. Bulk-forming drugs, such as ispaghula husk p. 45, methylcellulose p. 45, and sterculia p. 46 are useful in controlling diarrhoea associated with diverticular disease

Colestyramine p. 173 binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

Enkephalinase inhibitors

Racecadotril p. 57 is a pro-drug of thiorphan. Thiorphan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racecadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea; it should only be used in children over 3 months of age when usual supportive measures, including oral rehydration, are insufficient to control the condition. Racecadotril does not affect the duration of intestinal transit.

Drugs used for Diarrhoea not listed below; *Codeine phosphate*, p. 360 · *Colestyramine*, p. 173 · *Morphine*, p. 367

ANTIMOTILITY DRUGS

Co-phenotrope

INDICATIONS AND DOSE

Adjunct to rehydration in acute diarrhoea

- BY MOUTH
 ► Child 4-8 years: 1 tablet 3 times a day
- ► Child 9-11 years: 1 tablet 4 times a day
 ► Child 12-15 years: 2 tablets 3 times a day
- ► Child 16-17 years: Initially 4 tablets, followed by
- 2 tablets every 6 hours until diarrhoea controlled

 Adult: Initially 4 tablets, followed by 2 tablets every
- 6 hours until diarrhoea controlled

 Control of faecal consistency after colostomy or ileostomy
- ► Child 4-8 years: 1 tablet 3 times a day
- ▶ Child 9-11 years: 1 tablet 4 times a day
- ► Child 12-15 years: 2 tablets 3 times a day
- Child 16-17 years: Initially 4 tablets, then 2 tablets 4 times a day
- Adult: Initially 4 tablets, then 2 tablets 4 times a day
- UNLICENSED USE Not licensed for use in children under 4 years.
- CONTRA-INDICATIONS Gastro-intestinal obstruction intestinal atony myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) paralytic ileus prostatic enlargement (in adults) pyloric stenosis severe ulcerative colitis significant bladder outflow obstruction toxic megacolon urinary retention
- CAUTIONS Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage - young children are particularly susceptible to overdosage; symptoms may be delayed and observation is needed for at least 48 hours after ingestion
- INTERACTIONS → Appendix 1 (antimuscarinics, opioid analgesics).
- SIDE-EFFECTS
- ▶ Very rare Angle-closure glaucoma

- Frequency not known Abdominal pain · anorexia · confusion (particularly in the elderly) · constipation · dilation of the pupils with loss of accomodation · dry mouth · dryness of the skin · fever · flushing · giddiness · nausea · photophobia · reduced bronchial secretions · transient bradycardia (followed by tachycardia, palpitation and arrhythmias) · urinary retention · urinary urgency · vomiting
- PREGNANCY Manufacturer advises caution.
- BREAST FEEDING May be present in milk.
- HEPATIC IMPAIRMENT Avoid in jaundice.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth tablets may be crushed.
- PRESCRIBING AND DISPENSING INFORMATION A mixture
 of diphenoxylate hydrochloride and atropine sulfate in
 the mass proportions 100 parts to 1 part respectively.
- EXCEPTIONS TO LEGAL CATEGORY Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

Dyspepsia

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration and, gastric cancer, but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by 'alarm features' (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

Antacids may provide some symptomatic relief, however if symptoms persist in *uninvestigated dyspepsia*, treatment involves a **proton pump inhibitor** for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for *Helicobacter pylori* and given eradication therapy if *H. pylori* is present. Alternatively, particularly in populations where *H. pylori* infection is more likely, the 'test and treat' strategy for *H. pylori* can be used before a trial with a proton pump inhibitor.

If *H. pylori* is present in patients with *functional* (*investigated*, *non-ulcer*) *dyspepsia*, eradication therapy should be provided. If symptoms persist, treatment with

either a **proton pump inhibitor** or a **histamine** H₂-**receptor antagonist** can be given for 4 weeks. These
antisecretory drugs can be used intermittently to control
symptoms long term. However, most patients with
functional dyspepsia do not benefit symptomatically from *H. pylori* eradication therapy or antisecretory drugs.

ALGINATES

Alginic acid

INDICATIONS AND DOSE

GAVISCON INFANT® POWDER SACHETS

Management of gastro-oesophageal reflux disease

- ► Child 1 month-2 years (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breastfed infants); maximum 6 doses per day
- Child 1 month-2 years (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day
- CONTRA-INDICATIONS Intestinal obstruction preterm neonates where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)
- INTERACTIONS → Appendix 1 (antacids).
 Not to be used with other preparations containing thickening agents.

Antacids should preferably not be taken at the same time as other drugs since they may impair absorption.

Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

- HEPATIC IMPAIRMENT In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
- RENAL IMPAIRMENT In patients with fluid retention, avoid antacids containing large amounts of sodium.
- PRESCRIBING AND DISPENSING INFORMATION Each half of the dual-sachet is identified as 'one dose'.
 To avoid errors prescribe with directions in terms of

ANTACIDS

Antacids

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in *ulcer dyspepsia* and in non-erosive gastro-oesophageal reflux; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesiumaluminium antacids promote ulcer healing, but less well than antisecretory drugs; proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

Aluminium- and magnesium-containing antacids (e.g. aluminium hydroxide p. 859, and magnesium carbonate p. 60, hydroxide and magnesium trisilicate p. 61), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal.

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage.

Sodium bicarbonate p. 848 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

Bismuth-containing antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic. causing encephalopathy; they tend to be constipating. Calcium-containing antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milkalkali syndrome.

Simeticone

Simeticone p. 60 (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

Alginates

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginatecontaining preparations form a viscous gel ('raft') that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, magnesium hydroxide p. 46.

INDICATIONS AND DOSE

MUCOGEI®

Dyspepsia

ву моитн

- ► Child 12-17 years: 10-20 mL 3 times a day, to be taken 20-60 minutes after meals, and at bedtime, or when required
- ▶ Adult: 10-20 mL 3 times a day, to be taken 20-60 minutes after meals, and at bedtime, or when required

MAALOX® Dyspepsia

BY MOUTH

- ► Child 14-17 years: 10-20 mL, to be taken 20-60 minutes after meals, and at bedtime or when required
- ▶ Adult: 10-20 mL, to be taken 20-60 minutes after meals, and at bedtime or when required

• PRESCRIBING AND DISPENSING INFORMATION Comagaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively. Maalox® and Mucogel® are low in sodium.

MEDICINAL FORMS

Aluminium hydroxide gel dried 44 mg per 1 ml, Magnesium hydroxide 39 mg per 1 ml Mucogel oral suspension (sugar-free) 500 ml GSL £2.99

Co-simalcite

INDICATIONS AND DOSE

Dyspepsia

ву моитн

- ► Child 8-11 years: 5 mL 4 times a day as required, to be taken between meals and at bedtime
- ▶ Child 12-17 years: 10 mL 4 times a day as required, to be taken between meals and at bedtime
- ▶ Adult: 10 mL 4 times a day as required, to be taken between meals and at bedtime
- CONTRA-INDICATIONS Hypophosphataemia · infants · neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

Aluminium-containing antacids Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasmaaluminium concentrations.

• INTERACTIONS → Appendix 1 (antacids). Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Constination and diarrhoea Magnesium-containing antacids tend to be laxative whereas aluminiumcontaining antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects.

- HEPATIC IMPAIRMENT Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.
- RENAL IMPAIRMENT Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.
- In adults There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts.
 Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
- In children Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.
- \bullet PRESCRIBING AND DISPENSING INFORMATION Altacite Plus $^{\circledcirc}$ is low in Na $^{+}.$

4.2 Gastric and duodenal ulceration

Peptic ulceration

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

Helicobacter pylori infection

Eradication of Helicobacter pylori reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa associated lymphoid-tissue (MALT) lymphomas. The presence of H. pylori should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin p. 470, and either amoxicillin p. 482 or metronidazole p. 475 can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate H. pylori in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H2-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of *H. pylori* eradication and are **not** recommended.

Tinidazole p. 476 is also used occasionally for H. pylori eradication as an alternative to metronidazole: tinidazole should be combined with antisecretory drugs and other antihactorials

Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated H. pylori associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratobismuthate p. 63, plus tetracycline p. 498, plus metronidazole can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

See under NSAID-associated ulcers for the role of H. pylori eradication therapy in patients starting or taking a NSAID. Also see Dyspepsia p. 57 for *H. pylori* eradication in patients with dyspepsia.

Recommended regimens for Helicobacter pylori eradication **Antibacterial** Acid suppressant Price for 7-day course Amoxicillin Clarithromycin Metronidazole Esomeprazole 20 mg 500 mg twice daily £6.63 1 g twice daily twice daily 250 mg twice daily 400 mg twice daily £4.30 500 mg twice daily Lansoprazole 30 mg 1 g twice daily £5.52 twice daily 1 g twice daily 400 mg twice daily £3.70 400 mg twice daily 250 mg twice daily £3.19 500 mg twice daily Omeprazole 20 mg twice 1 g twice daily £5.36 500 mg 3 times a day 400 mg 3 times a day daily £3.40 250 mg twice daily 400 mg twice daily £3.03 Pantoprazole 40 mg 1 g twice daily 500 mg twice daily £5.48 twice daily 250 mg twice daily 400 mg twice daily £3.15 Rabeprazole sodium 1 g twice daily 500 mg twice daily £6.04 20 mg twice daily 250 mg twice daily 400 mg twice daily £3.71

Test for Helicobacter pylori

¹³C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹³Curea breath test kit for children is available (*Helicobacter Test INFAI for children of the age* 3–11 [®]). However, the appropriateness of testing for *H. pylori* infection in children has not been established.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs. Whenever possible, the NSAID should be **withdrawn** if an ulcer

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal sideeffects, or those with serious co-morbidity (e.g. cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H2-receptor antagonist such as ranitidine p. 65 given at twice the usual dose or misoprostol p. 710 are alternatives. Colic and diarrhoea may limit the dose of misoprostol. Its use is most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID can be discontinued, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a $\rm H_2$ -receptor antagonist or misoprostol p. 710. On healing, patients should be tested for $\rm H.~pylori$ and given

eradication therapy if *H. pylori* is present (see also Test for *Helicobacter pylori*).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur):
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

GASTROPROTECTIVE COMPLEXES AND CHELATORS

Chelates and complexes

Tripotassium dicitratobismuthate p. 63 is a bismuth chelate effective in healing gastric and duodenal ulcers. See under Peptic ulceration p. 61 for the role of tripotassium dicitratobismuthate p. 63 in a *Helicobacter pylori* eradication regimen for those who have not responded to first-line regimens.

The bismuth content of tripotassium dicitratobismuthate p. 63 is low but absorption has been reported; encephalopathy (described with older high-dose bismuth preparations) has not been reported.

Sucralfate p. 63 may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.

Sucralfate

INDICATIONS AND DOSE

Benign gastric ulceration | Benign duodenal ulceration

- ▶ Child 15-17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4-6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime: maximum 8 g per day
- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4-6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per

Tripotassium dicitratobismuthate

INDICATIONS AND DOSE

Eradication failure of Helicobacter pylori infection (in combination with omeprazole, tetracycline and metronidazole)

BY MOUTH

▶ Adult: 120 mg 4 times a day for 2 weeks Benign gastric and duodenal ulceration

BY MOUTH

- ▶ Adult: 240 mg twice daily, alternatively 120 mg 4 times a day both dosage regimens taken for 28 days followed by a further 28 days if necessary, maintenance dose not indicated but course may be repeated after interval of 1 month
- INTERACTIONS → Appendix 1 (tripotassium dicitratobismuthate).
- SIDE-EFFECTS
- ► Common or very common May blacken faeces may darken tongue
- ► Uncommon Constipation · diarrhoea · nausea · pruritus · rash · vomiting
- PREGNANCY Manufacturer advises avoid on theoretical grounds.
- BREAST FEEDING No information available.
- RENAL IMPAIRMENT Avoid in severe impairment.
- DIRECTIONS FOR ADMINISTRATION To be swallowed with half a glass of water. Twice-daily dosage to be taken 30 minutes before breakfast and main evening meal. Fourtimes-daily dosage to be taken as follows: one dose 30 minutes before breakfast, midday meal and main evening meal, and one dose 2 hours after main evening meal.
- PATIENT AND CARER ADVICE Milk should not be drunk by itself during treatment but small quantities may be taken in tea or coffee or on cereal. Antacids, fruit, or fruit juice should not be taken half an hour before or after a dose. Patients and carers should be aware that the patient may develop darkened tongue and blackened faeces.

ELECTROLYTES: May contain Potassium

 De-Noltab (Astellas Pharma Ltd) Tripotassium dicitratobismuthate 120 mg De-Noltab 120mg tablets | 112 tablet P £5.09

H2-RECEPTOR ANTAGONISTS

H₂ -receptor antagonists

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease. H₂-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens.

In adults, H₂-receptor antagonists are used for the treatment of *functional dyspepsia* and may be used for the treatment of *uninvestigated dyspepsia* without alarm features

H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal).

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from *gastroduodenal erosions in hepatic coma*, and possibly in other conditions requiring intensive care. H₂- receptor antagonists also reduce the risk of *acid aspiration* in obstetric patients at delivery (Mendelson's syndrome).

H₂-receptor antagonists

 CAUTIONS Signs and symptoms of gastric cancer CAUTIONS, FURTHER INFORMATION

Gastric cancer H₂-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with 'alarm features' in such cases gastric malignancy should be ruled out before treatment.

- SIDE-EFFECTS
- ► Common or very common Diarrhoea dizziness headache
- ▶ Uncommon Erythema multiforme rash toxic epidermal necrolysis
- Rare Arthralgia · blood disorders · bradycardia · cholestatic jaundice · confusion · depression · hallucinations · hepatitis · leucopenia · myalgia · pancytopenia · psychiatric reactions · thrombocytopenia
- ► Frequency not known Gynaecomastia · impotence

 SIDE-EFFECTS. FURTHER INFORMATION

Psychiatric reactions Psychiatric reactions, including confusion, depression, and hallucinations occur particularly in the elderly or the very ill.

Cimetidine

INDICATIONS AND DOSE

Benign duodenal ulceration

ву моитн

Adult: 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

Benign gastric ulceration

ву моитн

► Adult: 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

NSAID-associated ulceration

BY MOUTH

Adult: 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

Reflux oesophagitis

ву моитн

▶ Adult: 400 mg 4 times a day for 4-8 weeks

Prophylaxis of stress ulceration

ву моитн

▶ Adult: 200-400 mg every 4-6 hours

Gastric acid reduction in obstetrics

BY MOU

 Adult: Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

Gastric acid reduction during surgical procedures

► Adult: 400 mg, to be given 90–120 minutes before induction of general anaesthesia

Short-bowel syndrome

BY MOU

 Adult: 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

To reduce degradation of pancreatic enzyme supplements BY MOUTH

- ► Adult: 0.8–1.6 g daily in 4 divided doses, dose to be taken 1–1½ hours before meals
- INTERACTIONS \rightarrow Appendix 1 (histamine H₂-antagonists).
- SIDE-EFFECTS
- ► Common or very common Malaise
- ► Uncommon Tachycardia
- ► Rare Interstitial nephritis
- ► Very rare alopecia galactorrhoea pancreatitis vasculitis
- PREGNANCY Manufacturer advises avoid unless essential.
- BREAST FEEDING Significant amount present in milk—not known to be harmful but manufacturer advises avoid.
- HEPATIC IMPAIRMENT Reduce dose. Increased risk of confusion.
- RENAL IMPAIRMENT Occasional risk of confusion.
 Reduce dose to 200 mg 4 times daily if eGFR
 30-50 mL/minute/1.73 m². Reduce dose to 200 mg 3 times daily if eGFR 15-30 mL/minute/1.73 m². Reduce dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m².
- EXCEPTIONS TO LEGAL CATEGORY Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

Famotidine

INDICATIONS AND DOSE

Treatment of benign gastric and duodenal ulceration

 Adult: 40 mg once daily for 4-8 weeks, dose to be taken at night

Maintenance treatment of duodenal ulceration

► Adult: 20 mg once daily, dose to be taken at night Reflux oesophagitis

BY MOUTH

- ➤ Adult: 20-40 mg twice daily for 6-12 weeks; maintenance 20 mg twice daily
- INTERACTIONS → Appendix 1 (histamine H₂-antagonists).
- CIDE EFFECTS
- ► Common or very common Constipation
- ► Uncommon fatigue · vomiting · anorexia · dry mouth · flatulence · nausea · taste disorders
- Very rare Chest tightness · interstitial pneumonia · paraesthesia · seizures
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Present in milk—not known to be harmful but manufacturer advises avoid.
- RENAL IMPAIRMENT Use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 mL/minute/1.73 m².
 Seizures reported very rarely.
- EXCEPTIONS TO LEGAL CATEGORY Famotidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink including when they cause sleep disturbance (max. single dose 10 mg, max. daily dose 20 mg).

MEDICINAL FORMS

Ranitidine

INDICATIONS AND DOSE

Benign gastric ulceration | Duodenal ulceration BY MOUTH

- Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- ▶ Child 6 months-2 years: 2-4 mg/kg twice daily
- ► Child 3-11 years: 2-4 mg/kg twice daily (max. per dose 150 mg) for 4-8 weeks
- ➤ Child 12-17 years: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night
- Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

Chronic episodic dyspesia

BY MOUTH

- Child 12-17 years: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night
- Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night continued →

NSAID-associated gastric ulceration

RY MOUTH

- Child 12-17 years: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night
- Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

NSAID-associated duodenal ulcer

BY MOUTH

- ► Child 12-17 years: 300 mg twice daily for 4 weeks, to achieve a higher healing rate
- Adult: 300 mg twice daily for 4 weeks, to achieve a higher healing rate

Prophylaxis of NSAID-associated gastric ulcer | Prophylaxis of NSAID-associated duodenal ulcer

ву моитн

▶ Child 12-17 years: 300 mg twice daily

▶ Adult: 300 mg twice daily

Gastro-oesophageal reflux disease

ву моитн

- Child 12-17 years: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night
- Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

Moderate to severe gastro-oesophageal reflux disease BY MOUTH

- ► Child 12-17 years: 600 mg daily in 2-4 divided doses for up to 12 weeks
- Adult: 600 mg daily in 2-4 divided doses for up to 12 weeks

Long-term treatment of healed gastro-oesophageal reflux disease

BY MOUTH

- ► Child 3-11 years: 2.5-5 mg/kg twice daily (max. per dose 300 mg)
- ► Child 12-17 years: 150 mg twice daily
- ▶ Adult: 150 mg twice daily

Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics

BY MOUTH

- Child 12-17 years: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours
- Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures

INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

Prophylaxis of stress ulceration

INITIALLY BY SLOW INTRAVENOUS INJECTION

 Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

Reflux oesophagitis and other conditions where gastric acid reduction is beneficial

ву моитн

- ► Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- ▶ Child 6 months-2 years: 2-4 mg/kg twice daily
- Child 3-11 years: 2-4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastrooesophageal disease
- Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

Conditions where reduction of gastric acidity is beneficial and oral route not available

BY INTRAMUSCULAR INJECTION

► Adult: 50 mg every 6-8 hours

BY SLOW INTRAVENOUS INJECTION

- Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6−8 hours
- UNLICENSED USE Oral preparations not licensed for use in children under 3 years. Injection not licensed for use in children under 6 months.
- In adults Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.
- INTERACTIONS \rightarrow Appendix 1 (histamine H₂-antagonists).
- SIDE-EFFECTS
- ► Uncommon Blurred vision
- Frequency not known Alopecia · interstitial nephritis · involuntary movement disorders · pancreatitis
- PREGNANCY Manufacturer advises avoid unless essential, but not known to be harmful.
- BREAST FEEDING Significant amount present in milk, but not known to be harmful.

RENAL IMPAIRMENT

- In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m².
- In children Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

- With intravenous use in children For slow intravenous injection dilute to a concentration of 2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 3 minutes.
- With intravenous use in adults For intravenous infusion (Zantac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%.

• PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ranitidine for acid reflux www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement.

 EXCEPTIONS TO LEGAL CATEGORY Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

PROTON PUMP INHIBITORS

Proton pump inhibitors

Proton pump inhibitors are effective short-term treatments for *gastric* and *duodenal ulcers*; they are also used in combination with antibacterials for the eradication of Helicobacter pylori (see specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of *dyspepsia* and *gastro-oesophageal reflux disease*.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers. In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in *Zollinger–Ellison syndrome*; high doses are often required.

Proton pump inhibitors

- DRUG ACTION Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the 'proton pump') of the gastric parietal cell.
- CAUTIONS Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) · may increase the risk of gastro-intestinal infections (including Clostridium difficile infection) · may mask the symptoms of gastric cancer · patients at risk of osteoporosis

CAUTIONS, FURTHER INFORMATION

Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.

Gastric cancer Particular care is required in those presenting with 'alarm features', in such cases gastric malignancy should be ruled out before treatment.

- SIDE-EFFECTS
- ► Common or very common Abdominal pain · constipation · diarrhoea · flatulence · gastro-intestinal disturbances · headache · nausea · vomiting
- Uncommon Arthralgia · dizziness · dry mouth · fatigue · myalgia · paraesthesia · peripheral oedema · pruritus · rash · sleep disturbances
- ▶ Rare Alopecia anaphylaxis blood disorders bronchospasm confusion depression fever gynaecomastia hallucinations hepatitis hypersensitivity reactions hypomagnesaemia (usually after 1 year of treatment, but sometimes after 3 months of treatment) hyponatraemia interstitial nephritis jaundice leucocytosis leucopenia pancytopenia photosensitivity Stevens-Johnson syndrome stomatitis sweating taste disturbance thrombocytopenia toxic epidermal necrolysis visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Rebound acid hypersecretion and protracted dyspepsia may occur after stopping prolonged treatment with a proton pump inhibitor.

- MONITORING REQUIREMENTS Measurement of serummagnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.
- PRESCRIBING AND DISPENSING INFORMATION A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

Esomeprazole

INDICATIONS AND DOSE

NSAID-associated gastric ulcer

ву моитн

- ▶ Adult: 20 mg once daily for 4-8 weeks
- BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
- Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment

ву моитн

- ► Adult: 20 mg daily
- BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
- Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)

BY MOUTH

- Child 1-11 years (body-weight 10-19 kg): 10 mg once daily for 8 weeks
- ► Child 1-11 years (body-weight 20 kg and above): 10-20 mg once daily for 8 weeks
- ➤ Child 12-17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
- Adult: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

 Adult: 40 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Symptomatic treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis)

ву моитн

- Child 1-11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
- ► Child 12-17 years: 20 mg once daily for up to 4 weeks, then 20 mg daily if required
- Adult: 20 mg once daily for up to 4 weeks, then 20 mg daily if required

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

 Adult: 20 mg once daily continue until oral administration possible, injection to be given over at least 3 minutes

Zollinger-Ellison syndrome

BY MOUTH

► Adult: Initially 40 mg twice daily, adjusted according to response; usual dose 80–160 mg daily, daily dose above 80mg should be given in 2 divided doses

Severe peptic ulcer bleeding (following endoscopic treatment)

INITIALLY BY INTRAVENOUS INFUSION

 Adult: Initially 80 mg, to be given over 30 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, then (by mouth) 40 mg once daily for 4 weeks

Helicobacter pylori eradication in combination with clarithromycin and amoxicillin or metronidazole BY MOUTH

► Adult: 20 mg twice daily

- UNLICENSED USE Tablets and capsules not licensed for use in children 1–12 years.
- INTERACTIONS → Appendix 1 (proton pump inhibitors).
- PREGNANCY Manufacturer advises caution—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.

• HEPATIC IMPAIRMENT

- In adults In severe hepatic impairment max. 20 mg daily.
 Severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion. 4 mg/hour for 72 hours.
- ▶ In children 1-11 years max. 10 mg daily in severe impairment. 12-18 years max. 20 mg daily in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in severe renal insufficiency.

DIRECTIONS FOR ADMINISTRATION

With intravenous use in adults For intravenous infusion (Nexium®), give continuously or intermittently in Sodium Chloride 0.9%; reconstitute 40–80 mg with up to 100 ml infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in Sodium Chloride 0.9%.

- With intravenous use in children For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 800 micrograms/mL with Sodium Chloride 0.9%; give over 10–30 minutes.
- With oral use Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

PATIENT AND CARER ADVICE

 With oral use Counselling on administration of gastroresistant capsules, tablets, and granules advised.

Lansoprazole

INDICATIONS AND DOSE

Helicobacter pylori eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

ву моитн

► Adult: 30 mg twice daily

Benign gastric ulcer

ву моитн

▶ Adult: 30 mg once daily for 8 weeks, dose to be taken in the morning

Duodenal ulcer

ву моитн

▶ Adult: 30 mg once daily for 4 weeks, dose to be taken in the morning; maintenance 15 mg once daily

NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer

BY MOUTH

Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed

Prophylaxis of NSAID-associated duodenal ulcer Prophylaxis of NSAID-associated gastric ulcer ву моитн

▶ Adult: 15-30 mg once daily

Zollinger-Ellison syndrome (and other hypersecretory conditions)

BY MOUTH

▶ Adult: Initially 60 mg once daily, adjusted according to response, daily doses of 120 mg or more given in two divided doses

Gastro-oesophageal reflux disease

BY MOUTH

Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15-30 mg once daily, doses to be taken in the morning

Acid-related dyspepsia

ву моитн

- ▶ Adult: 15-30 mg once daily for 2-4 weeks, doses to be taken in the morning
- UNLICENSED USE Lansoprazole doses in BNF may differ from those in product literature.
- INTERACTIONS → Appendix 1 (proton pump inhibitors).
- SIDE-EFFECTS
- ▶ Very rare Colitis raised serum cholesterol raised triglycerides
- ► Frequency not known Anorexia · glossitis · impotence · pancreatitis · petechiae · purpura · restlessness · tremor
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Avoid—present in milk in animal
- HEPATIC IMPAIRMENT. Use half normal dose in moderate. to severe liver disease.
- DIRECTIONS FOR ADMINISTRATION Orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.
- PATIENT AND CARER ADVICE Counselling on administration of orodispersible tablet advised.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Lansoprazole capsules may be prescribed.

INDICATIONS AND DOSE

Helicobacter pylori eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

ву моитн

▶ Adult: 20 mg twice daily

Eradication failure of Helicobacter pylori infection in combination with tripotassium dicitratobismuthate. tetracycline and metronidazole

ву моитн

▶ Adult: 20 mg twice daily

Benign gastric ulceration

BY MOUTH

▶ Adult: 20 mg once daily for 8 weeks, increased if necessary to 40 mg once daily, in severe or recurrent

Duodenal ulceration

▶ Adult: 20 mg once daily for 4 weeks, increased if necessary to 40 mg once daily, in severe or recurrent

Prevention of relapse in gastric ulcer

▶ Adult: 20 mg once daily, increased if necessary to 40 mg once daily

Prevention of relapse in duodenal ulcer

ву моитн

▶ Adult: 20 mg once daily, dose may range between 10-40 mg daily

NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer | NSAID-associated gastroduodenal erosions

▶ Adult: 20 mg once daily for 4 weeks, continued for a further 4 weeks if not fully healed continued → Prophylaxis in patients with a history of NSAID-associated duodenal ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastric ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastroduodenal lesions who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated dyspeptic symptoms who require continued NSAID treatment

ву моитн

► Adult: 20 mg once daily

Gastro-oesophageal reflux disease

BY MOUTH

 Adult: 20 mg once daily for 4 weeks, continued for a further 4–8 weeks if not fully healed; maintenance 20 mg once daily

Gastro-oesophageal reflux disease refractory to other treatment

ву моитн

► Adult: 40 mg once daily for 8 weeks; maintenance 20 mg once daily

Acid reflux disease (long-term management)

 Adult: 10 mg once daily, increased to 20 mg once daily, dose only increased if symptoms return

Acid-related dyspepsia

ву моитн

 Adult: 10-20 mg once daily for 2-4 weeks according to response

Treatment and prevention of benign gastric ulcers | Treatment and prevention of duodenal ulcers | Treatment and prevention of NSAID-associated ulcers | Treatment and prevention of gastro-oesophageal reflux disease

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

► Adult: 40 mg once daily until oral administration possible, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

Major peptic ulcer bleeding (following endoscopic treatment)

INITIALLY BY INTRAVENOUS INFUSION

 Adult: Initially 80 mg, to be given over 40–60 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, subsequent dose then changed to oral therapy

Zollinger-Ellison syndrome

ву моитн

 Adult: Initially 60 mg once daily; usual dose 20-120 mg daily, total daily doses greater than 80 mg should be given in 2 divided doses

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: Initially 60 mg once daily, adjusted according to response, total daily doses greater than 60 mg should be given in 2 divided doses, injection to be given over 5 minutes, infusion to be given over 20–30 minutes
- UNLICENSED USE Treatment of major peptic ulcer bleeding (following endoscopic treatment) is an unlicensed indication.
- INTERACTIONS → Appendix 1 (proton pump inhibitors).
- SIDE-EFFECTS Agitation impotence
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Present in milk but not known to be harmful.
- HEPATIC IMPAIRMENT Not more than 20 mg daily should be needed.
- DIRECTIONS FOR ADMINISTRATION For administration by mouth, swallow whole, or disperse Losec MUPS® tablets in water. or mix capsule contents or Losec MUPS® tablets

- with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should **not** be opened.
- ▶ With intravenous use For intravenous infusion (Losec®), give intermittently or continuously in Glucose 5% or Sodium chloride 0.9%; reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%.
- PATIENT AND CARER ADVICE
- With oral use Counselling on administration advised.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Gastro-resistant omeprazole capsules may be prescribed.

 EXCEPTIONS TO LEGAL CATEGORY Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets.

4.3 Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For mild symptoms of gastro-oesophageal reflux disease, initial management may include the use of antacids and alginates. Alginate-containing antacids can form a 'raft' that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. Histamine H₂-receptor antagonists may relieve symptoms and permit reduction in antacid consumption. However, proton pump inhibitors provide more effective relief of symptoms than H2-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For severe symptoms of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett's oesophagus), initial management involves the use of a **proton pump inhibitor**; patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting

treatment with a histamine H₂-receptor antagonist). However, for endoscopically confirmed *erosive*, *ulcerative*, or *stricturing* disease, or *Barrett's oesophagus*, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

Pregnancy

If dietary and lifestyle changes fail to control gastrooesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 65 can be tried. Omeprazole p. 69 is reserved for women with severe or complicated reflux disease.

Gastro-oesophageal reflux disease in children

Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H₂-receptor antagonist may be needed to reduce acid secretion. If the oesophagitis is resistant to H₂-receptor blockade, the proton pump inhibitor omeprazole p. 69 can be tried.

4.4 Helicobacter pylori diagnosis

DIAGNOSTICS

Urea (13c)

INDICATIONS AND DOSE

Diagnosis of gastro-duodenal *Helicobacter pylori* infection BY MOUTH

Adult: (consult product literature)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► diabact UBT (Seahorse Laboratories Ltd)

Urea [13-C] 50 mg diabact UBT 50mg tablets | 1 tablet PoM

5 Food allergy

Food allergy

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as cow's milk or shellfish should be managed by strict avoidance. The

condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. Sodium cromoglicate p. 234 may be helpful as an adjunct to dietary avoidance.

Gastro-intestinal smooth muscle spasm

ANTIMUSCARINICS

Dicycloverine hydrochloride (Dicyclomine hydrochloride)

The properties listed below are those particular to the drug only. For properties common to the class, see antimuscarinics (systemic), p. 668.

INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ву моитн ▶ Child 6 months-1 year: 5-10 mg 3-4 times a day, dose to
- be taken 15 minutes before feeds ▶ Child 2-11 years: 10 mg 3 times a day
- ▶ Child 12-17 years: 10-20 mg 3 times a day
- ► Adult: 10-20 mg 3 times a day
- CONTRA-INDICATIONS Child under 6 months
- PREGNANCY Not known to be harmful; manufacturer advises use only if essential.
- BREAST FEEDING Avoid—present in milk; apnoea reported in infant.
- EXCEPTIONS TO LEGAL CATEGORY Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Aluminium hydroxide with dicycloverine hydrochloride, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, dicycloverine hydrochloride above, simeticone p. 60.

INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ Child 12-17 years: 10-20 mL every 4 hours as required
- ▶ Adult: 10–20 mL every 4 hours as required

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

 Kolanticon (Peckforton Pharmaceuticals Ltd) Aluminium hydroxide dried 40 mg per 1 ml, Dicycloverine hydrochloride 500 microgram per 1 ml, Magnesium oxide light 20 mg per 1 ml, Simeticone 4 mg per 1 ml Kolanticon gel (sugarfree) | 200 ml P £4.00 (sugar-free) | 500 ml P £6.00

Hyoscine butylbromide

The properties listed below are those particular to the drug only. For properties common to the class, see antimuscarinics (systemic), p. 668.

INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

- ► Child 6-11 years: 10 mg 3 times a day
- ► Child 12-17 years: 20 mg 4 times a day
- ► Adult: 20 mg 4 times a day

Irritable bowel syndrome

BY MOUTH

▶ Adult: 10 mg 3 times a day; increased if necessary up to 20 mg 4 times a day

Acute spasm | Spasm in diagnostic procedures INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

► Adult: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 100 mg per day

Excessive respiratory secretions (in palliative care)

- ► Child 1 month-1 year: 300-500 micrograms/kg 3-4 times a day (max. per dose 5 mg)
- Child 2-4 years: 5 mg 3-4 times a day
- ► Child 5-11 years: 10 mg 3-4 times a day
- ► Child 12-17 years: 10-20 mg 3-4 times a day

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ► Child 1 month-3 years: 300-500 micrograms/kg 3-4 times a day (max. per dose 5 mg)
- ► Child 5-11 years: 5-10 mg 3-4 times a day
- ▶ Child 12-17 years: 10-20 mg 3-4 times a day

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 20 mg every 4 hours if required, increased according to response, up to 20 mg every hour
- BY SUBCUTANEOUS INFUSION

► Adult: 20-120 mg/24 hours Bowel colic (in palliative care)

- ► Child 1 month-1 year: 300-500 micrograms/kg 3-4 times a day (max. per dose 5 mg)
- ► Child 2-4 years: 5 mg 3-4 times a day
- ▶ Child 5-11 years: 10 mg 3-4 times a day
- ► Child 12-17 years: 10-20 mg 3-4 times a day

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ► Child 1 month-3 years: 300-500 micrograms/kg 3-4 times a day (max. per dose 5 mg)
- ▶ Child 5-11 years: 5-10 mg 3-4 times a day
- ▶ Child 12-17 years: 10-20 mg 3-4 times a day BY SUBCUTANEOUS INJECTION

▶ Adult: 20 mg every 4 hours if required, increased according to response, up to 20 mg every hour BY SUBCUTANEOUS INFUSION

▶ Adult: 60-300 mg/24 hours

PHARMACOKINETICS

Administration by mouth is associated with poor absorption.

UNLICENSED USE

- ▶ In children *Tablets* not licensed for use in children under 6 years. *Injection* not licensed for use in children (age range not specified by manufacturer).
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Amount too small to be harmful.

DIRECTIONS FOR ADMINISTRATION

- With oral use in children For administration by mouth, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
- With intravenous use in children For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.
- EXCEPTIONS TO LEGAL CATEGORY Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

ANTISPASMODICS

Antispasmodics

Antimuscarinics

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in *irritable bowel syndrome* and in *diverticular disease*.

Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility. They can be used for the management of *irritable bowel syndrome* and *diverticular disease*. However, their value has not been established and response varies.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p. 1099 and dicycloverine hydrochloride p. 73 and the quaternary ammonium compounds propantheline bromide above and hyoscine butylbromide p. 73. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the bloodbrain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine sulfate and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine sulfate and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Other indications for antimuscarinic drugs include arrhythmias, asthma and airways disease, motion sickness, parkinsonism, urinary incontinence, mydriasis and cycloplegia, premedication, and as an antidote to organophosphorus poisoning.

Other antispasmodics

Alverine citrate below, mebeverine hydrochloride p. 75, and peppermint oil p. 40 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in *irritable bowel syndrome* and *diverticular disease*. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

Alverine citrate

INDICATIONS AND DOSE

Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm | Dysmenorrhoea

ву моитн

- ► Child 12-17 years: 60-120 mg 1-3 times a day
- ► Adult: 60-120 mg 1-3 times a day
- CONTRA-INDICATIONS Paralytic ileus
- SIDE-EFFECTS Dizziness · dyspnoea · headache · hepatitis · nausea · pruritus · rash
- PREGNANCY Use with caution.
- BREAST FEEDING Manufacturer advises avoid—limited information available.

Liver disorders and related conditions

7.1 Biliary disorders

Biliary disorders

Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid ursodeoxycholic acid p. 76 in gallstone disease. Ursodeoxycholic acid is suitable for patients with unimpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to other treatment. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment.

Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain.

A **terpene** mixture (*Rowachol*®) raises biliary cholesterol solubility. It is not considered to be a useful adjunct.

Bile acid sequestrants

Colestyramine p. 173 is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves diarrhoea and pruritus by forming an insoluble complex with bile acids in the intestine.

Dancreatin

Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, gastrectomy, or chronic pancreatitis. Pancreatin may also be necessary if a tumour (e.g. pancreatic cancer) obstructs outflow from the pancreas.

Pancreatin preparations			
Preparation	Protease units	Amylase units	Lipase units

8 Obesity

Obesity

Obesity is associated with many health problems including cardiovascular disease, diabetes mellitus, gallstones and osteoarthritis. Factors that aggravate obesity may include depression, other psychosocial problems, and some drugs.

The main treatment of the obese individual is a suitable diet, carefully explained to the individual, with appropriate support and encouragement; the individual should also be advised to increase physical activity. Smoking cessation (while maintaining body weight) may be worthwhile before attempting supervised weight loss since cigarette smoking may be more harmful than obesity. Attendance at weight loss groups helps some individuals.

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity; the individual should receive advice on diet and lifestyle modification and be monitored for changes in weight as well as in blood pressure, blood lipids and other associated conditions

An anti-obesity drug should be considered only for those with a body mass index (BMI, individual's bodyweight divided by the square of the individual's height) of 30 kg/m² or greater in whom at least 3 months of managed care involving supervised diet, exercise and behaviour modification fails to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of $28\,{\rm kg/m^2}$ or greater. Drugs should never be used as the sole element of treatment. The individual should be monitored on a regular basis; drug treatment should be discontinued if the individual regains weight at any time whilst receiving drug treatment.

Combination therapy involving more than one antiobesity drug is **contra-indicated** by the manufacturers; there is no evidence-base to support such treatment.

Thyroid hormones have **no** place in the treatment of obesity except in biochemically proven hypothyroid patients. The use of diuretics, chorionic gonadotrophin, or amfetamines is **not** appropriate for weight reduction.

Anti-obesity drugs acting on the gastro-intestinal tract

Orlistat p. 78 should be used in conjunction with other lifestyle measures to manage obesity; treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss.

Some of the weight loss in those taking orlistat below probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhoea

Methylcellulose p. 45 is claimed to reduce food intake by producing a feeling of satiety, but there is little evidence to support its use in the management of obesity.

Centrally acting appetite suppressants

Phentermine and diethylpropion are central stimulants; they are not recommended for the treatment of obesity. Phentermine has been associated with a risk of pulmonary hypertension.

Sibutramine, dexfenfluramine, and fenfluramine have been withdrawn because the benefit of treatment does not outweigh the risk of serious adverse effects.

LIPASE INHIBITORS

Orlistat

 DRUG ACTION Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

INDICATIONS AND DOSE

Adjunct in obesity (in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more or in individuals with a BMI of 28 kg/m² or more in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia)

- Adult: 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes), if a meal is missed or contains no fat, the dose of orlistat should be omitted
- CONTRA-INDICATIONS Cholestasis · chronic malabsorption syndrome
- CAUTIONS Chronic kidney disease may impair absorption of fat-soluble vitamins volume depletion

CAUTIONS, FURTHER INFORMATION

Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

- INTERACTIONS → Appendix 1 (orlistat).
- Multivitamins If a multivitamin supplement is required, it should be taken at least 2 hours after orlistat dose or at bedtime.
- SIDE-EFFECTS
- ➤ Common or very common Abdominal distension (gastrointestinal effects minimised by reduced fat intake) • abdominal pain (gastro-intestinal effects minimised by reduced fat intake) • anxiety • faecal incontinence • faecal urgency • flatulence • gingival disorders • headache • hypoglycaemia • liquid stools • malaise • menstrual disturbances • oily leakage from rectum • oily stools • respiratory infections • tooth disorders • urinary tract infection
- ► Frequency not known Bullous eruptions · cholelithiasis · diverticulitis · hepatitis · hypothyroidism · oxalate nephropathy · rectal bleeding
- PREGNANCY Use with caution.
- BREAST FEEDING Avoid—no information available.

9 Rectal and anal disorders

Rectal and anal disorders

Anal and perianal pruritus, soreness, and excoriation are best treated by application of bland ointments and suppositories. These conditions occur commonly in patients suffering from haemorrhoids, fistulas, and proctitis. Cleansing with attention to any minor faecal soiling, adjustment of the diet to avoid hard stools, the use of bulk-forming materials such as bran and a high residue diet are helpful. In proctitis these measures may supplement treatment with corticosteroids or sulfasalazine p. 37.

When necessary, topical preparations containing **local anaesthetics** or **corticosteroids** are used, provided perianal thrush has been excluded. Perianal thrush is treated with a topical antifungal preparation.

Soothing haemorrhoidal preparations

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vasoconstrictors, or mild antiseptics.

Local anaesthetics are used to relieve pain associated with haemorrhoids and pruritus ani but good evidence is lacking. Lidocaine hydrochloride ointment is used before emptying the bowel to relieve pain associated with anal fissure. Alternative local anaesthetics include tetracaine, cinchocaine (dibucaine), and pramocaine (pramoxine), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be avoided, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

Compound haemorrhoidal preparations with corticosteroids Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin.

Rectal sclerosants

Oily phenol injection is used to inject haemorrhoids particularly when unprolapsed.

Anal fissures

The management of *anal fissures* requires stool softening by increasing dietary fibre in the form of bran or by using a bulk-forming laxative. Short-term use of local anaesthetic preparations may help. If these measures are inadequate, the patient should be referred for specialist treatment in hospital. The use of a topical nitrate (e.g. glyceryl trinitrate 0.4% ointment p. 190) may be considered. Before considering surgery, topical diltiazem hydrochloride 2%

may be used twice daily [unlicensed indication] in patients with chronic anal fissures unresponsive to topical nitrates.

Rectal and anal disorders in children

Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this may aggravate the child's fear of defaecation.

9.1 Haemorrhoids

CORTICOSTEROIDS

Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

INDICATIONS AND DOSE

Haemorrhoids | Pruritus ani

BY RECTUM USING OINTMENT

► Adult: Apply twice daily for no longer than 7 days, to be applied morning and night, an additional dose should be applied after a bowel movement

BY RECTUM USING SUPPOSITORIES

- Adult: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement
- CAUTIONS Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)
- PRESCRIBING AND DISPENSING INFORMATION A
 proprietary brand Anusol Plus HC[®] (ointment and
 suppositories) is on sale to the public.

Haemorrhoids | Pruritus ani

BY RECTUM USING OINTMENT

 Adult: Apply twice daily for 5-7 days, apply 3-4 times a day if required, on the first day of treatment, then apply once daily for a few days after symptoms have cleared.

BY RECTUM USING SUPPOSITORIES

 Adult: Initially 1 suppository daily for 5-7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week

Haemorrhoids (severe cases) | Pruritus ani (severe cases) | BY RECTUM USING SUPPOSITORIES

- Adult: Initially 1 suppository 2-3 times a day for 5-7 days, then 1 suppository once daily on alternate days for 1 week
- CAUTIONS Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suppository

► Ultraproct (Meadow Laboratories Ltd)

Cinchocaine hydrochloride 1 mg, Fluocortolone caproate 630 microgram, Fluocortolone pivalate 610 microgram Ultraproct suppositories | 12 suppository PoM £2.15

Ointment

► Ultraproct (Meadow Laboratories Ltd)
Cinchocaine hydrochloride 5 mg per 1 gram, Fluocortolone
caproate 950 microgram per 1 gram, Fluocortolone pivalate 920
microgram per 1 gram Ultraproct ointment | 30 gram [PoM] £4.57

Cinchocaine with hydrocortisone

INDICATIONS AND DOSE

UNIROID-HC® SUPPOSITORIES

Haemorrhoids | Pruritis ani

BY RECTUM

- Child 12-17 years: 1 suppository, insert twice daily and after a bowel movement, do not use for longer than 7 days
- Adult: 1 suppository, insert twice daily and after a bowel movement, do not use for longer than 7 days

PROCTOSEDYL® SUPPOSITORIES

Haemorrhoids | Pruritis ani

BY RECTUM

- Child 12-17 years: 1 suppository, insert suppository night and morning and after a bowel movement, do not use for longer than 7 days
- Adult: 1 suppository, insert suppository night and morning and after a bowel movement, do not use for longer than 7 days

UNIROID-HC® OINTMENT

Haemorrhoids | Pruritus ani

TO THE SKIN OR BY RECTUM

- Child 12-17 years: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days
- Adult: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

PROCTOSEDYL® OINTMENT

Haemorrhoids | Pruritis ani

TO THE SKIN OR BY RECTUM

- Child: Apply twice daily, to be administered morning and night and after a bowel movement, apply externally or by rectum, do not use for longer than 7 days
- Adult: Apply twice daily, to be administered morning and night and after a bowel movement, apply externally or by rectum, do not use for longer than 7 days
- CAUTIONS Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

MEDICINAL FORMS

RECTAL SCLEROSANTS

Phenol

INDICATIONS AND DOSE

Haemorrhoids (particularly when unprolapsed) BY SUBMUCOSAL INJECTION

- ▶ Adult: 2-3 mL, dose (using phenol 5%) to be injected into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time
- SIDE-EFFECTS Irritation tissue necrosis
- PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Oily Phenol Injection, BP consists of phenol 5% in a suitable fixed oil.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cutaneous solution, liquid

Solution for injection

► PHENOL (Non-proprietary)

Phenol 50 mg per 1 ml Oily phenol 5% solution for injection 5ml ampoules | 10 ampoule PoM £47.91-£50.00 Oily phenol 5% solution for injection 2ml ampoules | 10 ampoule PoM £38.03

10 Reduced exocrine secretions

PANCREATIC ENZYMES

Pancreatin

• DRUG ACTION Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

INDICATIONS AND DOSE

PANCREX® V TABLETS

Pancreatic insufficiency

ву моитн

- ▶ Child 2-17 years: 5-15 tablets, to be taken before meals
- ▶ Adult: 5-15 tablets, to be taken before meals

PANCREX® V TABLETS FORTE

Pancreatic insufficiency

BY MOUTH

- ▶ Child 2-17 years: 6-10 tablets, to be taken before meals
- ▶ Adult: 6-10 tablets, to be taken before meals

PANCREX® V

Pancreatic insufficiency

- BY MOLITH
- ▶ Child 1-11 months: 1-2 capsules, contents of capsule to be mixed with feeds
- ► Child 1-17 years: 2-6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food
- ► Adult: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

CREON® 10000

Pancreatic insufficiency

BY MOUTH

- ► Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- ► Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

PANCREASE HL®

Pancreatic insufficiency

- ► Child 15-17 years: Initially 1-2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)
- ▶ Adult: Initially 1-2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

CREON® 40000

Pancreatic insufficiency

ву моитн

- ► Child 2-17 years: Initially 1-2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- ▶ Adult: Initially 1-2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing) continued →

NUTRIZYM 22® GASTRO-RESISTANT CAPSULES

Pancreatic insufficiency

BY MOUTH

Adult: Initially 1-2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing)

CREON® 25000

Pancreatic insufficiency

ву моитн

- Child 2-17 years: Initially 1-2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1-2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON® MICRO Pancreatic insufficiency

Pancieatic insumici

ву моитн

- Child: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing
- Adult: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing

Dose equivalence and conversion

100 mg granules = one measured scoopful (scoop supplied with product).

PANCREX®

Pancreatic insufficiency

ву моитн

- ► Child 2-17 years: 5-10 g, to be taken just before meals, washed down or mixed with milk or water
- Adult: 5-10 g, to be taken just before meals, washed down or mixed with milk or water

PANCREX® V POWDER

Pancreatic insufficiency

ву моитн

- Child: 0.5-2 g, to be taken before or with meals, washed down or mixed with milk or water
- Adult: 0.5-2 g, to be taken before or with meals, washed down or mixed with milk or water

CONTRA-INDICATIONS

PANCREASE HL® Should not be used in children aged 15 years or less with cystic fibrosis

- CAUTIONS Can irritate the perioral skin and buccal mucosa if retained in the mouth • excessive doses can cause perianal irritation
- INTERACTIONS → Appendix 1 (pancreatin).
- SIDE-EFFECTS Abdominal discomfort · hyperuricaemia (associated with very high doses) · hyperuricosuria (associated with very high doses) · mucosal irritation · nausea · skin irritation · vomiting
- PREGNANCY Not known to be harmful.
- DIRECTIONS FOR ADMINISTRATION Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations

are mixed with liquids or food; the resulting mixtures should not be kept for more than one hour. Gastro-resistant granules should be mixed with milk, slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Any left-over food or liquid containing pancreatin should be discarded. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food). Gastric acid secretion may be reduced by giving cimetidine or ranitidine an hour beforehand. Concurrent use of antacids also reduces gastric acidity.

- HANDLING AND STORAGE Hypersensitivity reactions occur occasionally and may affect those handling the powder.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on administration. It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

11 Stoma care

Stoma care

Prescribing for patients with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release preparations are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Laxatives

Enemas and washouts should **not** be prescribed for patients with an ileostomy as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs should be tried. If they are insufficient, as small a dose as possible of senna p. 53 should be used.

Antidiarrhoeals

Drugs such as loperamide hydrochloride p. 56, codeine phosphate p. 360, or co-phenotrope p. 55 (diphenoxylate with atropine) are effective. Bulk-forming drugs may be tried but it is often difficult to adjust the dose appropriately.

Antibacterials should not be given for an episode of acute diarrhoea.

Antacids

The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in these patients.

Diuretics

Diuretics should be used with caution in patients with an ileostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a **potassium-sparing** diuretic.

Digoxin

Patients with a stoma are particularly susceptible to hypokalaemia if on digoxin p. 94 therapy and potassium supplements or a potassium-sparing diuretic may be advisable.

Potassium supplements

Liquid formulations are preferred to modified-release formulations.

Analgesics

Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required paracetamol p. 354 is usually suitable but antiinflammatory analgesics may cause gastric irritation and bleeding.

Iron preparations

Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

Care of stoma

Patients are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

1 Arrhythmias

Arrhythmias

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment

Ectopic beats

If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation

Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate ('rate control') or by attempting to restore and maintain sinus rhythm ('rhythm control'). At any stage if treatment fails to control symptoms, or, if symptoms reoccur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

Acute presentation

All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion has been agreed, intravenous amiodarone hydrochloride p. 88, or alternatively flecainide acetate p. 91, can be used

(amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a betablocker or verapamil hydrochloride p. 156 can be given intravenously.

Cardioversion

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

Drug treatment

Rate control is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with newonset atrial fibrillation, heart failure secondary to atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard betablocker (not sotalol hydrochloride p. 93) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156 as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 94 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled with a combination of two drugs, a rhythmcontrol strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.

If drug treatment is required to maintain sinus rhythm ('rhythm control') post-cardioversion, a standard beta-

blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride p. 93, flecainide acetate p. 91, propafenone hydrochloride p. 92, or amiodarone hydrochloride p. 88; dronedarone p. 90 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochloride should not be given when there is known ischaemic or structural heart disease. Consider amiodarone hydrochloride in patients with left ventricular impairment or heart failure.

Paroxysmal atrial fibrillation

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard betablocker is not appropriate, an oral anti-arrhythmic drug such as dronedarone p. 90 (see NICE guidance), sotalol hydrochloride p. 93, flecainide acetate p. 91, propafenone hydrochloride p. 92, or amiodarone hydrochloride p. 88 can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the 'pill-inthe-pocket' approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to selftreat an episode of atrial fibrillation when it occurs.

Stroke prevention

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; this needs to be balanced with the patient's risk of bleeding; a NICE guideline (NICE clinical guideline 180 (June 2014). Atrial fibrillation: The management of atrial fibrillation) recommends using the CHA₂DS₂-VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA2DS2-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA2DS2-VASc score of 0 for men or 1 for women) do not require an antithrombotic for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulation treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g warfarin sodium p. 121, or in nonvalvular atrial fibrillation with apixaban p. 108, dabigatran etexilate p. 117, or rivaroxaban p. 109. Anticoagulants are also indicated during cardioversion procedures. Aspirin p. 104 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contraindicated or not tolerated, left atrial appendage occlusion can be considered.

Atrial flutter

Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156; an intravenous betablocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 94 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 91 or propafenone hydrochloride p. 92 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156. Amiodarone hydrochloride p. 88 can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

Paroxysmal supraventricular tachycardia

This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring.

If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine p. 87 should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil hydrochloride p. 156 is an alternative, but it should be avoided in patients recently treated with beta-blockers.

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride p. 149, verapamil hydrochloride p. 156, beta-blockers including sotalol hydrochloride p. 93, flecainide acetate p. 91 or propafenone hydrochloride p. 92.

86 Arrhythmias BNF 70

Arrhythmias after myocardial infarction

In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an antiarrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with an intravenous dose of atropine sulfate p. 949 the dose may be repeated if necessary. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine sulfate, adrenaline/epinephrine p. 196 should be given by intravenous infusion, and the dose adjusted according to

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia

Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary resuscitation).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone hydrochloride p. 88 should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone hydrochloride is the preferred drug. Flecainide acetate p. 91, propafenone hydrochloride p. 92, and, although less effective, lidocaine hydrochloride p. 91 have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride p. 93 (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de pointes

Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate p. 858 is usually effective. A beta-blocker (but not sotalol hydrochloride p. 93) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride p. 156), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride p. 88), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride p. 91).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
- · Class II: beta-blockers
- Class III: amiodarone; sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine p. 87 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole p. 107), most side-effects are short lived. Unlike verapamil hydrochloride p. 156, adenosine can be used after a betablocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a **cardiac glycoside** (such as digoxin p. 94) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff- Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular tachycardias. An initial intravenous dose (important: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a **beta-blocker** such as esmolol hydrochloride p. 143 or propranolol hydrochloride p. 146, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 88, **beta-blockers**, disopyramide p. 89, flecainide acetate p. 91, **procainamide** (available from 'special-order' manufacturers or specialist importing companies), and propafenone hydrochloride p. 92.

Supraventricular and ventricular arrhythmias

Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contraindicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson- White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular

fibrillation or pulseless tachycardia unresponsive to other

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steadystate plasma-amiodarone concentration; this is particularly important when drug interactions are likely.

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride p. 93 has a role in the management of ventricular arrhythmias.

Disopyramide p. 89 can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine hydrochloride p. 91), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide acetate p. 91 belongs to the same general class as lidocaine hydrochloride p. 91 and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone hydrochloride p. 92 is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways diseasecontra- indicated if severe).

Drugs for supraventricular arrhythmias include adenosine below, cardiac glycosides, and verapamil hydrochloride p. 156. Drugs for ventricular arrhythmias include lidocaine hydrochloride.

Mexiletine and procainamide are both available from 'special-order' manufacturers or specialist importing companies. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

Ventricular arrhythmias

Intravenous lidocaine hydrochloride can be used for the treatment of ventricular tachycardia in haemodynamically stable patients, and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation, however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride, betablockers, disopyramide, flecainide acetate, procainamide (available from 'special- order' manufacturers or specialist importing companies), and propafenone hydrochloride.

Mexiletine is available from 'special-order' manufacturers or specialist importing companies for treatment of life-threatening ventricular arrhythmias.

Drugs used for Arrhythmias not listed below; Acebutolol, p. 141 · Atenolol, p. 141 · Atropine sulfate, p. 949 · Esmolol hydrochloride, p. 143 · Lidocaine hydrochloride, p. 91 · Metoprolol tartrate, p. 144 · Nadolol, p. 145 · Oxprenolol hydrochloride, p. 145 · Propranolol hydrochloride, p. 146 · Verapamil hydrochloride, p. 156

ANTIARRHYTHMICS

Adenosine

INDICATIONS AND DOSE

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) | Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias BY RAPID INTRAVENOUS INJECTION

▶ Adult: Initially 6 mg, administer into central or large peripheral vein and give over 2 seconds, cardiac monitoring required, followed by 12 mg after 1-2 minutes if required, then 12 mg after 1-2 minutes if required, increments should not be given if high level AV block develops at any particular dose

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) in patients with a heart transplant | Aid to diagnosis of broad or narrow complex supraventricular tachycardias in patients with a heart transplant

▶ Adult: Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by 6 mg after 1-2 minutes if required, then 12 mg after 1-2 minutes if required, patients with a heart transplant are very sensitive to the effects of adenosine

Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

BY INTRAVENOUS INFUSION

BY RAPID INTRAVENOUS INJECTION

► Adult: (consult product literature)

Dose adjustments due to interactions If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

- UNLICENSED USE Adenosine doses in the BNF may differ from those in the product literature.
- CONTRA-INDICATIONS Asthma · chronic obstructive lung disease · decompensated heart failure · long QT syndrome · second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) · severe hypotension
- CAUTIONS Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase). atrial flutter with accessory pathway (conduction down anomalous pathway may increase) · autonomic dysfunction · bundle branch block · first-degree AV block · heart transplant · left main coronary artery stenosis · left to right shunt · pericardial effusion · pericarditis · OTinterval prolongation · recent myocardial infarction · severe heart failure · stenotic carotid artery disease with cerebrovascular insufficiency · stenotic valvular heart disease · uncorrected hypovolaemia
- INTERACTIONS → Appendix 1 (adenosine); also possibility of interaction with drugs tending to impair myocardial conduction.
- SIDE-EFFECTS
- ► Common or very common Angina (discontinue) apprehension · arrhythmia (discontinue if asystole or severe bradycardia occur) · AV block · dizziness · dyspnoea · flushing · headache · nausea · sinus pause
- ▶ Uncommon Blurred vision hyperventilation metallic taste · palpitation · sweating · weakness
- ► Very rare Bronchospasm · injection-site reactions · transient worsening of intracranial hypertension
- ► Frequency not known Cardiac arrest · convulsions · hypotension (discontinue if severe) · respiratory failure (discontinue) · syncope · vomiting

88 Arrhythmias BNF 70

- PREGNANCY Large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING No information available—unlikely to be present in milk owing to short half-life.
- MONITORING REQUIREMENTS Monitor ECG and have resuscitation facilities available.
- DIRECTIONS FOR ADMINISTRATION For rapid intravenous injection give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion, infusion

Solution for injection

ELECTROLYTES: May contain Sodium

► ADENOSINE (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 6mg/2ml solution for injection vials | 6 vial PoM £22.00-£29.24 (Hospital only)

► Adenocor (Sanofi)

Adenosine 3 mg per 1 ml Adenocor 6mg/2ml solution for injection vials | 6 vial PoM £29.94 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

► ADENOSINE (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 30mg/10ml solution for infusion vials | 6 vial PoM £65.00-£85.57 (Hospital only)

► Adenoscan (Sanofi)

Adenosine 3 mg per 1 ml Adenoscan 30mg/10ml solution for infusion vials | 6 vial PoM £85.57

Amiodarone hydrochloride

INDICATIONS AND DOSE

Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolff-Parkinson-White syndrome) (initiated in hospital or under specialist supervision)

ву моитн

 Adult: 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, followed by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia

BY INTRAVENOUS INFUSION

 Adult: Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation

INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 mL Glucose 5%, then (by intravenous injection) 150 mg if required, followed by (by intravenous infusion) 900 mg/24 hours

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in severe conduction disturbances (unless pacemaker fitted) · avoid in sinus node disease (unless pacemaker fitted) · iodine sensitivity · sino-atrial heart block (except in cardiac arrest) · sinus bradycardia (except in cardiac arrest) · thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS

With intravenous use Avoid bolus injection in cardiomyopathy

 avoid bolus injection in congestive heart failure · avoid in
 circulatory collapse · avoid in severe arterial hypotension ·
 avoid in severe respiratory failure

CAUTIONS

GENERAL CAUTIONS

Acute porphyrias p. 864 · conduction disturbances (in excessive dosage) · elderly · heart failure · hypokalaemia · severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS

- With intravenous use Moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) - severe hepatocellular toxicity
- INTERACTIONS → Appendix 1 (amiodarone). Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Use extreme caution or avoid concomitant use of drugs that prolong QT interval. Risk of severe bradycardia or heart block when amiodarone is used in combination with sofosbuvir and daclatasvir for hepatitis C.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Bradycardia · hyperthyroidism · hypothyroidism · jaundice · nausea · persistent slate grey skin discoloration · phototoxicity · pulmonary toxicity (including pneumonitis and fibrosis) · taised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) · reversible corneal microdeposits (sometimes with night glare) · sleep disorders · taste disturbances · tremor · vomiting
- Uncommon Conduction disturbances onset or worsening of arrhythmia - peripheral myopathy (usually reversible on withdrawal) - peripheral neuropathy (usually reversible on withdrawal)
- Very rare Alopecia · aplastic anaemia · ataxia · benign intracranial hypertension · bronchospasm (in patients with severe respiratory failure) · chronic liver disease · cirrhosis · epididymo-orchitis · exfoliative dermatitis · haemolytic anaemia · headache · hypersensitivity · impaired vision due to optic neuritis or optic neuropathy (including blindness) · impotence · rash · sinus arrest · thrombocytopenia · vasculitis · vertigo
- ► Frequency not known Hot flushes hypotension respiratory distress syndrome sweating

SPECIFIC SIDE-EFFECTS

► Common or very common

supervision is required.

- ▶ With intravenous use injection-site reactions
- Very rare
- With intravenous use anaphylaxis on rapid injection

SIDE-EFFECTS, FURTHER INFORMATION

Corneal microdeposits Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if

severe liver function abnormalities or clinical signs of liver disease develop.

Pulmonary toxicity Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone. Peripheral neuropathy Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

- PREGNANCY Possible risk of neonatal goitre; use only if no alternative.
- BREAST FEEDING Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

MONITORING REQUIREMENTS

BNF 70

- Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroidstimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
- Liver function tests required before treatment and then every 6 months.
- Serum potassium concentration should be measured before treatment.
- Chest x-ray required before treatment.
- ► If concomitant use of amiodarone with sofosbuvir and daclatasvir cannot be avoided because other antiarrhythmics are not tolerated or contraindicated, patients should be closely monitored, particularly during the first weeks of treatment.
- Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment.
- Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir should be monitored.
- With intravenous use ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (Cordarone X[®]), give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexphthalate (DEHP).
- With oral use For administration by mouth, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).
- PATIENT AND CARER ADVICE Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

If taking amodarone with sofosbuvir and daclatasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

MEDICINAL FORMS

Disopyramide

INDICATIONS AND DOSE

Prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction | Maintenance of sinus rhythm after cardioversion

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 300-800 mg daily in divided doses
BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 250-375 mg every 12 hours
- CONTRA-INDICATIONS Bundle-branch block associated with first-degree AV block second- and third-degree AV block or bifascicular block (unless pacemaker fitted) severe heart failure (unless secondary to arrhythmia) severe sinus node dysfunction
- CAUTIONS Atrial flutter or atrial tachycardia with partial block · avoid in Acute porphyrias p. 864 · elderly · heart failure (avoid if severe) · myasthenia gravis · prostatic enlargement · structural heart disease · susceptibility to angle-closure glaucoma
- INTERACTIONS → Appendix 1 (disopyramide).
- SIDE-EFFECTS Angle-closure glaucoma · antimuscarinic effects · AV block · blurred vision · cholestatic jaundice · dry mouth · gastro-intestinal irritation · hypoglycaemia · hypotension · myocardial depression · psychosis · urinary retention · ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval)
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester.
- BREAST FEEDING Present in milk—use only if essential.
 Monitor infant for antimuscarinic effects.
- HEPATIC IMPAIRMENT Half-life prolonged—may need dose reduction. Avoid modified-release preparation.
- RENAL IMPAIRMENT Reduce dose by increasing dose interval; adjust according to response. Avoid modifiedrelease preparation.

MONITORING REQUIREMENTS

- Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur).
- Monitor serum potassium.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Dronedarone

 DRUG ACTION Dronedarone is a multi-channel blocking anti-arrhythmic drug.

INDICATIONS AND DOSE

Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision) BY MOUTH

- ► Adult: 400 mg twice daily
- CONTRA-INDICATIONS Atrial conduction defects · bradycardia · complete bundle branch block · distal block · existing or previous heart failure or left ventricular systolic dysfunction · haemodynamically unstable patients · liver toxicity associated with previous amiodarone use · lung toxicity associated with previous amiodarone use · permanent atrial fibrillation · prolonged QT interval · second · or third · degree AV block · sick sinus syndrome (unless pacemaker fitted) · sinus node dysfunction
- CAUTIONS Coronary artery disease · correct hypokalaemia and hypomagnesaemia before starting and during treatment
- INTERACTIONS → Appendix 1 (dronedarone).
- SIDE-EFFECTS
- ► Common or very common Bradycardia gastro-intestinal disturbances heart failure malaise pruritus QT-interval prolongation raised serum creatinine rash
- Uncommon Dermatitis · eczema · erythema · interstitial lung disease (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) · photosensitivity · pneumonitis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) · pulmonary fibrosis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) · taste disturbance
- Rare Liver injury (including life-threatening acute liver failure)

SIDE-EFFECTS, FURTHER INFORMATION

Liver injury Liver injury, including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.

Heart failure New onset or worsening heart failure reported. If heart failure or left ventricular systolic dysfunction develops, discontinue treatment.

- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- Ongoing monitoring should occur under specialist supervision.
- Monitor for heart failure.
- Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
- Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
- Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.

PATIENT AND CARER ADVICE

Heart failure Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Dronedarone for the treatment of non-permanent atrial fibrillation (December 2012) NICE TA197
 Dronedarone is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:

- who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older and
- who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure

Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinicians consider it appropriate to stop. www.nice.org.uk/TA197

MEDICINAL FORMS

Dronedarone (as Dronedarone hydrochloride) 400 mg Multaq 400mg tablets | 20 tablet PoM £22.50 | 60 tablet PoM £67.50

Flecainide acetate

INDICATIONS AND DOSE

AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily) (specialist supervision in hospital) | Ventricular tachyarrhythmias resistant to other treatment (specialist supervision in hospital)

INITIALLY BY SLOW INTRAVENOUS INJECTION

Adult: Initially 2 mg/kg (max. per dose 150 mg), to be given over 10–30 minutes with ECG monitoring, followed by (by intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by intravenous infusion) reduced to 100–250 micrograms/kg/hour for up to 24 hours, maximum cumulative dose of 600 mg in first 24 hours, then transfer to oral treatment

Supraventricular arrhythmias

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: Initially 50 mg twice daily, (by mouth) increased if necessary up to 300 mg daily

BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Adult: 200 mg daily

Ventricular arrhythmias (initiated under direction of hospital consultant)

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

 Adult: Initially 100 mg twice daily for 3-5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients, then (by mouth) maintenance, reduce to the lowest dose that controls the arrhythmia

Dose equivalence and conversion

Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

- UNLICENSED USE Capules, tablets and injections: AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily. Immediate-release tablets only: symptomatic sustained ventricular tachycardia, disabling symptoms of pre-mature ventricular contractions or nonsustained ventricular tachycardia in patients resistant to or intolerant of other therapy. Injection only: ventricular tachyarrhythmias resistant to other treatment.
- CONTRA-INDICATIONS Abnormal left ventricular function atrial conduction defects (unless pacing rescue available) bundle branch block (unless pacing rescue available) control of arrhythmias in acute situations (for modified release forms only) distal block (unless pacing rescue available) haemodynamically significant valvular heart disease heart failure history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia long-standing atrial fibrillation where conversion to sinus rhythm not attempted second-degree or greater AV block (unless pacing rescue available) sinus node dysfunction (unless pacing rescue available)
- CAUTIONS Atrial fibrillation following heart surgeryelderly (accumulation may occur) - patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)
- INTERACTIONS → Appendix 1 (flecainide).

SIDE-EFFECTS

- Common or very common Asthenia dizziness dyspnoea fatigue fever oedema pro-arrhythmic effects visual disturbances
- ► Rare Amnesia · confusion · convulsions · depression · dyskinesia · hallucinations · peripheral neuropathy · pneumonitis
- Frequency not known Anaemia anorexia anxiety ataxia corneal deposits drowsiness flushing gastrointestinal disturbances headache hepatic dysfunction hypersensitivity reactions increased antinuclear antibodies increased sweating insomnia leucopenia paraesthesia photosensitivity rash syncope thrombocytopenia tinnitus tremor urticaria vertigo
- PREGNANCY Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinaemia also reported.
- BREAST FEEDING Significant amount present in milk but not known to be harmful.
- HEPATIC IMPAIRMENT Avoid or reduce dose in severe impairment.
- RENAL IMPAIRMENT Reduce initial oral dose to max.
 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- With intravenous use ECG monitoring and resuscitation facilities must be available.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Tambocor®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Minimum volume in infusion fluids containing chlorides 500 mL.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Lidocaine hydrochloride (Lignocaine hydrochloride)

INDICATIONS AND DOSE

Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)

BY INTRAVENOUS INJECTION

▶ Adult: 1 mg/kg, do not exceed 3 mg/kg over the first hour continued \rightarrow

92 Arrhythmias BNF 70

Ventricular arrhythmias, especially after myocardial infarction in patients without gross circulatory impairment

INITIALLY BY INTRAVENOUS INJECTION

Adult: 100 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Ventricular arrhythmias, especially after myocardial infarction in lighter patients or those whose circulation is severely impaired

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 50 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 50 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

- CONTRA-INDICATIONS All grades of atrioventricular block severe myocardial depression sino-atrial disorders
- CAUTIONS Acute prophyria (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose)
- INTERACTIONS → Appendix 1 (lidocaine).
- SIDE-EFFECTS
- ► Common or very common Bradycardia (may lead to cardiac arrest) · confusion · convulsions · dizziness (particularly if injection too rapid) · drowsiness (particularly if injection too rapid) · hypotension (may lead to cardiac arrest) · paraesthesia (particularly if injection too rapid) · respiratory depression
- ▶ Rare Anaphylaxis
- PREGNANCY Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.
- BREAST FEEDING Present in milk but amount too small to be harmful
- HEPATIC IMPAIRMENT Caution—increased risk of sideeffects
- RENAL IMPAIRMENT Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- MONITORING REQUIREMENTS Monitor ECG and have resuscitation facilities available.

Propafenone hydrochloride

INDICATIONS AND DOSE

Ventricular arrhythmias (specialist supervision in hospital) | Paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated (specialist supervision in hospital) BY MOUTH

- Adult: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 3 days, reduce total daily dose for patients under 70 kg
- ▶ Elderly: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 5 days, reduce total daily dose for patients under 70 kg
- CONTRA-INDICATIONS Atrial conduction defects (unless adequately paced) · Brugada syndrome · bundle branch block (unless adequately paced) · cardiogenic shock (except arrhythmia induced) · distal block (unless adequately paced) · electrolyte disturbances · marked hypotension · myasthenia gravis · myocardial infarction within last 3 months · second degree or greater AV block (unless adequately paced) · severe bradycardia · severe obstructive pulmonary disease (due to weak beta-blocking activity) · sinus node dysfunction (unless adequately paced) · uncontrolled congestive heart failure with left ventricular ejection fraction less than 35%

- INTERACTIONS → Appendix 1 (propafenone).
- SIDE-EFFECTS
- ► Common or very common Bradycardia · abdominal pain · anxiety · atrioventricular block · blurred vision · chest pain · constipation · diarrhoea · dizziness · dry mouth · dyspnoea · headache · intraventricular blocks · malaise · nausea · palpitation · sino-atrial block · sleep disorders · tachycardia · taste disturbance · vomiting
- ► Uncommon Abdominal distension · anorexia · ataxia · erectile dysfunction · flatulence · hypotension · paraesthesia · pro-arrhythmic effects · rash · syncope · thrombocytopenia · vertigo
- ► Frequency not known Agranulocytosis cholestasis confusion · convulsions · extrapyramidal symptoms · granulocytopenia · hepatitis · jaundice · leucopenia · lupus erythematosus-like syndrome · reduced sperm count (reversible on withdrawal) · restlessness
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Use with caution—present in milk.
- PATIENT AND CARER ADVICE May affect performance of skilled tasks e.g. driving.

BETA-ADRENOCEPTOR BLOCKERS

Sotalol hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see Beta-blockers, p. 139.

INDICATIONS AND DOSE

Symptomatic non-sustained ventricular tachyarrhythmias Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

▶ Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160-320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2-3 days

Life-threatening arrhythmias including ventricular tachyarrhythmias (under expert supervision) ву моитн

▶ Adult: Initially 80 mg daily in 1-2 divided doses, then increased to 480-640 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2-3 days

Important safety information

Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (important: particular care is required to avoid hypokalaemia in patients taking sotalol-electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use).

- CONTRA-INDICATIONS Long QT syndrome (congenital or acquired) · torsade de pointes
- CAUTIONS Diarrhoea (severe or prolonged)
- INTERACTIONS Extreme caution or avoid concomitant use of drugs that prolong QT interval.
- SIDE-EFFECTS Arrhythmogenic (pro-arrhythmic) effect (torsade de pointes-increased risk in females)
- BREAST FEEDING Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.
- RENAL IMPAIRMENT Use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10-30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Measurement of corrected OT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

MEDICINAL FORMS

Cardiac glycosides

Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Emergency treatment of poisoning p. 1123). Digoxin-specific antibody p. 1132 fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular

94 Arrhythmias BNF 70

arrhythmias or bradyarrhythmias unresponsive to atropine sulfate p. 949 and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary.

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter. Digoxin also has a role in heart failure.

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is **not** recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasmadigoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea); renal function is the most important determinant of digoxin dosage.

Ünwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

Digoxin

 DRUG ACTION Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

INDICATIONS AND DOSE

Rapid digitalisation, for atrial fibrillation or flutter BY MOUTH

 Adult: 0.75-1.5 mg in divided doses, dose to be given over 24 hours, reduce dose in the elderly

Maintenance, for atrial fibrillation or flutter BY MOUTH

 Adult: Maintenance 125–250 micrograms daily, dose according to renal function and initial loading dose, reduce dose in the elderly

Heart failure (for patients in sinus rhythm) BY MOUTH

 Adult: 62.5–125 micrograms once daily, reduce dose in the elderly

Emergency loading dose, for atrial fibrillation or flutter INITIALLY BY INTRAVENOUS INFUSION

► Adult: Loading dose 0.75-1 mg, to be given over at least 2 hours, then (by mouth) maintenance, start on the following day, reduce dose in the elderly

Dose equivalence and conversion

Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks

When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

- UNLICENSED USE Digoxin doses in the BNF may differ from those in product literature.
- CONTRA-INDICATIONS Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution) hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution) intermittent complete heart block myocarditis second degree AV block supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) ventricular tachycardia or fibrillation
- CAUTIONS Hypercalcaemia (risk of digitalis toxicity) hypokalaemia (risk of digitalis toxicity) hypomagnesaemia (risk of digitalis toxicity) hypoxia (risk
 of digitalis toxicity) recent myocardial infarction severe
 respiratory disease sick sinus syndrome thyroid disease
- INTERACTIONS → Appendix 1 (cardiac glycosides).
- SIDE-EFFECTS
- ► Common or very common Arrhythmias blurred vision conduction disturbances diarrhoea dizziness eosinophilia nausea rash vomiting yellow vision
- ▶ Uncommon Depression
- Very rare Anorexia · apathy · confusion · fatigue · gynaecomastia on long-term use · headache · intestinal ischaemia and necrosis · psychosis · thrombocytopenia · weakness

Overdose If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

- PREGNANCY May need dosage adjustment.
- BREAST FEEDING Amount too small to be harmful.
- RENAL IMPAIRMENT Reduce dose. Monitor plasmadigoxin concentration in renal impairment.

MONITORING REQUIREMENTS

- For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.
- Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For intravenous infusion (Lanoxin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours.
- With oral use For oral administration, oral solution must not be diluted
- PATIENT AND CARER ADVICE Patient counselling is advised for digoxin elixir (use pipette).

2 Bleeding disorders

Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of tranexamic acid, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic hyphaema) and in the management of menorrhagia. Tranexamic acid below may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin p. 574 is used in the management of mild to moderate haemophilia and von Willebrand's disease. It is also used for fibrinolytic response testing.

Etamsylate p. 96 reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.

ANTIFIBRINOLYTICS

Tranexamic acid

INDICATIONS AND DOSE

Inhibition of fibrinolysis (local)

ву моштн

► Adult: 1-1.5 g 2-3 times a day, alternatively 15-25 mg/kg 2-3 times a day

INITIALLY BY SLOW INTRAVENOUS INJECTION

 Adult: 0.5-1 g 2-3 times a day, to be administered at a rate not exceeding 100 mg/minute, dose may be followed by continuous infusion; (by continuous intravenous infusion) 25-50 mg/kg, dose to be given over 24 hours

Menorrhagia

ву моитн

 Adult: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

Hereditary angioedema

ву моитн

Adult: 1-1.5 g 2-3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2-5 days afterwards

Epistaxis

ву моитн

▶ Adult: 1 g 3 times a day for 7 days

General fibrinolysis

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 1 g every 6-8 hours, alternatively 15 mg/kg every 6-8 hours, dose to be given at a rate not exceeding 100 mg/minute
- UNLICENSED USE Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration.
- CONTRA-INDICATIONS Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) · history of convulsions · thromboembolic disease
- CAUTIONS Irregular menstrual bleeding (establish cause before initiating therapy) · massive haematuria (avoid if risk of ureteric obstruction) · patients receiving oral contraceptives (increased risk of thrombosis)

CAUTIONS, FURTHER INFORMATION

Menorrhagia Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

- SIDE-EFFECTS
- ► Common or very common Diarrhoea (reduce dose) nausea vomiting
- ► Uncommon Dermatitis
- ► Rare Impairment of colour vision (discontinue) thromboembolic events · visual disturbances (discontinue)
- ► Frequency not known Convulsions (usually with high doses) hypotension (on rapid intravenous injection) malaise (on rapid intravenous injection)
- PREGNANCY No evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- BREAST FEEDING Small amount present in milk antifibrinolytic effect in infant unlikely.
- RENAL IMPAIRMENT Reduce dose—consult product literature for details.
- MONITORING REQUIREMENTS Regular liver function tests in long-term treatment of hereditary angiodema.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Cyklokapron®), give continuously in Glucose 5% or Sodium chloride 0.9%.

MEDICINAL FORMS

2.1 Coagulation factor deficiencies

BLOOD COAGULATION FACTORS

Dried prothrombin complex (Human prothrombin complex)

INDICATIONS AND DOSE

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available | Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

BY INTRAVENOUS INJECTION

► Adult: (consult haematologist)

Major bleeding in patients on warfarin following phytomenadione

BY INTRAVENOUS INJECTION
► Adult: 25–50 units/kg

- CONTRA-INDICATIONS Angina · history of heparin induced thrombocytopenia · recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)
- CAUTIONS Disseminated intravascular coagulation ·
 history of myocardial infarction or coronary heart disease
 postoperative use · risk of thrombosis
- SIDE-EFFECTS
- ► Rare Headache

- ► Very rare Anaphylaxis antibody formation hypersensitivity reactions pyrexia
- ► Frequency not known Disseminated intravascular coagulation nephrotic syndrome thrombotic events
- HEPATIC IMPAIRMENT Monitor closely in hepatic impairment (risk of thromboembolic complications).
- PRESCRIBING AND DISPENSING INFORMATION Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X. Available from CSL Behring (Beriplex®P/N) Octapharma (Octaplex®)

Factor IX fraction, dried

INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

BY INTRAVENOUS INJECTION OR BY CONTINUOUS INTRAVENOUS INFLISION

- ► Adult: (consult haematologist)
- CONTRA-INDICATIONS Disseminated intravascular coagulation
- CAUTIONS Risk of thrombosis—principally with former low purity products
- SIDE-EFFECTS Allergic reactions · chills · dizziness · fever · gastro-intestinal disturbances · headache
- PRESCRIBING AND DISPENSING INFORMATION Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

Factor VIIa (recombinant) (Eptacog alfa (activated))

INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia

BY INTRAVENOUS INJECTION OR BY CONTINUOUS INTRAVENOUS

- ► Adult: (consult haematologist)
- CAUTIONS Disseminated intravascular coagulation risk of thrombosis
- SIDE-EFFECTS
- ► Uncommon Deep vein thrombosis · fever · pulmonary embolism · rash · venous thromboembolic events
- ▶ Rare Angina · arterial thrombotic events · cerebrovascular accident · coagulation disorders · headache · myocardial infarction · nausea
- ► Frequency not known Anaphylaxis angioedema flushing
- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

NovoSeven (Novo Nordisk Ltd)

Eptacog alfa activated 50000 unit NovoSeven 1mg (50,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £525.20 (Hospital only) NovoSeven 1mg (50,000units) powder and solvent for solution for injection vials | 1 vial PoM £525.20 (Hospital only)

Factor VIII fraction, dried (Human coagulation factor VIII, dried)

INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency | Von Willebrand's disease

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: (consult haematologist)
- CAUTIONS Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates
- SIDE-EFFECTS Anaphylaxis · angioedema · antibody formation · blurred vision · chills · coughing · dizziness · drowsiness · dyspnoea · fever · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypotension · palpitation · paraesthesia · taste disturbances · urticaria
- MONITORING REQUIREMENTS Monitor for development of factor VIII inhibitors.

 PRESCRIBING AND DISPENSING INFORMATION Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor.

BLOOD PRODUCTS

Fresh frozen plasma

INDICATIONS AND DOSE

Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced

BY INTRAVENOUS INFUSION

Adult: (consult haematologist)

Major bleeding in patients on warfarin following phytomenadione

► Adult: 15 mL/kilogram

Dose equivalence and conversion

Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.

- CONTRA-INDICATIONS Avoid use as a volume expander IgA deficiency with confirmed antibodies to IgA
- CAUTIONS Cardiac decompensation need for compatibility • pulmonary oedema • severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG®)
- SIDE-EFFECTS
- ► Common or very common Nausea pruritus rash
- ► Uncommon Oedema · vomiting
- Rare Agitation · allergic reactions · bronchospasm · cardiorespiratory collapse · chills · fever · tachycardia
- ▶ Very rare Arrhythmia hypertension thromboembolism
- PRESCRIBING AND DISPENSING INFORMATION Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood. A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (OctaplasLG®)

Protein C concentrate

INDICATIONS AND DOSE

Congenital protein C deficiency

BY INTRAVENOUS INJECTION

- ► Adult: (consult haematologist)
- CAUTIONS Hypersensitivity to heparins
- SIDE-EFFECTS
- Very rare Bleeding · dizziness · fever · hypersensitivity reactions
- PRESCRIBING AND DISPENSING INFORMATION Protein C is prepared from human plasma.

BNF 70

2.2 Subarachnoid haemorrhage

CALCIUM-CHANNEL BLOCKERS

Nimodipine

The properties listed below are those particular to the drug. For properties common to the class, see Calcium-channel blockers, p. 147.

 DRUG ACTION Nimodipine is a dihydropyridine calciumchannel blocker.

INDICATIONS AND DOSE

Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

ву моитн

 Adult: 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage
BY INTRAVENOUS INFUSION

- ▶ Adult (body-weight up to 70 kg): Initially 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter
- Adult (body-weight 70 kg and above): Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage in patients with unstable blood pressure

BY INTRAVENOUS INFUSION

- Adult: Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter
- CONTRA-INDICATIONS Acute porphyrias p. 864 · unstable angina · within 1 month of myocardial infarction
- CAUTIONS Cerebral oedema · hypotension · severely raised intracranial pressure
- INTERACTIONS → Appendix 1 (calcium-channel blockers, alcohol (infusion only)).
 - Avoid concomitant administration with other calciumchannel blockers, beta-blocker and nephrotoxic drugs.
- SIDE-EFFECTS Flushing · gastro-intestinal disorders · headache · hypotension · ileus · nausea · sweating and feeling of warmth · thrombocytopenia · variation in heartrate
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in milk.
- HEPATIC IMPAIRMENT Elimination reduced in cirrhosis monitor blood pressure.
- RENAL IMPAIRMENT
- With intravenous use Manufacturer advises monitor renal function closely in renal impairment.

DIRECTIONS FOR ADMINISTRATION

Avoid concomitant administration of nimodipine infusion and tablets.

- With oral use For administration by mouth, tablets may be crushed or halved but are light sensitive—administer immediately
- With intravenous use For intravenous infusion, give via drip tubing in Glucose 5% or Sodium chloride 0.9%. Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light. Polyethylene, polypropylene, or glass apparatus should be used. PVC should be avoided.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Nimotop (Bayer Plc)

Solution for infusion

Nimotop (Bayer Plc)

Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 5 vial PoM £68.00 (Hospital only)

3 Blood clots

3.1 Blocked catheters and lines

Drugs used for Blocked catheters and lines not listed below; *Heparin (unfractionated)*, p. 114 · *Urokinase*, p. 119

PROSTAGLANDINS (CARDIOVASCULAR)

Epoprostenol

(Prostacyclin)

 DRUG ACTION Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

INDICATIONS AND DOSE

Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated | Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)

BY CONTINUOUS INTRAVENOUS INFUSION

► Adult: (consult product literature)

PHARMACOKINETICS

Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion

- CONTRA-INDICATIONS Severe left ventricular dysfunction
- CAUTIONS Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension) · extreme caution in coronary artery disease · haemorrhagic diathesis · pulmonary venoocclusive disease · reconstituted solution highly alkaline avoid extravasation (irritant to tissues) · risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)
- INTERACTIONS Caution with concomitant use of drugs that increase risk of bleeding.

CIDE-EFFECTS

- Common or very common Abdominal pain · anxiety · arthralgia · bleeding · bradycardia · chest pain · diarrhoea · flushing · headache · hypotension · jaw pain · nausea · rash · sepsis · tachycardia · thrombocytopenia · vomiting
- ► Uncommon Dry mouth sweating
- ► Very rare Agitation hyperthyroidism malaise pallor
- ► Frequency not known Hyperglycaemia pulmonary oedema (avoid chronic use if occurs during dose titration)
- PREGNANCY Use if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS Anticoagulant monitoring required when given with anticoagulants.
- TREATMENT CESSATION Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension).
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Flolan®), give continuously in Sodium chloride 0.9%; reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for pulmonary hypertension dilute further with glycine buffer diluent only and administer via a central venous catheter (can give via peripheral vein until central venous access established); for renal dialysis may be diluted further with sodium chloride 0.9%; protect infusion from light. For intravenous infusion (Veletri®), give continuously in Sodium chloride 0.9%; reconstitute each vial with 5 mL sodium chloride 0.9% then dilute to required concentration with sodium chloride 0.9% (consult product literature); administer through an in-line 0.22 micron filter; for pulmonary hypertension, administer via a central venous catheter (can give via peripheral vein until central venous access established); protect infusion from direct sunlight.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

3.2 Thromboembolism

Venous thromboembolism

Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism, and occurs as a result of thrombus formation in a vein.

Prophylaxis of venous thromboembolism

All patients admitted to hospital should undergo a risk assessment for venous thromboembolism on admission. Patients considered to be at high risk include those anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, or patients over 60 years. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive pharmacological prophylaxis when the risk of bleeding does not outweigh the risk of venous thromboembolism. NICE clinical guideline 92 (January 2010) provides a full list of risk factors, and gives recommendations for prophylaxis. A venous thromboembolism risk assessment checklist is also available from the Department of Health (www.gov.uk/dh).

Patients scheduled for surgery should be offered mechanical prophylaxis (e.g. anti-embolism stockings) on admission if appropriate; prophylaxis should continue until the patient is sufficiently mobile. Choice of mechanical prophylaxis will depend on factors such as the type of surgery, suitability for the patient, and their condition.

Patients undergoing general or orthopaedic surgery, who are considered to be at high risk of venous thromboembolism, should be offered pharmacological prophylaxis. Choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 114 is preferred for patients in renal failure. Fondaparinux sodium p. 109 is an option for patients undergoing hip or knee replacement surgery, hip fracture surgery, gastro-intestinal, bariatric, or day surgery procedures. The oral anticoagulants apixaban p. 108, dabigatran etexilate p. 117, and rivaroxaban p. 109 are indicated for thromboprophylaxis following hip or knee replacement surgery.

Pharmacological prophylaxis in general surgery should usually continue for 5–7 days, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen or pelvis. Hip or knee replacement surgery, and hip fracture surgery, require an extended duration of pharmacological prophylaxis, depending on the preparation used (consult product literature).

General medical patients who are considered to be at high risk of venous thromboembolism should be offered pharmacological prophylaxis on admission. Choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. Patients should receive either a low molecular weight heparin, heparin (unfractionated) (if patient in renal failure), or fondaparinux sodium prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. antiembolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Treatment of venous thromboembolism

For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 121 is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is ≥ 2 for at least 24 hours). Laboratory monitoring for heparin (unfractionated),

preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

Management of venous thromboembolism in pregnancy

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 112, enoxaparin sodium p. 113, and tinzaparin sodium p. 115. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 1133 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Management of stroke

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

Transient ischaemic attack

Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 104 (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel p. 106 [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke).

Ischaemic stroke

Initial management

Alteplase p. 194 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolytics and the treatment of acute stroke, preferably within a specialist stroke centre. Treatment with aspirin should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patientsnot receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin sodium p. 121 should not be commenced in the acute phase of ischaemic stroke.

Anticoagulants should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency, or in those patients considered for thrombolysis.

Long-term management

Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a transient ischaemic attack, long-term treatment with modified-release dipyridamole in combination with aspirin is recommended. If patients are intolerant of aspirin, or it is contra-indicated, then modified-release dipyridamole p. 107 alone is recommended; if patients are intolerant of dipyridamole, or it is contra-indicated, then aspirin alone is recommended. Patients who are intolerant of both aspirin and dipyridamole should receive clopidogrel alone [unlicensed use].

Following an ischaemic stroke (not associated with atrial fibrillation), clopidogrel is recommended as long-term treatment. If clopidogrel is contra-indicated or not tolerated, patients should receive modified-release dipyridamole in combination with aspirin; if both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with stroke associated with atrial fibrillation should be reviewed for long-term treatment with warfarin sodium or an alternative anticoagulant (see Initial Management under Ischaemic Stroke).

Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation.

A statin should be initiated 48 hours after stroke symptom onset, irrespective of the patient's serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of <130/80 mmHg. Betablockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

Intracerebral haemorrhage

Initial Management

Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped and reversed; anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of

102 Blood clots BNF 70

deep vein thrombosis or pulmonary embolism; placement of a cayal filter is an alternative in this situation.

Long-term management

Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Anticoagulant therapy is not recommended following an intracerebral haemorrhage, even in those with atrial fibrillation, unless the patient is at very high risk of an ischaemic stroke or cardiac ischaemic events; advice from a specialist should be sought in this situation. Blood pressure should be measured and treatment initiated where appropriate, taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

Oral anticoagulants

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Coumarins and phenindione

The oral anticoagulants warfarin sodium p. 121, acenocoumarol p. 120 and phenindione p. 120, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin sodium is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin p. 104 is more appropriate for reduction of risk in transient ischaemic attacks. Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 104) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin sodium can be continued in selected patients currently taking long-term warfarin sodium and who are at high risk of thromboembolism (seek expert advice).

Dose

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

Target INR

The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology guidelines on oral anticoagulation with warfarin—fourth edition. *Br J Haematol* 2011; 154: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:

- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium p. 121)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3
 weeks before cardioversion and anticoagulation should
 continue for at least 4 weeks after the procedure (higher
 target values, such as an INR of 3, can be used for up to

4 weeks before the procedure to avoid cancellations due to low INR)

- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction

INR 3.5 for:

 recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2:

Mechanical prosthetic heart valves:

- the recommended target INR depends on the type and location of the valve, and patient-related risk factors
- consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Duration

The risks of thromboembolism recurrence and anticoagulant-related bleeding should be considered when deciding the duration of anticoagulation.

The following durations of warfarin sodium for the treatment of deep-vein thrombosis and pulmonary embolism reflect the recommendations of the British Society for Haematology (Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; 154: 311–324):

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

Haemorrhage

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. Br J Haematol 2011; 154: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytomenadione p. 889 (vitamin K₁) by slow intravenous injection; give dried prothrombin complex p. 96 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium p. 121; give phytomenadione p. 889 (vitamin K₁) by slow intravenous injection; repeat dose of phytomenadione p. 889 if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin when INR <5.0

- INR 5.0-8.0, minor bleeding-stop warfarin sodium; give phytomenadione (vitamin K₁) by slow intravenous injection; restart warfarin sodium when INR < 5.0
- INR 5.0-8.0, no bleeding-withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance
- · Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Peri-operative anticoagulation

Warfarin sodium should usually be stopped 5 days before elective surgery; phytomenadione (vitamin K₁) by mouth (using the intravenous preparation orally [unlicensed use]) should be given the day before surgery if the INR is >1.5. If haemostasis is adequate, warfarin sodium can be resumed at the normal maintenance dose on the evening of surgery or

Patients stopping warfarin sodium prior to surgery who are considered to be at high risk of thromboembolism (e.g. those with a venous thromboembolic event within the last 3 months, atrial fibrillation with previous stroke or transient ischaemic attack, or mitral mechanical heart valve) may require interim therapy ('bridging') with a low molecular weight heparin (using treatment dose). The low molecular weight heparin should be stopped at least 24 hours before surgery; if the surgery carries a high risk of bleeding, the low molecular weight heparin should not be restarted until at least 48 hours after surgery.

Patients on warfarin sodium who require emergency surgery that can be delayed for 6-12 hours can be given intravenous phytomenadione (vitamin K₁) to reverse the anticoagulant effect. If surgery cannot be delayed, dried prothrombin complex p. 96 can be given in addition to intravenous phytomenadione (vitamin K₁) and the INR checked before surgery.

Combined anticoagulant and antiplatelet therapy

Existing antiplatelet therapy following an acute coronary syndrome or percutaneous coronary intervention should be continued for the necessary duration according to the indication being treated. The addition of warfarin sodium, when indicated (e.g. for venous thromboembolism or atrial fibrillation) should be considered following an assessment of the patient's risk of bleeding and discussion with a cardiologist. The duration of treatment with dual therapy (e.g. aspirin p. 104 and warfarin sodium) or triple therapy (e.g. aspirin with clopidogrel p. 106 and warfarin sodium) should be kept to a minimum where possible. The risk of bleeding with aspirin and warfarin sodium dual therapy is lower than with clopidogrel and warfarin sodium Depending on the indications being treated and the patient's risk of thromboembolism, it may be possible to withhold antiplatelet therapy until warfarin sodium therapy is complete, or vice versa (on specialist advice) in order to reduce the length of time on dual or triple therapy.

Antiplatelet drugs

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin p. 104 in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication, for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in

Clopidogrel p. 106 is licensed for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation; in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation; the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin. Patients who are not already taking clopidogrel should receive a loading dose prior to procedure.

Clopidogrel is also licensed, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor (see also NICE guidance). Clopidogrel also has uses in stroke.

Dipyridamole is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 188, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 188, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

Antiplatelet drugs and coronary stents

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either clopidogrel, prasugrel, or ticagrelor. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent-there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

Glycoprotein IIb/IIIa inhibitors

Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab p. 183 is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin 104 Blood clots BNF 70

(unfractionated) p. 114 and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatide (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 184 (in combination with heparin (unfractionated), aspirin, and clopidogrel) also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction. Tirofiban is also licensed for use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatide p. 183 and tirofiban should be used by specialists only.

Epoprostenol p. 99 is also used to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated.

Parenteral anticoagulants

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as 'standard' or heparin (unfractionated) p. 114 to distinguish it from the low molecular weight heparins, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Low molecular weight heparins

Low molecular weight heparins (dalteparin sodium p. 112, enoxaparin sodium p. 113, and tinzaparin sodium p. 115) are usually preferred over heparin (unfractionated) in the prevention of Venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and once-daily subcutaneous administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the *treatment* of deep vein thrombosis and pulmonary embolism, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see under Acute coronary syndromes p. 186) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Heparinoids

Danaparoid sodium p. 111 is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

Argatroban

An oral anticoagulant can be given with argatroban monohydrate p. 116, but it should only be started once thrombocytopenia has substantially resolved.

Hirudins

Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention—see also Myocardial infarction: ST-segment elevation p. 186).

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol

Epoprostenol (prostacyclin) p. 99 can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

Fondaparinux

Fondaparinux sodium p. 109 is a synthetic pentasaccharide that inhibits activated factor X.

Aspirin (Acetylsalicylic Acid)

INDICATIONS AND DOSE

Cardiovascular disease (secondary prevention)
BY MOUTH

► Adult: 75 mg daily

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) | Management of ST-segment elevation myocardial infarction (STEMI) BY MOUTH

Adult: 300 mg

Suspected transient ischaemic attack

► Adult: 300 mg daily until diagnosis established

Transient ischaemic attack (long-term treatment following in combination with dipyridamole) | Ischaemic stroke not associated with atrial fibrillation (in combination with dipyridamole if clopidogrel contraindicated or not tolerated)

ву моитн

▶ Adult: 75 mg daily

Acute ischaemic stroke

BY MOUTH

 Adult: 300 mg daily for 14 days, to be initiated 24 hours after thrombolysis or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis

Atrial fibrillation following a disabling ischaemic stroke

▶ Adult: 300 mg daily for 14 days

Following disabling ischaemic stroke in patients receiving anticoagulation for a prosthetic heart valve

 Adult: 300 mg daily, anticoagulant treatment stopped for 7 days and to be substituted with aspirin

Following coronary by-pass surgery

▶ Adult: 75-300 mg daily

Mild to moderate pain | Pyrexia

DV MOUTE

 Adult: 300-900 mg every 4-6 hours as required; maximum 4 g per day

BY RECTUA

- ► Adult: 450–900 mg every 4 hours; maximum 3.6 g per
- CONTRA-INDICATIONS Active peptic ulceration · bleeding disorders (antiplatelet dose) · children under 16 years (risk of Reye's syndrome) · haemophilia · previous peptic ulceration (analgesic dose) · severe cardiac failure (analgesic dose)

CONTRA-INDICATIONS, FURTHER INFORMATION

Reye's syndrome Owing to an association with Reye's syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.

- CAUTIONS Allergic disease · anaemia · asthma ·
 dehydration · elderly · G6PD deficiency · preferably avoid
 during fever or viral infection in children (risk of Reye's
 syndrome) · previous peptic ulceration (but manufacturers
 may advise avoidance of low-dose aspirin in history of
 peptic ulceration) · thyrotoxicosis · uncontrolled
 hypertension
- INTERACTIONS → Appendix 1 (aspirin).
 Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS Blood disorders (with analgesic doses) · bronchospasm · confusion (with analgesic doses) · gastro-intestinal haemorrhage (occasionally major) · gastro-intestinal irritation (with slight asymptomatic blood loss at higher doses) · haemorrhage including subconjunctival haemorrhage (reported with antiplatelet doses) · increased bleeding time · skin reactions in hypersensitive patients · tinnitus (with analgesic doses)

Overdose The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.

For specific details on the management of poisoning, see *Aspirin*, under Emergency treatment of poisoning p. 1123.

- ALLERGY AND CROSS-SENSITIVITY Aspirin is contraindicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.
- PREGNANCY Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine

growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.

- BREAST FEEDING Avoid—possible risk of Reye's syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low.
- HEPATIC IMPAIRMENT Avoid in severe impairment increased risk of gastro-intestinal bleeding.
- RENAL IMPAIRMENT Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.
- PRESCRIBING AND DISPENSING INFORMATION BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Aspirin Dispersible Tablets 300 mg may be prescribed.

 EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS

Clopidogrel

INDICATIONS AND DOSE

Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clopidogrel

зү моитн

 Adult: Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation

Transient ischaemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin | Acute ischaemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin

ву моитн

► Adult: 75 mg once daily

Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke

► Adult: 75 mg once daily

Prevention of artherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin)

ву моитн

► Adult: Initially 300 mg, then 75 mg daily for up to 12 months

Prevention of artherothrombotic events in acute myocardial infarction with ST-segment elevation (given with aspirin)

- Adult 18-75 years: Initially 300 mg, then 75 mg for at least 4 weeks
- Adult 76 years and over: 75 mg daily

Prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (with aspirin) and for whom warfarin is unsuitable

ву моитн

► Adult: 75 mg once daily

- UNLICENSED USE 600 mg loading dose prior to percutanous coronary intervention is an unlicensed dose.
 Use in transient ischaemic attack or acute ischaemic stroke, in patients with aspirin hypersensitivity or intolerant of aspirin, is unlicensed.
- CONTRA-INDICATIONS Active bleeding
- CAUTIONS Discontinue 7 days before elective surgery if antiplatelet effect not desirable - patients at risk of increased bleeding from trauma, surgery, or other pathological conditions
- INTERACTIONS → Appendix 1 (clopidogrel).
 Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- ► Common or very common Abdominal pain bleeding disorders (including gastro-intestinal and intracranial) diarrhoea dyspepsia
- ► Uncommon Constipation · decreased platelets · dizziness · duodenal ulcers · eosinophilia · flatulence · gastric ulcer ·

gastritis · headache · leucopenia · nausea · paraesthesia · pruritus · rash · vomiting

- Rare Vertigo
- ➤ Very rare Acquired haemophilia · acute liver failure · agranulocytosis · arthralgia · blood disorders · bronchospasm · colitis · confusion · eosinophilic pneumonia · fever · glomerulonephritis · hallucinations · hepatitis · hypersensitivity-like reactions · interstitial pneumonitis · lichen planus · pancreatitis · pancytopenia · severe thrombocytopenia · Stevens-Johnson syndrome · stomatitis · taste disturbance · thrombocytopenic purpura · toxic epidermal necrolysis · vasculitis
- ALLERGY AND CROSS-SENSITIVITY Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of bleeding). Avoid in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises caution.

NICE technology appraisals (TAs)

 Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease. or
- a myocardial infarction, only if aspirin is contraindicated or not tolerated. www.nice.org.uk/TA210

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only.

The Scottish Medicines Consortium has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

FACTOR Xa INHIBITORS

Apixaban

 DRUG ACTION Apixaban is a direct inhibitor of activated factor X (factor Xa).

INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following knee replacement surgery

ву моитн

Adult: 2.5 mg twice daily for 10−14 days, to be started 12−24 hours after surgery

Prophylaxis of venous thromboembolism following hip replacement surgery

BY MOUTH

 Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

ву моитн

 Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily

Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism

BY MOUTH

 Adult: 2.5 mg twice daily, following completion of 6 months anticoagulant treatment

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age \geq 75 years

BY MOUTH

- ▶ Adult 18-79 years: 5 mg twice daily
- Adult 80 years and over (body-weight up to 61 kg): 2.5 mg twice daily

Dose equivalence and conversion

For information on changing from, or to, other anticoagulants, consult product literature.

- CONTRA-INDICATIONS Active bleeding · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm
- CAUTIONS Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal) · prosthetic heart valve (efficacy not established) · risk of bleeding
- INTERACTIONS → Appendix 1 (apixaban).
 Caution in concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- ► Common or very common Anaemia · bruising · haemorrhage · nausea
- ▶ Uncommon Hypotension rash thrombocytopenia
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Avoid in severe impairment and in hepatic disease associated with coagulopathy.
- RENAL IMPAIRMENT
- When used for prophylaxis of stroke and systemic embolism in atrial fibrillation Reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute, or if serum-

- creatinine \geq 133 micromol/litre and age \geq 80 years or body-weight \leq 60 kg.
- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deepvein thrombosis or pulmonary embolism, and treatment of deepvein thrombosis or pulmonary embolism. Use with caution if creatinine clearance 15–29 mL/minute. Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available.
- MONITORING REQUIREMENTS
- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- ► No routine anticoagulant monitoring required (INR tests are unreliable).
- PRESCRIBING AND DISPENSING INFORMATION Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation. Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults (January 2012) NICE TA245

Apixaban is an option for the prevention of venous thromboembolism in adults after elective hip or knee replacement surgery, www.nice.org.uk/TA245

- Apixaban for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation (February 2013) NICE TA275 Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:
- previous stroke or transient ischaemic attack
- symptomatic heart failure
- age ≥75 years
- diabetes mellitus
- hypertension

The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient. www.nice.org.uk/TA275

 Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015) NICE TA341

Apixaban is an option for the treatment and prevention of recurrent deep vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA341

Fondaparinux sodium

 DRUG ACTION Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery

BY SUBCUTANEOUS INJECTION

► Adult: Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily

Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness

BY SUBCUTANEOUS INJECTION

► Adult: 2.5 mg once daily

Treatment of superficial-vein thrombosis

BY SUBCUTANEOUS INJECTION

 Adult (body-weight 50 kg and above): 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively

Treatment of unstable angina and non-ST-segment elevation myocardial infarction

BY SUBCUTANEOUS INJECTION

 Adult: 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

Treatment of ST-segment elevation myocardial infarction INITIALLY BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

Adult: Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

Treatment of deep-vein thrombosis and pulmonary embolism

BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 50 kg): 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)
- Adult (body-weight 50-100 kg): 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)
- Adult (body-weight 101 kg and above): 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)
- CONTRA-INDICATIONS Active bleeding bacterial endocarditis
- CAUTIONS Active gastro-intestinal ulcer disease · bleeding disorders · brain surgery · elderly patients · low bodyweight · ophthalmic surgery · recent intracranial haemorrhage · risk of catheter thrombus during percutaneous coronary intervention · spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses) · spinal surgery
- INTERACTIONS → Appendix 1 (fondaparinux).
 Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

- ► Common or very common Anaemia bleeding purpura
- ► Uncommon Chest pain · dyspnoea · gastro-intestinal disturbances · hepatic impairment · oedema · pruritus · rash · thrombocythaemia · thrombocytopenia
- ► Rare Anxiety · confusion · cough · dizziness · drowsiness · flushing · headache · hyperbilirubinaemia · hypokalaemia · hypotension · injection-site reactions · vertigo
- Frequency not known Atrial fibrillation · pyrexia · tachycardia
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available.
- BREAST FEEDING Present in milk in animal studies manufacturer advises avoid.
- HEPATIC IMPAIRMENT Caution in severe impairment (increased risk of bleeding).
- RENAL IMPAIRMENT Increased risk of bleeding in renal impairment.
- When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Reduce dose to 1.5 mg daily if eGFR 20-50 mL/minute/1.73 m².
- When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Avoid if eGFR less than 20 mL/minute/1.73 m².
- When used for treatment of venous thromboembolism Use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m².
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Arixtra®), give intermittently in Sodium chloride 0.9%.
 For ST-segment elevation myocardial infarction, add requisite dose to 25-50 mL infusion fluid and give over 1-2 minutes

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Arixtra 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £116.53

Arixtra 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £116.53

Rivaroxaban

• DRUG ACTION Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following knee replacement surgery

ву моитн

► Adult: 10 mg once daily for 2 weeks, to be started 6–10 hours after surgery

Prophylaxis of venous thromboembolism following hip replacement surgery

BY MOUTH

Adult: 10 mg once daily for 5 weeks, to be started 6-10 hours after surgery continued →

110 Blood clots BNF 70

Initial treatment of deep-vein thrombosis | Initial treatment of pulmonary embolism
BY MOUTH

 Adult: Initially 15 mg twice daily for 21 days, to be taken with food

Continued treatment of deep-vein thrombosis (following initial treatment) | Continued treatment of pulmonary embolism (following initial treatment) | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism

ву моитн

Adult: 20 mg once daily, to be taken with food

Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age 2–75 years, or diabetes mellitus

- Adult: 20 mg once daily, to be taken with food Prophylaxis of atherothrombotic events in acute coronary syndrome (with aspirin alone or aspirin and clopidogrel)
- Adult: 2.5 mg twice daily usual duration 12 months
 Dose equivalence and conversion
 For information on changing from, or to, other anticoagulants—consult product literature.
- CONTRA-INDICATIONS Active bleeding in acute coronary syndrome—previous stroke in acute coronary syndrome—transient ischaemic attack malignant neoplasms oesophageal varices recent brain surgery recent gastrointestinal ulcer recent intracranial haemorrhage recent ophthalmic surgery recent spine surgery significant risk of major bleeding vascular aneurysm
- CAUTIONS Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal) · bronchiectasis · prosthetic heart valve (efficacy not established) · risk of bleeding · rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy · severe hypertension · vascular retinopathy
- INTERACTIONS → Appendix 1 (rivaroxaban).
 Caution in concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- Common or very common Abdominal pain · constipation · diarrhoea · dizziness · dyspepsia · haemorrhage · headache · hypotension · nausea · pain in extremities · pruritus · rash · renal impairment · vomiting
- ► Uncommon Angioedema · dry mouth · malaise · syncope · tachycardia · thrombocythaemia
- ► Rare Jaundice oedema
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Avoid in liver disease with coagulopathy.
- RENAL IMPAIRMENT
- When used for treatment of deep-vein thrombosis or pulmonary embolism and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism Initially 15 mg twice daily for 21 days, then 20 mg once daily (but consider reducing to 15 mg once daily if risk of bleeding outweighs risk of recurrent deep-vein thrombosis or pulmonary embolism) if creatinine clearance 15-49 mL/minute.

- When used for prophylaxis of stroke and systemic embolism in atrial fibrillation Reduce dose to 15 mg once daily if creatinine clearance 15-49 mL/minute.
- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery and prophylaxis of atherothrombotic events in acute coronary syndrome Use with caution if creatinine clearance 15–29 mL/minute. Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature).

Avoid if creatinine clearance less than 15 mL/minute; manufacturer recommends Cockroft and Gault formula to calculate creatinine clearance.

MONITORING REQUIREMENTS

- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs
- No routine anticoagulant monitoring required (INR tests are unreliable).
- DIRECTIONS FOR ADMINISTRATION Tablets may be crushed and mixed with water or apple puree just before administration.
- PRESCRIBING AND DISPENSING INFORMATION Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009) NICE TA170

Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery, www.nice.org.uk/TA170

- Rivaroxaban for the prevention of stroke and systemic embolism in atrial fibrillation (May 2012) NICE TA256 Rivaroxaban is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors:
 - previous stroke or transient ischaemic attack
 - congestive heart failure
 - age ≥75 years
 - diabetes mellitus
 - hypertension

The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient. www.nice. org.uk/TA256

- Rivaroxaban for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism (July 2012) NICE TA261 Rivaroxaban is an option for the treatment of deep-vein
 - thrombosis and prevention of recurrent deep-vein thombosis and pulmonary embolism in adults after diagnosis of acute deep-vein thrombosis. www.nice.org.uk/
- Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013) NICE TA287

Rivaroxaban is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA287

► Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome (March 2015) NICE TA335

Rivaroxaban is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers.

The patient's risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the

A decision on continuation of treatment should be taken no later than 12 months after starting treatment. www. nice.org.uk/TA335

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2012) that rivaroxaban (Xarelto®) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in accordance with the licensed indication; use is restricted to patients with poor INR control despite compliance with coumarin anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

HEPARINOIDS

Danaparoid sodium

INDICATIONS AND DOSE

Prevention of deep-vein thrombosis in general or orthopaedic surgery

BY SUBCUTANEOUS INJECTION

► Adult: 750 units twice daily for 7-10 days, initiate treatment before operation, with last pre-operative dose 1-4 hours before surgery

Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

INITIALLY BY INTRAVENOUS INJECTION

- ► Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- Adult (body-weight 55-89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- Adult (body-weight 90 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then

(by continuous intravenous infusion) 200 units/hour for 5 days

- CONTRA-INDICATIONS Active peptic ulcer (unless this is the reason for operation) · acute bacterial endocarditis · diabetic retinopathy · epidural anaesthesia (with treatment doses) · haemophilia and other haemorrhagic disorders · recent cerebral haemorrhage · severe hypertension · spinal anaesthesia (with treatment doses) · thrombocytopenia (unless patient has heparin-induced thrombocytopenia)
- CAUTIONS Antibodies to heparins (risk of antibodyinduced thrombocytopenia) · body-weight over 90 kg · recent bleeding · risk of bleeding
- INTERACTIONS → Appendix 1 (danaparoid). Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS Bleeding hypersensitivity reactions rash
- PREGNANCY Manufacturer advises avoid—limited information available but not known to be harmful.
- BREAST FEEDING Amount probably too small to be harmful but manufacturer advises avoid.
- HEPATIC IMPAIRMENT Caution in moderate impairment (increased risk of bleeding). Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.
- RENAL IMPAIRMENT Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available. Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.
- MONITORING REQUIREMENTS Monitor anti factor Xa activity in patients with body-weight over 90 kg.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Orgaran®), give continuously in Glucose 5% or Sodium chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

 Orgaran (Aspen Pharma Trading Ltd) Danaparoid sodium 1250 unit per 1 ml Orgaran 750units/0.6ml solution for injection ampoules | 10 ampoule Pom £266.73

HEPARINS

Heparins

- CONTRA-INDICATIONS Acute bacterial endocarditis after major trauma · epidural anaesthesia with treatment doses · haemophilia and other haemorrhagic disorders · peptic ulcer · recent cerebral haemorrhage · recent surgery to eye · recent surgery to nervous system · severe hypertension · spinal anaesthesia with treatment doses . thrombocytopenia (including history of heparin-induced
 - thrombocytopenia)
- CAUTIONS Elderly
- INTERACTIONS → Appendix 1 (heparins). Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- ▶ Rare Alopecia (on prolonged use) anaphylaxis angioedema · hyperkalaemia · hypersensitivity reactions · injection-site reactions · osteoporosis (risk lower with low molecular weight heparins) · priapism · rebound hyperlipidaemia (following unfractionated heparin withdrawal) · skin necrosis · urticaria
- ▶ Frequency not known Haemorrhage thrombocytopenia

SIDE-EFFECTS. FURTHER INFORMATION

Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be **stopped** and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity to unfractionated or low molecular weight heparin.
- MONITORING REQUIREMENTS
- Heparin-induced thrombocytopenia Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology's Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. Br J Haematol 2012; 159: 578-540
- Hyperkalaemia Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

Dalteparin sodium

INDICATIONS AND DOSE

FRAGMIN® GRADUATED SYRINGES

Unstable coronary artery disease (including non-STsegment-elevation myocardial infarction)

BY SUBCUTANEOUS INJECTION

 Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin

BY SUBCUTANEOUS INJECTION

- ► Adult (body-weight up to 69 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days)
- Adult: (body-weight up to 79 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days)
- Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days)
- Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days)

FRAGMIN® SINGLE-DOSE SYRINGES

Prophylaxis of deep-vein thrombosis in surgical patients—moderate risk

BY SUBCUTANEOUS INJECTION

► Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

Prophylaxis of deep-vein thrombosis in surgical patients—high risk

BY SUBCUTANEOUS INJECTION

Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by 2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients BY SUBCUTANEOUS INJECTION

► Adult: 5000 units every 24 hours

Treatment of deep-vein thrombosis, with oral anticoagulant treatment | Treatment of pulmonary embolism, with oral anticoagulant treatment

BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 45 kg): 7500 units daily until adequate oral anticoagulation established
- Adult (body-weight 46-56 kg): 10 000 units daily until adequate oral anticoagulation established
- Adult (body-weight 57-68 kg): 12 500 units daily until adequate oral anticoagulation established
- Adult (body-weight 69-82 kg): 15 000 units daily until adequate oral anticoagulation established
- Adult (body-weight 83 kg and above): 18 000 units daily until adequate oral anticoagulation established

Extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours BY SUBCUTANEOUS INJECTION

- Adult (body-weight 40-45 kg): 7500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 46-56 kg): 10 000 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 57-68 kg): 12 500 units once daily for 30 days, then 10 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 69-82 kg): 15 000 units once daily for 30 days, then 12 500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 83-98 kg): 18 000 units once daily for 30 days, then 15 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 99 kg and above): 18 000 units once daily for 30 days, then 18 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Treatment of venous thromboembolism in pregnancy BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 49 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
- Adult (body-weight 50-69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
- Adult (body-weight 70-89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
- Adult (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

FRAGMIN®

Treatment of deep-vein thrombosis, with oral anticoagulant treatment | Treatment of pulmonary embolism, with oral anticoagulant treatment

BY SUBCUTANEOUS INJECTION

 Adult: 200 units/kg daily (max. per dose 18 000 units) until adequate oral anticoagulation established

Treatment of deep-vein thrombosis, with oral anticoagulant treatment (in patients at increased risk of haemorrhage) |
Treatment of pulmonary embolism, with oral anticoagulant treatment (in patients at increase risk of haemorrhage)

BY SUBCUTANEOUS INJECTION

 Adult: 100 units/kg twice daily until adequate oral anticoagulation established

Unstable coronary artery disease

BY SUBCUTANEOUS INJECTION

► Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for 5–8 days

Prevention of clotting in extracorporeal circuits TO THE DEVICE AS A FLUSH

► Adult: (consult product literature)

- UNLICENSED USE Not licensed for treatment of venous thromboembolism in pregnancy.
- PREGNANCY Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.
- BREAST FEEDING Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.
- HEPATIC IMPAIRMENT Dose reduction may be required in severe impairment—risk of bleeding may be increased.
- RENAL IMPAIRMENT Risk of bleeding may be increased—dose reduction may be required. Use of unfractionated heparin may be preferable.

MONITORING REQUIREMENTS

- For monitoring during treatment of deep-vein thrombosis and of pulmonary embolism, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen.
- Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2011) that dalteparin (Fragmin*) is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism and prevention of its recurrence in patients with solid tumours.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

► Fragmin (Pfizer Ltd)

Enoxaparin sodium

INDICATIONS AND DOSE

Treatment of venous thromboembolism in pregnancy BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
- Adult (body-weight 50-69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
- Adult (body-weight 70-89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
- Adult (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk

BY SUBCUTANEOUS INJECTION

 Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)

BY SUBCUTANEOUS INJECTION

► Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients
BY SUBCUTANEOUS INJECTION

▶ Adult: 40 mg every 24 hours

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

BY SUBCUTANEOUS INJECTION

 Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)

INITIALLY BY INTRAVENOUS INJECTION

 Adult 18-74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours

(max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only BY SUBCUTANEOUS INJECTION

▶ Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only

Treatment of acute ST-segment elevation myocardial infarction (patients undergoing percutaneous coronary intervention)

INITIALLY BY INTRAVENOUS INJECTION

Adult 18-74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

INITIALLY BY SUBCUTANEOUS INJECTION

▶ Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours

Unstable angina | Non-ST-segment-elevation myocardial infarction

BY SUBCUTANEOUS INJECTION

► Adult: 1 mg/kg every 12 hours usually for 2-8 days (minimum 2 days)

Prevention of clotting in extracorporeal circuits

TO THE DEVICE AS A FLUSH

► Adult: (consult product literature)

Dose equivalence and conversion 1 mg equivalent to 100 units.

- UNLICENSED USE Not licensed for treatment of venous thromboembolism in pregnancy.
- CAUTIONS Low body-weight (increased risk of bleeding)
- PREGNANCY Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol-avoid.
- BREAST FEEDING Due to the relatively high molecular weight of enoxaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturers advise avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution—no information available.
- RENAL IMPAIRMENT Risk of bleeding increased; reduce dose if eGFR less than 30 mL/minute/1.73 m²—consult product literature for details. Use of unfractionated heparin may be preferable.
- MONITORING REQUIREMENTS Routine monitoring of anti-Factor Xa activity is not usually required during treatment with enoxaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).
- DIRECTIONS FOR ADMINISTRATION When administered in conjunction with a thrombolytic, enoxaparin should be given between 15 minutes before and 30 minutes after the start of thrombolytic therapy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Heparin (unfractionated)

INDICATIONS AND DOSE

Treatment of mild to moderate pulmonary embolism | Treatment of unstable angina | Treatment of acute peripheral arterial occlusion

INITIALLY BY INTRAVENOUS INJECTION

► Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essentialpreferably on a daily basis, and dose adjusted accordingly

Treatment of severe pulmonary embolism

INITIALLY BY INTRAVENOUS INJECTION

Adult: Loading dose 10 000 units, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

Treatment of deep-vein thrombosis

INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, alternatively (by subcutaneous injection) 15 000 units every 12 hours, laboratory monitoring essential-preferably on a daily basis, and dose adjusted accordingly

Thromboprophylaxis in medical patients

BY SUBCUTANEOUS INJECTION

► Adult: 5000 units every 8-12 hours

Thrombophylaxis in surgical patients

BY SUBCUTANEOUS INJECTION

▶ Adult: 5000 units for 1 dose, to be taken 2 hours before surgery, then 5000 units every 8-12 hours

Thromboprophylaxis during pregnancy

BY SUBCUTANEOUS INJECTION

▶ Adult: 5000-10 000 units every 12 hours, to be administered with monitoring, Important: prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management

Haemodialysis

INITIALLY BY INTRAVENOUS INJECTION

► Adult: Initially 1000-5000 units, followed by (by continuous intravenous infusion) 250-1000 units/hour

Prevention of clotting in extracorporeal circuits

TO THE DEVICE AS A FLUSH

► Adult: (consult product literature)

To maintain patency of catheters, cannulas, other indwelling intravenous infusion devices

TO THE DEVICE AS A FLUSH

- ► Adult: 10–200 units, to be flushed through every 4–8 hours, not for therapeutic use
- PREGNANCY Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.
- BREAST FEEDING Not excreted into milk due to high molecular weight.
- HEPATIC IMPAIRMENT Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).
- RENAL IMPAIRMENT Risk of bleeding increased in severe impairment—dose may need to be reduced.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.
- PRESCRIBING AND DISPENSING INFORMATION
 Doses listed take into account the guidelines of the
 British Society for Haematology.

THROMBIN INHIBITORS

Argatroban monohydrate

INDICATIONS AND DOSE

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment

INITIALLY BY CONTINUOUS INTRAVENOUS INFUSION

 Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased to up to 10 micrograms/kg/minute maximum duration of treatment 14 days

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)

BY CONTINUOUS INTRAVENOUS INFUSION

► Adult: (consult product literature)

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)

BY CONTINUOUS INTRAVENOUS INFUSION

- ➤ Adult: Dose should be temporarily reduced to 2 micrograms/kg/minute, and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details
- CAUTIONS Bleeding disorders · diabetic retinopathy · gastro-intestinal ulceration · immediately after lumbar puncture · major surgery (especially of brain, spinal cord, or eye) · risk of bleeding · severe hypertension · spinal anaesthesia
- INTERACTIONS → Appendix 1 (argatroban).
 Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

- ► Common or very common Haemorrhage nausea purpura
- Uncommon Alopecia · constipation · deafness · diarrhoea · dizziness · fever · gastritis · headache · hepatic failure · hepatomegaly · hiccups · hyperbilirubinaemia · hypertension · hypoglycaemia · hyponatraemia · hypotension · malaise · muscle weakness · myalgia · rash · renal impairment · sweating · syncope · tachycardia · visual disturbance · vomiting
- PREGNANCY Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING Avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce initial dose to 500 nanograms/kg/minute in moderate impairment. Avoid in severe impairment *or* in patients with hepatic impairment undergoing percutaneous coronary intervention.
- MONITORING REQUIREMENTS Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Exembol) give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute each 2.5-mL vial with 250 mL infusion fluid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

Exembol (Mitsubishi Pharma Europe Ltd)

Argatroban monohydrate 100 mg per 1 ml Exembol 250mg/2.5ml concentrate for solution for infusion vials | 1 vial Pom no price available

Bivalirudin

 DRUG ACTION Bivalirudin, a hirudin analogue, is a thrombin inhibitor.

INDICATIONS AND DOSE

Unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention (in addition to aspirin and clopidogrel)
INITIALLY BY INTRAVENOUS INJECTION

► Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 250 micrograms/kg/hour (for up to 72 hours in medically managed patients)

Unstable angina or non-ST-segment elevation myocardial infarction (in addition to aspirin and clopidogrel) in patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiooulmonary bypass

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 100 micrograms/kg for 1 dose, then (by intravenous injection) 500 micrograms/kg for 1 dose, then (by intravenous infusion) 1.75 mg/kg/hour for duration of procedure; (by intravenous infusion) reduced to 250 micrograms/kg/hour for 4-12 hours as necessary following percutaneous coronary intervention, for patients proceeding to coronary artery bypass surgery with cardiopulmonary bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin

Anticoagulation in patients undergoing percutaneous coronary intervention including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention (in addition to aspirin and clopidogrel)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 750 micrograms/kg, followed immediately by (by intravenous infusion)
 1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour may be continued for a further 4–12 hours if necessary
- CONTRA-INDICATIONS Active bleeding bleeding disorders severe hypertension subacute bacterial endocarditis
- CAUTIONS Brachytherapy procedures · previous exposure to lepirudin (theoretical risk from lepirudin antibodies)
- INTERACTIONS → Appendix 1 (bivalirudin).
 Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- ► Common or very common Bleeding (discontinue) ecchymosis
- ► Uncommon Allergic reactions · anaemia · headache · hypotension · isolated reports of anaphylaxis · nausea · thrombocytopenia
- ► Rare Back pain · bradycardia · dyspnoea · tachycardia · thrombosis · yomiting
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises caution—no information available.
- RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².
- ▶ When used for percutaneous coronary intervention Reduce rate of infusion to 1.4 mg/kg/hour and monitor blood clotting parameters if eGFR 30-60 mL/minute/1.73 m².
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Angiox®), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

▶ Bivalirudin for the treatment of ST-segment elevation myocardial infarction (July 2011) NICE TA230
Bivalirudin in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. www.nice.org.uk/TA230

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2008) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

The Scottish Medicines Consortium has advised (August 2010) that bivalirudin $(Angiox^{\otimes})$ is accepted for restricted use within NHS Scotland as an anticoagulant in patients undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

 Adult: 110-150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Treatment of deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Treatment of pulmonary embolism in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent pulmonary embolism in patients receiving concomitant treatment with verapamil

BY MOUTH

► Adult: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension

▶ Adult 18-74 years: 150 mg twice daily

► Adult 75-79 years: 110-150 mg twice daily

► Adult 80 years and over: 110 mg twice daily

Prophylaxis of stroke and systemic embolism in nonvalvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension in patients receiving concomitant treatment with verapamil

ву моитн

► Adult: 110 mg twice daily

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension, in patients at increased risk of bleeding | Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension, in patients with moderate renal impairment

BY MOUTH

Adult: 110–150 mg twice daily
 Dose equivalence and conversion
 For information on changing from, or to, other anticoagulants, consult product literature.

- CONTRA-INDICATIONS Active bleeding · do not use as anticoagulant for prosthetic heart valve · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular analysm
- CAUTIONS Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor

neurological signs) · bacterial endocarditis · bleeding disorders · body-weight less than 50 kg · elderly · gastritis · gastro-oesophageal reflux · oesophagitis · recent biopsy · recent major trauma · thrombocytopenia

INTERACTIONS → Appendix 1 (dabigatran).
 Caution in concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

- ► Common or very common Abdominal pain · anaemia · diarrhoea · dyspepsia · haemorrhage · nausea
- Uncommon Dysphagia · gastro-intestinal ulcer · gastrooesophageal reflux · hepatobiliary disorders · oesophagitis · thrombocytopenia · vomiting
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid in severe liver disease, especially if prothrombin time already prolonged.

RENAL IMPAIRMENT

- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery Reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; reduce dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil.
- When used for treatment of deep-vein thrombosis and pulmonary embolism, prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation Consider reduced dose of 110 mg twice daily if creatinine clearance 30–50 mL/minute, based on individual assessment of thromboembolic risk and risk of bleeding. Avoid if creatinine clearance less than 30 mL/minute. In renal impairment monitor renal function at least annually (manufacturer recommends Cockroft and Gault formula to calculate creatinine clearance).

MONITORING REQUIREMENTS

- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).
- Assess renal function (manufacturer recommends Cockroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly.
- DIRECTIONS FOR ADMINISTRATION When given concomitantly with amiodarone or verapamil, doses should be taken at the same time.
- PRESCRIBING AND DISPENSING INFORMATION Dabigatran etexilate, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; it is also licensed for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism in adults. Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation, and longer duration of treatment should be based on permanent risk factors, or idiopathic deepvein thrombosis or pulmonary embolism.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008) NICE TAL57
 Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip

replacement or total knee replacement surgery. www.nice.

 Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012)

Dabigatran etexilate is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:

- previous stroke, transient ischaemic attack, or systemic embolism
- left ventricular ejection fraction <40%
- symptomatic heart failure
- age >75 years
- age ≥65 years in patients with diabetes mellitus, coronary artery disease, or hypertension

The risks and benefits of dabigatran compared to warfarin should be discussed with the patient. www.nice.org.uk/

 Dabigatran etexilate for the treatment and secondary prevention of deep vein thrombosis and /or pulmonary embolism (December 2014) NICE TA327

Dabigatran etexilate is recommended, within its marketing authorisation, as an option for treating and for preventing recurrent deep vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA327

TISSUE PLASMINOGEN ACTIVATORS

Urokinase

The properties listed below are those particular to the drug only. For properties common to the class, see fibrinolytics, p. 194.

INDICATIONS AND DOSE

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

BY INTRAVENOUS INFUSION

► Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

Pulmonary embolism (thromboembolic occlusive vascular disease)

BY INTRAVENOUS INFUSION

 Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

Occlusive peripheral arterial disease (thromboembolic occlusive vascular disease)

BY INTRA-ARTERIAL INFUSION

► Adult: (consult product literature)

Occluded central venous catheters

BY INTRAVENOUS INJECTION

 Adult: Inject directly into occluded catheter, to be dissolved in sodium chloride 0.9% to a concentration of 5000 units/mL; use a volume sufficient to fill the catheter lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

Occluded arteriovenous haemodialysis shunts

BY INTRAVENOUS INFUSION OR BY INTRA-ARTERIAL INFUSION

► Adult: (consult product literature)

SYNER-KINASE®

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

BY INTRAVENOUS INFUSION

► Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 ml sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

Pulmonary embolism (thromboembolic occlusive vascular disease)

INITIALLY BY INTRAVENOUS INFUSION

Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 ml sodium chloride 0.9%, followed by (by intravenous infusion) 4400 micrograms/kg/hour for 12 hours, alternatively (by intra-arterial injection) initially 15 000 units/kg, to be injected into pulmonary artery, subsequent doses adjusted according to response; maximum 3 doses per day

Occlusive peripheral arterial disease

BY INTRA-ARTERIAL INFUSION

► Adult: (consult product literature)

Occluded catheters and cannulas

BY INTRA-ARTERIAL INJECTION OR BY INTRAVENOUS INJECTION

Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume

of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Dose reduction may be required.
- RENAL IMPAIRMENT Dose reduction may be required.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Syner-KINASE®), give continuously or intermittently in Sodium chloride 0.9%.

VITAMIN K ANTAGONISTS

Vitamin K antagonists

- CONTRA-INDICATIONS Avoid use within 48 hours postpartum haemorrhagic stroke significant bleeding
- CAUTIONS Bacterial endocarditis (use only if warfarin otherwise indicated) conditions in which risk of bleeding

is increased · history of gastrointestinal bleeding · peptic ulcer · postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) · recent ischaemic stroke · recent surgery · uncontrolled hypertension

INTERACTIONS → Appendix 1 (coumarins, phenindione).
 Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may affect warfarin control.

Caution if concomitant use of drugs that increase risk of bleeding. Avoid cranberry juice.

- SIDE-EFFECTS Alopecia · diarrhoea · haemorrhage · hepatic dysfunction · jaundice · nausea · pancreatitis · purpura · pyrexia · rash · skin necrosis (increased risk in patients with protein C or protein S deficiency) · vomiting · 'purple toes'
- CONCEPTION AND CONTRACEPTION Women of childbearing age should be warned of the danger of teratogenicity.
- PREGNANCY Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.

MONITORING REQUIREMENTS

- The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
- ► It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response), then up to every 12 weeks.
- Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.
- PATIENT AND CARER ADVICE Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from: 3M Security Print and Systems Limited

GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. In Scotland, treatment booklets and starter information packs can be obtained by emailing stockorders. dppas@theapsgroup.com or by fax on (0131) 6299 967 Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

Acenocoumarol

(Nicoumalone)

INDICATIONS AND DOSE

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

BY MOUTH

- Adult: Initially 2-4 mg once daily for 2 days, alternatively initially 6 mg on day 1, then 4 mg on day 2; maintenance 1-8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, liver disease, severe heart failure with hepatic congestion, and malnutrition
- CAUTIONS Patients over 65 years
- SIDE-EFFECTS
- ▶ Rare Anorexia
- ▶ Very rare Vasculitis
- BREAST FEEDING Risk of haemorrhage; increased by vitamin k deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).
- HEPATIC IMPAIRMENT Use with caution in mild to moderate impairment. Avoid in severe impairment, especially if prothrombin time is already prolonged.
- RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.
- PATIENT AND CARER ADVICE Anticoagulant card to be provided.

Phenindione

INDICATIONS AND DOSE

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism

BY MOUTH

- ► Adult: Initially 200 mg on day 1, then 100 mg on day 2, then, adjusted according to response; maintenance 50–150 mg daily
- SIDE-EFFECTS Agranulocytosis · eosinophilia · exanthema · exfoliative dermatitis · fever · hypersensitivity reactions · leucopenia · micro-adenopathy · renal damage · urine coloured pink or orange
- BREAST FEEDING Avoid. Risk of haemorrhage; increased by vitamin K deficiency.
- HEPATIC IMPAIRMENT Avoid in severe impairment, especially if prothrombin time is already prolonged.
- RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.

• PATIENT AND CARER ADVICE Anticoagulant card to be provided. Patient counselling is advised for phenindione tablets (may turn urine pink or orange).

Warfarin sodium

INDICATIONS AND DOSE

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic

BY MOUTH

- ▶ Adult: Initially 5-10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time, reported as INR (international normalised ratio), a lower induction dose can be given over 3-4 weeks in patients who do not require rapid anticoagulation, elderly patients to be given a lower induction dose; maintenance 3-9 mg daily, to be taken at the same time each day
- PREGNANCY Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytomenadione (vitamin K₁).
- BREAST FEEDING Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.
- HEPATIC IMPAIRMENT Avoid in severe impairment, especially if prothrombin time is already prolonged.
- RENAL IMPAIRMENT Use with caution in mild to moderate impairment. In severe renal impairment, monitor INR more frequently.
- PATIENT AND CARER ADVICE Anticoagulant card to be provided.

Blood pressure conditions

4.1 Hypertension

Hypertension

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment, Advice on antihypertensive therapy in this section takes into account the recommendations of NICE clinical guidance 127 (August 2011), Hypertension-Clinical management of primary hypertension in adults.

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

Thresholds and targets for treatment

Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

Stage 1 hypertension:

- Clinic blood pressure 140/90 mmHg or higher, and ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk >20%: in the absence of these conditions, advise lifestyle changes and review annually. For patients under 40 years with stage 1 hypertension but no overt targetorgan damage, cardiovascular disease, renal disease, or diabetes, consider seeking specialist advice for evaluation of secondary causes of hypertension

Stage 2 hypertension:

- Clinic blood pressure 160/100 mmHg or higher, and ambulatory daytime average or home blood pressure average 150/95 mmHg or higher
- · Treat all patients who have stage 2 hypertension, regardless of age
- Severe hypertension:
- Clinic systolic blood pressure ≥180 mmHg or clinic diastolic blood pressure ≥110 mmHg; treat promptly see Hypertensive Crises p. 123.

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient's waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly p. 122. A target clinic blood pressure below

130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drug treatment of hypertension

A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment. Response to drug treatment may be affected by age and ethnicity.

Patients under 55 years:

Step 1

- ACE inhibitor; if not tolerated, offer an angiotensin-II receptor antagonist. If both ACE inhibitors and angiotensin-II receptor antagonists are contraindicated or not tolerated, consider a beta-blocker; beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes
- Step 2
- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker. If a calcium-channel blocker is not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide). If a beta-blocker was given at Step 1, add a calcium channel blocker in preference to a thiaziderelated diuretic (see Step 1)

Step 3

 ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker and a thiazide-related diuretic

Step 4 (resistant hypertension)

- · Consider seeking specialist advice
- Add low-dose spironolactone [unlicensed indication], or use high-dose thiazide related diuretic if plasmapotassium concentration above 4.5 mmol/litre
- Monitor renal function and electrolytes
- If additional diuretic therapy is contra-indicated, ineffective, or not tolerated, consider an alpha-blocker or a beta-blocker

Patients over 55 years, and patients of any age who are of African or Caribbean family origin: Step 1

 Calcium-channel blocker; if not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide)

Step 2

 Calcium-channel blocker or thiazide-related diuretic in combination with an ACE inhibitor or angiotensin-II receptor antagonist (an angiotensin-II receptor antagonist in combination with a calcium-channel blocker is preferred in patients of African or Caribbean family origin)

Steps 3 and 4

· Treat as for patients under 55 years

Other measures to reduce cardiovascular risk

Aspirin p. 104 reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated,

aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit. Aspirin also has a role in the prevention of stroke in patients with atrial fibrillation.

Statins are also of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease.

Hypertension in the elderly

Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. If patients are aged over 80 years when diagnosed with stage 1 hypertension, the decision to treat should be based on the presence of other comorbidities; patients with stage 2 hypertension should be treated as for patients over 55 years. A target clinic blood pressure below 150/90 mmHg is suggested for patients over 80 years; the suggested target ambulatory or home blood pressure average (during the patient's waking hours) is below 145/85 mmHg.

Isolated systolic hypertension

Isolated systolic hypertension (systolic pressure ≥ 160 mmHg, diastolic pressure < 90 mmHg) is common in patients over 60 years, and is associated with an increased cardiovascular disease risk; it should be treated as for patients with both a raised systolic and diastolic blood pressure. Patients with severe postural hypotension should be referred to a specialist.

Hypertension in diabetes

For patients with diabetes, a target clinic blood pressure below 140/80 mmHg is suggested (below 130/80 mmHg is advised if kidney, eye, or cerebrovascular disease are also present). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy; in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

Hypertension in renal disease

A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

Hypertension in pregnancy

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.

Labetalol hydrochloride p. 143 is widely used for treating hypertension in pregnancy. Methyldopa p. 138 is considered safe for use in pregnancy. Modified-release preparations of nifedipine p. 154 [unlicensed] are also used.

BNF 70

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 104 once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged \geq 40 years, pregnancy interval >10 years, BMI \geq 35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg, should receive initial treatment with oral labetalol hydrochloride to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80-100 mmHg. If labetalol hydrochloride is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of ≥160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 157, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80-100 mmHg.

Also see use of magnesium sulfate in pre-eclampsia and eclampsia p. 858.

Hypertensive crises

If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A hypertensive emergency is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitroprusside p. 161 [unlicensed], nicardipine hydrochloride p. 153, labetalol hydrochloride p. 143, glyceryl trinitrate p. 190, phentolamine mesilate p. 161, hydralazine hydrochloride

p. 157, or esmolol hydrochloride p. 143; choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure ≥ 180/110 mmHg) without acute target-organ damage is defined as a hypertensive urgency; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol hydrochloride, or the calciumchannel blockers amlodipine p. 148 or felodipine p. 151. Use of sublingual nifedipine is not recommended.

Also see advice on short-term management of hypertensive episodes in phaeochromocytoma.

Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred.

Phenoxybenzamine hydrochloride p. 161, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. Phentolamine mesilate p. 161 is a short-acting alphablocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metirosine (available from 'special-order' manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should not be used to treat essential hypertension.

Antihypertensive drugs

Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 157 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 161 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 158 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 201, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 674, doxazosin p. 673, and terazosin p. 675 have alpha-blocking and vasodilator properties. Ambrisentan p. 162, bosentan p. 163, iloprost p. 164, macitentan p. 163, sildenafil p. 699, and tadalafil p. 700 are

mactientan p. 163, sildenafil p. 699, and tadalafil p. 700 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 90 can be used in patients with primary pulmonary hypertension resistant to other

treatments. Bosentan p. 163 is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease. Riociguat p. 163 is licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

Sitaxentan has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

Centrally acting antihypertensive drugs

Methyldopa p. 138 is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 137 has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine p. 138, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

Guanethidine monosulfate p. 162, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred.

Alpha-adrenoceptor blocking drugs

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin p. 673, and terazosin have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

Prostatic hyperplasia

Alfuzosin hydrochloride p. 672, doxazosin, indoramin, prazosin, tamsulosin hydrochloride p. 674, and terazosin are indicated for benign prostatic hyperplasia.

Drugs affecting the reninangiotensin system

Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

Heart Failure

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 168 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide p. 201 80 mg daily or more).

Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

Hypertension

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

Diabetic nephropathy

ACE inhibitors have a role in the management of diabetic nephropathy.

Prophylaxis of cardiovascular events

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

Initiation under specialist supervision

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin-II receptor antagonist or aliskiren;
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

Renal effects

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe

unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

Cautions

ACE inhibitors need to be initiated with care in patients receiving diuretics.

Concomitant diuretics

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide p. 201 or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Combination products

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

Angiotensin-II receptor antagonists

Azilsartan medoxomil p. 132, candesartan cilexetil p. 133, eprosartan p. 133, irbesartan p. 133, losartan potassium p. 134, olmesartan medoxomil p. 135, telmisartan p. 136, and valsartan p. 136 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under ACE Inhibitors, above).

Renin inhibitor

Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

Concomitant use of drugs affecting the reninangiotensin system

Combination therapy with two drugs affecting the reninangiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 158 is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

Drugs used for Hypertension not listed below;

Chlortalidone, p. 204 · Cyclopenthiazide, p. 204 · Doxazosin. p. 673 · Furosemide, p. 201 · Indoramin, p. 673 · Metolazone, p. 205 · Prazosin, p. 674 · Spironolactone, p. 168 · Terazosin, p. 675 · Torasemide, p. 202 · Xipamide, p. 205

ANGIOTENSIN-CONVERTING ENZYME INHIBITORS

Angiotensin-converting enzyme inhibitors

• CAUTIONS Afro-Caribbean patients (may respond less well to ACE inhibitors) · concomitant diuretics · first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) · peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) · primary aldosteronism (patients may respond less well to ACE inhibitors) • the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) · use with care (or avoid) in those with a history of idiopathic or hereditary angioedema · use with care in patients with hypertrophic cardiomyopathy · use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

CAUTIONS, FURTHER INFORMATION

Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate: they should also be withheld before desensitisation with wasp or bee venom.

- INTERACTIONS → Appendix 1 (ACE inhibitors).
- SIDE-EFFECTS Pruritus · abdominal pain · altered liver function tests · angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients) · arthralgia · blood disorders · bronchospasm · cholestatic jaundice ·

constipation · diarrhoea · dizziness · dyspepsia · eosinophilia · fatigue · fever · fulminant hepatic necrosis · haemolytic anaemia · headache · hepatic failure · hepatitis · hyperkalaemia · hypoglycaemia · leucocytosis · leucopenia · malaise · myalgia · nausea · neutropenia · pancreatitis · paraesthesia · persistent dry cough · photosensitivity · positive antinuclear antibody · profound hypotension · raised erythrocyte sedimentation rate · rash · renal impairment · rhinitis · serositis · sinusitis · sore throat · taste disturbance · thrombocytopenia · urticaria · vasculitis · vomiting

SIDE-EFFECTS. FURTHER INFORMATION

Hepatic effects In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

- ALLERGY AND CROSS-SENSITIVITY ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).
- PREGNANCY ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.
- BREAST FEEDING Information on the use of ACE inhibitors in breast-feeding is limited.
- RENAL IMPAIRMENT Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.
- MONITORING REQUIREMENTS Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).
- **DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

Captopril

INDICATIONS AND DOSE

Hypertension

ву моштн

- Adult: Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken
- Elderly: Initially 6.25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, oncedaily dosing may be appropriate if other concomitant antihypertensive drugs taken

Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension

Adult: Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Heart failure

BY MOUTH

 Adult (under close medical supervision): Initially 6.25–12.5 mg 2–3 times a day, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients BY MOUTH

 Adult: Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours; increased if tolerated to 50 mg twice daily for 4 weeks

Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3-16 days after infarction) (under close medical supervision)

BY MOLITH

 Adult: Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses to be increased gradually

Diabetic nephropathy

BY MOUTH

▶ Adult: 75–100 mg daily in divided doses

SIDE-EFFECTS

- ► Common or very common Alopecia · dry mouth · dyspnoea · sleep disorder
- ► **Uncommon** Angina · arrhythmia · flushing · pallor · palpitation · Raynaud's syndrome · tachycardia
- ▶ Rare Anorexia · stomatitis
- ➤ Very rare Allergic alveolitis · blurred vision · cardiac arrest · cardiogenic shock · cerebrovascular events · confusion · depression · eosinophilic pneumonia · glossitis · gynaecomastia · hyponatraemia · impotence · peptic ulcer · photosensitivity · Stevens-Johnson syndrome · syncope
- BREAST FEEDING Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.
- RENAL IMPAIRMENT Reduce dose; max. initial dose 50 mg if eGFR above 40 mL/minute/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR

10–20 mL/minute/1.73 m 2 ; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m 2 .

INDICATIONS AND DOSE

Hypertension

BY MOUTH

► Adult: Initially 10 mg once daily; maintenance 20 mg once daily; maximum 80 mg per day

Hypertension, when used in addition to diuretic, in cardiac decompensation or in volume depletion

 Adult: Initially 2.5-5 mg once daily; maintenance 20 mg once daily; maximum 80 mg per day

Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg

BY MOUTH

Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg once daily, to be taken 24 hours after second dose, then 10 mg once daily for 6 weeks (or continued if heart failure), temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment. Withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90mmHg for more than 1 hour)

Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure 100-120 mmHg

BY MOUTI

 Adult: Initially 2.5 mg once daily, maintenance 5 mg once daily, should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg, temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment. Withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

Renal complications of diabetes mellitus

ву моитн

► Adult: Initially 2.5–5 mg once daily, adjusted according to response; maintenance 10–20 mg once daily

Heart failure (adjunct) (under expert supervision)

► Adult: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

• SIDE-EFFECTS

- Uncommon Raynaud's syndrome · vertigo · asthenia · cerebrovascular accident · confusion · impotence · mood changes · myocardial infarction · palpitation · sleep disturbances · tachycardia
- ▶ Rare Alopecia · dry mouth · gynaecomastia · psoriasis
- Very rare Allergic alveolitis · pemphigus · profuse sweating · pulmonary infiltrates · Stevens-Johnson syndrome · toxic epidermal necrolysis
- BREAST FEEDING Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.
- RENAL IMPAIRMENT Max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily);
 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily);
 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m².

Moexipril hydrochloride

INDICATIONS AND DOSE

Essential hypertension (monotherapy)

- ► Adult: Initially 7.5 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day
- ► Elderly: Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

Essential hypertension when used in addition with nifedipine or other antihypertensive drug

ву моитн

- Adult: Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day
- CAUTIONS Significant mitral valve stenosis
- SIDE-EFFECTS
- ▶ Verv rare Numbness
- Frequency not known Alopecia · angina · appetite · arrhythmias · blurred vision · cerebrovascular accident · confusion · depression · drowsiness · dry mouth · dyspnoea · flushing · hyperuricaemia · impotence · myocardial infarction · palpitation · pemphigus · sleep disturbance · Stevens-Johnson syndrome · sweating · syncope · tachycardia · tinnitus · toxic epidermal necrolysis · weight changes
- BREAST FEEDING Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

- HEPATIC IMPAIRMENT Initial dose 3.75 mg once daily.
 Moexipril is a prodrug and requires close monitoring in patients with hepatic impairment.
- RENAL IMPAIRMENT If eGFR less than 40 mL/minute/1.73 m², initial dose 3.75 mg once daily titrated to max. 15 mg once daily.

Trandolapril

INDICATIONS AND DOSE

Mild to moderate hypertension

BY MOUTH

► Adult: Initially 500 micrograms once daily; increased to 1–2 mg once daily, dose to be increased at intervals of 2–4 weeks; maximum 4 mg per day

Prophylaxis after myocardial infarction in patients with left ventricular dysfunction (starting as early as 3 days after infarction)

ву моитн

- Adult: Initially 500 micrograms once daily, then increased to up to 4 mg once daily, doses to be increased gradually
- SIDE-EFFECTS Alopecia · angina · arrhythmias · asthenia · bronchitis · cerebral haemorrhage · dry mouth · dyspnoea · hot flushes · ileus · myocardial infarction · nervousness · palpitation · psoriasis · like efflorescence · skin reactions · sleep disturbances · Stevens Johnson syndrome · sweating · syncope · tachycardia · toxic epidermal necrolysis · transient ischaemic attacks

SIDE-EFFECTS, FURTHER INFORMATION

Symptomatic hypotension If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

- BREAST FEEDING Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.
- HEPATIC IMPAIRMENT Trandolapril is a prodrug and requires close monitoring in patients with hepatic impairment.
- RENAL IMPAIRMENT Max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m².

MEDICINAL FORMS

ANGIOTENSIN-II RECEPTOR ANTAGONISTS

Angiotensin-II receptor antagonists

- CONTRA-INDICATIONS The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² · the combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with diabetes mellitus
- CAUTIONS Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) aortic or mitral valve stenosis elderly (lower initial doses may be appropriate) hypertrophic cardiomyopathy patients with a history of angioedema patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) renal artery stenosis
- INTERACTIONS → Appendix 1 (angiotensin-II receptor antagonists).
- SIDE-EFFECTS Hyperkalaemia · angioedema (may be delayed onset) · symptomatic hypotension including dizziness (particularly in patients with intravascular volume depletion, e.g. those taking high-dose diuretics)
- PREGNANCY Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.
- BREAST FEEDING Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.
- RENAL IMPAIRMENT Use with caution, starting with low dose, and adjust according to response.
- MONITORING REQUIREMENTS Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

Azilsartan medoxomil

INDICATIONS AND DOSE

Hypertension

ву моитн

- Adult 18-74 years: Initially 40 mg once daily, increased if necessary to 80 mg once daily
- Adult 75 years and over: Initially 20–40 mg once daily, increased if necessary to 80 mg once daily

Hypertension with intravascular volume depletion BY MOUTH

- Adult: Initially 20–40 mg daily, increased if necessary to 80 mg daily
- CAUTIONS Heart failure

information available).

- SIDE-EFFECTS
- ► Common or very common Diarrhoea raised creatine
- Uncommon Hyperuricaemia · peripheral oedema · raised creatinine · malaise
- HEPATIC IMPAIRMENT Manufacturer advises to consider initial dose of 20 mg in mild to moderate impairment (limited information available).
 Manufacturer advises avoid in severe impairment (no information available). Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited

 RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.

BETA-ADRENOCEPTOR BLOCKERS

Beta-adrenoceptor blocking drugs

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors.

Oxprenolol hydrochloride p. 145, pindolol p. 146, acebutolol p. 141, and celiprolol hydrochloride p. 143 have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol p. 141, celiprolol hydrochloride, nadolol p. 145, and sotalol hydrochloride p. 93 are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol fumarate p. 142, celiprolol hydrochloride, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure.

Labetalol hydrochloride p. 143, celiprolol hydrochloride, carvedilol p. 142, and nebivolol p. 145 are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol fumarate, metoprolol tartrate p. 144, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta₂ (bronchial) receptors and are, therefore, relatively

cardioselective, but they are not cardiospecific. They have a lesser effect on airways resistance but are not free of this side-effect

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with *phaeochromocytoma*. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p. 161 should always be used together with the beta-blocker.

Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with *angina* (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

Myocardial infarction

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of *myocardial infarction*. However, uncontrolled heart failure, hypotension, bradyarrhythmias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol p. 141 and metoprolol tartrate p. 144 may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol p. 141, metoprolol tartrate, propranolol hydrochloride p. 146, and timolol maleate p. 147 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less

convincing; some have not been tested in trials of secondary prevention.

Arrhythmias

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction.

Esmolol hydrochloride p. 143 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol hydrochloride p. 93, a non-cardioselective betablocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 142 and carvedilol p. 142 reduce mortality in any grade of stable heart failure; nebivolol p. 145 is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis

Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 146 can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

Other uses

Beta-blockers have been used to alleviate some symptoms of *anxiety*; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the *prophylaxis of migraine*. Betaxolol p. 963, carteolol hydrochloride p. 963, levobunolol hydrochloride p. 964, and timolol maleate p. 965 are used topically in *glaucoma*.

Beta-adrenoceptor blockers (systemic)

• CONTRA-INDICATIONS Asthma · cardiogenic shock · hypotension · marked bradycardia · metabolic acidosis · phaeochromocytoma (apart from specific use with alphablockers) · Prinzmetal's angina · second-degree AV block · severe peripheral arterial disease · sick sinus syndrome · third-degree AV block · uncontrolled heart failure CONTRA-INDICATIONS, FURTHER INFORMATION Bronchospasm Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing

- bronchospasm should be appreciated and appropriate precautions taken.
- CAUTIONS Diabetes · first-degree AV block · history of obstructive airways disease (introduce cautiously) · myasthenia gravis · portal hypertension (risk of deterioration in liver function) · psoriasis · symptoms of hypoglycaemia may be masked · symptoms of thyrotoxicosis may be masked
- INTERACTIONS → Appendix 1 (beta-blockers).
- Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with betablockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a betablocker is sufficient has not been confirmed. It may also be hazardous to give verapamil and a betablocker together by mouth (should only be contemplated if myocardial function well preserved). There is a risk of precipitating heart failure when betablockers and verapamil are used together in established

SIDE-FFFFCTS

ischaemic heart disease.

- ► Rare Dry eyes (reversible on withdrawal) rashes (reversible on withdrawal)
- Frequency not known Alopecia · bradycardia · bronchospasm · coldness of the extremities · conduction disorders · dizziness · dyspnoea · exacerbation of intermittent claudication · exacerbation of psoriasis · exacerbation of Raynaud's phenomenon · fatigue · gastro-intestinal disturbances · headache · heart failure · hyperglycaemia (in patients with or without diabetes) · hypoglycaemia (in patients with or without diabetes) · hypotension · paraesthesia · peripheral vasoconstriction · psychoses · purpura · sexual dysfunction · sleep disturbances (with nightmares) · symptoms of hypoglycaemia masked · thrombocytopenia · vertigo · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia With administration by intravenous injection, excessive bradycardia can occur and may be countered with **intravenous injection** of atropine sulfate.

Overdose Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 1123.

- ALLERGY AND CROSS-SENSITIVITY Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore betaadrenoceptor blockers may reduce response to adrenaline (epinephrine).
- PREGNANCY Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.
- BREAST FEEDING With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.
- MONITORING REQUIREMENTS Monitor lung function (in patients with a history of obstructive airway disease).
- TREATMENT CESSATION Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped.

Acebutolol

INDICATIONS AND DOSE

 ▶ Adult: Initially 3.125 mg twice daily, dose to be taken with food, then increased to 6.25 mg twice daily, then increased to 12.5 mg twice daily, then increased to 25 mg twice daily, dose should be increased at intervals of at least 2 weeks up to the highest tolerated dose, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg; max. 50 mg twice daily in patients over 85 kg
- CONTRA-INDICATIONS Acute or decompensated heart failure requiring intravenous inotropes
- SIDE-EFFECTS Allergic skin reactions angina AV block changes in liver enzymes depressed mood disturbances of micturition influenza-like symptoms leucopenia nasal stuffiness postural hypotension thrombocytopenia wheezing
- PREGNANCY Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alphablockade (as well as beta-blockade).
- BREAST FEEDING Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
- HEPATIC IMPAIRMENT Avoid in hepatic impairment.
- MONITORING REQUIREMENTS Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

Carvedilol 6.25 mg Carvedilol 6.25mg tablets | 28 tablet \boxed{PoM} £8.99 DT price = £1.31

Carvedilol 12.5 mg Carvedilol 12.5mg tablets | 28 tablet PoM £9.99 DT price = £1.29

Carvedilol 25 mg Carvedilol 25mg tablets | 28 tablet PoM £12.50 DT price = £1.47

Celiprolol hydrochloride

INDICATIONS AND DOSE

Mild to moderate hypertension

BY MOUTH

 Adult: 200 mg once daily, dose to be taken in the morning, then increased if necessary to 400 mg once daily

- SIDE-EFFECTS
- ▶ Rare Depression pneumonitis
- ► Frequency not known Hot flushes
- BREAST FEEDING Manufacturers advise avoidance.
- HEPATIC IMPAIRMENT Consider dose reduction.
- RENAL IMPAIRMENT Reduce dose by half if eGFR 15–40 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 22

Celiprolol hydrochloride 400 mg Celectol 400mg tablets | 28 tablet | PoM £39.65 DT price = £10.32

Co-tenidone

Also consider properties of the Thiazides class, p. 159

INDICATIONS AND DOSE

Hypertension

BY MOUTH

 Adult: 50/12.5 mg daily, alternatively increased if necessary to 100/25 mg daily, doses higher than 50 mg atenolol rarely necessary

Dose equivalence and conversion

A mixture of atenolol and chlortalidone in mass proportions corresponding to 4 parts of atenolol and 1 part chlortalidone.

- SIDE-EFFECTS Allergic interstitial nephritis jaundice
- PREGNANCY Avoid. Diuretics not used to treat hypertension in pregnancy.
- BREAST FEEDING Atenolol present in milk in greater amounts than some other beta-blockers. Possible toxicity due to beta-blockade—monitor infant. Large doses of chlortalidone may suppress lactation.
- RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m²—consider alternative treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Labetalol hydrochloride

INDICATIONS AND DOSE

Controlled hypotension in anaesthesia

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

► Adult: (consult product literature or local protocols)

Hypertension of pregnancy

BY INTRAVENOUS INFUSION

 Adult: Initially 20 mg/hour, then increased if necessary to 40 mg/hour after 30 minutes, then increased if necessary to 80 mg/hour after 30 minutes, then increased if necessary to 160 mg/hour after 30 minutes, adjusted according to response; Usual maximum 160 mg/hour

ву моитн

► Adult: Use dose for hypertension

Hypertension following myocardial infarction

BY INTRAVENOUS INFUSION

 Adult: 15 mg/hour, then increased to up to 120 mg/hour, dose to be increased gradually continued →

Hypertensive emergencies

BY INTRAVENOUS INJECTION

▶ Adult: 50 mg, to be given over at least 1 minute, then 50 mg every 5 minutes if required until a satisfactory response occurs; maximum 200 mg per course

BY INTRAVENOUS INFUSION

► Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50-200 mg

Hypertension

ву моитн

- ▶ Adult: Initially 100 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3-4 divided doses; maximum 2.4 g per day
- ▶ Elderly: Initially 50 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3-4 divided doses; maximum 2.4 g per

BY INTRAVENOUS INJECTION

▶ Adult: 50 mg, dose to be given over at least 1 minute. then 50 mg after 5 minutes if required; maximum 200 mg per course

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50-200 mg
- CAUTIONS Liver damage
- SIDE-EFFECTS
- ▶ Rare Lichenoid rash
- ▶ Frequency not known Difficulty in micturition epigastric pain · liver damage · nausea · postural hypotension · vomiting · weakness
- PREGNANCY The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta blockade).
- BREAST FEEDING Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
- HEPATIC IMPAIRMENT Avoid—severe hepatocellular injury
- RENAL IMPAIRMENT Dose reduction may be required.
- MONITORING REQUIREMENTS
- ▶ Liver damage Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.
- EFFECT ON LABORATORY TESTS Interferes with laboratory tests for catecholamines.
- DIRECTIONS FOR ADMINISTRATION Avoid upright position during and for 3 hours after intravenous administration. For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride and glucose. Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette.

CALCIUM-CHANNEL BLOCKERS

Calcium-channel blockers

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important

differences between verapamil hydrochloride p. 156, diltiazem hydrochloride p. 149, and the dihydropyridine calcium-channel blockers (amlodipine below, felodipine p. 151, lacidipine p. 152, lercanidipine hydrochloride p. 153, nicardipine hydrochloride p. 153, nifedipine p. 154, and nimodipine p. 99). Verapamil hydrochloride and diltiazem hydrochloride should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil hydrochloride is used for the treatment of angina, hypertension, and arrhythmias. It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should **not** be used with beta-blockers. Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride, and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work.

Nicardipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine hydrochloride in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine hydrochloride, amlodipine, and felodipine are used for the treatment of angina or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Intravenous nicardipine hydrochloride is licensed for the treatment of acute life-threatening hypertension, for example in the event of malignant arterial hypertension or hypertensive encephalopathy; aortic dissection, when a short-acting beta-blocker is not suitable, or in combination with a beta-blocker when beta-blockade alone is not effective; severe pre-eclampsia, when other intravenous anti-hypertensives are not recommended or are contra-indicated; and for treatment of postoperative hypertension.

Isradipine, lacidipine and lercanidipine hydrochloride have similar effects to those of nifedipine and nicardipine hydrochloride; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is effective in most forms of angina; the longer-acting formulation is also used for hypertension. It may be used in patients for whom betablockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil hydrochloride and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina

Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem hydrochloride or verapamil hydrochloride should be reserved for patients resistant to treatment with betablockers.

Calcium-channel blockers

• DRUG ACTION Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

SIDE-EFFECTS

Overdose Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning p. 1123.

 TREATMENT CESSATION There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

Amlodipine

 DRUG ACTION Amlodipine is a dihydropyridine calciumchannel blocker.

INDICATIONS AND DOSE

Angina

ву моитн

 Adult: Initially 5 mg once daily; maximum 10 mg per day

Hypertension

ву моитн

 Adult: Initially 5 mg once daily; maximum 10 mg per day

Dose equivalence and conversion

Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

- CONTRA-INDICATIONS Cardiogenic shock significant aortic stenosis unstable angina
- INTERACTIONS → Appendix 1 (calcium-channel blockers).
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · dizziness · fatigue · flushing · headache · nausea · oedema · palpitation · sleep disturbances
- ▶ Uncommon Alopecia · arthralgia · asthenia · back pain · chest pain · dry mouth · dyspnoea · gastro-intestinal disturbances · gynaecomastia · hypotension · impotence · mood changes · muscle cramps · myalgia · paraesthesia · pruritus · purpura · rashes · rhinitis · skin discolouration · sweating · syncope · taste disturbances · tinnitus · tremor · urinary disturbances · visual disturbances · weight changes
- Very rare Angioedema · arrhythmias · cholestasis · coughing · gastritis · gingival hyperplasia · hepatitis · hyperglycaemia · jaundice · myocardial infarction · pancreatitis · peripheral neuropathy · tachycardia · thrombocytopenia · urticaria · vasculitis
- Frequency not known Erythema multiforme
 Overdose In overdose, the dihydropyridine calciumchannel blockers cause severe hypotension secondary to profound peripheral vasodilatation.
- PREGNANCY No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT May need dose reduction—half-life prolonged.
- DIRECTIONS FOR ADMINISTRATION Tablets may be dispersed in water.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Diltiazem hydrochloride

INDICATIONS AND DOSE

Angina

BY MOUTH

- Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
- ► Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day

Dose equivalence and conversion

The standard formulations containing 60 mg diltiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation 'modified-release', their duration of action corresponds to that of tablets requiring administration more frequently.

TILDIEM RETARD®

Mild to moderate hypertension

ву моитн

- Elderly: Initially 60 mg twice daily; increased if necessary to 90 mg twice daily
- CONTRA-INDICATIONS Acute porphyrias p. 864 · left ventricular failure with pulmonary congestion · second- or third-degree AV block (unless pacemaker fitted) · severe bradycardia · sick sinus syndrome
- CAUTIONS Bradycardia (avoid if severe) · first degree AV block · heart failure · prolonged PR interval · significantly impaired left ventricular function
- ullet INTERACTIONS ullet Appendix 1 (calcium-channel blockers).
- SIDE-EFFECTS
- Common or very common Asthenia · AV block · bradycardia · dizziness · gastro-intestinal disturbances · headache · hot flushes · hypotension · malaise · oedema (notably of ankles) · palpitation · sino-atrial block
- ▶ Rare Erythema multiforme exfoliative dermatitis photosensitivity rashes

- Frequency not known Depression extrapyramidal symptoms • gum hyperplasia • gynaecomastia • hepatitis
 Overdose In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.
- PREGNANCY Avoid.
- BREAST FEEDING Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.
- HEPATIC IMPAIRMENT Reduce dose.

TILDIEM RETARD®

Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day. For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

TILDIEM® LA Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

VIAZEM® XL, DILZEM® XL, ADIZEM-XL®, ZEMTARD®, SLOZEM®

Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

 ${\color{red}\textbf{ANGITIL}}^{\scriptsize{\textcircled{\tiny{\$}}}}$ XL Dose form not appropriate for initial dose titration.

DILCARDIA SR Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

• RENAL IMPAIRMENT Start with smaller dose.

TILDIEM RETARD® Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

TILDIEM® LA

Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

VIAZEM® XL, DILZEM® XL, ADIZEM-XL®, ZEMTARD®, SLOZEM® Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

 $\overline{\text{ANGITIL}}^{\circledcirc}$ XL Dose form not appropriate for initial dose titration.

DILCARDIA SR Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

- PRESCRIBING AND DISPENSING INFORMATION Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed.
- PATIENT AND CARER ADVICE

TILDIEM RETARD® Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

- Common or very common Dizziness · flushing · headache · oedema · palpitation
- Rare Aggravation of angina · asthenia · erythema · gastrointestinal disturbances · gum hyperplasia · mood disturbances · muscle cramps · polyuria · pruritus · skin rash

Overdose In overdose, the dihydropyridine calciumchannel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- PREGNANCY Manufacturer advises avoid; may inhibit labour.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Antihypertensive effect possibly increased.

 price = £2.90
 Lacidipine 4 mg Motens 4mg tablets | 28 tablet PoM £3.10 DT
 price = £3.20
- ► Brands may include Molap

Lercanidipine hydrochloride

 DRUG ACTION Lercanidipine is a dihydropyridine calciumchannel blocker.

INDICATIONS AND DOSE

Mild to moderate hypertension

BY MOUTH

- ► Adult: Initially 10 mg once daily; increased if necessary to 20 mg daily, dose can be adjusted after 2 weeks
- CONTRA-INDICATIONS Acute porphyrias p. 864 · aortic stenosis · uncontrolled heart failure · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Left ventricular dysfunction sick sinus syndrome (if pacemaker not fitted)
- INTERACTIONS → Appendix 1 (calcium-channel blockers).
- SIDE-EFFECTS
- Uncommon Dizziness · flushing · headache · palpitation · peripheral oedema · tachycardia
- ▶ Rare Angina · asthenia · drowsiness · gastro-intestinal disturbances · myalgia · polyuria · rash
- Very rare Gingival hyperplasia · hypotension · myocardial infarction

Overdose In overdose, the dihydropyridine calciumchannel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT Avoid in severe disease.
- RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².

Nicardipine hydrochloride

 DRUG ACTION Nicardipine is a dihydropyridine calciumchannel blocker

INDICATIONS AND DOSE

Prophylaxis of angina

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

Mild to moderate hypertension

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Adult: Initially 30 mg twice daily; increased if necessary up to 45 mg twice daily. usual dose 30-60 mg twice daily

Life-threatening hypertension (specialist use only) | Post-operative hypertension (specialist use only)

BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Initially 3–5 mg/hour for 15 minutes, increased in steps of 0.5–1 mg every 15 minutes, adjusted according to response, maximum rate 15 mg/hour, reduce dose gradually when target blood pressure achieved; maintenance 2–4 mg/hour
- ► Elderly: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Life-threatening hypertension in patients with hepatic or renal impairment (specialist use only) | Postoperative hypertension in patients with hepatic or renal impairment (specialist use only)

BY CONTINUOUS INTRAVENOUS INFUSION

 Adult: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Acute life-threatening hypertension in pregnancy (specialist use only)

BY CONTINUOUS INTRAVENOUS INFUSION

 Adult: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, usual maximum rate 4 mg/hour in treatment of pre-eclampsia (maximum rate 15 mg/hour)

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 864 · cardiogenic shock · significant or advanced aortic stenosis · unstable or acute attacks of angina

SPECIFIC CONTRA-INDICATIONS:

- ► With intravenous use Avoid within 8 days of myocardial infarction compensatory hypertension
- ▶ With oral use Avoid within 1 month of myocardial infarction
- CAUTIONS Congestive heart failure · elderly · elevated intracranial pressure · portal hypertension · pulmonary oedema · significantly impaired left ventricular function · stroke · withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose
- INTERACTIONS → Appendix 1 (calcium-channel blockers).
- SIDE-EFFECTS Atrioventricular block · depression · dizziness · drowsiness · dyspnoea · flushing · frequency of micturition · gastro-intestinal disturbances · gingival hyperplasia · headache · hypotension · impotence · insomnia · nausea · palpitations · paraesthesia · paralytic ileus · peripheral oedema · pruritus · pulmonary oedema · rashes · tachycardia · thrombocytopenia · tinnitus · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypotension and reflex tachycardia Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur—during intravenous use consider stopping infusion or decreasing dose by half.

Overdose In overdose, the dihydropyridine calciumchannel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

 PREGNANCY For treatment of acute life-threatening hypertension only. May inhibit labour. Not to be used in

multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in animal studies. Risk of severe maternal hypotension and fatal foetal hypoxia—avoid excessive decrease in blood pressure.

 BREAST FEEDING Manufacturer advises avoid—present in breast milk.

HEPATIC IMPAIRMENT

- With oral use Use with caution—consider using lowest initial dose and extending dosing interval according to individual response.
- ▶ With intravenous use Use with caution—use lower initial

RENAL IMPAIRMENT

- With oral use Consider using lowest initial dose and extending dosing interval according to individual
- With intravenous use Use with caution—use lower initial

MONITORING REQUIREMENTS

- With intravenous use Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.
- DIRECTIONS FOR ADMINISTRATION Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored. For intravenous infusion give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100-200 micrograms/mL (undiluted solution via central venous line only) and give via volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product litoraturo

MEDICINAL FORMS

Nifedipine

• DRUG ACTION Nifedipine is a dihydropyridine calciumchannel blocker.

INDICATIONS AND DOSE

Ravnaud's syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

Angina prophylaxis (not recommended)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

Postponement of premature labour

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 20 mg, followed by 10-20 mg 3-4 times a day, adjusted according to uterine activity

Hiccup in palliative care

BY MOUTH

Adult: 10 mg 3 times a day

Angina prophylaxis (not recommended) | Raynaud's phenomenon

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

Dose equivalence and conversion

Adalat liquid gel capsules contain 5 mg nifedipine in 0.17 mL and 10 mg nifedipine in 0.34 mL.

ADALAT® LA

Hypertension

► Adult: 20–30 mg once daily, increased if necessary up to 90 mg once daily

Angina prophylaxis

ву моитн

Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

FORTIPINE® LA 40

Hypertension | Angina prophylaxis

BY MOUTH

► Adult: Initially 40 mg once daily, increased if necessary to 80 mg daily in 1-2 divided doses

VALNI® XL

Severe hypertension | Prophylaxis of angina

▶ Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

ADALAT RETARD®

Hypertension | Angina prophylaxis

▶ Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

ADIPINE® XL

Hypertension | Angina prophylaxis

BY MOUTH

▶ Adult: 30 mg daily, increased if necessary up to 90 mg

ADIPINE® MR

Hypertension | Angina prophylaxis

 Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

NIFEDIPRESS® MR

Hypertension | Angina prophylaxis

BY MOUTH

▶ Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

TENSIPINE® MR

Hypertension | Angina prophylaxis

ву моитн

► Adult: Initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

CORACTEN® SR

Hypertension | Angina prophylaxis

BY MOUTH

 Adult: Initially 10 mg twice daily, increased if necessary up to 40 mg twice daily

CORACTEN® XL

Hypertension | Angina prophylaxis

- Adult: Initially 30 mg daily, increased if necessary up to 90 mg daily
- UNLICENSED USE Not licensed for use in postponing premature labour.
- CONTRA-INDICATIONS Acute attacks of angina · cardiogenic shock · significant aortic stenosis · unstable angina · within 1 month of myocardial infarction
- CAUTIONS Diabetes mellitus · elderly · heart failure · poor cardiac reserve · severe hypotension · short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia · significantly impaired left ventricular function (heart failure deterioration observed) · withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment

ADALAT® LA

Crohn's disease · decreased lumen diameter of the gastrointestinal tract · history of gastro-intestinal obstruction · history of oesophageal obstruction · inflammatory bowel disease

CAUTIONS, FURTHER INFORMATION

ADALAT® LA. VALNI® XL

Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn's disease).

- INTERACTIONS → Appendix 1 (calcium-channel blockers).
- SIDE-FFFFCTS
- ➤ Common or very common Asthenia · dizziness · gastrointestinal disturbance · headache · hypotension · lethargy · oedema · palpitation · vasodilatation
- Uncommon Angioedema · anxiety · chills · dyspnoea · dysuria · epistaxis · erectile dysfunction · hypersensitivity reactions · jaundice · joint swelling · migraine · myalgia · nasal congestion · nocturia · paraesthesia · polyuria · pruritus · rash · sleep disturbance · sweating · syncope · tachycardia · tremor · urticaria · vertigo · visual disturbance
- ► Rare Anorexia · gum hyperplasia · hyperglycaemia · male infertility · mood disturbances · photosensitivity reactions · purpura
- Frequency not known Agranulocytosis · anaphylaxis · bezoar formation (with some modified-release preparations) · dysphagia · gynaecomastia · intestinal obstruction · intestinal ulcer

Overdose In overdose, the dihydropyridine calciumchannel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

 PREGNANCY May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.

- BREAST FEEDING Amount too small to be harmful but manufacturers advise avoid.
- HEPATIC IMPAIRMENT Dose reduction may be required in severe liver disease. Some modified-release formulations may not be suitable for dose titration in hepatic disease consult product literature.

ADALAT® LA, VALNI® XL Dose form not appropriate.

DIRECTIONS FOR ADMINISTRATION

FORTIPINE® LA 40 Take with or just after food, or a meal.

- PRESCRIBING AND DISPENSING INFORMATION Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.
- PATIENT AND CARER ADVICE

ADALAT® LA Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

UNLICENSED USE

- With oral use Prophylaxis of cluster headaches is an unlicensed indication.
- CONTRA-INDICATIONS Acute porphyrias p. 864 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · history of heart failure (even if controlled by therapy) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block
- CAUTIONS Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) · firstdegree AV block
- INTERACTIONS → Appendix 1 (calcium-channel blockers).

► Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with betablockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a betablocker is sufficient has not been confirmed. It may also be hazardous to give verapamil and a betablocker together by mouth (should only be contemplated

SIDE-EFFECTS

- if myocardial function well preserved). ► Common or very common Constipation
- ► Uncommon Ankle oedema · dizziness · fatigue · flushing · headache · nausea · vomiting
- ▶ Rare Allergic reactions angioedema arthralgia asystole · bradycardia · erythema · erythromelalgia · gingival hyperplasia after long-term treatment · gynaecomastia after long-term treatment · heart block · heart failure · hypotension · increased prolactin concentration · myalgia · paraesthesia · pruritus · Stevens-Johnson syndrome · urticaria

SIDE-EFFECTS, FURTHER INFORMATION

Intravenous administration or high doses Hypotension, heart failure, bradycardia, heart block, and asystole are side-effects associated with intravenous administration or high doses.

Overdose In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- PREGNANCY May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Oral dose may need to be reduced.

PERIPHERAL VASODILATORS

Hydralazine hydrochloride

INDICATIONS AND DOSE

Moderate to severe hypertension (adjunct)

▶ Adult: Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily

Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision) ву моитн ▶ Adult: Initially 25 mg 3-4 times a day, then increased

if necessary to every 2 days; maintenance 50-75 mg 4 times a day Hypertensive emergencies (including during pregnancy) | Hypertension with renal complications

BY INTRAVENOUS INFUSION

► Adult: Initially 200-300 micrograms/minute; maintenance 50-150 micrograms/minute

Hypertensive emergencies (including during pregnancy) Hypertension with renal complications

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5-10 mg, to be diluted with 10 mL sodium chloride 0.9%, dose may be repeated after 20-30 minutes
- CONTRA-INDICATIONS Acute porphyrias p. 864 · cor pulmonale · dissecting aortic aneurysm · high output heart failure · idiopathic systemic lupus erythematosus · myocardial insufficiency due to mechanical obstruction · severe tachycardia
- CAUTIONS Cerebrovascular disease coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) · occasionally blood pressure reduction too rapid even with low parenteral doses
- INTERACTIONS → Appendix 1 (hydralazine).
- SIDE-EFFECTS
- ▶ Rare Rashes
- ► Frequency not known Abnormal liver function agitation anorexia · anxiety · arthralgia · blood disorders · dizziness · dyspnoea · fever · fluid retention · flushing · gastrointestinal disturbances · haematuria · haemolytic anaemia · headache · hypotension · increased lacrimation · jaundice · leucopenia · myalgia · nasal congestion · palpitation · paraesthesia · peripheral neuritis · polyneuritis · proteinuria · raised plasma creatinine · systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) · tachycardia · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

- PREGNANCY Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.
- BREAST FEEDING Present in milk but not known to be harmful. Monitor infant in breast-feeding.
- HEPATIC IMPAIRMENT Reduce dose.
- RENAL IMPAIRMENT Reduce dose if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Apresoline®) give continuously in Sodium chloride 0.9%. Suggested infusion volume 500 mL.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

EXCIPIENTS: May contain Gluten, propylene glycol

► HYDRALAZINE HYDROCHLORIDE (Non-proprietary)
Hydralazine hydrochloride 25 mg Hydralazine 25mg tablets |
56 tablet [₱om] £28.50 DT price = £10.12

Powder for solution for injection

► Apresoline (AMCo)

Hydralazine hydrochloride 20 mg Apresoline 20mg powder for solution for injection ampoules | 5 ampoule PoM £11.09

Minoxidil

INDICATIONS AND DOSE

Severe hypertension, in addition to a diuretic and a betablocker

BY MOUTH

- Adult: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day
- Elderly: Initially 2.5 mg daily in 1-2 divided doses, then increased in steps of 5-10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day
- CONTRA-INDICATIONS Phaeochromocytoma
- CAUTIONS Acute porphyrias p. 864 · after myocardial infarction (until stabilised) · angina
- INTERACTIONS Appendix 1 (vasodilator antihypertensives).
- SIDE-EFFECTS Breast tenderness · gastro-intestinal disturbances · hypertrichosis · peripheral oedema · rashes · reversible rise in creatinine and blood urea nitrogen · sodium retention · tachycardia · water retention · weight gain
- PREGNANCY Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.
- BREAST FEEDING Present in milk but not known to be harmful.
- RENAL IMPAIRMENT Use with caution in significant impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

RENIN INHIBITORS

Aliskiren

• DRUG ACTION Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I.

INDICATIONS AND DOSE

Essential hypertension either alone or in combination with other antihypertensives

V MOUTU

- Adult: 150 mg once daily, increased if necessary to 300 mg once daily
- CONTRA-INDICATIONS Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with an eGFR less than 60 mL/minute/ 1.73 m² · concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with diabetes mellitus · hereditary angioedema · idiopathic angioedema
- CAUTIONS Combination treatment with an ACE inhibitor combination treatment with an angiotensin-II receptor antagonist · concomitant use of diuretics (first doses may cause hypotension—initiate with care) · history of angioedema · moderate to severe congestive heart failure · patients at risk of renal impairment · salt depletion (first doses may cause hypotension—initiate with care) · volume depletion (first doses may cause hypotension—initiate with care)

CAUTIONS, FURTHER INFORMATION

Concomitant use of drugs affecting the renin-angiotensin system Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable. however, the concomitant use of this combination, together with an aldosterone antagonist or a potassiumsparing diuretic is not recommended. For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

- INTERACTIONS → Appendix 1 (aliskiren).
- SIDE-EFFECTS
- ➤ Common or very common Arthralgia · dizziness · hyperkalaemia · diarrhoea
- Uncommon Acute renal failure (reversible on discontinuation of treatment) - hypotension - palpitation peripheral oedema · cough · pruritus · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria

- ▶ Rare Anaemia · angioedema · ervthema
- Frequency not known Liver disorders · nausea · vertigo · vomiting

SIDE-EFFECTS. FURTHER INFORMATION

If diarrhoea severe or persistent discontinue treatment.

- PREGNANCY Manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death.
- BREAST FEEDING Present in milk in animal studies manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR is less than 30 mL/minute/1.73 m²— no information available. Use with caution in renal artery stenosis—no information available. Monitor plasma-potassium concentration in renal impairment.
- MONITORING REQUIREMENTS Monitor patients with a history of angioedema closely during treatment.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2010) that aliskiren (*Rasilez* [®]) is **not** recommended for use within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Aliskiren (as Aliskiren hemifumarate) 300 mg
Rasilez 300mg
tablets | 28 tablet [□M] £28.56 DT price = £28.56

THIAZIDES AND RELATED DIURETICS

Thiazides and related diuretics (

- CONTRA-INDICATIONS Addison's disease hypercalcaemia hyponatraemia refractory hypokalaemia symptomatic hyperuricaemia
- CAUTIONS Diabetes gout hyperaldosteronism malnourishment nephrotic syndrome systemic lupus ervthematosus

CAUTIONS, FURTHER INFORMATION

Potassium loss Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular dispasses and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements. Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

Elderly Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

Existing conditions Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

- INTERACTIONS → Appendix 1 (diuretics).
- SIDE-EFFECTS
- ► Common or very common Altered plasma-lipid concentrations · gout · hypercalcaemia · hyperglycaemia · hyperuricaemia · hypochloraemic alkalosis · hypokalaemia · hypomagnesaemia · hyponatraemia · metabolic and electrolyte disturbances · mild gastrointestinal disturbances · postural hypotension
- ► Uncommon Agranulocytosis blood disorders impotence leucopenia thrombocytopenia
- Frequency not known Cardiac arrhythmias · dizziness · headache · hypersensitivity reactions · intrahepatic cholestasis · pancreatitis · paraesthesia · photosensitivity · pneumonitis · pulmonary oedema · severe skin reactions · visual disturbances
- PREGNANCY Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.
- HEPATIC IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassiumsparing diuretic. There is an increased risk of hypomagnesaemia in alcoholic cirrhosis.
- RENAL IMPAIRMENT Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if eGFR is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis.

Electrolytes should be monitored in renal impairment.

 MONITORING REQUIREMENTS Electrolytes should be monitored, particularly with high doses and long-term use

Bendroflumethiazide (Bendrofluazide)

INDICATIONS AND DOSE

Oedema

ву моитн

Adult: Initially 5-10 mg once daily or on alternate days, dose to be taken in the morning, then maintenance 5-10 mg 1-3 times a week

Hypertension

RY MOUTH

- Adult: 2.5 mg daily, dose to be taken in the morning, higher doses are rarely necessary
- BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Co-amilozide

INDICATIONS AND DOSE

Hypertension

BY MOUTH

 Adult: Initially 2.5/25 mg daily, increased if necessary up to 5/50 mg daily

Congestive heart failure

RV MOLITH

 Adult: Initially 2.5/25 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if nossible

Oedema and ascites in cirrhosis of the liver

 Adult: Initially 5/50 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

Dose equivalence and conversion

A mixture of amiloride hydrochloride and hydrochlorothiazide in the mass proportions of 1 part amiloride hydrochloride to 10 parts hydrochlorothiazide.

- CONTRA-INDICATIONS Anuria · hyperkalaemia
- CAUTIONS Diabetes mellitus · elderly
- SIDE-EFFECTS Abdominal pain · agitation · alopecia · angina · anorexia · arrhythmias · arthralgia · confusion · constipation · cough · diarrhoea · dizziness · dry mouth · dyspepsia · dyspnoea · encephalopathy · fever · flatulence · flushing · gastro-intestinal bleeding · headache · hyperkalaemia · insomnia · jaundice · malaise · muscle cramp · nasal congestion · nausea · palpitation · paraesthesia · postural hypotension · pruritus · raised intra-ocular pressure · rash · respiratory distress · restlessness · sexual dysfunction · sweating · thirst · tinnitus · tremor · urinary disturbances · visual disturbance · vomiting · weakness
- BREAST FEEDING Avoid—no information regarding amiloride component available. Amount of hydrochlorothiazide in milk probably too small to be harmful. Large doses of hydrochlorothiazide may suppress lactation
- RENAL IMPAIRMENT Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- MONITORING REQUIREMENTS Monitor electrolytes.

4.2 Hypertension associated with phaeochromocytoma

Drugs used for Hypertension associated with phaeochromocytoma not listed below; *Propranolol hydrochloride*, p. 146

ALPHA-ADRENOCEPTOR BLOCKERS

Phenoxybenzamine hydrochloride

INDICATIONS AND DOSE

Hypertension in phaeochromocytoma

BY MOUTH

- Adult: Initially 10 mg daily, increased in steps of 10 mg daily until hypertension controlled or treatment not tolerated; maintenance 1-2 mg/kg daily in 2 divided doses
- CONTRA-INDICATIONS History of cerebrovascular accident
- CAUTIONS Avoid contact with skin (risk of contact sensitisation) · avoid in Acute porphyrias p. 864 · carcinogenic in animals · cerebrovascular disease · congestive heart failure · elderly · severe ischaemic heart disease
- SIDE-FFFFCTS
- Rare Gastro-intestinal disturbances
- Frequency not known Inhibition of ejaculation · lassitude · miosis · nasal congestion · postural hypotension (with dizziness and marked compensatory tachycardia)
- PREGNANCY Hypotension may occur in newborn.
- BREAST FEEDING May be present in milk.
- RENAL IMPAIRMENT Use with caution.
- HANDLING AND STORAGE Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

► PHENOXYBENZAMINE HYDROCHLORIDE (Non-proprietary)
Phenoxybenzamine hydrochloride 10 mg Phenoxybenzamine
10mg capsules | 30 capsule PoM £65.75 DT price = £65.75

Phentolamine mesilate

INDICATIONS AND DOSE

Hypertensive episodes due to phaeochromocytoma e.g. during surgery

BY INTRAVENOUS INJECTION

► Adult: 2-5 mg, repeated if necessary

Diagnosis of phaeochromocytoma

- BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Angina · coronary insufficiency · evidence of coronary artery disease · history of myocardial infarction · hypotension
- CAUTIONS Elderly gastritis peptic ulcer
- INTERACTIONS → Appendix 1 (alpha-blockers).
- SIDE-EFFECTS Acute or prolonged hypotension angina arrhythmias chest pain diarrhoea dizziness flushing nasal congestion nausea postural hypotension tachycardia vomiting
- PREGNANCY Use with caution—may cause marked decrease in maternal blood pressure with resulting fetal anoxia.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS Monitor blood pressure and heart rate

MEDICINAL FORMS

Medicines not identified.

4.3 Hypertensive crises

Drugs used for Hypertensive crises not listed below; *Hydralazine hydrochloride,* p. 157 · *Labetalol hydrochloride,* p. 143

PERIPHERAL VASODILATORS

Sodium nitroprusside

INDICATIONS AND DOSE

Hypertensive emergencies

BY INTRAVENOUS INFUSION

Adult: Initially 0.5–1.5 micrograms/kg/minute, adjusted in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of 300 nanograms/kg/minute has been used

Maintenance of blood pressure at 30-40% lower than pretreatment diastolic blood pressure

BY INTRAVENOUS INFUSION

 Adult: 20-400 micrograms/minute, use lower doses for patients being treated with other antihypertensives

Controlled hypotension in anaesthesia during surgery BY INTRAVENOUS INFUSION

▶ Adult: Up to 1.5 micrograms/kg/minute

Heart failure

BY INTRAVENOUS INFUSION

 Adult: Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual dose 10–200 micrograms/minute normally for max. 3 days

- UNLICENSED USE Not licensed for use in the UK.
- CONTRA-INDICATIONS Compensatory hypertension Leber's optic atrophy severe vitamin B₁₂ deficiency
- CAUTIONS Elderly · hyponatraemia · hypothermia · hypothyroidism · impaired cerebral circulation · ischaemic heart disease
- INTERACTIONS → Appendix 1 (sodium nitroprusside).
- SIDE-EFFECTS Abdominal pain acute transient phlebitis anxiety dizziness headache nausea palpitation perspiration reduced platelet count retching retrosternal discomfort

SIDE-EFFECTS. FURTHER INFORMATION

Side-effects associated with over rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort—reduce infusion rate if any of these side-effects occur.

Overdose Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see p. 1131).

- PREGNANCY Avoid prolonged use—potential for accumulation of cyanide in fetus.
- BREAST FEEDING No information available. Caution advised due to thiocyanate metabolite.
- HEPATIC IMPAIRMENT Use with caution. Avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate.
- RENAL IMPAIRMENT Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.
- MONITORING REQUIREMENTS Monitor blood pressure (including intra-arterial blood pressure) and bloodcyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.
- TREATMENT CESSATION Avoid sudden withdrawal terminate infusion over 15–30 minutes
- DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion in Glucose 5%, infuse via infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.
- MEDICINAL FORMS

Medicines are available from importing manufacturers.

SELECTIVE POSTGANGLIONIC ADRENERGIC INHIBITORS

Guanethidine monosulfate

INDICATIONS AND DOSE

Hypertensive crisis (but no longer recommended)
BY INTRAMUSCULAR INJECTION

- Adult: 10–20 mg, dose may be repeated after 3 hours if necessary
- CONTRA-INDICATIONS Heart failure phaeochromocytoma
- CAUTIONS Asthma · cerebral arteriosclerosis · coronary arteriosclerosis · history of peptic ulceration
- INTERACTIONS → Appendix 1 (adrenergic neurone blockers).
- SIDE-EFFECTS Diarrhoea drowsiness failure of ejaculation fluid retention headache nasal congestion postural hypotension
- PREGNANCY Postural hypotension and reduced uteroplacental perfusion. Should not be used to treat hypertension in pregnancy.

- RENAL IMPAIRMENT Reduce dose if eGFR 40–65 mL/minute/1.73 m². Avoid if eGFR less than 40 mL/minute/1.73 m².
- LESS SUITABLE FOR PRESCRIBING Guanethidine monosulfate is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► GUANETHIDINE MONOSULFATE (Non-proprietary)

Guanethidine monosulfate 10 mg per 1 ml Guanethidine

10mg/1ml solution for injection ampoules | 5 ampoule PoM £224.15

4.4 Pulmonary hypertension

Drugs used for Pulmonary hypertension not listed below; *Epoprostenol*, p. 99 · *Sildenafil*, p. 699 · *Tadalafil*, p. 700

ENDOTHELIN RECEPTOR ANTAGONISTS

Ambrisentan

INDICATIONS AND DOSE

Pulmonary arterial hypertension

ву моитн

 Adult: 5 mg once daily, increased if necessary to 10 mg once daily

Dose adjustments due to interactions

Max. 5 mg daily with concomitant ciclosporin.

- CONTRA-INDICATIONS Idiopathic pulmonary fibrosis
- CAUTIONS Not to be initiated in significant anaemia
- INTERACTIONS → Appendix 1 (ambrisentan).
- SIDE-EFFECTS
- Common or very common Abdominal pain anaemia chest pain constipation diarrhoea dizziness dyspnoea epistaxis flushing headache heart failure hypotension malaise nausea palpitation peripheral oedema upper respiratory-tract disorders vomiting
- Uncommon Autoimmune hepatitis · hepatic injury · syncope
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.
- PREGNANCY Avoid (teratogenic in animal studies).
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Use with caution if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS
- Monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin concentration or haematocrit observed).
- Monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2008) that ambrisentan (Volibris®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Bosentan

INDICATIONS AND DOSE

Pulmonary arterial hypertension BY MOUTH

► Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg); maximum 500 mg per day

Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily
- CONTRA-INDICATIONS Acute porphyrias p. 864
- CAUTIONS Not to be initiated if systemic systolic blood pressure is below 85 mmHg
- INTERACTIONS → Appendix 1 (bosentan).
- SIDE-EFFECTS
- ► Common or very common Anaemia · diarrhoea · flushing · gastro-oesophageal reflux · headache · hypotension · oedema · palpitation · syncope
- ► Uncommon Leucopenia · neutropenia · thrombocytopenia
- ▶ Rare Liver cirrhosis · liver failure
- CONCEPTION AND CONTRACEPTION Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.
- PREGNANCY Avoid (teratogenic in animal studies).
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid in moderate and severe impairment.
- MONITORING REQUIREMENTS
- ► Monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly).
- Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.
- TREATMENT CESSATION Avoid abrupt withdrawal withdraw treatment gradually.

Macitentan

INDICATIONS AND DOSE

Pulmonary arterial hypertension

ву моитн

► Adult: 10 mg daily

- CONTRA-INDICATIONS Severe anaemia
- CAUTIONS Patients over 75 years pulmonary venoocclusive disease
- INTERACTIONS → Appendix 1 (macitentan).

SIDE-EFFECTS

- ► Common or very common Anaemia bronchitis headache hypotension upper respiratory-tract disorders urinary-tract infection
- ► Frequency not known Leucopenia · thrombocytopenia
- CONCEPTION AND CONTRACEPTION Manufacturer advices exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.
- PREGNANCY Toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Do not initiate if serum transaminases exceed 3 times upper limit of normal. Avoid in moderate and severe impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available).
 In renal impairment consider monitoring blood pressure (risk of hypotension).

MONITORING REQUIREMENTS

- Monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury).
- Monitor haemoglobin concentration before treatment and then as indicated.
- PATIENT AND CARER ADVICE Patient card should be provided. Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, nausea, vomiting, fatigue, abdominal pain, or pruritus develop.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2014) that macitentan (Opsumit®) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

Riociguat

INDICATIONS AND DOSE

Chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable (initiated under specialist supervision) | Monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hypertension, or pulmonary arterial hypertension associated with connective tissue disease (initiated under specialist supervision)

Y MOUTH

 Adult: Initially 1 mg 3 times a day for 2 weeks, increased in steps of 0.5 mg 3 times a day, dose to be increased every 2 weeks, increased to up to 2.5 mg 3 times a day, increase up to maximum dose continued → only if systolic blood pressure \geq 95 mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

- CONTRA-INDICATIONS History of serious haemoptysis previous bronchial artery embolisation - pulmonary venoocclusive disease
- CAUTIONS Autonomic dysfunction · elderly (risk of hypotension) · hypotension (do not initiate if systolic blood pressure below 95 mmHg) · hypovolaemia · severe left ventricular outflow obstruction

CAUTIONS. FURTHER INFORMATION

Smoking Smoking cessation advised (response possibly reduced); dose adjustment may be necessary if smoking started or stopped during treatment.

- INTERACTIONS → Appendix 1 (riociguat).
- SIDE-EFFECTS
- Common or very common Anaemia · constipation · diarrhoea · dizziness · dyspepsia · dysphagia · epistaxis · gastritis · gastro-oesophageal reflux · haemoptysis · headache · hypotension · nasal congestion · nausea · palpitation · peripheral oedema · vomiting
- ▶ Uncommon Pulmonary haemorrhage
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment. Monthly pregnancy tests advised.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Titrate dose cautiously in moderate impairment. Manufacturer advises avoid in severe impairment—no information available.
- RENAL IMPAIRMENT Titrate dose cautiously—risk of hypotension. Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—limited information available.
- PATIENT AND CARER ADVICE Smoking cessation advised (response possibly reduced). Patients should inform prescriber if smoking started or stopped during treatment; dose adjustment may be necessary.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2014) that riociguat (Adempas®) is accepted for restricted use within NHS Scotland for the treatment of chronic thromboembolic pulmonary hypertension in patients for whom a phosphodiesterase type-5 inhibitor is inappropriate, not tolerated, or ineffective, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

PROSTAGLANDINS (CARDIOVASCULAR)

Iloprost

INDICATIONS AND DOSE

Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)

BY INHALATION OF NEBULISED SOLUTION

- Adult: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, if tolerated maintain at 5 micrograms 6–9 times a day, according to response; reduced if higher dose not tolerated to 2.5 micrograms 6–9 times a day
- CONTRA-INDICATIONS Conditions which increase risk of haemorrhage · congenital or acquired valvular defects of the myocardium · decompensated cardiac failure (unless under close medical supervision) · pulmonary venoocclusive disease · severe arrhythmias · unstable angina · within 3 months of cerebrovascular events · within 6 months of myocardial infarction

CAUTIONS

GENERAL CAUTIONS Hypotension (do not initiate if systolic blood pressure below 85 mmHg) · unstable pulmonary hypertension with advanced right heart failure · acute pulmonary infection · chronic obstructive pulmonary disease · severe asthma

- INTERACTIONS → Appendix 1 (iloprost).
- SIDE-EFFECTS
- ► Common or very common Chest pain · cough · diarrhoea · dyspnoea · haemorrhage · headache · hypotension · jaw pain · nausea · oral irritation · rash · throat pain · vomiting
- ► Frequency not known Bronchospasm taste disturbance thrombocytopenia wheezing
- PREGNANCY Use if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Elimination reduced. Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature)
- DIRECTIONS FOR ADMINISTRATION To minimise accidental exposure use only with nebulisers listed in *Ventavis* [®] product literature in a well ventilated room.
- PRESCRIBING AND DISPENSING INFORMATION Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2005) that iloprost (Ventavis®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

MEDICINAL FORMS

4.5 Hypotension and shock

Sympathomimetics

Inotropic sympathomimetics

Shock

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine p. 196, dobutamine p. 193 or dopamine hydrochloride below. In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline/norepinephrine p. 166 may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock p. 242.

Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 237. As well as constricting peripheral vessels ephedrine hydrochloride p. 237 also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine hydrochloride p. 237 to manage associated bradycardia (although intravenous injection of atropine sulfate p. 949 may also be required if bradycardia persists).

Drugs used for Hypotension and shock not listed below; Dobutamine, p. 193 · Ephedrine hydrochloride, p. 237 · Labetalol hydrochloride, p. 143 · Sodium nitroprusside, p. 161

SYMPATHOMIMETICS (INOTROPIC)

Dopamine hydrochloride

 DRUG ACTION Dopamine is a cardiac stimulant which acts on beta₁ receptors in cardiac muscle, and increases contractility with little effect on rate.

INDICATIONS AND DOSE

Cardiogenic shock in infarction or cardiac surgery BY INTRAVENOUS INFUSION

▶ Adult: Initially 2-5 micrograms/kg/minute

- CONTRA-INDICATIONS Phaeochromocytoma tachvarrhythmia
- CAUTIONS Correct hypovolaemia hyperthyroidism low dose in shock due to acute myocardial infarction
- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS
- Common or very common Chest pain · dyspnoea · headache · hypotension · nausea · palpitation · tachycardia · vasoconstriction · vomiting
- Uncommon Bradycardia · gangrene · hypertension · mydriasis
- ▶ Rare Fatal ventricular arrhythmias
- PREGNANCY No evidence of harm in animal studies manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING May suppress lactation—not known to be harmful.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion give continuously in Glucose 5% or Sodium chloride 0.9%.
 Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate. Dopamine concentrate for intravenous infusion to be diluted before use.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

► DOPAMINE HYDROCHLORIDE (Non-proprietary)

Dopamine hydrochloride 40 mg per 1 ml Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule PoM £19.42-£20.00 Dopamine 200mg/5ml concentrate for solution for infusion ampoules | 10 ampoule PoM no price available

Dopamine hydrochloride 160 mg per 1 ml Dopamine 800mg/5ml

solution for infusion ampoules | 10 ampoule PoM no price available

SYMPATHOMIMETICS (VASOCONSTRICTOR)

Metaraminol

.....

INDICATIONS AND DOSE

Acute hypotension

BY INTRAVENOUS INFUSION

► Adult: 15–100 mg, adjusted according to response Emergency treatment of acute hypotension

INITIALLY BY INTRAVENOUS INJECTION

 Adult: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response

Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)

BY INTRACAVERNOSAL INJECTION

- ► Adult: 1 mg every 15 minutes
- UNLICENSED USE Use for priapism is an unlicensed indication.
- CONTRA-INDICATIONS Hypertension
- CAUTIONS

GENERAL CAUTIONS Cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia

SPECIFIC CAUTIONS:

 With intracavernosal use Associated with fatal hypertensive crises

CAUTIONS, FURTHER INFORMATION

Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive

vasopressor response may cause a prolonged rise in blood

- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS Angle-closure glaucoma · anorexia · anxiety · arrhythmias · bradycardia · confusion · dyspnoea · fatal ventricular arrhythmia reported in Laennec's cirrhosis · headache · hypertension · hypoxia · insomnia · nausea · palpitation · peripheral ischaemia · psychosis · tachycardia · tremor · urinary retention · vomiting · weakness
- PREGNANCY May reduce placental perfusion manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS Monitor blood pressure and rate of flow frequently.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Aramine®), give continuously or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Suggested volume 500 ml.

For intracavernosal injection, dilute 1 mg (0.1 mL of 10 mg/mL metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5-mL injections.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Noradrenaline/norepinephrine

INDICATIONS AND DOSE

Acute hypotension

BY INTRAVENOUS INFUSION

 Adult: Initially 0.16-0.33 mL/minute, adjusted according to response, to be given via central venous catheter, of a solution containing noradrenaline 40 micrograms(base)/mL

Dose equivalence and conversion

1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

- CONTRA-INDICATIONS Hypertension
- CAUTIONS Coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia
- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS Angle-closure glaucoma · anorexia · anxiety · arrhythmias · bradycardia · confusion · dyspnoea · headache · hypertension · hypoxia · insomnia · nausea · palpitation · peripheral ischaemia · psychosis · tachycardia · tremor · urinary retention · vomiting · weakness
- PREGNANCY Avoid—may reduce placental perfusion.
- MONITORING REQUIREMENTS Monitor blood pressure and rate of flow frequently.
- DIRECTIONS FOR ADMINISTRATION For treatment of acute hypotension in adults, use a solution containing noradrenaline 40 micrograms (base)/mL.
 For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride and glucose via a controlled infusion device. For administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid. For administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL

infusion fluid; give through a central venous catheter; incompatible with alkalis.

PRESCRIBING AND DISPENSING INFORMATION For a period
of time, preparations on the UK market may be described
as either noradrenaline base or noradrenaline acid
tartrate; doses in the BNF are expressed as the base.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for infusion

► NORADRENALINE/NOREPINEPHRINE (Non-proprietary)
Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1

ml Noradrenaline (base) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule | FoM| no price available Noradrenaline (base) 4mg/4ml solution for infusion ampoules | 5 ampoule | FoM| £22.00 (Hospital only)

Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule PoM £12.00 (Hospital only)

Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule PoM no price available

Phenylephrine hydrochloride

INDICATIONS AND DOSE

Acute hypotension

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ► Adult: Initially 2–5 mg, followed by further doses of 1–10 mg, after at least 15 minutes if required.
- BY SLOW INTRAVENOUS INJECTION
- ► Adult: 100-500 micrograms, repeated as necessary after at least 15 minutes; a 1 mg/1 mL solution to be used

BY INTRAVENOUS INFUSION

► Adult: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

Priapism

BY INTRACAVERNOSAL INJECTION

- ► Adult: 100-200 micrograms every 5-10 minutes; maximum 1 mg per course
- UNLICENSED USE Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.
- CONTRA-INDICATIONS Hypertension Severe hyperthyroidism
- CAUTIONS Coronary disease coronary vascular thrombosis diabetes elderly extravasation at injection site may cause necrosis following myocardial infarction hypercapnia hyperthyroidism hypoxia mesenteric vascular thrombosis peripheral vascular thrombosis Prinzmetal's variant angina susceptibility to angle-closure glaucoma uncorrected hypovolaemia

CAUTIONS, FURTHER INFORMATION

Hypertensive response Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasopressor response may cause a prolonged rise in blood pressure.

- INTERACTIONS → Appendix 1 (sympathomimetics).
 Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.
- SIDE-EFFECTS Arrhythmias · hypertension · palpitation · tachycardia · angle-closure glaucoma · anorexia · anxiety · bradycardia (also reflex bradycardia) · confusion · dyspnoea · headache · hypoxia · insomnia · nausea · peripheral ischaemia · psychosis · tremor · urinary retention · vomiting · weakness
- PREGNANCY Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.

- MONITORING REQUIREMENTS Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 10 mg in 500 mL infusion fluid.
 For intracavernosal injection, if suitable strength of phenylephrine injection is not available, it may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection to 5 mL with sodium chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► PHENYLEPHRINE HYDROCHLORIDE (Non-proprietary)

Phenylephrine hydrochloride 10 mg per 1 ml Phenylephrine

10mg/1ml solution for injection ampoules | 10 ampoule PoM £99.12

5 Heart failure

Heart failure

Drug treatment of **heart failure** associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An ACE inhibitor, titrated to a 'target dose' (or the maximum tolerated dose if lower), together with a beta-blocker, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction.

An ACE inhibitor is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An **angiotensin-II receptor antagonist** may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan cilexetil p. 133 or valsartan p. 136 may be given under specialist supervision as adjuncts to an ACE inhibitor in the treatment of heart failure when other treatments are unsuitable; the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

The beta-blockers bisoprolol fumarate p. 142 and carvedilol p. 142 are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol p. 145 is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone p. 168 can be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with moderate to severe heart failure); low doses of spironolactone reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone below may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction, or for chronic mild heart failure with left ventricular systolic dysfunction. Close monitoring of serum creatinine, eGFR, and potassium is

necessary, particularly following any change in treatment or any change in the patient's clinical condition.

Heart failure 167

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given isosorbide dinitrate p. 191 with hydralazine hydrochloride p. 157 but this combination may be poorly tolerated. The combination of isosorbide dinitrate p. 191 and hydralazine hydrochloride p. 157 may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in patients of African or Caribbean origin who have moderate to severe heart failure).

Digoxin p. 94 improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan cilexetil, or isosorbide dinitrate with hydralazine hydrochloride.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A **thiazide diuretic** may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m²) and a **loop diuretic** is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone p. 205 may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

Drugs used for Heart failure not listed below:

Bendroflumethiazide, p. 159 · Bisoprolol fumarate, p. 142 · Candesartan cilexetil, p. 133 · Captopril, p. 126 · Chlortalidone, p. 204 · Co-amilozide, p. 160 · Cyclopenthiazide, p. 204 · Digoxin, p. 94 · Enalapril maleate, p. 127 · Fosinopril sodium, p. 127 · Glyceryl trinitrate, p. 190 · Hydralazine hydrochloride, p. 157 · Isosorbide dinitrate, p. 191 · Isosorbide mononitrate, p. 192 · Ivabradine, p. 185 · Lisinopril, p. 128 · Losartan potassium, p. 134 · Metoprolol tartrate, p. 144 · Nebivolol, p. 145 · Perindopril arginine, p. 129 · Perindopril erbumine, p. 130 · Prazosin, p. 674 · Quinapril, p. 130 · Ramipril, p. 131 · Sodium nitroprusside, p. 161 · Valsartan, p. 136

ALDOSTERONE ANTAGONISTS

Eplerenone

INDICATIONS AND DOSE

Adjunct in stable patients with left ventricular ejection fraction \leq 40% with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) | Adjunct in chronic mild heart failure with left ventricular ejection fraction \leq 30%

ву моитн

- Adult: Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment
- CONTRA-INDICATIONS Hyperkalaemia
- CAUTIONS Elderly
- INTERACTIONS → Appendix 1 (diuretics).
 Concomitant use of potassium-sparing diuretics or potassium supplements is contra-indicated.
- SIDE-FEEECTS
- ► Common or very common Azotaemia · constipation · cough · diarrhoea · dizziness · hyperkalaemia · hypotension ·

muscle spasm • musculoskeletal pain • nausea • pruritus • rash • renal impairment • syncope

- ▶ Uncommon Arterial thrombosis · atrial fibrillation · back pain · cholecystitis · dehydration · dyslipidaemia · eosinophilia · epidermal growth factor receptor decreased · flatulence · gynaecomastia · headache · hyporagylcaemia · hypoaesthesia · hyponatraemia · hypothyroidism · insomnia · malaise · pharyngitis · postural hypotension · pyelonephritis · sweating · tachycardia · vomiting
- ▶ Frequency not known Angioedema
- PREGNANCY Manufacturer advises caution—no information available.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Initially 25 mg on alternate days if eGFR 30–60 mL/minute/1.73 m², adjust dose according to serum-potassium concentration—consult product literature. Avoid if eGFR less than 30 mL/ minute/1.73 m². Increased risk of hyperkalaemia in renal impairment—close monitoring required.
- MONITORING REQUIREMENTS Monitor plasma-potassium concentration before treatment, during initiation, and when dose changed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spironolactone

INDICATIONS AND DOSE

Oedema | Ascites in cirrhosis of the liver

 Adult: 100-400 mg daily, adjusted according to response

Malignant ascites

BY MOUTH

 Adult: Initially 100–200 mg daily, then increased if necessary to 400 mg daily, maintenance dose adjusted according to response

Nephrotic syndrome

BY MOUTH

► Adult: 100-200 mg daily

Oedema in congestive heart failure

 Adult: Initially 100 mg daily, alternatively initially 25–200 mg daily, dose may be taken as a single dose or divided doses, maintenance dose adjusted according to response

Moderate to severe heart failure (adjunct)

► Adult: Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

Resistant hypertension (adjunct)

ву моитн

► Adult: 25 mg once daily

Primary hyperaldosteronism in patients awaiting surgery

- ► Adult: 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose
- UNLICENSED USE Resistant hypertension (adjunct) unlicensed indication.
- CONTRA-INDICATIONS Addison's disease · anuria · hyperkalaemia
- CAUTIONS Acute porphyrias p. 864 elderly potential metabolic products carcinogenic in *rodents*
- INTERACTIONS → Appendix 1 (diuretics).
 Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.
- SIDE-EFFECTS Acute renal failure · agranulocytosis · alopecia · benign breast tumour · breast pain · changes in libido · confusion · dizziness · drowsiness · electrolyte disturbances · gastro-intestinal disturbances · gynaecomastia · hepatotoxicity · hyperkalaemia (discontinue) · hypertrichosis · hyperuricaemia · hyponatraemia · leg cramps · leucopenia · malaise · menstrual disturbances · rash · Stevens-Johnson syndrome · thrombocytopenia
- PREGNANCY Use only if potential benefit outweighs risk feminisation of male fetus in *animal* studies.
- BREAST FEEDING Metabolites present in milk, but amount probably too small to be harmful.
- RENAL IMPAIRMENT Avoid in acute renal insufficiency or severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- MONITORING REQUIREMENTS Monitor electrolytes discontinue if hyperkalaemia occurs (in severe heart failure monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months).

MEDICINAL FORMS

PHOSPHODIESTERASE TYPE-3 INHIBITORS

Enoximone

 DRUG ACTION Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

INDICATIONS AND DOSE

Congestive heart failure where cardiac output reduced and filling pressures increased

BY SLOW INTRAVENOUS INJECTION (RATE NOT EXCEEDING 12.5 MG/MINUTE)

 Adult: Initially 0.5-1 mg/kg, then 500 micrograms/kg every 30 minutes until a satisfactory response is achieved or a total dose of 3 mg/kg is reached; maintenance, initial dose of up to 3 mg/kg every 3-6 hours as required

BY INTRAVENOUS INFUSION

- Adult: Initially 90 micrograms/kg/minute, dose to be given over 10-30 minutes, followed by 5-20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day
- CAUTIONS Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction
- INTERACTIONS → Appendix 1 (phosphodiesterase type-3 inhibitors).
- SIDE-EFFECTS Chills · diarrhoea · ectopic beats · fever · headache · hypotension · insomnia · nausea · oliguria · supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) · upper and lower limb pain · urinary retention · ventricular tachycardia (more likely in patients with pre-existing arrhythmias) · vomiting
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises caution—no information available.
- HEPATIC IMPAIRMENT Dose reduction may be required.
- RENAL IMPAIRMENT Consider dose reduction.
- MONITORING REQUIREMENTS Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
- DIRECTIONS FOR ADMINISTRATION Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.

For *intravenous infusion (Perfan®*), give continuously or intermittently in Sodium chloride 0.9% or Water for injections; dilute to a concentration of 2.5 mg/mL.

Heart failure 169

 PRESCRIBING AND DISPENSING INFORMATION Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

► Perfan (Myogen GmbH)

Enoximone 5 mg per 1 ml Perfan 100mg/20ml solution for injection ampoules | 10 ampoule PoM no price available (Hospital only)

Milrinone

 DRUG ACTION Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

INDICATIONS AND DOSE

Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction) | Acute heart failure, including low output states following heart surgery

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 nanograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48-72 hours; maximum 1.13 mg/kg per day
- CONTRA-INDICATIONS Severe hypovolaemia
- CAUTIONS Correct hypokalaemia heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction
- INTERACTIONS → Appendix 1 (phosphodiesterase type-3 inhibitors).
- SIDE-EFFECTS
- Common or very common Ectopic beats · headache · hypotension · supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) · ventricular tachycardia
- ► **Uncommon** Chest pain · hypokalaemia · thrombocytopenia · tremor · ventricular fibrillation
- ▶ Very rare Anaphylaxis bronchospasm rash
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details.
- MONITORING REQUIREMENTS Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
- DIRECTIONS FOR ADMINISTRATION Avoid extravasation. For intravenous injection, may be given either undiluted or diluted before use. For intravenous infusion (Primacor®) give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to a suggested concentration of 200 micrograms/mL.

 PRESCRIBING AND DISPENSING INFORMATION Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

Primacor (Sanofi)

Milrinone 1 mg per 1 ml Primacor 10mg/10ml solution for injection ampoules | 10 ampoule PoMl £199.06

SYMPATHOMIMETICS (INOTROPIC)

Dopexamine hydrochloride

 DRUG ACTION Dopexamine acts on beta₂ receptors in cardiac muscle to produce a positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

INDICATIONS AND DOSE

Inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery

BY INTRAVENOUS INFUSION

- Adult: 0.5 microgram/kg/minute, to be administered into central or large peripheral vein, then increased if necessary to 1 microgram/kg/minute, increased if necessary up to 6 micrograms/kg/minute, in increments of 0.5-1 microgram/kg/minute at intervals of not less than 15 minutes
- CONTRA-INDICATIONS Aortic stenosis · hypertrophic cardiomyopathy · left ventricular outlet obstruction · phaeochromocytoma · thrombocytopenia
- CAUTIONS Correct hypovolaemia before starting and during treatment · hyperglycaemia · hyperthyroidism · hypokalaemia · myocardial infarction · recent angina
- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS
- ► Common or very common Angina · arrhythmias · bradycardia · dyspnoea · headache · myocardial infarction · nausea · reversible thrombocytopenia · sweating · tachycardia · tremor · vomiting
- PREGNANCY No information available—manufacturer advises avoid
- MONITORING REQUIREMENTS Monitor blood pressure, pulse, plasma potassium, and blood glucose.
- TREATMENT CESSATION Avoid abrupt withdrawal.
- DIRECTIONS FOR ADMINISTRATION Concentrate for intravenous infusion to be diluted before use. For continuous intravenous infusion, dilute to a concentration of 400 or 800 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein; give via infusion pump or other device which provides accurate control of rate; contact with metal in infusion apparatus should be minimised; incompatible with bicarbonate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Dopacard (Teva UK Ltd)

Dopexamine hydrochloride 10 mg per 1 ml Dopacard 50mg/5ml concentrate for solution for infusion ampoules | 10 ampoule PoM £252.00 (Hospital only)

6 Hyperlipidaemia

Lipid-regulating drugs

Primary and secondary prevention of cardiovascular disease

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Primary prevention

Individuals at high risk of developing cardiovascular disease include those who have diabetes mellitus, chronic kidney disease (eGFR < 60 mL/minute/1.73 m²) and/or albuminuria, and those with familial hypercholesterolaemia. The risk also increases with age; those aged 85 years and over are at particularly high risk, especially if they smoke or have hypertension. Preventative measures are also required for other individuals who are considered to be at high risk of developing atherosclerotic cardiovascular disease based on risk estimated using risk calculators (see Risk calculators); those with a 10-year risk of cardiovascular disease of 10% or more stand to benefit most from drug treatment. Patients with a 10-year cardiovascular risk of less than 10% may benefit from an assessment of their lifetime risk (using the JBS3 tool—see Risk calculators for more detail), discussion on the impact of lifestyle interventions and, if necessary, drug therapy.

Risk calculators

Risk assessment calculators are recommended by both NICE (clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) and JBS3 (Joint British Societies' consensus recommendations for the prevention of cardiovascular disease 2014). They should not be used in patients at high cardiovascular risk. Both calculators are unsuitable for assessing risk in those aged 85 years and over, and NICE advises against using a risk assessment tool in those with type 1 diabetes mellitus.

The QRISK[®]2 risk calculator www.qrisk.org/ is recommended by NICE clinical guideline 181, and the JBS3 risk calculator www.jbs3risk.com/pages/risk_calculator.htm is endorsed by JBS3. Both tools assess cardiovascular risk—coronary heart disease (angina and myocardial infarction), stroke, and transient ischaemic attack, on the basis of lipid profile, systolic blood pressure, gender, age, ethnicity, smoking status, BMI, chronic kidney disease, diabetes mellitus, atrial fibrillation, treated hypertension, rheumatoid arthritis, or a family history of premature cardiovascular disease. Risk assessment tools underestimate risk in patients with additional risk due to existing conditions or medication, such as:

- · serious mental disorder
- autoimmune disorders such as systemic lupus erythematosus and other systemic inflammatory disorders
- antiretroviral treatment
- medication causing dyslipidaemia as a side-effect e.g. antipsychotics, corticosteroids, or immunosuppressants
- triglyceride concentration > 4.5 mmol/litre

Cardiovascular disease risk is also underestimated in those who are already taking antihypertensive or lipid-regulating drugs, and in those who have recently stopped smoking. Severe obesity (BMI > 40 kg/m²) also increases cardiovascular risk: the need for further treatment of risk

factors in patients below the cardiovascular risk threshold for treatment should be based on clinical judgement.

Preventative measures for primary prevention

All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation.

Offer a statin as first-line drug treatment if lifestyle modifications are inappropriate or ineffective (see also Statins for the prevention of cardiovascular disease). Lipidregulating drug treatment must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

Secondary prevention

Statins should be offered to all patients, including the elderly, with cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

Preventative measures for secondary prevention

Patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation. however, initiation of lipid-regulating drug treatment should not be delayed to manage modifiable risk factors. and must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

Statins for the prevention of cardiovascular disease

A statin reduces the risk of cardiovascular disease events. and is the drug of first choice for primary and secondary prevention of cardiovascular disease. Before starting treatment with statins, secondary causes of dyslipidaemia should be addressed; these include uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, and excessive alcohol consumption. Patients with hypothyroidism should receive adequate thyroid replacement therapy (before assessing the requirement for lipid-regulating treatment if for primary prevention) because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

For the purpose of reducing cardiovascular risk, NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) defines statins by the percentage reduction in LDL-cholesterol they

For primary prevention, NICE Clinical Guideline 181 recommends that atorvastatin p. 179 a high-intensity statin (when prescribed at a dose of at least 20 mg/day), should be offered to those with a 10-year risk of cardiovascular disease of 10% or more; patients aged 85 years and over may benefit from atorvastatin to reduce the risk of non-fatal myocardial infarction. For secondary prevention, atorvastatin is also recommended. Patients taking a low- or medium-intensity statin should discuss the benefits and risks of switching to a high intensity statin at their next medication review.

A statin should be considered for all adults with type 1 diabetes mellitus, particularly those aged 40 years and over, or who have had diabetes for more than 10 years, or who have established nephropathy, or other risk factors for cardiovascular disease, IBS3 recommendations (Joint British Societies' consensus recommendations for the prevention of cardiovascular disease (JBS3) 2014) in diabetes mellitus

Reduction in low-density lipoprotein cholesterol

Therapy intensity	Drug	Daily dose (reduction in LDL cholesterol)
High-intensity	Atorvastatin	20mg (43%)
		40mg (49%)
		80mg (55%)
	Rosuvastatin	10mg (43%)
		20mg (48%)
		40mg (53%)
	Simvastatin	80mg (42%)
Medium-intensity	Atorvastatin	10mg (37%)
	Fluvastatin	80mg (33%)
	Rosuvastatin	5mg (38%)
	Simvastatin	20mg (32%)
		40mg (37%)
Low-intensity	Fluvastatin	20mg (21%)
		40mg (27%)
	Pravastatin	10mg (20%)
		20mg (24%)
	Pravastatin	40mg (29%)
	Simvastatin	10mg (27%)

Advice from the MHRA: there is an increased risk of myopathy associated with high-dose (80 mg) simvastatin. The 80 mg dose should be considered only in patients with severe hypercholesterolaemia and high risk of cardiovascular complications who have not achieved their treatment goals on lower doses, when the benefits are expected to outweigh the potential risks.

differ in certain respects from NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease)-see JBS3 recommendations for further details. In type 2 diabetes. assess level of risk using the risk calculator and treat for primary prevention if necessary.

Total cholesterol, HDL-cholesterol, and non-HDL cholesterol concentrations should be checked 3 months after starting treatment with a high intensity statin. NICE Clinical Guideline 181 recommends aiming for a reduction in non-HDL cholesterol concentration greater than 40%; JBS3 recommends a target non-HDL cholesterol concentration below 2.5 mmol/litre. If these are not achieved, ensure lifestyle modifications are optimised and consider increasing the dose of the statin if started on less than atorvastatin 80 mg and the patient is judged to be at higher risk because of comorbidities, risk score or, using clinical judgement.

Specialist advice should be sought about treatment options for patients at high risk of cardiovascular disease or those with existing cardiovascular disease, who are intolerant of three different statins.

Fibrates should not be routinely used for primary or secondary prevention. Nicotinic acid p. 177, bile acid sequestrants, and omega-3 fatty acid compounds are not recommended for primary or secondary prevention.

Hypercholesterolaemia, hypertriglyceridaemia, and familial hypercholesterolaemia

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hyperlipidaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 173; such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Fenofibrate p. 175 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; nicotinic acid may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate or with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should not be used.

A statin is recommended for all patients with familial hypercholesterolaemia. A 'high-intensity' statin (as defined in NICE Clinical Guideline 71, August 2008. Identification and management of familial hypercholesterolaemia) e.g. rosuvastatin p. 180 (initiated by a specialist) or atorvastatin should be considered in order to achieve the recommended reduction in LDL-cholesterol concentration of greater than 50% from baseline; a 'high-intensity' statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg. Patients with heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of, statins should receive ezetimibe p. 173. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred to a specialist for the consideration of treatment with a bile acid sequestrant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

Bile acid sequestrants

Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia. Treatment with bile acid sequestrants may be appropriate under specialist supervision if statins and ezetimibe are inappropriate, and when LDL-cholesterol is severely raised, for example in familial hypercholesterolaemia.

Fibrates

Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Lomitapide

Lomitapide p. 176 is licensed as an adjunct to dietary measures and other lipid-regulating drugs for the treatment of homozygous familial hypercholesterolaemia.

Nicotinic acid group

The value of nicotinic acid p. 177 is limited by its side-effects, especially vasodilatation.

Nicotinic acid is used by specialists in combination with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol).

Acipimox p. 177 seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

Omega-3 fatty acid compounds

There is no evidence that omega-3 fatty acid compounds reduce the risk of cardiovascular disease.

Statins

Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

BILE ACID SEQUESTRANTS

Bile acid sequestrants

- DRUG ACTION Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.
- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).
- SIDE-EFFECTS Constipation · diarrhoea · gastro-intestinal discomfort · hypertriglyceridaemia (aggravation) · hypoprothrombinaemia associated with vitamin K deficiency · increased risk of bleeding · nausea · vomiting
- PREGNANCY Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- BREAST FEEDING Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use

Colesevelam hydrochloride

INDICATIONS AND DOSE

Primary hypercholesterolaemia as an adjunct to dietary measures (monotherapy)

ву моитн

► Adult: 3.75 g daily in 1–2 divided doses; maximum 4.375 g per day

Primary hypercholesterolaemia as an adjunct to dietary measures, in combination with a statin | Primary and familial hypercholesterolaemia, in combination with ezetimibe, either with or without a statin

- ву моитн
- ► Adult: 2.5–3.75 g daily in 1–2 divided doses, may be taken at the same time as the statin and ezetimibe
- CONTRA-INDICATIONS Biliary obstruction · bowel obstruction
- CAUTIONS Gastro-intestinal motility disorders inflammatory bowel disease major gastro-intestinal surgery
- INTERACTIONS → Appendix 1 (colesevelam).
- SIDE-EFFECTS Headache · mvalgia
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- MONITORING REQUIREMENTS Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colesevelam.
- DIRECTIONS FOR ADMINISTRATION Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption.
- PATIENT AND CARER ADVICE Patient counselling on administration is advised for colesevelam hydrochloride tablets (avoid other drugs at same time).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 21

Cholestagel (Sanofi)

Colesevelam hydrochloride 625 mg Cholestagel 625mg tablets 180 tablet [PoM] £96.10 DT price = £96.10

Colestipol hydrochloride

INDICATIONS AND DOSE

Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures

ву моитн

- ▶ Adult: Initially 5 g 1-2 times a day, increased in steps of 5 g every 1 month if required, total daily dose may be given in 1-2 divided doses; maximum 30 g per day
- INTERACTIONS → Appendix 1 (colestipol).
- DIRECTIONS FOR ADMINISTRATION The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk: alternatively it can be mixed with thin soups, cereals, voghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided. Other drugs should be taken at least 1 hour before or 4-6 hours after colestipol to reduce possible interference with absorption.
- PATIENT AND CARER ADVICE Patient counselling on administration is advised for colestipol hydrochloride granules (avoid other drugs at same time).

MEDICINAL FORMS

FIBRATES

Bezafibrate

 DRUG ACTION Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholestrol.

INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 200 mg 3 times a day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 400 mg once daily, modified-release dose form is not appropriate in patients with renal impairment
- CONTRA-INDICATIONS Gall bladder disease hypoalbuminaemia - nephrotic syndrome photosensitivity to fibrates
- CAUTIONS Correct hypothyroidism before initiating treatment
- INTERACTIONS → Appendix 1 (fibrates).
 Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.
- SIDE-EFFECTS
- ► Common or very common Abdominal distension anorexia • diarrhoea • nausea
- Uncommon Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment · photosensitivity reactions · pruritus · rash · renal failure · urticaria
- ▶ Rare Pancreatitis peripheral neuropathy
- Very rare Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis
- PREGNANCY Manufacturers advise avoid—no information available.

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid in severe liver disease.
- RENAL IMPAIRMENT Reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m². Reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m². Avoid immediate-release preparations if eGFR less than 15 mL/minute/1.73 m². Avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m². Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
- MONITORING REQUIREMENTS Consider monitoring of liver function and creatine kinase when fibrates used in combination with a statin.
- PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

MONITORING REQUIREMENTS

- ► Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
- Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.
- PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► CIPROFIBRATE (Non-proprietary)

Ciprofibrate 100 mg Ciprofibrate 100mg tablets | 28 tablet PoM £117.12 DT price = £105.31

Fenofibrate

 DRUG ACTION Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholestrol.

INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contraindicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk

BY MOUTH USING CAPSULES

 Adult: Initially 200 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin; 200 mg capsules not appropriate for use in renal impairment; 267 mg capsules not appropriate for initial dose titration or in renal impairment

BY MOUTH USING TABLETS

- Adult: 160 mg daily, tablets not appropriate in renal impairment
- CONTRA-INDICATIONS Gall bladder disease · pancreatitis (unless due to severe hypertriglyceridaemia) · photosensitivity to ketoprofen

- CAUTIONS Correct hypothyroidism before initiating treatment
- INTERACTIONS → Appendix 1 (fibrates).
 Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

SIDE-EFFECTS

- ► Common or very common Abdominal distension anorexia • diarrhoea • nausea
- Uncommon Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment · pancreatitis · photosensitivity reactions · pruritus · pulmonary embolism · rash · renal failure · urticaria
- ► Rare Hepatitis peripheral neuropathy
- Very rare Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis
- ▶ Frequency not known Interstitial pneumopathies
- PREGNANCY Avoid—embryotoxicity in animal studies.
- BREAST FEEDING Manufacturers advise avoid—no information available.
- HEPATIC IMPAIRMENT Avoid
- RENAL IMPAIRMENT Reduce dose to 134 mg daily if eGFR less than 60 mL/minute/1.73 m². Reduce dose to 67 mg daily if eGFR less than 20 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m².
 Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

MONITORING REQUIREMENTS

- ► Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
- Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.
- PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Gemfihrozil

 DRUG ACTION Fibrates act by decreasing serum triglycerides: they have variable effect on LDL-cholestrol.

INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in primary hypercholesterolaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to diet and other appropriate measures in primary prevention of cardiovascular disease in men with hyperlipidaemias if statin contra-indicated or not tolerated

ву моитн

- ► Adult: 1.2 g daily in 2 divided doses. Maintenance 0.9–1.2 g daily
- CONTRA-INDICATIONS History of gall-bladder or biliary tract disease including gallstones · photosensitivity to fibrates
- CAUTIONS Correct hypothyroidism before initiating treatment • elderly
- INTERACTIONS → Appendix 1 (fibrates).
 The combination of gemfibrozil and a statin should preferably be avoided; high risk of muscle effects (especially rhabdomyolysis).
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · constipation · diarrhoea · dyspepsia · eczema · fatigue · flatulence · headache · nausea · rash · vertigo · vomiting
- ► Uncommon Atrial fibrillation
- ▶ Rare hepatitis · paraesthesia · alopecia · anaemia · angioedema · appendicitis · blurred vision · bone-marrow suppression · cholestatic jaundice · depression · disturbances in hepatic function · dizziness · drowsiness · eosinophilia · exfoliative dermatitis · leucopenia · myalgia · myasthenia · myopathy · myositis accompanied by increase in creatine kinase (discontinue if raised significantly) · pancreatitis · photosensitivity · pruritus · sexual dysfunction · thrombocytopenia · urticaria
- PREGNANCY Manufacturers advise avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid.
- RENAL IMPAIRMENT Initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

- MONITORING REQUIREMENTS
- Monitor blood counts for first year.
- Monitor liver-function (discontinue treatment if abnormalities persist).
- Consider monitoring creatine kinase if used in combination with a statin.
- PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

MICROSOMAL TRIGLYCERIDE TRANSFER PROTEIN INHIBITORS

Lomitapide

 DRUG ACTION Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoproteinborne lipids such as cholesterol and triglycerides.

INDICATIONS AND DOSE

Adjunct to dietary measures and other lipid-regulating drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)

ву моитн

- Adult: Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day
- CONTRA-INDICATIONS Significant or chronic bowel disease
- CAUTIONS Concomitant use of hepatotoxic drugs lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required - patients over 65 years
- ullet INTERACTIONS ullet Appendix 1 (lomitapide).
- SIDE-EFFECTS
- Common or very common Bloating · abdominal pain · appetite changes · constipation · diarrhoea · dizziness · dyspepsia · ecchymosis · eructation · erythematous rash · flatulence · gastro-oesophageal reflux disease · gastroenteritis · haemorrhoids · headache · hepatic steatosis · hepatomegaly · hypokalaemia · leucopenia · malaise · migraine · muscle spasms · nausea · neutropenia · raised serum transaminases · tenesmus · vomiting · weight loss
- Uncommon Abnormal gait · anaemia · arthralgia · chest pain · drowsiness · dry mouth · dry skin · eye swelling · gastro-intestinal haemorrhage · haematemesis · haematuria · hyperbilirubinaemia · joint swelling · myalgia · pain in extremities · paraesthesia · proteinuria · pyrexia · sweating · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Raised transaminases Reduce dose if serum transaminases raised during treatment (consult product literature).

- CONCEPTION AND CONTRACEPTION Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.
- PREGNANCY Avoid—teratogenicity and embryotoxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Reduce dose if serum transaminases raised during treatment (consult product literature). Max. 40 mg daily in mild impairment.

Avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.

- RENAL IMPAIRMENT Max. 40 mg daily in end-stage renal disease.
- MONITORING REQUIREMENTS
- Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.
- Screen for hepatic steatosis and fibrosis before treatment, then annually thereafter.

NICOTINIC ACID DERIVATIVES

Acipimox

INDICATIONS AND DOSE

Adjunct or alternative treatment in hyperlipidaemias of types IIb and IV in patients who have not responded adequately to other lipid-regulating drugs such as a statin or fibrate, and lifestyle changes (including diet, exercise, and weight reduction)

ву моитн

- ▶ Adult: 250 mg 2-3 times a day
- CONTRA-INDICATIONS Peptic ulcer
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · dyspepsia · flushing · headache · malaise · urticaria
- ► Uncommon Anaphylactoid reaction · arthralgia · bronchospasm · erythema · myalgia · myositis · nausea · pruritus · rash
- ▶ Frequency not known Diarrhoea · dry eyes · vasodilatation
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available
- RENAL IMPAIRMENT Reduce dose to 250 mg 1–2 times daily if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Monitor hepatic and renal function.

CAUTIONARY AND ADVISORY LABELS 21

► Olbetam (Pfizer Ltd)

Acipimox 250 mg Olbetam 250mg capsules | 90 capsule PoM 546.33 DT price = 546.33

Nicotinic acid

 DRUG ACTION In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol.

INDICATIONS AND DOSE

Adjunct to statin in dyslipidaemia or used alone if statin not tolerated

ву моитн

- ► Adult: (consult product literature)
- CONTRA-INDICATIONS Active peptic ulcer disease arterial bleeding
- CAUTIONS Acute myocardial infarction · diabetes mellitus
 gout · history of peptic ulceration · unstable angina
- INTERACTIONS → Appendix 1 (nicotinic acid).
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · diarrhoea · dyspepsia · flushing · nausea · pruritus · rash · vomiting
- Uncommon Dizziness · headache · hypophosphataemia increase in uric acid · palpitation · peripheral oedema · prolonged prothrombin time · reduced platelet count · shortness of breath · tachycardia
- ▶ Rare Hypotension · insomnia · myalgia · myasthenia · myopathy · reduced glucose tolerance · rhinitis · syncope
- ► Very rare Anorexia · rhabdomyolysis · visual disturbance
- ► Frequency not known Jaundice

SIDE-EFFECTS, FURTHER INFORMATION

Prostaglandin-mediated symptoms Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid

- PREGNANCY No information available—manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Present in milk—avoid.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
 Discontinue if severe abnormalities in liver function tests.
 Manufacturer advises monitor liver function in mild to moderate hepatic impairment.
- RENAL IMPAIRMENT Manufacturer advises use with caution—no information available

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, powder, tablet, capsule

OMEGA-3 FATTY ACIDS

Omega-3-acid ethyl esters

INDICATIONS AND DOSE

Adjunct to diet and statin in type IIb or III hypertriglyceridaemia | Adjunct to diet in type IV hypertriglyceridaemia

ву моитн

 Adult: Initially 2 capsules daily, dose to be taken with food, increased if necessary to 4 capsules daily

Adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

- ▶ Adult: 1 capsule daily, dose to be taken with food
- CAUTIONS Anticoagulant treatment (bleeding time increased) · haemorrhagic disorders
- SIDE-EFFECTS
- ► Common or very common Dyspepsia · nausea
- ▶ Uncommon Abdominal pain · dizziness · gastritis · taste disturbances
- ▶ Rare Acne headache hepatic disorders hyperglycaemia • rash
- Very rare Gastro-intestinal haemorrhage · hypotension · increased white cell count · nasal dryness · urticaria

- PREGNANCY Manufacturers advise use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturers advise avoid—no information available.
- HEPATIC IMPAIRMENT Monitor liver function in hepatic impairment.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2002) that omega-3-acid ethyl esters are **not** recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

STATINS

Statins

- DRUG ACTION Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.
- CAUTIONS Elderly · high alcohol intake · history of liver disease · hypothyroidism · patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

CAUTIONS, FURTHER INFORMATION

Muscle effects Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

Hypothyroidism Hypothyroidism should be managed adequately before starting treatment with a statin.

• INTERACTIONS → Appendix 1 (statins).

There is an increased incidence of myopathy if a statin is given with a fibrate (the combination of a statin and gemfibrozil should preferably be avoided), with lipid-lowering doses of nicotinic acid, with fusidic acid (risk of rhabdomyolysis—the combination of a statin and fusidic acid should be avoided; temporarily discontinue statin and restart 7 days after last fusidic acid dose), or with drugs that increase the plasma-statin concentration, such as macrolide antibiotics, imidazole and triazole antifungals, and ciclosporin; close monitoring of liver function and, if muscular symptoms occur, of creatine kinase is necessary.

- SIDE-EFFECTS
- ► Rare Hepatitis jaundice
- ▶ Very rare Hepatic failure. interstitial lung disease lupus erythematosus-like reactions pancreatitis
- ► Frequency not known Alopecia · altered liver function tests · amnesia · arthralgia · asthenia · depression · dizziness · fatigue · gastro-intestinal disturbances · headache · hyperglycaemia · hypersensitivity reactions · may be associated with the development of diabetes mellitus (particularly in those already at risk of the condition) · myalgia · myopathy · myositis · paraesthesia · peripheral neuropathy · pruritus · rash · rhabdomyolysis · sexual dysfunction · sleep disturbance · thrombocytopenia · urticaria · visual disturbance

SIDE-EFFECTS, FURTHER INFORMATION

Muscle effects The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses.

If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. rigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated, particularly if statin treatment has previously been tolerated for more than 3 months. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statins should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients. Statins should not be discontinued if there is an increase

in the blood-glucose concentration or HbA_{1C} as the benefits continue to outweigh the risks.

Interstitial lung disease. If nationts develon symptoms such

Interstitial lung disease If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

- CONCEPTION AND CONTRACEPTION Adequate contraception is required during treatment and for 1 month afterwards.
- PREGNANCY Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.

 HEPATIC IMPAIRMENT Statins should be used with caution in those with a history of liver disease. Avoid in active liver disease or when there are unexplained persistent elevations in serum transaminases.

MONITORING REQUIREMENTS

- ▶ Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.
- ▶ Liver function There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease). Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.
- ▶ Creatine kinase Before initiation of statin treatment, creatine kinase concentration should be measured in patients who have had persistent, generalised, unexplained muscle pain (whether associated or not with previous lipid-regulating drugs); if the concentration is more than 5 times the upper limit of normal, a repeat measurement should be taken after 7 days. If the repeat concentration remains above 5 times the upper limit, statin treatment should not be started; if concentrations are still raised but less than 5 times the upper limit, the statin should be started at a lower dose.
- Diabetes Patients at high risk of diabetes mellitus should have fasting blood-glucose concentration or HbA_{1C} checked before starting statin treatment, and then repeated after 3 months.
- PATIENT AND CARER ADVICE Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

Atorvastatin

INDICATIONS AND DOSE

Primary hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Combined hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures

ву моитн

 Adult: Usual dose 10 mg daily; increased if necessary up to 80 mg daily, dose to be increased at intervals of at least 4 weeks

Heterozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Homozygous familial hypercholestrolaemia in patients who have not responded adequately to diet and other appropriate measures BY MOUTH

 Adult: Initially 10 mg daily for at least 4 weeks, then increased if necessary to 40 mg daily for at least a further 4 weeks, then increased if necessary up to 80 mg daily Primary prevention of cardiovascular events in patients at high risk of a first cardiovascular event
BY MOUTH

► Adult: 20 mg daily, dose can be increased if necessary Secondary prevention of cardiovascular events

▶ Adult: 80 mg once daily

Dose adjustments due to interactions

Reduced dose required (max. 10 mg daily) with concomitant ciclosporin, or tipranavir combined with ritonavir—seek specialist advice.

Maximum dose of 40 mg once daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.

- UNLICENSED USE Not licensed for use in secondary prevention of cardiovascular events. Starting dose of 20 mg once daily is not licensed for the primary prevention of cardiovascular events.
- CAUTIONS Haemorrhagic stroke
- SIDE-EFFECTS
- ➤ Common or very common Back pain epistaxis hyperglycaemia nasopharyngitis pharyngeolaryngeal pain
- ► Uncommon Anorexia blurred vision chest pain hypoglycaemia malaise neck pain peripheral oedema pyrexia tinnitus weight gain
- ▶ Rare Cholestasis Stevens-Johnson syndrome toxic epidermal necrolysis
- ► Very rare Gynaecomastia · hearing loss
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT In chronic kidney disease, for primary and secondary prevention of cardiovascular events [unlicensed starting dose in *primary* prevention; unlicensed in *secondary* prevention], initially 20 mg once daily, increased if necessary (on specialist advice if eGFR < 30 mL/minute/1.73 m²); max. 80 mg once daily.
- PATIENT AND CARER ADVICE Patient counselling is advised for atorvastatin tablets (muscle effects).

Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control

 Adult: 10-40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina | Adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia

BY MOUTH

 Adult: 40 mg daily, dose to be taken at night Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

ву моитн

 Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

SIDE-EFFECTS

- ► **Uncommon** Abnormal urination dysuria nocturia urinary frequency
- ▶ Very rare Fulminant hepatic necrosis
- BREAST FEEDING Manufacturer advises avoid—small amount of drug present in breast milk.
- RENAL IMPAIRMENT Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.
- PATIENT AND CARER ADVICE Patient counselling is advised for pravastatin tablets (muscle effects).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder

Rosuvastatin

INDICATIONS AND DOSE

£14 18 DT price = £1 31

Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

ву моитн

- Adult 18-69 years: Initially 5-10 mg once daily, then increased if necessary to 20 mg once daily, dose to be increased at intervals of at least 4 weeks
- Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks

► Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks

Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures and who have risk factors for myopathy or rhabdomyolysis

ву моитн

 Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks

Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures, in patients with high cardiovascular risk (under expert supervision)

ву моштн

 Adult: Initially 5–10 mg once daily, increased if necessary to 20 mg once daily, then increased if necessary to 40 mg once daily, dose to be increased at intervals of at least 4 weeks

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event

BY MOUTH

- ▶ Adult 18-69 years: 20 mg once daily
- Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily.
- ▶ Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event and with risk factors for myopathy or rhabdomyolysis

BY MOITH

 Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily

Dose adjustments due to interactions

Initially 5 mg once daily with concomitant fibrate increased if necessary to max. 20 mg daily. For dose adjustments with concomitant atazanavir, clopidogrel, darunavir, dronedarone, eltrombopag, ezetimibe, itraconazole, lopinavir, or tipranavir, consult product literature.

- CAUTIONS Patients of Asian origin
- SIDE-EFFECTS
- ► Common or very common Proteinuria
- ► Very rare Gynaecomastia · haematuria
- Frequency not known Oedema · Stevens-Johnson syndrome
- BREAST FEEDING Manufacturer advises avoid—no information available
- RENAL IMPAIRMENT Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m².
 Avoid if eGFR less than 30 mL/minute/1.73 m².
- PATIENT AND CARER ADVICE Patient counselling is advised for rosuvastatin tablets (muscle effects).

Simvastatin

INDICATIONS AND DOSE

Primary hypercholesterolaemia, or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures BY MOUTH

Adult: 10-20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures BY MOUTH

Adult: Initially 40 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus BY MOUTH

Adult: Initially 20–40 mg once daily, increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Dose adjustments due to interactions

Max. 10 mg daily with concomitant bezafibrate or ciprofibrate.

Max. 20 mg daily with concomitant amiodarone, verapamil, diltiazem, amlodipine, or ranolazine. Max. 40 mg daily with concomitant lomitapide.

- SIDE-EFFECTS
- ▶ Rare Anaemia
- ► Frequency not known Tendinopathy
- BREAST FEEDING Manufacturer advises avoid—no information available
- RENAL IMPAIRMENT Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m².
- PATIENT AND CARER ADVICE Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).
- EXCEPTIONS TO LEGAL CATEGORY Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15 % risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

7 Myocardial ischaemia

Stable angina

It is important to distinguish stable angina from unstable angina. Stable angina usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long term management to prevent angina attacks and to reduce the risk of cardiovascular events.

Management

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 190 which can be taken immediately before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.

Patients with stable angina should be given a **betablocker** or a **calcium-channel blocker**. In those with leftventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months. If a beta-blocker or a calcium-channel blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a dihydropyridine calcium-channel blocker (e.g. amlodipine p. 148, felodipine p. 151, modified-release nifedipine p. 154) should be used; if this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, addition of a long-acting nitrate, ivabradine p. 185, nicorandil p. 185, or ranolazine p. 184 can be considered.

For those patients in whom both beta-blockers and calcium-channel blockers are not tolerated or are contra-indicated, monotherapy with a long-acting nitrate, ivabradine, nicorandil, or ranolazine should be considered.

Response to treatment should be assessed every 2–4 weeks after initiating or changing drug therapy; the drug should be titrated (according to symptom control) to the maximum tolerated dose. Consider referring the patient to a specialist if a combination of two drugs fails to control symptoms. Addition of a third antianginal drug should only be considered if symptom control is not achieved with two drugs and the patient is either due to undergo a revascularisation procedure, or a revascularisation procedure is considered inappropriate. See the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events.

Antianginal drugs

Nitrates, calcium-channel blockers, and potassium channel activators (use in adults only) have a vasodilating and, consequently, blood pressure lowering effect. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

Nicorandil p. 185, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina. Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs [unlicensed indication].

Ivabradine p. 185 lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contraindicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm

Ranolazine p. 184 is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs.

Drugs used for Myocardial ischaemia not listed below;

Acebutolol, p. 141 · Amlodipine, p. 148 · Aspirin, p. 104 · Atenolol, p. 141 · Bisoprolol fumarate, p. 142 · Bivalirudin, p. 116 · Carvedilol, p. 142 · Diltiazem hydrochloride, p. 149 · Felodipine, p. 151 · Fondaparinux sodium, p. 109 · Metoprolol tartrate, p. 144 · Nadolol, p. 145 · Nicardipine hydrochloride, p. 153 · Nifedipine, p. 154 · Oxprenolol hydrochloride, p. 145 · Pindolol, p. 146 · Propranolol hydrochloride, p. 146 · Timolol maleate, p. 147 · Verapamil hydrochloride, p. 156

GLYCOPROTEIN IIB/IIIA INHIBITORS

Abciximab

INDICATIONS AND DOSE

continue for 12 hours

Prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion)
 125 nanograms/kg/minute (max.
 10 micrograms/minute), to be started 10–60 minutes before percutaneous coronary intervention and

Short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion)
 125 nanograms/kg/minute (max.
 10 micrograms/minute), to be started up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention
- CONTRA-INDICATIONS Active internal bleeding arteriovenous malformation or aneurysm · haemorrhagic diathesis · hypertensive retinopathy · intracranial neoplasm · intracranial or intraspinal surgery or trauma within last 2 months · major surgery within last 2 months · severe hypertension · stroke within last 2 years · thrombocytopenia · vasculitis
- CAUTIONS Discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed (consult product literature for details of procedures to minimise bleeding) · elderly
- INTERACTIONS Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- ► Common or very common Back pain · bleeding manifestations · bradycardia · chest pain · fever · headache · hypotension · nausea · puncture site pain · thrombocytopenia · vomiting
- Rare Adult respiratory distress · cardiac tamponade · hypersensitivity reactions
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid in severe liver disease increased risk of bleeding.
- RENAL IMPAIRMENT Caution in severe impairment increased risk of bleeding.
- MONITORING REQUIREMENTS
- Measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit.
- Monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment.

• DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (ReoPro®), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-progenic low protein-binding 0.2 or 0.22 micron filter

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

➤ ReoPro (Eli Lilly and Company Ltd)
Abciximab 2 mg per 1 ml ReoPro 10mg/5ml solution for injection vials | 1 vial [PoM] £250.24

Eptifibatide

INDICATIONS AND DOSE

In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

INITIALLY BY INTRAVENDUS INJECTION

- Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)
- CONTRA-INDICATIONS Abnormal bleeding within 30 days aneurysm · arteriovenous malformation · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · neoplasm · severe hypertension · stroke within last 30 days · thrombocytopenia
- CAUTIONS Discontinue if emergency cardiac surgery necessary discontinue if intra-aortic balloon pump necessary discontinue if thrombolytic therapy necessary risk of bleeding—discontinue immediately if uncontrolled serious bleeding
- INTERACTIONS Caution with concomitant drugs that increase risk of bleeding—discontinue immediately if uncontrolled serious bleeding.
- SIDE-EFFECTS
- ▶ Common or very common Bleeding manifestations
- ▶ Very rare Anaphylaxis rash
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid in severe liver disease increased risk of bleeding.
- RENAL IMPAIRMENT Reduce infusion to 1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.
- Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Eptifibatide 750 microgram per 1 ml Integrilin 75mg/100ml solution for infusion vials | 1 vial PoM £42.79 (Hospital only)

Tirofiban

INDICATIONS AND DOSE

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography planned for 4-48 hours after diagnosis (initiated under specialist supervision)

BY INTRAVENOUS INFUSION

 Adult: Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)

INITIALLY BY INTRAVENOUS INJECTION

 Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision)

INITIALLY BY INTRAVENOUS INJECTION

- ➤ Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours
- CONTRA-INDICATIONS Abnormal bleeding within 30 days history of aneurysm history of arteriovenous malformation history of haemorrhagic stroke history of intracranial disease history of neoplasm increased INR increased prothrombin time severe hypertension stroke within 30 days thrombocytopenia
- CAUTIONS Active peptic ulcer (within 3 months) acute pericarditis anaemia aortic dissection cardiogenic shock discontinue if intra-aortic balloon pump necessary discontinue if thrombolytic therapy necessary discontinue immediately if serious or uncontrollable bleeding occurs discontiue if emergency cardiac surgery necessary elderly faecal occult blood haematuria haemorrhagic retinopathy low body-weight major surgery within 3 months (avoid if within 6 weeks) organ biopsy or lithotripsy within last 2 weeks puncture of non-compressible vessel within 24 hours risk of bleeding (within 3 months) severe heart failure severe trauma within 3 months (avoid if within 6 weeks) traumatic or protracted cardiopulmonary resuscitation within last 2 weeks uncontrolled severe hypertension vasculitis
- INTERACTIONS → Appendix 1 (tirofiban).
 Concomitant drugs that increase risk of bleeding (including within 48 hours of thrombolytic administration).
- SIDE-EFFECTS Bleeding manifestations fever headache nausea reversible thrombocytopenia
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Caution in mild to moderate liver disease. Avoid in severe liver disease—increased risk of bleeding.
- RENAL IMPAIRMENT Increased risk of bleeding. Use half normal dose if eGFR less than 30 mL/minute/ 1.73 m². Monitor carefully if eGFR less than 60 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Aggrastat®), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

SELECTIVE SINUS NODE IF INHIBITORS

Ivabradine

INDICATIONS AND DOSE

Treatment of angina in patients in normal sinus rhythm
BY MOUTH

- Adult: Initially 5 mg twice daily for 3-4 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5-5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
- Elderly: Initially 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

Mild to severe chronic heart failure

- Adult: Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
- CONTRA-INDICATIONS Acute myocardial infarction · cardiogenic shock · congenital QT syndrome · do not initiate for angina if heart rate below 70 beats per minute · do not initiate for chronic heart failure if heart rate below 75 beats per minute · immediately after cerebrovascular accident · patients dependent on pacemaker · second- and third-degree heart block · severe hypotension · sick-sinus syndrome · sino-atrial block · unstable angina · unstable or acute heart failure
- CAUTIONS Atrial fibrillation or other arrhythmias (treatment ineffective) • elderly • in angina, consider stopping if there is no or limited symptom improvement after 3 months • intraventricular conduction defects • mild to moderate hypotension (avoid if severe) • retinitis pigmentosa
- INTERACTIONS → Appendix 1 (ivabradine).
- SIDE-FFFFCTS

NICE technology appraisals (TAs)

► Ivabradine for the treatment of chronic heart failure (November 2012) NICE TA267

Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), an ACE inhibitor, and an aldosterone antagonist, is an option for treating mild to severe stable chronic heart failure in patients who:

- have a left ventricular ejection fraction of \leq 35%, and
- are in sinus rhythm with a heart rate of ≥75 beats per minute

Ivabradine should be initiated only by a heart failure specialist after 4 weeks of stable optimal standard therapy; monitoring and dose titration should be carried out by a heart failure specialist, or a GP with special interest in heart failure, or by a heart failure specialist nurse, www.nice.org.uk/TA267

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2012) that ivabradine (Procoralan®) is accepted for restricted use within NHS Scotland in accordance with its licensed indication for heart failure only if resting heart rate remains \geq 75 beats per minute despite optimal standard therapy.

MEDICINAL FORMS

7.1 Acute coronary syndromes

Acute coronary syndromes

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These are related acute coronary syndromes that fall between the classifications of stable angina and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI.

myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 190 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 191 is given. If pain continues, diamorphine hydrochloride p. 361 or morphine p. 367 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride p. 347 should also be given.

Aspirin p. 104 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 106 should also be given. Prasugrel p. 188 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance p. 188). Ticagrelor p. 188 is also an alternative to clopidogrel (see NICE guidance p. 188). Patients should also receive either heparin (unfractionated) p. 114, a low molecular weight heparin, or fondaparinux sodium p. 109.

Patients without contra-indications should receive **beta-blockers** which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 149 or verapamil hydrochloride p. 156 can be given.

The glycoprotein IIb/IIIa inhibitors eptifibatide p. 183 (in combination with heparin (unfractionated) p. 114 and aspirin) and tirofiban p. 184 (in combination with heparin (unfractionated) aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab or eptifibatide (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 116 can be considered as an alternative to the combination of a glyocprotein IIb/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

ST-segment elevation myocardial infarction (STEMI)

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also

occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

Management of ST-segment elevation myocardial infarction (STEMI)

These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine hydrochloride p. 361 or morphine p. 367 can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; anticoagulants help to reduce reocclusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine hydrochloride or morphine; an antiemetic such as metoclopramide hydrochloride p. 347 (or, if left ventricular function is not compromised, cyclizine p. 343) by intravenous injection should also be given.

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 106, should also be given. Prasugrel p. 188, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance p. 188). Ticagrelor p. 188, is also an alternative to clopidogrel (see NICE guidance p. 188).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a thrombolytic drug, unless contra-indicated. Percutaneous coronary intervention is the preferred method; a glycoprotein IIb/IIIa inhibitor can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 113); bivalirudin p. 116 is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance p. 117). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium), or fondaparinux sodium. See use of antiplatelet drugs in patients undergoing coronary stenting p. 103.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated). Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 190 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 191 is given.

Early administration of some **beta-blockers** has been shown to be of benefit and should be given to patients without contra-indications. ACE inhibitors, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment).

All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 603.

Long-term management

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin should be given to all patients, unless contraindicated. The addition of clopidogrel has been shown to reduce morbidity and mortality. Prasugrel p. 188 or ticagrelor are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 121 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 109, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI-see Prevention of cardiovascular events p. 187. For details of antiplatelet drug duration following coronary stenting-see also Antiplatelet drugs and coronary stents p. 103.

Beta-blockers should be given to all patients in whom they are not contra-indicated. Acebutolol p. 141, metoprolol tartrate p. 144, propranolol hydrochloride p. 146 and timolol maleate p. 147 are suitable; for patients with left ventricular dysfunction, carvedilol p. 142, bisoprolol fumarate p. 142, or long-acting metoprolol tartrate may be appropriate

Diltiazem hydrochloride p. 149 [unlicensed] or verapamil hydrochloride p. 156 can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An ACÉ inhibitor should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

Nitrates are used for patients with angina.

Eplerenone p. 167 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

See also the role of **statins** in preventing recurrent cardiovascular events p. 178.

Prevention of cardiovascular events

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.

In patients with stable angina, addition of an **ACE inhibitor** should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel below or ticagrelor below are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban p. 109, in combination with aspirin alone *or* aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

Drugs used for Acute coronary syndromes not listed below; Captopril, p. 126 · Clopidogrel, p. 106 · Dalteparin sodium, p. 112 · Enoxaparin sodium, p. 113 · Heparin (unfractionated), p. 114 · Lisinopril, p. 128 · Perindopril arginine, p. 129 · Perindopril erbumine, p. 130 · Ramipril, p. 131 · Trandolapril, p. 132 · Valsartan, p. 136

ANTIPLATELETS

Prasugrel

INDICATIONS AND DOSE

In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention BY MOLITH

- Adult 18-74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
- Adult 18-74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
- ► Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months

Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI

 Adult: Initially 60 mg, to be administered at the time of percutaneous coronary intervention to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate

Alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention

ву моитн

- ▶ Adult: 60 mg as a single dose
- CONTRA-INDICATIONS Active bleeding history of stroke or transient ischaemic attack
- CAUTIONS Body-weight less than 60 kg · discontinue at least 7 days before elective surgery if antiplatelet effect not desirable · elderly · patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastrointestinal bleeding, or active peptic ulcer disease)
- INTERACTIONS → Appendix 1 (prasugrel).
 Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- ► Common or very common Anaemia gastro-intestinal haemorrhage haematoma haematuria haemorrhage intracranial haemorrhage rash
- ▶ Uncommon Angioedema · hypersensitivity reactions
- ► Rare Thrombocytopenia
- Frequency not known Thrombotic thrombocytopenic purpura
- ALLERGY AND CROSS-SENSITIVITY Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Use with caution in moderate impairment—increased risk of bleeding. Avoid in severe impairment.
- RENAL IMPAIRMENT Use with caution—increased risk of bleeding.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014) NICE TA317 Prasugrel 10 mg in combination with aspirin is recommended as an option, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction (NSTEMI) or ST segment elevation myocardial infarction (STEMI)) having primary or delayed percutaneous coronary intervention. www.nice.org.uk/TA317

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2009) that prasugrel (Efient®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

- HEPATIC IMPAIRMENT Avoid in moderate or severe impairment—no information available.
- MONITORING REQUIREMENTS Monitor renal function 1 month after initiation.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

► Ticagrelor for the treatment of acute coronary syndromes (October 2011) NICE TA236

Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:

- with ST-segment elevation myocardial infarction defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, or
- with non-ST-segment elevation myocardial infarction (NSTEMD, or
- admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist.

Characteristics to be used in defining treatment with ticagrelor for unstable angina are:

- age 60 years or older:
- previous myocardial infarction or previous coronary artery bypass grafting;
- coronary artery disease with stenosis of 50% or more in at least two vessels:
- previous ischaemic stroke:
- previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral revascularisation;
- · diabetes mellitus;
- peripheral arterial disease, or
- chronic renal dysfunction (creatinine clearance less than 60 mL/minute/1.73 m²).

NITRATES

Nitrates

Nitrates have a useful role in *angina*. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual glyceryl trinitrate p. 190 is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the

300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The *aerosol* spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by *transdermal* preparations (but tolerance may develop).

Isosorbide dinitrate p. 191 is active *sublingually* and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for *modified-release* preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate p. 192. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate p. 190 or isosorbide dinitrate may be tried by *intravenous injection* when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Nitrates

- CONTRA-INDICATIONS Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema
- CAUTIONS Heart failure due to obstruction hypothermia hypothyroidism hypoxaemia malnutrition metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy recent history of myocardial infarction susceptibility to angle-closure glaucoma tolerance ventilation and perfusion abnormalities

CAUTIONS, FURTHER INFORMATION

Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8-12 hours (usually overnight) in each 24 hours; in the case of modifiedrelease tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modifiedrelease formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

- INTERACTIONS → Appendix 1 (nitrates).
- SIDE-EFFECTS

GENERAL SIDE-FEFFCTS

- ► Common or very common Dizziness postural hypotension • tachycardia • throbbing headache
- Uncommon Flushing · heartburn · nausea · rash · syncope · temporary hypoxaemia · vomiting
- ► Very rare Angle-closure glaucoma
- ► Frequency not known Paradoxical bradycardia SPECIFIC SIDE-EFFECTS
- ► Uncommon
- With transdermal use application site reactions with transdermal patches
- ► Frequency not known

With intravenous use abdominal pain · apprehension · diaphoresis · muscle twitching · palpitation · prolonged administration has been associated with methaemoglobinaemia · restlessness · retrosternal discomfort · severe hypotension

SIDE-EFFECTS. FURTHER INFORMATION

- ▶ With intravenous use Side-effects may be associated with over rapid administration (reduce rate of injection).
- ALLERGY AND CROSS-SENSITIVITY Contraindicated in nitrate hypersensitivity.
- BREAST FEEDING No information available manufacturers advise use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Caution in severe impairment.
- RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.
- MONITORING REQUIREMENTS Monitor blood pressure and heart rate during intravenous infusion.
- TREATMENT CESSATION Avoid abrupt withdrawal.

Glyceryl trinitrate

INDICATIONS AND DOSE

Prophylaxis and treatment of angina

BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS

Adult: 0.3–1 mg, dose may be repeated as required

Control of hypertension and myocardial ischaemia during

Control of hypertension and myocardial ischaemia during and after cardiac surgery | Induction of controlled hypotension during surgery | Congestive heart failure | Unstable angina

BY INTRAVENOUS INFUSION

 Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response, consult product literature for recommended starting doses specific to indication

Treatment or prophylaxis of angina

BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY

 Adult: 1–2 sprays, dose be administered under tongue and then close mouth

NITRO-DUR®

Prophylaxis of angina

BY TRANSDERMAL APPLICATION

 Adult: One '0.2mg/h' patch to be applied to chest or outer upper arm and replaced every 24 hours, siting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day

DEPONIT®

Prophylaxis of angina

BY TRANSDERMAL APPLICATION

Adult: One '5' or one '10' patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two '10' patches every 24 hours if necessary, to be replaced every 24 hours, siting replacement patch on different area

MINITRAN®

Prophylaxis of angina

BY TRANSDERMAL APPLICATION

 Adult: One '5' patch to be applied to chest or upper arm; replace every 24 hours, siting replacement patch on different area, dose to be adjusted according to response

Maintenance of venous patency ('5' patch only)

BY TRANSDERMAL APPLICATION

► Adult: (consult product literature)

TRANSIDERM-NITRO®

Prophylaxis of angina

BY TRANSDERMAL APPLICATION

 Adult: One '5' or one '10' patch to be applied to lateral chest wall and replaced every 24 hours, siting replacement patch on different area, max. two '10' patches daily

Prophylaxis of phlebitis and extravasation ('5' patch only) BY TRANSDERMAL APPLICATION

► Adult: (consult product literature)

PERCUTOL®

Prophylaxis of angina (to determine dose) TO THE SKIN

 Adult: ½ inch to be administered on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch, approx. 800 micrograms/hour absorbed from 1 inch of ointment

Prophylaxis of angina

TO THE SKIN

 Adult: 1-2 inches every 3-4 hours as required, to be measured on to Applirule® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

Anal fissure

BY RECTUM USING RECTAL OINTMENT

 Adult: Apply 2.5 centimetres every 12 hours until pain stops. Max. duration of use 8 weeks, apply to anal canal, 2.5 cm of ointment contains 1.5 mg of glyceryl trinitrate

SIDE-EFFECTS

- ▶ With rectal use Burning · diarrhoea · itching · rectal bleeding
- PREGNANCY Not known to be harmful.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. For intravenous infusion (Nitrocine®, Nitronal®), give continuously in Glucose 5% or Sodium Chloride 0.9%. For Nitrocine®, suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as Viaflex® or Steriflex®; use glass or polyethylene containers or give via a syringe pump.
 Chyconyl tripitrate 1 mg/ml to be diluted before use or

Glyceryl trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/ml to be diluted before use.

PRESCRIBING AND DISPENSING INFORMATION

- With sublingual use Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.
- PATIENT AND CARER ADVICE Rectal ointment should be discarded 8 weeks after first opening.
 PERCUTOL® Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic $^{\circ}$) is **not** recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

Glyceryl trinitrate 4 mg per 1 gram Rectogesic 0.4% rectal ointment | 30 gram FoM £39.30 DT price = £39.30

Isosorbide dinitrate

INDICATIONS AND DOSE

Prophylaxis and treatment of angina

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: 30–120 mg daily in divided doses
BY INTRAVENOUS INFUSION

► Adult: 2-10 mg/hour, increased if necessary up to 20 mg/hour

BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY

► Adult: 1-3 sprays, to be administered under tongue whilst holding breath, allow a 30 second interval between each dose

Left ventricular failure

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 40-160 mg daily in divided doses, increased if necessary up to 240 mg daily in divided doses
- BY INTRAVENOUS INFUSION
- ► Adult: Initially 2–10 mg/hour, increased if necessary up to 20 mg/hour

Prophylaxis of angina

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses
- PREGNANCY May cross placenta—manufacturers advise avoid unless potential benefit outweighs risk.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Isoket 0.05%®, Isoket 0.15%®), give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; Isoket 0.05%® can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe. Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, solution for infusion, oral solution

Tablet

Isosorbide mononitrate

INDICATIONS AND DOSE

Prophylaxis of angina | Adjunct in congestive heart failure BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

 Adult: Initially 20 mg 2-3 times a day, alternatively initially 40 mg twice daily, increased if necessary up to 120 mg daily in divided doses

Prophylaxis of angina (for patients who have not previously had a nitrate) | Adjunct in congestive heart failure (for patients who have not previously had a nitrate)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 10 mg twice daily, increased if necessary up to 120 mg daily in divided doses

MONOMIL® XL

Prophylaxis of angina

ву моитн

► Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets once daily, to be taken in the morning

ISMO RETARD

Prophylaxis of angina

ву моитн

► Adult: 1 tablet daily, to be taken in the morning

Prophylaxis of angina

ву моитн

 Adult: Initially 0.5 tablet daily for 2-4 days, to be taken if headache occurs, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

MONOSORB® XL60

Prophylaxis of angina

BY MOUTH

 Adult: Initially 0.5 tablet daily for the first 2-4 days, to minimise the possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, to be taken in the morning

IMDUR⁶

Prophylaxis of angina

ву моитн

➤ Adult: Initially 0.5 tablet daily, to be taken if headache occurs; 1 tablet daily, then increased if necessary to 2 tablets daily, dose to be taken in the morning

MONOMAX® XL

Prophylaxis of angina

ву моитн

 Adult: Initially 0.5 tablet daily for 2-4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, to be taken in the morning

Prophylaxis of angina

ZEMON® Prophylax BY MOUTH

 Adult: Initially 30 mg daily for 2-4 days, to minimise possibility of headache, then 40-60 mg daily, increased if necessary to 80-120 mg once daily, to be taken in the morning

ISOTARD®

Prophylaxis of angina

BY MOUTH

 Adult: 25–60 mg daily, if headaches occur with 60 mg tablet, half a 60 mg tablet may be given for 2–4 days, then increased if necessary to 50–120 mg daily, to be taken in the morning

MODISAL® XL

Prophylaxis of angina

ву моитн

 Adult: Initially 0.5 tablet once daily for 2-4 days, to minimise the possibility of headache; 1 tablet once daily, then increased if necessary to 2 tablets once daily, dose to be taken in the morning

CHEMYDUR® 60XI

Prophylaxis of angina

BY MOUTH

 Adult: Initially 0.5 tablet daily for 2-4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

ELANTAN® LA

Prophylaxis of angina

ву моитн

 Adult: 1 capsule daily, then increased if necessary to 2 capsules daily, dose to be taken in the morning

Prophylaxis of angina

ву моитн

► Adult: 25–50 mg daily, then increased if necessary to 50–100 mg once daily, to be taken in the morning

MONOMAX® SR Prophylaxis of angina

ву моитн

▶ Adult: 40-60 mg daily, increased if necessary to 120 mg daily, to be taken in the morning

 PREGNANCY Manufacturers advise avoid unless potential benefit outweighs risk.

SYMPATHOMIMETICS (INOTROPIC)

Dobutamine

• DRUG ACTION Dobutamine is a cardiac stimulant which acts on beta1 receptors in cardiac muscle, and increases contractility with little effect on rate.

INDICATIONS AND DOSE

Inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation BY INTRAVENOUS INFUSION

► Adult: Usual dose 2.5-10 micrograms/kg/minute, adjusted according to response, alternatively 0.5-40 micrograms/kg/minute

Cardiac stress testing

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

- CONTRA-INDICATIONS Phaeochromocytoma
- CAUTIONS Acute heart failure acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypovolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · elderly · extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · ischaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours
- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS
- Rare Psychosis
- ▶ Very rare Angle-closure glaucoma AV block bradycardia · cardiac arrest · coronary artery spasm · hypokalaemia · myocardial infarction · petechial bleeding
- ► Frequency not known Anxiety arrhythmias bronchospasm · cerebral haemorrhage · chest pain · dyspnoea · eosinophilia · fever · headache · hypertension (marked increase in systolic blood pressure indicates overdose) · hypotension · increased urinary urgency · myoclonic spasm · nausea · palpitation · paraesthesia · phlebitis · pruritus of scalp · pulmonary oedema · rash · reduced platelet aggregation (on prolonged use) . tachycardia · tremor · vomiting
- PREGNANCY No evidence of harm in animal studies manufacturers advise use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturers advise avoid—no information available.
- MONITORING REQUIREMENTS Monitor serum-potassium concentration.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5-1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions. Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted hefore use

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Sulfites

► DOBUTAMINE (Non-proprietary)

Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml Dobutamine 250mg/50ml solution for infusion vials | 1 vial Pom

Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule PoM £26.00-£26.25

Fibrinolytic drugs

The value of thrombolytic drugs for the treatment of myocardial infarction has been established. Streptokinase p. 195 and alteplase p. 194 have been shown to reduce mortality. Reteplase p. 195 and tenecteplase p. 195 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest

in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase and urokinase p. 119 can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke.

Urokinase p. 119 is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

Fibrinolytics

fibrin and so breaks up thrombi.

- CONTRA-INDICATIONS Active pulmonary disease with cavitation acute pancreatitis aneurysm aortic dissection bacterial endocarditis bleeding diatheses coagulation defects coma heavy vaginal bleeding history of cerebrovascular disease (especially recent events or with any residual disability) oesophageal varices pericarditis recent haemorrhage recent surgery (including dental extraction) recent symptoms of possible peptic ulceration recent trauma severe hypertension
- CAUTIONS Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) ⋅ elderly ⋅ external chest compression ⋅ hypertension ⋅ risk of bleeding (including that from venepuncture or invasive procedures)
- INTERACTIONS Caution with recent or concomitant use of drugs that increase the risk of bleeding.
- SIDE-EFFECTS Allergic reactions anaphylaxis angina (when used in myocardial infarction) back pain bleeding bleeding (usually limited to the site of injection, but can occur from other sites) cerebral oedema (caused by reperfusion) convulsions fever flushing hypotension intracerebral haemorrhage nausea pulmonary oedema (caused by reperfusion) rash recurrent ischaemia (when used in myocardial infarction) reperfusion arrhythmias (when used in myocardial infarction) uveitis vomiting SIDE-EFFECTS. FURTHER INFORMATION

Bleeding Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli). Hypotension Hypotension can usually be controlled by elevating the patient's legs, or by reducing the rate of infusion or stopping it temporarily.

- PREGNANCY Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.
- HEPATIC IMPAIRMENT Avoid in severe hepatic impairment as there is an increased risk of bleeding.

Alteplase

(rt-PA; Tissue-type plasminogen activator)

INDICATIONS AND DOSE

Acute myocardial infarction, accelerated regimen

INITIALLY BY INTRAVENOUS INJECTION

- Adult (body-weight up to 65 kg): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
- Adult (body-weight 65 kg and above): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 30 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes

Acute myocardial infarction

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg for 4 infusions, each 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg

Pulmonary embolism

INITIALLY BY INTRAVENOUS INJECTION

► Adult: Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg

Acute stroke (under specialist neurology physician only) BY INTRAVENOUS INFUSION

Adult 18-79 years: Initially 900 micrograms/kg (max. per dose 90 mg), treatment must begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial 10% of dose is to be administered by intravenous injection and the remainder by intravenous infusion

ACTILYSE CATHFLO®

Thrombolytic treatment of occluded central venous access devices

BY INTRAVENOUS INJECTION

Adult: (consult product literature)

CONTRA-INDICATIONS

- When used for acute ischaemic stroke Convulsion accompanying stroke - history of stroke in patients with diabetes - hyperglycaemia - hypoglycaemia - severe stroke stroke in last 3 months
- INTERACTIONS Contra-indicated if concomitant treatment with oral anticoagulants.
- SIDE-EFFECTS Risk of cerebral bleeding increased in acute stroke
- ALLERGY AND CROSS-SENSITIVITY Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

MONITORING REQUIREMENTS

- When used for acute ischaemic stroke Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Actilyse®), give intermittently or continuously in Sodium chloride 0.9%; dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in

the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Alteplase for the treatment of acute ischaemic stroke (September 2012) NICE TA264

Alteplase is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication if:

- treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, *and*
- intracranial haemorrhage has been excluded by appropriate imaging techniques, www.nice.org.uk/TA264

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

► Actilyse (Boehringer Ingelheim Ltd)

Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial PoM £144.00

Alteplase 20 mg Actilyse 20mg powder and solvent for solution for

injection vials | 1 vial Pom £216.00

Actilyse Cathflo (Boehringer Ingelheim Ltd)

Alteplase 2 mg Actilyse Cathflo 2mg powder and solvent for solution for injection vials | 5 vial PoM £225.00 (Hospital only)

Powder and solvent for solution for infusion

► Actilyse (Boehringer Ingelheim Ltd)

Alteplase 50 mg Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial PoM £360.00

Reteplase

INDICATIONS AND DOSE

Acute myocardial infarction
BY INTRAVENOUS INJECTION

- Adult: 10 units, initiated within 12 hours of onset of symptoms, dose to be given over not more than 2 minutes, followed by 10 units after 30 minutes
- BREAST FEEDING Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Rapilysin (Actavis UK Ltd)

Reteplase 10 unit Rapilysin 10unit powder and solvent for solution for injection vials | 2 vial PoM £566.00

Streptokinase

INDICATIONS AND DOSE

Acute myocardial infarction

BY INTRAVENOUS INFUSION

 Adult: 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes

Deep-vein thrombosis | Pulmonary embolism | Acute arterial thromboembolism | Central retinal venous or arterial thrombosis

BY INTRAVENOUS INFUSION

 Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 12–72 hours, duration is adjusted according to condition with monitoring of clotting parameters (consult product literature)

SIDE-FFFFCTS

- ► Rare Guillain-Barré syndrome
- ALLERGY AND CROSS-SENSITIVITY Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Streptase®), give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► STREPTOKINASE (Non-proprietary)

Streptokinase 1.5 mega u Biofactor Streptokinase 1.5million unit powder for solution for infusion vials | 1 vial [Pom] E83.44
Streptokinase 250000 unit Biofactor Streptokinase 250,000unit powder for solution for infusion vials | 1 vial [Pom] E15.91
Streptokinase 750000 unit Biofactor Streptokinase 750,000unit powder for solution for infusion vials | 1 vial [Pom] E17.70

Tenecteplase

INDICATIONS AND DOSE

Acute myocardial infarction BY INTRAVENOUS INJECTION

- Adult: 30-50 mg (max. per dose 50 mg), dose to be given over 10 seconds and initiated within 6 hours of symptom onset, dose varies according to body weight—consult product literature
- BREAST FEEDING Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Tenecteplase 8000 unit Metalyse 8,000unit powder and solvent for solution for injection vials | 1 vial PoM £502.25

Tenecteplase 10000 unit Metalyse 10,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £502.25

7.2 Cardiac arrest

Cardiopulmonary resuscitation

The algorithm for cardiopulmonary resuscitation (Life support algorithm) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at www.resus.org.uk.

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine p. 196 1 in 10000 (100 micrograms/mL) is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest

compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation.

Intravenous injection of amiodarone hydrochloride p. 88 should be considered after adrenaline/epinephrine below to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone hydrochloride can be given if necessary, followed by an intravenous infusion of amiodarone hydrochloride. Lidocaine hydrochloride p. 91, is an alternative if amiodarone hydrochloride is not available. Atropine sulfate p. 949 is no longer recommended in the treatment of asystole or pulseless electrical activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 241.

SYMPATHOMIMETICS (VASOCONSTRICTOR)

Adrenaline/epinephrine

 DRUG ACTION Acts on both alpha and beta receptors and increases both heart rate and contractility (beta₁ effects); it can cause peripheral vasodilation (a beta₂ effect) or vasoconstriction (an alpha effect).

INDICATIONS AND DOSE

Cardiopulmonary resuscitation

BY INTRAVENOUS INJECTION

 Adult: 1 mg every 3-5 minutes as required, a 1 in 10000 (100 micrograms/mL) solution is recommended

Acute hypotension

BY CONTINUOUS INTRAVENOUS INFUSION

- ➤ Neonate: Initially 100 nanograms/kg/minute (up to 1.5 micrograms/kg/minute has been used), adjusted according to response
- Child: Initially 100 nanograms/kg/minute (up to 1.5 micrograms/kg/minute has been used), adjusted according to response

Emergency treatment of acute anaphylaxis (under expert supervision) | Angioedema (if laryngeal oedema is present) (under expert supervision)

BY INTRAMUSCULAR INJECTION

- Child 1 month-5 years: 150 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, repeated if necessary, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 6-11 years: 300 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function
- Child 12-17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal
- Adult: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if

necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function

Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) | Angioedema (if laryngeal oedema is present) (specialist use only)
BY SLOW INTRAVENOUS INJECTION

▶ Adult: 50 micrograms, using 0.5 mL of the dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained

Control of bradycardia in patients with arrhythmias after myocardial infarction, if there is a risk of asystole, or if the patient is unstable and has failed to respond to atronine

BY INTRAVENOUS INFUSION

 Adult: 2-10 micrograms/minute, adjusted according to response

EMERADE® 150 MICROGRAMS

Acute anaphylaxis (for self-administration)

BY INTRAMUSCULAR INJECTION

- ► Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15-30 kg): 150 micrograms, then 150 micrograms after 5-15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

EMERADE® 300 MICROGRAMS

Acute anaphylaxis (for self-administration)

BY INTRAMUSCULAR INJECTION

- Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- ► Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

EMERADE® 500 MICROGRAMS

Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)

BY INTRAMUSCULAR INJECTION

- ► Child 12-17 years: 500 micrograms, then 500 micrograms after 5-15 minutes as required
- Adult: 500 micrograms, then 500 micrograms after 5-15 minutes as required

EPIPEN® JR AUTO-INJECTOR 0.15MG

Acute anaphylaxis (for self-administration)

BY INTRAMUSCULAR INJECTION

- ► Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15-30 kg): 150 micrograms, then 150 micrograms after 5-15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

EPIPEN® AUTO-INJECTOR 0.3MG

Acute anaphylaxis (for self-administration)

BY INTRAMUSCULAR INJECTION

- ► Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

JEXT® 150 MICROGRAMS

Acute anaphylaxis (for self-administration)

BY INTRAMUSCULAR INJECTION

- ➤ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15-30 kg): 150 micrograms, then 150 micrograms after 5-15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

IEXT[®] 300 MICROGRAMS

Acute anaphylaxis (for self-administration)

BY INTRAMUSCULAR INJECTION

- ► Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- ► Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)

BY INTRACAVERNOSAL INJECTION

Adult: 10-20 micrograms every 5-10 minutes, using a 20 microgram/mL solution, Important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse: maximum 100 micrograms per course

UNLICENSED USE

 With intravenous use Adrenaline 1 in 1000 (1mg/mL) solution is not licensed for intravenous administration.
 Auto-injector delivering 150-microgram dose of adrenaline not licensed for use in children body-weight under 15 kg.

Important safety information

SAFE PRACTICE

Intravenous route should be used with **extreme care** by specialists only.

• CAUTIONS Arteriosclerosis • arrhythmias • cerebrovascular disease • cor pulmonale • diabetes mellitus • elderly • hypercalcaemia • hyperreflexia • hypertension • hypethyroidism • hypokalaemia • ischaemic heart disease • obstructive cardiomyopathy • occlusive vascular disease • organic brain damage • phaeochromocytoma • prostate disorders • psychoneurosis • severe angina • susceptibility to angle • closure glaucoma

CAUTIONS, FURTHER INFORMATION

Cautions listed are only for non-life-threatening situations.

- INTERACTIONS → Appendix 1 (sympathomimetics) Severe anaphylaxis in patients taking beta-blockers may not respond to adrenaline—consider bronchodilator therapy. Furthermore, adrenaline can cause severe hypertension and bradycardia in those taking noncardioselective beta-blockers.
- SIDE-EFFECTS Angina · angle-closure glaucoma · anorexia · anxiety · arrhythmias · cold extremities · confusion · difficulty in micturition · dizziness · dry mouth · dyspnoea · headache · hyperglycaemia · hypersalivation · hypertension (risk of cerebral haemorrhage) · hypokalaemia · insomnia · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitation · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · restlessness · sweating · tachycardia · tissue necrosis at injection site · tissue necrosis of bowel · tissue necrosis of extremities · tissue necrosis of kidneys · tissue necrosis of liver · tremor · urinary retention · vomiting · weakness
- PREGNANCY May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.
- BREAST FEEDING Present in milk but unlikely to be harmful as poor oral bioavailability.
- RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.
- MONITORING REQUIREMENTS Monitor blood pressure and ECG.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use in children Acute hypotension (same text as above) For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central
 - 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solutions.
- With intravenous use Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation.
- PRESCRIBING AND DISPENSING INFORMATION It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

Great vigilance is needed to ensure that the *correct* strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength. Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.

Packs for self-administration need to be **clearly labelled** with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone.

Adrenaline for administration by intramuscular injection is available in 'auto-injectors' (e.g. $Emerade^{\otimes}$, $EpiPen^{\otimes}$, or $Jext^{\otimes}$), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

• PATIENT AND CARER ADVICE

Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be *instructed in advance* when and how to inject it.

Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-foranapylaxis

EPIPEN® AUTO-INJECTOR 0.15MG, 0.3MG

1.7 mL of the solution remains in the auto-injector device after use.

EMERADE® 500 MICROGRAMS

No solution remains in the auto-injector device after use.

EMERADE® 150 MICROGRAMS

0.35 mL of the solution remains in the auto-injector device after use.

EMERADE® 300 MICROGRAMS

0.2 mL of the solution remains in the auto-injector device after use.

JEXT® 300 MICROGRAMS

1.1 mL of the solution remains in the auto-injector device after use.

JEXT® 150 MICROGRAMS

 $1.25\;\mathrm{mL}$ of the solution remains in the auto-injector device after use.

 EXCEPTIONS TO LEGAL CATEGORY POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

EXCIPIENTS: May contain Sulfites

► ADRENALINE/EPINEPHRINE (Non-proprietary)

8 Oedema

Diuretics

Overview

Thiazides are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure.

Loop diuretics are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure.

Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of *hypertension* a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlortalidone p. 204 and indapamide p. 160 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 159 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication, although patients with stable and controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlortalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlortalidone can also be used under close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 205 and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone p. 205 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, cyclopenthiazide p. 204, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and

oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide and bumetanide are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torasemide p. 202 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Potassium-sparing diuretics and aldosterone antagonists

Amiloride hydrochloride p. 203 and triamterene p. 203 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.

Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Aldosterone antagonists

Spironolactone p. 168 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication].

Spironolactone is also used in primary hyperaldosteronism (Conn's syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 167 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction.

Potassium supplements must **not** be given with aldosterone antagonists

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

Other diuretics

Mannitol p. 202 is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 965 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide p. 966 and brinzolamide p. 965 inhibit the formation of aqueous humour and are used in glaucoma.

Diuretics with potassium

Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should **not** usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

LOOP DILIBETICS

Loop diuretics

- DRUG ACTION Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.
- CONTRA-INDICATIONS Anuria comatose and precomatose states associated with liver cirrhosis - renal failure due to nephrotoxic or hepatotoxic drugs - severe hypokalaemia severe hyponatraemia
- CAUTIONS Can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) can excacerbate gout hypotension should be corrected before initiation of treatment hypovolaemia should be corrected before initiation of treatment urinary retention can occur in prostatic hyperplasia

CAUTIONS, FURTHER INFORMATION

Elderly Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

Potassium loss Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic. Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassiumsparing diuretics avoids the need to take potassium supplements.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

Urinary retention If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment.

- INTERACTIONS → Appendix 1 (diuretics).
- SIDE-EFFECTS
- ► Very rare Hyperuricaemia
- Frequency not known Acute urinary retention · blood disorders · bone-marrow depression · deafness (usually with high doses and rapid intravenous administration, and in renal impairment) · electrolyte disturbances · hepatic encephalopathy · hyperglycaemia (less common than with thiazides) · hypersensitivity reactions ·

hypocalcaemia · hypochloraemia · hypokalaemia · hypomagnesaemia · hyponatraemia · leucopenia · metabolic alkalosis · mild gastro-intestinal disturbances · pancreatitis · photosensitivity · postural hypotension · pruritus · rash · temporary increase in serum-cholesterol and triglyceride concentration · thrombocytopenia · tinnitus (usually with high doses and rapid intravenous administration, and in renal impairment) · visual disturbances

- HEPATIC IMPAIRMENT Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this. Diuretics can increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias.
- RENAL IMPAIRMENT High doses of loop diuretics may occasionally be needed in renal impairment.
 High doses or rapid intravenous administration can cause tinnitus and deafness.
- MONITORING REQUIREMENTS Monitor electrolytes during treatment.

Bumetanide

INDICATIONS AND DOSE

Oedema

ву моитн

- ▶ Adult: 1 mg, dose to be taken in the morning, then 1 mg after 6-8 hours if required
- Elderly: 500 micrograms daily, this lower dose may be sufficient in elderly patients

Oedema, severe cases

ву моитн

- ► Adult: Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response
- SIDE-EFFECTS Breast pain gynaecomastia musculoskeletal pain (associated with high doses in renal failure)
- PREGNANCY Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- \bullet BREAST FEEDING No information available. May inhibit lactation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► BUMETANIDE (Non-proprietary)

Bumetanide 1 mg Bumetanide 1 mg tablets | 28 tablet PoM £2.50 DT price = £1.35

Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet $\boxed{\text{PoM}}$ £7.00 DT price = £6.98

Oral solution

► BUMETANIDE (Non-proprietary)

Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar free (sugar-free) | 150 ml PoM £128.00 DT price = £128.00

Also available in combination with amiloride, p. 203

Co-amilofruse

INDICATIONS AND DOSE

Oedema

ву моитн

 Adult: 2.5/20-10/80 mg daily, dose to be taken in the morning

Dose equivalence and conversion

A mixture of amiloride hydrochloride and furosemide (frusemide) in the mass proportions of 1 part amiloride hydrochloride to 8 parts furosemide (frusemide).

- CONTRA-INDICATIONS Addison's disease · anuria · comatose or precomatose states associated with liver cirrhosis · dehydration · hyperkalaemia · hypovolaemia · renal failure · severe hypokalaemia · severe hyponatraemia
- CAUTIONS Correct hypovolaemia before using in oliguria diabetes mellitus elderly gout hepatorenal syndrome hypoproteinaemia hypotension impaired micturition prostatic enlargement
- INTERACTIONS → Appendix 1 (diuretics).
- SIDE-EFFECTS Agranulocytosis · anaphylaxis · aplastic anaemia · blood disorders · bone marrow depression (withdraw treatment) · confusion · deafness (usually in renal impairment or in hypoproteinaemia) · dry mouth · eosinophilia · exfoliative dermatitis · gastro-intestinal disturbances · gout · haemolytic anaemia · hepatic encephalopathy · hyperglycaemia · hypersensitivity reactions · hyperuricaemia · hypocalcaemia · hypokalaemia (due to furosemide—may be followed by hyperkalaemia due to amiloride) · hypomagnesaemia · hyponatraemia · hypotension · intrahepatic cholestasis · leucopenia · metabolic alkalosis or acidosis · pancreatitis · paraesthesia · photosensitivity · purpura · rashes · Stevens-Johnson syndrome · temporary increase in serum cholesterol and triglyceride concentrations · thrombocytopenia · tinnitus · toxic epidermal necrolysis
- PREGNANCY Not used to treat hypertension in pregnancy.
- BREAST FEEDING Manufacturers advise avoid—no information regarding amilloride component available. Amount of furosemide in milk too small to be harmful. Furosemide may inhibit lactation.
- HEPATIC IMPAIRMENT Increased risk of hypomagnesaemia in alcoholic cirrhosis.
- RENAL IMPAIRMENT Risk of hyperkalaemia in renal impairment but may need higher doses. Monitor plasmapotassium concentration. Avoid if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Monitor electrolytes.

Furosemide

(Frusemide)

INDICATIONS AND DOSE

Oedema

▶ Adult: Initially 40 mg daily, dose to be taken in the morning, then maintenance 20-40 mg daily INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 20-50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

Resistant oedema

BY MOUTH

► Adult: 80-120 mg daily

INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 20-50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

Resistant hypertension

BY MOUTH

▶ Adult: 40-80 mg daily

INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 20-50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day
- CAUTIONS Hepatorenal syndrome hypoproteinaemia may reduce diuretic effect and increase risk of side-effects
- SIDE-EFFECTS Gout · intrahepatic cholestasis
- PREGNANCY Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- BREAST FEEDING Amount too small to be harmful. May inhibit lactation.
- DIRECTIONS FOR ADMINISTRATION Intravenous administration rate should not usually exceed 4 mg/minute however single doses of up to 80 mg may be administered more rapidly. A lower rate of infusion may be necessary in renal impairment. For intravenous infusion (Lasix®), give continuously in Sodium chloride 0.9%; infusion pH must be above 5.5 and rate should not exceed 4 mg/minute; glucose solutions are unsuitable.

9 Vascular disease

Peripheral vascular disease

Peripheral vascular disease can be either occlusive (e.g. intermittent claudication) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. Raynaud's syndrome). Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation, effective control of blood pressure,

regulating blood lipids, optimising glycaemic control in diabetes, taking aspirin p. 104 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Naftidrofuryl oxalate p. 206 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl oxalate p. 206 should be assessed for improvement after 3–6 months.

Cilostazol p. 206 is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance.

Inositol nicotinate p. 206 and pentoxifylline p. 207 are not established as being effective for the treatment of intermittent claudication.

Management of *Raynaud's syndrome* includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud's syndrome. Nifedipine p. 154 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl oxalate p. 206 may produce symptomatic improvement; inositol nicotinate p. 206 (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 674, and moxisylyte below are not established as being effective for the treatment of Raynaud's syndrome.

Vasodilator therapy is not established as being effective for *chilblains*.

ALPHA-ADRENOCEPTOR BLOCKERS

Moxisylyte

(Thymoxamine)

INDICATIONS AND DOSE

Primary Raynaud's syndrome (short-term treatment)

- Adult: Initially 40 mg 4 times a day, increased if necessary to 80 mg 4 times a day, increase dose if poor initial response, discontinue after 2 weeks if no response
- CONTRA-INDICATIONS Active liver disease
- CAUTIONS Diabetes mellitus
- SIDE-EFFECTS Cholestatic jaundice · diarrhoea · dizziness · flushing · headache · hepatic reactions · hepatitis · nausea
- PREGNANCY Manufacturer advises avoid.
- LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing.

Cilostazol

INDICATIONS AND DOSE

Intermittent claudication in patients without rest pain and no peripheral tissue necrosis

ву моитн

 Adult: 100 mg twice daily, to be taken 30 minutes before food, cilostazol should be initiated by those experienced in the management of intermittent claudication, patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance

Dose adjustments due to interactions

Reduce dose to 50 mg twice daily with concomitant use of potent inhibitors of cytochrome P450 enzymes CYP3A4 (e.g. clarithromycin, itraconazole, ketoconazole, protease inhibitors) or CYP2C19, or with erythromycin or omeprazole.

• CONTRA-INDICATIONS Active peptic ulcer · congestive heart failure · coronary intervention in previous 6 months · haemorrhagic stroke in previous 6 months · history of severe tachyarrhythmia · myocardial infarction in previous 6 months · poorly controlled hypertension · predisposition to bleeding · proliferative diabetic retinopathy ·

prolongation of QT interval · severe atrial flutter · unstable angina

- CAUTIONS Atrial fibrillation atrial or ventricular ectopy diabetes mellitus (higher risk of intraocular bleeding) mild to moderate atrial flutter stable coronary disease surgery
- INTERACTIONS → Appendix 1 (cilostazol).
 Caution with concomitant use of drugs that increase risk of bleeding. Contra-indicated with concomitant use of 2 or more antiplatelets or anticoagulants.

SIDE-EFFECTS

- ► Common or very common Abdominal pain · angina · anorexia · arrhythmia · diarrhoea · dizziness · dyspepsia · ecchymosis · flatulence · headache · malaise · nausea · oedema · palpitation · pharyngitis · pruritus · rash · rhinitis · tachycardia · vomiting
- Uncommon Abnormal dreams · anaemia · anxiety · congestive heart failure · cough · diabetes mellitus · dyspnoea · gastritis · haemorrhage · hyperglycaemia · insomnia · myalgia · myocardial infarction · pneumonia · postural hypotension
- ▶ Rare Bleeding disorders increased urinary frequency renal impairment thrombocythaemia
- Frequency not known Agranulocytosis aplastic anemia conjunctivitis hepatitis hot flushes hypertension leucopenia pancytopenia pyrexia Stevens-Johnson syndrome thrombocytopenia tinnitus toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Blood Disorders A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Present in milk in animal studies manufacturer advises avoid.
- HEPATIC IMPAIRMENT Avoid in moderate or severe liver disease.
- RENAL IMPAIRMENT Avoid if eGFR less than 25 mL/minute/1 73 m²

PATIENT AND CARER ADVICE

Blood disorders Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223

Cilostazol is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA223

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► CILOSTAZOL (Non-proprietary)

Cilostazol 50 mg Cilostazol 50mg tablets | 56 tablet $\boxed{\text{PoM}}$ £40.05 DT price = £39.91

Cilostazol 100 mg Cilostazol 100mg tablets | 56 tablet PoM £31.70 DT price = £14.77

XANTHINES

Pentoxifylline (Oxpentifylline)

INDICATIONS AND DOSE

Peripheral vascular disease | Venous leg ulcer (adjunct)

- ► Adult: 400 mg 2-3 times a day
- UNLICENSED USE Use of pentoxifylline as adjunct therapy for venous leg ulcers is an unlicensed indication.
- CONTRA-INDICATIONS Acute myocardial infarction · cerebral haemorrhage · extensive retinal haemorrhage · severe cardiac arrhythmias
- CAUTIONS Avoid in Acute porphyrias p. 864 · coronary artery disease · hypotension
- INTERACTIONS → Appendix 1 (pentoxifylline).
- SIDE-EFFECTS
- ▶ Rare Angina · hypotension
- ▶ Very rare Bleeding
- Frequency not known Agitation · diarrhoea · dizziness · flushing · headache · intra-hepatic cholestasis · nausea · sleep disturbances · tachycardia · thrombocytopenia · vomiting
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Present in milk—manufacturer advises use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Manufacturer advises reduce dose in severe impairment.
- RENAL IMPAIRMENT Reduce dose by 30-50% if eGFR less than 30 mL/minute/1 73 m²
- NATIONAL FUNDING/ACCESS DECISIONS

9.1 Vein malformations

SCLEROSANTS

Sodium tetradecvl sulfate

INDICATIONS AND DOSE

Sclerotherapy of reticular veins and spider veins in legs and varicose veins

BY INTRAVENOUS INJECTION

- ▶ Adult: Test dose recommended before each treatment (consult product literature)
- CONTRA-INDICATIONS Acute infection · asthma · blood disorders · deep vein thrombosis · high risk of thromboembolism · hyperthyroidism · inability to walk · neoplasm · occlusive arterial disease · phlebitis · pulmonary embolism · recent acute superficial thrombophlebitis · recent surgery · respiratory disease · significant valvular incompetence in deep veins · skin disease · symptomatic patent foramen ovale (if administered as foam) · uncontrolled diabetes mellitus · varicose veins caused by tumours (unless tumour
- CAUTIONS Arterial disease asymptomatic patent foramen ovale (use smaller volumes and avoid Valsalva manoeuvre immediately after administration) • extravasation may cause necrosis of tissues · history of migraine (use smaller volumes) · resuscitation facilities must be available · venous insufficiency with lymphoedema (pain and inflammation may worsen)

SIDE-EFFECTS

- ► Common or very common Local burning · local pain · phlebitis · skin discoloration · superficial thrombophlebitis · telangiectatic matting
- ▶ Uncommon Deep vein thrombosis scotoma
- ▶ Rare Chest pain · cough · headache · migraine · paraesthesia · shortness of breath · vasovagal reactions
- Very rare Anaphylaxis · circulatory collapse · diarrhoea · dry mouth · fever · hot flushes · hypersensitivity reactions · nausea · necrosis of skin and tissues · palpitation · pulmonary embolism · sloughing of skin and tissues · stroke · swollen tongue · transient ischaemic attack · vasculitis · vomiting · weakness
- PREGNANCY Avoid unless benefits outweigh risks—no information available.
- BREAST FEEDING Use with caution—no information available.

Respiratory system

Inhalation

This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Inhaler devices

These include pressurised metered-dose inhalers, breath-actuated inhalers, and dry powder inhalers. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. Spacer devices can help such patients because they remove the need to co-ordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

Pressurised metered-dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

Spacer devices

Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices

Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Nehulisers

Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser usually driven by oxygen in hospital.

Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta₂ agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta₂ agonist or ipratropium bromide p. 217 to a
 patient with an acute exacerbation of asthma or of
 chronic obstructive pulmonary disease;
- a beta₂ agonist, corticosteroid, or ipratropium bromide on a regular basis to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 489) or a mucolytic to a patient with cystic fibrosis;
- budesonide p. 228 or adrenaline/epinephrine p. 196 to a child with severe croup;
- pentamidine isetionate p. 523 for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see also Chronic Obstructive Pulmonary Disease p. 214) and the patient's ability to use hand-held devices:
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks:
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring:
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1-5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1-2 microns is needed for alveolar deposition of pentamidine isetionate p. 523 to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air. If oxygen is required, it should be given simultaneously by nasal cannula.

Tubing

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as dornase alfa p. 256 and nebulised suspensions.

Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

Ora

The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta₂ agonists, corticosteroids, theophylline p. 238, and leukotriene receptor antagonists.

Parenteral

Drugs such as beta₂ agonists, corticosteroids, and aminophylline p. 237 can be given by injection in acute severe asthma when administration by nebulisation is

inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.

NICE technology appraisals (TAs)

Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10

A child's needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child's condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered. www.nice.org.uk/TA10

Inhaler devices for children 5-15 years with chronic asthma (March 2002) NICE TA38

A child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored. www.nice.org.uk/TA38

1 Airways disease, obstructive

Asthma

Drugs used in the management of asthma include beta₂ agonists, antimuscarinic bronchodilators, theophylline p. 238, corticosteroids, sodium cromoglicate p. 234 and nedocromil sodium p. 234, leukotriene receptor antagonists, and, in specialist centres, omalizumab p. 235.

Management of acute asthma

Important: Patients with severe or life-threatening acute asthma may not be distressed and may not have all these abnormalities; the presence of any should alert the doctor Regard each emergency consultation as being for **severe** acute asthma until shown otherwise.

See medical emergencies, for doses of drugs used for the management of acute asthma.

Moderate acute asthma

- · Able to talk
- Respiration (breaths/minute) < 25; child 2-5 years ≤ 40, 5-12 years ≤ 30
- Pulse (beats/minute) < 110; child 2–5 years \le 140, 5–12 years \le 125
- Arterial oxygen saturation ≥ 92%
- Peak flow > 50% of predicted or best; child 5–12 years > 50%

Treat at home or in surgery and assess response to treatment

Treatment

 Inhaled short-acting beta₂ agonist via a large-volume spacer or oxygen-driven nebuliser (if available); give salbutamol 100 micrograms/metered inhalation p. 222, and repeat at 10–20 minute intervals if necessary or give nebulised salbutamol or terbutaline sulfate p. 225, and repeat at 20–30 minute intervals if necessary prednisolone by mouth for at least 5 days; and for up to 3 days in children, or longer if necessary. If the child has been taking an oral corticosteroid for more than a few days, give prednisolone at the upper end of the dose range.

Monitor response for 15-30 minutes

If response is poor or a relapse occurs in 3-4 hours, send immediately to hospital for assessment and further treatment.

Severe acute asthma

- Cannot complete sentences in one breath; in children, too breathless to talk or feed
- Respiration (breaths/minute) \geq 25; child 2–5 years > 40; 5–12 years > 30
- Pulse (beats/minute) \geq 110; child 2–5 years > 140; 5–12 years > 125
- Arterial oxygen saturation ≥ 92%; child under 12 years
- Peak flow 33–50% of predicted or best; child 5–12 years 33–50%

Start treatment below and send immediately to hospital.

Treatment

- High-flow oxygen (if available)
- Inhaled short-acting beta₂ agonist via a large-volume spacer or oxygen-driven nebuliser (if available) as for moderate acute asthma
- prednisolone p. 585 by mouth as for moderate acute asthma or intravenous hydrocortisone p. 583 (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible

Monitor response for 15-30 minutes

If response is poor:

 Inhaled ipratropium bromide p. 217 via oxygen-driven nebuliser (if available) every 4–6 hours in adults; or every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary in children.

Refer those who fail to respond and require ventilatory support to an intensive care or high-dependency unit

 Consider intravenous beta₂ agonist, aminophylline p. 237, or magnesium sulfate p. 858 [unlicensed indication] only after consultation with senior medical staff.

Life-threatening acute asthma

- Silent chest, feeble respiratory effort, cyanosis
- Hypotension, bradycardia, arrhythmia, exhaustion, agitation (in children), or reduced level of consciousness
- Arterial oxygen saturation < 92%
- Peak flow < 33% of predicted or best; child 5–12 years

Start treatment below and send immediately to hospital; consult with senior medical staff and refer to intensive care

Treatment

- High-flow oxygen (if available)
- Short-acting beta₂ agonist via oxygen-driven nebuliser (if available); give salbutamol or terbutaline, and repeat at 20–30 minute intervals or as necessary; reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably
- prednisolone by mouth as for moderate acute asthma or intravenous hydrocortisone p. 583 as for severe acute asthma
- Inhaled ipratropium bromide via oxygen-driven nebuliser (if available) as for severe acute asthma

Monitor response for 15-30 minutes

If response is poor:

 Consider intravenous aminophylline or magnesium sulfate [unlicensed indication] only after consultation with senior medical staff

Management of severe acute asthma

Important

Regard each emergency consultation as being for severe acute asthma until shown otherwise. Failure to respond adequately at any time requires immediate transfer to hospital.

Severe acute asthma can be fatal and must be treated promptly. All patients with severe acute asthma should be given high-flow oxygen (if available) and an inhaled shortacting beta, agonist via a large-volume spacer or nebuliser; give salbutamol 100 micrograms/metered inhalation p. 222, each puff inhaled separately via a large volume spacer, and repeat at 10-20 minute intervals or as necessary. If there are life-threatening features, give salbutamol or terbutaline sulfate p. 225 via an oxygendriven nebuliser every 20-30 minutes or as necessary. In all cases, a systemic corticosteroid should be given. For adults, give prednisolone by mouth for at least 5 days, or intravenous hydrocortisone (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. For children, give prednisolone by mouth for up to 3 days, or longer if necessary, or intravenous hydrocortisone (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. If the child has been taking an oral corticosteroid for more than a few days. then give prednisolone at the upper end of the dose range. In severe or life-threatening asthma, also consider initial treatment with ipratropium bromide by nebuliser.

Most patients do not require and do not benefit from the addition of intravenous aminophylline or of intravenous beta2 agonist; both cause more adverse effects than nebulised beta2 agonists. Nevertheless, an occasional patient who has not been taking theophylline may benefit from aminophylline infusion. A single dose of magnesium sulfate [unlicensed indication] by intravenous infusion over 20 minutes can be used for patients with severe acute asthma, but evidence of benefit is limited.

Treatment of severe acute asthma is safer in hospital where resuscitation facilities are immediately available. Treatment should **never** be delayed for investigations, patients should **never** be sedated, and the possibility of a pneumothorax should be considered.

If the patient's condition deteriorates despite pharmacological treatment, intermittent positive pressure ventilation may be needed.

Follow up in all cases

Episodes of acute asthma should be regarded as a failure of preventative therapy. A careful history should be taken to establish the reason for the exacerbation. Monitor symptoms and peak flow. Inhaler technique should be checked and regular treatment should be reviewed, see Management of chronic asthma below. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future exacerbations. Follow-up within 48 hours should be arranged with the general practitioner or appropriate primary care health professional. Patients should also be reviewed by a respiratory specialist within one month of the exacerbation.

Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated January 2012); updates available at www.brit-thoracic.org.uk.

Management of chronic asthma

Important: Start at step most appropriate to initial severity; before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute exacerbations.

Advice on the management of chronic asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated January 2012); updates available at www.brit-thoracic.org.uk

Adult and child over 5 years

Step 1: occasional relief bronchodilator

- Inhaled short-acting beta, agonist as required (up to
- Move to step 2 if needed more than twice a week, or if night-time symptoms at least once a week, or if exacerbation in the last 2 years

Step 2: regular inhaled preventer therapy

- Inhaled short-acting beta₂ agonist as required plus
- · Regular standard-dose inhaled corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled sodium cromoglicate, or inhaled nedocromil sodium, but are considerably less effective)

Step 3: inhaled corticosteroid + long-acting inhaled beta, agonist

- Inhaled short-acting beta, agonist as required plus
- Regular standard-dose inhaled corticosteroid plus
- Regular inhaled long-acting beta2 agonist (salmeterol p. 222 or formoterol fumarate p. 220); if asthma not controlled increase dose of inhaled corticosteroid to upper end of standard dose range and
- Either stop long-acting beta₂ agonist if of no benefit or continue long-acting beta2 agonist if of some benefit; if asthma still not controlled and long-acting beta, agonist stopped, add one of:

Leukotriene receptor antagonist Modified-release oral theophylline

Modified-release oral beta2 agonist (child under 12 years not recommended).

Step 4: high-dose inhaled corticosteroid + regular bronchodilators

- Inhaled short-acting beta2 agonist as required with
- Regular high-dose inhaled corticosteroid plus
- Inhaled long-acting beta2 agonist plus
- In adults 6-week sequential therapeutic trial of one or more of:

Leukotriene receptor antagonist Modified-release oral theophylline Modified-release oral beta2 agonist

Step 5: regular corticosteroid tablets (refer to a respiratory specialist)

- Inhaled short-acting beta, agonist as required with
- Regular high-dose inhaled corticosteroid and
- One or more long-acting bronchodilators (see step 4)
- Regular prednisolone p. 585 tablets (as single daily dose); in addition to regular prednisolone, continue high-dose inhaled corticosteroid (in exceptional cases may exceed licensed doses); these patients should normally be referred to an asthma clinic

Stepping down

• Review treatment every 3 months; if control achieved, stepwise reduction may be possible; reduce dose of inhaled corticosteroid slowly (consider reduction every 3 months, decreasing dose by up to 50% each time)

Child under 5 years

Lung function measurements cannot be used to guide management of those under 5 years.

Step 1: occasional relief bronchodilator

- Short-acting beta2 agonist as required (not more than once daily); preferably by inhalation (less effective and more side-effects when given by mouth)
- Move to step 2 if needed more than twice a week, or if night-time symptoms at least once a week, or if exacerbation in the last 2 years

Step 2: regular preventer therapy

- Inhaled short-acting beta2 agonist as required plus
- Either regular standard-dose inhaled corticosteroid
- Or (if inhaled corticosteroid cannot be used) leukotriene receptor antagonist.

Step 3: add-on therapy

- Child under 2 years: Refer to respiratory paediatrician
- Child 2-5 years: Inhaled short-acting beta, agonist as required plus
- Regular inhaled corticosteroid in standard dose plus
- Leukotriene receptor antagonist

Step 4: persistent poor control

· Refer to respiratory paediatrician.

Stepping down

· Regularly review need for treatment.

Standard-dose inhaled corticosteroids Beclometasone dipropionate or budesonide:

- Adult and child over 12 years 100-400 micrograms twice
- Child under 12 years 100-200 micrograms twice daily
- Fluticasone propionate: Adult and child over 12 years 50–200 micrograms twice
- Child 4-12 years 50-100 micrograms twice daily Mometasone furoate:

- Adult and child over 12 years 400 micrograms as a single dose in the evening or in 2 divided doses
- Child under 12 years not recommended

Dose adjustments may be required for some inhaler devices. see individual preparations.

Hiah-dose inhaled corticosteroids

Beclometasone dipropionate or budesonide:

- Adult and child over 12 years 0.4-1 mg twice daily
- Child 5-12 years 200-400 micrograms twice daily

Fluticasone propionate:

- Adult and child over 12 years 200-500 micrograms twice
- Child 5-12 years 100-200 micrograms twice daily Mometasone furoate:
- Adult and child over 12 years 400 micrograms twice daily
- · Child under 12 years not recommended

Dose adjustments may be required for some inhaler devices, see individual preparations.

Failure to achieve control with these doses is unusual.

Pregnancy and breast-feeding

It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Inhaled drugs, theophylline p. 238, and prednisolone can be taken as normal during pregnancy and breast-feeding. See individual leukotriene receptor antagonists for information on their use during pregnancy. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control

Severe acute exacerbations of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including nebulisation of a beta2 agonist and oral or parenteral administration of a corticosteroid; prednisolone is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94-98% and prevent maternal and fetal hypoxia. An intravenous beta2 agonist, aminophylline p. 237, or magnesium sulfate p. 858 can be used during pregnancy if necessary; parenteral beta₂ agonists can affect the myometrium.

Peak flow meters

When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are 'poor perceivers' and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

3M Security Print and Systems Limited. Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112

 $\ensuremath{\mathsf{GP}}$ practices can obtain supplies through their Area Team stores.

Bronchodilators

stockorders.dppas@apsgroup.co.uk.

Adrenoceptor agonists (sympathomimetics)

Selective beta₂ agonists produce bronchodilation. A shortacting beta₂ agonist is used for immediate relief of asthma symptoms while some long-acting beta₂ agonists are added to an inhaled corticosteroid in patients requiring prophylactic treatment.

The selective beta₂ agonists (selective beta₂-adrenoceptor agonists, selective beta₂ stimulants) such as salbutamol p. 222 or terbutaline sulfate p. 225 are the safest and most effective short-acting beta₂ agonists for asthma. Less selective beta₂ agonists such as ephedrine hydrochloride p. 236 is less suitable and less safe for use as a bronchodilator than the selective beta₂ agonists, because it is more likely to cause arrhythmias and other side-effects; it should be avoided whenever possible.

Adrenaline/epinephrine p. 196 (which has both alpha-and beta-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, in cardiopulmonary resuscitation, and in the management of severe croup.

Short-acting beta2 agonists

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta₂ agonist such as salbutamol or terbutaline sulfate. If beta₂ agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last 2 years, then prophylactic treatment should be considered using a stepped approach.

A short-acting beta₂ agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta₂ agonists

Formoterol fumarate p. 220 (eformoterol) and salmeterol p. 222 are longer-acting beta₂ agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid. They have a role in the long-term management of chronic asthma and can be useful in nocturnal asthma.

Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline sulfate. Formoterol fumarate is licensed for short-term symptom relief and for the prevention of

exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

Combination inhalers that contain a long-acting beta₂ agonist and a corticosteroid ensure that long-acting beta₂ agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component.

Indacaterol p. 221 and olodaterol p. 222 are long-acting beta₂ agonists licensed for chronic obstructive pulmonary disease in adults; they are not indicated for the relief of acute bronchospasm.

Vilanterol is a long-acting beta₂ agonist available only in a combination inhaler with fluticasone furoate *or* with umeclidinium p. 219.

Oral

Oral preparations of beta₂ agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta₂ agonists are more effective and have fewer side-effects. The longeracting oral preparations, including bambuterol hydrochloride p. 220, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta₂ agonists are usually preferred.

Parenteral

Salbutamol or terbutaline sulfate can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta, agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. In adults, beta2 agonists may also be given by intramuscular injection.

Children

Selective beta₂ agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years. A beta₂ agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta₂ agonist may be used where appropriate. In severe attacks nebulisation using a selective beta₂ agonist or ipratropium bromide is advisable.

Antimuscarinic bronchodilators

Ipratropium bromide p. 217 can provide short-term relief in chronic asthma, but short-acting $beta_2$ agonists act more quickly and are preferred. Ipratropium bromide by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy.

The aerosol inhalation of ipratropium bromide can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a longacting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Aclidinium bromide p. 217, glycopyrronium bromide p. 217, tiotropium p. 218, and umeclidinium p. 219 are licensed for the maintenance treatment of adults with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm. Tiotropium p. 218 (via *Respimat* device) is also licensed as an adjunct to inhaled corticosteroids and long-acting beta₂ agonists for the maintenance treatment of patients with asthma who have suffered one or more severe exacerbations in the last year.

Theophylline

Theophylline p. 238 is a xanthine used as a bronchodilator in *asthma* and stable *chronic obstructive pulmonary disease*; it

is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta₂ agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 237, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

Compound bronchodilator preparations

In general, patients are best treated with single-ingredient preparations, such as a selective beta₂ agonist or ipratropium bromide p. 217, so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

Chronic obstructive pulmonary disease

Smoking cessation reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal vaccine p. 1089 and influenza vaccine p. 1085).

A trial of a high-dose inhaled corticosteroid *or* an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled **short-acting beta**₂ **agonist** or a **short-acting antimuscarinic bronchodilator** used as required

When the airways obstruction is more severe, regular inhaled therapy should be used. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV₁), is 50% of predicted or more, either a long-acting antimuscarinic bronchodilator or a long-acting beta2 agonist should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting beta2 agonist with a corticosteroid in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting beta2 agonist.

If FEV₁ is less than 50% of predicted, *either* a long-acting antimuscarinic bronchodilator *or* a long-acting beta₂ agonist with a corticosteroid in a combination inhaler should be used

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting beta2 agonist and a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a longacting antimuscarinic bronchodilator can be used with a long-acting beta₂ agonist (see Use of inhaled therapies in chronic obstructive pulmonary disease algorithm, p. 215).

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline p. 237 or theophylline p. 238 can be used.

Indacaterol p. 221 is a long-acting beta₂ agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of

frequent exacerbations, roflumilast p. 236 is licensed as an adjunct to existing bronchodilator treatment.

A **mucolytic** drug may be considered for a patient with a chronic productive cough.

Long-term **oxygen** therapy prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of **oral corticosteroid**, such as prednisolone for 7–14 days, should be given if increased breathlessness interferes with daily activities. **Antibacterial** treatment is required if sputum becomes more purulent than usual, or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an *oxygen alert card* endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation.

Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008)

Oxygen alert card
Name:
I am at risk of type II respiratory failure with a raised CO level.
Please use my% Venturi mask to achieve an
oxygen saturation of% to% during exacerbations.
Use compressed air to drive nebulisers (with nasal oxyger

Oxygen alert card is available at www.brit-thoracic.org.uk.

oxygen-driven nebulisers to 6 minutes.

at 2 litres/minute). If compressed air not available, limit

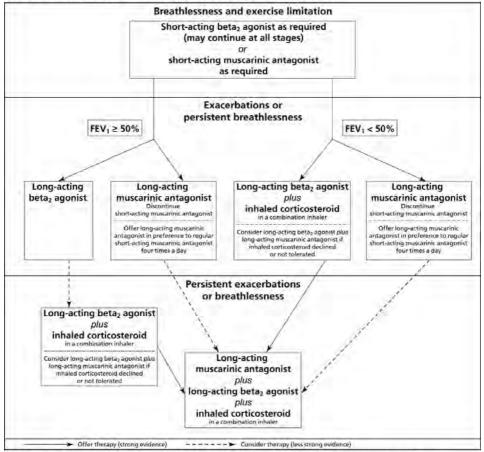

Oxygen

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near–normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide (P_a CO₂), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (P_aO_2) is usually associated with low or

Use of inhaled therapies in chronic obstructive pulmonary disease

Advice on the use of inhaled therapies in chronic obstructive pulmonary disease is based on the recommendations of the National Institute for Health and Eare Excellence (2010). Management of chronic obstructive pulmonary disease in adults in primary and secondary care. London: PICE, Available from www.nice.pr.uVCG101 Reproduced with parmission

normal arterial carbon dioxide (P_aCO_2), and therefore there is little risk of hypoventilation and carbon dioxide retention

In acute severe asthma, the arterial carbon dioxide $(P_a CO_2)$ is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide $(P_a CO_2)$ remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card.

Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

Air travel

Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient's requirement should be discussed with the airline before travel.

Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease.

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with P_aO₂
 <7.3 kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with P_aO₂
 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with P_aO₂<7.3 kPa or persistent disabling breathlessness;
- interstitial lung disease with P_aO₂<8 kPa and in patients with P_aO₂>8 kPa with disabling dyspnoea;
- cystic fibrosis when P_aO₂<7.3 kPa or if P_aO₂ 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when P_aO₂<8 kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime P_aO₂<7.3 kPa when breathing air or with nocturnal hypoxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as **oxygen cylinders**. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with 'medium' (2 litres/minute) and 'high' (4 litres/minute) settings.

Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- · emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- · long-term oxygen therapy;
- · ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient or carers consent, to pass on the patient's details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

In **Scotland** refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. In **Scotland** and **Northern Ireland** prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

ANTIMUSCARINICS

Antimuscarinics (inhaled)

- INTERACTIONS See Appendix 1 (antimuscarinics). However, note that interactions do not *generally* apply to antimuscarinics used by inhalation.
- SIDE-EFFECTS
- ► Common or very common Constipation · cough · diarrhoea · dry mouth · gastro-intestinal motility disorder · headache
- Uncommon Angle-closure glaucoma · atrial fibrillation · blurred vision · bronchospasm · dysphagia · dysphonia · gastro-oesophageal reflux disease · mydriasis · nasopharyngitis · nausea · palpitation · paradoxical bronchospasm · pharyngitis · tachycardia · throat irritation · urinary retention
- ▶ Rare Dental caries dry skin

QT-interval prolongation · left ventricular failure · unstable ischaemic heart disease

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk.
- \bullet RENAL IMPAIRMENT Use with caution if eGFR less than 30 mL/minute/1.73 $m^2.$
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer glycopyrronium for inhalation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

Seebri Breezhaler (Novartis Pharmaceuticals UK Ltd) ▼ Glycopyrronium bromide 55 microgram Seebri Breezhaler 44microgram inhalation powder capsules with device | 6 capsule [PoM] 55.50 | 30 capsule [PoM] £27.50

Aclidinium bromide

INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

BY INHALATION OF POWDER

► Adult: 375 micrograms twice daily

Dose equivalence and conversion

Each 375 microgram inhalation of aclidinium bromide delivers 322 micrograms of aclidinium.

- CAUTIONS Hospitalisation with moderate or severe heart failure within last 12 months · myocardial infarction within last 6 months · newly diagnosed arrhythmia within last 3 months · unstable angina
- SIDE-EFFECTS Sinusitis
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer aclidinium bromide powder inhalation.

Ipratropium bromide

INDICATIONS AND DOSE

Reversible airways obstruction

► Child 1 month-5 years: 20 micrograms 3 times a day

- ► Child 6-11 years: 20-40 micrograms 3 times a day
- ► Child 12-17 years: 20–40 micrograms 3–4 times a day

Reversible airways obstruction, particularly in chronic obstructive pulmonary disease

BY INHALATION OF AEROSOL

- ► Adult: 20-40 micrograms 3-4 times a day
- BY INHALATION OF NEBULISED SOLUTION
- ► Adult: 250-500 micrograms 3-4 times a day

Acute bronchospasm

BY INHALATION OF NEBULISED SOLUTION

- Child 1 month-4 years: 125–250 micrograms as required; maximum 1 mg per day
- Child 6-11 years: 250 micrograms as required; maximum 1 mg per day
- ► Child 12-17 years: 500 micrograms as required
- ▶ Adult: 500 micrograms as required

Severe or life-threatening acute asthma

BY INHALATION OF NEBULISED SOLUTION

- Child 1 month-11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
- ► Child 12-17 years: 500 micrograms every 4–6 hours as required
- ▶ Adult: 500 micrograms every 4–6 hours as required

PHARMACOKINETICS

The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

• CAUTIONS Cystic fibrosis

CAUTIONS, FURTHER INFORMATION

Glaucoma Acute angle-closure glaucoma has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta₂ agonists); care needed to protect the patient's eyes from nebulised drug or from drug powder.

SIDE-EFFECTS

- ► Common or very common Dizziness · nausea (in children)
- ► **Uncommon** Laryngospasm pharyngeal oedema (in children) pruritus stomatitis vomiting
- ▶ Rare Atrial fibrillation (in children) ocular accommodation disorder (in children)

- PREGNANCY Inhaled drugs for asthma can be taken as normal during pregnancy.
- BREAST FEEDING Inhaled drugs for asthma can be taken as normal during breast-feeding.
- DIRECTIONS FOR ADMINISTRATION If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.
- PATIENT AND CARER ADVICE Advise patient not to exceed prescribed dose and to follow manufacturer's directions.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- ► Uncommon Arrhythmias rash sinusitis urinary tract infection
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Use with caution in severe impairment.
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer umeclidinium inhalation powder.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

► Incruse Ellipta (GlaxoSmithKline UK Ltd) ▼ Umeclidinium bromide 65 microgram per 1 dose Incruse Ellipta 55micrograms/dose dry powder inhaler | 30 dose [PoM] £27.50 DT price = £27.50

Umeclidinium with vilanterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, umeclidinium above.

INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

BY INHALATION OF POWDER

- ► Adult: 1 inhalation once daily
- CAUTIONS Arrhythmias · bladder outflow obstruction · cardiac disorders · convulsive disorders · diabetes— monitor blood glucose (risk of ketoacidosis) · hypertension · hyperthyroidism · hypokalaemia · prostatic hyperplasia · severe cardiovascular disease · severe hepatic impairment · susceptability to angle-closure glaucoma · susceptibility to OT-interval prolongation
- INTERACTIONS → Appendix 1 (antimuscarinics, sympathomimetics beta₂). However, note that interactions do not generally apply to antimuscarinics used by inhalation.
- SIDE-EFFECTS
- Common or very common Constipation · cough · dry mouth · headache · nasopharyngitis · oropharyngeal pain · pharyngitis · sinusitis · upper respiratory tract infection urinary tract infection

- ► Uncommon Atrial fibrillation · rash · rhythm idioventricular · supraventricular extrasystoles · supraventricular tachycardia · tachycardia
- ➤ Frequency not known Angle-closure glaucoma arrhythmias • fine tremor (particularly in the hands) • hyperglycaemia • hypokalaemia (when in high doses) • paradoxical bronchospasm • urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer umeclidinium with vilanterol dry powder inhaler.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

► Anoro Ellipta (GlaxoSmithKline UK Ltd) ▼
Umeclidinium bromide 65 microgram per 1 dose, Vilanterol (as Vilanterol trifenatate) 22 microgram per 1 dose Anoro Ellipta 55micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose [PoM] £32.50

BETA₂ AGONISTS (LONG-ACTING)

Selective beta, agonists

- CONTRA-INDICATIONS Severe pre-eclampsia
- CAUTIONS Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation CAUTIONS. FURTHER INFORMATION

Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

- INTERACTIONS → Appendix 1 (sympathomimetics, beta₂). Hypokalaemia may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics.
- SIDE-EFFECTS Angioedema · arrhythmias · behavioural disturbances · collapse · fine tremor (particularly in the hands) · headache · hyperglycaemia (especially when given intravenously) · hypersensitivity reactions · hypokalaemia (with high doses) · hypotension · ketoacidosis (especially when given intravenously) · muscle cramps · myocardial ischaemia · nervous tension · palpitation · paradoxical bronchospasm (occasionally severe) · peripheral vasodilation · rash · sleep disturbances · tachycardia · urticaria
- PREGNANCY Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.
- MONITORING REQUIREMENTS
- ► In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
- In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).
- PATIENT AND CARER ADVICE
- When used by inhalation The dose, the frequency, and the maximum number of inhalations in 24 hours of the beta₂

agonist should be **stated explicitly** to the patient or their carer. The patient or their carer should be advised to seek medical advice when the prescribed dose of beta₂ agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug. Patients or their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

Bambuterol hydrochloride

DRUG ACTION Bambuterol is a pro-drug of terbutaline.

INDICATIONS AND DOSE

Asthma (patients who have previously tolerated beta₂ -agonists) | Other conditions associated with reversible airways obstruction (patients who have previously tolerated beta₂ -agonists)

ву моитн

 Adult: 20 mg once daily, dose to be taken at bedtime Asthma (patients who have not previously tolerated beta₂ agonists) | Other conditions associated with reversible airways obstruction (patients who have not previously tolerated beta₂ -agonists)

ву моитн

- ► Adult: Initially 10 mg once daily for 1–2 weeks, then increased if necessary to 20 mg once daily, dose to be taken at bedtime
- PREGNANCY Manufacturer advises avoid—no information available
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Reduce initial dose by half if eGFR less than 50 mL/minute/1.73 m².

MEDICINAL FORMS

Tablet

► Bambec (AstraZeneca UK Ltd)

Bambuterol hydrochloride 10 mg Bambec 10mg tablets | 28 tablet [₱⋻м] £14.46 DT price = £14.46 Bambuterol hydrochloride 20 mg Bambec 20mg tablets | 28 tablet [₱⋻м] £15.77 DT price = £15.77

Formoterol fumarate (Eformoterol fumarate)

INDICATIONS AND DOSE

Reversible airways obstruction in patients requiring longterm regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

BY INHALATION OF POWDER

- Child 6-11 years: 12 micrograms twice daily, a daily dose
 of 24 micrograms of formoterol should be sufficient
 for the majority of children, particularly for younger
 age-groups; higher doses should be used rarely, and
 only when control is not maintained on the lower dose
- Child 12-17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger agegroups; higher doses should be used rarely, and only when control is not maintained on the lower dose

► Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

BY INHALATION OF AEROSOL

- Child 12-17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger agegroups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

Chronic obstructive pulmonary disease

BY INHALATION OF POWDER

► Adult: 12 micrograms twice daily

BY INHALATION OF AEROSOL

 Adult: 12 micrograms twice daily (max. per dose 24 micrograms), for symptom relief additional doses may be taken to maximum daily dose; maximum 48 micrograms per day

OXIS® Chronic asthma

BY INHALATION OF POWDER

- Child 6-17 years: 6-12 micrograms 1-2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day
- Adult: 6-12 micrograms 1-2 times a day, increased if necessary up to 24 micrograms twice daily (max. per dose 36 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 72 micrograms per day

Relief of bronchospasm

BY INHALATION OF POWDER

- ► Child 6-17 years: 6-12 micrograms
- ► Adult: 6-12 micrograms

Prophylaxis of exercise-induced bronchospasm

BY INHALATION OF POWDER

- ► Child 6-17 years: 6-12 micrograms, dose to be taken before exercise
- ▶ Adult: 12 micrograms, dose to be taken before exercise

Chronic obstructive pulmonary disease

BY INHALATION OF POWDER

 Adult: 12 micrograms 1-2 times a day (max. per dose 24 micrograms), for symptom relief additional doses up to maximum daily dose can be taken; maximum 48 micrograms per day

PHARMACOKINETICS

At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

Important safety information

CHM ADVICE

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma:
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;

- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

SIDE-EFFECTS

- ▶ Very rare QT-interval prolongation
- ► Frequency not known Dizziness · nausea · pruritus · taste disturbances
- PREGNANCY Inhaled drugs for asthma can be taken as normal during pregnancy.
- BREAST FEEDING Inhaled drugs for asthma can be taken as normal during breast-feeding.
- PATIENT AND CARER ADVICE Advise patients not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist.
 Patient or carer should be given advice on how to administer formoterol fumarate inhalers.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation

Atimos Modulite (Chiesi Ltd)

Beclometasone with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, beclometasone dipropionate p. 227, formoterol fumarate p. 220.

INDICATIONS AND DOSE

Asthma maintenance therapy

BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER

► Adult: 100/6-200/12 micrograms twice daily; maximum 400/24 micrograms per day

Asthma, maintenance and reliever therapy

BY INHALATION OF AEROSOL

 Adult: Maintenance 100/6 micrograms twice daily; 100/6 micrograms as required for relief of symptoms; maximum 800/48 micrograms per day

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted $\,$

BY INHALATION OF AEROSOL

▶ Adult: 200/12 micrograms twice daily

Dose equivalence and conversion

For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, Fostair® 100/6 can be prescribed for patients already using beclometasone dipropionate 250 micrograms in another CFC-free inhaler; the dose of Fostair® should be adjusted according to response. For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution, the dose should be adjusted according to response.

1 puff is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

 PATIENT AND CARER ADVICE With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer beclometasone with formoterol inhalation.

MEDICINAL FORMS

Striverdi Respimat (Boehringer Ingelheim Ltd) ▼ Olodaterol (as Olodaterol hydrochloride) 2.5 microgram per 1 dose Striverdi Respimat 2.5micrograms/dose solution for inhalation cartridge with device | 60 dose | Fpoll £26.35 DT price = £26.35

Salmeterol

INDICATIONS AND DOSE

Reversible airways obstruction in patients requiring longterm regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy| Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy| Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)

BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER
► Child 5-11 years: 50 micrograms twice daily

- Child 12-17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
- ➤ Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

Chronic obstructive pulmonary disease

BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER

► Adult: 50 micrograms twice daily

PHARMACOKINETICS

At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

 UNLICENSED USE Neovent® not licensed for use in children under 12 years.

Important safety information

CHM ADVICE

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should:

 be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;

- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used:
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.
- SIDE-EFFECTS Arthralgia dizziness nausea
- PREGNANCY Inhaled drugs for asthma can be taken as normal during pregnancy.
- BREAST FEEDING Inhaled drugs for asthma can be taken as normal during breast-feeding.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Salmeterol inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/salmeterol-inhaler-for-asthma-prevention

Advise patients that salmeterol should **not** be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist.

BETA₂ AGONISTS (SHORT-ACTING)

Salbutamol (Albuterol)

INDICATIONS AND DOSE

Asthma | Other conditions associated with reversible airways obstruction

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 4 mg 3-4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route, use elderly dose for sensitive patients
- Elderly: Initially 2 mg 3-4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route
- BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 500 micrograms every 4 hours if required

BY SLOW INTRAVENOUS INJECTION

 Adult: 250 micrograms, repeated if necessary, injection to be diluted to a concentration of 50 micrograms/mL, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably

BY INTRAVENOUS INFUSION

 Adult: Initially 5 micrograms/minute, adjusted according to response and heart rate, usual dose 3-20 micrograms/minute, higher doses may be required, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably

BY INHALATION OF AEROSOL

 Adult: 100–200 micrograms, up to 4 times a day for persistent symptoms

BY INHALATION OF NEBULISED SOLUTION

 Adult: 2.5-5 mg, repeated up to 4 times daily or more frequently in severe cases

Prophylaxis of allergen- or exercise-induced bronchospasm BY INHALATION OF AEROSOL

► Adult: 200 micrograms

Moderate, severe, or life-threatening acute asthma

BY INHALATION OF NEBULISED SOLUTION

- Child 1 month-4 years: 2.5 mg, then 2.5 mg every 20–30 minutes or when required, give via oxygendriven nebuliser if available
- ► Child 5-11 years: 2.5-5 mg, then 2.5-5 mg every 20-30 minutes or when required, give via oxygendriven nebuliser if available
- ► Child 12-17 years: 5 mg, then 5 mg every 20-30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Adult: 5 mg, then 5 mg every 20-30 minutes or when required, give via oxygen-driven nebuliser if available

Moderate and severe acute asthma

BY INHALATION OF AEROSOL

- Child: 2–10 puffs, each puff is to be inhaled separately, then 2–10 puffs every 10–20 minutes or when required, give via large volume spacer, give via closefitting face mask in children under 3 years
- Adult: 2-10 puffs, each puff is to be inhaled separately, then 2-10 puffs every 10-20 minutes or when required, give via large volume spacer, give via closefitting face mask in children under 3 years

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prophylaxis of allergen- or exercise-induced bronchospasm

BY INHALATION OF AEROSOL

 Child: 100-200 micrograms, up to 4 times a day for persistent symptoms

ву моитн

- ► Child 1 month-1 year: 100 micrograms/kg 3-4 times a day (max. per dose 2 mg), inhalation route preferred over oral route
- ► Child 2-5 years: 1-2 mg 3-4 times a day, inhalation route preferred over oral route
- ► Child 6-11 years: 2 mg 3-4 times a day, inhalation route preferred over oral route
- Child 12-17 years: 2-4 mg 3-4 times a day, inhalation route preferred over oral route

Chronic acthma

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 3-11 years: 4 mg twice daily
- ► Child 12-17 years: 8 mg twice daily
- ▶ Adult: 8 mg twice daily

Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist use only)

BY INTRAVENOUS INFUSION

Adult: Initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

VENTOLIN ACCUHALER®

Acute bronchospasm

BY INHALATION OF POWDER

 Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm BY INHALATION OF POWDER

► Adult: 200 micrograms

SALBULIN NOVOLIZER®

Acute bronchospasm
BY INHALATION OF POWDER

► Adult: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm BY INHALATION OF POWDER

► Adult: 200 micrograms

PULVINAL® SALBUTAMOL Acute bronchospasm

BY INHALATION OF POWDER

 Adult: Initially 200 micrograms, up to 800 micrograms for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm BY INHALATION OF POWDER

▶ Adult: 200 micrograms

EASYHALER® SALBUTAMOL

Acute bronchospasm

BY INHALATION OF POWDER

► Adult: Initially 100–200 micrograms, increased if necessary to 400 micrograms; maximum 800 micrograms per day

Prophylaxis of allergen- or exercise-induced bronchospasm

BY INHALATION OF POWDER

► Adult: 200 micrograms

ASMASAL CLICKHALER® Acute bronchospasm

BY INHALATION OF POWDER

 Adult: 1–2 puffs, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm BY INHALATION OF POWDER

▶ Adult: 1–2 puffs

PHARMACOKINETICS

At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours. $\,$

UNLICENSED USE

- With oral use Syrup and tablets not licensed for use in children under 2 years.
- With intravenous use Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

CONTRA-INDICATIONS

When used for uncomplicated premature labour under specialist supervision abruptio placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia ·

significant risk factors for myocardial ischaemia • threatened miscarriage

CAUTIONS

 With intravenous use mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Lactic acidosis (with high doses) • nausea SPECIFIC SIDE-EFFECTS

- ► When used for uncomplicated premature
 - **labour** bronchospasm \cdot muscle tension \cdot pulmonary oedema \cdot vomiting
- BREAST FEEDING Inhaled drugs for asthma can be taken as normal during breast-feeding.
- MONITORING REQUIREMENTS In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid overhydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).

DIRECTIONS FOR ADMINISTRATION

- When used by inhalation For nebulisation, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.
- When used by continuous intravenous infusion For bronchodilation, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.

For *premature labour*, dilute with Glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump *or* for other infusion methods (preferably *via* controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Salbutamol inhaler for asthma and wheeze www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze

For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml Ventolin 5mg Nebules | 20 unit dose PoM £2.78 DT price = £3.82

► Brands may include Salamol Steri-Neb

Also available in combination with ipratropium, p. 218

Terbutaline sulfate

INDICATIONS AND DOSE

Asthma | Other conditions associated with reversible airways obstruction

BY MOUTH

► Adult: Initially 2.5 mg 3 times a day for 1–2 weeks, then increased to up to 5 mg 3 times a day, use by inhalation preferred over by mouth

BY SUBCUTANEOUS INJECTION OR BY SLOW INTRAVENOUS INJECTION

 Adult: 250-500 micrograms up to 4 times a day, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

BY CONTINUOUS INTRAVENOUS INFUSION

 Adult: 90–300 micrograms/hour for 8-10 hours, to be administered as a solution containing 3–5 micrograms/mL, high doses require close monitoring, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

BY INHALATION OF POWDER

 Adult: 500 micrograms up to 4 times a day, for persistent symptoms

BY INHALATION OF NEBULISED SOLUTION

► Adult: 5-10 mg 2-4 times a day, additional doses may be necessary in severe acute asthma

Acute asthma

BY SUBCUTANEOUS INJECTION OR BY SLOW INTRAVENOUS

- Child 2-14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- Child 15-17 years: 250-500 micrograms up to 4 times a day, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

BY CONTINUOUS INTRAVENOUS INFUSION

 Child: Loading dose 2-4 micrograms/kg, then 1-10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

Moderate, severe, or life-threatening acute asthma

BY INHALATION OF NEBULISED SOLUTION

- Child 1 month-4 years: Initially 5 mg, then 5 mg every 20–30 minutes or when required, give via oxygendriven nebuliser if available
- ► Child 5-11 years: Initially 5-10 mg, then 5-10 mg every 20-30 minutes or when required, give via oxygendriven nebuliser if available
- Child 12-17 years: Initially 10 mg, then 10 mg every 20–30 minutes or when required, give via oxygendriven nebuliser if available
- Adult: Initially 10 mg, then 10 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prevention of exercise-induced bronchospasm

BY INHALATION OF POWDER

► Child 5-17 years: 500 micrograms up to 4 times a day, for occasional use only

ву моитн

 Child 1 month-6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg)

- ► Child 7-14 years: 2.5 mg 2-3 times a day
- ► Child 15-17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day

Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)
BY INTRAVENOUS INFUSION

▶ Adult: Initially 5 micrograms/minute for 20 minutes, then increased in steps of 2.5 micrograms/minute every 20 minutes until contractions have ceased (more than 10 micrograms/minute should **seldom** be given—20 micrograms/minute should **not** be exceeded), continue for 1 hour, then reduced in steps of 2.5 micrograms/minute every 20 minutes to lowest dose that maintains suppression (maximum total duration 48 hours)

PHARMACOKINETICS

At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

- UNLICENSED USE Tablets not licensed for use in children under 7 years. Injection not licensed for use in children under 2 years.
- CONTRA-INDICATIONS
- When used for uncomplicated premature labour abruptio placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage
- CAUTIONS Mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Nausea

SPECIFIC SIDE-EFFECTS

- ► When used for uncomplicated premature labour muscle tension pulmonary oedema vomiting
- PREGNANCY Inhaled drugs for asthma can be taken as normal during pregnancy.
- BREAST FEEDING Inhaled drugs for asthma can be taken as normal during breast-feeding.
- MONITORING REQUIREMENTS In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid overhydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).
- DIRECTIONS FOR ADMINISTRATION
- When used by inhalation For nebulisation, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.
- With intravenous use in children For continuous intravenous infusion, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluidrestricted, dilute to a concentration of 100 micrograms/mL.
- With intravenous use in adults For bronchodilation by continuous intravenous infusion, dilute 1.5-2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8-10 hours. For premature labour by continuous intravenous infusion, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if

syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

 PATIENT AND CARER ADVICE For inhalation by dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible.

For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Tablet

► Bricanyl (AstraZeneca UK Ltd)

Terbutaline sulfate 5 mg Bricanyl 5mg tablets | 100 tablet PoM

£4.91 DT price = £4.91

Oral solution

► Bricanyl (AstraZeneca UK Ltd)

Terbutaline sulfate 300 microgram per 1 ml Bricanyl 1.5mg/5ml syrup (sugar-free) | 100 ml PoM £2.80 DT price = £2.80

Solution for injection

► Bricanyl (AstraZeneca UK Ltd)

Terbutaline sulfate 500 microgram per 1 ml Bricanyl 2.5mg/5ml solution for injection ampoules | 10 ampoule [PoM] £16.74 Bricanyl 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £2.16

Inhalation powder

► Bricanyl Turbohaler (AstraZeneca UK Ltd)

Terbutaline sulfate 500 microgram per 1 dose Bricanyl 500micrograms/dose Turbohaler | 100 dose PoM £6.92 DT price = £6.92

Nebuliser liquid

► TERBUTALINE SULFATE (Non-proprietary)

Terbutaline sulfate 2.5 mg per 1 ml Terbutaline 5mg/2ml nebuliser liquid unit dose vials | 20 unit dose | FoM| £4.08 DT price = £4.06

► Bricanyl Respules (AstraZeneca UK Ltd)

Terbutaline sulfate 2.5 mg per 1 ml Bricanyl 5mg/2ml Respules | 20 unit dose PoM £5.82 DT price = £4.06

CORTICOSTEROIDS

Airways disease, use of corticosteroids

Corticosteroids are used for the management of reversible and irreversible airways disease.

Asthma

Inhaled corticosteroids

An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma

Corticosteroids are effective in *asthma*; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta₂ agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the patient has suffered an exacerbation in the last 2 years requiring a systemic corticosteroid. Regular use of inhaled corticosteroids reduces the risk of exacerbation of asthma

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. Beclometasone dipropionate p. 227, budesonide p. 228, fluticasone p. 230, and mometasone furoate p. 232 appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a longacting beta2 agonist for the prophylaxis of asthma, but who are poorly controlled, Symbicort® or DuoResp Spiromax® (both containing budesonide with formoterol p. 229) can be used as relievers (instead of a short-acting beta, agonist), in addition to their regular use for the prophylaxis of asthma. Symbicort® can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily, but who are poorly controlled (standard doses of other inhaled corticosteroids can be used). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy. Patients using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. The use of Symbicort® for both reliever and maintenance therapy is also used by some specialists in children 12-18 years [unlicensed]. Fostair® can also be used in adults as a reliever (instead of a short-acting beta2 agonist) in addition to its regular use for the prophylaxis of asthma. It may be particularly useful for patients with poorly controlled asthma requiring reliever therapy, or for those who have had previous exacerbations of asthma which needed medical intervention. Patients requiring frequent daily use of Fostair® as a reliever should have their maintenance treatment reviewed. This approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta₂

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta $_2$ agonist or another long-acting bronchodilator. High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Oral corticosteroids

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of corticosteroid tablets.

In chronic asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements. Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid

treatment or where oral corticosteroids are required for 3 or more weeks). In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

Parenteral corticosteroids

Hydrocortisone p. 583 injection has a role in the emergency treatment of acute severe asthma.

Chronic obstructive pulmonary disease

Inhaled corticosteroids

In chronic obstructive pulmonary disease inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta₂ agonist.

Oral corticosteroids

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone p. 585 should be given; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone p. 585 is of no benefit and maintenance treatment is not normally recommended.

Corticosteroids (inhaled)

- INTERACTIONS → Appendix 1 (corticosteroids). Interactions do not generally apply to corticosteroids used for inhalation unless specified.
- ▶ Very rare Paradoxical bronchospasm
- ▶ Frequency not known Adrenal crisis (with prolonged high doses) · adrenal suppression (with prolonged high doses) · aggression (particularly in children) · anxiety · behavioural changes (particularly in children) · bruising · candidiasis of the mouth · candidiasis of the throat · cataracts · coma (with prolonged high doses) · Cushing's syndrome (with moon face, striae and acne) · depression · dysphonia · glaucoma (with prolonged high doses) · hoarseness · hyperactivity (particularly in children) · hyperglycaemia (usually only with high doses) • irritability (particularly in children) · lower respiratory tract infections in older patients with chronic obstructive pulmonary disease (with high doses) · pneumonia in older patients with chronic obstructive pulmonary disease (with high doses) · reduced mineral bone density (with long-term treatment of high doses) · side-effects applicable to systemic corticosteroids may also apply if absorption occurs following inhaled use · sleep disturbances · throat irritation

SIDE-EFFECTS. FURTHER INFORMATION

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind-mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

• PREGNANCY Inhaled drugs for asthma can be taken as normal during pregnancy.

- BREAST FEEDING Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008) NICE TA138 For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta, agonist is considered appropriate, the following apply:

- the use of a combination inhaler within its marketing authorisation is recommended as an option;
- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;
- if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended. www.nice.org.uk/TA138

Beclometasone dipropionate (Beclomethasone dipropionate)

INDICATIONS AND DOSE

Prophylaxis of asthma

BY INHALATION OF POWDER

- ► Child 5-11 years: 100-200 micrograms twice daily, dose to be adjusted as necessary
- ► Child 12-17 years: 200-400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
- ► Adult: 200-400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary

ASMABEC CLICKHALER

Prophylaxis of asthma

BY INHALATION OF POWDER

- ► Child 6-11 years: 100-200 micrograms twice daily, dose to be adjusted as necessary
- ► Child 12-17 years: 100–400 micrograms twice daily (max. 1 mg twice daily), dose to be adjusted as necessary
- ▶ Adult: 100-400 micrograms twice daily (max. 1 mg twice daily), dose to be adjusted as necessary

CLENIL MODULITE

Prophylaxis of asthma

BY INHALATION OF AEROSOL

- ▶ Child 2-11 years: 100-200 micrograms twice daily
- ► Child 12-17 years: 200-400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily
- ▶ Adult: 200-400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

QVAR PREPARATIONS®

Prophylaxis of asthma

BY INHALATION OF AEROSOL

- ► Child 12-17 years: 50-200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily
- ▶ Adult: 50-200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily continued →

Dose equivalence and conversion

Dose adjustments may be required for some inhaler devices, see under individual preparations.

Potency

Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as Clenil Modulite®.

UNLICENSED USE

Easyhaler® Beclometasone Dipropionate is not licensed for use in children under 18 years. Clenil Modulite® -200 and -250 are not licensed for use in children under 12 years. Qvar® is not licensed for use in children under 12 years.

Important safety information

MHRA/CHM ADVICE (JULY 2008)

Beclometasone dipropionate CFC-free pressurised metered-dose inhalers ($Qvar^{\otimes}$ and Clenil $Modulite^{\otimes}$) are **not** interchangeable and should be prescribed by brand name; $Qvar^{\otimes}$ has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as Clenil $Modulite^{\otimes}$.

MHRA/CHM ADVICE (JULY 2008)

Fostair® is a combination beclometasone dipropionate and formoterol fumarate CFC-free pressurised metered-dose inhaler; Fostair® has extra-fine particles and is more potent than traditional beclometasone dipropionate CFC-free inhalers.

 PRESCRIBING AND DISPENSING INFORMATION The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name.
 QVAR® PREPARATIONS

When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of $Qvar^{\otimes}$ should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate.

When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of $Qvar^{\otimes}$ should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of $Qvar^{\otimes}$ should be adjusted according to response.

• PATIENT AND CARER ADVICE

Steroid card should be issued with high doses of inhaled beclometasone dipropionate.

Budesonide

INDICATIONS AND DOSE Prophylaxis of asthma

BY INHALATION OF POWDER

 Child 6-11 years: 100-400 micrograms twice daily, dose to be adjusted as necessary

- Child 12-17 years: 100-800 micrograms twice daily, dose to be adjusted as necessary
- Adult: 100-800 micrograms twice daily, dose to be adjusted as necessary

BY INHALATION OF NEBULISED SUSPENSION

- ► Child 6 months-11 years: 125-500 micrograms twice daily, adjusted according to response; maximum 2 mg per day
- Child 12-17 years: Initially 0.25-1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day
- Adult: Initially 0.25-1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)

BY INHALATION OF POWDER

- ► Child 6-11 years: 200-400 micrograms once daily, dose to be given in the evening
- ► Child 12-17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

PIII MICORT® RESPIII ES

Prophylaxis of asthma

BY INHALATION OF NEBULISED SUSPENSION

- Child 3 months-11 years: Initially 0.5-1 mg twice daily, reduced to 250-500 micrograms twice daily
- ► Child 12-17 years: Initially 1-2 mg twice daily, reduced to 0.5-1 mg twice daily
- ► Adult: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

BUDELIN NOVOLIZER®

Prophylaxis of asthma

BY INHALATION OF POWDER

 Adult: 200-800 micrograms twice daily, dose is adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

BY INHALATION OF POWDER

► Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

PULMICORT® TURBOHALER

Prophylaxis of asthma

BY INHALATION OF POWDER

 Adult: 100-800 micrograms twice daily, dose to be adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

BY INHALATION OF POWDER

► Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

Potency

Dose adjustments may be required for some inhaler devices, see under individual preparations.

- DIRECTIONS FOR ADMINISTRATION Budesonide nebuliser suspension is not suitable for use in ultrasonic nebulisers.
- PATIENT AND CARER ADVICE With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer budesonide dry powder

inhaler and nebuliser suspension.

Budesonide with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, budesonide p. 228, formoterol fumarate p. 220.

INDICATIONS AND DOSE

SYMBICORT 100/6 TURBOHALER®

Asthma, maintenance therapy

BY INHALATION OF POWDER

- ► Child 6-17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy

BY INHALATION OF POWDER

Adult: Maintenance 2 puffs daily in 1–2 divided doses; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; max. 8 per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

SYMBICORT 200/6 TURBOHALER®

Asthma maintenance therapy

BY INHALATION OF POWDER

- Child 12-17 years: Initially 1-2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy

BY INHALATION OF POWDER

Adult: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second <50% of predicted

BY INHALATION OF POWDER

► Adult: 2 puffs twice daily

SYMBICORT 400/12 TURBOHALER®

Asthma, maintenance therapy

BY INHALATION OF POWDER

- Child 12-17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1 puff twice daily, increased if necessary up to 2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second $<\!50\%$ of predicted

BY INHALATION OF POWDER

Fluticasone

INDICATIONS AND DOSE

Prophylaxis of asthma

BY INHALATION OF POWDER

- ► Child 5-15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- Child 16-17 years: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- Adult: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- BY INHALATION OF AEROSOL
- ➤ Child 4-15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- Child 16-17 years: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- Adult: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist

BY INHALATION OF NEBULISED SUSPENSION

- ► Child 4-15 years: 1 mg twice daily
- ► Child 16-17 years: 0.5-2 mg twice daily
- ▶ Adult: 0.5-2 mg twice daily
- SIDE-EFFECTS arthralgia · dyspepsia
- DIRECTIONS FOR ADMINISTRATION Fluticasone nebuliser liquid may be diluted with sterile sodium chloride 0.9%. It is not suitable for use in ultrasonic nebulisers.
- PATIENT AND CARER ADVICE With high doses, a steroid card should be supplied.

LEUKOTRIENE RECEPTOR ANTAGONISTS

Leukotriene receptor antagonist

The leukotriene receptor antagonists, montelukast below and zafirlukast below, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid.

Montelukast below has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Montelukast

INDICATIONS AND DOSE

Prophylaxis of asthma

ву моитн

- Child 6 months-5 years: 4 mg once daily, dose to be taken in the evening
- ► Child 6-14 years: 5 mg once daily, dose to be taken in the evening
- ► Child 15-17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

Symptomatic relief of seasonal allergic rhinitis in patients with asthma.

BY MOLITH

- ► Child 15-17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening
- INTERACTIONS → Appendix 1 (leukotriene receptor antagonists).
- SIDE-EFFECTS
- ► Common or very common Abdominal pain headache hyperkinesia (in young children) thirst
- ▶ Uncommon Abnormal dreams · aggressive behaviour · agitation · anxiety · arthralgia · bruising · depression · dizziness · drowsiness · dry mouth · dyspepsia · epistaxis · hostility · hypoaesthesia · irritability · malaise · muscle cramps · myalgia · oedema · paraesthesia · psychomotor hyperactivity · restlessness · seizures · sleep disturbances · sleep-walking
- ► Rare Disturbance in attention increased bleeding tendency memory impairment palpitation tremor
- Very rare Churg-Strauss syndrome disorientation erythema multiforme erythema nodosum hallucinations hepatic disorders hepatic eosinophilic infiltration suicidal behaviour suicidal thoughts

SIDE-EFFECTS, FURTHER INFORMATION

Churg-Strauss syndrome has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

PREGNANCY Manufacturer advises avoid unless essential.
There is limited evidence for the safe use of montelukast
during pregnancy; however, it can be taken as normal in
women who have shown a significant improvement in
asthma not achievable with other drugs before becoming
pregnant.

- BREAST FEEDING Manufacturer advises avoid unless essential.
- DIRECTIONS FOR ADMINISTRATION Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of chewable tablet formulations may include cherry.
- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/montelukast-for-

asthma Patients or carers should be given advice on how to administer montelukast granules.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2007) that Singulair® chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® chewable tablets should be initiated by a specialist in paediatric asthma.

MEDICINAL FORMS

Zafirlukast

INDICATIONS AND DOSE

Prophylaxis of asthma

ву моитн

- ▶ Child 12-17 years: 20 mg twice daily
- ▶ Adult: 20 mg twice daily
- CAUTIONS Elderly
- INTERACTIONS → Appendix 1 (leukotriene receptor antagonists).

SIDE-EFFECTS

- Common or very common Gastro-intestinal disturbances · headache · respiratory infections
- ▶ Uncommon Insomnia · malaise
- Rare Angioedema · arthralgia · bleeding disorders · hepatitis · hyperbilirubinaemia · hypersensitivity reactions · myalgia · skin reactions · thrombocytopenia
- ► Very rare Agranulocytosis Churg-Strauss syndrome

SIDE-EFFECTS. FURTHER INFORMATION

Hepatic disorder Patients or their carers should be told how to recognise development of liver disorder and advised to seek medical attention if symptoms or signs such as persistent nausea, vomiting, malaise, or jaundice develop.

Churg-Strauss syndrome has occurred very rarely in association with the use of zafirlukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk. There is limited evidence for the safe use of zafirlukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.
- BREAST FEEDING Present in milk—manufacturer advises
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- RENAL IMPAIRMENT Manufacturer advises caution in moderate to severe impairment.

MAST CELL STABILISERS

Cromoglicate and related therapy

The mode of action of sodium cromoglicate below and nedocromil sodium below is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, prophylaxis with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations. There is evidence of efficacy of nedocromil sodium in children aged 5-12 years. Sodium cromoglicate and nedocromil sodium are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Sodium cromoglicate below and nedocromil sodium below may also have a role in allergic conjunctivitis; sodium

cromoglicate is used also in allergic rhinitis and allergyrelated diarrhoea.

Nedocromil sodium

INDICATIONS AND DOSE

Prophylaxis of asthma

BY INHALATION OF AEROSOL

- ▶ Child 5-17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice
- Adult: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

Dose equivalence and conversion

2 puffs = 4 mg.

- UNLICENSED USE Not licensed for use in children under 6 years.
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · dyspepia · nausea · pharyngitis · vomiting
- Rare Taste disturbances
- ► Frequency not known Bronchospasm · cough · headache · paradoxical bronchospasm · throat irritation

SIDE-EFFECTS, FURTHER INFORMATION

Paradoxical bronchospasm If paradoxical bronchospasm occurs, a short-acting beta2 agonist such as salbutamol or terbutaline should be used to control symptoms; treatment with nedocromil should be discontinued.

- PREGNANCY Inhaled drugs can be taken as normal during pregnancy.
- BREAST FEEDING Inhaled drugs can be taken as normal during breast-feeding.
- TREATMENT CESSATION Withdrawal should be done gradually over a period of one week-symptoms of asthma may recur.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of inhalers may include mint.
- PATIENT AND CARER ADVICE Regular use is necessary. Patient counselling is advised for Nedocromil aerosol for inhalation (administration).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Prophylaxis of severe persistent allergic asthma
BY SUBCUTANEOUS INJECTION

 Adult: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment

BY SUBCUTANEOUS INJECTION

- ► Adult: 300 mg every 4 weeks
- CAUTIONS Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · arthralgia · headache · injection-site reactions · pyrexia · sinusitis · upper respiratory tract infection
- Uncommon Bronchospasm · cough · diarrhoea · dizziness · drowsiness · dyspepsia · flushing · influenza-like illness · malaise · nausea · paraesthesia · pharyngitis · photosensitivity · postural hypotension · pruritus · rash · syncope · urticaria · weight gain
- ▶ Rare Angioedema · antibody formation · laryngoedema · parasitic infection
- Frequency not known Alopecia · arterial thromboembolic events · Churg-Strauss syndrome · joint swelling · myalgia · serum sickness (including fever and lymphadenopathy) · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Churg-Strauss syndrome Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

- PREGNANCY Manufacturer advises avoid unless essential—crosses the placenta.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution—no information available.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Omalizumab for previously treated chronic spontaneous urticaria (June 2015) NICE TA339

Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:

- the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more
- the patient's condition has not responded to standard treatment with H₁-antihistamines and leukotriene receptor antagonists,
- omalizumab is stopped at or before the fourth dose if the condition has not responded.

- omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,
- omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,
- the manufacturer provides omalizumab with the discount agreed in the patient access scheme.
 Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop, www.nice.org.uk/TA339
- Omalizumab for severe persistent allergic asthma (April 2013) NICE TA278

Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:

- who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), and
- only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme.
 Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta₂ agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA278

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H₁-antihistamines, leukotriene receptor antagonists and H₂-antihistamines, used according to current treatment guidelines.

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Roflumilast

 DRUG ACTION Roflumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties.

INDICATIONS AND DOSE

Adjunct to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations

BY MOUTH

- ▶ Adult: 500 micrograms once daily
- CONTRA-INDICATIONS Cancer (except basal cell carcinoma) · concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids) · history of depression associated with suicidal ideation or behaviour · moderate to severe cardiac

- failure · severe acute infectious disease · severe immunological disease
- CAUTIONS History of psychiatric illness (discontinue if new or worsening psychiatric symptoms occur) · latent infection (such as tuberculosis, viral hepatitis, herpes infection)
- INTERACTIONS Caution with concomitant use of drugs likely to cause psychiatric events (discontinue if new or worsening psychiatric symptoms occur).
 Appendix 1 (roflumilast).

SIDE-EFFECTS

- ► Common or very common Abdominal pain · decreased appetite · diarrhoea · headache · insomnia · nausea · weight loss
- Uncommon Anxiety · back pain · dizziness · dyspepsia · gastritis · gastro-oesophageal reflux · malaise · muscle spasm · myalgia · palpitation · rash · tremor · vertigo · vomiting
- ▶ Rare Constipation · depression · gynaecomastia · haematochezia · nervousness · raised creatine kinase · respiratory tract infections · suicidal behaviour · suicidal ideation · taste disturbances · urticaria
- CONCEPTION AND CONTRACEPTION Women of childbearing age should use effective contraception.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Caution in mild impairment. Avoid in moderate to severe impairment.
- MONITORING REQUIREMENTS Monitor body-weight.
- PATIENT AND CARER ADVICE Patients should be given a patient card before starting treatment and advised to record body-weight at regular intervals.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

• Roflumilast for the management of severe chronic obstructive pulmonary disease (January 2012) NICE TA244 Roflumilast is recommended only in the context of research as part of a clinical trial for adults with severe chronic obstructive pulmonary disease associated with chronic bronchitis with a history of frequent exacerbations as an add-on to bronchodilator treatment. Patients receiving roflumilast should have the option to continue treatment until they and their clinicians consider it appropriate to stop. www.nice.org.uk/TA244

SYMPATHOMIMETICS (VASOCONSTRICTOR)

Ephedrine hydrochloride

INDICATIONS AND DOSE

Reversible airways obstruction

BY MOUTI

► Adult: 15-60 mg 3 times a day

Neuropathic oedema

ву моитн

▶ Adult: 30-60 mg 3 times a day

Reversal of hypotension from spinal or epidural anaesthesia BY SLOW INTRAVENOUS INJECTION

- Adult: 3-6 mg every 3-4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/mL; maximum 30 mg per course
- UNLICENSED USE Not licensed for neuropathic oedema.
- CAUTIONS

GENERAL CAUTIONS

Diabetes mellitus • elderly • hypertension • hyperthyroidism • ischaemic heart disease • prostatic hypertrophy (risk of acute urinary retention)

SPECIFIC CAUTIONS

- ► With intravenous use susceptibility to angle-closure
- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS
- ► Common or very common
- ▶ With intravenous use anginal pain · anorexia · anxiety · arrhythmias · changes in blood-glucose concentration · confusion · difficulty in micturition · dizziness · dyspnoea · flushing · headache · hypersalivation · insomnia · nausea · psychoses · restlessness · sweating · tachycardia · tremor · urine retention · vasoconstriction with hypertension · vasodilation with hypotension · vomiting
- With oral use anxiety arrhythmias insomnia restlessness tachycardia tremor
- Verv rare
- ► With intravenous use angle-closure glaucoma
- ► Frequency not known
- ▶ With intravenous use bradycardia
- ▶ With oral use cold extremities dry mouth
- With systemic use increased lacrimation (can have adverse effects on contact lens wear)
- PREGNANCY Increased fetal heart rate reported with parenteral ephedrine.
- ► With oral use Manufacturer advises avoid
- BREAST FEEDING Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- RENAL IMPAIRMENT Use with caution.
- LESS SUITABLE FOR PRESCRIBING Ephedrine tablets are less suitable and less safe for use as a bronchodilator than the selective beta₂ agonists.
- EXCEPTIONS TO LEGAL CATEGORY For exceptions relating to ephedrine tablets see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

XANTHINES

Aminophylline

INDICATIONS AND DOSE

Severe acute asthma

- BY INTRAVENOUS INFUSION
- Child 1 month-11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
- ➤ Child 12-17 years: 500-700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ► Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ► Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Severe acute asthma in patients not previously treated with theophylline

BY SLOW INTRAVENOUS INJECTION

- ► Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion
- Adult: 250-500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Severe acute exacerbation of chronic obstructive pulmonary disease

BY INTRAVENOUS INFUSION

- ► Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Severe acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline

BY SLOW INTRAVENOUS INJECTION

► Adult: 250-500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Chronic asthma

BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasmatheophylline concentration

Reversible airway obstruction

BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasmatheophylline concentration

PHYLLOCONTIN CONTINUS® FORTE

Reversible airways obstruction | Severe acute asthma BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

PHARMACOKINETICS

Aminophylline is a stable mixture or combination of the ophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.

Theophylline is metabolised in the liver. The plasmatheophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasmatheophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the continued continued

half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

- UNLICENSED USE Aminophylline injection not licensed for use in children under 6 months.
- CAUTIONS Arrhythmias following rapid intravenous injection · cardiac arrhythmias or other cardiac disease · elderly (increased plasma-theophylline concentration) · epilepsy · fever · hypertension · hyperthyroidism · peptic ulcer · risk of hypokalaemia
- INTERACTIONS → Appendix 1 (aminophylline).
- SIDE-EFFECTS Arrhythmias (especially if given rapidly by intravenous injection) CNS stimulation convulsions (especially if given rapidly by intravenous injection) diarrhoea gastric irritation headache hypotension (especially if given rapidly by intravenous injection) insomnia nausea palpitation tachycardia vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see *Theophylline*, under Emergency treatment of poisoning p. 1123.

- ALLERGY AND CROSS-SENSITIVITY Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis
- PREGNANCY Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- BREAST FEEDING Present in milk—irritability in infant reported; modified-release preparations preferable.
 Theophylline can be taken as normal during breast-feeding.
- HEPATIC IMPAIRMENT Reduce dose.
- MONITORING REQUIREMENTS
- ➤ Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations. Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to children who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity. In most individuals, a plasma-theophylline concentration of 10−20 mg/litre (55−110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5−15 mg/litre may be effective. Adverse effects can occur within the range 10−20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
- ► If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
- Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4-6 hours after an oral dose of a modified-release

preparation (sampling times may vary—consult local guidelines).

- DIRECTIONS FOR ADMINISTRATION
- With intravenous use in children For intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%. For intravenous injection, give very slowly over at least 20 minutes (with close monitoring).
- With intramuscular use Aminophylline is too irritant for intramuscular use.

PRESCRIBING AND DISPENSING INFORMATION

Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient. Phyllocontin Continus ** Forte tablets are for smokers and other patients where theophylline half-life is shorter.

- Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4-6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

DIRECTIONS FOR ADMINISTRATION

SLO-PHYLLIN® Swallow whole with fluid or swallow enclosed granules with soft food (e.g. yoghurt). Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing.

 PRESCRIBING AND DISPENSING INFORMATION The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

• PATIENT AND CARER ADVICE

SLO-PHYLLIN®

Patient or carer should be given advice on how to administer theophylline modified release capsules.

Medium-volume device. For use with all pressurised (aerosol) inhalers.

- Vortex Spacer (Pari Medical Ltd) | 1 device NHS indicative price = £6.28 • Drug Tariff (Part IXa)
- ► Vortex with child mask 0-2 years (Pari Medical Ltd) | 1 device NHS indicative price = £7.99 Drug Tariff (Part IXa)
- ► Vortex with child mask 2 years+ (Pari Medical Ltd) | 1 device NHS indicative price = £7.99 Drug Tariff (Part IXa)

2 Allergic conditions

Antihistamines, allergen immunotherapy and allergic emergencies

Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhoea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin.

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 245 or promethazine hydrochloride p. 251 are used as an adjunct to adrenaline/epinephrine p. 196 in the emergency treatment of anaphylaxis and angiodema. Antihistamines (including cinnarizine p. 342, cyclizine p. 343, and promethazine teoclate p. 252) may also have a role in nausea and vomiting. Buclizine is included as an antimetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but alimemazine tartrate p. 243 and **promethazine** may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, 'sedating' antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 243, bilastine p. 244, cetirizine hydrochloride p. 244, desloratadine p. 247 (an active metabolite of loratadine p. 250), fexofenadine hydrochloride p. 247 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 249 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (*Grazax*®) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 235 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta2 agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to $\rm H_1$ antihistamine treatment.

Allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow's milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

Treatment of anaphylaxis

Adrenaline/epinephrine p. 196 provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema.

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting):
- administering adrenaline/epinephrine (by) intramuscular injection in a dose of 500 micrograms (a dose of 300 micrograms may be appropriate for immediate self-administration); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration;
- administering high-flow oxygen and intravenous fluids is also of primary importance;
- · administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection is a useful adjunctive treatment, given after adrenaline.
- · Administering an intravenous corticosteroid such as hydrocortisone p. 583 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 222, inhaled ipratropium bromide p. 217, intravenous aminophylline p. 237, or intravenous magnesium sulfate p. 858 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately.

On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine autoinjector should be given for self-administration or a replacement supplied.

Intramuscular adrenaline (epinephrine)

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

Age	Dose	Volume of adrenaline 1 in 1000 (1 mg/mL)
► Child under 6 years	150 micrograms	0.15 mL ¹
► Child 6-11 years	300 micrograms	0.3 mL
► Child 12-17 years	500 micrograms	0.5 mL ²
► Adult	500 micrograms	0.5 mL

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function.

- 1. Use suitable syringe for measuring small volume
- 2. 300 micrograms (0.3 mL) if child is small or prepubertal

Intravenous adrenaline (epinephrine)

Intravenous adrenaline/epinephrine p. 196 should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by slow intravenous injection repeated according to response: if multiple doses are required. adrenaline/epinephrine should be given as a slow

intravenous infusion stopping when a response has been

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous

The intravenous route is also used for cardiac resuscitation

Angioedema

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection and oxygen should be given as described under Anaphylaxis; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

Hereditary anaioedema

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 255, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 255 and icatibant p. 255 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 95 and danazol p. 636 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

ANTIHISTAMINES

Acrivastine

INDICATIONS AND DOSE

Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria

- ву моитн
- ▶ Child 12-17 years: 8 mg 3 times a day
- ▶ Adult: 8 mg 3 times a day
- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe) elderly
- CAUTIONS Epilepsy
- INTERACTIONS → Appendix 1 (antihistamines).
 Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.
- SIDE-FFFFCTS
- Uncommon Antimuscarinic effects · gastro-intestinal disturbances · headache · psychomotor impairment
- ▶ Rare Anaphylaxis · angioedema · angle-closure glaucoma (in adults) · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- ► Frequency not known Blurred vision drowsiness dry mouth urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to side-effects.

- ALLERGY AND CROSS-SENSITIVITY Contraindicated if history of hypersensitivity to triprolidine.
- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- RENAL IMPAIRMENT Avoid in severe impairment.
- PATIENT AND CARER ADVICE Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); excess alcohol should be avoided.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► Benadryl Allergy Relief (McNeil Products Ltd)

Acrivastine 8 mg Benadryl Allergy Relief 8mg capsules |
12 capsule GSL £2.91 DT price = £2.91 | 24 capsule P £4.95

Alimemazine tartrate

(Trimeprazine tartrate)

INDICATIONS AND DOSE

Urticaria | Pruritus

- BY MOUTH
- ► Child 2-4 years: 2.5 mg 3-4 times a day ► Child 5-11 years: 5 mg 3-4 times a day
- ► Child 12-17 years: 10 mg 2-3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- ► Adult: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- ▶ Elderly: 10 mg 1-2 times a day
- CONTRA-INDICATIONS Epilepsy · hepatic dysfunction · history of narrow angle glaucoma · hypothyroidism · many antihistamines should be avoided in Acute porphyrias p. 864 but alimemazine is thought to be safe · myasthenia gravis · parkinson's disease · phaeochromocytoma · prostatic hypertrophy · renal dysfunction
- CAUTIONS Cardiovascular diseases (due to tachycardiainducing and hypotensive effects of phenothiazines) • elderly • exposure to sunlight should be avoided during treatment with high doses • pyloroduodenal obstruction • urinary retention • volume depleted patients who are more susceptible to orthostatic hypotension
- INTERACTIONS → Appendix 1 (antihistamines).
- SIDE-EFFECTS
- ▶ Rare Anaphylaxis angioedema bronchospasm hypersensitivity reactions
- ► Frequency not known Acute dystonia · agitation · agranulocytosis · akathisia · akinesia · angle-closure glaucoma · anti-muscarinic effects · arrhythmias (may be predisposed by hypokalaemia and cardiac disease) · blurred vision · contact sensitisation · convulsions · drowsiness · dry mouth · dyskinesia · gastro-intestinal disturbances · headache · hyperprolactinaemia · hypotension · insomnia · jaundice · leukopenia (on prolonged high dose) · nasal stuffiness · neuroleptic malignant syndrome · ocular changes · pallor (in children) · paradoxical excitement · parkinsonism · photosensitivity · postural hypotension (in elderly) · postural hypotension (in volume depletion) · rashes · respiratory depression · rigidity · tardive dyskinesia (usually after prolonged high doses) · tremor · urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight.

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days

of treatment and is considerably less of a problem with the newer antihistamines.

- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- HEPATIC IMPAIRMENT Avoid in severe liver disease increased risk of coma.
- RENAL IMPAIRMENT Avoid.
- PATIENT AND CARER ADVICE Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- ► Child 2-5 years: 2.5 mg twice daily
- ► Child 6-11 years: 5 mg twice daily
- ► Child 12-17 years: 10 mg once daily
- ► Adult: 10 mg once daily
- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe)
- CAUTIONS Epilepsy
- INTERACTIONS → Appendix 1 (antihistamines).
 Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.
- SIDE-EFFECTS
- ► **Uncommon** Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention
- Rare Anaphylaxis angioedema angle-closure glaucoma (in adults) arrhythmias blood disorders bronchospasm confusion convulsions depression dizziness extrapyramidal effects hypersensitivity reactions hypotension liver dysfunction palpitation photosensitivity reactions rashes sleep disturbances tremor
- ► Frequency not known Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION

Non-sedating antihistamines such as cetirizine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to sideeffects.

- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

■ RENAL IMPAIRMENT

- ▶ In adults Use half normal dose if eGFR 30-50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if eGFR 10-30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².
- ▶ In children Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- PATIENT AND CARER ADVICE Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- UNLICENSED USE *Tablets* not licensed for use in children under 6 years.

Important safety information

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-thecounter cough and cold medicines containing chlorphenamine.

- CONTRA-INDICATIONS Many antihistamines should be avoided in Acute porphyrias p. 864 but chlorphenamine is thought to be safe
- CAUTIONS Epilepsy · prostatic hypertrophy · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention
- INTERACTIONS → Appendix 1 (antihistamines).
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ➤ Common or very common Blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention
- ➤ Rare Anaphylaxis · angioedema · angle-closure glaucoma (in adults) · arrhythmias · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · sleep disturbances · tremor
- ► Frequency not known Antimuscarinic effects · blood disorders · exfoliative dermatitis · rashes · tinnitus
- ▶ With intramuscular use CNS stimulation irritant effects transient hypotension
- ► With intravenous use CNS stimulation irritant effects transient hypotension

SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be

harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- HEPATIC IMPAIRMENT Avoid in severe liver disease increased risk of coma.
- DIRECTIONS FOR ADMINISTRATION
- In children For intravenous injection, give over 1 minute; if small dose required, dilute with Sodium Chloride 0.9%.
- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

Hydroxyzine hydrochloride

INDICATIONS AND DOSE

Pruritus

ву моитн

- Child 1-5 years: Initially 5-15 mg once daily, dose to be taken at night, increased if necessary to 50 mg daily in 3-4 divided doses
- ➤ Child 6-11 years: Initially 15–25 mg once daily, dose to be taken at night, increased if necessary to 50–100 mg daily in 3–4 divided doses
- ► Child 12-17 years: Initially 25 mg once daily, dose to be taken at night, increased if necessary to 100 mg daily in 3-4 divided doses
- ► Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3-4 times a day

Important safety information

HYDROXYZINE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and Torsade de Pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia.

To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with prolonged QT- interval or who have risk factors for QT-interval prolongation;
- Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;
- Consider the risks of QT-interval prolongation and Torsade de Pointes before prescribing to patients taking drugs that lower heart rate or plasmapotassium concentration;

- In adults, the maximum daily dose is 100 mg:
- In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg:
- The lowest effective dose for the shortest period of time should be prescribed.
- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe)
- CAUTIONS Epilepsy · prostatic hypertrophy · pyloroduodenal obstruction · susceptibility to angleclosure glaucoma · susceptibility to QT interval prolongation · urinary retention
- INTERACTIONS → Appendix 1 (antihistamines).
- SIDE-EFFECTS
- Rare Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- Frequency not known Antimuscarinic effects · blurred vision · drowsiness · dry mouth · gastro-intestinal disturbances · headach · psychomotor impairment · urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to sideeffects

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- BREAST FEEDING Manufacturer advises avoid. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- HEPATIC IMPAIRMENT Reduce daily dose by one-third.
 Avoid in severe liver disease—increased risk of coma.
- RENAL IMPAIRMENT Reduce daily dose by half.
- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- ▶ Adult: 10 mg once daily
- CAUTIONS Acute porphyrias p. 864 epilepsy
- INTERACTIONS → Appendix 1 (antihistamines).
 Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.
 Interactions do not generally apply to antihistamines used for topical action (including inhalation).
- SIDE-EFFECTS
- ► **Uncommon** Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · Headache · psychomotor impairment · urinary retention
- Rare Anaphylaxis · angioedema · angle-closure glaucoma (in adults) · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- ► Frequency not known Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION

Children and elderly are more susceptible to side-effects. Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- HEPATIC IMPAIRMENT Reduce dose frequency to alternate days in severe impairment.
- PATIENT AND CARER ADVICE Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Loratadine 10 mg tablets may be prescribed. Loratadine syrup 5 mg/5 mL may be prescribed.

- ▶ Adult: 20-25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

Important safety information

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR

Children under 6 years should not be given over-thecounter cough and cold medicines containing promethazine.

- CONTRA-INDICATIONS Many antihistamines should be avoided in Acute porphyrias p. 864 but promethazine is thought to be safe.
- CALITIONS

GENERAL CAUTIONS

Epilepsy · prostatic hypertrophy · pyloroduodenal obstruction · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

SPECIFIC CAUTIONS

- With intravenous use avoid extravasation with intravenous injection
- INTERACTIONS → Appendix 1 (antihistamines).
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Rare Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- ► Frequency not known Antimuscarinic effects blurred vision · drowsiness · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · restlessness · urinary retention

SPECIFIC SIDE-EFFECTS

▶ With intramuscular use injection pain

SIDE-EFFECTS, FURTHER INFORMATION

Children and elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- HEPATIC IMPAIRMENT Avoid in severe liver disease increased risk of coma.
- RENAL IMPAIRMENT Use with caution.
- PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed. Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

- LESS SUITABLE FOR PRESCRIBING Promethazine is less suitable for prescribing for sedation.
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.

VACCINES (ALLERGEN-TYPE)

Bee venom extract

INDICATIONS AND DOSE

Hypersensitivity to bee venom
BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature)

Important safety information

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms.
 Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.
- CONTRA-INDICATIONS Consult product literature
- CAUTIONS Consult product literature
- INTERACTIONS → Appendix 1 (bee venom extracts).
 Contra-indicated in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction).
- SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Consult product literature.

Hypersensitivity reactions Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If

symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have **resolved completely**.

- PREGNANCY Avoid.
- PRESCRIBING AND DISPENSING INFORMATION Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

► Pharmalgen for bee and wasp venom allergy (February 2012)

 $Pharmalgen^{\circ}$ is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have

- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with *Pharmalgen* ** should be initiated and monitored in a specialist centre experienced in venom immunotherapy, www.nice.org.uk/TA246

C1-esterase inhibitor

INDICATIONS AND DOSE

CINRYZE®

Acute attacks of hereditary angioedema (under expert supervision)

BY SLOW INTRAVENOUS INJECTION

► Adult: 1000 units for 1 dose, repeated if necessary

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

BY SLOW INTRAVENOUS INJECTION

Adult: 1000 units for 1 dose, to be administered up to 24 hours before procedure

Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)

BY SLOW INTRAVENOUS INJECTION

 Adult: 1000 units every 3-4 days, interval between doses to be adjusted according to response

_____R

Acute attacks of hereditary angioedema (under expert supervision)

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFLISION

► Adult: 20 units/kg

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: 1000 units for 1 dose, to be administered less than 6 hours before procedure
- CAUTIONS Vaccination against hepatitis A and hepatitis B may be required
- SIDE-EFFECTS Fever · headache · thrombosis (with high doses)
- PREGNANCY Manufacturer advises avoid unless essential.
- PRESCRIBING AND DISPENSING INFORMATION C1-esterase inhibitor is prepared from human plasma.

3.1 Cystic fibrosis

Mucolytics for cystic fibrosis

Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis.

Dornase alfa below is used to reduce sputum viscosity in patients with cystic fibrosis.

Nebulised hypertonic sodium chloride (3–7%) is used to mobilise lower respiratory tract secretions in mucus consolidation (e.g cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants.

Mannitol, administered by inhalation, improves mucus clearance and is licensed for the treatment of cystic fibrosis as an add-on therapy to standard care.

Dornase alfa

(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))

 DRUG ACTION Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

INDICATIONS AND DOSE

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

BY INHALATION OF NEBULISED SOLUTION

 Adult: 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

Dose equivalence and conversion

Dornase alfa 1000 units is equivalent to 1 mg

SIDE-EFFECTS

- ▶ Rare Chest pain · conjunctivitis · dyspepsia · dysphonia · dyspnoea · laryngitis · pharyngitis · pyrexia · rash · rhinitis · urticaria
- PREGNANCY No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Amount probably too small to be harmful—manufacturer advises caution.
- DIRECTIONS FOR ADMINISTRATION Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment. For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

▶ Pulmozyme (Roche Products Ltd)
Dornase alfa 1 mg per 1 ml Pulmozyme 2.5mg nebuliser liquid 2.5ml ampoules | 30 ampoule PoM £496.43 DT price = £496.43

Ivacaftor

INDICATIONS AND DOSE

Treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)

ву моитн

► Adult: 150 mg every 12 hours

Dose adjustments due to interactions

Reduce dose to 150 mg twice a week with concomitant use of itraconazole, ketoconazole, posaconazole, voriconazole, telithromycin, and clarithromycin. Reduce dose to 150 mg once daily with concomitant use of fluconazole and erythromycin.

- CONTRA-INDICATIONS Organ transplantation (no information available)
- INTERACTIONS → Appendix 1 (ivacaftor). Avoid grapefruit and Seville oranges.
- SIDE-FFFFCTS
- Common or very common Abdominal pain · diarrhoea · dizziness · ear discomfort · headache · nasal congestion · nasopharyngitis · oropharyngeal pain · pharyngeal oedema · rash · rhinitis · tinnitus · upper respiratory-tract infection
- ► Uncommon Gynaecomastia · vestibular disorder
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk—no information available.
- HEPATIC IMPAIRMENT Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.
- RENAL IMPAIRMENT Caution in severe impairment.
- PRE-TREATMENT SCREENING If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.
- MONITORING REQUIREMENTS Test liver function before treatment, every 3 months during the first year of treatment, then annually thereafter.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.
- PRESCRIBING AND DISPENSING INFORMATION Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer ivacaftor tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mannitol

INDICATIONS AND DOSE

Treatment of cystic fibrosis as an add-on therapy to standard care

BY INHALATION OF POWDER

- Adult: Maintenance 400 mg twice daily, an initiation dose assessment must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature
- CONTRA-INDICATIONS Bronchial hyperresponsiveness to inhaled mannitol impaired lung function (forced expiratory volume in 1 second < 30% of predicted) non-CF bronchiectasis
- CAUTIONS Asthma · haemoptvsis
- INTERACTIONS → Appendix 1 (mannitol).
- SIDE-EFFECTS
- ► Common or very common Cough · haemoptysis · headache · pharyngolaryngeal pain · throat irritation · vomiting · wheezing
- ▶ Uncommon Acne · arthralgia · bronchospasm · dizziness · dysphonia · dyspnoea · ear pain · eructation · flatulence · gastro-oesophageal reflux disease · glossodynia · hyperventilation · influenza-like illness · malaise · nausea · oral candidiasis · pharyngitis · pruritis · pyrexia · rash · rhinorrhoea · stomatitis · transient insomnia
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises avoid.
- PRE-TREATMENT SCREENING Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.
- DIRECTIONS FOR ADMINISTRATION The dose should be administered 5-15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2-3 hours before bedtime.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer mannitol inhalation powder.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012) NICE TA266

Mannitol dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:

- who cannot use dornase alfa (rhDNase) because of ineligibility, intolerance or inadequate response to dornase alfa (rhDNase), and
- whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), and
- for whom other osmotic agents are not considered appropriate. www.nice.org.uk/TA266

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium, has advised (November 2013) that mannitol (Bronchitol®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults aged 18 years and over as an addon therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

MEDICINAL FORMS

4 Cough and congestion

Aromatic inhalations, cough preparations and systemic nasal decongestants

Aromatic inhalations in adults

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. Inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis. Eucalyptus with menthol p. 259 inhalation is used to relieve sinusitis affecting the maxillary antrum.

Cough preparations in adults

Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor, or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

Codeine phosphate p. 360 may be effective but it is constipating and can cause dependence; dextromethorphan and pholcodine p. 259 have fewer side-effects.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Palliative care

Diamorphine hydrochloride p. 361 and methadone hydrochloride p. 436 have been used to control distressing cough in terminal lung cancer although morphine p. 367 is now preferred. In other circumstances they are contraindicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone hydrochloride linctus should be avoided because it has a long duration of action and tends to accumulate.

Demulcent and expectorant cough preparations Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as simple linctus have the advantage of being harmless and inexpensive; paediatric simple linctus

is particularly useful in children.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine hydrochloride p. 982 is available over the counter; it has few sympathomimetic effects.

Aromatic inhalations in children

The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations in children

The use of over-the-counter cough suppressants containing codeine phosphate p. 360 should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine p. 259 are not generally recommended in children and should be avoided in children under 6 years.

MHRA/CHM advice (March 2008 and February 2009)
Over-the-counter cough and cold medicines for children
Children under 6 years should not be given over-thecounter cough and cold medicines containing the following
ingredients:

- brompheniramine, chlorphenamine maleate, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- phenylephrine hydrochloride, pseudoephedrine hydrochloride, ephedrine hydrochloride, oxymetazoline, or xylometazoline hydrochloride (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

Drugs used for cough and congestion not listed below;

Codeine phosphate, p. 360 · Methadone hydrochloride, p. 436 · Morphine hydrochloride, p. 367

Citric acid

(Formulated as Simple Linctus)

INDICATIONS AND DOSE Cough

BY MOUTH

► Adult: 5 mL 3-4 times a day, this dose is for Simple Linctus, BP (2.5%)

 PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include anise. When prepared extemporaneously, the BP states Simple Linctus, BP consists of citric acid monohydrate 2.5%, in a suitable vehicle with an anise flavour.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

► CITRIC ACID (Non-proprietary)

Citric acid monohydrate 6.25 mg per 1 ml Simple linctus | 200 ml | GSL | £0.93 DT price = £0.92 | 2000 ml | GSL | £9.20

MENTHOL AND DERIVATIVES

Eucalyptus with menthol

INDICATIONS AND DOSE

Aromatic inhalation for relief of nasal congestion

- Adult: Add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour
- PRESCRIBING AND DISPENSING INFORMATION When
 prepared extemporaneously, the BP states Menthol and
 Eucalyptus Inhalation, BP 1980 consists of racementhol or
 levomenthol 2 g, eucalyptus oil 10 mL, light magnesium
 carbonate 7 g, water to 100 mL.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed.

OPIOIDS

Pholcodine

INDICATIONS AND DOSE

Dry cough

BY MOUTH USING LINCTUS

- ➤ Child 6-11 years: 2-5 mg 3-4 times a day
 ➤ Child 12-17 years: 5-10 mg 3-4 times a day
- ► Adult: 5-10 mg 3-4 times a day

Important safety information

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009)
OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR

Children under 6 years should not be given over-thecounter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

• CONTRA-INDICATIONS Bronchiectasis • bronchiolitis (in children) • chronic bronchitis • chronic obstructive

- pulmonary disease (in adults) patients at risk of respiratory failure

5 Idiopathic pulmonary fibrosis

ANTIFIBROTICS

Pirfenidone

 DRUG ACTION The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and antiinflammatory properties.

INDICATIONS AND DOSE

Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)
BY MOUTH

 Adult: Initially 267 mg 3 times a day for 7 days, then increased to 534 mg 3 times a day for 7 days, then increased to 801 mg 3 times a day

Dose adjustments due to interactions

Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily). Caution with concomitant use of drugs known to cause photosensitivity—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).

- CONTRA-INDICATIONS Cigarette smoking
- CAUTIONS

CAUTIONS, FURTHER INFORMATION

Photosensitivity Avoid exposure to direct sunlight—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).

Treatment interruption If treatment is interrupted for 14 consecutive days or more, the initial 2 week titration regimen should be repeated; if treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.

- INTERACTIONS → Appendix 1 (pirfenidone).
- SIDE-EFFECTS
- Common or very common Abdominal discomfort · anorexia · arthralgia · constipation · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · erythema · flatulence · gastritis · gastro-oesophageal reflux disease · headache · hot flush · insomnia · malaise · myalgia · nausea · non-cardiac chest pain · photosensitivity reaction · pruritus · raised hepatic enzymes · rash · somnolence · upper respiratory tract infection · urinary tract infection · vomiting · weight loss
- Rare Raised bilirubin in combination with raised hepatic transaminases

SIDE-EFFECTS, FURTHER INFORMATION

Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

 PREGNANCY Manufacturer advises avoid—no information available.

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Use with caution in mild to moderate hepatic impairment, particularly if concomitant use of CYP1A2 inhibitors. Avoid use in severe hepatic impairment.
- RENAL IMPAIRMENT Avoid use if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS
- ► Monitor for weight loss.
- Test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature).
- PATIENT AND CARER ADVICE Dizziness or malaise may affect performance of skilled tasks (e.g. driving).
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Pirfenidone for treating idiopathic pulmonary fibrosis (April 2013) NICE TA282

Pirfenidone is recommended as an option for treating idiopathic pulmonary fibrosis only if:

- the patient has a forced vital capacity (FVC) between 50% and 80% predicted, and
- the manufacturer provides pirfenidone with the discount agreed in the patient access scheme. Treatment should be discontinued if there is evidence of disease progression, defined as a decline in predicted FVC of 10% or more within any 12 month period.

Patients currently receiving pirfenidone that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2013) that pirfenidone is accepted for restricted use within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 80%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6 Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when

ventilatory support is contra- indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under expert supervision in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

RESPIRATORY STIMULANTS

Doxapram hydrochloride

INDICATIONS AND DOSE

Postoperative respiratory depression INITIALLY BY INTRAVENOUS INJECTION

► Adult: Initially 1-1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2-3 mg/minute, adjusted according to response

Acute respiratory failure

BY INTRAVENOUS INFUSION

- ▶ Adult: 1.5-4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions
- CONTRA-INDICATIONS Cerebral oedema cerebrovascular accident · coronary artery disease · epilepsy and other convulsive disorders · hyperthyroidism · physical obstruction of respiratory tract · severe hypertension · status asthmaticus
- CAUTIONS Give with beta2 agonist in bronchoconstriction · give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing) . hypertension · impaired cardiac reserve · phaeochromocytoma
- INTERACTIONS → Appendix 1 (doxapram).
- SIDE-EFFECTS Arrhythmias bradycardia bronchospasm chest pain · confusion · convulsions · cough · dizziness · dyspnoea · extrasystoles · flushing · hallucination · headache · hyperactivity · hypertension · incontinence · larvngospasm · muscle spasms · nausea · perineal warmth · pyrexia · tachycardia · urinary retention · vomiting
- PREGNANCY No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.
- HEPATIC IMPAIRMENT Use with caution.
- MONITORING REQUIREMENTS Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

1 Dementia

Dementia

Acetylcholinesterase inhibiting drugs are used in the treatment of Alzheimer's disease, specifically for mild to moderate disease. Rivastigmine p. 264 is also licensed for mild to moderate dementia associated with Parkinson's disease. The evidence to support the use of these drugs relates to their cognitive enhancement.

Treatment with drugs for dementia should be initiated and supervised only by a specialist experienced in the management of dementia.

Benefit is assessed by repeating the cognitive assessment at around 3 months. Such assessment cannot demonstrate how the disease may have progressed in the absence of treatment but it can give a good guide to response. Up to half the patients given these drugs will show a slower rate of cognitive decline. Drugs for dementia should be discontinued in those thought not to be responding. Many specialists repeat the cognitive assessment 4 to 6 weeks after discontinuation to assess deterioration; if significant deterioration occurs during this short period, consideration should be given to restarting therapy.

ANTICHOLINESTERASES

Donepezil hydrochloride

 DRUG ACTION Donepezil is a reversible inhibitor of acetylcholinesterase.

INDICATIONS AND DOSE

Mild to moderate dementia in Alzheimer's disease BY MOUTH

- Adult: Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime
- CAUTIONS Asthma · chronic obstructive pulmonary disease · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers

- INTERACTIONS → Appendix 1 (parasympathomimetics).
 Caution with concomitant antipsychotic treatment—increased risk of neuroleptic malignant syndrome.
- SIDE-FFFFCTS
- Common or very common Abnormal dreams · aggression · agitation · anorexia · diarrhoea · dizziness · fatigue · hallucinations · headache · insomnia · muscle cramps · nausea · pruritus · rash · syncope · urinary incontinence · vomiting
- Uncommon Bradycardia · duodenal ulcers · gastric ulcers · gastro-intestinal haemorrhage · seizures
- ▶ Rare AV block extrapyramidal symptoms hepatitis potential for bladder outflow obstruction sino-atrial block
- Very rare Neuroleptic malignant syndrome
 SIDE-EFFECTS, FURTHER INFORMATION
 Acetylcholinesterase inhibitors can cause un

Acetylcholinesterase inhibitors can cause unwanted doserelated cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability

- HEPATIC IMPAIRMENT Caution in mild to moderate impairment. No information available for severe impairment.
- DIRECTIONS FOR ADMINISTRATION Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.
- PATIENT AND CARER ADVICE Patient or carers should be given advise on how to administer donepezil hydrochloride orodispersible tablets.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease (March 2011) NICE TA217
 These drugs can be used for the treatment of mild to moderate Alzheimer's disease. Treatment should only be prescribed under the following conditions:
 - Alzheimer's disease must be diagnosed and treatment initiated by a specialist; treatment can be continued by general practitioners under a shared-care protocol;
 - the carer's view of the condition should be sought before and during treatment;

 treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties. www.nice.org.uk/TA217

MEDICINAL FORMS

Donepezil hydrochloride 5 mg Aricept Evess 5mg orodispersible tablets (sugar-free) | 28 tablet [PoM] £59.85 DT price = £6.75 Donepezil hydrochloride 10 mg Aricept Evess 10mg orodispersible tablets (sugar-free) | 28 tablet [PoM] £83.89 DT price = £8.50

Oral solution

► DONEPEZIL HYDROCHLORIDE (Non-proprietary)

Donepezil hydrochloride 1 mg per 1 ml Donepezil 1mg/ml oral solution sugar free (sugar-free) | 150 ml PoM £37.50 DT price = £37.50

Galantamine

 DRUG ACTION Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

INDICATIONS AND DOSE

Mild to moderate dementia in Alzheimer's disease
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

 Adult: Initially 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for 4 weeks; maintenance 8–12 mg twice daily

Mild to moderate dementia in Alzheimer's disease
BY MOUTH USING MODIFIED-RELEASE CAPSULES

- Adult: Initially 8 mg once daily for 4 weeks, increased to 16 mg once daily for 4 weeks; maintenance 16-24 mg daily
- CAUTIONS Asthma · avoid in gastro-intestinal obstruction · avoid in urinary retention · avoid whilst recovering from bladder surgery · avoid whilst recovering from gastro-intestinal surgery · cardiac disease · chronic obstructive pulmonary disease · congestive heart failure · electrolyte disturbances · history of seizures · pulmonary infection · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers · unstable angina
- INTERACTIONS → Appendix 1 (parasympathomimetics).

SIDE-EFFECTS

- ► Common or very common Abdominal pain · anorexia · bradycardia · depression · diarrhoea · dizziness · drowsiness · dyspepsia · hallucination · headache · hypertension · malaise · muscle spasm · nausea · sweating · syncope · tremor · vomiting · weight loss
- Uncommon Arrhythmias · blurred vision · dehydration · first-degree AV block · flushing · hypotension · muscular weakness · palpitation · paraesthesia · seizures · taste disturbance · tinnitus
- ► Rare Exacerbation of Parkinson's disease hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

Acetylcholinesterase inhibitors can cause unwanted doserelated cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- PREGNANCY Use with caution.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT For immediate-release preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; max. 8 mg twice daily; avoid in severe impairment. For modified-release preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; max. 16 mg daily; avoid in severe impairment.
- RENAL IMPAIRMENT Avoid if eGFR less than 9 mL/minute/1.73 m².

Galantamine (as Galantamine hydrobromide) 4 mg per 1 ml Reminyl 4mg/ml oral solution (sugar-free) | 100 ml PoM £120.00

Rivastigmine

 DRUG ACTION Rivastigmine is a reversible noncompetitive inhibitor of acetylcholinesterases.

INDICATIONS AND DOSE

Mild to moderate dementia in Alzheimer's disease

 Adult: Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

BY TRANSDERMAL APPLICATION USING PATCHES

Adult: Apply 4.6 mg/24 hours daily for at least 4 weeks, increased if tolerated to 9.5 mg/24 hours daily for a further 6 months, then increased if necessary to 13.3 mg/24 hours daily, increase to 13.3 mg/24 hours patch if well tolerated and cognitive deterioration or functional decline demonstrated; use caution in patients with body-weight less than 50 kg, if treatment interrupted for more than 3 days, retitrate from 4.6 mg/24 hours patch

Mild to moderate dementia in Parkinson's disease

Adult: Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

Dose equivalence and conversion

When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated. patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

- CAUTIONS Bladder outflow obstruction · conduction abnormalities · duodenal ulcers · gastric ulcers · history of asthma · history of chronic obstructive pulmonary disease · history of seizures · risk of fatal overdose with patch administration errors · sick sinus syndrome · susceptibility to ulcers
- INTERACTIONS → Appendix 1 (parasympathomimetics).
- SIDE-EFFECTS
- Common or very common Abdominal pain · agitation · anorexia · anxiety · bradycardia · confusion · diarrhoea · dizziness · drowsiness · dyspepsia · extrapyramidal symptoms · headache · increased salivation · insomnia · malaise · nausea · sweating · tremor · urinary incontinence · vomiting · weight loss · worsening of Parkinson's disease
- ► **Uncommon** Atrial fibrillation AV block depression syncope
- ▶ Rare Angina · duodenal ulceration · gastric ulceration · rash · seizures
- Very rare Gastro-intestinal haemorrhage · hallucinations · hypertension · pancreatitis · tachycardia
- ► Frequency not known Aggression dehydration hepatitis restlessness sick sinus syndrome skin hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

Transdermal administration less likely to cause gastrointestinal disturbance. Treatment should be interrupted if gastro-intestinal sideeffects occur and withheld until their resolution—retitrate dose if necessary.

Acetylcholinesterase inhibitors can cause unwanted doserelated cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability

- HEPATIC IMPAIRMENT Titrate according to individual tolerability in mild to moderate impairment.
 Use with caution in severe impairment—no information available.
- RENAL IMPAIRMENT Titrate according to individual tolerability.
- MONITORING REQUIREMENTS Monitor body-weight.
- DIRECTIONS FOR ADMINISTRATION
- With transdermal use Apply patches to clean, dry, nonhairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days).
- PATIENT AND CARER ADVICE

EXELON® TRANSDERMAL PATCHES.

Advise patients and carers of patch administration instructions, particularly to remove the previous day's patch before applying the new patch—consult product literature

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

 Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease (March 2011) NICE TA217
 See Donepezil, p. 262, www.nice.org.uk/TA217

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2007) that Exelon® patches should be restricted for use in patients with moderately severe Alzheimer's disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation.

CARBAMATES

Meprobamate

INDICATIONS AND DOSE

Short-term use in anxiety—not recommended

- ► Adult: 400 mg 3-4 times a day
- ► Elderly: Up to 200 mg 3-4 times a day

Important safety information

The European Medicines Agency has recommended (January 2012) the suspension of all marketing authorisations for meprobamate because the risks, particularly of serious CNS side-effects, outweigh the henefits.

- CONTRA-INDICATIONS Acute porphyrias p. 864 acute pulmonary insufficiency respiratory depression
- CAUTIONS Abrupt withdrawal (may precipitate convulsions) avoid prolonged use debilitated elderly epilepsy (may induce seizures) history of alcohol abuse history of drug abuse marked personality disorder muscle weakness respiratory disease
- INTERACTIONS → Appendix 1 (anxiolytics and hypnotics).
- SIDE-EFFECTS
- ► Common or very common Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ► Uncommon Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes ·

- slurred speech \cdot tremor \cdot urinary retention \cdot vertigo \cdot visual disturbances
- ▶ Rare Agranulocytosis · apnoea · blood disorders · jaundice · rashes · respiratory depression · skin reactions
- ► Frequency not known CNS effects paradoxical excitement • paraesthesia • weakness
- PREGNANCY Avoid if possible.
- BREAST FEEDING Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.
- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Increased cerebral sensitivity. Start with small doses in severe impairment.
- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- LESS SUITABLE FOR PRESCRIBING Meprobamate is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

► MEPROBAMATE (Non-proprietary)

Meprobamate 400 mg Meprobamate 400mg tablets | 84 tablet PoM £197.63-£200.54 DT price = £200.54 Schedule 3 (CD No Register)

HYPNOTICS AND SEDATIVES (BENZODIAZEPINE)

Benzodiazepines

- CONTRA-INDICATIONS Acute pulmonary insufficiency · marked neuromuscular respiratory weakness · sleep apnoea syndrome · unstable myasthenia gravis
- CAUTIONS Avoid prolonged use (and abrupt withdrawal thereafter) · debilitated patients (reduce dose) · elderly (reduce dose) · history of alcohol dependence or abuse · history of drug dependence or abuse · myasthenia gravis · respiratory disease

CAUTIONS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- INTERACTIONS → Appendix 1 (anxiolytics and hypnotics).
- SIDE-EFFECTS

Overdose Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 1123.

- PREGNANCY Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- RENAL IMPAIRMENT Increased cerebral sensitivity to benzodiazepines.
- PATIENT AND CARER ADVICE Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
 For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including

benzodiazepines, see *Drugs and driving* under Guidance on prescribing p. 1.

Alprazolam

INDICATIONS AND DOSE

Short-term use in anxiety BY MOUTH

- ► Adult: 250-500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose
- ► Elderly: 250 micrograms 2–3 times a day, increased if necessary up to 3 mg daily
- CONTRA-INDICATIONS Chronic psychosis · hyperkinesis · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression
- CAUTIONS Muscle weakness · organic brain changes · personality disorder (within the fearful group— dependent, avoidant, obsessive-compulsive) may increase risk of dependence
- SIDE-EFFECTS
- Common or very common Amnesia ataxia (especially in the elderly) - confusion (especially in the elderly) dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression
- Uncommon Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- ▶ Rare Apnoea blood disorders jaundice respiratory depression skin reactions
- BREAST FEEDING Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- HEPATIC IMPAIRMENT Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Start with smaller initial doses or reduce dose. Avoid in severe impairment.
- RENAL IMPAIRMENT Start with small doses in severe impairment.
- PATIENT AND CARER ADVICE May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.
- NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Alprazolam tablets are not prescribable under the NHS.

Diazepam

INDICATIONS AND DOSE

Muscle spasm of varied aetiology

ву моитн

 Adult: 2-15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spastic conditions

Acute muscle spasm

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

➤ Adult: 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute

Tetanus

BY INTRAVENOUS INJECTION

- ► Child: 100-300 micrograms/kg every 1-4 hours
- ► Adult: 100-300 micrograms/kg every 1-4 hours BY INTRAVENOUS INFUSION OR BY NASODUODENAL TUBE
- ► Child: 3-10 mg/kg, adjusted according to response, to be given over 24 hours
- Adult: 3-10 mg/kg, adjusted according to response, to be given over 24 hours

Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm

ву моитн

- ► Child 1-11 months: Initially 250 micrograms/kg twice
- ► Child 1-4 years: Initially 2.5 mg twice daily
- ► Child 5-11 years: Initially 5 mg twice daily
- ► Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

Anxiety

BY MOUTH

- Adult: 2 mg 3 times a day, then increased if necessary to 15–30 mg daily in divided doses, for debilitated patients, use elderly dose
- ► Elderly: 1 mg 3 times a day, then increased if necessary to 7.5–15 mg daily in divided doses

Insomnia associated with anxiety

BY MOUTI

▶ Adult: 5-15 mg daily, to be taken at bedtime

Severe acute anxiety | Control of acute panic attacks | Acute alcohol withdrawal

INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW

 Adult: 10 mg, then (by intramuscular injection or by intravenous injection) 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than
 5 mg/minute

continued →

Acute anxiety and agitation

RV PECTIIM

- ► Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
- ► Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

Acute drug-induced dystonic reactions

BY INTRAVENOUS INJECTION

► Adult: 5–10 mg, then 5–10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

Premedication

BY MOUTH

- ▶ Adult: 5-10 mg, to be given 1-2 hours before procedure, for debilitated patients, use elderly dose
- ► Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

BY INTRAVENOUS INJECTION

 Adult: 100-200 micrograms/kg, to be administered into a large vein at a rate of not more than 5 mg/minute, immediately before procedure

Sedation in dental procedures carried out in hospital

► Adult: Up to 20 mg, to be given 1–2 hours before procedure

Conscious sedation for procedures, and in conjunction with local anaesthesia

зү моитн

- ► Adult: 5-10 mg, to be given 1-2 hours before procedure, for debilitated patients, use elderly dose
- ► Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

Sedative cover for minor surgical and medical procedures BY INTRAVENOUS INJECTION

► Adult: 10–20 mg, to be administered into a large vein over 2–4 minutes, immediately before procedure

Status epilepticus | Febrile convulsions | Convulsions due to poisoning

BY INTRAVENOUS INJECTION

- ➤ Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.
- Child I month-11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes (max. per dose 10 mg) if required, to be given over 3–5 minutes
- Child 12-17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3-5 minutes
- ► Adult: 10 mg, then 10 mg after 10 minutes if required, administered at a rate of 1 mL (5 mg) per minute
- ► Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.
- ► Child 1 month-1 year: 5 mg, then 5 mg after 10 minutes if required
- ► Child 2-11 years: 5-10 mg, then 5-10 mg after 10 minutes if required
- ► Child 12-17 years: 10-20 mg, then 10-20 mg after 10 minutes if required
- ► Adult: 10-20 mg, then 10-20 mg after 10 minutes if required
- ► Elderly: 10 mg, then 10 mg after 10–15 minutes if required

Life-threatening acute drug-induced dystonic reactions BY INTRAVENOUS INJECTION

- Child 1 month-11 years: 100 micrograms/kg, repeated if necessary, to be given over 3–5 minutes
- ► Child 12-17 years: 5–10 mg, repeated if necessary, to be given over 3–5 minutes

Dyspnoea associated with anxiety in palliative care

▶ Adult: 5-10 mg daily

Pain of muscle spasm in palliative care

ву моитн

► Adult: 5-10 mg daily

UNLICENSED USE

With rectal use in children Diazepam Desitin®, Diazepam Rectubes®, and Stesolid Rectal Tubes® not licensed for use in children under 1 year.

Important safety information

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

• CONTRA-INDICATIONS Avoid injections containing benzyl alcohol in neonates · chronic psychosis (in adults) · CNS depression · compromised airway · hyperkinesis · not for use alone to treat depression (or anxiety associated with depression) (in adults) · obsessional states · phobic states · respiratory depression

CAUTIONS

GENERAL CAUTIONS

Muscle weakness • organic brain changes • parenteral administration (close observation required until full recovery from sedation) • personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

SPECIFIC CAUTIONS

 With intravenous use high risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation)

CAUTIONS, FURTHER INFORMATION

Special precautions for intravenous injection When given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available.

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Amnesia · ataxia (in children) · ataxia (especially in the elderly) · confusion (in children) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ Uncommon Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances
- ▶ Rare Ápnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)
- Frequency not known Delusions (in children) · excitement (in children) · hallucinations (in children) · hypotonia (when used for muscle spasm) · irritability (in children) · marked respiratory depression, particularly with high dose (facilities for its treatment are essential) · psychosis (in children) · restlessness (in children)

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use pain thrombophlebitis venous thrombosis (in adults)
- PREGNANCY Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any

change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Epilepsy and Pregnancy Register All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

- BREAST FEEDING Present in milk, and should be avoided if possible during breast-feeding.
- HEPATIC IMPAIRMENT Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Start with smaller initial doses or reduce dose.
 Avoid in severe impairment.
- RENAL IMPAIRMENT Start with small doses in severe impairment.

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use Diazepam is adsorbed by plastics of infusion bags and giving sets.
- With intravenous use Emulsion formulation preferred for intravenous injection.
- With intravenous use in children For continuous intravenous infusion of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For continuous intravenous infusion of diazepam solution, dilute to a concentration of max.
 50 micrograms/mL with Glucose 5% or Sodium Chloride
- With intravenous use in adults For intravenous infusion (solution) (Diazepam, Wockhardt), give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of not more than 10 mg in 200 mL.
- With intravenous use in adults For intravenous infusion (emulsion) (Diazemuls®), give continuously in Glucose 5% or 10%. May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration. May be given via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%.
- With intramuscular use or intravenous use in adults Solution for injection should not be diluted, except for intravenous infusion
- With intramuscular use in adults Only use intramuscular route when oral and intravenous routes not possible.
- PATIENT AND CARER ADVICE May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

Medicines for Children leaflet: Diazepam (rectal) for stopping seizures www.medicinesforchildren.org.uk/diazepam-rectal-stopping-seizures-0

Medicines for Children leaflet: Diazepam for muscle spasm www.medicinesforchildren.org.uk/diazepam-for-muscle-spasm Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Diazepam Tablets may be prescribed. Diazepam Oral Solution 2 mg/5 mL may be prescribed.

SEROTONIN RECEPTOR AGONISTS

Buspirone hydrochloride

INDICATIONS AND DOSE

Anxiety (short-term use)

ву моитн

- Adult: 5 mg 2-3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2-3 days; usual dose 15-30 mg daily in divided doses
- CONTRA-INDICATIONS Acute porphyrias p. 864 epilepsy
- CAUTIONS Does not alleviate symptoms of benzodiazepine withdrawal

CAUTIONS, FURTHER INFORMATION

A patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone.

- INTERACTIONS → Appendix 1 (anxiolytics and hypnotics).
- SIDE-EFFECTS
- ► Common or very common Dizziness excitement headache nausea nervousness
- Rare Chest pain · confusion · drowsiness · dry mouth · fatigue · palpitation · seizures · sweating · tachycardia
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.

- HEPATIC IMPAIRMENT Reduce dose in mild to moderate disease. Avoid in severe disease.
- RENAL IMPAIRMENT Reduce dose. Avoid if eGFR less than 20 mL/minute/1.73 m².
- PATIENT AND CARER ADVICE May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

2.2 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

Central nervous system stimulants include the **amfetamines** (dexamfetamine sulfate below and lisdexamfetamine mesilate p. 271) **and related drugs** (e.g. methylphenidate hydrochloride p. 273). They have very few indications and in particular, should **not** be used to treat depression, obesity, senility, debility, or for relief of fatigue.

CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependance; and preferences of the patient and carers. Methylphenidate hydrochloride and atomoxetine are used for the management of ADHD; dexamfetamine sulfate and lisdexamfetamine mesilate are an alternative in children who do not respond to these drugs.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

CNS STIMULANTS (AMFETAMINE ISOMERS)

Dexamfetamine sulfate (Dexamphetamine sulfate)

INDICATIONS AND DOSE

Narcolepsy

ву моитн

 Adult: Initially 10 mg daily in divided doses, increased in steps of 10 mg every 1 week, maintenance dose to

- be given in 2–4 divided doses; maximum 60 mg per day
- ► Elderly: Initially 5 mg daily in divided doses, increased in steps of 5 mg every 1 week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

ву моитн

- Child 6-17 years: Initially 2.5 mg 2-3 times a day, increased in steps of 5 mg daily if required, dose to be increased at weekly intervals, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2-4 divided doses, up to 20 mg daily (40 mg daily has been required in some children)
- Adult: Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day
- UNLICENSED USE Not licensed for use in adults for refractory attention deficit hyperactivity disorder.
- CONTRA-INDICATIONS Advanced arteriosclerosis (in adults) · agitated states · cardiovascular disease · history of alcohol abuse · history of drug abuse · hyperexcitability · hyperthyroidism · moderate hypertension · severe hypertension · structural cardiac abnormalities
- CAUTIONS Anorexia · bipolar disorder · history of epilepsy (discontinue if seizures occur) · mild hypertension · psychosis · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

CAUTIONS, FURTHER INFORMATION

Tics and Tourette syndrome Discontinue use if tics occur. Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECT
- ► Common or very common Abdominal cramps acidosis aggression · alopecia · anhedonia · anorexia · anxiety · ataxia · cardiomyopathy · cardiovascular collapse · cerebral vasculitis · chest pain · confusion · depression · diarrhoea · dizziness · dry mouth · dysphoria · euphoria · growth restriction in children · headache · hyperactivity · hyperpyrexia (in children) · hyperreflexia · hypertension · hypotension · impaired concentration · irritability · ischaemic colitis · malaise · mydriasis · myocardial infarction · nausea · nervousness · neuroleptic malignant syndrome · obsessive-compulsive behaviour · palpitations · panic attack · paranoia · psychosis · pyrexia (in adults) · rash · renal impairment · restlessness · rhabdomyolysis · seizures · sexual dysfunction · sleep disturbances · stroke · sweating · tachycardia · taste disturbance · Tourette syndrome (in predisposed individuals) • tremor • urticaria • visual disturbances · weight loss
- ► Very rare Angle-closure glaucoma
- Frequency not known Choreoathetoid movements (in predisposed individuals) · dyskinesia (in predisposed individuals) · increased appetite · tics (in predisposed individuals)

Overdose Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning, p. 1123.

- **PREGNANCY** Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).
- BREAST FEEDING Significant amount in milk—avoid.
- RENAL IMPAIRMENT Use with caution.

MONITORING REQUIREMENTS

- ▶ Monitor growth in children.
- Monitor for aggressive behaviour or hostility during initial treatment
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- TREATMENT CESSATION Avoid abrupt withdrawal.
- DIRECTIONS FOR ADMINISTRATION
- With oral use in children Tablets can be halved.
- PRESCRIBING AND DISPENSING INFORMATION Data on safety and efficacy of long-term use not complete.
- PATIENT AND CARER ADVICE

Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk. For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

► Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006)

Dexamfetamine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. www.nice.org.uk/TA98

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, modified-release capsule

Tablet

► DEXAMFETAMINE SULFATE (Non-proprietary)

Oral solution

► DEXAMFETAMINE SULFATE (Non-proprietary)

Dexamfetamine sulfate 1 mg per 1 ml Dexamfetamine 5mg/5ml oral solution sugar free (sugar-free) | 500 ml PoM £109.04 DT price = £109.04 Schedule 2 (CD)

Lisdexamfetamine mesilate

 DRUG ACTION Lisdexamfetamine is a prodrug of dexamfetamine.

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist)

- Child 6-17 years: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day
- Adult: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

UNLICENSED USE

Not licensed for use in adults for attention deficit hyperactivity disorder.

- CONTRA-INDICATIONS Advanced arteriosclerosis · agitated states · hyperexcitability · hyperthyroidism · moderate hypertension · severe hypertension · symptomatic cardiovascular disease
- CAUTIONS Anorexia · bipolar disorder · history of alcohol abuse · history of cardiac abnormalities · history of cardiovascular disease · history of drug abuse · may lower seizure threshold (discontinue if seizures occur) · psychosis · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

CAUTIONS, FURTHER INFORMATION

Tics and Tourette syndrome Discontinue use if tics occur. Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

- INTERACTIONS → Appendix 1 (sympathomimetics).
- SIDE-EFFECTS
- Common or very common Abdominal cramps aggression decreased appetite diarnhoea dizziness drowsiness dry mouth dyspnoea growth restriction in children headache labile mood malaise mydriasis nausea pyrexia sleep disturbances tics vomiting weight loss
- Uncommon Anorexia · anxiety · depression · dermatillomania · dysphoria · hallucination · hypertension · logorrhoea · mania · palpitation · paranoia · rash · restlessness · sexual dysfunction · sweating · tachycardia · tremor · visual disturbances
- ▶ Very rare Angle-closure glaucoma
- Frequency not known Cardiomyopathy · choreoathetoid movements (in predisposed individuals) · dyskinesia (in predisposed individuals) · euphoria · seizures · Tourette syndrome (in predisposed individuals)

Overdose Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning. p. 1123.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in human milk.
- RENAL IMPAIRMENT Max. dose 50 mg daily in severe impairment.

MONITORING REQUIREMENTS

- Monitor for aggressive behaviour or hostility during initial treatment.
- Monitor growth in children.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- TREATMENT CESSATION Avoid abrupt withdrawal.
- DIRECTIONS FOR ADMINISTRATION Swallow whole or mix contents of capsule in yoghurt or a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

• PATIENT AND CARER ADVICE

Patients and carers should be counselled on the administration of capsules.

Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

CNS STIMULANTS (NORADRENALINE REUPTAKE INHIBITORS)

Atomoxetine

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated by a specialist)

ву моитн

- Child 6-17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day
- Child 6-17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- Adult (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- Adult (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80–100 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

UNLICENSED USE

- In children Doses above 100 mg daily not licensed.
- In adults Dose maximum of 120 mg not licensed. Atomoxetine doses in BNF may differ from those in product literature.
- CONTRA-INDICATIONS Phaeochromocytoma · severe cardiovascular disease · severe cerebrovascular disease

- CAUTIONS QT-interval prolongation aggressive behaviour cardiovascular disease cerebrovascular disease emotional lability history of seizures hostility hypertension mania psychosis structural cardiac abnormalities susceptibility to angle-closure glaucoma tachycardia
- INTERACTIONS → Appendix 1 (atomoxetine).
 Avoid concomitant use of drugs that prolong QT interval.

SIDE-FEEECTS

- Common or very common Abdominal pain · anorexia · anxiety · constipation · depression · dermatitis · dizziness · drowsiness · dry mouth · dyspepsia · flatulence · flushing · headache · chills · increased blood pressure · irritability · lethargy · malaise · mydriasis · nausea · palpitation · paraesthesia · prostatitis · rash · sexual dysfunction · sleep disturbances · sweating · tachycardia · taste disturbances · tremor · urinary dysfunction · vomiting
- Uncommon Aggression · cold extremities · emotional lability · hostility · hypoaesthesia · menstrual disturbances · muscle spasms · pruritus · psychosis · QT-interval prolongation · suicidal ideation · syncope · tics
- ▶ Rare Raynaud's phenomenon seizures
- ► Very rare Angle-closure glaucoma hepatic disorders
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Avoid-present in milk in animal studies.
- HEPATIC IMPAIRMENT Halve dose in moderate impairment. Quarter dose in severe impairment.

MONITORING REQUIREMENTS

- Monitor for appearance or worsening of anxiety, depression or tics.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd Suicidal ideation Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression. Hepatic impairment Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or iaundice.

Methylphenidate hydrochloride

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated under specialist supervision)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ► Child 6-17 years: Initially 5 mg 1-2 times a day, increased in steps of 5-10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2-3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2-3 divided doses, the licensed maximum dose is 60 mg daily in 2-3 doses, higher dose under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation; maximum 90 mg per
- ▶ Adult: Initially 5 mg 2-3 times a day, dose is increased if necessary at weekly intervals according to response, increased if necessary up to 100 mg daily in 2-3 divided doses, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

Narcolepsy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: 10-60 mg daily in divided doses; usual dose 20-30 mg daily in divided doses, dose to be taken before meals

CONCERTA® XI

Attention deficit hyperactivity disorder

▶ Adult: Initially 18 mg once daily, dose to be taken in the morning; adjusted at weekly intervals according to response; maximum 108 mg per day

Dose equivalence and conversion

Total daily dose of 15 mg of standard-release formulation is considered equivalent to Concerta® XL 18 mg once daily.

MEDIKINET® XL

Attention deficit hyperactivity disorder

- ▶ Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
- Adult: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; maximum 100 mg per day

- PREGNANCY Limited experience—avoid unless potential benefit outweighs risk.
- BREAST FEEDING Limited information available—avoid.
- MONITORING REQUIREMENTS
- Monitor for psychiatric disorders.
- ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- TREATMENT CESSATION Avoid abrupt withdrawal.
- DIRECTIONS FOR ADMINISTRATION

MEDIKINET® XL

Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

FΩΙΙΔSΥΜ[®] XI

Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

 PRESCRIBING AND DISPENSING INFORMATION Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

CONCERTA® XL

Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose)

EOUASYM® XL

Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the

MEDIKINET® XI

Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

PATIENT AND CARER ADVICE

Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see *Drugs and driving* under Guidance on prescribing p. 1.

CONCERTA® XL

Tablet membrane may pass through gastro-intestinal tract unchanged.

2.3 Bipolar disorder and mania

Drugs used for mania and hypomania

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

Benzodiazepines

Use of benzodiazepines (such as lorazepam p. 412) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

Antipsychotic drugs (normally olanzapine p. 315, quetiapine p. 318, or risperidone p. 319) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Olanzapine p. 315 can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine p. 315 therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine p. 276, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

Carbamazepine

Carbamazepine p. 387 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine p. 387 should not normally be increased if an acute episode of mania occurs.

Valproate

Valproic acid (as the semisodium salt) and sodium valproate p. 403 are used for the treatment of manic episodes associated with bipolar disorder. Valproate (valproic acid below and sodium valproate) is also used for the prophylaxis of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine p. 315, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine p. 318, or risperidone p. 319.

Lithium

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine p. 315 or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

Drugs used for Bipolar disorder and mania not listed below; Carbamazepine, p. 387 · Chlorpromazine hydrochloride, p. 304 · Haloperidol, p. 306 · Lamotrigine, p. 394 · Olanzapine, p. 315 · Paliperidone, p. 317 · Perphenazine, p. 308 · Prochlorperazine, p. 309 · Quetiapine, p. 318 · Sodium valproate, p. 403 · Zuclopenthixol acetate, p. 311

ANTIEPILEPTICS

Valproic acid

INDICATIONS AND DOSE

Treatment of manic episodes associated with bipolar disorder

BY MOUTH

 Adult: Initially 750 mg daily in 2-3 divided doses, then increased to 1-2 g daily, adjusted according to response, doses greater than 45 mg/kg daily require careful monitoring

Migraine prophylaxis

ву моитн

 Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in divided doses

CONVULEX

Epilepsy

BY MOUTH

- ► Child: Total daily dose to be given in 2–4 divided doses (consult product literature)
- ► Adult: Total daily dose to be given in 2–4 divided doses (consult product literature)

Dose equivalence and conversion

Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid.

Convulex® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

- UNLICENSED USE Not licensed for migraine prophylaxis.
- CONTRA-INDICATIONS Acute porphyrias p. 864 · family history of severe hepatic dysfunction
- CAUTIONS Systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- INTERACTIONS → Appendix 1 (valproic acid).
- SIDE-EFFECTS
- ▶ Common or very common Diarrhoea · gastric irritation · hyperammonaemia · nausea · thrombocytopenia · transient hair loss (regrowth may be curly) · weight gain
- ► Uncommon Aggression · ataxia · behavioural disturbances · hyperactivity · increased alertness · tremor · vasculitis
- ► Rare Anaemia · blood disorders · confusion · drowsiness · hallucinations · hearing loss · hepatic dysfunction · lethargy · leucopenia · pancytopenia · rash · stupor
- Very rare Acne · coma · dementia · encephalopathy · enuresis · extrapyramidal symptoms · Fanconi's syndrome · gynaecomastia · hirsutism · hyponatraemia · increase in bleeding time · pancreatitis · peripheral oedema · reduced bone mineral density · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- Frequency not known Drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · hypersensitivity reactions · male infertility · menstrual disturbances · syndrome of inappropriate secretion of antidiuretic hormone

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

CONCEPTION AND CONTRACEPTION Valproate is associated
with teratogenic risks and should not be used in women
of child-bearing potential unless there is no safer
alternative—this should be fully considered and discussed
before prescribing for women of child-bearing age.

Effective contraception advised in women of child-bearing notential.

- PREGNANCY Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy or in women of child-bearing potential unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity.
 - Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.
 - Neonatal bleeding (related to hypofibrinaemia) and neonatal hepatotoxicity also reported. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.
- RENAL IMPAIRMENT Reduce dose.
- MONITORING REQUIREMENTS
- ▶ Monitor closely if dose greater than 45 mg/kg daily.
- Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- EFFECT ON LABORATORY TESTS False-positive urine tests for ketones.
- TREATMENT CESSATION If treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.
- PRESCRIBING AND DISPENSING INFORMATION Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral Valproic acid product.
- PATIENT AND CARER ADVICE

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop. Counselling advised on pregnancy.

LITHIUM SALTS

Lithium salts

- CONTRA-INDICATIONS Addison's disease · cardiac insufficiency · dehydration · family history of Brugada syndrome · low sodium diets · personal history of Brugada syndrome · rhythm disorder · untreated hypothyroidism
- CAUTIONS Avoid abrupt withdrawal · cardiac disease · concurrent ECT (may lower seizure threshold) · diuretic treatment (risk of toxicity) · elderly (reduce dose) · epilepsy (may lower seizure threshold) · myasthenia gravis · psoriasis (risk of exacerbation) · QT interval prolongation · review dose as necessary in diarrhoea · review dose as necessary in intercurrent infection (especially if sweating profusely) · review dose as necessary in vomiting · surgery

CAUTIONS, FURTHER INFORMATION

Long-term use Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).

The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

INTERACTIONS → Appendix 1 (lithium).
 Caution with concomitant use of drugs and any therapy that may lower seizure threshold.
 Caution with concomitant use of drugs that prolong the

Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided.

- SIDE-EFFECTS
- ► Very rare Nystagmus
- ► Frequency not known Acneiform eruptions · alopecia · anorexia · arrhythmia · arthralgia · AV block · benign intracranial hypertension · bradycardia · cardiomyopathy · cognitive impairment · dry mouth · dysgeusia · ECG changes · electrolyte imbalance · encephalopathy · euthyroid goitre · extrapyramidal side-effects · fine tremor · gastritis · gastro-intestinal disturbances · hallucinations · hyperparathyroidism · hypersalivation · hyperthyroidism · hypothyroidism · kidney changes · leucocytosis · malaise · memory loss · myalgia · myasthenia gravis · nephrogenic diabetes insipidus · nephrotic syndrome · oedema · other skin disorders · parathyroid adenoma · peripheral neuropathy · polydipsia · psoriasis exacerbation · OT interval prolongation · Raynaud's phenomena · renal impairment · sexual dysfunction · sinus node dysfunction · speech disorder · thyroid changes · vertigo · weight

Overdose Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdosage (serum-lithium concentration above 2 mmol/litre) seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1123.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment for women of child bearing potential.
- PREGNANCY Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).

Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal). Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- BREAST FEEDING Present in milk and risk of toxicity in infant—avoid.
- RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment. In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.
- MONITORING REQUIREMENTS
- Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
- Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4-1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).

- ▶ A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have subsyndromal symptoms. It is important to determine the optimum range for each individual patient.
- Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient's sodium or fluid intake.
- Renal function should be monitored at baseline and every 6 months thereafter (more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics).
- Assess cardiac and thyroid function before initiating, and thereafter every 6 months on stabilised regimens.
- TREATMENT CESSATION While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

PATIENT AND CARER ADVICE

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving, operating machinery). Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M: 0845 610 1112 nhsforms@mm.uk.com Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual

disturbance).

Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

Lithium carbonate

INDICATIONS AND DOSE

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour BY MOUTH

▶ Adult: Dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

CAMCOLIT® TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour BY MOUTH

 Adult: Initially 1-1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4-1 mmol/litre 12 hours after a dose on days 4-7 of treatment, then

continued \rightarrow

every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

▶ Elderly: Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

Adult: Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serumlithium concentration stabilised

LISKONUM®

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour BY MOUTH

- Adult: Initially 450-675 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4-1 mmol/litre 12 hours after a dose on days 4-7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serumlithium concentration stabilised
- Elderly: Initially 225 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serumlithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

- Adult: Initially 450 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4-1 mmol/litre 12 hours after a dose on days 4-7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serumlithium concentration stabilised
- ► Elderly: Initially 225 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

CAMCOLIT® MODIFIED-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

BY MOUTH

- Adult: Initially 1-1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4-1 mmol/litre 12 hours after a dose on days 4-7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly: Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

Adult: Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serumlithium concentration stabilised

PRIADEL® TABLETS

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophlyaxis of aggressive or self-harming behaviour BY MOLITH

- Adult (body-weight up to 49 kg): Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Adult (body-weight 50 kg and above): Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted to achieve a serumlithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- ▶ Elderly: Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Dose equivalence and conversion

Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

2.4 Depression

Antidepressant drugs

Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep

disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression (typically of at least 2 years duration)).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice

The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient's requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 288 has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdosage is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics or antipsychotic drugs should therefore be used with caution in depression but they are useful adjuncts in agitated patients. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

St John's wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John's wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John's wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John's wort, the concentration of interacting drugs may increase, leading to toxicity.

Management

Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Hyponatraemia and Antidepressant Therapy Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal Behaviour and Antidepressant Therapy The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to lifethreatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Failure to respond

Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 291. Other second-line choices include lofepramine p. 297, moclobemide p. 283, and reboxetine p. 284. Other tricyclic antidepressants and venlafaxine p. 289 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 312 [unlicensed], olanzapine p. 315 [unlicensed], quetiapine p. 318, or risperidone p. 319 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Anxiety disorders and obsessive-compulsive disorder Management of acute anxiety generally involves the use of a benzodiazepine or buspirone hydrochloride p. 269. For chronic anxiety (of longer than 4 weeks' duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with *generalised anxiety disorder*, a form of chronic anxiety, should be offered

psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 285, paroxetine p. 287, or sertraline p. 288 [unlicensed], can be used. Duloxetine p. 288 and venlafaxine p. 289 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder; if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 400 can be considered

Panic disorder, obsessive-compulsive disorder, posttraumatic stress disorder, and phobic states such as social anxiety disorder are treated with SSRIs. Clomipramine hydrochloride p. 294 or imipramine hydrochloride p. 296 can be used second-line in panic disorder [unlicensed]; clomipramine hydrochloride p. 294 can also be used secondline for obsessive-compulsive disorder. Moclobemide p. 283 is licensed for the treatment of social anxiety disorder.

Tricyclic and related antidepressant drugs

Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride p. 294 is more selective for serotonergic transmission, and imipramine hydrochloride p. 296 is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with sedative properties include amitriptyline hydrochloride p. 292, clomipramine hydrochloride p. 294, dosulepin hydrochloride p. 295, doxepin p. 296, mianserin hydrochloride p. 290, trazodone hydrochloride p. 291, and trimipramine p. 299. Those with less sedative properties include imipramine hydrochloride p. 296, lofepramine p. 297, and nortriptyline p. 298.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdosage, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdosage but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and dosulepin hydrochloride are effective but they are particularly dangerous in overdosage and are not recommended for the treatment of depression; dosulepin hydrochloride should be initiated by a specialist.

Dosage

About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the elderly. In most patients the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Some tricyclic antidepressants are used in the management of *panic* and other *anxiety disorders*. Some tricyclic antidepressants may also have a role in some forms of *neuralgia* and in *nocturnal enuresis* in children.

Children and adolescents

Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

Monoamine-oxidase inhibitors

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranylcypromine p. 283 has a greater stimulant action than phenelzine p. 283 or isocarboxazid p. 282 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranylcypromine.

Moclobemide p. 283 should be reserved as a second line treatment

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

Other antidepressant drugs

The thioxanthene flupentixol p. 305 (Fluanxol ®) has antidepressant properties when given by mouth in low doses. Flupentixol is also used for the treatment of psychoses.

Drugs used for Depression not listed below; *Flupentixol,* p. 305 · *Lithium carbonate,* p. 277 · *Lithium citrate,* p. 279 · *Quetiapine,* p. 318

MELATONIN RECEPTOR AGONISTS

Agomelatine

 DRUG ACTION A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

INDICATIONS AND DOSE

Major depression

ву моитн

 Adult: 25 mg daily, dose to be taken at bedtime, dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime

Dose adjustments due to interactions

Caution—dose adjustment may be necessary if smoking started or stopped during treatment.

- CONTRA-INDICATIONS Dementia patients over 75 years of age
- CAUTIONS Bipolar disorder · diabetes · excessive alcohol consumption · hypomania · mania · non-alcoholic fatty liver disease · obesity
- INTERACTIONS → Appendix 1 (agomelatine).
 Caution with concomitant use of drugs associated with hepatic injury.

SIDE-EFFECTS

- Common or very common Abdominal pain · agitation · anxiety · back pain · constipation · diarrhoea · dizziness · drowsiness · fatigue · headache · increased serum transaminases · nausea · sleep disturbances · sweating · yomiting
- ► Uncommon Blurred vision eczema paraesthesia restless legs syndrome tinnitus
- Rare Hepatic failure · hepatic injury · hepatitis · rash · weight changes
- ► Frequency not known Pruritus suicidal behaviour

SIDE-FEFFCTS, FURTHER INFORMATION

Suicidal behaviour The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Avoid—present in milk in animal studies
- HEPATIC IMPAIRMENT Avoid. Do not start if serum transaminases exceed 3 times the upper limit of reference range.
- RENAL IMPAIRMENT Caution in moderate to severe impairment.
- MONITORING REQUIREMENTS Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.

PATIENT AND CARER ADVICE

Hepatotoxicity Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or pruritus develop.

Patients should be given a booklet with more information on the risk of hepatic side-effects.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Valdoxan (Servier Laboratories Ltd)

Agomelatine 25 mg Valdoxan 25mg tablets | 28 tablet PoM £30.00

DT price = £30.00

MONOAMINE-OXIDASE A AND B INHIBITORS (IRREVERSIBLE)

Monoamine-oxidase inhibitors

- DRUG ACTION MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters.
- CONTRA-INDICATIONS Cerebrovascular disease · not indicated in manic phase · phaeochromocytoma
- CAUTIONS Acute porphyria · avoid in agitated patients · blood disorders · cardiovascular disease · concurrent electroconvulsive therapy · diabetes mellitus · elderly (great caution) · epilepsy · severe hypertensive reactions to certain drugs and foods · surgery
- INTERACTIONS → Appendix 1 (MAOIs).

The metabolism of some amine drugs such as *indirect-acting sympathomimetics* (present in many cough and decongestant preparations) is inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and *Bovril®*, *Oxo®*, *Marmite®* or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued.

Some psychiatrists use selected tricyclics in conjunction

with MAOIs but this is hazardous, indeed potentially

lethal, except in experienced hands and there is no

evidence that the combination is more effective than when either constituent is used alone.

SIDE-FFFFCTS

- ► Common or very common Dizziness postural hypotension (especially in elderly)
- ▶ Uncommon Agitation · arrhythmias · blurred vision · confusion · constipation · convulsions · difficulty in micturition · drowsiness · dry mouth · elevated liver enzymes · euphoria · fatigue · gastro-intestinal disturbances · hallucinations · headache · hyperreflexia · insomnia · leucopenia · myoclonic movement · nervousness · nystagmus · oedema · psychotic episodes with hypomanic behaviour · purpura · rashes · sexual disturbances · suicidal behaviour · sweating · tremors · weakness · weight gain with inappropriate appetite
- ▶ Rare Fatal progressive hepatocellular necrosis
- ► Frequency not known jaundice · hyponatraemia · paraesthesia · peripheral neuritis · peripheral neuropathy (may be due to pyridoxine deficiency)

SIDE-EFFECTS, FURTHER INFORMATION

Risk of postural hypotension and hypertensive responses Discontinue use if palpitations or frequent headaches occur.

- PREGNANCY Increased risk of neonatal malformations manufacturer advises avoid unless there are compelling reasons
- HEPATIC IMPAIRMENT MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment.
- MONITORING REQUIREMENTS Monitor blood pressure (risk of postural hypotension and hypertensive responses).
- TREATMENT CESSATION If possible avoid abrupt withdrawal, MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly. Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving). Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or 'going off'. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also be advised to avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

Isocarboxazid

INDICATIONS AND DOSE

Depressive illness

ву моитн

 Adult: Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks up to 60 mg daily for 4-6 weeks, dose to be increased under

close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg may be required

- ► Elderly: 5–10 mg daily
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Avoid in hepatic impairment.
- RENAL IMPAIRMENT Use with caution.
- LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing.

INDICATIONS AND DOSE

Depressive illness

BY MOUTH

- Adult: Initially 10 mg twice daily, dose to be taken at a
 time no later than 3 p.m, dose may be increased if
 necessary after 1 week, increased if necessary to 10 mg
 daily, dose to be taken in the morning and 20 mg
 daily, dose to be taken in the afternoon, doses above
 30 mg daily, under close supervision only;
 maintenance 10 mg daily
- CONTRA-INDICATIONS Congestive heart failure · history of hepatic disease · hyperthyroidism
- INTERACTIONS The combination of tranylcypromine with clomipramine is particularly dangerous.

SIDE-EFFECTS

- Common or very common Insomnia
- Uncommon Hypernatraemia · lupus erythematous-like syndrome · speech disturbances
- ▶ Very rare Angle-closure glaucoma · hypertensive crises with throbbing headache · liver damage (less frequent than with phenelzine)
- ► Frequency not known Blood dyscrasias

SIDE-EFFECTS. FURTHER INFORMATION

Hypertensive crisis Hypertensive crisis and throbbing headache requiring discontinuation of treatment is more frequent than with other MAOIs.

- BREAST FEEDING Present in milk in animal studies.
- HEPATIC IMPAIRMENT Avoid if history of hepatic disease or if abnormal liver function tests.
- LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing.

MONOAMINE-OXIDASE A INHIBITORS (REVERSIBLE)

Moclobemide

 DRUG ACTION Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

INDICATIONS AND DOSE

Depressive illness

ву моитн

 Adult: Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food

Social anxiety disorder

ву моитн

- ► Adult: Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy
- CONTRA-INDICATIONS Acute confusional states phaeochromocytoma
- CAUTIONS Avoid in agitated or excited patients (or give with sedative for up to 2−3 weeks) · may provoke manic episodes in bipolar disorders · thyrotoxicosis
- INTERACTIONS → Appendix 1 (moclobemide).

The risk of drug interactions is claimed to be less than with the traditional (irreversible) MAOIs, but patients still need to avoid sympathomimetics such as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (at least 5 weeks in the case of fluoxetine), or for at least a week after an MAOI has been stopped.

SIDE-EFFECTS

- ► Rare Galactorrhoea hyponatraemia raised liver enzymes
- Frequency not known Agitation · confusional states · dizziness · dry mouth · gastrointestinal disorders · headache · oedema · paraesthesia · restlessness · skin reactions · sleep disturbances · visual disturbances

- PREGNANCY Safety in pregnancy has not been established—manufacturer advises avoid unless there are compelling reasons.
- BREAST FEEDING Amount too small to be harmful, but patient information leaflet advises avoid.
- HEPATIC IMPAIRMENT Reduce dose in severe hepatic disease.
- TREATMENT CESSATION Withdrawal effects may occur
 within 5 days of stopping treatment with antidepressant
 drugs; they are usually mild and self-limiting, but in some
 cases may be severe. The risk of withdrawal symptoms is
 increased if the antidepressant is stopped suddenly after
 regular administration for 8 weeks or more. The dose
 should preferably be reduced gradually over about 4
 weeks, or longer if withdrawal symptoms emerge (6
 months in patients who have been on long-term
 maintenance treatment).
- PATIENT AND CARER ADVICE Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tahlat

CAUTIONARY AND ADVISORY LABELS 10, 21

NORADRENALINE REUPTAKE INHIBITORS

Reboxetine

 DRUG ACTION Reboxetine is a selective inhibitor of noradrenaline re-uptake.

INDICATIONS AND DOSE

Major depression

BY MOUTH

- Adult: 4 mg twice daily, then increased if necessary to 10 mg/24 hours after 3-4 weeks in divided doses; maximum 12 mg per day
- CAUTIONS Bipolar disorder · history of cardiovascular disease · history of epilepsy · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
- INTERACTIONS → Appendix 1 (reboxetine).
- SIDE-EFFECTS
- Common or very common Anorexia · chills · constipation · dizziness · dry mouth · headache · impaired visual accommodation · impotence · insomnia · lowering of plasma-potassium concentration on prolonged administration in the elderly · nausea · palpitation · postural hypotension · sweating · tachycardia · urinary retention · vasodilation
- ▶ Very rare Angle-closure glaucoma
- Frequency not known Aggression · agitation · anxiety · cold extremities · hallucinations · hypertension · hyponatraemia · irritability · paraesthesia · rash ·

- Raynaud's syndrome \cdot suicidal behaviour \cdot testicular pain \cdot vomiting
- PREGNANCY Use only if potential benefit outweighs risk limited information available.
- BREAST FEEDING Small amount present in milk—use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Initial dose 2 mg twice daily, increased according to tolerance.
- RENAL IMPAIRMENT Initial dose 2 mg twice daily, increased according to tolerance.
- TREATMENT CESSATION Caution— avoid abrupt withdrawal.
- PATIENT AND CARER ADVICE Counselling advised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

► Edronax (Pfizer Ltd)

Reboxetine (as Reboxetine mesilate) 4 mg Edronax 4mg tablets | 60 tablet | PoM £18.91 DT price = £18.91

SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS

Selective serotonin re-uptake inhibitors

- DRUG ACTION Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).
- CONTRA-INDICATIONS Poorly controlled epilepsy · SSRIs should not be used if the patient enters a manic phase.
- CAUTIONS Cardiac disease concurrent electroconvulsive therapy • diabetes mellitus • epilepsy (discontinue if convulsions develop) • history of bleeding disorders (especially gastro-intestinal bleeding) • history of mania • susceptibility to angle-closure glaucoma
- INTERACTIONS → Appendix 1 (antidepressants, SSRI).
 Caution with other drugs that increase the risk of bleeding.
- SIDE-EFFECTS
- Common or very common Abdominal pain (dose-related) constipation (dose-related) - diarrhoea (dose-related) dyspepsia (dose-related) - gastro-intestinal effects (doserelated) - nausea (dose-related) - vomiting (dose-related)
- ▶ Uncommon Serotonin syndrome
- ▶ Very rare Angle-closure glaucoma
- ▶ Frequency not known Anaphylaxis · angioedema · anorexia with weight loss · anxiety · arthralgia · asthenia · bleeding disorders · convulsions · dizziness · drowsiness · dry mouth · dyskinesias · ecchymoses · galactorrhoea · hallucinations · headache · hypersensitivity reactions · hypomania · hyponatraemia · increased appetite · insomnia · mania · movement disorders · myalgia · nervousness · photosensitivity · purpura · tash · sexual dysfunction · suicidal behaviour · sweating · tremor · urinary retention · urticaria · visual disturbances · weight gain

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions If hypersensitivity reactions (including rash) occur, consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis.

Overdose Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1123.

- PREGNANCY Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk.
 There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.
- TREATMENT CESSATION Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist. Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- PATIENT AND CARER ADVICE May also impair performance of skilled tasks (e.g. driving, operating machinery).

Citalopram

INDICATIONS AND DOSE

Depressive illness

BY MOUTH USING TABLETS

- Adult: 20 mg once daily, increased in steps of 20 mg daily if required, dose to be increased at intervals of 3-4 weeks; maximum 40 mg per day
- ► Elderly: 10–20 mg once daily; maximum 20 mg per day BY MOUTH USING ORAL DROPS
- Adult: 16 mg once daily, increased in steps of 16 mg daily if required, dose to be increased at intervals of 3-4 weeks; maximum 32 mg per day
- ▶ Elderly: 8–16 mg daily; maximum 16 mg per day

Panic disorder

BY MOUTH USING TABLETS

- Adult: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; usual dose 20-30 mg daily; maximum 40 mg per day
- Elderly: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; maximum 20 mg per day

BY MOUTH USING ORAL DROPS

- ► Adult: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; usual dose 16–24 mg daily; maximum 32 mg per day
- ► Elderly: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; maximum 16 mg per day

Dose equivalence and conversion

4 oral drops (8 mg) is equivalent in the rapeutic effect to 10 mg tablet.

- CONTRA-INDICATIONS QT-interval prolongation
- CAUTIONS Susceptibility to QT-interval prolongation

- INTERACTIONS Avoid concomitant administration of drugs that prolong QT interval.
- SIDE-EFFECTS abnormal dreams · aggression · amnesia · bradycardia · confusion · coughing · euphoria · haemorrhage · hepatitis · hypokalaemia · impaired concentration · increased salivation · malaise · micturition disorders · migraine · mydriasis · oedema · palpitation · paradoxical increased anxiety during initial treatment of panic disorder (reduce dose) · paraesthesia · polyuria · postural hypotension · pruritus · QT-interval prolongation · rhinitis · tachycardia · tinnitus · taste disturbance · yawning
- BREAST FEEDING Present in milk—use with caution.
- HEPATIC IMPAIRMENT Use doses at lower end of range; for tablets up to maximum 20 mg; for oral solution up to maximum 16 mg.
- RENAL IMPAIRMENT No information available for eGFR less than 20 mL/minute/1.73 m².
- DIRECTIONS FOR ADMINISTRATION Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.
- PATIENT AND CARER ADVICE Patients should be advised of the effects of citalopram on driving.
 Counselling on administration of oral drops is advised.

SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

Duloxetine

 DRUG ACTION Inhibits the re-uptake of serotonin and noradrenaline.

INDICATIONS AND DOSE

Major depressive disorder

ву моитн

▶ Adult: 60 mg once daily

Generalised anxiety disorder

Y MOUTH

► Adult: Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

Diabetic neuropathy

BY MOUTH

 Adult: 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

Moderate to severe stress urinary incontinence

- Adult (female): 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.
- CAUTIONS Bleeding disorders · cardiac disease · elderly · history of mania · history of seizures · hypertension (avoid if uncontrolled) · raised intra-ocular pressure · susceptibility to angle-closure glaucoma
- INTERACTIONS Appendix 1 (duloxetine). Caution with concomitant use of drugs that increase risk of bleeding.
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · abnormal dreams · anorexia · anxiety · constipation · decreased appetite · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · fatigue · flatulence · headache · hot flush · insomnia · nausea · nervousness · palpitation · paraesthesia · pruritus · sexual dysfunction · sweating · tremor · visual disturbances · vomiting · weakness · weight changes
- ▶ Uncommon Bruxism · cold extremities · dysphagia · gastritis · halitosis · hepatitis · hypertension · hypothyroidism · impaired attention · impaired temperature regulation · movement disorders · muscle twitching · musculoskeletal pain · photosensitivity · postural hypotension · raised cholesterol · stomatitis · syncope · tachycardia · taste disturbance · thirst · urinary disorders · vertigo
- ▶ Rare Mania
- ▶ Very rare Angle-closure glaucoma
- Frequency not known Anaphylaxis angioedema chest pain hallucinations hypersensitivity reactions hyponatraemia rash seizures Stevens-Johnson syndrome suicidal behaviour supraventricular arrhythmia curticaria
- PREGNANCY Toxicity in animal studies—avoid in patients
 with stress urinary incontinence; in other conditions use
 only if potential benefit outweighs risk. Risk of neonatal
 withdrawal symptoms if used near term.
- BREAST FEEDING Present in milk—manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².
- TREATMENT CESSATION Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2006) that duloxetine (Cymbalta® should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate.

MEDICINAL FORMS

BNF 70

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

Duloxetine (as Duloxetine hydrochloride) 20 mg Yentreve 20mg gastro-resistant capsules | 28 capsule | PoM | 18.48 DT price = £18.48 DT price = £36.96 DT pr

Venlafaxine

 DRUG ACTION A serotonin and noradrenaline re-uptake inhibitor.

INDICATIONS AND DOSE

Major depression

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

 Adult: Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Adult: Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

Generalised anxiety disorder

BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Adult: 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

Social anxiety disorder

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks: maximum 225 mg per day
- CONTRA-INDICATIONS Conditions associated with high risk of cardiac arrhythmia uncontrolled hypertension
- CAUTIONS Diabetes heart disease (monitor blood pressure) - history of bleeding disorders - history of epilepsy - history or family history of mania - susceptibility to angle - closure glaucoma

• INTERACTIONS Appendix 1 (venlafaxine). Concomitant use of drugs that increase risk of bleeding.

SIDE-FFFFCTS

- ► Common or very common Abnormal dreams · anorexia · anxiety · anxiety (on withdrawal) · asthenia · changes in serum cholesterol · chills · confusion · constipation · difficulty with micturition · dizziness · dizziness (on withdrawal) · drowsiness · dry mouth · gastro-intestinal disturbances (on withdrawal) · headache · headache (on withdrawal) · hypertension · hypertonia · insommia · menstrual disturbances · mydriasis · nausea · nervousness · palpitation · paraesthesia (on withdrawal) · sensory disturbances · sexual dysfunction · sleep disturbances (on withdrawal) · sweating · sweating (on withdrawal) · tremor · tremor (on withdrawal) · vasodilatation · visual disturbances · vomiting · weight changes · yawning
- Uncommon Agitation alopecia angioedema apathy arrhythmias bleeding disorders bruxism diarrhoea ecchymosis gastro-intestinal haemorrhage hallucinations incoordination myoclonus photosensitivity postural hypotension rash taste disturbance timitus urinary retention
- ▶ Rare Akathisia extrapyramidal symptoms hypomania mania seizures urinary incontinence
- ▶ Very rare Angle-closure glaucoma
- Frequency not known Aggression · blood dyscrasias · delirium · hepatitis · hyperprolactinaemia · hypotension · neuroleptic malignant syndrome · pancreatitis · pruritus · QT interval prolongation · rhabdomyolysis · Stevens-Johnson syndrome · suicidal behaviour · syndrome of inappropriate anti-diuretic hormone secretion · urticaria · vertigo
- PREGNANCY Avoid unless potential benefit outweighs risk—toxicity in animal studies. Risk of withdrawal effects in pennate
- BREAST FEEDING Present in milk-avoid.
- HEPATIC IMPAIRMENT Consider reducing dose by 50% in mild or moderate impairment; use with caution and reduce dose by at least 50% in severe impairment.
- RENAL IMPAIRMENT Use with caution. Use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m².
- TREATMENT CESSATION Associated with a higher risk of withdrawal effects compared with other antidepressants. Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.
- PATIENT AND CARER ADVICE May affect performance of skilled tasks (e.g. driving).

TETRACYCLIC ANTIDEPRESSANTS

Mianserin hydrochloride

INDICATIONS AND DOSE

Depressive illness (particularly where sedation is required)

- Adult: Initially 30–40 mg daily in divided doses, alternatively initially 30–40 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary: usual dose 30–90 mg
- Elderly: Initially 30 mg daily in divided doses, alternatively initially 30 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg
- CONTRA-INDICATIONS Acute porphyrias p. 864 arrhythmias - during the manic phase of bipolar disorder heart block - immediate recovery period after myocardial infarction
- CAUTIONS Cardiovascular disease chronic constipation diabetes epilepsy history of bipolar disorder history of psychosis hyperthyroidism (risk of arrhythmias) increased intra-ocular pressure patients with a significant risk of suicide phaeochromocytoma (risk of arrhythmias) prostatic hypertrophy susceptibility to angle-closure glaucoma urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- INTERACTIONS Antidepressants, tricyclic (related).
- SIDE-EFFECTS
- ► Common or very common Agitation anxiety arrhythmia blurred vision confusion dizziness dry mouth ECG

- changes · heart block · irritability · paraesthesia · postural hypotension · sleep disturbances · sudden death of patients with cardiac disease · tachycardia
- ▶ Rare Dysarthria extrapyramidal symptoms paralytic ileus • tremor • urinary retention
- ► Very rare Constipation neuroleptic malignant syndrome precipitation of angle-closure glaucoma
- ► Frequency not known Alopecia · anorexia · arthralgia · arthritis · blood dyscrasias · breast enlargement · changes in blood sugar · chills (on withdrawal) · convulsions · delusions · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · hepatic reactions · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · Insomnia (on withdrawal) • jaundice • mania • movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · oedema · photosensitivity · pruritus · rash · sexual dysfunction · suicidal behaviour · sweating · sweating (on withdrawal) · taste disturbance · tinnitus · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss SIDE-EFFECTS, FURTHER INFORMATION The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be

Overdose

effect as soon as possible.

Emergency treatment of poisoning The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdosage.

balanced against the need to obtain a full therapeutic

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- PREGNANCY Avoid.
- BREAST FEEDING The amount secreted into breast milk is too small to be harmful.
- HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- RENAL IMPAIRMENT Caution in renal impairment.
- MONITORING REQUIREMENTS A full blood count is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if fever, sore throat, stomatitis, or other signs of infection develop.
- TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced

Mirtazapine

 DRUG ACTION Mirtazapine is a presynaptic alpha₂adrenoreceptor antagonist which increases central noradrenergic and serotonergic neurotransmission.

INDICATIONS AND DOSE

Major depression

ву моитн

- Adult: Initially 15-30 mg daily for 2-4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily; increased if necessary up to 45 mg daily in 2 divided doses
- CAUTIONS Cardiac disorders · diabetes mellitus · elderly · history of bipolar depression · history of seizures · history of urinary retention · hypotension · psychoses (may aggravate psychotic symptoms) · susceptibility to angle-closure glaucoma
- INTERACTIONS → Appendix 1 (mirtazapine).
- SIDE-EFFECTS
- ► Common or very common Abnormal dreams · agitation (on withdrawal) · anxiety · anxiety (on withdrawal) · arthralgia · confusion · dizziness · dizziness (on withdrawal) · drowsiness · dry mouth · fatigue · headache (on withdrawal) · increased appetite · insomnia · myalgia · nausea (on withdrawal) · oedema · postural hypotension · tremor · vomiting (on withdrawal) · weight gain
- ► Uncommon Hallucinations mania movement disorders syncone
- ► Rare Aggression myoclonus pancreatitis
- Frequency not known Angle-closure glaucoma · blood disorders · convulsions · dysarthria · hypersalivation · hyponatraemia · inappropriate secretion of antidiuretic hormone · sedation during initial treatment · Stevens-Johnson syndrome · suicidal behaviour · toxic epidermal necrolysis
- PREGNANCY Use with caution—limited experience; monitor neonate for withdrawal effects.
- BREAST FEEDING Present in milk; use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Use with caution. Discontinue if iaundice occurs.
- RENAL IMPAIRMENT Clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m²; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m².
- TREATMENT CESSATION Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.
- DIRECTIONS FOR ADMINISTRATION Orodispersible tablet (Zispin SolTab®) should be placed on the tongue, allowed to disperse and swallowed.
- PATIENT AND CARER ADVICE Counselling on administration of orodispersible tablet advised.
 Blood Disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection

during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected.

TRICYCLIC ANTIDEPRESSANTS

Amitriptyline hydrochloride

INDICATIONS AND DOSE

Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics) BY MOUTH

► Adult: Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 30 mg per day

Depressive illness (but not recommended) BY MOUTH

- Adult: Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually
- Elderly: Initially 30–75 mg daily in divided doses, alternatively initially 30–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually

Neuropathic pain

ву моитн

 Adult: Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

Migraine prophylaxis

BY MOUTH

- ► Adult: Initially 10 mg once daily, then increased if necessary to 50–75 mg once daily (max. per dose 150 mg), dose to be taken at night
- UNLICENSED USE Not licensed for use in neuropathic pain. Not licensed for use in migraine prophylaxis. Not

licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics.

- CONTRA-INDICATIONS Acute porphyrias p. 864 arrhythmias during manic phase of bipolar disorder heart block immediate recovery period after myocardial infarction
- CAUTIONS Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- INTERACTIONS → Appendix 1 (Antidepressants, tricyclic).
- SIDE-EFFECTS
- ▶ Common or very common Abdominal pain · fatigue · hypertension · mydriasis · oedema · palpitation · restlessness · stomatitis

CAUTIONARY AND ADVISORY LABELS 2

► Triptafen (AMCo)

Amitriptyline hydrochloride 25 mg, Perphenazine 2 mg Triptafen tablets | 100 tablet PoM £33.13

Clomipramine hydrochloride

INDICATIONS AND DOSE

Depressive illness

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 10 mg daily, then increased if necessary to 30–150 mg daily in divided doses, dose to be increased gradually, alternatively increased if necessary to 30–150 mg once daily, dose to be taken at bedtime; maximum 250 mg per day
- ► Elderly: Initially 10 mg daily, then increased to 30–75 mg daily, dose to be increased carefully over approximately 10 days

Phobic and obsessional states

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ► Adult: Initially 25 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day
- ► Elderly: Initially 10 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

 Adult: Initially 10 mg daily, dose to be gradually increased until satisfactory response; increased if necessary to 10-75 mg daily

ANAFRANIL SR®

Depressive illness

BY MOUTH

- Adult: Initially 10 mg once daily, then increased if necessary to 30-150 mg once daily, to be taken at bedtime, doses to be titrated using clomipramine capsules, dose to be increased gradually; maximum 250 mg per day
- Elderly: Initially 10 mg once daily, then increased to 30–75 mg once daily, dose to be increased carefully over approximately 10 days, doses to be titrated using clomipramine capsules

Phobic and obsessional states

ву моитн

- Adult: Initially 25 mg once daily, then increased to 100–150 mg once daily, dose to be increased gradually over 2 weeks, doses to be titrated using clomipramine capsules; maximum 250 mg per day
- Elderly: Initially 10 mg once daily, then increased to 100–150 mg once daily, dose to be increased gradually over 2 weeks, doses to be titrated using clomipramine capsules; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy

BY MOUTH

- Adult: Initially 10 mg once daily, dose to be gradually increased until satisfactory response; usual dose 10-75 mg once daily, doses to be titrated using clomipramine capsules
- CONTRA-INDICATIONS Acute porphyrias p. 864 arrhythmias - during the manic phase of bipolar disorder heart block - immediate recovery period after myocardial infarction
- CAUTIONS Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- INTERACTIONS → Appendix 1 (antidepressants, tricyclic).
- SIDE-EFFECTS
- Common or very common Abdominal pain aggression diarrhoea · fatigue · flushing · hypertension · impaired memory · muscle hypertonia · muscle weakness · mydriasis · myoclonus · restlessness · yawning
- ► Rare Dysarthria extrapyramidal symptoms paralytic ileus tremor
- Very rare Allergic alveolitis · neuroleptic malignant syndrome · precipitation of angle-closure glaucoma
- Frequency not known Agitation · alopecia · anorexia · anxiety \cdot arrhythmias \cdot blurred vision \cdot breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constipation · convulsions · delusions · dizziness · dry mouth · ECG changes · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · paraesthesia · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- PREGNANCY Neonatal withdrawal symptoms reported if used during third trimester.
- BREAST FEEDING The amount secreted into breast milk is too small to be harmful.
- HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be

prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

- PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
- LESS SUITABLE FOR PRESCRIBING
 ANAFRANIL SR® Anafranil SR® is less suitable for prescribing.

INDICATIONS AND DOSE

Depressive illness (particularly where sedation is required) (initiated by a specialist)

ву моитн

- Adult: Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g., hospital use)
- ► Elderly: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)
- CONTRA-INDICATIONS Acute porphyrias p. 864 arrhythmias - during the manic phase of bipolar disorder heart block - immediate recovery period after myocardial infarction
- CAUTIONS Cardiovascular disease chronic constipation diabetes epilepsy history of bipolar disorder history of psychosis hyperthyroidism (risk of arrhythmias) increased intra-ocular pressure patients with a significant risk of suicide phaeochromocytoma (risk of arrhythmias) prostatic hypertrophy susceptibility to angle-closure glaucoma urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- INTERACTIONS → Appendix 1 (antidepressants, tricyclic).
- SIDE-EFFECTS
- ▶ Rare Dysarthria extrapyramidal symptoms paralytic ileus tremor
- Very rare Neuroleptic malignant syndrome · precipitation of angle-closure glaucoma

► Frequency not known Agitation · alopecia · anorexia · anxiety • arrhythmias • blurred vision • breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constipation · convulsions · delusions · dizziness · dry mouth · ECG changes · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · increased intraocular pressure · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · paraesthesia · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease • suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose Overdosage with dosulepin is associated with a relatively high rate of fatality. Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING The amount secreted into breast milk is too small to be harmful.
- HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
 A maximum prescription equivalent to 2 weeks' supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs.
- PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
- LESS SUITABLE FOR PRESCRIBING Dosulepin hydrochloride is less suitable for prescribing.

- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING The amount secreted into breast milk is too small to be harmful.
- HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- MONITORING REQUIREMENTS Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.
- TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

MEDICINAL FORMS

INDICATIONS AND DOSE

Depressive illness (particularly where sedation required)
BY MOUTH

- Adult: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–300 mg daily
- ► Elderly: Initially 10–25 mg 3 times a day, maintenance 75–150 mg daily
- CONTRA-INDICATIONS Acute porphyrias p. 864 arrhythmias - during the manic phase of bipolar disorder heart block - immediate recovery period after myocardial infarction
- CAUTIONS Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- INTERACTIONS → Appendix 1 (antidepressants, tricyclic).
- SIDE-EFFECTS
- ► Rare Paralytic ileus
- Very rare Neuroleptic malignant syndrome · precipitation of angle-closure glaucoma
- ► Frequency not known Agitation · alopecia · anorexia · anxiety · arrhythmia · blurred vision · breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constination · convulsions · delusions · dizziness · dry mouth · dysarthria · ECG changes · extrapyramidal symptoms · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · Insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) • nausea • nausea (on withdrawal) · paraesthesia · photosensitivity · postural hypotension · pruritis · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · tremor · urinary $\dot{\text{retention}} \cdot \text{urticaria} \cdot \text{vivid dreams (on withdrawal)} \cdot$ vomiting · weight gain · weight loss

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems

to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING The amount secreted into breast milk is too small to be harmful.
- HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

2.5 Deviant antisocial sexual hehaviour

ANTIPSYCHOTICS (FIRST-GENERATION)

Benperidol

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

INDICATIONS AND DOSE

Control of deviant antisocial sexual behaviour

- Adult: 0.25-1.5 mg daily in divided doses, adjusted according to response, for debilitated patients, use elderly dose
- Elderly: Initially 0.125-0.75 mg daily in divided doses, adjusted according to response
- CONTRA-INDICATIONS CNS depression · comatose states · phaeochromocytoma
- CAUTIONS Risk factors for stroke
- PREGNANCY Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- BREAST FEEDING There is limited information available
 on the short- and long-term effects of antipsychotic drugs
 on the breast-fed infant. Animal studies indicate possible
 adverse effects of antipsychotic medicines on the
 developing nervous system. Chronic treatment with
 antipsychotic drugs whilst breast-feeding should be
 avoided unless absolutely necessary.
- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS Manufacturer advises regular blood counts and liver function tests during longterm treatment.
- PRESCRIBING AND DISPENSING INFORMATION The proprietary name Benquil® has been used for benperidol tablets.

2.6 Psychoses and schizophrenia

Psychoses and related disorders

Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore **unlicensed**

- Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.
- Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.
- Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and

- reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important: When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be lower than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and should not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least daily.

Antipsychotic drugs

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'.

In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D_2 receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The **phenothiazine** derivatives can be divided into 3 main groups:

- Group 1: chlorpromazine hydrochloride p. 304, levomepromazine p. 345, and promazine hydrochloride p. 320, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- Group 2: pericyazine p. 308 and pipotiazine palmitate, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- Group 3: fluphenazine decanoate p. 306, perphenazine p. 308, prochlorperazine p. 309, and trifluoperazine p. 310, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Butyrophenones (benperidol p. 300 and haloperidol p. 306) resemble the group 3 phenothiazines in their clinical properties. Thioxanthenes (flupentixol p. 305 and zuclopenthixol p. 311) have moderate sedative, antimuscarinic effects, and extrapyramidal effects. Diphenylbutylpiperidines (pimozide p. 308) and the substituted benzamides (sulpiride p. 310) have reduced sedative, antimuscarinic, and extrapyramidal effects.

Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (sometimes referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

- It is recommended that:
- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient's weight, comorbidity, and concomitant medication.
- Treatment should be reviewed regularly.

Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- parkinsonian symptoms (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- dystonia (abnormal face and body movements) and dyskinesia, which occur more commonly in children or young adults and appear after only a few doses;
- akathisia (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- tardive dyskinesia (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on longtern therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

Parkinsonian symptoms remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

Tardive dyskinesia is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly

frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Most antipsychotic drugs, both first- and secondgeneration, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha₁-adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

Hyperglycaemia and sometimes diabetes can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.

Hypotension and interference with temperature regulation Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients.

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Blood dyscrasias

Perform blood counts if unexplained infection or fever develops.

Choice

There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 313), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient's medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects,

weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 312, clozapine p. 313, olanzapine p. 315, and quetiapine p. 318 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 312 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

Aripiprazole p. 312 has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride p. 312, clozapine p. 313, flupentixol p. 305, fluphenazine decanoate p. 306, olanzapine p. 315, perphenazine p. 308, prochlorperazine p. 309, risperidone p. 319, and sulpiride p. 310.

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine decanoate p. 306 and haloperidol p. 306 are lowest risk. Amisulpride p. 312 and aripiprazole p. 312 have the lowest risk of diabetes of the second-generation antipsychotic drugs. Amisulpride, aripiprazole, haloperidol, sulpiride p. 310, and trifluoperazine p. 310 are least likely to cause weight gain.

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole p. 312 and quetiapine p. 318. Olanzapine p. 315 may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine p. 313, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks' treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

Monitoring

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

Some antipsychotic drugs can be used for the treatment of nausea and vomiting, choreas, and motor tics.

Chlorpromazine hydrochloride p. 304 and haloperidol p. 306 can be used for intractable hiccup. Benperidol p. 300 is used in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

Equivalent doses of oral antipsychotics

These equivalences are intended **only** as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5-1 mg · Sulpiride 200 mg
- Trifluoperazine 5 mg

Important: These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with secondgeneration antipsychotic depot preparations, such as risperidone p. 319 and olanzapine embonate p. 316.

Choice

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol p. 311 may be suitable for the treatment of agitated or aggressive patients whereas flupentixol decanoate p. 305 can cause over-excitement in such patients. Zuclopenthixol decanoate may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

Equivalent doses of depot antipsychotics

Antipsychotic drug/interval	Dosage (mg)
Flupentixol decanoate / 2 weeks	40
Fluphenazine decanoate / 2 weeks	25
Haloperidol (as decanoate) / 4 weeks	100
Pipotiazine palmitate / 4 weeks	50
Zuclopenthixol decanoate / 2 weeks	200

Important: These equivalences must not be extrapolated beyond the maximum dose for the drug

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

Dosage

Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient's response.

ANTIPSYCHOTICS (FIRST-GENERATION)

Antipsychotic drugs

• CAUTIONS Blood dyscrasias • cardiovascular disease • conditions predisposing to seizures · depression · epilepsy · history of jaundice · myasthenia gravis · Parkinson's disease (may be exacerbated) · photosensitisation (may occur with higher dosages) · prostatic hypertrophy · severe respiratory disease · susceptibility to angle-closure

CAUTIONS, FURTHER INFORMATION

Cardiovascular disease An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

 INTERACTIONS → Appendix 1 (antipsychotics). Increased risk of toxicity with myelosuppressive drugs.

SIDE-EFFECTS

- ▶ Rare Neuroleptic malignant syndrome—discontinue (potentially fatal)
- ▶ Very rare Precipitation of angle-closure glaucoma
- ► Frequency not known Agitation agranulocytosis akathisia · antimuscarinic symptoms · apathy · blood dvscrasias · blurred vision · cardiovascular side-effects · confusion · constipation · contact sensitisation · convulsions · corneal and lens opacities · diabetes · difficulty with micturition · dizziness · drowsiness · dry mouth · dystonia · excitement · extrapyramidal symptoms · gastro-intestinal disturbances · headache · hyperglycaemia · hyperprolactineamia · hypotension (dose related) · insomnia · interference with temperature regulation (dose related) · jaundice (including cholestatic) · leucopenia · nasal congestion · parkinsonian symptoms · photosensitisation · purplish pigmentation of the conjunctiva · purplish pigmentation of the cornea · purplish pigmentation of the retina · purplish pigmentation of the skin · rashes · sexual dysfunction · tardive dyskinesia · venous thromboembolism · weight

Overdose Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning, p. 1123.

- PREGNANCY Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- BREAST FEEDING There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

MONITORING REQUIREMENTS

- ▶ It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
- Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Chlorpromazine hydrochloride

INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

BY MOUTH

 Adult: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses, take a third to half adult dose in the elderly and debilitated patients

BY RECTUM

 Adult: 100 mg every 6-8 hours, dose expressed as chlorpromazine base

Intractable hiccup

ву моштн

▶ Adult: 25-50 mg 3-4 times a day

Relief of acute symptoms of psychoses (under expert supervision)

BY DEEP INTRAMUSCULAR INJECTION

► Adult: 25-50 mg every 6-8 hours

Nausea and vomiting of terminal illness (where other drugs have failed or are not available)

ву моитн

- Child 1-5 years: 500 micrograms/kg every 4-6 hours; maximum 40 mg per day
- Child 6-11 years: 500 micrograms/kg every 4-6 hours; maximum 75 mg per day
- ▶ Child 12-17 years: 10-25 mg every 4-6 hours
- ► Adult: 10-25 mg every 4-6 hours

BY DEEP INTRAMUSCULAR INJECTION

- ► Child 1-5 years: 500 micrograms/kg every 6-8 hours; maximum 40 mg per day
- Child 6-11 years: 500 micrograms/kg every 6-8 hours; maximum 75 mg per day
- ► Child 12-17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
- ► Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

BY RECTUM

► Adult: 100 mg every 6-8 hours

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

Dose equivalence and conversion

For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository \equiv 20–25 mg chlorpromazine hydrochloride by intramuscular injection \equiv 40–50 mg of chlorpromazine base or hydrochloride given by mouth.

- UNLICENSED USE Rectal route is not licensed.
- CONTRA-INDICATIONS CNS depression · comatose states · hypothyroidism · phaeochromocytoma
- CAUTIONS Diabetes
- SIDE-EFFECTS

SIDE-EFFECTS. FURTHER INFORMATION

Acute dystonic reactions Phenothiazines can induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- HEPATIC IMPAIRMENT Can precipitate coma; phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS
- With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.
- HANDLING AND STORAGE Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, capsule

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 11

Chlorpromazine hydrochloride 25 mg per 1 ml Largactil 50mg/2ml solution for injection ampoules | 10 ampoule Pom £7.51

Flupentixol (Flupenthixol)

INDICATIONS AND DOSE

Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity

ву моитн

- ► Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day
- ► Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

Depressive illness

ву моитн

- ▶ Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day
- ▶ Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day
- CONTRA-INDICATIONS Circulatory collapse CNS depression · comatose states · excitable patients · impaired consciousness · overactive patients · phaeochromocytoma
- CAUTIONS Acute porphyrias p. 864 · cardiac disorders · cardiovascular disease · cerebral arteriosclerosis · diabetes · elderly · parkinsonism · OT-interval prolongation · senile confusional states
- INTERACTIONS Avoid concomitant administration of drugs that prolong QT interval.
- SIDE-EFFECTS Asthenia · dyspnoea · hypersalivation · myalgia · sudden death · torsade de pointes SIDE-EFFECTS, FURTHER INFORMATION

Less sedating but extrapyramidal symptoms frequent.

- PREGNANCY Avoid unless potential benefit outweighs
- BREAST FEEDING Present in breast milk—avoid.
- HEPATIC IMPAIRMENT Can precipitate coma. Consider serum-flupentixol concentration monitoring in hepatic impairment.
- RENAL IMPAIRMENT Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity.

Manufacturer advises caution in renal failure.

 PATIENT AND CARER ADVICE Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

CAUTIONARY AND ADVISORY LABELS 2

► Depixol (Flupentixol dihydrochloride) (Lundbeck Ltd) Flupentixol (as Flupentixol dihydrochloride) 3 mg Depixol 3mg tablets | 100 tablet PoM £13.92 DT price = £13.92

Flupentixol decanoate (Flupenthixol Decanoate)

INDICATIONS AND DOSE

Maintenance in schizophrenia and other psychoses BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: Test dose 20 mg, dose to be injected into the upper outer buttock or lateral thigh, then 20–40 mg after at least 7 days, then 20-40 mg every 2-4 weeks, adjusted according to response, usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; maximum 400 mg per week
- ▶ Elderly: Dose is initially quarter to half adult dose
- CONTRA-INDICATIONS Children · CNS depression · comatose states · excitable patients · overactive patients · phaeochromocytoma
- CAUTIONS An alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear · avoid in Acute porphyrias p. 864 · diabetes · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- SIDE-EFFECTS Ervthema · hvperglycaemia · mood elevating effect · nodules · pain at injection site · swelling SIDE-EFFECTS, FURTHER INFORMATION

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

Less sedating but extrapyramidal symptoms frequent.

- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS Treatment requires careful monitoring for optimum effect.
- DIRECTIONS FOR ADMINISTRATION In general not more than 2-3mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable sideeffects are prolonged.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Depixol (Flupentixol decanoate) (Lundbeck Ltd)

Flupentixol decanoate 20 mg per 1 ml Depixol 40mg/2ml solution for injection ampoules | 10 ampoule PoM £25.39 Depixol 20mg/1ml solution for injection ampoules 10 ampoule PoM £15.17

Fluphenazine decanoate

INDICATIONS AND DOSE

Maintenance in schizophrenia and other psychoses

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: Test dose 12.5 mg, dose to be administered into the gluteal muscle, then 12.5-100 mg after 4-7 days, then 12.5-100 mg every 14-35 days, adjusted according to response
- ▶ Elderly: Test dose 6.25 mg, dose to be administered into the gluteal muscle, then 12.5-100 mg after 4-7 days, then 12.5-100 mg every 14-35 days, adjusted according to response

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

- CONTRA-INDICATIONS Children CNS depression comatose states · marked cerebral atherosclerosis · phaeochromocytoma
- CAUTIONS OT-interval prolongation when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- INTERACTIONS Avoid concomitant drugs that prolong OT
- SIDE-EFFECTS Erythema inappropriate antidiuretic hormone secretion · nodules · oedema · pain at injection site · swelling · systemic lupus erythematosus

SIDE-EFFECTS, FURTHER INFORMATION

Less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent. Extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed.

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- HEPATIC IMPAIRMENT Avoid in hepatic failure. Can precipitate coma: phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Manufacturer advises caution. Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. Avoid in renal failure.
- MONITORING REQUIREMENTS Treatment requires careful monitoring for optimum effect.
- DIRECTIONS FOR ADMINISTRATION In general not more than 2-3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable sideeffects are prolonged.

Haloperidol

INDICATIONS AND DOSE

Schizophrenia | Psychoses | Mania and hypomania | Organic brain damage (depending on symptoms) BY MOUTH

- ▶ Adult: Initially 2–20 mg once daily, alternatively initially 2-20 mg daily in divided doses; maintenance 1-3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses, for debilitated patients, use elderly dose; maximum 20 mg per day
- ▶ Elderly: Initially 1–10 mg once daily, alternatively initially 1-10 mg daily in divided doses; maintenance 1-3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses; maximum 20 mg per day

BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 2-5 mg, repeated if necessary, repeated dose given according to response and tolerability, for debilitated patients, use elderly dose; maximum 12 mg per day
- ► Elderly: Initially 1–2.5 mg, repeated if necessary, repeated dose given according to response and tolerability; maximum 12 mg per day

Agitation and restlessness in the elderly ву моитн

▶ Elderly: Initially 0.75-1.5 mg 2-3 times a day, adjusted according to response

Management of mental or behavioural problems such as aggression, hyperactivity and self-mutilation in the mentally retarded and in patients with organic brain damage (depending on symptoms) | Gilles de la Tourette syndrome | Severe tics | Intractable hiccup | Adjunct to short-term management of moderate to severe psychomotor agitation, excitement and, violent or dangerously impulsive behaviour

- ► Adult: Initially 1.5–3 mg 2–3 times a day, alternatively initially 3-5 mg 2-3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5-1 mg 3 times a day, increased if necessary to 2-3 mg 3 times a day, once symptoms are controlled. gradually reduce dose to the lowest effective maintenance dose, for debilitated patients, use elderly
- ▶ Elderly: Initially 0.75–1.5 mg 2–3 times a day, alternatively initially 1.5-2.5 mg 2-3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5-1 mg 3 times a day, increased if necessary to 2-3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose

Nausea and vomiting

BY INTRAMUSCULAR INJECTION

▶ Adult: 1-2 mg

Nausea and vomiting in palliative care ву моитн

▶ Adult: Initially 1.5 mg 1-2 times a day, increased if necessary to 5-10 mg daily in divided doses

BY SUBCUTANEOUS INFUSION

► Adult: 2.5-10 mg/24 hours

Restlessness and confusion in palliative care

ву моитн

- ► Adult: 2 mg, then 2 mg every 2 hours if required BY SUBCUTANEOUS INJECTION
- ► Adult: 2.5 mg, then 2.5 mg every 2 hours if required BY SUBCUTANEOUS INFUSION
- ► Adult: 5-15 mg standard 24 hours

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

• UNLICENSED USE BNF doses for schizophrenia, psychoses, mania, hypomania, and organic brain damage differ from those in product literature.

Important safety information

When prescribing, dispensing or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

- CONTRA-INDICATIONS Bradycardia · CNS depression · comatose states · lesions of the basal ganglia · Parkinson's disease · phaeochromocytoma · QT-interval prolongation
- CAUTIONS Arteriosclerosis hypocalcaemia hypokalaemia hypomagnesaemia metabolic disturbances subarachnoid haemorrhage thyrotoxicosis
- INTERACTIONS Avoid concomitant administration of drugs that prolong QT interval.
- SIDE-EFFECTS
- ► Common or very common Depression weight loss
- ► Uncommon Dyspnoea oedema
- ► Rare Bronchospasm hypoglycaemia inappropriate antidiuretic hormone secretion photosensitivity reactions pigmentation
- Frequency not known Hypertension · Stevens-Johnson syndrome · sweating · toxic epidermal necrolysis
 SIDE-EFFECTS, FURTHER INFORMATION
 Less sedating and fewer antimuscarinic or hypotensive
- PREGNANCY Avoid unless benefits outweigh risks.
- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.

Perphenazine

INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of anxiety | Severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour | Severe nausea and vomiting unresponsive to other anti-emetics

BY MOUTH

- Adult: Initially 4 mg 3 times a day, adjusted according to response; maximum 24 mg per day
- ► Elderly: Initially 1–2 mg 3 times a day; maximum 12 mg per day
- CONTRA-INDICATIONS Agitation in the elderly · CNS depression · comatose states · phaeochromocytoma · restlessness in the elderly
- CAUTIONS
- ▶ With oral use hypothyroidism
- SIDE-EFFECTS
- ▶ Rare Systemic lupus erythematosus
- ▶ Frequency not known Dystonic reactions

SIDE-EFFECTS, FURTHER INFORMATION

Less sedating.

Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- HEPATIC IMPAIRMENT Can precipitate coma; phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

Pimozide

INDICATIONS AND DOSE

Schizophrenia

ву моитн

- ► Adult: Initially 2 mg daily, adjusted according to response, then increased in steps of 2–4 mg at least every 1 week; usual dose 2–20 mg daily
- ► Elderly: Initially 1 mg daily, adjusted according to response, increased in steps of 2–4 mg at least every 1 week; usual dose 2–20 mg daily

Monosymptomatic hypochondriacal psychosis | Paranoid psychosis

ву моитн

- ► Adult: Initially 4 mg daily, adjusted according to response, then increased in steps of 2-4 mg at least every 1 week; maximum 16 mg per day
- ► Elderly: Initially 2 mg daily, adjusted according to response, increased in steps of 2–4 mg at least every 1 week; maximum 16 mg per day

- CONTRA-INDICATIONS CNS depression · comatose states · history of arrhythmias · history or family history of congenital QT prolongation · phaeochromocytoma
- SIDE-EFFECTS
- ▶ Rare Hyponatraemia
- ► Frequency not known Glycosuria · serious arrhythmias SIDE-EFFECTS, FURTHER INFORMATION Less sedating.
- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS
- ▶ ECG monitoring Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also recommended that patients taking pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Prochlorperazine

INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania

➤ Adult: 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily

BY DEEP INTRAMUSCULAR INJECTION

► Adult: 12.5–25 mg 2–3 times a day

Short-term adjunctive management of severe anxiety

 Adult: 15-20 mg daily in divided doses; maximum 40 mg per day

Nausea and vomiting, acute attack

ву моштн

- ► Adult: Initially 20 mg, then 10 mg after 2 hours
- Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Nausea and vomiting, prevention

ву моитн

- ► Adult: 5-10 mg 2-3 times a day
- BY DEEP INTRAMUSCULAR INJECTION
- Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Prevention and treatment of nausea

ву моитн

- ► Child 1-11 years (body-weight 10 kg and above): 250 micrograms/kg 2-3 times a day
- ► Child 12-17 years: 5-10 mg up to 3 times a day if required

BY INTRAMUSCULAR INJECTION

- ► Child 2-4 years: 1.25–2.5 mg up to 3 times a day if required
- ► Child 5-11 years: 5-6.25 mg up to 3 times a day if required
- ▶ Child 12-17 years: 12.5 mg up to 3 times a day if required

Labyrinthine disorders

INITIALLY BY MOUTH

 Adult: 5 mg 3 times a day, (by mouth) increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5-10 mg daily, dose is reduced after several weeks

Nausea and vomiting in previously diagnosed migraine BY MOUTH USING BUCCAL TABLET

- Child 12-17 years: 3-6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
- ► Adult: 3-6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

Dose equivalence and conversion

Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate \equiv 1 mg prochlorperazine mesilate.

UNLICENSED USE

- With intramuscular use in children Injection not licensed for use in children.
- With buccal use in children Buccal tablets not licensed for use in children
- CONTRA-INDICATIONS Avoid oral route in child under 10 kg · children (in psychotic disorders) · CNS depression · comatose states · phaeochromocytoma
- CAUTIONS Elderly (in adults) hypotension (more likely after intramuscular injection)
- SIDE-EFFECTS Dystonic reactions respiratory depression may occur in susceptible patients

SIDE-EFFECTS, FURTHER INFORMATION

Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- HEPATIC IMPAIRMENT Can precipitate coma; phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- DIRECTIONS FOR ADMINISTRATION
- With buccal use Buccal tablets are placed high between upper lip and gum and left to dissolve.

PATIENT AND CARER ADVICE

 With buccal use Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

INDICATIONS AND DOSE

Schizophrenia with predominantly negative symptoms

- Adult: 200–400 mg twice daily; maximum 800 mg per day
- ► Elderly: Lower initial dose to be given, increased gradually according to response

Schizophrenia with mainly positive symptoms

- ▶ Adult: 200-400 mg twice daily; maximum 2.4 g per day
- Elderly: Lower initial dose to be given, increased gradually according to response
- CONTRA-INDICATIONS CNS depression · comatose states · phaeochromocytoma
- CAUTIONS Aggressive patients (even low doses may aggravate symptoms) - agitated patients (even low doses may aggravate symptoms) - excited patients (even low doses may aggravate symptoms)
- SIDE-EFFECTS Hepatitis
- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include lemon and aniseed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Trifluoperazine

INDICATIONS AND DOSE

Schizophrenia and other psychoses | Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

- Adult: Initially 5 mg twice daily for 1 week, then increased in steps of 5 mg daily, dose then to be increased at intervals of 3 days, according to response
- Elderly: Initially up to 2.5 mg twice daily for 1 week, then increased in steps of 5 mg daily, dose then to be increased at intervals of 3 days, according to response

Short-term adjunctive management of severe anxiety BY MOUTH

- Adult: 2-4 mg daily in divided doses, increased if necessary to 6 mg daily
- Elderly: Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily

Severe nausea and vomiting

BY MOUTH

- Adult: 2-4 mg daily in divided doses; maximum 6 mg per day
- CONTRA-INDICATIONS CNS depression · comatose states · phaeochromocytoma
- SIDE-EFFECTS Anorexia dystonic reactions muscle weakness

SIDE-EFFECTS, FURTHER INFORMATION

Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily.

Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- HEPATIC IMPAIRMENT Can precipitate coma; phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

Zuclopenthixol

INDICATIONS AND DOSE

Schizophrenia and other psychoses

ву моитн

- Adult: Initially 20–30 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg), for debilitated patients, use elderly dose
- Elderly: Initially 5–15 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg)
- CONTRA-INDICATIONS Apathetic states CNS depression comatose states phaeochromocytoma withdrawn states
- CAUTIONS Avoid in Acute porphyrias p. 864
- SIDE-EFFECTS Urinary frequency urinary incontinence weight loss (less common than weight gain)
- HEPATIC IMPAIRMENT Halve dose. Can precipitate coma.
 Consider serum-level monitoring in patients with hepatic impairment.
- RENAL IMPAIRMENT Halve dose in renal failure; smaller starting doses used in severe renal impairment because of increased cerebral sensitivity.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

25 mg Clopixol 25mg tablets | 100 tablet PoM £16.13 DT price =

Zuclopenthixol acetate

INDICATIONS AND DOSE

Short-term management of acute psychosis | Short-term management of mania | Short-term management of exacerbation of chronic psychosis

BY DEEP INTRAMUSCULAR INJECTION

- Adult: 50-150 mg, then 50-150 mg after 2-3 days, repeated if necessary maximum duration of treatment 2 weeks, to be administered into the gluteal muscle or lateral thigh, 1 additional dose may be needed 1-2 days after the first injection, maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections, if maintenance treatment necessary change to an oral antipsychotic 2-3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate.
- Elderly: 50-100 mg, then 50-100 mg after 2-3 days, repeated if necessary maximum duration of treatment 2 weeks, to be administered into the gluteal muscle or lateral thigh, 1 additional dose may be needed 1-2 days after the first injection, maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections, if maintenance treatment necessary change to an oral antipsychotic 2-3 days after last injection, or to a longer acting antipsychotic depot injection given

concomitantly with last injection of zuclopenthixol acetate

Important safety information

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is usually used in hospital for an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

- CONTRA-INDICATIONS CNS depression comatose states phaeochromocytoma
- CAUTIONS Avoid in Acute porphyrias p. 864
- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Clopixol Acuphase (Lundbeck Ltd)

Zuclopenthixol acetate 50 mg per 1 ml Clopixol Acuphase

50mg/1ml solution for injection ampoules | 5 ampoule | PoM £24.21

DT price = £24.21

Zuclopenthixol decanoate

Maintenance in schizophrenia and paranoid psychoses
BY DEEP INTRAMUSCULAR INJECTION

- ► Adult: Test dose 100 mg, dose to be administered into the upper outer buttock or lateral thigh, followed by 200–500 mg after at least 7 days, then 200–500 mg every 1–4 weeks, adjusted according to response, higher doses of more than 500mg can be used; do not exceed 600 mg weekly
- ► Elderly: A quarter to half usual starting dose to be used

Important safety information

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the short-term management of an *acute episode*.

- CONTRA-INDICATIONS Children · CNS depression · comatose states · phaeochromocytoma
- CAUTIONS Avoid in Acute porphyrias p. 864 · QT interval prolongation · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- INTERACTIONS Avoid concomitant use of drugs that prolong QT interval.
- SIDE-EFFECTS Erythema · nodules · pain at injection site · swelling

SIDE-EFFECTS, FURTHER INFORMATION

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- HEPATIC IMPAIRMENT Can precipitate coma.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- MONITORING REQUIREMENTS Treatment requires careful monitoring for optimum effect.
- DIRECTIONS FOR ADMINISTRATION In general not more than 2-3 mL of oily injection should be administered at

any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

➤ Clopixol (Zuclopenthixol decanoate) (Lundbeck Ltd)

Zuclopenthixol decanoate 200 mg per 1 ml Clopixol 200mg/1ml solution for injection ampoules | 10 ampoule PoM £31.51 DT price = 521.51

ANTIPSYCHOTICS (SECOND-GENERATION)

Amisulpride

 DRUG ACTION Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D₂ and D₃ receptors.

INDICATIONS AND DOSE

Acute psychotic episode in schizophrenia BY MOUTH

▶ Adult: 400-800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day

Schizophrenia with predominantly negative symptoms

- ▶ Adult: 50-300 mg daily
- CONTRA-INDICATIONS CNS depression comatose states phaeochromocytoma pre-pubertal children prolactin-dependent tumours
- SIDE-EFFECTS
- ► Common or very common Anxiety
- ▶ Uncommon Bradycardia
- PREGNANCY Avoid.
- BREAST FEEDING Avoid—no information available.
- RENAL IMPAIRMENT Halve dose if eGFR 30-60 mL/minute/1.73 m². Use one-third dose if eGFR 10-30 mL/minute/1.73 m². No information available if eGFR less than 10 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include caramel.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Aripiprazole

 DRUG ACTION Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT_{1a} partial agonism and 5-HT_{2A} receptor antagonism.

INDICATIONS AND DOSE

Maintenance in schizophrenia in patients stabilised with oral aripiprazole

INITIALLY BY INTRAMUSCULAR INJECTION

 Adult: 400 mg every 1 month, to be injected into the gluteal muscle, minimum of 26 days between injections, for dose adjustment due to side effects or concomitant use of interacting drugs, consult product literature and (by mouth) 10–20 mg daily continued for 14 consecutive days after the first injection, for missed depot doses consult product literature

Schizophrenia

INITIALLY BY MOUTH

 Adult: 10-15 mg once daily; (by mouth) usual dose 15 mg once daily (max. per dose 30 mg once daily), for dose adjustments due to concomitant use of interacting drugs—consult product literature

Treatment and recurrence prevention of mania

 Adult: 15 mg once daily, increased if necessary up to 30 mg once daily, for dose adjustments due to concomitant use of interacting drugs—consult product literature

Control of agitation and disturbed behaviour in schizophrenia

BY INTRAMUSCULAR INJECTION

Adult: Initially 5.25-15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25-15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg, for dose adjustments due to concomitant use of interacting drugs—consult product literature

Important safety information

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an *acute episode* (solution for injection containing aripiprazole 7.5 mg/mL) should **not** be confused with depot preparations (aripiprazole 400-mg vial with solvent), which are usually used in the community or clinics for *maintenance treatment*.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS:

CNS depression \cdot comatose state \cdot phaeochromocytoma

SPECIFIC CONTRA-INDICATIONS:

With intramuscular use do not use in children

CAUTIONS

GENERAL CAUTIONS:

Cerebrovascular disease • elderly (reduce initial dose) SPECIFIC CAUTIONS:

▶ With intramuscular use when transferring from oral to depot

therapy, the dose by mouth should be reduced gradually

SIDE-FFFFCTS

GENERAL SIDE-EFFECTS

- ► Common or very common Anxiety hypersalivation malaise
- ▶ Uncommon Depression dry mouth
- ► Frequency not known Alopecia · anorexia · bradycardia · hepatitis · hyponatraemia · infection · laryngospasm · myalgia · oedema · oropharyngeal spasm · pancreatitis · pathological gambling · respiratory disorders · rhabdomyolysis · suicidal ideation · sweating · urinary disorders

SPECIFIC SIDE-EFFECTS

▶ With intramuscular use erythema · nodules · pain at injection site · swelling

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose of the depot injection, therefore it may be a month or longer before side-effects subside.
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in milk.
- HEPATIC IMPAIRMENT Use with caution in severe impairment (oral treatment preferred to intramuscular administration).
- MONITORING REQUIREMENTS Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- ▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- ▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

PATIENT AND CARER ADVICE

 With oral use Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Clozapine

 DRUG ACTION Clozapine is a dopamine D₁, dopamine D₂, 5-HT_{2A}, alpha₁-adrenoceptor, and muscarinic-receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

- ▶ Adult 18-59 years: 12.5 mg 1-2 times a day for day 1, then 25-50 mg for day 2, then increased, if tolerated, in steps of 25-50 mg daily, dose to be increased gradually over 14-21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50-100 mg 1-2 times a week if required, it is preferable to increase once a week; usual dose 200-450 mg daily, restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)-extreme caution if previous respiratory or cardiac arrest with initial
- dosing; maximum 900 mg per day ▶ Adult 60 years and over: 12.5 mg once daily for day 1, then increased to 25-37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, dose to be increased gradually over 14-21 days. increased to up to 300 mg daily in divided doses, larger dose at to be taken night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50-100 mg 1-2 times a week if required, it is preferable to increase once a week; usual dose 200-450 mg daily, restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing; maximum 900 mg continued → per day

Psychosis in Parkinson's disease

▶ Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25-37.5 mg once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1-2 divided doses; Usual maximum 50 mg/24 hours

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

- CONTRA-INDICATIONS Alcoholic and toxic psychoses bone-marrow disorders · coma · drug intoxication · history of agranulocytosis · history of circulatory collapse · history of neutropenia · paralytic ileus · severe cardiac disorders (e.g. myocarditis) · severe CNS depression · uncontrolled epilepsy
- CAUTIONS Age over 60 years prostatic hypertrophy susceptibility to angle-closure glaucoma · taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION

Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000 /mm3 or if absolute neutrophil count below 1500 /mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis: patients should report immediately symptoms of infection, especially influenza-like illness. Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

- Perform physical examination and take full medical history before starting
- Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
- Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
- If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by
- Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

Intestinal obstruction Impairment of intestinal peristalsis, including constination, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

- INTERACTIONS Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.
- SIDE-EFFECTS
- ► Common or very common Anorexia · constipation · hypersalivation · malaise · speech disorders · urinary incontinence
- ► Uncommon Agranulocytosis

- ► Rare Circulatory collapse dysphagia hepatitis myocarditis · pancreatitis · pericarditis · pneumonia · pulmonary aspiration
- ► Very rare Cardiomyopathy hypercholesterolaemia hypertriglyceridaemia · interstitial nephritis · intestinal obstruction (including fatal cases) · myocardial infarction · obsessive compulsive disorder · parotid gland enlargement · respiratory depression
- ► Frequency not known Hepatic disorders hepatic failure muscle disorders · renal failure

SIDE-EFFECTS, FURTHER INFORMATION

Hypersalivation Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic sideeffects of hyoscine and clozapine.

- PREGNANCY Use with caution.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Avoid in symptomatic liver disease. Avoid in progressive liver disease. Avoid in hepatic failure. Monitor hepatic function regularly.
- RENAL IMPAIRMENT Avoid in severe impairment.
- MONITORING REQUIREMENTS
- ▶ Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
- Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
- ▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters; every 3 months for the first year, then yearly.
- ▶ Fasting blood glucose should be measured at baseline, at 4-6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months' treatment, then every 4-6 months.
- ▶ Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.
- TREATMENT CESSATION On planned withdrawal reduce dose over 1-2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.
- DIRECTIONS FOR ADMINISTRATION Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer clozapine oral suspension.

Lurasidone hydrochloride

• **DRUG ACTION** Lurasidone is a dopamine D₂, 5-HT₂, 5-HT₇, alpha₂, and alpha₂- adrenoceptor antagonist, and is a partial agonist at 5-HT₁ receptors.

INDICATIONS AND DOSE

Schizophrenia

ву моитн

► Adult: Initially 37 mg once daily, increased if necessary up to 148 mg once daily

Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)

ву моитн

- Adult: Initially 18.5 mg once daily (max. per dose 74 mg once daily)
- CAUTIONS High doses in elderly · susceptibility to QTinterval prolongation
- INTERACTIONS Contra-indicated with concomitant use of potent CYP3A4 inhibitors.
 Contra-indicated with concomitant use of potent CYP3A4

inducers.

Caution with concomitant use of drugs that prolong the OT interval.

- SIDE-EFFECTS
- ► Common or very common Anxiety musculoskeletal stiffness
- Uncommon Catatonia · decreased appetite · dysarthria · dysuria · hot flush · myalgia · nightmares
- Frequency not known Angina · AV block · bradycardia · dysphagia · panic attacks · pruritus · suicidal behaviour · vertigo
- PREGNANCY Use only if potential benefit outweighs risk limited information available.
- HEPATIC IMPAIRMENT Initially 18.5 mg once daily, up to max. 74 mg once daily in moderate impairment. Use with caution in severe impairment—initially 18.5 mg once daily, up to max. 37 mg once daily.
- RENAL IMPAIRMENT Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m². Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m².
- DIRECTIONS FOR ADMINISTRATION Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 21, 25

► Latuda (Sunovion Pharmaceuticals Europe Ltd) ▼
Lurasidone (as Lurasidone hydrochloride) 18.5 mg Latuda
18.5mg tablets | 28 tablet PoM £90.72

Lurasidone (as Lurasidone hydrochloride) 37 mg Latuda 37mg tablets | 28 tablet PoM £90.72

Lurasidone (as Lurasidone hydrochloride) 74 mg Latuda 74mg tablets | 28 tablet PoM £90.72

Olanzapine

 DRUG ACTION Olanzapine is a dopamine D₁, D₂, D₄, 5-HT₂, histamine- 1-, and muscarinic-receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia | Combination therapy for mania BY MOUTH

Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Preventing recurrence in bipolar disorder

BY MOUTH

Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Monotherapy for mania

BY MOUTH

Adult: 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Control of agitation and disturbed behaviour in schizophrenia or mania

BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
- ▶ Elderly: Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

CONTRA-INDICATIONS

- With intramuscular use acute myocardial infarction · bradycardia · recent heart surgery · severe hypotension · sick sinus syndrome · unstable angina
- CAUTIONS Bone-marrow depression · diabetes mellitus (risk of exacerbation or ketoacidosis) · hypereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus

CAUTIONS, FURTHER INFORMATION

CNS and respiratory depression Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also

receiving a benzodiazepine or another antipsychotic (leave at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Common or very common Arthralgia •

 $hypercholesterolaemia \cdot hypertriglyceridaemia \cdot increased \\ appetite \cdot malaise \cdot oedema$

- ▶ Uncommon Alopecia amnesia bradycardia epistaxis
- ▶ Rare Hepatitis pancreatitis rhabdomyolysis SPECIFIC SIDE-EFFECTS
- ▶ With intramuscular use hypoventilation sinus pause
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Avoid—present in milk.
- HEPATIC IMPAIRMENT Consider initial dose of 5 mg daily.
- RENAL IMPAIRMENT Consider initial dose of 5 mg daily.
- MONITORING REQUIREMENTS
- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4-6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months' treatment, then every 4-6 months.
- DIRECTIONS FOR ADMINISTRATION Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.
- PRESCRIBING AND DISPENSING INFORMATION
- With intramuscular use When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer orodispersible tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Olanzapine embonate (Olanzapine pamoate)

INDICATIONS AND DOSE

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)

BY DEEP INTRAMUSCULAR INJECTION

Adult 18-75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)

BY DEEP INTRAMUSCULAR INJECTION

Adult 18-75 years: Initially 300 mg every 2 weeks, then
maintenance 210 mg every 2 weeks, alternatively
maintenance 405 mg every 4 weeks, maintenance dose
to be started after 2 months of initial treatment, dose
to be administered into the gluteal muscle, consult
product literature if supplementation with oral
olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)

BY DEEP INTRAMUSCULAR INJECTION

Adult: Initially 300 mg every 2 weeks, then maintenance 300 mg every 2 weeks (max. per dose 300 mg every 2 weeks), adjusted according to response, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

Important safety information

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the rapid control of an *acute* episode.

• CONTRA-INDICATIONS Children

• CAUTIONS Bone-marrow depression · diabetes mellitus (risk of exacerbation or ketoacidosis) · hypereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

SIDE-FFFFCT^o

- ► Common or very common Arthralgia hypercholesterolaemia hypertriglyceridaemia increased appetite malaise oedema
- ▶ Uncommon Alopecia · amnesia · bradycardia · epistaxis
- ▶ Rare Hepatitis pancreatitis rhabdomyolysis
- ► Frequency not known Erythema · nodules · pain at injection site · swelling

SIDE-EFFECTS. FURTHER INFORMATION

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

Overdose Post-injection reactions have been reported leading to signs and symptoms of overdose.

- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Avoid—present in milk.
- HEPATIC IMPAIRMENT Initially 150 mg every 4 weeks; increase with caution in moderate impairment.
- RENAL IMPAIRMENT Initially 150 mg every 4 weeks.
- MONITORING REQUIREMENTS
- ▶ Observe patient for at least 3 hours after injection.
- Treatment requires careful monitoring for optimum effect
- ▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months' treatment, then every 4–6 months.
- DIRECTIONS FOR ADMINISTRATION Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

➤ Zypadhera (Eli Lilly and Company Ltd)
Olanzapine (as Olanzapine embonate monohydrate)
210 mg Zypadhera 210mg powder and solvent for susspension for injection vials | 1 vial PoM £142.76 (Hospital only)
Olanzapine (as Olanzapine embonate monohydrate)

300 mg Zypadhera 300mg powder and solvent for suspension for injection vials | 1 vial PoM £222.64 (Hospital only)

Olanzapine (as Olanzapine embonate monohydrate)
405 mg Zypadhera 405mg powder and solvent for suspension for injection vials | 1 vial Pom £285.52 (Hospital only)

Paliperidone

• DRUG ACTION Paliperidone is a metabolite of risperidone.

INDICATIONS AND DOSE

Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

BY DEEP INTRAMUSCULAR INJECTION

Adult: 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle, for missed doses see product literature

Schizophrenia | Psychotic or manic symptoms of schizoaffective disorder

V MOLITH

 Adult: 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3-12 mg daily

CONTRA-INDICATIONS

▶ With intramuscular use children

CAUTIONS

GENERAL CAUTIONS

Cataract surgery (risk of intraoperative floppy iris syndrome) • elderly patients with dementia • elderly patients with risk factors for stroke • predisposition to gastro-intestinal obstruction • prolactin-dependent tumours

SPECIFIC CAUTIONS

 With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Anxiety appetite changes arthralgia - depression - epistaxis - hypertension - infection - malaise - myalgia - oedema - respiratory disorders - sleep disorders - toothache - urinary disorders
- Uncommon Alopecia elevated plasma-cholesterol concentrations - elevated plasma-triglyceride concentrations - hypoaesthesia - paraesthesia - taste disturbances - tinnitus - visual disorders
- Rare Inappropriate antidiuretic hormone secretion intestinal obstruction intra-operative floppy iris syndrome pancreatitis pulmonary embolism rhabdomyolysis

SPECIFIC SIDE-EFFECTS

► With intramuscular use erythema · nodules · pain at injection site · swelling

SIDE-EFFECTS, FURTHER INFORMATION

- With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.
- PREGNANCY Use only if potential benefit outweighs risk toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually.
- BREAST FEEDING Avoid—present in milk.
- HEPATIC IMPAIRMENT Caution in severe impairment—no information available.

RENAL IMPAIRMENT

 With oral use Initially 3 mg once daily if eGFR 50-80 mL/minute/1.73 m² (max. 6 mg once daily). Initially 1.5 mg once daily if eGFR 10–50 mL/minute/1.73 m² (max. 3 mg once daily).

- With oral use Avoid if eGFR less than 10 mL/minute/1.73 m².
- With intramuscular use Initial dose 100 mg on day 1 and then 75 mg on day 8 if eGFR 50–80 mL/minute/1.73 m²; recommended maintenance dose 50 mg (range 25–100 mg) monthly if eGFR 50–80 mL/minute/1.73 m².
- With intramuscular use Avoid if eGFR less than 50 mL/minute/1.73 m².
- MONITORING REQUIREMENTS
- With intramuscular use Treatment requires careful monitoring for optimum effect.
- DIRECTIONS FOR ADMINISTRATION
- With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.
- With oral use Always take with breakfast or always take on an empty stomach.
- PATIENT AND CARER ADVICE
- With intramuscular use For missed doses see product literature.
- With oral use Patients or carers should be given advice on how to administer paliperidone tablets.
- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Quetiapine

DRUG ACTION Quetiapine is a dopamine D₁, dopamine D₂,
 5-HT₂, alpha₁-adrenoceptor, and histamine-1 receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day
- ► Elderly: Initially 50 mg once daily, adjusted according to response. Adjusted in steps of 50 mg daily

Treatment of mania in bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg ner day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ► Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 400–800 mg once daily
- ► Elderly: Initially 50 mg once daily, adjusted according to response, adjusted in steps of 50 mg daily

Treatment of depression in bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily; maximum 600 mg per day

Prevention of mania and depression in bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

➤ Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300-800 mg daily in 2 divided doses

BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300-800 mg once daily

Adjunctive treatment of major depression

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily
- ► Elderly: Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment

Dose equivalence and conversion

Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

- CAUTIONS Cerebrovascular disease · elderly · patients at risk of aspiration pneumonia · treatment of depression in patients under 25 years (increased risk of suicide)
- SIDE-EFFECT
- Common or very common Asthenia · dysarthria · dyspnoea · elevated plasma-cholesterol concentrations · elevated plasma-triglyceride concentrations · increased appetite · irritability · peripheral oedema · sleep disorders
- ► Uncommon Hyponatraemia hypothyroidism restless legs syndrome • rhinitis
- ► Rare Hepatitis pancreatitis

- ▶ Very rare Angioedema · inappropriate secretion of antidiuretic hormone · rhabdomyolysis · Stevens-Johnson syndrome
- ▶ Frequency not known Suicidal behaviour (particularly on initiation) · toxic epidermal necrolysis
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT For immediate-release tablets, initially 25 mg daily, increased daily in steps of 25-50 mg. For modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg.

Risperidone

• DRUG ACTION Risperidone is a dopamine D2, 5-HT2A, alpha₁-adrenoceptor, and histamine-1 receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily

BY DEEP INTRAMUSCULAR INJECTION

▶ Adult: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg at least every 4 weeks (max. per dose 50 mg every 2 weeks), during initiation risperidone by mouth may need to be continued for 4-6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily

BY DEEP INTRAMUSCULAR INJECTION

▶ Adult: Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg at least every 4 weeks (max. per dose 50 mg every 2 weeks), during initiation risperidone by mouth may need to be continued for 4-6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Acute and chronic psychosis

BY MOUTH

▶ Adult: 2 mg daily in 1-2 divided doses for day 1, then 4 mg daily in 1-2 divided doses for day 2, slower titration is appropriate in some patients, usual dose 4-6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day

► Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1-2 mg twice daily

Mania

BY MOUTH

- ▶ Adult: Initially 2 mg once daily, then increased in steps of 1 mg daily if required; usual dose 1-6 mg daily
- ▶ Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1-2 mg twice daily

Short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer's dementia unresponsive to nonpharmacological interventions and when there is a risk of harm to self or others

▶ Adult: Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily)

CONTRA-INDICATIONS

With intramuscular use children

CAUTIONS

GENERAL CAUTION

Avoid in Acute porphyrias p. 864 · cataract surgery (risk of intra-operative floppy iris syndrome) · dehydration · dementia with Lewy bodies · prolactin-dependent tumours

SPECIFIC CAUTIONS

With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ➤ Common or very common Anxiety · appetite changes · arthralgia · depression · epistaxis · hypertension · infection · malaise · myalgia · oedema · respiratory disorders · sleep disorders · toothache · urinary disorders
- ▶ Uncommon Alopecia elevated plasma-cholesterol concentrations · elevated plasma-triglyceride concentrations · hypoaesthesia · paraesthesia · taste disturbances · tinnitus · visual disorders
- ▶ Rare Inappropriate antidiuretic hormone secretion intestinal obstruction · intra-operative floppy iris syndrome · pancreatitis · pulmonary embolism · rhabdomyolysis

SPECIFIC SIDE-EFFECTS

▶ With intramuscular use erythema · nodules · pain at injection site · swelling

SIDE-EFFECTS. FURTHER INFORMATION

- With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Use only if potential benefit outweighs risk—small amount present in milk.

HEPATIC IMPAIRMENT

- With intramuscular use If an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks.
- With oral use Initial and subsequent oral doses should be halved.
- RENAL IMPAIRMENT Initial and subsequent oral doses should be halved.

MONITORING REQUIREMENTS

 With intramuscular use Treatment requires careful monitoring for optimum effect.

DIRECTIONS FOR ADMINISTRATION

- With oral use Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid may be diluted with any non-alcoholic drink, except tea.
- With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

PATIENT AND CARER ADVICE

 With oral use Patients or carers should be given advice on how to administer risperidone orodispersible tablets.
 Patients or carers should be given advice on how to administer risperidone oral liquid; counselling on use of dose syringe advised.

ANTIPSYCHOTICS (FIRST-GENERATION)

Promazine hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

INDICATIONS AND DOSE

Short-term adjunctive management of psychomotor agitation

ву моитн

▶ Adult: 100–200 mg 4 times a day

Agitation and restlessness in elderly

- ▶ Elderly: 25-50 mg 4 times a day
- CONTRA-INDICATIONS CNS depression · comatose states · phaeochromocytoma
- CAUTIONS Cerebral arteriosclerosis
- SIDE-EFFECTS Haemolytic anaemia
- HEPATIC IMPAIRMENT Can precipitate coma: phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- LESS SUITABLE FOR PRESCRIBING Promazine hydrochloride is less suitable for prescribing.

MEDICINAL FORMS

CNS STIMULANTS

Piracetam

INDICATIONS AND DOSE

Adjunctive treatment of cortical myoclonus

- ► Adult: Initially 7.2 g daily in 2-3 divided doses, then increased in steps of 4.8 g every 3-4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day
- CONTRA-INDICATIONS Cerebral haemorrhage Huntington's chorea
- CAUTIONS Gastric ulcer · history of haemorrhagic stroke · increased risk of bleeding · major surgery · underlying disorders of haemostasis
- INTERACTIONS Caution with concomitant drugs that increase bleeding.
- SIDE-EFFECTS
- ► Common or very common Hyperkinesia · nervousness · weight gain
- ▶ Uncommon Abdominal pain anxiety asthenia ataxia confusion · depression · dermatitis · diarrhoea · drowsiness · haemorrhagic disorder · hallucination · headache · insomnia · nausea · pruritus · urticaria · vertigo · vomiting
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Adjust dose if both hepatic and renal impairment.
- RENAL IMPAIRMENT Use two-thirds of normal dose if eGFR 50-80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30-50 mL/

- minute/1.73 m²; use one-sixth of normal dose as a single dose if eGFR 20-30 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².
- TREATMENT CESSATION Avoid abrupt withdrawal.
- PRESCRIBING AND DISPENSING INFORMATION Piracetam has been used in children 16 years and over as adjunctive treatment for cortical myoclonus.
- DIRECTIONS FOR ADMINISTRATION Follow the oral solution with a glass of water (or soft drink) to reduce hitter taste

MONOAMINE DEPLETING DRUGS

Tetrahenazine

INDICATIONS AND DOSE

Movement disorders due to Huntington's chorea, hemiballismus, senile chorea, and related neurological

BY MOUTH

- ▶ Adult: Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3-4 days; maximum 200 mg per day
- ▶ Elderly: Lower initial dose may be necessary

Moderate to severe tardive dyskinesia ву моитн

- ▶ Adult: Initially 12.5 mg daily, dose to be gradually increased according to response
- CONTRA-INDICATIONS Depression parkinsonism phaeochromocytoma · prolactin-dependent tumours
- CAUTIONS Susceptibility to OT-interval prolongation
- INTERACTIONS → Appendix 1 (tetrabenazine). Caution with concomitant use of drugs that prolong OT interval.
- SIDE-EFFECTS
- ► Common or very common Anxiety confusion constipation · depression · diarrhoea · drowsiness · dysphagia · hypotension · insomnia · nausea · parkinsonism · vomiting
- ► Uncommon Altered consciousness level extrapyramidal disorders · hyperthermia
- ▶ Rare Neuroleptic malignant syndrome
- ► Very rare Rhabdomyolysis
- ► Frequency not known Agitation · amnesia · ataxia · bradycardia · disorientation · dizziness · dry mouth · dyspepsia
- PREGNANCY Avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Use half initial dose and slower dose titration in mild to moderate impairment. Use with caution in severe impairment.
- RENAL IMPAIRMENT Use with caution.
- TREATMENT CESSATION Avoid abrupt withdrawal.

 PATIENT AND CARER ADVICE May affect performance of skilled tasks (e.g. driving).

NEUROPROTECTIVE AGENTS

Riluzole

INDICATIONS AND DOSE

To extend life in patients with amyotrophic lateral sclerosis, initiated by specialist experienced in the management of motor neurone disease

ву моитн

► Adult: 50 mg twice daily

- CONTRA-INDICATIONS Acute porphyria
- CAUTIONS History of abnormal hepatic function (consult product literature for details) · interstitial lung disease
 CAUTIONS, FURTHER INFORMATION
 Interstitial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · tachycardia · vomiting
- Uncommon Anaemia · angioedema · interstitial lung disease · pancreatitis
- ▶ Rare Neutropenia
- ▶ Very rare Hepatitis

SIDE-EFFECTS. FURTHER INFORMATION

Neutropenia White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole

- PREGNANCY Avoid—no information available.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Avoid.
- RENAL IMPAIRMENT Avoid—no information available.
- PATIENT AND CARER ADVICE Dizziness or vertigo may affect performance of skilled tasks (e.g. driving).
 Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Riluzole for motor neurone disease (January 2001) NICE TA20 Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.

Tafamidis

INDICATIONS AND DOSE

Treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment (initiated under specialist supervision) BY MOUTH

- ▶ Adult: 20 mg once daily
- SIDE-EFFECTS Abdominal pain diarrhoea urinary tract infection vaginal infection
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment.
- PREGNANCY Avoid (toxicity in animal studies).
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Caution in severe impairment—no information available.
- PRESCRIBING AND DISPENSING INFORMATION Tafamidis should be prescribed in addition to standard treatment, but before liver transplantation; it should be discontinued in patients who undergo liver transplantation.

NEUROTOXINS (BOTULINUM TOXINS)

Botulinum toxin type A

INDICATIONS AND DOSE

Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only) | Blepharospasm (specialist use only) | Hemifacial spasm (specialist use only) | Spasmodic torticollis (specialist use only) | Severe hyperhidrosis of the axillae (specialist use only) | Prophylaxis of headaches in adults with chronic migraine (specialist use only) | Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only) | Ankle disability due to lower limb spasticity associated with stroke (specialist use only) | Management of bladder dysfunctions (specialist use only) | Temporary improvement of moderate to severe crow's feet (specialist use only)

BY SUBCUTANEOUS INJECTION OR BY INTRADERMAL INJECTION OR BY INTRAMUSCULAR INJECTION

► Adult: (consult product literature)

Dose equivalence and conversion

Important: information is specific to each individual preparation.

 CONTRA-INDICATIONS Acute urinary retention (specific to) use in bladder disorders only) · catheterisation difficulties (specific to use in bladder disorders only) • generalised disorders of muscle activity · infection at injection site · myasthenia gravis · presence of bladder calculi (specific to use in bladder disorders only) · urinary tract infection (specific to use in bladder disorders only)

CAUTIONS

GENERAL CAUTIONS:

Atrophy in target muscle · chronic respiratory disorder · elderly · excessive weakness in target muscle · history of aspiration · history of dysphagia · inflammation in target muscle · neurological disorders · neuromuscular disorders · off-label use (fatal adverse events reported)

SPECIFIC CAUTIONS:

▶ When used for blepharospasm or hemifacial spasm risk of angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

When used for blepharospasm and hemifacial spasm, reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed. Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.

SIDE-FFFFCTS

GENERAL SIDE-EFFECTS

- ► Common or very common Excessive doses may paralyse distant muscles · increased electrophysiologic jitter in some distant muscles · influenza-like symptoms · misplaced injections may paralyse nearby muscle groups
- ▶ Rare Antibody formation (substantial deterioration in response) · arrhythmias · myocardial infarction · seizures
- ▶ Very rare Aspiration · dysphagia · dysphonia · exaggerated muscle weakness · respiratory disorders

SPECIFIC SIDE-FFFFCTS

- ► Common or very common
- When used for focal upper-limb spasticity associated with stroke dysphagia · hypertonia · purpura
- ▶ When used for axillary hyperhidrosis pain in extremities
- ▶ When used for spasmodic torticollis back pain · dizziness · drowsiness · dry mouth · dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle) · headache · hypertonia · malaise · nausea · $numbness \cdot rhinitis \cdot stiffness \cdot weakness$
- ▶ When used for hemifacial spasm dry eye ecchymosis facial oedema · irritation · keratitis · lacrimation · lagophthalmos · photophobia · ptosis
- ▶ When used for temporary improvement of moderate to severe wrinkles between the eyebrows facial oedema · headache · ptosis
- ▶ When used for blepharospasm dry eye ecchymosis facial oedema · irritation · keratitis · lacrimation · lagophthalmos · photophobia · ptosis
- ► When used for axillary hyperhidrosis abnormal skin odour alopecia · hot flushes · non-axillary sweating · paraesthesia · pruritus · subcutaneous nodule
- Lincommon
- When used for focal upper-limb spasticity associated with stroke amnesia · arthralgia · bursitis · cough · depression · dry mouth · dysaesthesia · haematoma · headache · insomnia · malaise · pain in extremities · paraesthesia · peripheral oedema · vertigo
- ► When used for blepharospasm conjunctivitis · dermatitis · diplopia · dizziness · drooping · dry mouth · ectropion · entropion · facial weakness · headache · paraesthesia · tiredness · visual disturbances
- ▶ When used for axillary hyperhidrosis joint pain myalgia

- ▶ When used for hemifacial spasm conjunctivitis dermatitis · diplopia · dizziness · drooping · dry mouth · ectropion · entropion · facial weakness · headache · paraesthesia · tiredness · visual disturbances
- ▶ When used for spasmodic torticollis colitis · diarrhoea · diplopia · dyspnoea · eve pain · myalgia · ptosis · skeletal pain · sweating · tremor · voice alteration · vomiting
- ▶ When used for focal upper-limb specificity associated with stroke nausea
- When used for temporary improvement of moderate to severe wrinkles between the eyebrows anxiety · asthenia · blepharitis · dizziness · dry mouth · dry skin · muscle cramp · nausea · paraesthesia · photosensitivity reactions · tinnitus · visual disturbances
- ▶ When used for blepharospasm eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)
- ▶ When used for hemifacial spasm eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)
- Very rare
- ▶ When used for blepharospasm angle-closure glaucoma corneal epithelial defect · corneal perforation · corneal
- ▶ When used for hemifacial spasm angle-closure glaucoma corneal epithelial defect · corneal perforation · corneal ulceration
- ► Frequency not known
- ► When used for focal lower-limb spasticity associated with stroke arthralgia · peripheral oedema · rash
- CONCEPTION AND CONTRACEPTION Avoid in women of child-bearing age unless using effective contraception.
- PREGNANCY Avoid unless essential—toxicity in animal studies (manufacturer of Botox® advise avoid).
- BREAST FEEDING Low risk of systemic absorption but avoid unless essential.
- PRESCRIBING AND DISPENSING INFORMATION Preparations are not interchangeable.
- PATIENT AND CARER ADVICE Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

▶ Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012) NICE TA260 Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse. www.nice.org.uk/TA260

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2011 and March 2013) that Botox® is not recommended for use within NHS Scotland for prophylaxis of headaches in adults with chronic migraine.

The Scottish Medicines Consortium has advised that Azzalure® and Vistabel® (December 2010), and Bocouture (February 2011) are **not** recommended for use within NHS Scotland.

£111.20 (Hospital only)

3.2 Parkinson's disease

Parkinson's disease and related disorders

Parkinson's disease

In idiopathic Parkinson's disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients' quality of life.

Patients with suspected Parkinson's disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6-12 months.

Features resembling those of Parkinson's disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson's disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5-10% of patients with Parkinson's disease respond poorly to

Treatment is usually not started until symptoms cause significant disruption of daily activities. Levodopa, nonergot-derived dopamine-receptor agonists, or monoamine-oxidase-B inhibitors can be prescribed for initial treatment in early Parkinson's disease. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.

Elderly

Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

Dopaminergic drugs used in Parkinson's disease

Dopamine-receptor agonists

The dopamine-receptor agonists have a direct action on dopamine receptors. Initial treatment of Parkinson's disease is often with the dopamine-receptor agonists pramipexole p. 336, ropinirole p. 338, and rotigotine p. 339. The ergotderived dopamine-receptor agonists bromocriptine p. 333, cabergoline p. 334, and pergolide p. 336 are rarely used because the risk of fibrotic reactions.

When used alone, dopamine-receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine-receptor agonists are associated with more psychiatric side-effects than levodopa.

Dopamine-receptor agonists are also used with levodopa in more advanced disease. If a dopamine-receptor agonist is added to levodopa therapy, the dose of levodopa needs to

Apomorphine hydrochloride p. 332 is a potent dopaminereceptor agonist that is sometimes helpful in advanced

disease for patients experiencing unpredictable 'off' periods with levodopa treatment. Apomorphine hydrochloride should be initiated in a specialist clinic. After an overnight withdrawal of oral antiparkinsonian medication to induce an 'off' episode, the threshold dose of apomorphine hydrochloride is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine hydrochloride by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an 'off' episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications.

Levodopa

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa p. 328) and carbidopa (in co-careldopa p. 329).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting and domperidone p. 346 can be useful in controlling these effects.

Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'of' period. 'End-of-dose' deterioration with progressively shorter duration of benefit also occurs. Modified-release preparations may help with 'end-of-dose' deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

Monoamine-oxidase-B inhibitors

Rasagiline p. 340 and selegiline hydrochloride p. 340 are monoamine-oxidase-B inhibitors used in Parkinson's disease. Early treatment with selegiline hydrochloride alone can delay the need for levodopa therapy.

Antimuscarinic drugs used in parkinsonism

Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson's disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine hydrochloride below, procyclidine hydrochloride p. 326, and trihexyphenidyl hydrochloride p. 326 reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson's disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea.

There are no important differences between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 267 can be given for lifethreatening acute drug-induced dystonic reactions.

Drugs used in essential tremor, chorea, tics, and related disorders

Tetrabenazine p. 321 is mainly used to control movement disorders in Huntington's chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 306 [unlicensed indication], olanzapine p. 315 [unlicensed indication], risperidone p. 319 [unlicensed indication], and quetiapine p. 318 [unlicensed indication], can also be used to suppress chorea in Huntington's disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 308 [unlicensed indication] (important: ECG monitoring required), clonidine hydrochloride p. 137 [unlicensed indication], and sulpiride p. 310 [unlicensed indication]. Trihexyphenidyl hydrochloride p. 326 in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 304 and haloperidol p. 306 are used to relieve intractable hiccup.

Propranolol hydrochloride p. 146 or another betaadrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primidone p. 401 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 321 is used as an adjunctive treatment for myoclonus of cortical myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 322 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

Torsion dystonia and other involuntary movements
Treatment with botulinum toxin type A p. 322 can be
considered after an acquired non-progressive brain injury if
rapid-onset spasticity causes postural or functional
difficulties.

ANTIMUSCARINICS

Orphenadrine hydrochloride

 DRUG ACTION Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

INDICATIONS AND DOSE

Parkinsonism \mid Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)

ву моитн

- Adult: Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2-3 days, adjusted according to response; usual dose 150-300 mg daily in divided doses; maximum 400 mg per day
- ▶ Elderly: Preferably dose at lower end of range

- CONTRA-INDICATIONS Acute porphyrias p. 864 gastrointestinal obstruction • myasthenia gravis
- CAUTIONS Cardiovascular disease · elderly · hypertension · in patients susceptible to angle-closure glaucoma · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia
- INTERACTIONS → Appendix 1 (antimuscarinics). Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.
- SIDE-FFFFCTS
- ► Common or very common Urinary retention
- Uncommon Drowsiness · impaired coordination · insomnia · seizures
- ► Very rare Angle-closure glaucoma
- Frequency not known Anxiety · blurred vision · confusion · constipation · dizziness · dry mouth · euphoria · hallucinations · impaired memory · nausea · rash · restlessness · tachycardia · yomiting
- PREGNANCY Caution.
- BREAST FEEDING Caution.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Use with caution.
- TREATMENT CESSATION Avoid abrupt withdrawal in patients taking long-term treatment.
- PATIENT AND CARER ADVICE May affect performance of skilled tasks (e.g. driving).

CATECHOL-O-METHYLTRANSFERASE INHIBITORS

Entacapone

 DRUG ACTION Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-Omethyltransferase, allowing more levodopa to reach the brain.

INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)

BY MOUTH

- ► Adult: 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day
- CONTRA-INDICATIONS History of neuroleptic malignant syndrome • history of non-traumatic rhabdomyolysis • phaeochromocytoma
- CAUTIONS Concurrent levodopa dose may need to be reduced by about 10−30% · ischaemic heart disease
- INTERACTIONS → Appendix 1 (entacapone).
 Avoid iron-containing products at the same time of day.

SIDE-FFFFCTS

- ► Common or very common Abdominal pain · abnormal dreams · confusion · constipation · diarrhoea · dizziness · dry mouth · dyskinesia · dystonia · fatigue · hallucinations · insomnia · ischaemic heart disease · nausea · sweating · urine may be coloured reddish-brown · vomiting
- ► Uncommon Myocardial infarction
- ► Rare Rash
- ▶ Very rare Agitation anorexia urticaria weight loss
- ► Frequency not known Colitis · hepatitis · neuroleptic malignant syndrome · rhabdomyolysis · skin, hair, and nail discoloration
- PREGNANCY Avoid—no information available.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Avoid.
- TREATMENT CESSATION Avoid abrupt withdrawal.
- PATIENT AND CARER ADVICE Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

£17.24 DT price = £6.12 | 100 tablet PoM £57.45

Also available in combination with *carbidopa* with entacapone and levodopa, p. 331

Tolcapone

 DRUG ACTION Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-Omethyltransferase, allowing more levodopa to reach the brain.

INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under expert supervision)

BY MOUTH

Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks only if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances

- CONTRA-INDICATIONS Phaeochromocytoma · previous history of hyperthermia · previous history of neuroleptic malignant syndrome · previous history of rhabdomyolysis · severe dyskinesia
- CAUTIONS Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

CAUTIONS, FURTHER INFORMATION

Hepatotoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not reintroduce tolcapone once discontinued.

- INTERACTIONS → Appendix 1 (tolcapone).
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · anorexia · chest pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dyskinesia · dyspepsia · dystonia · excessive dreaming · hallucinations · headache · hepatotoxicity · nausea · sleep disturbances · sweating · syncope · urine discoloration · vomiting · xerostomia
- Frequency not known Neuroleptic malignant syndrome reported on dose reduction or withdrawal · rhabdomyolysis reported on dose reduction or withdrawal
- PREGNANCY Toxicity in animal studies—use only if potential benefit outweighs risk.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Avoid.
- RENAL IMPAIRMENT Caution if eGFR less than 30 mL/ minute/1.73 m².
- MONITORING REQUIREMENTS Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).
- TREATMENT CESSATION Avoid abrupt withdrawal.
- PATIENT AND CARER ADVICE Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

INDICATIONS AND DOSE

Parkinson's disease

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 50 mg 3-4 times a day, then (by mouth) increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; (by mouth) maintenance 400-800 mg daily in divided doses
- ► Elderly: Initially 50 mg 1–2 times a day, then (by mouth) increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

Parkinson's disease (in advanced disease)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

 Adult: Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

Parkinson's disease (natients not taking levodona/dona-

Parkinson's disease (patients not taking levodopa/dopadecarboxylase inhibitor therapy)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Adult: Initially 1 capsule 3 times a day; maximum 6 capsules per day

Parkinson's disease (patients transferring from immediaterelease levodopa/dopa-decarboxylase inhibitor preparations)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Adult: Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release Madopar® may be needed with first morning dose; if response still poor to total daily dose of Madopar® CR plus Madopar® corresponding to 1.2 g levodopa—consider alternative therapy.

Dose equivalence and conversion Dose is expressed as levodopa.

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- CAUTIONS Cushing's syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · phaeochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma
- ullet INTERACTIONS ullet Appendix 1 (co-beneldopa, levodopa).
- SIDE-EFFECTS
- ► Common or very common Abnormal dreams · anorexia · anxiety · arrhythmias · chorea · confusion · dementia · depression · dizziness · drowsiness · dry mouth · dyskinesia · dystonia · euphoria · fatigue · insomnia · nausea · palpitations · postural hypotension · psychosis · syncope · taste disturbances · vomiting
- Uncommon Ataxia · chest pain · constipation · diarrhoea · dysphagia · flatulence · hand tremor · hoarseness · hypersalivation · hypertension · malaise · muscle cramps, · oedema · reddish discoloration of the urine and other body fluids · weakness · weight changes
- ➤ Rare Abdominal pain · activation of Horner's syndrome · activation of malignant melanoma · agitation · agranulocytosis · alopecia · blepharospasm · blurred vision · bruxism · convulsions · diplopia · disorientation · duodenal ulcer · dyspepsia · dyspnoea · exanthema · flushing · gastro-intestinal bleeding · haemolytic anaemia · headache · Henoch-Schönlein purpura · hiccups · leucopenia · neuroleptic malignant syndrome (associated with abrupt withdrawal) · non-haemolytic anaemia · oculogyric crisis · paraesthesia · phlebitis · priapism · pupil dilatation · reduced mental acuity · sweating · thrombocytopenia · trismus · urinary incontinence · urinary retention
- ► Very rare Angle-closure glaucoma · suicidal ideation
- ▶ Frequency not known Compulsive behaviour

- PREGNANCY Caution in pregnancy—toxicity has occurred in animal studies.
- BREAST FEEDING May suppress lactation; present in milk—avoid.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Use with caution.
- EFFECT ON LABORATORY TESTS False positive tests for urinary ketones have been reported.
- TREATMENT CESSATION Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).
- DIRECTIONS FOR ADMINISTRATION The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.
- PRESCRIBING AND DISPENSING INFORMATION Cobeneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa.

When transferring patients from another levodopa/dopadecarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).

When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%

When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Patients or carers should be given advice on how to administer co-beneldopa dispersible tablets.

- INTERACTIONS → Appendix 1 (co-careldopa, levodopa).
- SIDE-EFFECTS
- ➤ Common or very common Abnormal dreams · anorexia · anxiety · arrhythmias · chorea · confusion · dementia · depression · dizziness · drowsiness · dry mouth · dyskinesia · dystonia · euphoria · fatigue · insomnia · nausea · palpitations · postural hypotension · psychosis · syncope · taste disturbances · vomiting
- Uncommon Ataxia · chest pain · constipation · diarrhoea · dysphagia · flatulence · hand tremor · hoarseness · hypersalivation · hypertension · malaise · muscle cramps · oedema · reddish discoloration of the urine and other body fluids · weakness · weight changes
- ▶ Rare Abdominal pain · activation of Horner's syndrome · activation of malignant melanoma · agitation · agranulocytosis · alopecia · blepharospasm · blurred vision · bruxism · convulsions · diplopia · disorientation · duodenal ulcer · dyspepsia · dyspnoea · exanthema · flushing · gastro-intestinal bleeding · haemolytic anaemia · headache · Henoch-Schönlein purpura · hiccups · leucopenia · neuroleptic malignant syndrome (associated with abrupt withdrawal) · non-haemolytic anaemia · oculogyric crisis · paraesthesia · phlebitis · priapism · pupil

dilatation • reduced mental acuity • sweating • thrombocytopenia • trismus • urinary incontinence • urinary retention

- ▶ Very rare Angle-closure glaucoma suicidal ideation
- ▶ Frequency not known Compulsive behaviour
- PREGNANCY Use with caution—toxicity has occurred in animal studies
- BREAST FEEDING May suppress lactation; present in milk—avoid.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Use with caution.
- EFFECT ON LABORATORY TESTS False positive tests for urinary ketones have been reported.
- TREATMENT CESSATION Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).
- PRESCRIBING AND DISPENSING INFORMATION Cocareldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

When transferring patients from another levodopa/dopadecarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours

Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed. 2 tablets $Sinemet^{©}$ 12.5 mg/50 mg \equiv 1 tablet $Sinemet^{©}$ Plus 25 mg/100 mg.

MEDICINAL FORMS

Carbidopa with entacapone and levodopa

The properties listed below are those particular to the combination only. For the properties of the components please consider, entacapone p. 327, co-careldopa p. 329.

INDICATIONS AND DOSE

STALEVO® 75/18.75/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

BY MOUTH

 Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 50/12.5/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

ву моитн

 Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 150/37.5/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

ву моитн

 Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 200/50/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopadecarboxylase inhibitor treatment

ву моитн

 Adult: 1 tablet for each dose; maximum 7 tablets per day

STALEVO® 125/31.25/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopadecarboxylase inhibitor treatment

ву моитн

 Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 175/43.75/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopadecarboxylase inhibitor treatment

ву моитн

 Adult: 1 tablet for each dose; maximum 8 tablets per day

STALEVO® 100/25/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopadecarboxylase inhibitor treatment

ву моитн

 Adult: 1 tablet for each dose; maximum 10 tablets per day

PRESCRIBING AND DISPENSING INFORMATION Patients

receiving standard-release co-careldopa or co-beneldopa alone, initiate $Stalevo^{\oplus}$ at a dose that provides similar (or slightly lower) amount of levodopa.

Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to *Stalevo* [®] (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release cocareldopa or co-beneldopa, initiate *Stalevo*[®] at a dose that provides similar (or slightly higher) amount of levodopa.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with Stalevo. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

DOPAMINE RECEPTOR AGONISTS

Amantadine hydrochloride

• DRUG ACTION Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.

INDICATIONS AND DOSE

Parkinson's disease

BY MOUTH

Adult: 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may

require higher doses; maximum 400 mg per day ▶ Elderly: 100 mg daily, adjusted according to response

Post-herpetic neuralgia

ву моитн

▶ Adult: 100 mg twice daily for 14 days (continued for another 14 days if necessary)

Treatment of influenza A (but not recommended)

► Adult: 100 mg daily 4-5 days

Prophylaxis of influenza A (but not recommended) BY MOUTH

- ▶ Adult: 100 mg daily usually for 6 weeks or with influenza vaccination for 2-3 weeks after vaccination
- CONTRA-INDICATIONS Epilepsy · history of gastric
- CAUTIONS Confused or hallucinatory states · congestive heart disease (may exacerbate oedema) · elderly · tolerance to the effects of amantadine may develop in Parkinson's disease
- INTERACTIONS → Appendix 1 (amantadine).
- SIDE-EFFECTS
- ► Common or very common Anorexia anxiety dizziness dry mouth · gastro-intestinal disturbances · hallucinations · headache · impaired concentration · insomnia · lethargy · livedo reticularis · mood changes · myalgia · palpitation · peripheral oedema · postural hypotension · slurred speech
- ► Uncommon Confusion movement disorders neuroleptic malignant syndrome • psychosis • rash • seizure • tremor • urinary incontinence · urinary retention · visual disturbances
- ► Frequency not known Heart failure · leucopenia · photosensitisation
- PREGNANCY Avoid; toxicity in animal studies.
- BREAST FEEDING Avoid; present in milk; toxicity in infant reported.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Reduce dose. Avoid if eGFR less than 15 mL/minute/1.73 m².
- TREATMENT CESSATION Avoid abrupt withdrawal in Parkinson's disease.
- PATIENT AND CARER ADVICE May affect performance of skilled tasks (e.g. driving).
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- · Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158 Amantadine is not recommended for prophylaxis of influenza, www.nice.org.uk/TA158
- Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168 Amantadine is not recommended for treatment of

Apomorphine hydrochloride

INDICATIONS AND DOSE

Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or cocareldopa or other dopaminergics (for capable and motivated patients) (under expert supervision)

BY SUBCUTANEOUS INJECTION

▶ Adult: Initially 1 mg, dose to be administered at the first sign of 'off' episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3-30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day

Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or cocareldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)

BY CONTINUOUS SUBCUTANEOUS INFUSION

► Adult: Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1-4 mg/hour, alternatively usual dose 15-60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these sideeffects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- CONTRA-INDICATIONS Avoid if 'on' response to levodopa marred by severe dyskinesia or dystonia · dementia · psychosis · respiratory depression
- CAUTIONS Cardiovascular disease history of postural hypotension (special care on initiation) · neuropsychiatric conditions · pulmonary disease · susceptibility to OTinterval prolongation
- INTERACTIONS → Appendix 1 (apomorphine).
- SIDE-EFFECTS
- ► Common or very common Confusion · drowsiness · hallucinations · nausea · sudden onset of sleep · vomiting · vawning

- Uncommon Dyskinesia during 'on' periods (may require discontinuation) - dyspnoea - haemolytic anaemia (with levodopa) - postural hypotension - rash thrombocytopenia (with levodopa)
- ▶ Rare Eosinophilia
- Frequency not known Compulsive behaviour · dizziness · peripheral oedema
- ALLERGY AND CROSS-SENSITIVITY Contraindicated if history of hypersensitivity to opioids.
- PREGNANCY Avoid unless clearly necessary.
- BREAST FEEDING No information available; may suppress lactation.
- HEPATIC IMPAIRMENT Avoid.
- RENAL IMPAIRMENT Use with caution.
- MONITORING REQUIREMENTS
- Monitor hepatic, haemopoietic, renal, and cardiovascular function
- With concomitant levodopa test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).
- TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see *Drugs and driving* under Guidance on prescribing p. 1.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10 EXCIPIENTS: May contain Sulfites

Apomorphine hydrochloride 5 mg per 1 ml APO-go PFS 50mg/10ml solution for infusion pre-filled syringes | 5 pre-filled disposable injection PoM £73.11

Bromocriptine

 DRUG ACTION Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

INDICATIONS AND DOSE

Prevention of lactation

BY MOUTH

 Adult: Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

Suppression of lactation

ву моитн

► Adult: Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

Hypogonadism | Galactorrhoea | Infertility BY MOUTH

 Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

Acromegaly

ву моитн

▶ Adult: Initially 1-1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

Prolactinoma

ву моитн

 Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

Parkinson's disease

ву моитн

➤ Adult: Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

Important safety information

FIBROTIC REACTIONS

Bromocriptine has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders.

There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

 CONTRA-INDICATIONS Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · hypertension in postpartum women or in puerperium

CONTRA-INDICATIONS, FURTHER INFORMATION

Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop.

 CAUTIONS Acute porphyrias p. 864 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome
 CAUTIONS, FURTHER INFORMATION

Hyperprolactinemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment)

- INTERACTIONS → Appendix 1 (bromocriptine).
 Tolerance may be reduced by alcohol.
- SIDE-FEFECTS
- ► Common or very common Constipation headache nasal congestion nausea
- Uncommon Confusion (particularly with high doses) dizziness dry mouth fatigue hallucinations
 (particularly with high doses) postural hypotension psychomotor excitation (particularly with high doses) vomiting
- Rare Abdominal pain · arrhythmia · bradycardia · diarrhoea · gastric ulcer · gastro-intestinal bleeding · insomnia · paraesthesia · psychosis · tachycardia · tinnitus · visual disturbances
- Very rare Neuroleptic malignant syndrome on withdrawal
 vasospasm of fingers and toes (particularly in patients with Raynaud's syndrome)
- Frequency not known Allergic skin reactions · alopecia · cardiac valvulopathy · constrictive pericarditis · drowsiness · dyskinesia · hypersexuality · hyponatraemia · hypotension · increased libido · leg cramps · leucopenia · pathological gambling · pericardial effusion · peripheral oedema · pleural effusion · pleural fibrosis · pleuritis · pulmonary fibrosis · retroperitoneal fibrosis · reversible hearing loss · thrombocytopenia · urinary incontinence SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- ALLERGY AND CROSS-SENSITIVITY Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids
- CONCEPTION AND CONTRACEPTION Caution—provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).

- BREAST FEEDING Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.
- HEPATIC IMPAIRMENT Dose reduction may be necessary.
- MONITORING REQUIREMENTS
- Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
- ► Monitor for fibrotic disease.
- Monitor blood pressure for a few days after starting treatment and following dosage increase.
- TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Cabergoline

 DRUG ACTION Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

INDICATIONS AND DOSE

Prevention of lactation

BY MOUTH

 Adult: 1 mg, to be taken as a single dose on the first day postpartum

Suppression of established lactation

BY MOUTH

Adult: 250 micrograms every 12 hours for 2 days

Hyperprolactinaemic disorders

BY MOUTH

► Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on separate days, then increased in steps of 500 micrograms every 1 month until optimal therapeutic response reached, increase dose following monthly monitoring of serum prolactin levels; usual dose 0.25–2 mg once weekly, usually 1 mg weekly; reduce initial dose and increase more gradually if patient intolerant, doses over 1 mg weekly to be given as divided dose; maximum 4.5 mg per week

Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate BY MOUTH

 Adult: Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased; maximum 3 mg per day

Important safety information

FIBROTIC REACTIONS

Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- CONTRA-INDICATIONS Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · history of pericardial fibrotic disorders · history of puerperal psychosis · history of pulmonary fibrotic disorders · history of retroperitoneal fibrotic disorders
- CAUTIONS Acute porphyrias p. 864 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome

CAUTIONS, FURTHER INFORMATION

Hyperprolactinemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- INTERACTIONS → Appendix 1 (cabergoline). Tolerance may be reduced by alcohol.
- SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal bleeding Treatment should be withdrawan if gastro-intestinal bleeding occurs.

- ALLERGY AND CROSS-SENSITIVITY Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise nonhormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).
- PREGNANCY Discontinue if pregnancy occurs during treatment (specialist advice needed).
- BREAST FEEDING Suppresses lactation; avoid breastfeeding if lactation prevention fails.
- HEPATIC IMPAIRMENT Reduce dose in severe hepatic impairment.
- MONITORING REQUIREMENTS
- ▶ Monitor for fibrotic disease.
- ► Monitor blood pressure for a few days after starting treatment and following dosage increase.
- TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Pergolide

INDICATIONS AND DOSE

Monotherapy in Parkinson's disease where dopaminereceptor agonists other than ergot derivative not appropriate

BY MOUTH

Adult: Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

 Adult: Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every
 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

Important safety information

FIBROTIC REACTIONS

Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

 CONTRA-INDICATIONS Cardiac valvulopathy (exclude before treatment) - history of fibrotic disorders

- CAUTIONS Acute porphyrias p. 864 · arrhythmias · dyskinesia (may exacerbate) · hallucinations · history of confusion · psychosis · underlying cardiac disease
- INTERACTIONS → Appendix 1 (pergolide).
- SIDE-EFFECTS Abdominal pain · atrial premature contractions · compulsive behaviour · confusion · constipation · diarrhoea · diplopia · dizziness · drowsiness · dyskinesia · dyspepsia · dyspnoea · erythromelalgia · fever · hallucinations · hiccups · hypotension · insomnia · nausea · palpitation · rash · Raynaud's phenomenon · rhinitis · sudden onset of sleep · syncope · tachycardia · vomiting
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING May suppress lactation.
- TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Pergolide (as Pergolide mesilate) 1 mg Pergolide 1mg tablets | 100 tablet PoM £125.00-£140.00 DT price = £131.66

Pramipexole

INDICATIONS AND DOSE

Parkinson's disease, used alone or as an adjunct to cobeneldopa or co-careldopa

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 88 micrograms 3 times a day, increased if tolerated to 350 micrograms 3 times a day, dose to be increased by doubling dose every 5–7 days, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 260 micrograms once daily, increased to 1.05 mg once daily, dose to be increased by doubling dose every 5-7 days, then increased in steps of 520 micrograms every 1 week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

Restless legs syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

Dose equivalence and conversion

Doses and strengths are stated in terms of pramipexole (base).

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:

88 micrograms base = 125 micrograms salt;

180 micrograms base ≡ 250 micrograms salt;

350 micrograms base ≡ 500 micrograms salt;

700 micrograms base $\equiv 1$ mg salt.

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:

260 micrograms base = 375 micrograms salt;

520 micrograms base ≡ 750 micrograms salt;

1.05 mg base \equiv 1.5 mg salt;

1.57 mg base \equiv 2.25 mg salt; 2.1 mg base \equiv 3 mg salt;

2.62 mg base \equiv 3.75 mg salt:

 $3.15 \text{ mg base} \equiv 4.5 \text{ mg salt.}$

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- CAUTIONS Psychotic disorders · risk of visual disorders (ophthalmological testing recommended) · severe cardiovascular disease
- INTERACTIONS → Appendix 1 (pramipexole).
- SIDE-EFFECTS
- ► Common or very common Confusion · constipation · decreased appetite · dizziness · drowsiness · dyskinesia · hallucinations · headache · hyperkinesia · hypotension · nausea · peripheral oedema · postural hypotension · restlessness · sleep disturbances · sudden onset of sleep · visual disturbances · vomiting · weight changes
- Uncommon Amnesia · binge eating · cardiac failure · compulsive behaviour · delusion · dyspnoea · hiccups · paranoia · pneumonia · pruritus · rash · syncope
- Frequency not known Paradoxical worsening of restless legs syndrome
- PREGNANCY Use only if potential benefit outweighs risk no information available.
- BREAST FEEDING May suppress lactation; avoid—present in milk in animal studies.
- RENAL IMPAIRMENT For immediate-release tablets in Parkinson's disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20-50 mL/minute/1.73 m², initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during

treatment, reduce dose by the same percentage as the decline in eGFR. For *immediate-release* tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m². For *modified-release* tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m², increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily. For *modified-release* tablets, avoid if eGFR less than 30 mL/minute/1.73 m².

- MONITORING REQUIREMENTS Risk of postural hypotension (especially on initiation)—monitor blood pressure.
- TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Ropinirole

INDICATIONS AND DOSE

Parkinson's disease, either used alone or as adjunct to cobeneldopa or co-careldopa

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at least every 1 week, adjusted according to response, increased to up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2-4 mg at least every 2 weeks if required; maximum 24 mg per day

Parkinson's disease in patients transferring from ropinirole immediate-release tablets

BY MOUTH USING MODIFIED-RELEASE MEDICINES

 Adult: Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose, consider slower titration in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%, if treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets

Moderate to severe restless legs syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night, repeat dose titration if restarting after interval of more than a few days; maximum 4 mg per day

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

 UNLICENSED USE Doses in the BNF may differ from those in product literature.

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that Neupro® is accepted for restricted use for the treatment of advanced Parkinson's disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

The Scottish Medicines Consortium has advised that Neupro® is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson's disease (June 2007). The Scottish Medicines Consortium has advised (April 2009) that rotigotine (Neupro®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

CAUTIONARY AND ADVISORY LABELS 10

► Neupro (UCB Pharma Ltd)

Rotigotine 1 mg per 24 hour Neupro 1mg/24hours transdermal patches | 28 patch PoM £77.24

Rotigotine 2 mg per 24 hour Neupro 2mg/24hours transdermal patches | 7 patch PoM no price available | 28 patch PoM £81.10 DT price = £81.10

Rotigotine 3 mg per 24 hour Neupro 3mg/24hours transdermal patches | 28 patch PoM £102.35

Rotigotine 4 mg per 24 hour Neupro 4mg/24hours transdermal patches | 7 patch FoM no price available | 28 patch FoM £123.60 DT price = £123.60

Rotigotine 6 mg per 24 hour Neupro 6mg/24hours transdermal patches | 7 patch PoM no price available | 28 patch PoM £149.93 DT price = £149.93

Rotigotine 8 mg per 24 hour Neupro 8mg/24hours transdermal patches | 7 patch PoM no price available | 28 patch PoM £149.93 DT price = £149.93

MONOAMINE-OXIDASE B INHIBITORS

Rasagiline

DRUG ACTION Rasagiline is a monoamine-oxidase B inhibitor.

INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to cobeneldopa or co-careldopa for 'end-of-dose' fluctuations

- ▶ Adult: 1 mg daily
- INTERACTIONS → Appendix 1 (rasagiline).
- SIDE-EFFECTS
- ► Common or very common Abnormal dreams angina anorexia arthralgia conjunctivitis constipation •

- depression dry mouth dyspepsia flatulence hallucinations headache influenza-like symptoms leucopenia rash rhinitis skin carcinoma urinary urgency vertigo weight loss
- Uncommon Cerebrovascular accident · myocardial infarction
- PREGNANCY Use with caution.
- BREAST FEEDING Use with caution—may suppress lactation.
- HEPATIC IMPAIRMENT Use with caution in mild impairment. Avoid in moderate to severe impairment.
- TREATMENT CESSATION Avoid abrupt withdrawal.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

► Azilect (Teva UK Ltd)

Rasagiline (as Rasagiline mesilate) 1 mg Azilect 1mg tablets |

28 tablet PoM £70.72 DT price = £70.72

Selegiline hydrochloride

DRUG ACTION Selegiline is a monoamine-oxidase-B inhibitor.

INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to cobeneldopa or co-careldopa to reduce 'end of dose' deterioration | Symptomatic parkinsonism

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning

BY MOUTH USING ORAL LYOPHILISATE

 Adult: 1.25 mg once daily, dose to be taken before breakfast

Dose equivalence and conversion

1.25-mg oral lyophilisate is equivalent to 10-mg tablet. Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyophilisates (Zelapar®) 1.25 mg.

- CONTRA-INDICATIONS Active duodenal ulceration active gastric ulceration - avoid or use with great caution in postural hypotension (when used in combination with levodopa)
- CAUTIONS Angina · arrhythmias · avoid in Acute porphyrias p. 864 · duodenal ulceration · gastric ulceration · history of hepatic dysfunction · patients predisposed to confusion and psychosis · psychosis · uncontrolled hypertension
- INTERACTIONS → Appendix 1 (selegiline).
 Avoid with drugs that increase blood pressure.
- SIDE-EFFECTS
- Common or very common Arthralgia · bradycardia · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · fatigue · hair loss · headache · hypertension · hypotension · impaired balance · mouth ulcers · movement disorders · muscle cramps · myalgia · myopathy · nasal congestion · nausea · psychosis · sleeping disorders · stomatitis · sweating · tremor
- ► Uncommon Agitation · angina · ankle oedema · anxiety · arrhythmias · blurred vision · dyspnoea · leucocytopenia · loss of appetite · micturition difficulties · palpitation · postural hypotension · skin reactions · supraventricular tachycardia · thrombocytopenia
- ► Frequency not known Hypersexuality
