- **Uncommon** Anisocytosis • arrhythmias • balance impaired • cardiovascular disorder • cataract • chest discomfort • cyanosis • drowsiness • ear pain • electrolyte imbalance • embolism and thrombosis • eosinophilia • eye discomfort • eye disorders • eye inflammation • feeling hot • feeling jittery • food poisoning • gout • haemorrhage • headaches • hemiparesis • increased leucocytes • lens opacity • mood altered • muscle weakness • myocardial infarction • nasal complaints • nephritis lupus • nerve disorders • oropharyngeal complaints • rectosigmoid cancer • renal failure • retinal pigment epitheliopathy • sinus disorder • sleep apnoea • speech disorder • sunburn • thrombocytopenia • tremor • urinary disorders • urine abnormalities • vasodilation • wound inflammation

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** For thrombocytopenia associated with chronic hepatitis C infection, manufacturer advises use only if potential benefit outweighs risk in severe impairment and monitor closely—increased risk of hepatic decompensation and thromboembolic events.

Dose adjustments For idiopathic thrombocytopenic purpura, manufacturer advises avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.

For severe aplastic anaemia, manufacturer advises reduce initial dose to 25 mg once daily and wait at least 2 weeks before upwards titration of dose.

For thrombocytopenia associated with chronic hepatitis C infection, manufacturer advises reduce initial dose to 25 mg once daily and wait at least 2 weeks before upwards titration of dose in moderate-to-severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

- **PRE-TREATMENT SCREENING** For severe aplastic anaemia, manufacturer advises do not initiate if patients have existing cytogenetic abnormalities of chromosome 7.

MONITORING REQUIREMENTS

- Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
- Manufacturer advises regular ophthalmological examinations for cataract formation.
- Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
- For idiopathic thrombocytopenic purpura, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50×10^9 /litre or

more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.

- ▶ For *severe aplastic anaemia*, manufacturer advises bone marrow examination with aspirations for cytogenetics prior to initiation, at 3 months of treatment and 6 months thereafter.
- ▶ For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached (50–75×10⁹/litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter.

● **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

● **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (July 2013)** NICE TA293
Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated, only if:

- the manufacturer provides eltrombopag at the agreed discount as part of the patient access scheme *and*
- their condition is refractory to standard active treatments and rescue therapies *or*
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA293

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2010) that eltrombopag (*Revolade*®) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Nutrition and metabolic disorders

1 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see **warning on renal insufficiency**). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 226 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal*

insufficiency (common in the elderly) to reduce the **risk of hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium gluconate 10% p. 1014 by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) p. 696 with 50 mL glucose 50% given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol p. 252 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 1006 should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes.

Oral sodium and water

Sodium chloride p. 1008 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na⁺ 75 mmol, K⁺ 20 mmol, Cl⁻ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the

WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hyponatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 1008 or glucose 5% p. 1009) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

Intravenous sodium

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

Sodium chloride with glucose solutions p. 1009 are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na^+ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Intravenous glucose

Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion p. 1008 is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and lactate

Sodium bicarbonate p. 1006 is used to control severe *metabolic acidosis* ($\text{pH} < 7.1$) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Fluids and electrolytes

Electrolyte concentrations—intravenous fluids

Intravenous infusion	Millimoles per litre				
	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻	Ca ²⁺
<i>Normal plasma values</i>	142	4.5	26	103	2.5
Sodium Chloride 0.9%	150	-	-	150	-
Compound Sodium Lactate (Hartmann's)	131	5	29	111	2
Sodium Chloride 0.18% and Glucose 4% (Adults only)	30	-	-	30	-
Sodium Chloride 0.45% and Glucose 5% (Children only)	75	-	-	75	-
Potassium Chloride 0.15% and Glucose 5% (Children only)	-	20	-	20	-
Potassium Chloride 0.15% and Sodium Chloride 0.9% (Children only)	150	20	-	170	-
Potassium Chloride 0.3% and Glucose 5%	-	40	-	40	-
Potassium Chloride 0.3% and Sodium Chloride 0.9%	150	40	-	190	-
<i>To correct metabolic acidosis</i>					
Sodium Bicarbonate 1.26%	150	-	150	-	-
Sodium Bicarbonate 8.4% for cardiac arrest	1000	-	1000	-	-
Sodium Lactate (m/6)	167	-	167	-	-

Electrolyte content—gastro-intestinal secretions

Type of fluid	Millimoles per litre				
	H ⁺	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻
Gastric	40–60	20–80	5–20	-	100–150
Biliary	-	120–140	5–15	30–50	80–120
Pancreatic	-	120–140	5–15	70–110	40–80
Small bowel	-	120–140	5–15	20–40	90–130

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For chronic acidotic states, sodium bicarbonate can be given by mouth.

Plasma and plasma substitutes

Plasma and plasma substitutes ('colloids') contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose ('crystalloids'), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solution p. 1015, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water

overload than isotonic solutions. Concentrated albumin solution p. 1015 may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Dextran, gelatin p. 1016, and the hydroxyethyl starch, tetra starch, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

BICARBONATE

Sodium bicarbonate

● INDICATIONS AND DOSE

Alkalinisation of urine | Relief of discomfort in mild urinary-tract infections

► BY MOUTH

- Adult: 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water

Maintenance of alkaline urine

► BY MOUTH

- Adult: 5–10 g daily, to be dissolved in water

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

► BY MOUTH

- Adult: 4.8 g daily, (57 mmol each of Na^+ and HCO_3^-), higher doses may be required and should be adjusted according to response

Severe metabolic acidosis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

● CONTRA-INDICATIONS

- With oral use Salt restricted diet

- **CAUTIONS** Avoid prolonged use in urinary conditions · cardiac disease · elderly · patients on sodium-restricted diet · respiratory acidosis

- **INTERACTIONS** → Appendix 1: sodium bicarbonate

● SIDE-EFFECTS

- With intravenous use Skin exfoliation · soft tissue necrosis · ulcer
- With oral use Abdominal cramps · burping · flatulence · hypokalaemia · metabolic alkalosis

● PREGNANCY

- With oral use Use with caution in urinary conditions.

- **HEPATIC IMPAIRMENT** In patients with fluid retention, avoid large amounts of sodium.

● RENAL IMPAIRMENT

- With oral use Avoid (except for specialised role in some forms of renal disease).

● MONITORING REQUIREMENTS

- With intravenous use Plasma-pH and electrolytes should be monitored.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *slow intravenous injection* use a small volume of hypertonic solution (such as 50 mL of 8.4%). For *continuous intravenous infusion* a weaker solution of 1.26% solution can be infused over 3–4 hours.
- With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

● PRESCRIBING AND DISPENSING INFORMATION

- With oral use *Sodium bicarbonate* 500mg capsules contain approximately 6 mmol each of Na^+ and HCO_3^- ; *Sodium bicarbonate* 600mg capsules contain approximately 7 mmol each of Na^+ and HCO_3^- . Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.
- With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na^+ and HCO_3^- /litre), various other strengths available.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection

Infusion

► Potassium chloride with calcium chloride dihydrate and sodium chloride (Non-proprietary)

Potassium chloride 300 microgram per 1 ml, Calcium chloride 320 microgram per 1 ml, Sodium chloride 8.6 mg per 1 ml Polyfusor C ringers infusion 500ml bottles | 1 bottle [PoM] £3.25
Steriflex No.9 ringers infusion 1litre bags | 1 bag [PoM] £2.22
Steriflex No.9 ringers infusion 500ml bags | 1 bag [PoM] £1.96

Potassium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 1025, glucose p. 1009.

INDICATIONS AND DOSE

Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Adult: Dosed according to the deficit or daily maintenance requirements

• **INTERACTIONS** → Appendix 1: glucose · potassium chloride

• **PRESCRIBING AND DISPENSING INFORMATION** Potassium chloride 0.3% contains 40 mmol each of K^+ and Cl^- /litre or 0.15% contains 20 mmol each of K^+ and Cl^- /litre with 5% of anhydrous glucose.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

► Potassium chloride with glucose (Non-proprietary)

Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / glucose 5% infusion 500ml bags | 1 bag [PoM] £1.67

Potassium chloride 0.3% (potassium 40mmol/1litre) / Glucose 5% infusion 1litre bags | 1 bag [PoM] £3.11

Potassium chloride 2 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Steriflex No.29 potassium chloride 0.2% (potassium 27mmol/1litre) / glucose 5% infusion 1litre bags | 1 bag [PoM] £2.20
Steriflex No.29 potassium chloride 0.2% (potassium 13.3mmol/500ml) / glucose 5% infusion 500ml bags | 1 bag [PoM] £1.67

Potassium chloride 1.5 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Steriflex No.13 potassium chloride 0.15% (potassium 10mmol/500ml) / glucose 5% infusion 500ml bags | 1 bag [PoM] £1.67

Potassium chloride 0.15% (potassium 20mmol/1litre) / glucose 5% infusion 1litre bags | 1 bag [PoM] £1.07-£2.20

Potassium chloride 0.15% (potassium 20mmol/1litre) / Glucose 5% infusion 1litre bags | 1 bag [PoM] 

Potassium chloride with glucose and sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 1025, glucose p. 1009, sodium chloride p. 1008.

INDICATIONS AND DOSE

Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Adult: Dosed according to the deficit or daily maintenance requirements

• **INTERACTIONS** → Appendix 1: glucose · potassium chloride

PRESCRIBING AND DISPENSING INFORMATION

Concentration of potassium chloride to be specified by the prescriber (usually K^+ 10–40 mmol/litre).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

► Potassium chloride with glucose and sodium chloride (Non-proprietary)

Sodium chloride 1.8 mg per 1 ml, Potassium chloride 3 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / Glucose 4% / Sodium chloride 0.18% infusion 500ml bags | 1 bag [PoM] 

Potassium chloride 0.3% (potassium 40mmol/1litre) / Glucose 4% / Sodium chloride 0.18% infusion 1litre bags | 1 bag [PoM] 

Potassium chloride 1.5 mg per 1 ml, Sodium chloride 1.8 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Potassium chloride 0.15% (potassium 20mmol/1litre) / Glucose 4% / Sodium chloride 0.18% infusion 1litre bags | 1 bag [PoM] 

Potassium chloride 0.15% (potassium 10mmol/500ml) / Glucose 4% / Sodium chloride 0.18% infusion 500ml bags | 1 bag [PoM] 

Sodium chloride 1.8 mg per 1 ml, Potassium chloride 2 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Steriflex No.30 potassium chloride 0.2% (potassium 13.3mmol/500ml) / glucose 4% / sodium chloride 0.18% infusion 500ml bags | 1 bag [PoM] £1.67
Steriflex No.30 potassium chloride 0.2% (potassium 27mmol/1litre) / glucose 4% / sodium chloride 0.18% infusion 1litre bags | 1 bag [PoM] 

Potassium chloride 1.5 mg per 1 ml, Sodium chloride 4.5 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Intraven potassium chloride 0.15% (potassium 10mmol/500ml) / glucose 5% / sodium chloride 0.45% infusion 500ml bags | 1 bag [PoM] £3.12

Potassium chloride with potassium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 1025.

● INDICATIONS AND DOSE

Potassium depletion

- BY MOUTH
- Adult: Dosed according to the deficit or daily maintenance requirements (consult product literature)

● INTERACTIONS → Appendix 1: potassium chloride

- **PRESCRIBING AND DISPENSING INFORMATION** Each *Sando-K*[®] tablet contains potassium 470 mg (12 mmol of K⁺) and chloride 285mg (8 mmol of Cl⁻).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

- **Sando-K** (HK Pharma Ltd)
Potassium bicarbonate 400 mg, Potassium chloride 600 mg Sando-K effervescent tablets | 100 tablet  £9.95 DT = £9.95

Potassium chloride with sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 1025, sodium chloride below.

● INDICATIONS AND DOSE

Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Adult: Depending on the deficit or the daily maintenance requirements (consult product literature)

● INTERACTIONS → Appendix 1: potassium chloride

- **PRESCRIBING AND DISPENSING INFORMATION** Potassium chloride 0.15% with sodium chloride 0.9% contains K⁺ 20 mmol, Na⁺ 150 mmol, and Cl⁻ 170 mmol/litre or potassium chloride 0.3% with sodium chloride 0.9% contains K⁺ 40 mmol, Na⁺ 150 mmol, and Cl⁻ 190 mmol/litre.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

- **Potassium chloride with sodium chloride (Non-proprietary)**
Potassium chloride 3 mg per 1 ml, Sodium chloride 9 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag  £1.67-£2.46
Potassium chloride 0.3% (potassium 40mmol/1litre) / Sodium chloride 0.9% infusion 1litre bags | 1 bag  £
- Potassium chloride 1.5 mg per 1 ml, Sodium chloride 9 mg per 1 ml** Potassium chloride 0.15% (potassium 10mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag  £
- Potassium chloride 0.15% (potassium 20mmol/1litre) / Sodium chloride 0.9% infusion 1litre bags** | 1 bag  £
- Potassium chloride 2 mg per 1 ml, Sodium chloride 9 mg per 1 ml** Steriflex No.28 potassium chloride 0.2% (potassium 13.3mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag  £1.67
Steriflex No.28 potassium chloride 0.2% (potassium 27mmol/1litre) / sodium chloride 0.9% infusion 1litre bags | 1 bag  £2.20

ELECTROLYTES AND MINERALS > SODIUM CHLORIDE

Sodium chloride

● INDICATIONS AND DOSE

Prophylaxis of sodium chloride deficiency

- BY MOUTH
- Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

Chronic renal salt wasting

- BY MOUTH
- Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake

Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

- BY INTRAVENOUS INFUSION
- Adult: 500 mL, sodium chloride 0.9% to be given over 10–15 minutes, repeat if blood pressure remains below 90 mmHg and seek senior medical advice, when blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance, management regimen also includes administration of potassium chloride, soluble insulin, long acting insulin analogues and glucose 10% solution

Diluent for instillation of drugs to the bladder

- BY INTRAVESICAL INSTILLATION
- Adult: (consult product literature)

● CAUTIONS

- With intravenous use Avoid excessive administration • cardiac failure • dilutional hyponatraemia especially in the elderly • hypertension • peripheral oedema • pulmonary oedema • restrict intake in impaired renal function • toxæmia of pregnancy

● SIDE-EFFECTS

- With intravenous use Chills • fever • hypervolaemia • hypotension • local reaction • localised pain • paraesthesia • skin reactions • tremor • vascular disorders • venous thrombosis
- With oral use Abdominal cramps • acidosis hyperchloraemic • diarrhoea • generalised oedema • hypertension • hypotension • irritability • muscle complaints • nausea • vomiting

● MONITORING REQUIREMENTS

- With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

● PRESCRIBING AND DISPENSING INFORMATION

- With intravenous use Sodium chloride 0.9% intravenous infusion contains Na⁺ and Cl⁻ each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).
- With oral use Each *Slow Sodium*[®] tablet contains approximately 10 mmol each of Na⁺ and Cl⁻;  tablets can be crushed before administration .

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

NUTRIENTS > SUGARS

Glucose

(Dextrose Monohydrate)

INDICATIONS AND DOSE

Establish presence of gestational diabetes

- BY MOUTH
- Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Oral glucose tolerance test

- BY MOUTH
- Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Hypoglycaemia

- BY INTRAVENOUS INFUSION
- Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs
- Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein

continued →

through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

Energy source

► BY INTRAVENOUS INFUSION

- Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

Water replacement

► BY INTRAVENOUS INFUSION

- Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

► BY INTRAVENOUS INFUSION

- Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Management of diabetic ketoacidosis

► BY INTRAVENOUS INFUSION

- Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre
- Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion

DOSE EQUIVALENCE AND CONVERSION

- 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes. prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
- **INTERACTIONS** → Appendix 1: glucose
- **SIDE-EFFECTS** Chills · electrolyte imbalance · fever · fluid imbalance · hypersensitivity · local reaction · localised pain · polyuria · rash · venous thrombosis
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use in children Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

ORAL REHYDRATION SALTS

Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride

(Formulated as oral rehydration salts)

• INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

► BY MOUTH

- Child 1-11 months: 1–1½ times usual feed volume to be given
- Child 1-11 years: 200 mL, to be given after every loose motion
- Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss
- Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

- **PATIENT AND CARER ADVICE** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

1.1 Calcium imbalance

Calcium

Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate injection 10% p. 1014 should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride injection p. 1014 is also available, but is more irritant; care should be taken to prevent extravasation. Oral

supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 1019.

See the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 1008. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 712 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 716 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

Hyperparathyroidism

Paricalcitol p. 1055 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide p. 165. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

1.1a Hypercalcaemia and hypercalciuria

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Cinacalcet

- DRUG ACTION** Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

INDICATIONS AND DOSE
Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis

► BY MOUTH

- Adult: Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day continued →

Treatment of hypercalcaemia in parathyroid carcinoma | Primary hyperparathyroidism in patients where parathyroidectomy is inappropriate

► BY MOUTH

- Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

- **CAUTIONS** Treatment should not be initiated in patients with hypocalcaemia
- **INTERACTIONS** → Appendix 1: cinacalcet
- **SIDE-EFFECTS**
 - **Common or very common** Appetite decreased · asthenia · back pain · constipation · cough · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypersensitivity · hypotension · muscle complaints · nausea · paraesthesia · rash · seizure · upper respiratory tract infection · vomiting
 - **Frequency not known** Heart failure aggravated · osteodystrophy · QT interval prolongation · tetany · ventricular arrhythmia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.
- **Monitoring** Monitor closely in hepatic impairment especially when increasing dose.
- **MONITORING REQUIREMENTS**
 - Measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism, and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma.
 - In secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007) NICE TA117 Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) **only** in those:

- who have 'very uncontrolled' plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, **and**
- in whom surgical parathyroidectomy is contra-indicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

www.nice.org.uk/TA117

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- **Mimpara** (Amgen Ltd)

Cinacalcet (as Cinacalcet hydrochloride) 30 mg Mimpara 30mg tablets | 28 tablet **[PoM]** £125.75 DT = £125.75

Cinacalcet (as Cinacalcet hydrochloride) 60 mg Mimpara 60mg tablets | 28 tablet **[PoM]** £231.97 DT = £231.97

Cinacalcet (as Cinacalcet hydrochloride) 90 mg Mimpara 90mg tablets | 28 tablet **[PoM]** £347.96 DT = £347.96

Etelcalcetide

26-Jul-2017

- **DRUG ACTION** Etelcalcetide reduces parathyroid hormone secretion, which leads to a decrease in serum calcium concentrations.

● INDICATIONS AND DOSE

Secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis

► BY INTRAVENOUS INJECTION

- **Adult:** Initially 5 mg 3 times a week, then increased in steps of 2.5–5 mg if required, dose to be increased at intervals of at least 4 weeks; usual maintenance 2.5–15 mg 3 times a week, max. dose 15 mg 3 times a week; consult product literature for information on missed doses, and for dose adjustment due to parathyroid hormone levels or serum-calcium concentrations

- **CAUTIONS** Conditions that may worsen with hypocalcaemia · hypocalcaemia (do not initiate if serum-calcium concentration is less than the lower limit of normal range) · switching from cinacalcet (do not initiate until 7 days after the last dose of cinacalcet)

CAUTIONS, FURTHER INFORMATION

- Conditions that may worsen with hypocalcaemia Manufacturer advises caution with use in patients with conditions that may worsen with hypocalcaemia, including predisposition to QT-interval prolongation, history of seizures, and history of congestive heart failure—serum-calcium concentration should be closely monitored.

- **INTERACTIONS** → Appendix 1: etelcalcetide

● SIDE-EFFECTS

- **Common or very common** Diarrhoea · electrolyte imbalance · headache · heart failure aggravated · hypotension · muscle complaints · nausea · paraesthesia · QT interval prolongation · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises if formation of anti-etelcalcetide antibodies with a clinically significant effect is suspected, contact manufacturer to discuss antibody testing.

- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor parathyroid hormone level 4 weeks after treatment initiation or dose adjustment and approximately every 1–3 months during maintenance treatment; monitor serum-calcium concentration before treatment initiation, within 1 week of initiation or dose adjustment, and then approximately every 4 weeks during maintenance treatment.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told to seek medical advice if symptoms of hypocalcaemia occur.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Etelcalcetide for treating secondary hyperparathyroidism (June 2017) NICE TA448 Etelcalcetide is recommended as an option for treating secondary hyperparathyroidism in patients with chronic

kidney disease on haemodialysis, only if treatment with a calcimimetic is indicated but cinacalcet is not suitable, and the manufacturer provides etelcalcetide with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA448

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2017) that etelcalcetide (*Parsabiv*®) is not recommended for use within NHS Scotland for the treatment of secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis as the economic case was not demonstrated.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► *Parsabiv* (Amgen Ltd) ▼

Etelcalcetide (as Etelcalcetide hydrochloride) 5 mg per 1 ml *Parsabiv* 2.5mg/0.5ml solution for injection vials | 6 vial [PoM] £136.87

Parsabiv 10mg/2ml solution for injection vials | 6 vial [PoM] £327.84
Parsabiv 5mg/1ml solution for injection vials | 6 vial [PoM] £163.92

1.1b Hypocalcaemia

ELECTROLYTES AND MINERALS > CALCIUM

Calcium salts

- **CONTRA-INDICATIONS** Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) • conditions associated with hypercalciuria (e.g. some forms of malignant disease)

- **CAUTIONS** History of nephrolithiasis • sarcoidosis

• SIDE-EFFECTS

- **Uncommon** Constipation • diarrhoea • hypercalcaemia • nausea

- **RENAL IMPAIRMENT** Use with caution.

Calcium carbonate

• INDICATIONS AND DOSE

Phosphate binding in renal failure and hyperphosphataemia

► BY MOUTH

- **Adult:** (consult product literature)

Calcium deficiency

► BY MOUTH

- **Adult:** (consult product literature)

- **INTERACTIONS** → Appendix 1: calcium salts

• SIDE-EFFECTS

- **Uncommon** Hypercalciuria
- **Rare or very rare** Flatulence • gastrointestinal discomfort • milk-alkali syndrome • skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION** *Adcal*® contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol); *CalciChew*® contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol); *CalciChew Forte*® contains calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol); *Cacit*® contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca²⁺ 12.5 mmol); consult product literature for details of other available products.

Flavours of chewable tablet formulations may include orange or fruit flavour.

• MEDICINAL FORMS

F 1013

Calcium gluconate

• INDICATIONS AND DOSE

Severe acute hypocalcaemia or hypocalcaemic tetany

- INITIALLY BY SLOW INTRAVENOUS INJECTION
- Adult: Initially 10–20 mL, calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be administered with plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence, alternatively (by continuous intravenous infusion), initially 50 mL/hour, adjusted according to response, infusion to be administered using 100 mL of calcium gluconate 10% diluted in 1 litre of glucose 5% or sodium chloride 0.9%

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)

- BY SLOW INTRAVENOUS INJECTION
- Adult: 10–20 mL, calcium gluconate 10% should be administered, dose titrated and adjusted to ECG improvement

Calcium deficiency | Mild asymptomatic hypocalcaemia

- BY MOUTH
- Adult: Dose according to requirements

DOSE EQUIVALENCE AND CONVERSION

- 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

IMPORTANT SAFETY INFORMATION

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

- **INTERACTIONS** → Appendix 1: calcium salts

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS Arrhythmias

SPECIFIC SIDE-EFFECTS

- With intravenous use Circulatory collapse · feeling hot · hyperhidrosis · hypotension · vasodilation · vomiting
- With oral use Gastrointestinal disorder
- **MONITORING REQUIREMENTS**
- With intravenous use Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use For continuous intravenous infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Avoid bicarbonates, phosphates, or sulfates.

- **PRESCRIBING AND DISPENSING INFORMATION** Calcium gluconate 1 g contains calcium 89 mg or Ca^{2+} 2.23 mmol.

● INDICATIONS AND DOSE

Indications listed in combination monographs (available in the UK only in combination with other drugs)

- BY MOUTH
- Adult: Doses listed in combination monographs

● **INTERACTIONS** → Appendix 1: calcium salts

● **SIDE-EFFECTS** Epigastric pain · gastrointestinal disorder · hypercalciuria

● MEDICINAL FORMS

No licensed medicines listed.

PARATHYROID HORMONES AND ANALOGUES

Parathyroid hormone

21-Nov-2017

(Human recombinant parathyroid hormone)

● **DRUG ACTION** Parathyroid hormone is produced by recombinant DNA technology; endogenous parathyroid hormone is involved in modulating serum calcium and phosphate levels, regulating renal calcium and phosphate excretion, activating vitamin D, and maintaining normal bone turnover.

● INDICATIONS AND DOSE

Chronic hypoparathyroidism (specialist use only)

- BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

● **CONTRA-INDICATIONS** Bone metastases · current or previous radiation therapy to skeleton · increased risk factors for osteosarcoma (including Paget's disease or hereditary disorders) · pseudohypoparathyroidism · skeletal malignancy · unexplained raised levels of bone-specific alkaline phosphatase

● **CAUTIONS** Concomitant use of cardiac glycosides (hypercalcaemia may predispose to digitalis toxicity)—monitor cardiac glycoside levels and check for signs and symptoms of digitalis toxicity · concomitant use of drugs that affect calcium levels · young adults with open epiphyses—increased risk of osteosarcoma

● **INTERACTIONS** → Appendix 1: parathyroid hormone

● SIDE-EFFECTS

► **Common or very common** Electrolyte imbalance · fatigue · pain in extremity

SIDE-EFFECTS, FURTHER INFORMATION Hypercalcaemia is more likely during initial dose titration; if severe hypercalcaemia develops, hydrate and consider suspending treatment (including calcium supplement and active vitamin D).

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **PRE-TREATMENT SCREENING** Manufacturer advises confirm sufficient 25-hydroxyvitamin D stores and normal serum magnesium before treatment.

● MONITORING REQUIREMENTS

► Manufacturer advises monitor serum calcium and assess for signs and symptoms of hypocalcaemia and hypercalcaemia—adjust active vitamin D and calcium supplement as necessary; consult product literature.

► Manufacturer advises periodic monitoring of the response of serum calcium to treatment (response may decrease over time—if 25-hydroxyvitamin D is low, supplementation may restore serum calcium response).

● **TREATMENT CESSATION** Abrupt interruption or discontinuation can result in severe hypocalcaemia—manufacturer advises to monitor serum calcium and adjust calcium supplement and active vitamin D treatment.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises record the brand name and batch number after each administration.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C); reconstituted solution may be stored for up to 14 days in a refrigerator, and up to 3 days outside of a refrigerator (below 25 °C), during the 14-day use period.

● **PATIENT AND CARER ADVICE** Patients may self-administer *Natpar*®, after appropriate training in subcutaneous injection technique.

Missed doses Manufacturer advises missed doses should be administered as soon as possible, and additional treatment with calcium and/or active vitamin D must be taken, based on symptoms of hypocalcaemia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

1.2 Low blood volume

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Albumin solution

(Human Albumin Solution)

● INDICATIONS AND DOSE

Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

● **CONTRA-INDICATIONS** Cardiac failure · severe anaemia

● **CAUTIONS** Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure,

and monitor cardiovascular and respiratory function) · increased capillary permeability

● SIDE-EFFECTS

- **Rare or very rare** Fever · flushing · nausea · shock · urticaria

● MONITORING REQUIREMENTS

Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **CAUTIONS** Cardiac disease · hyperosmolality · severe hypoglycaemia · severe liver disease

- **SIDE-EFFECTS** Anaphylactic reaction

- **PREGNANCY** Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

● MONITORING REQUIREMENTS

- Where possible, monitor central venous pressure.
- Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

- **EFFECT ON LABORATORY TESTS** Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

- **PRESCRIBING AND DISPENSING INFORMATION** Dextran 70 is dextran with an average molecular weight of about 70 000^o.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

Gelatin

● INDICATIONS AND DOSE

Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

- BY INTRAVENOUS INFUSION

► Adult: Initially 500–1000 mL, use 3.5–4% solution

- **CAUTIONS** Cardiac disease · severe liver disease

● SIDE-EFFECTS

- **Rare or very rare** Chills · dyspnoea · fever · hyperhidrosis · hypersensitivity · hypertension · hypotension · hypoxia · tachycardia · tremor · urticaria · wheezing

- **PREGNANCY** Manufacturer of *Geloplasma*[®] advises avoid at the end of pregnancy.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in renal impairment.

● MONITORING REQUIREMENTS

- Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.

Gelaspan[®] contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre; *Gelofusine*[®] contains

PLASMA SUBSTITUTES

Dextran 70 with sodium chloride

● INDICATIONS AND DOSE

Initial treatment of hypovolaemia with hypotension induced by traumatic injury

- BY INTRAVENOUS INFUSION

- Adult: 250 mL, to be given over 2–5 minutes using *RescueFlow*[®], followed immediately by administration of isotonic fluids.

succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre; *Geloplasma*[®] contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre; *Isoplex*[®] contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre; *Volplex*[®] contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre.

Tetrastarch

• INDICATIONS AND DOSE

VOLULYTE[®] INFUSION

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 10–20 mL, then increased to up to 30 mL/kg/day for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

VOLUVEN[®] INFUSION

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 10–20 mL, then increased to up to 30 mL/kg/day for maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

- **CONTRA-INDICATIONS** Burns · cerebral haemorrhage · critically ill patients · dehydration · hyperhydration · intracranial haemorrhage · pulmonary oedema · sepsis · severe coagulopathy

- **CAUTIONS** Cardiac disease · care should be taken to avoid haematocrit concentration from falling below 25–30% · children · renal impairment · severe liver disease · surgery · trauma

• SIDE-EFFECTS

- ▶ **Rare or very rare** Hypersensitivity
- ▶ **Frequency not known** Pruritus

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid.

• MONITORING REQUIREMENTS

- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times. Treatment with hydroxyethyl starches should be guided by continuous haemodynamic monitoring so that the infusion is stopped as soon as appropriate haemodynamic goals have been achieved.
- ▶ Monitor renal function.
- ▶ Monitor for hypersensitivity reactions.
- ▶ Urine output should be monitored.

• PRESCRIBING AND DISPENSING INFORMATION

Hydroxyethyl starch is composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term tetrastarch reflects the degree of etherification. Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Volulyte[®] contains hydroxyethyl starch 6% (average molecular weight 130 000) in sodium chloride intravenous infusion 0.6%, containing Na⁺ 137 mmol, K⁺ 4 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 110 mmol, acetate 34 mmol/litre.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **Volulyte** (Fresenius Kabi Ltd) ▼
Magnesium chloride hexahydrate 300 mg per 1 litre, Potassium chloride 300 mg per 1 litre, Sodium acetate trihydrate 4.63 gram per 1 litre, Sodium chloride 6.02 gram per 1 litre, Tetrastarch 60 gram per 1 litre Volulyte 6% infusion 500ml Freeflex bags | 15 bag [PoM] £229.60
- ▶ **Voluven** (Fresenius Kabi Ltd) ▼
Tetrastarch 60 mg per 1 gram Voluven 6% infusion 500ml Freeflex bags | 1 bag [PoM] £10.63
Tetrastarch 100 mg per 1 ml Voluven 10% infusion 500ml Freeflex bags | 20 bag [PoM] £5

1.3 Magnesium imbalance

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypermagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and

duration of infusion and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution below is available as a licensed preparation and, magnesium glycerophosphate tablets and liquid [unlicensed] below are available from 'special-order' manufacturers or specialist importing companies.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

Myocardial infarction

Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

Eclampsia and pre-eclampsia

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with *eclampsia*. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully.

1.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

● INDICATIONS AND DOSE

Treatment and prevention of magnesium deficiency

- BY MOUTH
- Adult: 10–20 mmol daily, taken as 1–2 sachets of *Magnaspartate*® powder.

- **CONTRA-INDICATIONS** Disorders of cardiac conduction

- **INTERACTIONS** → Appendix 1: magnesium

● SIDE-EFFECTS

- **Uncommon** Diarrhoea · faeces soft
- **Rare or very rare** Fatigue · hypermagnesaemia
- **Frequency not known** Gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose Symptoms of hypermagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasodilatation, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Avoid in severe impairment (eGFR less than 30 mL/minute/1.73²).
- **DIRECTIONS FOR ADMINISTRATION** Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

● PRESCRIBING AND DISPENSING INFORMATION

Magnaspartate® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer magnesium aspartate powder.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

EXCIPIENTS: May contain Sucrose

► **Magnaspartate** (KoRa Healthcare)

Magnesium (as Magnesium aspartate) 243 mg Magnaspartate 243mg (magnesium 10mmol) oral powder sachets | 10 sachet (PoM)
£8.95 DT = £8.95

Magnesium glycerophosphate

24-Oct-2017

● INDICATIONS AND DOSE

Prevent recurrence of magnesium deficit

- BY MOUTH
- Adult: 24 mmol daily in divided doses, dose expressed as Mg²⁺

DOSE EQUIVALENCE AND CONVERSION

- Magnesium glycerophosphate 1 g is approximately equivalent to Mg²⁺ 4 mmol or magnesium 97 mg.

NEOMAG® CHEWABLE TABLETS

Hypomagnesaemia

- BY MOUTH
- Adult: Initially 1–2 tablets 3 times a day, dose to be adjusted according to the serum total magnesium level

DOSE EQUIVALENCE AND CONVERSION

- Each *Neomag*® chewable tablet contains Mg²⁺ 4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Preparations other than *Neomag*® are not licensed for use.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Diarrhoea · hypermagnesaemia

- **RENAL IMPAIRMENT** Increased risk of toxicity. Dose adjustments Avoid or reduce dose.

NEOMAG® CHEWABLE TABLETS Manufacturer advises avoid in severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum magnesium levels every 3–6 months.

● DIRECTIONS FOR ADMINISTRATION

NEOMAG® CHEWABLE TABLETS Manufacturer advises that tablets may be broken into quarters and chewed or swallowed with water.

● NATIONAL FUNDING/ACCESS DECISIONS

NEOMAG® CHEWABLE TABLETS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2017) that magnesium glycerophosphate (*Neomag*®) is accepted for use within NHS Scotland as an oral magnesium supplement for the treatment of patients with chronic magnesium loss, hypomagnesaemia or drug-induced hypomagnesaemia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, powder

Oral solution

► **LiquaMag GP** (Fontus Health Ltd)

Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 mL LiquaMag GP (magnesium 121.25mg/5mL (5mmol/5mL)) oral solution sugar-free | 200 mL £49.99

- ▶ **MagnaPhos** (TriOn Pharma Ltd)

Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml MagnaPhos 121.25mg/5ml (5mmol/5ml) oral solution | 200 ml £37.87 DT = £37.87

Chewable tablet

EXCIPIENTS: May contain Aspartame

- ▶ **MagnaPhate** (Arjun Products Ltd)
Magnesium (as Magnesium glycerophosphate) 97.2 mg MagnaPhate (magnesium 97.2mg (4mmol)) chewable tablets sugar-free | 50 tablet £22.64 DT = £22.77
- ▶ **MagnaPhos** (TriOn Pharma Ltd)
Magnesium (as Magnesium glycerophosphate) 97.2 mg MagnaPhos 97.2mg (4mmol) chewable tablets sugar-free | 50 tablet £17.89 DT = £22.77
- ▶ **Neomag** (Neocuticals Ltd)
Magnesium (as Magnesium glycerophosphate) 97.2 mg Neomag (magnesium 97mg (4mmol)) chewable tablets sugar-free | 50 tablet **[PoM]** £22.77 DT = £22.77

Capsule

- ▶ **MagnaPhos** (TriOn Pharma Ltd)
Magnesium (as Magnesium glycerophosphate) 48.6 mg MagnaPhos 48.6mg (2mmol) capsules | 50 capsule £35.87
- ▶ **MagnaPhos** (as Magnesium glycerophosphate) 97.2 mg MagnaPhos 97.2mg (4mmol) capsules | 50 capsule £37.87

Magnesium sulfate

● INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 2–17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes
- ▶ Adult: 1.2–2 g, to be given over 20 minutes

Prevention of seizures in pre-eclampsia

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

Treatment of seizures and prevention of seizure recurrence in eclampsia

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose of 2 g by intravenous injection

Hypomagnesaemia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 2.5–5 g daily, usual dose 3 g daily

Emergency treatment of serious arrhythmias

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g, to be given over 10–15 minutes, dose may be repeated once if necessary

Rapid bowel evacuation (acts in 2–4 hours)

- ▶ BY MOUTH
- ▶ Adult: 5–10 g, dose to be mixed in a glass of water, taken preferably before breakfast

DOSE EQUIVALENCE AND CONVERSION

- ▶ Magnesium sulfate heptahydrate 1 g equivalent to Mg^{2+} approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.
- **CONTRA-INDICATIONS**
 - ▶ With oral use In rapid bowel evacuation—acute gastrointestinal conditions
- **CAUTIONS**
 - ▶ With oral use In rapid bowel evacuation—elderly and debilitated patients
- **INTERACTIONS** → Appendix 1: magnesium
- **SIDE-EFFECTS**
 - ▶ Rare or very rare
 - ▶ With oral use Paralytic ileus
 - ▶ Frequency not known
 - ▶ With intravenous use Electrolyte imbalance
 - ▶ With oral use Diarrhoea · gastrointestinal discomfort · hypermagnesaemia
- **PREGNANCY**
 - ▶ When used for Hypomagnesaemia or Arrhythmias or Prevention of seizures in pre-eclampsia or Treatment of seizures and prevention of seizure recurrence in eclampsia or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis Not known to be harmful for short-term intravenous administration in eclampsia. Sufficient amount may cross the placenta in mothers treated with high doses, causing hypotonia and respiratory depression in newborns.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** Increased risk of toxicity.
Dose adjustments Avoid or reduce dose.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump).
For intravenous injection, in arrhythmias, hypomagnesaemia, eclampsia, and pre-eclampsia, give continuously in Glucose 5% or Sodium chloride 0.9%. Concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg^{2+}); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections. Max. rate 150 mg/minute (0.6 mmol/minute Mg^{2+}).
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - ▶ With oral use Magnesium sulfate is on sale to the public as Epsom Salts.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

▶ **Magnesium sulfate (Non-proprietary)**

Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial **[PoM]** £49.20

Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection
5ml ampoules | 10 ampoule [PoM] £37.80-£61.26
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection
2ml ampoules | 10 ampoule [PoM] £17.30-£17.35 DT = £17.35

Solution for infusion

► Magnesium sulfate (Non-proprietary)

Magnesium sulfate heptahydrate 100 mg per 1 ml Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £66.26 DT = £66.26

Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial [PoM] £73.00

Powder

► Magnesium sulfate (Non-proprietary)

Magnesium sulfate dried 1 mg per 1 mg Magnesium sulfate powder | 300 gram [GSL] £2.09 | 500 gram [GSL] £3.20 DT = £3.20 | 2000 gram [GSL] £5.60 | 5000 gram [GSL] £11.49

► Brands may include Epsom salts

1.4 Phosphate imbalance

Phosphorus

Phosphate supplements

Oral phosphate supplements p. 1023 may be required in addition to vitamin D in a small minority of patients with hypophosphataemia vitamin D-resistant rickets.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis.

For phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 1038.

Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.

Sevelamer p. 1022 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum p. 1021 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

Sucroferric oxyhydroxide p. 1022 is licensed for the control of hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis. It is used as part of a multiple therapeutic approach to control the development of renal bone disease; this could include the concomitant use of a calcium supplement, a vitamin D analogue or calcimimetics.

1.4a Hyperphosphataemia

ELECTROLYTES AND MINERALS > ALUMINIUM

Aluminium hydroxide

● INDICATIONS AND DOSE

Hyperphosphataemia in renal failure

► BY MOUTH USING CAPSULES

► Adult: 4–20 capsules daily in divided doses, to be taken with meals

Antacid

► BY MOUTH USING CAPSULES

► Adult: 475 mg 5 times a day, last dose to be taken at bedtime

● **CONTRA-INDICATIONS** Hypophosphataemia

● **INTERACTIONS** → Appendix 1: antacids

● **SIDE-EFFECTS** Constipation

● **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma.

● **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► **Alu-Cap** (Meda Pharmaceuticals Ltd)

Aluminium hydroxide 475 mg Alu-Cap 475mg capsules | 120 capsule [P] £13.71 DT = £13.71

1013

Calcium acetate

● INDICATIONS AND DOSE

PHOSEX[®] TABLETS

Hyperphosphataemia

► BY MOUTH

► Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serum-phosphate concentration, usual dose 4–6 tablets daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

RENACET[®] TABLETS

Hyperphosphataemia

► BY MOUTH

► Adult: 475–950 mg, to be taken with breakfast and with snacks, 0.95–2.85 g, to be taken with main meals and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day

● **INTERACTIONS** → Appendix 1: calcium salts

● **SIDE-EFFECTS**

► Uncommon Vomiting

● **DIRECTIONS FOR ADMINISTRATION**

PHOSEX[®] TABLETS Phosex[®] tablets are taken with meals.

Tablets can be broken to aid swallowing, but not chewed (bitter taste).

RENACET[®] TABLETS Manufacturer advises that other drugs should be taken 1 to 2 hours before or after Renacet[®]

to reduce the possible interference with absorption of other drugs. *Renacet*® tablets are taken with meals.

- **PRESCRIBING AND DISPENSING INFORMATION** *Renacet*® tablets contain calcium acetate 475 mg (equivalent to calcium 120.25 mg or Ca^{2+} 3 mmol); *Phosex*® tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or Ca^{2+} 6.2 mmol).

● PATIENT AND CARER ADVICE

PHOSEX® TABLETS Patients or carers should be given advice on how to administer *Phosex*® tablets.

RENACET® TABLETS Patients or carers should be given advice on how to administer *Renacet*® tablets.

● MEDICINAL FORMS

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

► BY MOUTH

- Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

- **CONTRA-INDICATIONS** Bowel obstruction

- **CAUTIONS** Gastro-intestinal disorders

● **SIDE-EFFECTS**

- **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea · vomiting
- **Frequency not known** Skin reactions

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING**

RENVELA® 2.4G ORAL POWDER SACHETS Unlikely to be present in milk (however, manufacturer advises avoid).

RENVELA® 800MG TABLETS Unlikely to be present in milk (however, manufacturer advises avoid).

RENAGEL® Manufacturer advises use only if potential benefit outweighs risk.

● **DIRECTIONS FOR ADMINISTRATION**

RENVELA® 2.4G ORAL POWDER SACHETS Manufacturer advises each sachet should be dispersed in 60 mL water, or mixed with a small amount of cool food (100 g), prior to administration and discarded if unused after 30 minutes.

● **PATIENT AND CARER ADVICE**

RENVELA® 2.4G ORAL POWDER SACHETS Patients and carers should be advised on how to administer powder for oral suspension.

● **NATIONAL FUNDING/ACCESS DECISIONS****RENVELA® 2.4G ORAL POWDER SACHETS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (April 2011) that sevelamer carbonate (*Renvela®*) is accepted for restricted use within NHS Scotland for the second-line management of hyperphosphataemia in adults receiving haemodialysis.

RENVELA® 800MG TABLETS**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (April 2011) that sevelamer carbonate (*Renvela®*) is accepted for restricted use within NHS Scotland for the second-line management of hyperphosphataemia in adults receiving haemodialysis.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Sucroferric oxyhydroxide

16-Feb-2016

● **INDICATIONS AND DOSE****Hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis**

► BY MOUTH

- **Adult:** Initially 1.5 g daily in 3 divided doses, dose to be taken with meals, then adjusted in steps of 500 mg every 2–4 weeks, dose adjusted according to serum-phosphate concentration; maintenance 1.5–2 g daily in divided doses; maximum 3 g per day

- **CONTRA-INDICATIONS** Haemochromatosis · iron accumulation disorders

- **CAUTIONS** Gastric disorders · hepatic disorders · major gastrointestinal surgery · peritonitis in the last 3 months

● **SIDE-EFFECTS**

- **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea · oral disorders · product taste abnormal · vomiting
- **Uncommon** Dysphagia · dyspnoea · electrolyte imbalance · fatigue · headache · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Discoloured faeces may mask the visual signs of gastrointestinal bleeding.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** *Velphoro®* tablets must be chewed or crushed, not swallowed whole.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of sucroferric oxyhydroxide tablets and advised that this medication can cause discoloured black stools.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Chewable tablet

- **Velphoro** (Vifor Fresenius Medical Care Renal Pharma UK Ltd) ▼ **Iron (as Sucroferric oxyhydroxide) 500 mg** Velphoro 500mg chewable tablets | 90 tablet (PoM) £179.00

1.4b Hypophosphataemia

ELECTROLYTES AND MINERALS > PHOSPHATES

Phosphate

● INDICATIONS AND DOSE

Treatment of moderate to severe hypophosphatemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Established hypophosphataemia (with monobasic potassium phosphate)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), increased dose to be used in critically ill patients; dose to be infused over 6–12 hours, according to severity

Vitamin D-resistant hypophosphataemic osteomalacia

- ▶ BY MOUTH USING EFFERVESCENT TABLETS
- ▶ Adult: 4–6 tablets daily, using *Phosphate Sandoz*®.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Common or very common Diarrhoea
- ▶ Frequency not known Nausea

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Acute kidney injury · hypocalcaemia · hypotension · metastatic calcification · oedema
- ▶ With oral use Abdominal distress

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea is a common side-effect and should prompt a reduction in dosage.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose.

Monitoring Monitor closely in renal impairment.

- **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

- **PRESCRIBING AND DISPENSING INFORMATION** *Phosphate Sandoz*® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na^+ 20.4 mmol), potassium 123 mg (K^+ 3.1 mmol); *Polyfusor NA*® contains Na^+ 162 mmol/litre, K^+ 19 mmol/litre, PO_4^{3-} 100 mmol/litre; non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

- ▶ **Phosphate Sandoz** (HK Pharma Ltd)

Sodium dihydrogen phosphate anhydrous 1.936 gram Phosphate Sandoz effervescent tablets | 100 tablet  £19.39

Solution for infusion

- ▶ **Phosphate (Non-proprietary)**

Potassium dihydrogen phosphate 136 mg per 1 ml Potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule  £80.25–£92.69 DT = £92.69

Infusion

- ▶ **Phosphate (Non-proprietary)**

Potassium dihydrogen phosphate 1.295 gram per 1 litre, Disodium hydrogen phosphate anhydrous 5.75 gram per 1 litre Polyfusor NA phosphates infusion 500ml bottles | 1 bottle  £5.15

1.5 Potassium imbalance

1.5a Hyperkalaemia

Other drugs used for Hyperkalaemia Calcium gluconate, p. 1014

ANTIDOTES AND CHELATORS > CATION EXCHANGE RESINS

Calcium polystyrene sulfonate

● INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- ▶ BY MOUTH
- ▶ Adult: 15 g 3–4 times a day
- ▶ BY RECTUM
- ▶ Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS** Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · sarcoidosis

- **INTERACTIONS** → Appendix 1: polystyrene sulfonate

- **SIDE-EFFECTS** Appetite decreased · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · gastrointestinal necrosis (in combination with sorbitol) · hypercalcaemia (in dialysed patients and occasionally in those with renal impairment) · increased risk of infection · nausea · vomiting

- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder

CAUTIONARY AND ADVISORY LABELS 13, 21 (Sorbisterit® powder only)

EXCIPIENTS: May contain Sucrose

- ▶ **Calcium Resonium** (Sanofi)

Calcium polystyrene sulfonate 999.34 mg per 1 gram Calcium Resonium powder sugar-free | 300 gram  £82.16

Patiromer calcium

15-Oct-2017

- **DRUG ACTION** Patiromer is a non-absorbed cation-exchange polymer that acts as a potassium binder in the gastro-intestinal tract.

● INDICATIONS AND DOSE

Hyperkalaemia

- BY MOUTH
- Adult: Initially 8.4 g once daily; adjusted in steps of 8.4 g as required, dose adjustments should be made at intervals of at least one week; maximum 25.2 g per day

PHARMACOKINETICS

- Onset of action 4–7 hours.

- **CAUTIONS** Risk factors for hypercalcaemia (calcium partially released from counterion complex) · severe gastro-intestinal disorders (ischaemia, necrosis, and intestinal perforation reported with other potassium binders)
- **INTERACTIONS** → Appendix 1: patiromer
- **SIDE-EFFECTS**
 - Common or very common Abdominal pain · constipation · diarrhoea · flatulence · hypomagnesaemia
 - Uncommon Nausea · vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available (although no effects on the infant are anticipated).
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for electrolyte disturbances, particularly plasma-potassium (as clinically indicated) and plasma-magnesium (continue to monitor for at least 1 month after initiation of treatment).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises Veltassa[®] should be mixed with approx. 40 mL of water, then stirred and mixed with a further approx. 40 mL of water; the powder will not dissolve. More water may be added as needed. The mixture should be taken within 1 hour of preparation. Apple juice or cranberry juice may be used instead of water, other liquids should be avoided as they may contain high amounts of potassium.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) prior to dispensing; once dispensed, patient may store below 25°C for up to 6 months.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

Sodium polystyrene sulfonate

● INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- BY MOUTH
- Adult: 15 g 3–4 times a day
- BY RECTUM
- Adult: 30 g, retain for 9 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS** Obstructive bowel disease
- **CAUTIONS** Congestive heart failure · hypertension · oedema
- **INTERACTIONS** → Appendix 1: polystyrene sulfonate
- **SIDE-EFFECTS** Appetite decreased · bezoar · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · increased risk of infection · nausea · necrosis (in combination with sorbitol) · vomiting
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
- **DIRECTIONS FOR ADMINISTRATION**
 - With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.
 - With oral use Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Powder

CAUTIONARY AND ADVISORY LABELS 13

- Resonium A (Sanofi)

Sodium polystyrene sulfonate 999.34 mg per 1 gram Resonium A powder sugar-free | 454 gram [P] £81.11

1.5b Hypokalaemia

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium bicarbonate with potassium acid tartrate

● INDICATIONS AND DOSE

Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastro-intestinal disorders)

- BY MOUTH
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Hypochloraemia · plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS** Cardiac disease · elderly
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · flatulence · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. Monitoring Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** These tablets do not contain chloride.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 31

- ▶ **Potassium bicarbonate with potassium acid tartrate (Non-proprietary)**

Potassium acid tartrate 300 mg, Potassium bicarbonate

500 mg Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet [GSL] £77.77-£93.33 DT = £88.15

Potassium chloride

INDICATIONS AND DOSE

Prevention of hypokalaemia (patients with normal diet)

- ▶ BY MOUTH

- ▶ Adult: 2–4 g daily in divided doses

Electrolyte imbalance

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Dose dependent on deficit or the daily maintenance requirements

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

- **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre

CAUTIONS

- ▶ With intravenous use seek specialist advice in very severe potassium depletion or difficult cases
- ▶ With oral use Cardiac disease · elderly · hiatus hernia (with modified-release preparations) · history of peptic ulcer (with modified-release preparations) · intestinal stricture (with modified-release preparations)

- **INTERACTIONS** → Appendix 1: potassium chloride

SIDE-EFFECTS

GENERAL SIDE-EFFECTS Hyperkalaemia

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Abdominal cramps · diarrhoea · gastrointestinal disorders · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. Dose adjustments Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia.
- Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.

MONITORING REQUIREMENTS

- ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
- ▶ With intravenous use ECG monitoring should be performed in difficult cases.

DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloraemic states).
- ▶ With intravenous use Potassium chloride concentrate must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**. Ready-mixed infusion solutions should be used where possible; alternatively,

potassium chloride concentrate as ampoules containing 1.5 g (K⁺ 20 mmol) in 10 mL, is **thoroughly mixed** with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours with specialist advice and ECG monitoring in difficult cases. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

- **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L[®] contains 1 mmol/mL each of K⁺ and Cl⁻.

Potassium Tablets Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*[®] and *Ruthmol*[®]). These should not be used by patients with renal failure as potassium intoxication may result.
- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion

2 Metabolic disorders

2.1 Acute porphyrias

Acute porphyrias

01-Oct-2017

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 75 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

EvGr Where there is no safe alternative, drug treatment for serious or life-threatening conditions should not be withheld from patients with acute porphyria. Where possible, the clinical situation should be discussed with a porphyria specialist for advice on how to proceed and monitor the patient. In the UK clinical advice can be obtained from the National Acute Porphyria Service or from the UK Porphyria Medicines Information Service (UKPMIS)—see details below. 

Haem arginate p. 1027 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from two centres (University Hospital of Wales and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

EvGr The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available. 

An up-to-date list of drugs considered safe in acute porphyrias is available from the UKPMIS, see *Useful resources* below.

Further information may be obtained from: porphyria.eu/ and also from:

The UK Porphyria Medicines Information Service (UKPMIS)
University Hospital of Wales
CF14 4XW

Cardiff
(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Anabolic steroids
- Antidepressants, MAOIs (contact UKPMIS for advice)
- Antidepressants, Tricyclic and related (contact UKPMIS for advice)
- Barbiturates (includes primidone and thiopental)
- Contraceptives, hormonal (for detailed advice contact UKPMIS or a porphyria specialist)
- Hormone replacement therapy (for detailed advice contact UKPMIS or a porphyria specialist)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact UKPMIS for advice)
- Progestogens (for detailed advice contact UKPMIS or a porphyria specialist)
- Protease inhibitors (contact UKPMIS for advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonyleureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact UKPMIS for advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Busulfan
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clemastine
- Clindamycin
- Cocaine
- Danazol
- Dapsone
- Diltiazem
- Disopyramide
- Disulfiram
- Ergometrine
- Ergotamine
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Flutamide
- Fosaprepitant
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Ifosfamide
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact UKPMIS for advice)
- Ketamine
- Mefenamic acid (safety uncertain, contact UKPMIS for advice)
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (safety uncertain, contact UKPMIS for advice)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine
- Pentoxifylline
- Pergolide
- Phenoxylbenzamine
- Phenytoin
- Pivmecillinam
- Pizotifen
- Porfimer
- Raloxifene
- Rifabutin (safety uncertain, contact UKPMIS for advice)
- Rifampicin
- Riluzole
- Risperidone
- Spiroglactone
- Sulfapyrazone
- Tamoxifen
- Temoporfin
- Thiotepa
- Tiagabine

- Tibolone
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Verapamil
- Xipamide

BLOOD AND RELATED PRODUCTS > HAEM DERIVATIVES

Haem arginate

(Human hemin)

• INDICATIONS AND DOSE

Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphyria

► BY INTRAVENOUS INFUSION

- Adult: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

• SIDE-EFFECTS

- Rare or very rare Fever
- Frequency not known Headache · skin discolouration · venous thrombosis

• **PREGNANCY** Manufacturer advises avoid unless essential.

• **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

• **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Normosang*[®]), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 10 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebachial or central vein; administer within 1 hour after dilution.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **Normosang** (Orphan Europe (UK) Ltd)
Haem arginate 25 mg per 1 mL Normosang 250mg/10mL solution for infusion ampoules | 4 ampoule [PoM] £1,737.00

2.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levocarnitine

(Carnitine)

• INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

► BY MOUTH

- Adult: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► BY SLOW INTRAVENOUS INJECTION

- Adult: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

Secondary carnitine deficiency in haemodialysis patients

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

• **CAUTIONS** Diabetes mellitus

• SIDE-EFFECTS

- Rare or very rare Abdominal cramps · diarrhoea · nausea · skin odour abnormal · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

• **PREGNANCY** Appropriate to use; no evidence of teratogenicity in *animal* studies.

• **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.

• MONITORING REQUIREMENTS

- Monitoring of free and acyl carnitine in blood and urine recommended.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Solution for injection

- **Carnitor** (Logixx Pharma Solutions Ltd)

L-Carnitine 200 mg per 1 mL Carnitor 1g/5mL solution for injection ampoules | 5 ampoules [PoM] £59.50

Oral solution

- **Levocarnitine (Non-proprietary)**

L-Carnitine 300 mg per 1 mL Levocarnitine 1.5g/5mL (30%) oral solution paediatric | 20 mL [PoM] £71.40 DT = £71.40 | 40 mL [PoM] £69.80

- **Carnitor** (Logixx Pharma Solutions Ltd)

L-Carnitine 100 mg per 1 mL Carnitor oral single dose 1g solution sugar-free | 10 unit dose [PoM] £35.00

Chewable tablet

- **Carnitor** (Logixx Pharma Solutions Ltd)

L-Carnitine 1 gram Carnitor 1g chewable tablets | 10 tablet [PoM] £35.00

2.3 Cystinosis

2.3a Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine

(Cysteamine)

21-Nov-2017

• INDICATIONS AND DOSE

Nephropathic cystinosis (specialist use only)

► BY MOUTH

- Adult (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

Corneal cystine crystal deposits in patients with cystinosis (specialist use only)

► TO THE EYE

- Adult: Apply 1 drop 4 times a day, to be applied to both eyes (minimum 4 hours between doses); dose may be reduced according to response (minimum daily dose 1 drop in each eye)

continued →

DOSE EQUIVALENCE AND CONVERSION

- ▶ With oral use
- ▶ 1.3 g/m² is approximately equivalent to 50 mg/kg.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

● CAUTIONS

- ▶ When used by eye Contact lens wearers
- ▶ With oral use Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

● SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ When used by eye Dry eye · eye discomfort · eye erythema · excessive tearing · vision blurred
- ▶ With oral use Appetite decreased · asthenia · breath odour · diarrhoea · drowsiness · encephalopathy · fever · gastroenteritis · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon**
- ▶ With oral use Compression fracture · gastrointestinal ulcer · hair colour changes · hallucination · joint hyperextension · leg pain · leucopenia · musculoskeletal disorders · nephrotic syndrome · nervousness · osteopenia · seizure
- ▶ **Frequency not known**
- ▶ With oral use Depression · intracranial pressure increased · papilloedema

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.

● PREGNANCY

- ▶ With oral use Manufacturer advises avoid—teratogenic and toxic in *animal* studies.

● BREAST FEEDING

- ▶ With oral use Manufacturer advises avoid—no information available.

● MONITORING REQUIREMENTS

- ▶ With oral use Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

● HANDLING AND STORAGE

- ▶ When used by eye Manufacturer advises store in a refrigerator (2–8°C)—after opening store at room temperature up to 25°C for up to 7 days; protect from light.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

- ▶ With oral use The *Scottish Medicines Consortium* has advised (November 2017) that mercaptamine (*Procsyl*®) is **not** recommended for use within NHS Scotland for the treatment of proven nephropathic cystinosis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Gastro-resistant capsule

- ▶ *Procsyl* (Chiesi Ltd)

Mercaptamine (as Mercaptamine bitartrate) 25 mg *Procsyl* 25mg gastro-resistant capsules | 60 capsule [PoM] £335.97

Mercaptamine (as Mercaptamine bitartrate) 75 mg *Procsyl* 75mg gastro-resistant capsules | 250 capsule [PoM] £4,199.65

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ *Cystadrops* (Orphan Europe (UK) Ltd)

Mercaptamine (as Mercaptamine hydrochloride) 3.8 mg per 1 ml *Cystadrops* 3.8mg/ml eye drops | 5 ml [PoM] £865.00

Capsule

CAUTIONARY AND ADVISORY LABELS 21

- ▶ *Cystagon* (Orphan Europe (UK) Ltd)

Mercaptamine (as Mercaptamine bitartrate) 50 mg *Cystagon* 50mg capsules | 100 capsule [PoM] £70.00

Mercaptamine (as Mercaptamine bitartrate) 150 mg *Cystagon* 150mg capsules | 100 capsule [PoM] £190.00

2.4 Fabry's disease

ENZYMES

| Agalsidase alfa

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE

Fabry's disease (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · asthenia · chest discomfort · chills · cough · diarrhoea · dizziness · dyspnoea · excessive tearing · fever · flushing · gastrointestinal discomfort · headache · hearing impairment · hoarseness · hypersomnia · hypertension · increased risk of infection · influenza like illness · joint disorders · malaise · musculoskeletal discomfort · myalgia · nausea · pain · palpitations · peripheral oedema · peripheral swelling · rhinorrhoea · sensation abnormal · skin reactions · taste altered · temperature sensation altered · throat complaints · tremor · vomiting
- ▶ **Uncommon** Altered smell sensation · angioedema · hypersensitivity · sensation of pressure
- ▶ **Frequency not known** Heart failure · hyperhidrosis · hypotension · myocardial ischaemia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by interrupting the infusion, or minimise by pre-treatment with an antihistamine or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Administration for *intravenous infusion*, give intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ *Replagal* (Shire Pharmaceuticals Ltd)

Agalsidase alfa 1 mg per 1 ml *Replagal* 3.5mg/3.5ml solution for infusion vials | 1 vial [PoM] £1,049.94

Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE

Fabry's disease (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 1 mg/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

● SIDE-EFFECTS

- **Common or very common** Angioedema · arrhythmias · arthralgia · asthma · chest discomfort · chills · cough · diarrhoea · dizziness · drowsiness · dyspnoea · eye disorders · fever · gastrointestinal discomfort · headache · hypertension · hyperthermia · hypotension · increased risk of infection · muscle complaints · musculoskeletal stiffness · nasal complaints · nausea · oedema · oral hypoaesthesia · pain · pallor · palpitations · respiratory disorders · sensation abnormal · skin reactions · syncope · temperature sensation altered · throat complaints · tinnitus · vasodilation · vertigo · vomiting
- **Uncommon** Dysphagia · ear discomfort · eye pruritus · influenza like illness · malaise · peripheral coldness · tremor
- **Frequency not known** Anaphylactoid reaction · hypersensitivity vasculitis · hypoxia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by slowing the infusion rate, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Fabrazyme** (Genzyme Therapeutics Ltd)

Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial [PoM] £315.08

Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial [PoM] £2,196.59

ENZYME STABILISERS

Migalastat

24-Nov-2017

- **DRUG ACTION** Migalastat is a pharmacological chaperone that binds to the active sites of certain mutant forms of alpha-galactosidase A, thereby stabilising these mutant forms in the endoplasmic reticulum, and facilitating normal trafficking to lysosomes.

● INDICATIONS AND DOSE

Fabry's disease (specialist use only)

- BY MOUTH
- Adult: 123 mg once daily on alternate days, take at the same time of day, at least 2 hours before or after food

● SIDE-EFFECTS

- **Common or very common** Constipation · defaecation urgency · depression · diarrhoea · dizziness · dry mouth · dyspnoea · epistaxis · fatigue · gastrointestinal discomfort · headache · muscle complaints · nausea · pain in extremity · palpitations · proteinuria · sensation abnormal · skin reactions · torticollis · vertigo

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function, echocardiographic parameters and biochemical markers every 6 months.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is missed entirely for the day, the missed dose should not be taken and the next dose should be taken on the normal day and at the normal time (not to be taken on 2 consecutive days).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Migalastat for treating Fabry disease (February 2017)

NICE HST4

Migalastat is recommended, within its marketing authorisation, as an option for treating Fabry disease in people over 16 years of age with an amenable mutation, only if migalastat is provided with the discount agreed in the patient access scheme, and only if enzyme replacement therapy would otherwise be offered.

www.nice.org.uk/guidance/hst4

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* (November 2016) has advised that migalastat (*Galafold*®) is accepted for restricted use within NHS Scotland for long-term treatment of adults and adolescents aged 16 years and older with a confirmed diagnosis of Fabry disease (α-galactosidase A deficiency) and who have an amenable mutation—consult SMC advice for full details of restriction.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- **Galafold** (Amicus Therapeutics UK Ltd) ▼

Migalastat (as Migalastat hydrochloride) 123 mg Galafold 123mg capsules | 14 capsule [PoM] £16,153.85

2.5 Gaucher's disease

Other drugs used for Gaucher's disease Miglustat, p. 1034

ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Eliglustat

04-Dec-2017

- **DRUG ACTION** Eliglustat is an inhibitor of glucosylceramide synthase.

● INDICATIONS AND DOSE

Type 1 Gaucher disease (CYP2D6 poor metabolisers) (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: 84 mg once daily

Type 1 Gaucher disease (CYP2D6 intermediate or extensive metabolisers) (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: 84 mg twice daily

- **CONTRA-INDICATIONS** Cardiac disease (no information available) · concurrent use of Class IA and Class III antiarrhythmics · long QT syndrome (no information available)

- **INTERACTIONS** → Appendix 1: eliglustat

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · constipation · dyspepsia · fatigue · gastrointestinal disorders · nausea · palpitations

- ▶ **Frequency not known** Syncope

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **PRE-TREATMENT SCREENING** Manufacturer advises CYP2D6 metaboliser status should be determined before initiation of treatment.

● MONITORING REQUIREMENTS

- ▶ For treatment-naïve patients showing less than 20% spleen volume reduction after 9 months of treatment, manufacturer advises monitor for further improvement or consider an alternative treatment.
- ▶ For patients with stable disease who have switched from enzyme replacement therapy, manufacturer advises monitor for disease progression—consider reinstitution of enzyme replacement therapy or an alternative treatment if response sub-optimal.

- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Cerdelga*® has provided a *Prescriber Guide*, which includes a prescriber checklist.

- **PATIENT AND CARER ADVICE** A patient alert card should be provided.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Eliglustat for treating type 1 Gaucher disease (June 2017)** NICE HST5
Eliglustat is recommended within its marketing authorisation for treating type 1 Gaucher disease, that is, for long-term treatment in adults who are cytochrome P450 2D6 poor, intermediate or extensive metabolisers. Eliglustat is only recommended when the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/hst5

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2017) that eliglustat (*Cerdelga*®) is accepted for use within NHS Scotland for the long-term treatment of adult patients with type 1 Gaucher disease who are CYP2D6 poor metabolisers, intermediate metabolisers or extensive metabolisers. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

ENZYMES

Imiglucerase

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

● INDICATIONS AND DOSE

Non-neurological manifestations of type I Gaucher's disease (specialist use only) | Non-neurological manifestations of type III Gaucher's disease (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

● SIDE-EFFECTS

- ▶ **Common or very common** Angioedema · cough · dyspnoea · hypersensitivity · skin reactions
- ▶ **Uncommon** Abdominal cramps · arthralgia · back pain · chest discomfort · chills · cyanosis · diarrhoea · dizziness · fatigue · fever · flushing · headache · hypotension · nausea · paraesthesia · tachycardia · vomiting

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** No information available.

● MONITORING REQUIREMENTS

- ▶ Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- ▶ When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Cerezyme*®), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

Velaglucerase alfa

- **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

● INDICATIONS AND DOSE

Type I Gaucher's disease (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

● SIDE-EFFECTS

- **Common or very common** Arthralgia · asthenia · chest discomfort · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hypersensitivity · hypertension · hypotension · infusion related reaction · nausea · pain · skin reactions · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions are very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Manufacturer advises use with caution—limited information available.
- **BREAST FEEDING** Manufacturer advises use with caution—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (VPRIV®), give intermittently in Sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2.6 Homocystinuria

METHYL DONORS

Betaine

● INDICATIONS AND DOSE

Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

- BY MOUTH
- Adult: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

● SIDE-EFFECTS

- **Uncommon** Abdominal discomfort · agitation · alopecia · appetite decreased · brain oedema · diarrhoea · glossitis · irritability · nausea · skin reactions · urinary incontinence · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.
- **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

Powder

- **Cystadane** (Orphan Europe (UK) Ltd)
Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram (PoM) £347.00

2.7 Hypophosphatasia

ENZYMES

Asfotase alfa

04-Dec-2017

- **DRUG ACTION** Asfotase alfa is a human recombinant tissue-nonspecific alkaline phosphatase that promotes mineralisation of the skeleton.

● INDICATIONS AND DOSE

Paediatric-onset hypophosphatasia (initiated by a specialist)

- BY SUBCUTANEOUS INJECTION
- Adult: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on body-weight—consult product literature for further information

- **CAUTIONS** Hypersensitivity reactions

CAUTIONS, FURTHER INFORMATION

- Hypersensitivity reactions Reactions, including signs and symptoms consistent with anaphylaxis, have occurred within minutes of administration and can occur in patients on treatment for more than one year; if these reactions occur, manufacturer advises immediate discontinuation of treatment and initiation of appropriate medical treatment. For information on re-administration, consult product literature.

● SIDE-EFFECTS

- **Common or very common** Bruising tendency · chills · cutis laxa · fever · headache · hypersensitivity · irritability · lipohypertrophy · myalgia · nausea · oral hypoaesthesia · pain · skin reactions · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Injection-site reactions including hypertrophy, induration, skin discolouration, and cellulitis may occur, particularly in

patients receiving treatment 6 times a week. Manufacturer advises rotation of injection sites to manage these reactions; interrupt treatment if severe reactions occur and administer appropriate medical therapy.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor serum parathyroid hormone and calcium concentrations—supplements of calcium and oral vitamin D may be required.
 - ▶ Manufacturer advises periodic ophthalmological examination and renal ultrasounds.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises max. 1 mL per injection site; administer multiple injections if more than 1 mL is required—consult product literature.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).
- **PATIENT AND CARER ADVICE** Injection guides The manufacturer has produced injection guides for patients and carers to support training given by health care professionals.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Asfotase alfa for treating paediatric-onset hypophosphatasia (August 2017) NICE HST6**
Asfotase alfa is recommended as an option for treating paediatric-onset hypophosphatasia only:
 - for people who meet the criteria for treatment within the managed access arrangement (see section 4.18 of the guidance), **and**
 - for the duration of this arrangement and in line with the other conditions it specifies, **and**
 - when the manufacturer provides asfotase alfa with the confidential commercial terms agreed with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/HST6

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Strensiq** (Alexion Pharma UK Ltd) ▼

2.8 Mucopolysaccharidosis

ENZYMES

Elosulfase alfa

04-Dec-2017

- **DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylglucosamine-6-sulfatase (GALNS) deficiency.

• INDICATIONS AND DOSE

Mucopolysaccharidosis IVA (specialist use only)

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ Adult: 2 mg/kg once weekly

- **CAUTIONS** Elderly—no information available · infusion-related reactions

CAUTIONS, FURTHER INFORMATION

- ▶ **Infusion-related reactions** Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · chills · diarrhoea · dizziness · dyspnoea · fever · headache · hypersensitivity · infusion related reaction · myalgia · nausea · oropharyngeal pain · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Vimizim*®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Elosulfase alfa for treating mucopolysaccharidosis type IVA (December 2015) NICE HST2**
Elosulfase alfa, within its marketing authorisation, is recommended for funding for treating mucopolysaccharidosis type IVA (MPS IVA) according to the conditions in the managed access agreement for elosulfase alfa.

www.nice.org.uk/guidance/HST2

● MEDICINAL FORMS

Elosulfase alfa 1 mg per 1 mL Vimizim 5mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] £750.00

Galsulfase

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

● INDICATIONS AND DOSE

Mucopolysaccharidosis VI (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease
- **SIDE-EFFECTS** Abdominal pain · apnoea · chest pain · chills · conjunctivitis · corneal opacity · dyspnoea · ear pain · face oedema · hypertension · increased risk of infection · malaise · nasal congestion · reflexes absent · umbilical hernia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (**Naglazyme**®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Galsulfase 1 mg per 1 mL Naglazyme 5mg/5mL solution for infusion vials | 1 vial [PoM] £982.00

Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

● INDICATIONS AND DOSE

Mucopolysaccharidosis II (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) · infusion-related reactions can occur · severe respiratory disease

● SIDE-EFFECTS

- **Common or very common** Arrhythmias · arthralgia · chest pain · cough · cyanosis · diarrhoea · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hypertension · hypotension · hypoxia · nausea · oedema · respiratory disorders · skin reactions · tongue swelling · tremor · vomiting
- **Frequency not known** Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (**Elaprase**®), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

● MEDICINAL FORMS

Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

● INDICATIONS AND DOSE

Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur

- **INTERACTIONS** → Appendix 1: laronidase

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · alopecia · anaphylactic reaction · angioedema · chills · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · flushing · headache · hypotension · influenza like illness · joint disorders · nausea · pain · pallor · paraesthesia · peripheral coldness · respiratory disorders · restlessness · skin reactions · sweat changes · tachycardia · temperature sensation altered · vomiting
- **Frequency not known** Cyanosis · hypoxia · oedema

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Aldurazyme®), give intermittently in Sodium chloride 0.9%; body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Solution for infusion
ELECTROLYTES: May contain Sodium
▶ **Aldurazyme** (Genzyme Therapeutics Ltd)
Laronidase 100 unit per 1 mL Aldurazyme 500units/5mL solution for infusion vials | 1 vial [PoM](#) £444.70

2.9 Niemann-Pick type C disease

ENZYME INHIBITORS › GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.
- **INDICATIONS AND DOSE**
Mild to moderate type I Gaucher's disease for whom enzyme replacement therapy is unsuitable (under expert supervision)
▶ BY MOUTH
Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day
Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)
▶ BY MOUTH
Adult: 200 mg 3 times a day
- **SIDE-EFFECTS**
▶ **Common or very common** Appetite decreased · asthenia · chills · constipation · depression · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · insomnia · libido decreased · malaise · muscle spasms · muscle weakness · nausea · peripheral neuropathy · sensation abnormal · thrombocytopenia · tremor · vomiting · weight decreased
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments For Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m².

For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m²

- **MONITORING REQUIREMENTS**
▶ Monitor cognitive and neurological function.
▶ Monitor growth and platelet count in Niemann-Pick type C disease.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ **Zavesca** (Actelion Pharmaceuticals UK Ltd)
Miglustat 100 mg Zavesca 100mg capsules | 84 capsule [PoM](#)
£3,934.17 (Hospital only)

2.10 Pompe disease

ENZYMES

Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

• INDICATIONS AND DOSE

Pompe disease (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
Adult: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction
- **SIDE-EFFECTS**
▶ **Common or very common** Anxiety · arrhythmias · chest discomfort · chills · cough · cyanosis · diarrhoea · dizziness · fatigue · feeling hot · fever · flushing · hyperhidrosis · hypersensitivity · hypertension · irritability · local swelling · muscle complaints · nausea · oedema · pallor · paraesthesia · respiratory disorders · skin reactions · throat complaints · tremor · vomiting
▶ **Frequency not known** Abdominal pain · angioedema · apnoea · arthralgia · cardiac arrest · dyspnoea · excessive tearing · eye inflammation · headache · hypotension · nephrotic syndrome · peripheral coldness · proteinuria · vasoconstriction

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions are very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

- **PREGNANCY** Toxicity in *animal* studies, but treatment should not be withheld.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
▶ Monitor closely if cardiac dysfunction.
▶ Monitor closely if respiratory dysfunction.
▶ Monitor immunoglobulin G (IgG) antibody concentration.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Myozyme®), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Myozyme** (Genzyme Therapeutics Ltd)

Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £356.06 (Hospital only)

2.11 Tyrosinaemia type I

ENZYME INHIBITORS >

4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone

(NTBC)

• INDICATIONS AND DOSE

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

- **INTERACTIONS** → Appendix 1: nitisinone

• SIDE-EFFECTS

- ▶ **Common or very common** Corneal opacity · eye inflammation · eye pain · granulocytopenia · leucopenia · photophobia · thrombocytopenia
- ▶ **Uncommon** Leucocytosis · skin reactions
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—adverse effects in *animal* studies.
- **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function regularly.
 - ▶ Monitor platelet and white blood cell count every 6 months.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)

Nitisinone 4 mg per 1 ml Orfadin 4mg/1ml oral suspension sugar-free | 90 ml **[PoM]** £1,692.00 DT = £1,692.00

Nitisinone 2 mg Orfadin 2mg capsules | 60 capsule **[PoM]** £564.00
Nitisinone 5 mg Orfadin 5mg capsules | 60 capsule **[PoM]** £1,127.00
Nitisinone 10 mg Orfadin 10mg capsules | 60 capsule **[PoM]** £2,062.00
Nitisinone 20 mg Orfadin 20mg capsules | 60 capsule **[PoM]** £4,512.00

2.12 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Carglumic acid

• INDICATIONS AND DOSE

Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

Hyperammonaemia due to organic acidaemia (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

• SIDE-EFFECTS

- ▶ **Common or very common** Hyperhidrosis
- ▶ **Uncommon** Bradycardia · diarrhoea · fever · vomiting
- ▶ **Frequency not known** Rash
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13

DRUGS FOR METABOLIC DISORDERS >

AMMONIA LOWERING DRUGS

Glycerol phenylbutyrate

14-May-2018

- **DRUG ACTION** Glycerol phenylbutyrate is a nitrogen-binding agent that provides an alternative vehicle for waste nitrogen excretion.

• INDICATIONS AND DOSE

Urea cycle disorders (specialist use only)

- ▶ BY MOUTH, OR BY GASTROSTOMY TUBE, OR BY NASOGASTRIC TUBE
- ▶ Adult (body surface area up to 1.3 m²): Initially 9.4 g/m² daily in divided doses, usual maintenance continued →

5.3–12.4 g/m² daily in divided doses, with meals, each dose should be rounded up to the nearest 0.5 mL. For dose adjustments based on individual requirements—consult product literature

- ▶ **Adult** (body surface area 1.3 m² and above): Initially 8 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, with meals, each dose should be rounded up to the nearest 0.5 mL. For dose adjustments based on individual requirements—consult product literature

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 mL of liquid contains 1.1 g of glycerol phenylbutyrate.
- ▶ For patients switching from sodium phenylbutyrate—consult product literature.

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **CONTRA-INDICATIONS** Treatment of acute hyperammonaemia
- **CAUTIONS** Elderly—limited information available · intestinal malabsorption · pancreatic insufficiency
- **INTERACTIONS** → Appendix 1: glycerol phenylbutyrate
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headache · menstrual disorder · nausea · oral disorders · peripheral oedema · skin reactions · tremor · vomiting
 - ▶ **Uncommon** Akathisia · alopecia · biliary colic · bladder pain · confusion · depressed mood · drowsiness · epistaxis · hot flush · hyperhidrosis · hypoalbuminaemia · hypokalaemia · hypothyroidism · joint swelling · muscle spasms · pain · paraesthesia · plantar fasciitis · speech disorder · taste altered · ventricular arrhythmia · weight change
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—use lowest possible dose.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises may be added to a small amount of apple sauce, ketchup, or squash and used within 2 hours. For administration advice via nasogastric or gastrostomy tube—consult product literature.
- **HANDLING AND STORAGE** Manufacturer advises discard contents of bottle 14 days after opening.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

- ▶ **Ravicti** (Swedish Orphan Biovitrum Ltd) ▼
Glycerol phenylbutyrate 1.1 gram per 1 mL Ravicti 1.1g/mL oral liquid | 25 mL [PoM] £161.00

Sodium phenylbutyrate

● INDICATIONS AND DOSE

Long-term treatment of urea cycle disorders (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)

- ▶ **BY MOUTH**
- ▶ **Adult:** 9.9–13 g/m² daily in divided doses, with meals; maximum 20 g per day

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **CAUTIONS** Congestive heart failure (preparations contain significant amounts of sodium)
- **INTERACTIONS** → Appendix 1: sodium phenylbutyrate
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · constipation · depression · headache · irritability · leucocytosis · leucopenia · menstrual cycle irregularities · metabolic acidosis · metabolic alkalosis · nausea · oedema · renal tubular acidosis · skin reactions · syncope · taste altered · thrombocytopenia · thrombocytosis · vomiting · weight increased
 - ▶ **Uncommon** Anorectal haemorrhage · aplastic anaemia · arrhythmia · gastrointestinal disorders · pancreatitis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during administration in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution (preparations contain significant amounts of sodium).
- **DIRECTIONS FOR ADMINISTRATION** Granules should be mixed with food before taking. *Pheburane*® granules must not be administered by nasogastric or gastrostomy tubes.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion
- Granules**

2.13 Wilson's disease

Other drugs used for Wilson's disease Penicillamine, p. 1063

ANTIDOTES AND CHELATORS > COPPER ABSORPTION INHIBITORS

Zinc acetate

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson's disease.

● INDICATIONS AND DOSE

Wilson's disease (initiated under specialist supervision)

► BY MOUTH

- Adult: 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

DOSE EQUIVALENCE AND CONVERSION

- Doses expressed as elemental zinc.

PHARMACOKINETICS

- Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

- **INTERACTIONS** → Appendix 1: zinc

● SIDE-EFFECTS

- **Common or very common** Epigastric discomfort (usually transient)

- **Uncommon** Leucopenia · sideroblastic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

● PREGNANCY

Dose adjustments Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

- **MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

- **Wilzin** (Orphan Europe (UK) Ltd)

Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule [PoM] £132.00

Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule [PoM] £242.00

ANTIDOTES AND CHELATORS > COPPER CHELATORS

Trientine dihydrochloride

● INDICATIONS AND DOSE

Wilson's disease in patients intolerant of penicillamine

► BY MOUTH

- Adult: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

- **INTERACTIONS** → Appendix 1: trientine

● SIDE-EFFECTS

- **Rare or very rare** Anaemia
- **Frequency not known** Gastrointestinal disorders · nausea · neurological deterioration in Wilson's Disease · rash

- **PREGNANCY** Teratogenic in *animal* studies—use only if benefit outweighs risk.

Monitoring Monitor maternal and neonatal serum-copper concentrations.

- **PRESCRIBING AND DISPENSING INFORMATION** Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 6, 22

- **Trientine dihydrochloride (Non-proprietary)**

Trientine dihydrochloride 250 mg Metalite 250mg capsules | 100 capsule [PoM] £

Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule [PoM] £3,090.00 DT = £3,090.00

3 Mineral and trace elements deficiencies

3.1 Selenium deficiency

Selenium

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

VITAMINS AND TRACE ELEMENTS

Selenium

● INDICATIONS AND DOSE

Selenium deficiency

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Adult: 100–500 micrograms daily

- **INTERACTIONS** → Appendix 1: selenium

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **SelenoPrecise** (Pharma Nord (UK) Ltd)

Selenium (as L-Selenomethionine) 100 microgram SelenoPrecise 100microgram tablets | 60 tablet £4.02

L-Selenomethionine 200 microgram SelenoPrecise 200microgram tablets | 60 tablet £4.41 | 150 tablet £8.01

Solution for injection

- ▶ **Selenase** (Baxter Healthcare Ltd)
Selenium (as Sodium selenite) 50 microgram per 1 ml Selenium 100micrograms/2ml solution for injection ampoules | 10 ampoule [PoM] [S]
Selenase 500micrograms/10ml solution for injection vials | 10 vial [PoM] [S]

Solution for infusion

- ▶ **Selenium (Non-proprietary)**
Selenium (as Sodium selenite) 10 microgram per 1 ml Selenium 100micrograms/10ml solution for infusion vials | 10 vial [PoM] [S]

Oral solution

- ▶ **Selenase** (Baxter Healthcare Ltd)
Selenium (as Sodium selenite) 50 microgram per 1 ml Selenium 100micrograms/2ml oral solution 2ml unit dose ampoules | 20 unit dose [P] [S]

Capsule

- ▶ **Selenium (Non-proprietary)**
L-Selenomethionine 200 microgram Selenium 200microgram capsules | 30 capsule £3.20 | 60 capsule £5.79

- **INTERACTIONS** → Appendix 1: zinc
- **SIDE-EFFECTS** Diarrhoea · gastritis · gastrointestinal discomfort · nausea · vomiting
- **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.
- **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.
- **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Each Solvazinc[®] tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ **Solvazinc** (Galen Ltd)

Zinc sulfate monohydrate 125 mg Solvazinc 125mg effervescent tablets sugar-free | 90 tablet [P] £17.20 DT = £17.20

3.2 Zinc deficiency

Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

ELECTROLYTES AND MINERALS > ZINC

Zinc sulfate

INDICATIONS AND DOSE**Zinc deficiency or supplementation in zinc-losing conditions**

- ▶ **BY MOUTH USING EFFERVESCENT TABLETS**
- ▶ Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Adult (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

Additional elemental zinc for intravenous nutrition

- ▶ **BY INTRAVENOUS INJECTION**
- ▶ Adult: 6.5 mg daily (Zn²⁺ 100 micromol)

- **UNLICENSED USE** Solvazinc[®] is not licensed for use in acrodermatitis enteropathica.

4 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition** (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 1039.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin p. 994, is given by intramuscular injection; regular vitamin B₁₂ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 993 is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

2 Excludes protein- or amino acid-derived energy

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of nonessential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose p. 1009) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kJ) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. **Additives should not be mixed with fat emulsions unless compatibility is known.**

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *product literature and other specialist literature should be consulted.*

NUTRIENTS > PARENTERAL NUTRITION

Parenteral nutrition supplements

● INDICATIONS AND DOSE

Supplement in intravenous nutrition

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES

Amino acid supplement for hypercatabolic or hypermetabolic states

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

- **DIRECTIONS FOR ADMINISTRATION** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature, and other*

specialist literature should be consulted. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. **Additives should not be mixed with fat emulsions unless compatibility is known.**

CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT Dissolve in 5 mL water for injections.

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For addition to *Vamin*® solutions and glucose intravenous infusions.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES For addition to infusion solutions containing amino acids.

ADDIPHOS® VIALS For addition to *Vamin*® solutions and glucose intravenous infusions.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For addition to infusion solutions.

TRACUTIL® AMPOULES For addition to infusion solutions.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION

VIALS Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid*®; dissolve in *Vitlipid N*® or *Intralipid*® for adding to *Intralipid*® only.

VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES For addition to *Intralipid*®.

● PRESCRIBING AND DISPENSING INFORMATION

CERNEVIT SOLUTION FOR INJECTION VIALS AND

DILUENT *Cernevit*® solution contains *dl*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg.

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For patients over 40 kg. *Additrace*® solution contains traces of Fe³⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES *Dipeptiven*® solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

ADDIPHOS® VIALS *Addiphos*® sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For patients over 40 kg. *Decan*® solution contains trace elements Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺.

TRACUTIL® AMPOULES *Tracutal*® solution contains trace elements Fe²⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, I⁻, F⁻.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION

VIALS *Solivito N*® powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

VITLIPID N ADULT EMULSION FOR INJECTION 10ML

AMPOULES *Vitlipid N*® adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, *dl*-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL.

For adults and children over 11 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

- **Cernevit** (Baxter Healthcare Ltd)
Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic acid 414 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Pantothenic acid (as Dexpantenol) 17.25 mg, Nicotinamide 46 mg, Ascorbic acid 125 mg, Alpha tocopherol 11.2 unit, Colecalciferol 220 unit, Retinol 3500 unit | Cernevit solution for injection vials and diluent | 10 vial [PoM] £5

Solution for infusion

- **Parenteral nutrition supplements (Non-proprietary)**

Sodium glycerophosphate 216 mg per 1 ml Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion vials | 1 vial [PoM] £5.33

- **Additrac** (Fresenius Kabi Ltd)
Sodium molybdate 4.85 microgram per 1 ml, Chromic chloride 5.33 microgram per 1 ml, Sodium selenite 10.5 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml Additrac solution for infusion 10ml ampoules | 1 ampoule [PoM] £1.96

- **Dipeptiven** (Fresenius Kabi Ltd)
N(2)-L-alanyl-L-glutamine 200 mg per 1 ml Dipeptiven 20g/100ml concentrate for solution for infusion bottles | 1 bottle [PoM] £25.93
Dipeptiven 10g/50ml concentrate for solution for infusion bottles | 1 bottle [PoM] £13.94

- **Tracutit** (B.Braun Melsungen AG)
Sodium molybdate dihydrate 2.42 microgram per 1 ml, Chromic chloride 5.3 microgram per 1 ml, Sodium selenite pentahydrate 7.89 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 126 microgram per 1 ml, Manganese chloride 197.9 microgram per 1 ml, Copper chloride 204.6 microgram per 1 ml, Zinc chloride 681.5 microgram per 1 ml, Ferrous chloride 695.8 microgram per 1 ml Tracutit concentrate for solution for infusion 10ml ampoules | 5 ampoule [PoM] £7.96

Powder for solution for infusion

- **Solvitvo N** (Fresenius Kabi Ltd)
Cyanocobalamin 5 microgram, Biotin 60 microgram, Folic acid 400 microgram, Thiamine nitrate 3.1 mg, Pyridoxine hydrochloride 4.9 mg, Riboflavin sodium phosphate 4.9 mg, Sodium pantothenate 16.5 mg, Nicotinamide 40 mg, Sodium ascorbate 113 mg Solvitvo N powder for solution for infusion vials | 1 vial [PoM] £1.97

Emulsion for injection

- **Vitlipid N Adult** (Fresenius Kabi Ltd)
Ergocalciferol 500 nanogram per 1 ml, Phytomenadione 15 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Alpha tocopherol 910 microgram per 1 ml Vitlipid N Adult emulsion for injection 10ml ampoules | 1 ampoule [PoM] £1.97

nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored.

Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Enteral nutrition in children

Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought.

5.1 Special diets

Nutrition in special diets

Overview

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

Coeliac disease

Coeliac disease is caused by an abnormal immune response to gluten. For management and further information, see Coeliac disease p. 35.

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise **phenylalanine**, is managed by restricting dietary intake of **phenylalanine** to a small amount sufficient for tissue building and repair.

Sapropterin dihydrochloride p. 1045, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of **phenylalanine** in the management of patients with **phenylketonuria** and **tetrahydrobiopterin deficiency**.

Aspartame (used as a sweetener in some foods and medicines) contributes to the **phenylalanine** intake and may affect control of **phenylketonuria**. Where the presence of **aspartame** is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

5 Nutrition (oral)

Enteral nutrition

Overview

The body's reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds.

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a

5.1a Phenylketonuria

DRUGS FOR METABOLIC DISORDERS > TETRAHYDROBIOPTERIN AND DERIVATIVES

Sapropterin dihydrochloride

● INDICATIONS AND DOSE

Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)

► BY MOUTH

- Adult: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)

► BY MOUTH

- Adult: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

- **CAUTIONS** History of convulsions

- **INTERACTIONS** → Appendix 1: sapropterin

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · cough · diarrhoea · headache · laryngeal pain · nasal congestion · vomiting

- **Frequency not known** Hypersensitivity

- **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● MONITORING REQUIREMENTS

- Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.
- Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Sapropterin dihydrochloride 100 mg Kuvan 100mg soluble tablets sugar-free | 30 tablet (PoM) £597.22

6 Vitamin deficiency

Vitamins

Overview

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general 'pick-me-ups' is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 1049 and pyridoxine hydrochloride p. 1047, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects* 41. London: HMSO, 1991.

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A (retinol) p. 1047 is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin B group

Deficiency of the B vitamins, other than vitamin B₁₂, is rare in the UK and is usually treated by preparations containing thiamine (B₁) p. 1048, riboflavin (B₂), and nicotinamide p. 1237, which is used in preference to nicotinic acid p. 199, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate p. 232, and pantothenic acid or panthanol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke's encephalopathy and Korsakoff's psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (*Pabrinex*®), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B₆) deficiency is rare, but it may occur during isoniazid p. 576 therapy or penicillamine p. 1063 treatment in Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 993 and vitamin B₁₂ are used in the treatment of megaloblastic anaemia. Folic acid p. 916

(available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

Vitamin D

The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol (calciferol, vitamin D₂) p. 1054, colecalciferol (vitamin D₃) p. 1051, dihydroxycholesterol p. 1054, alfalcidol (1 α -hydroxycholecalciferol) p. 1050, and calcitriol (1,25-dihydroxycholecalciferol) p. 1050.

Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing colecalciferol with calcium carbonate p. 1053 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.

Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfalcidol or calcitriol should be prescribed if patients with *severe renal impairment* require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol p. 1055, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadiol sodium phosphate p. 1056 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

Other compounds

Potassium aminobenzoate p. 1047 has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie's disease. In Peyronie's disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate p. 1047 in scleroderma is doubtful.

VITAMINS AND TRACE ELEMENTS > MULTIVITAMINS

Vitamins A and D

• INDICATIONS AND DOSE

Prevention of vitamin A and D deficiency

► BY MOUTH

- Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D
- Adult: (consult product literature)

- **UNLICENSED USE** Not licensed in children under 6 months of age.

• SIDE-EFFECTS

Overdose

Excessive ingestion Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► Vitamins a and d (Non-proprietary)

Vitamin D 400 unit, Vitamin A 4000 unit Vitamins A and D capsules BPC 1973 | 28 capsule £2.81 | 28 capsule [GSL](#) £2.81 | 84 capsule £6.75-£8.42 DT = £8.42

Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A p. 1047, ascorbic acid p. 1049.

• INDICATIONS AND DOSE

Prevention of vitamin deficiency

► BY MOUTH

- Child 1 month-4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **INTERACTIONS** → Appendix 1: ascorbic acid · vitamin A

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during

pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral drops

- ▶ **Healthy Start Children's Vitamin** (Secretary of State for Health)
Vitamin A and D3 concentrate.55 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Ascorbic acid 150 mg per 1 ml, Vitamin D 2000 iu per 1 ml, Vitamin A 5000 iu per 1 ml Healthy Start Children's Vitamin drops | 10 ml 

VITAMINS AND TRACE ELEMENTS > VITAMIN A

Vitamin A

(Retinol)

● INDICATIONS AND DOSE

Vitamin A deficiency

- ▶ BY MOUTH
- ▶ Child 1–11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
- ▶ Child 1–17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency

- **UNLICENSED USE** Preparations containing only vitamin A are not licensed.

- **INTERACTIONS** → Appendix 1: vitamin A

● SIDE-EFFECTS

Overdose Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

- **PREGNANCY** Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver pâté or liver sausage.

- **BREAST FEEDING** Theoretical risk of toxicity in infants of mothers taking large doses.

- **MONITORING REQUIREMENTS** Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

● MEDICINAL FORMS

● INDICATIONS AND DOSE

Mild deficiency

- ▶ BY MOUTH
- ▶ Adult: 25–100 mg daily

Severe deficiency

- ▶ BY MOUTH
- ▶ Adult: 200–300 mg daily in divided doses

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (SEPTEMBER 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

- **CAUTIONS** Anaphylaxis may occasionally follow injection
- **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

Vitamin B substances with ascorbic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, thiamine above, ascorbic acid p. 1049.

● INDICATIONS AND DOSE

Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states) Maintenance of vitamins B and C in chronic intermittent haemodialysis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: See MHRA/CHM advice in thiamine above monograph (consult product literature).

Treatment of Wernicke's encephalopathy

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: 2–3 pairs 3 times a day for 2 days, discontinue if no response, continue treatment if symptoms respond after 2 days; (by intravenous infusion or by deep intramuscular injection) 1 pair once daily for 5 days or for as long as improvement continues, give deep intramuscular injection into the gluteal muscle

Prophylaxis of Wernicke's encephalopathy in alcohol dependence

- ▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1 pair once daily for at least 3–5 days, give deep intramuscular injection into the gluteal muscle

Psychosis following narcosis or electroconvulsive therapy | Toxicity from acute infections

- ▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1 pair twice daily for up to 7 days, give deep intramuscular injection into the gluteal muscle

Haemodialysis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 1 pair every 2 weeks

- **UNLICENSED USE** *Pabrinex*® doses in BNF may differ from those in product literature.
- **INTERACTIONS** → Appendix 1: ascorbic acid
- **DIRECTIONS FOR ADMINISTRATION** Give (*Pabrinex*® I/V High Potency) intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Ampoules contents should be mixed, diluted, and administered without delay; give over 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Some formulations of *Pabrinex*® may contain benzyl alcohol (avoid in neonates). *Pabrinex*® I/M High Potency injection is for intramuscular use only. *Pabrinex*® I/V High Potency injection is for intravenous use only.

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

- **CONTRA-INDICATIONS** Hypercalcaemia • metastatic calcification
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain • headache • hypercalcaemia • hypercalciuria • nausea • skin reactions
 - ▶ **Uncommon** Appetite decreased • constipation • thirst • vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**

Overdose Symptoms of overdose include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.
- **PREGNANCY** High doses teratogenic in *animals* but therapeutic doses unlikely to be harmful.
- **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- **MONITORING REQUIREMENTS** **Important:** all patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

F above

Alfacalcidol

(1 α -Hydroxycholecalciferol)

● INDICATIONS AND DOSE

Patients with severe renal impairment requiring vitamin D therapy

- ▶ **BY MOUTH, OR BY INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 1 microgram daily, dose to be adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily
- ▶ **Elderly:** Initially 500 nanograms daily, dose adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily

Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

- ▶ **BY MOUTH, OR BY INTRAVENOUS INJECTION**
- ▶ **Child 1 month–11 years:** 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
- ▶ **Child 12–17 years:** 1 microgram once daily, dose to be adjusted as necessary

Prevention of vitamin D deficiency in renal or cholestatic liver disease

- ▶ **BY MOUTH, OR BY INTRAVENOUS INJECTION**
- ▶ **Child 1 month–11 years (body-weight up to 20 kg):** 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
- ▶ **Child 1 month–11 years (body-weight 20 kg and above):** 250–500 nanograms once daily, dose to be adjusted as necessary
- ▶ **Child 12–17 years:** 250–500 nanograms once daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

- ▶ One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- **CAUTIONS** Nephrolithiasis • take care to ensure correct dose in infants
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort • hyperphosphataemia
 - ▶ **Uncommon** Asthenia • diarrhoea • malaise • myalgia • urolithiasis
 - ▶ **Rare or very rare** Dizziness
 - ▶ **Frequency not known** Confusion • renal impairment
- **RENAL IMPAIRMENT**

Monitoring Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

▶ **One-Alpha** (LEO Pharma)

Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £41.13
One-Alpha 1micrograms/0.5ml solution for injection ampoules | 10 ampoule [PoM] £21.57

Oral drops

EXCIPIENTS: May contain Alcohol

▶ **One-Alpha** (LEO Pharma)

Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/ml oral drops sugar-free | 10 ml [PoM] £21.30 DT = £21.30

Capsule

Calcitriol

(1,25-Dihydroxycholecalciferol)

● **INDICATIONS AND DOSE****Renal osteodystrophy**▶ **BY MOUTH**

- ▶ **Adult:** Initially 250 nanograms daily, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

Renal osteodystrophy (in patients with normal or only slightly reduced plasma-calcium concentration)▶ **BY MOUTH**

- ▶ **Adult:** Initially 250 nanograms once daily on alternate days, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

Established postmenopausal osteoporosis

- BY MOUTH
- Adult: 250 nanograms twice daily, plasma-calcium concentration and creatinine to be monitored (consult product literature)

● **INTERACTIONS** → Appendix 1: vitamin D substances

● **SIDE-EFFECTS**

- Common or very common Urinary tract infection
- Frequency not known Abdominal pain upper · apathy · arrhythmia · dehydration · drowsiness · fever · growth retardation · muscle weakness · paralytic ileus · polydipsia · psychiatric disorder · sensory disorder · urinary disorders · weight decreased

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.
Monitoring Monitor plasma-calcium concentration in renal impairment.

● **MONITORING REQUIREMENTS**

- Monitor plasma calcium, phosphate, and creatinine during dosage titration.
- Monitor plasma-calcium concentration in patients receiving high doses.

● **DIRECTIONS FOR ADMINISTRATION** Contents of capsule may be administered by oral syringe.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Colecalciferol

(Cholecalciferol; Vitamin D₃)

● **INDICATIONS AND DOSE**

Prevention of vitamin D deficiency

- BY MOUTH
- Adult: 400 units daily

Treatment of vitamin D deficiency

- BY MOUTH
- Adult: 800 units daily, higher doses may be necessary for severe deficiency

● **INTERACTIONS** → Appendix 1: vitamin D substances

● **SIDE-EFFECTS** Laryngeal oedema

● **RENAL IMPAIRMENT**

Monitoring Monitor plasma-calcium concentration in renal impairment.

● **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

● **DIRECTIONS FOR ADMINISTRATION**

INVITA D3[®] ORAL SOLUTION May be mixed with a small amount of cold or lukewarm food immediately before administration.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, oral drops

- **CAUTIONS** G6PD deficiency (risk of haemolysis) · vitamin E deficiency (risk of haemolysis)
- **SIDE-EFFECTS** Haemolysis
- **PREGNANCY** Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.
- **MEDICINAL FORMS**
Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Phytomenadione(Vitamin K₁)● **INDICATIONS AND DOSE****Major bleeding in patients on warfarin (in combination with dried prothrombin complex or fresh frozen plasma)**

► BY SLOW INTRAVENOUS INJECTION

- Adult: 5 mg for 1 dose, stop warfarin treatment

INR > 8.0 with minor bleeding in patients on warfarin

► BY SLOW INTRAVENOUS INJECTION

- Adult: 1–3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR <5

INR > 8.0 with no bleeding in patients on warfarin

► BY MOUTH

- Adult: 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR <5

INR 5.0–8.0 with minor bleeding in patients on warfarin

► BY SLOW INTRAVENOUS INJECTION

- Adult: 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR <5

Reversal of anticoagulation prior to elective surgery (after warfarin stopped)

► BY MOUTH

- Adult: 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR ≥1.5

Reversal of anticoagulation prior to emergency surgery (when surgery can be delayed 6–12 hours)

► BY INTRAVENOUS INJECTION

- Adult: 5 mg as a single dose, if surgery cannot be delayed, dried prothrombin complex can be given in addition to phytomenadione and the INR checked before surgery

- **UNLICENSED USE** Oral use of intravenous preparations is unlicensed.
- **CAUTIONS** Intravenous injections should be given very slowly—risk of vascular collapse
- **KONAKION[®] MM** Reduce dose in elderly
- **PREGNANCY** Use if potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk.
- **HEPATIC IMPAIRMENT**
KONAKION[®] MM Caution—glycocholic acid may displace bilirubin.
- **DIRECTIONS FOR ADMINISTRATION**

KONAKION[®] MM PAEDIATRIC Konakion[®] MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection. For intravenous injection, may be diluted with Glucose 5% if necessary.

KONAKION[®] MM Konakion[®] MM may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; **not** for intramuscular injection. For intravenous infusion (Konakion[®] MM), give intermittently

VITAMINS AND TRACE ELEMENTS > VITAMIN K**Menadiol sodium phosphate**● **INDICATIONS AND DOSE****Prevention of Vitamin K deficiency in malabsorption syndromes**

► BY MOUTH

- Adult: 10–40 mg daily, dose to be adjusted as necessary

in Glucose 5%; dilute with 55 mL; may be injected into lower part of infusion apparatus.

● MEDICINAL FORMS

6.1 Neural tube defects (prevention in pregnancy)

Neural tube defects (prevention in pregnancy)

01-Aug-2017

Description of condition

Neural tube defects represent a group of congenital defects, caused by incomplete closure of the neural tube within 28 days of conception. The most common forms are anencephaly, spina bifida and encephalocele.

The main risk factors are maternal folate deficiency, maternal vitamin B₁₂ deficiency, previous history of having an infant with a neural tube defect, smoking, diabetes, obesity, and use of antiepileptic drugs.

Prevention in pregnancy

[EvGr] Pregnant women or women who wish to become pregnant should be advised to take supplementation with folic acid p. 993 before conception and until week 12 of pregnancy.

A higher daily dose (see folic acid) is recommended for women at a high risk of conceiving a child with a neural tube defect, including women who have previously had an infant with a neural tube defect, who are receiving antiepileptic medication (see Epilepsy p. 304), or who have diabetes or sickle-cell disease.

1 Arthritis

Arthritis

Rheumatoid arthritis and other inflammatory disorders

A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol p. 438 or codeine phosphate p. 448 can also be used.

Drugs are also used to influence the rheumatic disease process itself. For *rheumatoid arthritis* these disease-modifying antirheumatic drugs (DMARDs) include methotrexate p. 888, cytokine modulators, azathioprine p. 816, ciclosporin p. 818, cyclophosphamide p. 871, leflunomide p. 1063, penicillamine p. 1063, gold, antimalarials (chloroquine p. 604 and hydroxychloroquine sulfate p. 1062), and sulfasalazine p. 42. Corticosteroids also have a significant role in the management of rheumatoid arthritis.

Drugs which may affect the disease process in *psoriatic arthritis* include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators.

Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol should be used first and may need to be taken regularly. A topical NSAID or topical capsaicin 0.025% p. 476 should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered before a NSAID in patients taking low-dose aspirin.

Intra-articular corticosteroid injections may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine p. 1061 and rubefacients are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (*Durolane*®, *Euflexxa*®, *Fermathron*®, *Orthovisc*®, *Ostenil*®, *Ostenil Plus*®, *RenheVis*®, *Suplasyn*®, *Synocom*®, *Synopsis*®) or hylan G-F 20 (*Synvisc*®) is injected intra-articularly to supplement natural hyaluronan in

the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (*SportVis*®) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

Spondyloarthritis

01-Sep-2017

Description of condition

Spondyloarthritis refers to a group of inflammatory musculoskeletal conditions with shared features which affect both axial and peripheral joints. Most people with these conditions have either axial spondyloarthritis (which includes ankylosing spondylitis and non-radiographic axial spondyloarthritis) or psoriatic arthritis. Axial spondyloarthritis primarily affects the spine, in particular the sacroiliac joint.

Psoriatic arthritis may present in several forms, including involvement of small joints (in the hands and feet), large joints (particularly in the knees), or combinations of both. Psoriatic arthritis may also involve the axial joints, finger and toe joints, and inflammation of the connective tissue between tendon/ligament and bone.

Less common subgroups are enteropathic spondyloarthritis, which is associated with inflammatory bowel disease (Crohn's disease p. 36 and Ulcerative colitis p. 37), and reactive arthritis (a form of peripheral arthritis), which can occur following gastro-intestinal or genito-urinary infections.

Aims of treatment

The aims of treatment are to relieve symptoms, slow the progression of the condition, and improve quality of life.

Non-drug treatment

EvGr Patients who have difficulties with everyday activities should be referred to a specialist therapist (such as a physiotherapist, occupational therapist, hand therapist, orthotist or podiatrist). Hydrotherapy can be considered as an adjunctive therapy to manage pain and maintain or improve function for people with axial spondyloarthritis. **A**

Drug treatment

Axial spondyloarthritis

EvGr For pain associated with axial spondyloarthritis, start one of the Non-steroidal anti-inflammatory drugs p. 1094 (NSAIDs) at the lowest effective dose. Clinical assessment, monitoring of risk factors, and the use of gastroprotective

treatment should be considered. If an NSAID taken at the maximum tolerated dose for 2–4 weeks does not provide adequate pain relief, consider switching to a different NSAID.

A tumour necrosis factor (TNF) alpha inhibitor (or biological DMARD) such as adalimumab p. 1073, certolizumab pegol p. 1076, etanercept p. 1078, golimumab p. 1080, or infliximab p. 1082 is recommended as an option for treating severe active **ankylosing spondylitis** in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

Secukinumab p. 1066 is recommended as an option for treating active ankylosing spondylitis in patients who have responded inadequately to NSAIDs or TNF-alpha inhibitors (see *National funding/access decisions* under secukinumab p. 1066).

Adalimumab p. 1073, certolizumab pegol p. 1076 and etanercept p. 1078 are also recommended as options for treating severe **non-radiographic axial spondyloarthritis** in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The choice of treatment should depend on patient preference and extra-articular involvement. The response to treatment should be assessed after 12 weeks and should only be continued if there is clear evidence of response.

Treatment with another TNF-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response. [A](#)

Psoriatic arthritis and other peripheral spondyloarthritides
[E](#)[V](#)[Gr](#) Monotherapy with local corticosteroid injections should be considered for non-progressive **monoarthritis** (see Corticosteroids, inflammatory disorders p. 1118).

Standard DMARDs, such as methotrexate p. 888, leflunomide p. 1063 or sulfasalazine p. 42, can be used for patients with peripheral **polyarthritis**, **oligoarthritis**, or persistent or progressive **monoarthritis** associated with peripheral spondyloarthritis.

Standard DMARDs, such as methotrexate p. 888 or leflunomide p. 1063 can also be used for patients with **psoriatic arthritis**.

The choice of DMARD will depend on numerous factors such as the patient's circumstances (such as pregnancy planning and alcohol consumption), comorbidities (such as uveitis, psoriasis and inflammatory bowel disease), and potential side-effects.

If a standard DMARD taken at the maximum tolerated dose for at least 3 months does not provide adequate relief from symptoms, a switch to, or the addition of, another standard DMARD can be considered.

An NSAID can be used as an adjunct to standard DMARDs or biological DMARDs to manage symptoms. If NSAIDs do not provide adequate relief from symptoms, consider corticosteroid injections or short-term oral corticosteroid therapy as an adjunct to standard DMARDs or biological DMARDs to manage symptoms.

If extra-articular disease is adequately controlled by an existing standard DMARD but peripheral spondyloarthritis is not, consider adding another standard DMARD. [A](#)

Further options for psoriatic arthritis

[E](#)[V](#)[Gr](#) The targeted DMARD apremilast p. 1084, used alone or in combination with standard DMARDs, is recommended for the treatment of active and progressive psoriatic arthritis if the patient has peripheral arthritis with 3 or more tender joints and 3 or more swollen joints, and the psoriatic arthritis has not responded to at least 2 standard DMARDs given alone or in combination.

The biological DMARDs etanercept p. 1078, infliximab p. 1082, golimumab p. 1080 and adalimumab p. 1073 (TNF-alpha inhibitors) are recommended for the treatment of active and progressive psoriatic arthritis if the patients has

peripheral arthritis with 3 or more tender joints and 3 or more swollen joints, and the psoriatic arthritis has not responded to at least 2 standard DMARDs given alone or in combination.

Ustekinumab p. 1069, alone or in combination with methotrexate, is recommended for treating active psoriatic arthritis when treatment with TNF-alpha inhibitors is contra-indicated but would otherwise be considered or the patient has had treatment with one or more TNF-alpha inhibitors. The response to treatment should be assessed at 24 weeks and should only be continued if there is clear evidence of response. [A](#)

Reactive arthritis

[E](#)[V](#)[Gr](#) After treating the initial infection, do not offer long-term (4 weeks or longer) treatment with an antibacterial solely to manage reactive arthritis caused by a gastrointestinal or genito-urinary infection. [A](#)

Rheumatic disease, suppressing drugs

Overview

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*; gold, penicillamine p. 1063, hydroxychloroquine sulfate p. 1062, chloroquine p. 604, and sulfasalazine p. 42 can also suppress the disease process in *rheumatoid arthritis* while sulfasalazine and possibly gold can suppress the disease process in *psoriatic arthritis*. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

Choice

The choice of a disease-modifying antirheumatic drug should take into account co-morbidity and patient preference. Methotrexate p. 888, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term **corticosteroid**, should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and penicillamine are effective in *palindromic rheumatism*. *Systemic* and *discoid lupus erythematosus* are sometimes treated with chloroquine or hydroxychloroquine sulfate.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

Gold

Gold can be given as sodium aurothiomalate p. 1064 for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Penicillamine

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

Antimalarials

The antimalarial hydroxychloroquine sulfate is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed.

Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine. Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine hydrochloride p. 498 is sometimes used in discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. Azathioprine p. 816, ciclosporin p. 818, cyclophosphamide p. 871, leflunomide p. 1063, and the **cytokine modulators** are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 993 given every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further

4–6 months. Leflunomide, which is similar in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used.

Ciclosporin is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide may be used for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given for severe systemic rheumatoid arthritis and for other connective tissue diseases (especially with active vasculitis).

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

Juvenile idiopathic arthritis

Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine are no longer used. Cytokine modulators have a role in juvenile idiopathic arthritis.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 1073, certolizumab pegol p. 1076, etanercept p. 1078, golimumab p. 1080, and infliximab p. 1082 inhibit the activity of tumour necrosis factor alpha (TNF- α).

Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other disease-modifying antirheumatic drugs (including methotrexate p. 888) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis and severe active ankylosing spondylitis that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate. Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active

axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Etanercept is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive *psoriatic arthritis* inadequately responsive to other disease-modifying antirheumatic drugs, and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive *rheumatoid arthritis* not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment.

Infliximab is licensed for the treatment of active *rheumatoid arthritis* in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive *rheumatoid arthritis*. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to disease-modifying antirheumatic drugs.

Rituximab p. 859 is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 1073 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

Anakinra p. 1065 inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone. Anakinra is not recommended for the treatment of *rheumatoid arthritis* except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for *rheumatoid arthritis* should continue treatment until they and their specialist consider it appropriate to stop.

Baricitinib p. 1071 and tofacitinib p. 1072 are licensed alone or in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* in patients who have had an inadequate response to, or who are intolerant to, one or more disease-modifying antirheumatic drugs.

Belimumab p. 825 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Sarilumab p. 1065 is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines; it is licensed alone or in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs.

Secukinumab p. 1066 inhibits the activity of interleukin-17A. Secukinumab is licensed for the treatment of active *psoriatic arthritis*, in combination with methotrexate or alone, which has not responded adequately to disease-modifying antirheumatic drugs; it is also licensed for the treatment of *ankylosing spondylitis*, in patients who have not responded adequately to conventional therapy. Secukinumab also has a role in plaque psoriasis.

Tocilizumab p. 1068 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 1069 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active *psoriatic arthritis* (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

Other drugs used for Arthritis Acetofenac, p. 1096 • Acemetacin, p. 1097 • Celecoxib, p. 1097 • Dexibuprofen, p. 1098 • Diclofenac potassium, p. 1100 • Diclofenac sodium, p. 1101 • Etodolac, p. 1103 • Etoricoxib, p. 1104 • Fenoprofen, p. 1105 • Flurbiprofen, p. 1106 • Ibuprofen, p. 1106 • Indometacin, p. 1109 • Ixekizumab, p. 1224 • Ketoprofen, p. 1110 • Mefenamic acid, p. 1111 • Meloxicam, p. 1112 • Nabumetone, p. 1113 • Naproxen, p. 1113 • Piroxicam, p. 1115 • Prednisone, p. 666 • Sulindac, p. 1116 • Tenoxicam, p. 1117 • Tiaprofenic acid, p. 1117

CHONDROPROTECTIVE DRUGS

Glucosamine

- **DRUG ACTION** Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

• INDICATIONS AND DOSE

ALATERIS®

Symptomatic relief of mild to moderate osteoarthritis of the knee

- BY MOUTH
- Adult: 1250 mg once daily, review treatment if no benefit after 2–3 months

DOLENIO®

Symptomatic relief of mild to moderate osteoarthritis of the knee

- BY MOUTH
- Adult: 1500 mg once daily, review treatment if no benefit after 2–3 months

continued →

GLUSARTEL®

Symptomatic relief of mild to moderate osteoarthritis of the knee

► BY MOUTH

- Adult: 1500 mg once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2–3 months

- **CAUTIONS** Asthma · impaired glucose tolerance · predisposition to cardiovascular disease
- **INTERACTIONS** → Appendix 1: glucosamine
- **SIDE-EFFECTS**
 - **Common or very common** Constipation · diarrhoea · fatigue · gastrointestinal discomfort · headache · nausea
 - **Uncommon** Flushing · skin reactions
 - **Rare or very rare** Jaundice
 - **Frequency not known** Angioedema · asthma · diabetes mellitus · dizziness · hypercholesterolaemia · oedema · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a shellfish allergy.
- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor blood-glucose concentration before treatment and periodically thereafter in patients with impaired glucose tolerance.
 - Monitor cholesterol in patients with predisposition to cardiovascular disease.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (May 2008) that glucosamine (*Alateris*®) and (July 2011) glucosamine (*Glusartel*®) are **not** recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing—the mechanism of action is not understood and there is limited evidence to show it is effective.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

ELECTROLYTES: May contain Sodium

► **Dolenio** (Alissa Healthcare Research Ltd)

Dolenio 1500mg tablets | 30 tablet (PoM) £18.20 DT = £18.20

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS**Hydroxychloroquine sulfate**● **INDICATIONS AND DOSE**

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

► BY MOUTH

- Adult: 200–400 mg daily, daily maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

- **CAUTIONS** Acute porphyrias p. 1025 · diabetes (may lower blood glucose) · elderly · G6PD deficiency · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy) · severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

- **Screening for ocular toxicity** A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening* 2009). The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

Before treatment:

- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)

During treatment:

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor's advice about stopping treatment
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

- **INTERACTIONS** → Appendix 1: hydroxychloroquine

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · appetite decreased · diarrhoea · emotional lability · headache · nausea · skin reactions · vision disorders · vomiting
- **Uncommon** Alopecia · corneal oedema · dizziness · eye disorders · hair colour changes · hearing impairment · nervousness · neuromuscular dysfunction · retinopathy · seizure · vertigo
- **Frequency not known** Acute hepatic failure · agranulocytosis · anaemia · angioedema · bone marrow disorders · bronchospasm · cardiac conduction disorders · cardiomyopathy · hypoglycaemia · leucopenia · movement disorders · muscle weakness · myopathy · photosensitivity reaction · psychosis · reflexes absent · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tremor · ventricular hypertrophy

Overdose Hydroxychloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.
- **BREAST FEEDING** Avoid—risk of toxicity in infant.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor plasma-hydroxychloroquine concentration in severe renal impairment.
- **MONITORING REQUIREMENTS** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists).
- **PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Hydroxychloroquine sulfate (Non-proprietary)

Hydroxychloroquine sulfate 200 mg Hydroxychloroquine 200mg tablets | 60 tablet [PoM] £32.49 DT = £5.83

Quinoric (Bristol Laboratories Ltd)

Hydroxychloroquine sulfate 200 mg Quinoric 200mg tablets | 60 tablet [PoM] £4.75 DT = £5.83

Leflunomide

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis (specialist use only)

BY MOUTH

- Adult: Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

Active psoriatic arthritis (specialist use only)

BY MOUTH

- Adult: Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily

- CONTRA-INDICATIONS** Serious infection · severe hypoproteinaemia · severe immunodeficiency

- CAUTIONS** Anaemia (avoid if significant and due to causes other than rheumatoid arthritis) · history of tuberculosis · impaired bone-marrow function (avoid if significant and due to causes other than rheumatoid arthritis) · leucopenia (avoid if significant and due to causes other than rheumatoid arthritis) · thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis)

- INTERACTIONS** → Appendix 1: leflunomide

SIDE-EFFECTS

- Common or very common** Abdominal pain · accelerated hair loss · appetite decreased · asthenia · diarrhoea · dizziness · gastrointestinal disorders · headache · leucopenia · nausea · oral disorders · paraesthesia · peripheral neuropathy · skin reactions · tendon disorders · vomiting · weight decreased
- Uncommon** Anaemia · anxiety · electrolyte imbalance · hyperlipidaemia · taste altered · thrombocytopenia
- Rare or very rare** Agranulocytosis · eosinophilia · hepatic disorders · infection · pancreatitis · pancytopenia · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · vasculitis
- Frequency not known** Cutaneous lupus erythematosus · hypouricaemia · pulmonary hypertension · renal failure
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).
- Hepatotoxicity** Potentially life-threatening hepatotoxicity reported usually in the first 6 months. Discontinue treatment (and institute washout procedure—consult product literature) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.
- CONCEPTION AND CONTRACEPTION** Effective contraception **essential** during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature). The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature.

- PREGNANCY** Avoid—active metabolite teratogenic in *animal* studies.

- BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- HEPATIC IMPAIRMENT** Avoid—active metabolite may accumulate.

- RENAL IMPAIRMENT** Manufacturer advises avoid in moderate or severe impairment—no information available.

- PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

MONITORING REQUIREMENTS

- Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.
- Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks.
- Monitor blood pressure.

TREATMENT CESSATION

Washout procedure The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give *either* colestyramine p. 196 or charcoal, activated p. 1326. Procedure may be repeated as necessary.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Penicillamine

- DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

INDICATIONS AND DOSE

Severe active rheumatoid arthritis (administered on expert advice)

BY MOUTH

- Adult: Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg, at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks, dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day
- Elderly: Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg, at intervals of at least 4 weeks; maximum 1 g per day

Wilson's disease

BY MOUTH

- Adult: 1.5–2 g daily in divided doses, adjusted according to response, to be taken before food; maintenance 0.75–1 g daily, a dose of 2 g daily should not be continued for more than one year; maximum 2 g per day
- Elderly: 20 mg/kg daily in divided doses, adjusted according to response

continued →

Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)

► BY MOUTH

- Adult: Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily

Cystinuria, therapeutic

► BY MOUTH

- Adult: 1–3 g daily in divided doses, to be adjusted to maintain urinary cystine below 200 mg/litre, to be taken before food

Cystinuria, prophylactic

► BY MOUTH

- Adult: 0.5–1 g daily, maintain urinary cystine below 300 mg/litre and adequate fluid intake (at least 3 litres daily), to be taken at bedtime
- Elderly: Minimum dose to maintain urinary cystine below 200 mg/litre is recommended

- **CONTRA-INDICATIONS** Lupus erythematosus
- **CAUTIONS** Neurological involvement in Wilson's disease
- **INTERACTIONS** → Appendix 1: penicillamine
- **SIDE-EFFECTS**
 - Common or very common Proteinuria • thrombocytopenia
 - Rare or very rare Alopecia • breast enlargement (males and females) • connective tissue disorders • haematuria (discontinue immediately if cause unknown) • hypersensitivity • oral disorders • skin reactions
 - Frequency not known Agranulocytosis • aplastic anaemia • appetite decreased • fever • glomerulonephritis • Goodpasture's syndrome • haemolytic anaemia • increased risk of infection • jaundice cholestatic • leucopenia • lupus-like syndrome • myasthenia gravis • nausea • nephrotic syndrome • neurological deterioration in Wilson's Disease • neutropenia • pancreatitis • polymyositis • pulmonary haemorrhage • rash (consider dose reduction) • respiratory disorders • Stevens-Johnson syndrome • taste loss (mineral supplements not recommended) • vomiting • yellow nail syndrome

SIDE-EFFECTS, FURTHER INFORMATION Proteinuria occurs in up to 30% of patients—can be a sign of immune-mediated nephropathy. Discontinue immediately if nephrotoxicity occurs.

Nausea and rash more common early in treatment if full dose used from initiation. Delayed rash can occur after months or years of treatment—manufacturer advises reduce dose.

- **ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.
- **PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose and monitor renal function or avoid (consult product literature).
- **MONITORING REQUIREMENTS**
 - Consider withdrawal if platelet count falls below $120\,000/\text{mm}^3$ or white blood cells below $2500/\text{mm}^3$ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).
 - Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they

should also be carried out in the week after any dose increase).

- A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase.
- Longer intervals may be adequate in cystinuria and Wilson's disease.
- **PATIENT AND CARER ADVICE** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

Sodium aurothiomalate● **INDICATIONS AND DOSE****Active progressive rheumatoid arthritis (administered on expert advice)**

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: Test dose 10 mg, followed by 50 mg once weekly until there is definite evidence of remission, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, dose to be reduced gradually. Benefit is not expected until 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given

Relapse in patients who have previously received sodium aurothiomalate therapy for active progressive rheumatoid arthritis (administered on expert advice)

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 50 mg once weekly until control has been obtained again, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, if no response is seen within 2 months, alternative treatment should be sought

- **CONTRA-INDICATIONS** Exfoliative dermatitis • history of blood disorders • history of bone marrow aplasia • necrotising enterocolitis • pulmonary fibrosis • systemic lupus erythematosus
- **CAUTIONS** Colitis • eczema • elderly • history of urticaria
- **CAUTIONS, FURTHER INFORMATION** Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre.
- **INTERACTIONS** → Appendix 1: sodium aurothiomalate
- **SIDE-EFFECTS** Abdominal pain • agranulocytosis • albuminuria • alopecia • asthenia • blood disorder • bone marrow disorders • circulatory collapse • dry cough • dyspnoea • encephalopathy • enterocolitis • eosinophilia • flushing • hepatic disorders • hypersensitivity • hypotension • leucopenia • nephrotic syndrome • nerve disorders • neutropenia • palpitations • respiratory disorders • shock • skin reactions • tachycardia • thrombocytopenia
- SIDE-EFFECTS, FURTHER INFORMATION** Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

- **PREGNANCY** Manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled.
Dose adjustments Consider reducing dose and frequency.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Urine tests and full blood counts (including total and differential white cell and platelet counts) must be performed before starting treatment and before each intramuscular injection.
 - ▶ Monitor for pulmonary fibrosis with annual chest X-ray.
- **PATIENT AND CARER ADVICE** Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop.

● MEDICINAL FORMS

Solution for injection

CAUTIONARY AND ADVISORY LABELS 11

▶ Myocrisin (Sanofi)

Sodium aurothiomalate 20 mg per 1 ml Myocrisin 10mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £45.55

Sodium aurothiomalate 100 mg per 1 ml Myocrisin 50mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £134.80

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

Anakinra

● INDICATIONS AND DOSE

Treatment of rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 100 mg once daily

- **CONTRA-INDICATIONS** Neutropenia
- **CAUTIONS** History of asthma (risk of serious infection) · predisposition to infection
- **INTERACTIONS** → Appendix 1: anakinra
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Headache · infection · neutropenia · thrombocytopenia
 - ▶ **Uncommon** Skin reactions
 - ▶ **Frequency not known** Hepatitis
- SIDE-EFFECTS, FURTHER INFORMATION** Neutropenia reported commonly—discontinue if neutropenia develops.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months.

● PATIENT AND CARER ADVICE

Blood disorders Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2002) that anakinra is **not** recommended for the treatment of rheumatoid arthritis within NHS Scotland.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Kineret (Swedish Orphan Biovitrum Ltd)

Anakinra 150 mg per 1 ml Kineret 100mg/0.67ml solution for injection pre-filled syringes | 28 pre-filled disposable injection [PoM] £734.44

Sarilumab

30-Nov-2017

- **DRUG ACTION** Sarilumab is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines.

● INDICATIONS AND DOSE

Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (specialist use only)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 200 mg every 2 weeks, for dose adjustments due to neutropenia, thrombocytopenia, or liver enzyme elevations—consult product literature

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than $2 \times 10^9/\text{litre}$ · do not initiate if platelet count less than $150 \times 10^3/\text{microlitre}$ · do not initiate if serum transaminases (ALT or AST) greater than 1.5 times the upper limit of normal · severe active infection

- **CAUTIONS** Chronic or recurrent infection · elderly (increased risk of infection) · history of diverticulitis · history of intestinal ulceration · history of serious or opportunistic infection · predisposition to infection

CAUTIONS, FURTHER INFORMATION

- ▶ **Infection** Manufacturer advises caution in patients who have been exposed to tuberculosis, or who have lived in or travelled to areas of endemic tuberculosis or mycoses. Patients with latent tuberculosis should complete anti-tuberculosis therapy before initiation of sarilumab; consider anti-tuberculosis therapy before initiation of sarilumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed, and for those with a negative test for latent tuberculosis but have risk factors for tuberculosis—consultation with a tuberculosis specialist may be appropriate.

Manufacturer advises patients should be brought up-to-date with current immunisation schedule before initiating treatment.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Dyslipidaemia · increased risk of infection · neutropenia · thrombocytopenia
- ▶ **Frequency not known** Hypersensitivity · skin reactions
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for up to 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in active hepatic disease or hepatic impairment—no information available.
- **PRE-TREATMENT SCREENING** Manufacturer advises that patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor for signs and symptoms of infection; monitor neutrophil count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if absolute neutrophil count less than $0.5 \times 10^9/\text{litre}$.
 - ▶ Manufacturer advises monitor platelet count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if platelet count less than $50 \times 10^3/\text{microlitre}$.
 - ▶ Manufacturer advises monitor hepatic transaminases (ALT and AST) 4 to 8 weeks after treatment initiation and every 3 months thereafter, and consider other liver function tests if clinically indicated—discontinue if ALT is greater than 5 times the upper limit of normal.
 - ▶ Manufacturer advises monitor lipid profile approximately 4 to 8 weeks after treatment initiation and approximately every 6 months thereafter—hyperlipidaemia should be managed according to clinical guidelines.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that are tender, damaged, or have bruises or scars; patients may self-administer Kevzara[®], after appropriate training in subcutaneous injection technique.
- **PRESCRIBING AND DISPENSING INFORMATION** Sarilumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients should be advised to seek immediate medical attention if symptoms of a hypersensitivity reaction occur. Self-administration Manufacturer advises patients and their carers should be given training in subcutaneous injection technique if appropriate.

An alert card should be provided.

Missed doses Manufacturer advises if a dose is more than 3 days late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Sarilumab for moderate-to-severe rheumatoid arthritis (November 2017) NICE TA485**
Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), only if:
 - disease is severe (a disease activity score [DAS28] of more than 5.1), and
 - the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to or who

cannot have other DMARDs, including at least 1 biological DMARD, only if:

- disease is severe (a DAS28 of more than 5.1), and
- they cannot have rituximab, and
- the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

Sarilumab can be used as monotherapy for people who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above criteria are met.

Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to rituximab and at least 1 biological DMARD, only if:

- disease is severe (a DAS28 of more than 5.1), and
- the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta485

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1314/18

The *Scottish Medicines Consortium* has advised (April 2018) that sarilumab (Kevzara[®]) is accepted for restricted use within NHS Scotland for treatment of severely active rheumatoid arthritis (a disease activity score [DAS28] greater than 5.1) that has not responded to intensive therapy with a combination of conventional disease-modifying anti-rheumatic drugs (DMARDs). In patients with severe disease inadequately controlled by a TNF antagonist, it may be used in patients ineligible to receive rituximab. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

Secukinumab

15-Aug-2017

- **DRUG ACTION** Secukinumab is a recombinant human monoclonal antibody that selectively binds to cytokine interleukin-17A (IL-17A) and inhibits the release of proinflammatory cytokines and chemokines.

● INDICATIONS AND DOSE

Psoriatic arthritis | Ankylosing spondylitis

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 150 mg every week for 5 doses, then maintenance 150 mg every month, review treatment if no response within 16 weeks of initial dose

Psoriatic arthritis with concomitant moderate to severe plaque psoriasis or if inadequate response to anti-TNF α treatment | Plaque psoriasis

► BY SUBCUTANEOUS INJECTION

- Adult: 300 mg every week for 5 doses, then maintenance 300 mg every month, review treatment if no response within 16 weeks of initial dose

● CONTRA-INDICATIONS Severe active infection

- CAUTIONS Chronic infection · Crohn's disease (monitor for exacerbations) · history of recurrent infection · predisposition to infection (discontinue if new serious infection develops)

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting secukinumab.

● INTERACTIONS → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- Common or very common Diarrhoea · increased risk of infection · rhinorrhoea
- Uncommon Conjunctivitis · neutropenia (usually mild and reversible) · urticaria

● CONCEPTION AND CONTRACEPTION Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 20 weeks after stopping treatment.

● PREGNANCY Manufacturer advises avoid—no information available.

● BREAST FEEDING Manufacturer advises avoid during treatment and for up to 20 weeks after discontinuing treatment—no information available.

● DIRECTIONS FOR ADMINISTRATION Manufacturer advises to take the syringe or pen out of the refrigerator 20 minutes before administration and to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer *Cosentyx*[®] pre-filled pen.

● PATIENT AND CARER ADVICE

Self-administration Patients and their carers should be given training in subcutaneous injection technique.
Infection Patients and their carers should be advised to seek immediate medical attention if symptoms of infection develop during treatment with secukinumab.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Secukinumab for treating moderate to severe plaque psoriasis (July 2015) NICE TA350

Secukinumab is recommended as an option for the treatment of moderate to severe plaque psoriasis in adults if:

- the disease has failed to respond to standard systemic treatments (including ciclosporin, methotrexate, and PUVA), or when standard treatments are contra-indicated or not tolerated; *and*
 - the manufacturer provides secukinumab with the discount agreed in the patient access scheme
- Secukinumab should be withdrawn in patients whose psoriasis has not responded adequately within 12 weeks of initial dose; further treatment cycles are not recommended.

Patients whose treatment with secukinumab was started before this guidance was published, but does not meet these criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA350

- Secukinumab for active ankylosing spondylitis after treatment with non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors (September 2016) NICE TA407

Secukinumab is recommended, within its marketing authorisation, as an option for treating active ankylosing spondylitis in adults who have responded inadequately to conventional therapy (non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors) only if the manufacturer provides secukinumab with the discount agreed in the patient access scheme.

Assess response to secukinumab after 16 weeks of treatment and continue only if there is clear evidence of response, defined as a reduction in the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score to 50% of the pre-treatment value or by 2 or more units *and* a reduction in the spinal pain visual analogue scale (VAS) by 2 cm or more.

www.nice.org.uk/TA407

- Certolizumab pegol and secukinumab for treating active psoriatic arthritis after inadequate response to DMARDs (May 2017) NICE TA445

Secukinumab alone, or in combination with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults only if:

- it is used as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2) or,
- the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has not responded within the first 12 weeks or has stopped responding after 12 weeks or,
- TNF-alpha inhibitors are contra-indicated but would otherwise be considered.

Secukinumab is only recommended if the manufacturer provides it as agreed in the patient access scheme.

Assess the response to secukinumab after 16 weeks of treatment. Treatment should only be continued if there is clear evidence of response, defined as an improvement in at least 2 of the 4 Psoriatic Arthritis Response Criteria (PsARC), 1 of which must be joint tenderness or swelling score, with no worsening in any of the 4 criteria. People whose disease has a Psoriasis Area and Severity Index (PASI) 75 response but whose PsARC response does not justify continuing treatment should be assessed by a dermatologist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA445

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2015) that secukinumab (*Cosentyx*[®]) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), or when standard treatments cannot be used because of intolerance or contra-indications.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- *Cosentyx* (Novartis Pharmaceuticals UK Ltd) ▼

Secukinumab 150 mg per 1 ml *Cosentyx* 150mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection [PoM] £1,218.78

Tocilizumab

24-May-2018

● INDICATIONS AND DOSE

Rheumatoid arthritis [severe, active and progressive, not previously treated with methotrexate] Rheumatoid arthritis [moderate-to-severe, in combination with methotrexate or alone if methotrexate inappropriate, when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs]

► BY INTRAVENOUS INFUSION

Adult: 8 mg/kg every 4 weeks (max. per dose 800 mg), for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature

► BY SUBCUTANEOUS INJECTION

Adult: 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature

Giant cell arteritis [in combination with a tapering course of glucocorticoid or alone following discontinuation of glucocorticoid]

► BY SUBCUTANEOUS INJECTION

Adult: 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, not to be used alone for acute relapses; review need for treatment beyond 52 weeks

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than $2 \times 10^9/\text{litre}$ · severe active infection
- **CAUTIONS** History of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count · low platelet count · predisposition to infection (interrupt treatment if serious infection occurs)
- **CAUTIONS, FURTHER INFORMATION**
 - Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · conjunctivitis · cough · dizziness · dyslipidaemia · dyspnoea · gastrointestinal disorders · headache · hypersensitivity · hypertension · increased risk of infection · leucopenia · neutropenia · oral disorders · peripheral oedema · skin reactions · weight increased
 - **Uncommon** Hypothyroidism · nephrolithiasis
 - **Frequency not known** Infusion related reaction · interstitial lung disease · pancytopenia · Stevens-Johnson syndrome
- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if absolute neutrophil count less than $0.5 \times 10^9/\text{litre}$ or platelet count less than $50 \times 10^3/\text{microlitre}$.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.

● RENAL IMPAIRMENT

- With intravenous use Manufacturer advises monitor renal function closely in moderate-to-severe impairment—no information available.
- With subcutaneous use Manufacturer advises monitor renal function closely in severe impairment—no information available.

● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- Manufacturer advises monitor for demyelinating disorders.
- Manufacturer advises monitor hepatic transaminases every 4–8 weeks for first 6 months of treatment, then every 12 weeks thereafter.
- Manufacturer advises monitor neutrophil and platelet count 4–8 weeks after starting treatment and then as indicated.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion*, manufacturer advises give intermittently in Sodium chloride 0.9%; dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.
- With subcutaneous use For *subcutaneous injection*, manufacturer advises rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer RoActemra[®], after appropriate training in subcutaneous injection technique.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises protect from light and store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

An alert card should be provided.

Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375
- Tocilizumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if **all** the following criteria are met:
- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
 - disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), and
 - the manufacturers provide tocilizumab as agreed in the patient access schemes.
- Tocilizumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.
- Continue treatment only if there is a moderate response measured using European League Against Rheumatism

(EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving tocilizumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/tas75

► **Tocilizumab for the treatment of rheumatoid arthritis (updated January 2016) NICE TA247**

Tocilizumab, in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:

- the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, **and** tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010), **or**
- the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
- **and** the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/guidance/ta247

► **Tocilizumab for treating giant cell arteritis (April 2018) NICE TA518**

Tocilizumab, when used with a tapering course of glucocorticoids (and when used alone after glucocorticoids), is recommended as an option for treating giant cell arteritis in adults, only if:

- they have relapsing or refractory disease,
- they have not already had tocilizumab,
- tocilizumab is stopped after 1 year of uninterrupted treatment at most, **and**
- the manufacturer provides it with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta518

Ustekinumab

03-Oct-2017

● **INDICATIONS AND DOSE**

Moderate-to-severe plaque psoriasis that has not responded to other systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications (specialist use only)

► **BY SUBCUTANEOUS INJECTION**

- Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks
- Adult (body-weight 100 kg and above): Initially 90 mg, then 90 mg after 4 weeks, then 90 mg every 12 weeks, consider discontinuation if no response within 28 weeks

Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs (specialist use only)

► **BY SUBCUTANEOUS INJECTION**

- Adult: Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks, higher doses of 90 mg may be used in patients with body-weight over 100 kg

Moderate to severe active Crohn's disease in patients who have had an inadequate response with, lost response to, are intolerant to, or have contra-indications to either conventional therapy or a tumour necrosis factor alpha inhibitor (specialist use only)

► **INITIALLY BY INTRAVENOUS INFUSION**

- Adult (body-weight up to 56 kg): 260 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency
- Adult (body-weight 56–85 kg): 390 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency
- Adult (body-weight 86 kg and above): 520 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency

● **CONTRA-INDICATIONS** Active infection

- **CAUTIONS** Development of malignancy · elderly · history of malignancy · predisposition to infection · start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected

CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately,

chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

► **Common or very common** Arthralgia · asthenia · back pain · diarrhoea · dizziness · headache · increased risk of infection · myalgia · nausea · oropharyngeal pain · skin reactions · vomiting

► **Uncommon** Depression · facial paralysis · hypersensitivity (may be delayed) · nasal congestion

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **PRE-TREATMENT SCREENING**

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● **MONITORING REQUIREMENTS**

► Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.
► Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (Stelara[®]), give intermittently in Sodium Chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and give over at least 1 hour through an in-line low-protein binding filter (pore size 0.2 micron); use within 4 hours of dilution.

● **PATIENT AND CARER ADVICE**

Exfoliative dermatitis Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.

Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Ustekinumab for the treatment of adults with moderate to severe psoriasis (updated March 2017)** NICE TA180
Ustekinumab is recommended as a treatment option for adults with plaque psoriasis only if:

- the disease is severe, defined by a total Psoriasis Area Severity Index (PASI) score of 10 or more and a Dermatology Life Quality Index (DLQI) score of 10 or more, **and**
- the psoriasis has not responded to standard systemic therapies (e.g. ciclosporin, methotrexate and psoralen and long-wave ultraviolet radiation), or patients are intolerant to or have a contra-indication to these treatments.

Ustekinumab treatment should be stopped 16 weeks after starting treatment if the psoriasis has not shown a 75% reduction in the PASI score from when treatment started, or a 50% reduction in the PASI score and a 5-point reduction in the DLQI score from when treatment started.

www.nice.org.uk/guidance/TA180

► **Ustekinumab for treating active psoriatic arthritis (updated March 2017)** NICE TA340

Ustekinumab is recommended as an option, alone or in combination with methotrexate, for treating active psoriatic arthritis in adults only when:

- treatment with tumour necrosis factor (TNF) alpha inhibitors is contra-indicated but would otherwise be considered, *or*
- the patient has had treatment with 1 or more TNF-alpha inhibitors.

Ustekinumab should be stopped at 24 weeks, if the psoriatic arthritis has not shown adequate response using the Psoriatic Arthritis Response Criteria (PsARC).

Patients currently receiving ustekinumab who do not meet the above criteria and whose treatment was started within the NHS before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA340

► **Ustekinumab for moderately to severely active Crohn's disease after previous treatment (July 2017)** NICE TA456

Ustekinumab is recommended as an option for treating moderately to severely active Crohn's disease in adults who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a TNF-alpha inhibitor or have medical contra-indications to such therapies.

Ustekinumab should be given until treatment failure (including the need for surgery) or until 12 months after the start of treatment, whichever is shorter.

www.nice.org.uk/guidance/TA456

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that ustekinumab (Stelara[®]) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

The *Scottish Medicines Consortium* has advised (July 2017) that ustekinumab (Stelara[®]) is accepted for use within NHS Scotland for the treatment of adults with moderately to severely active Crohn's disease who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a tumour necrosis factor-alpha antagonist or have medical contra-indications to such therapies. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Ustekinumab 5 mg per 1 ml Stelara 130mg/26ml concentrate for solution for infusion vials | 1 vial [PoM] £2,147.00

IMMUNOSUPPRESSANTS > PROTEIN KINASE INHIBITORS

Baricitinib

28-Sep-2017

- **DRUG ACTION** Baricitinib selectively and reversibly inhibits the Janus-associated tyrosine kinases JAK1 and JAK2.

● INDICATIONS AND DOSE

Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to, one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (initiated by a specialist)

► BY MOUTH

- Adult 18-74 years: 4 mg once daily, for dose adjustments due to side-effects or dose reduction due to history of infection or sustained control of disease activity, consult product literature
- Adult 75 years and over: 2 mg once daily, for dose adjustments due to side-effects, consult product literature

- **CONTRA-INDICATIONS** Absolute lymphocyte count less than 0.5×10^9 cells/litre (do not initiate) • absolute neutrophil count less than 1×10^9 cells/litre (do not initiate) • active tuberculosis • haemoglobin less than 8 g/dL (do not initiate)
- **CAUTIONS** Active, chronic or recurrent infection (interrupt treatment if no response to standard therapy) • risk of viral reactivation (consult product literature)
- CAUTIONS, FURTHER INFORMATION**
 - Tuberculosis Manufacturer advises consider anti-tuberculosis therapy prior to initiation of baricitinib in patients with previously untreated latent tuberculosis.
- **INTERACTIONS** → Appendix 1: baricitinib
- **SIDE-EFFECTS**
 - **Common or very common** Dyslipidaemia • herpes zoster (interrupt treatment) • increased risk of infection • nausea • oropharyngeal pain • thrombocytosis
 - **Uncommon** Acne • neutropenia • weight increased
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 1 week after treatment in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
Dose adjustments Manufacturer advises reduce dose to 2 mg once daily if creatinine clearance 30–60 mL/minute.
- **PRE-TREATMENT SCREENING** Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.
- **MONITORING REQUIREMENTS**
 - Manufacturer advises monitor patients with hepatitis B surface antibody and hepatitis B core antibody, without hepatitis B surface antigen, for expression of hepatitis B virus (HBV) DNA—if HBV DNA detected, consult liver specialist for advice.
 - Manufacturer advises monitor lipid profile 12 weeks after treatment initiation—hyperlipidaemia should be managed according to international clinical guidelines; monitor hepatic transaminases routinely—interrupt treatment if drug-induced liver injury suspected.

- Manufacturer advises monitor for haematological abnormalities; interrupt treatment if absolute neutrophil count less than 1×10^9 cells/litre, absolute lymphocyte count less than 0.5×10^9 cells/litre, or haemoglobin less than 8 g/dL—treatment may be restarted when levels return above these values.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Baricitinib for moderate to severe rheumatoid arthritis (August 2017)** NICE TA466
Baricitinib, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in patients whose disease has responded inadequately to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), only if:
 - disease is severe (a disease activity score [DAS28] of more than 5.1), **and**
 - the company provides baricitinib with the discount agreed in the patient access scheme (PAS).
 Baricitinib, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in patients whose disease has responded inadequately to or who cannot have other DMARDs, including at least one biological DMARD, only if:
 - disease is severe (a DAS28 of more than 5.1), **and**
 - they cannot have rituximab, **and**
 - the company provides baricitinib with the discount agreed in the PAS.
 Baricitinib can be used as monotherapy for people who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above two sets of criteria are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients currently receiving baricitinib whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA466

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2017) that baricitinib (Olumiant®) is accepted for restricted use within NHS Scotland for the treatment of active rheumatoid arthritis only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, **and**
- disease has not responded to intensive therapy with a combination of conventional disease-modifying anti-rheumatic drugs, **or**
- disease inadequately controlled by a tumour necrosis factor antagonist and patients are ineligible to receive rituximab.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent of lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Olumiant** (Eli Lilly and Company Ltd) ▼

Baricitinib 2 mg Olumiant 2mg tablets | 28 tablet [PoM] £805.56
Baricitinib 4 mg Olumiant 4mg tablets | 28 tablet [PoM] £805.56 | 84 tablet [PoM] £2,416.68

Tofacitinib

30-Nov-2017

- **DRUG ACTION** Tofacitinib selectively inhibits the Janus-associated tyrosine kinases JAK1 and JAK3.

● INDICATIONS AND DOSE

Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (specialist use only)

► BY MOUTH

- Adult: 5 mg twice daily, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to 5 mg once daily with concurrent use of potent CYP3A4 inhibitors or drugs which are both moderate CYP3A4 and potent CYP2C19 inhibitors.

- **CONTRA-INDICATIONS** Absolute lymphocyte count less than 750 cells/mm³ (do not initiate) · absolute neutrophil count less than 1000 cells/mm³ (do not initiate) · active infection including localised infection · active tuberculosis · haemoglobin less than 9 g/dL (do not initiate)

- **CAUTIONS** Active, chronic or recurrent infection · elderly · predisposition to infection · previous or current malignancy · raised serum transaminases (particularly in combination with potentially hepatotoxic drugs) · risk of gastrointestinal perforation (new onset abdominal signs and symptoms should be evaluated promptly) · risk of viral reactivation (consult product literature)

CAUTIONS, FURTHER INFORMATION Manufacturer advises patients should receive all recommended vaccinations before starting treatment (consider prophylactic varicella zoster vaccination); live vaccines should be given at least 2 weeks, but preferably 4 weeks before treatment initiation—consult product literature.

- Tuberculosis Manufacturer advises consider anti-tuberculosis therapy prior to initiation of tofacitinib in patients with previously untreated latent tuberculosis.

- **INTERACTIONS** → Appendix 1: tofacitinib

● SIDE-EFFECTS

- **Common or very common** Anaemia · cough · decreased leucocytes · diarrhoea · dyslipidaemia · dyspnoea · fatigue · fever · gastritis · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · joint disorders · musculoskeletal pain · nausea · peripheral oedema · skin reactions · vomiting · weight increased
- **Uncommon** Dehydration · hepatic steatosis · ligament sprain · muscle strain · neutropenia · non-melanoma skin cancer · paraesthesia · sepsis · sinus congestion · tendinitis
- **Rare or very rare** Meningitis cryptococcal

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 4 weeks after treatment in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

Dose adjustments Manufacturer advises reduce dose to 5 mg once daily in moderate impairment.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose to 5 mg once daily in severe impairment.

- **PRE-TREATMENT SCREENING** Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor for signs and symptoms of infection during and after treatment.
- Manufacturer advises periodic skin examination in patients at increased risk for skin cancer.
- Manufacturer advises monitor liver function routinely; monitor lipid profile 8 weeks after treatment initiation.
- Manufacturer advises monitor lymphocytes at baseline and every 3 months thereafter; neutrophils and haemoglobin should be monitored at baseline, after 4 to 8 weeks of treatment and every 3 months thereafter.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets may be crushed and taken with water.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Tofacitinib for moderate-to-severe rheumatoid arthritis (October 2017)** NICE TA480

Tofacitinib, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), only if:

- disease is severe (a disease activity score [DAS28] of more than 5.1), **and**

- the manufacturer provides tofacitinib with the discount agreed in the patient access scheme.

Tofacitinib, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to, or who cannot have, other DMARDs, including at least 1 biological DMARD, only if:

- disease is severe (a DAS28 of more than 5.1), **and**
- they cannot have rituximab, **and**
- the manufacturer provides tofacitinib with the discount agreed in the patient access scheme.

Tofacitinib can be used as monotherapy for adults who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above criteria are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta480

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2018) that tofacitinib citrate (*Xeljanz*®) is accepted for restricted use within NHS Scotland in combination with methotrexate in adults with severe active rheumatoid arthritis (a disease activity score [DAS28] greater than 5.1) that has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs). In patients with severe disease inadequately controlled by a tumour necrosis factor (TNF) antagonist it may be used in patients ineligible to receive rituximab.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Xeljanz** (Pfizer Ltd) ▼

Tofacitinib 5 mg Xeljanz 5mg tablets | 56 tablet [PoM] £690.03 (Hospital only)

IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

01-Dec-2017

● INDICATIONS AND DOSE

Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 60 kg): 500 mg every 2 weeks for 3 doses, then 500 mg every 4 weeks, review treatment if no response within 6 months
- Adult (body-weight 60–100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months
- Adult (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Adult: 125 mg once weekly, review treatment if no response within 6 months, subcutaneous dosing may be initiated with or without an intravenous loading dose—consult product literature

● CONTRA-INDICATIONS Severe infection

- **CAUTIONS** Do not initiate until active infections are controlled · elderly (increased risk of side-effects) · predisposition to infection (screen for latent tuberculosis and viral hepatitis) · progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

● INTERACTIONS → Appendix 1: abatacept

● SIDE-EFFECTS

- **Common or very common** Asthenia · cough · diarrhoea · dizziness · gastrointestinal discomfort · headaches · hypertension · increased risk of infection · nausea · oral ulceration · skin reactions · vomiting
- **Uncommon** Alopecia · anxiety · arrhythmias · arthralgia · bruising tendency · conjunctivitis · depression · dry eye · dyspnoea · gastritis · hyperhidrosis · hypotension · influenza like illness · leucopenia · menstrual cycle irregularities · musculoskeletal and connective tissue infections and inflammations · pain in extremity · palpitations · paraesthesia · respiratory disorders · sepsis · sleep disorders · throat tightness · thrombocytopenia · vasculitis · vasodilation · vertigo · visual acuity decreased · weight increased
- **Rare or very rare** Pelvic inflammatory disease · respiratory malignancy

● CONCEPTION AND CONTRACEPTION Effective contraception required during treatment and for 14 weeks after last dose.

● PREGNANCY Manufacturer advises avoid unless essential.

● BREAST FEEDING Present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195
Abatacept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.
www.nice.org.uk/TA195

- **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375

Abatacept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if **all** the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provides abatacept as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving abatacept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF- α) INHIBITORS

Adalimumab

21-Feb-2018

● INDICATIONS AND DOSE

Plaque psoriasis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, review treatment if no response within 16 weeks—consult product literature

continued →

Rheumatoid arthritis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks

Psoriatic arthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist) | Axial spondyloarthritis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 40 mg every 2 weeks, review treatment if no response within 12 weeks

Crohn's disease (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Crohn's disease (accelerated regimen) (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Ulcerative colitis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 8 weeks of initial dose

Hidradenitis suppurativa (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 160 mg, given as either four 40 mg injections in one day or as two 40 mg injections per day for 2 consecutive days, followed by 80 mg after 2 weeks, given as two 40 mg injections in one day, then 40 mg after 2 weeks; maintenance 40 mg once weekly, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature

Uveitis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 80 mg, given as two 40 mg injections in one day, then 40 mg after 1 week; maintenance 40 mg every 2 weeks

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infection

- **CAUTIONS** Demyelinating disorders (risk of exacerbation) · development of malignancy · do not initiate until active infections are controlled (discontinue if new serious infection develops) · hepatitis B virus—monitor for active infection · history of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

CAUTIONS, FURTHER INFORMATION

- ▶ Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin

test, chemoprophylaxis can be given concurrently with adalimumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · arterial occlusion · asthma · broken nails · chest pain · coagulation disorder · connective tissue disorders · cough · dehydration · depression · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · healing impaired · hyperglycaemia · hypersensitivity · hypertension · increased risk of infection · insomnia · leucocytosis · leucopenia · mood altered · muscle spasms · musculoskeletal pain · nausea · neoplasms · nerve disorders · neutropenia · oedema · renal impairment · seasonal allergy · sensation abnormal · sepsis · skin reactions · sweat changes · thrombocytopenia · vasculitis · vertigo · vision disorders · vomiting
- ▶ **Uncommon** Aortic aneurysm · congestive heart failure · demyelinating disorders · dysphagia · erectile dysfunction · gallbladder disorders · hearing impairment · hepatic disorders · inflammation · lupus erythematosus · meningitis viral · myocardial infarction · nocturia · pancreatitis · respiratory disorders · rhabdomyolysis · sarcoidosis · solid organ neoplasm · stroke · tremor
- ▶ **Rare or very rare** Cardiac arrest · pancytopenia · Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid; manufacturer advises avoid for at least 5 months after last dose.

- **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
- ▶ Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
- ▶ For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

Adalimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **PATIENT AND CARER ADVICE** When used to treat *hidradenitis suppurativa*, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab. An alert card should be provided.

Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Adalimumab for plaque psoriasis in adults (June 2008)

NICE TA146

Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.

www.nice.org.uk/guidance/ta146

► Infliximab and adalimumab for Crohn's disease (May 2010)

NICE TA187

Adalimumab is recommended for the treatment of severe active Crohn's disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.

Adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab can be restarted.

www.nice.org.uk/guidance/ta187

► Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015)

NICE TA329

Adalimumab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Adalimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/guidance/ta329

► Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)

NICE TA199

Adalimumab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Adalimumab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/guidance/ta199

► Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)

NICE TA195

Adalimumab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab can be given as monotherapy. Treatment should be continued only if there

is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/guidance/ta195

► Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)

NICE TA375

Adalimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Adalimumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving adalimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta375

► TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)

NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/guidance/ta383

► Adalimumab for treating moderate-to-severe hidradenitis suppurativa (June 2016)

NICE TA392

Adalimumab is recommended, within its marketing authorisation, as an option for treating active moderate-to-severe hidradenitis suppurativa in adults whose disease has not responded to conventional systemic therapy. The drug is recommended only if the manufacturer provides it at the price agreed in the patient access scheme. Response should be assessed after 12 weeks of treatment, and the drug continued only if there is clear evidence of response, defined as a reduction of 25% or more in the total abscess and inflammatory nodule count and no increase in abscesses and draining fistulas.

www.nice.org.uk/guidance/ta392

► Adalimumab and dexamethasone for treating non-infectious uveitis (July 2017)

NICE TA460

Adalimumab is recommended as an option for treating non-infectious uveitis in the posterior segment of the eye in adults with inadequate response to corticosteroids, only if there is:

- active disease (that is, current inflammation in the eye), and
- inadequate response or intolerance to immunosuppressants, and
- systemic disease or both eyes are affected (or one eye is affected if the second eye has poor visual acuity), and
- worsening vision with a high risk of blindness (for example, risk of blindness that is similar to that seen in people with macular oedema).

Stop adalimumab for non-infectious uveitis in the posterior segment of the eye in adults with inadequate response to corticosteroids if there is one of the following:

- new active inflammatory chorioretinal or inflammatory retinal vascular lesions, or both, or
- a two-step increase in vitreous haze or anterior chamber cell grade, or
- worsening of best corrected visual acuity by three or more lines or 15 letters.

Patients currently receiving adalimumab whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta460

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium issued similar advice for plaque psoriasis to NICE TA146 in May 2008.

Certolizumab pegol

07-Aug-2017

• INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (as monotherapy or in combination with methotrexate) | Severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate or other disease-modifying antirheumatic drugs (in combination with methotrexate) | Active psoriatic arthritis when response to disease-modifying antirheumatic drugs has been inadequate (as monotherapy or in combination with methotrexate)

► BY SUBCUTANEOUS INJECTION

- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, once clinical response is confirmed, an alternative maintenance dosing of 400 mg every 4 weeks can be considered, review treatment if no response within 12 weeks

Treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs | Treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs

► BY SUBCUTANEOUS INJECTION

- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, alternatively maintenance 400 mg every 4 weeks, review treatment if no response within 12 weeks

- **CONTRA-INDICATIONS** Moderate to severe heart failure · severe active infection
- **CAUTIONS** Demyelinating CNS disorders (risk of exacerbation) · do not initiate until active infections are controlled (discontinue if new serious infection develops and until infection controlled) · hepatitis B virus (monitor for active infection) · history or development of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection
- **CAUTIONS, FURTHER INFORMATION**
 - Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Abscess · asthenia · decreased leucocytes · eosinophilic disorders · fever · headaches · hepatic disorders · hypertension · increased risk of infection · nausea · neoplasms · neutropenia · pain · sensory disorder · skin reactions
 - **Uncommon** Alopecia · anaemia · anxiety · appetite disorder · arrhythmias · ascites · asthma · breast disorder · cardiomyopathy · chills · coronary artery disease · cough · cyst · dizziness · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · eye inflammation · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · healing impaired · heart failure · hypercoagulation · influenza like illness · lacrimation disorder · lymphadenopathy · menstrual cycle irregularities · mood disorder · muscle disorder · nail disorder · nerve disorders · oedema · oral disorders · oropharyngeal dryness · palpitations · photosensitivity reaction · renal impairment · respiratory disorders · sepsis · skin ulcer · solid organ neoplasm · sweat changes · syncope · systemic lupus erythematosus (SLE) · temperature perception abnormal · thrombocytopenia · thrombocytosis · tinnitus · tremor · urinary tract disorder · vasculitides · vertigo · vision disorders · weight change
 - **Rare or very rare** Atherosclerosis · atrioventricular block · cholelithiasis · cognitive impairment · delirium · fistula · haemosiderosis · hair texture abnormal · movement disorders · nephritis · nephropathy · odynophagia · pancytopenia · panniculitis · pericarditis · polycythaemia · Raynaud's phenomenon · sarcoidosis · seizure · serum sickness · sexual dysfunction · splenomegaly · stroke · suicide attempt · telangiectasia · thyroid disorder
 - **Frequency not known** Multiple sclerosis

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 5 months after last dose.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **PRE-TREATMENT SCREENING**

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

- **MONITORING REQUIREMENTS** Monitor for infection before, during, and for 5 months after treatment.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.
Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss and fever) develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375

Certolizumab pegol, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provide certolizumab pegol as agreed in the patient access schemes.

Certolizumab pegol can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving certolizumab pegol within the NHS whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

- ▶ **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)** NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in adult patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs.

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

- ▶ **Certolizumab pegol for treating rheumatoid arthritis after inadequate response to a TNF-alpha inhibitor (October 2016)** NICE TA415

Certolizumab pegol, in combination with methotrexate, or as monotherapy, is recommended as an option for treating active rheumatoid arthritis in adults who have had an inadequate response to, or who cannot tolerate, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor-alpha (TNF-alpha) inhibitor, only if the following criteria are met:

- disease activity is severe **and**
- rituximab is contra-indicated or not tolerated, or if monotherapy, rituximab cannot be given because methotrexate is contra-indicated or not tolerated **and**
- the manufacturers provide certolizumab pegol as agreed in the patient access scheme.

Continue treatment only if there is at least a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA415

- ▶ **Certolizumab pegol and secukinumab for treating active psoriatic arthritis after inadequate response to DMARDs (May 2017)** NICE TA445

Certolizumab pegol alone, or in combination with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults only if:

- it is used as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2) or,
- the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has stopped responding after the first 12 weeks.

Certolizumab pegol is only recommended if the manufacturer provides it as agreed in the patient access scheme.

Assess the response to treatment after 12 weeks.

Treatment should only be continued if there is clear evidence of response, defined as an improvement in at least 2 of the 4 Psoriatic Arthritis Response Criteria (PsARC), 1 of which must be joint tenderness or swelling score, with no worsening in any of the 4 criteria. People whose disease has a Psoriasis Area and Severity Index (PASI) 75 response but whose PsARC response does not justify continuing treatment should be assessed by a dermatologist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA445

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2014) that certolizumab pegol is accepted for restricted use within NHS Scotland, in combination with methotrexate, for the treatment of active psoriatic arthritis in patients

whose disease has not responded to adequate trials of at least two standard disease-modifying antirheumatic drugs (DMARDs), administered either individually or in combination.

- **MONITORING REQUIREMENTS** Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

- **PRESCRIBING AND DISPENSING INFORMATION** Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

- **PATIENT AND CARER ADVICE** An alert card should be provided.
Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.
Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Etanercept and efalizumab for plaque psoriasis (July 2006)** NICE TA103
Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks.
www.nice.org.uk/TA103
- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195
Etanercept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients

who cannot use methotrexate because of intolerance or contra-indications, etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

- ▶ **Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)** NICE TA199
Etanercept is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

- ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375

Etanercept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, **and**
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs)

Etanercept can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdrawal treatment if a moderate EULAR response is not maintained.

Patients currently receiving etanercept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

- ▶ **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)** NICE TA383

Etanercept is recommended as an option for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Etanercept is also recommended as an option for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) -alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

01-Mar-2018

• INDICATIONS AND DOSE

Ulcerative colitis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 80 kg): Initially 200 mg, then 100 mg after 2 weeks; maintenance 50 mg every 4 weeks, review treatment if no response after 4 doses
- Adult (body-weight 80 kg and above): Initially 200 mg, then 100 mg after 2 weeks; maintenance 100 mg every 4 weeks, review treatment if no response after 4 doses

Rheumatoid arthritis (initiated by a specialist) | Psoriatic arthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist) | Non-radiographic axial spondyloarthritis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 100 kg): 50 mg once a month, on the same date each month, review treatment if no response after 3–4 doses
- Adult (body-weight 100 kg and above): Initially 50 mg once a month for 3–4 doses, on the same date each month, dose may be increased if inadequate response, increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses

- **CONTRA-INDICATIONS** Moderate or severe heart failure - severe active infection

- **CAUTIONS** Active infection (do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled) - demyelinating disorders (risk of exacerbation) - hepatitis B virus—monitor for active infection - history or development of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection - risk factors for dysplasia or carcinoma of the colon—screen for dysplasia regularly

CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients who have tested negative for latent

tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

• SIDE-EFFECTS

- **Common or very common** Abscess - alopecia - anaemia - asthenia - asthma - bone fracture - chest discomfort - depression - dizziness - fever - gastrointestinal discomfort - gastrointestinal disorders - gastrointestinal inflammatory disorders - headache - hypersensitivity - hypertension - increased risk of infection - insomnia - nausea - paraesthesia - respiratory disorders - skin reactions - stomatitis
- **Uncommon** Arrhythmia - balance impaired - bone marrow disorders - breast disorder - cholelithiasis - constipation - eye inflammation - eye irritation - flushing - goitre - hyperthyroidism - hypothyroidism - leucopenia - liver disorder - menstrual disorder - myocardial ischaemia - neoplasms - sepsis - thrombocytopenia - thrombosis - thyroid disorder - vision disorders
- **Rare or very rare** Bladder disorder - congestive heart failure - demyelination - healing impaired - hepatitis B reactivation - lupus-like syndrome - Raynaud's phenomenon - renal disorder - sarcoidosis - taste altered - vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 6 months after last dose.

- **PREGNANCY** Use only if essential.

- **BREAST FEEDING** Manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

• PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

- **MONITORING REQUIREMENTS** Monitor for infection before, during, and for 5 months after treatment.

- **DIRECTIONS FOR ADMINISTRATION** For doses requiring multiple injections, each injection should be administered at a different site.

Missed dose If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Tuberculosis All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Golimumab for the treatment of psoriatic arthritis (April 2011)** NICE TA220

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

- golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors, **and**

- the manufacturer provides the 100 mg dose of golimumab at the same price as the 50 mg dose.

www.nice.org.uk/guidance/ta220

- ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375

Golimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if **all** the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provides golimumab as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving treatment with golimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta375

- ▶ **Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011)** NICE TA225

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in patients who have had an inadequate response to DMARDs, including a TNF inhibitor, if golimumab is used as described in the NICE technology appraisal guidance 195 (August 2010) for other TNF inhibitors, **and** the manufacturer provides the 100 mg dose of golimumab at the same price as the 50 mg dose.

www.nice.org.uk/guidance/ta225

- ▶ **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)** NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) -alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/guidance/ta383

- ▶ **Golimumab for treating non-radiographic axial spondyloarthritis (January 2018)** NICE TA497
- Golimumab is recommended, within its marketing authorisation, as an option for treating severe non-radiographic axial spondyloarthritis in adults whose disease has responded inadequately to, or who cannot tolerate, nonsteroidal anti-inflammatory drugs.

If patients and their clinicians consider golimumab to be one of a range of suitable treatments, including adalimumab, etanercept and certolizumab pegol, the least expensive (taking into account administration costs and patient access schemes) should be chosen.

Assess the response to golimumab 12 weeks after the start of treatment. Continue treatment only if there is clear evidence of response, defined as:

- a reduction in the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score to 50% of the pre-treatment value or by 2 or more units, **and**
- a reduction in the spinal pain visual analogue scale (VAS) score by 2 cm or more.

www.nice.org.uk/guidance/ta497

- ▶ **Infliximab, adalimumab and golimumab for treating moderately-to-severely active ulcerative colitis after the failure of conventional therapy (February 2015)** NICE TA329
- Golimumab is an option for treating moderately-to-severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

Golimumab is recommended only if the manufacturer provides the 100 mg dose of golimumab at the same cost as the 50 mg dose, as agreed in the patient access scheme.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Golimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/guidance/ta329

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2012) that golimumab (*Simponi*®) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

The *Scottish Medicines Consortium* has advised (February 2016) that golimumab (*Simponi*®) is accepted for use within NHS Scotland for the treatment of adults with severe, active non-radiographic axial spondyloarthritis with objective signs of inflammation as indicated by elevated C-reactive protein (CRP) and/or magnetic resonance imaging (MRI) evidence, who have had an inadequate response to, or are intolerant to non-steroidal anti-inflammatory drugs (NSAIDs). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Simponi** (Merck Sharp & Dohme Ltd)

Golimumab 100 mg per 1 ml Simponi 50mg/0.5ml solution for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £762.97

Simponi 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £762.97

Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £1,525.94

Infliximab

31-May-2016

• INDICATIONS AND DOSE

Severe active Crohn's disease

► BY INTRAVENOUS INFUSION

- Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, if condition has responded, then maintenance 5 mg/kg every 8 weeks

Fistulating Crohn's disease

► BY INTRAVENOUS INFUSION

- Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

Severe active ulcerative colitis

► BY INTRAVENOUS INFUSION

- Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response 14 weeks after initial dose

Rheumatoid arthritis (in combination with methotrexate)

► BY INTRAVENOUS INFUSION

- Adult: Initially 3 mg/kg, then 3 mg/kg after 2 weeks, followed by 3 mg/kg after 4 weeks, then 3 mg/kg every 8 weeks, dose to be increased only if response is inadequate after 12 weeks of initial treatment; increased in steps of 1.5 mg/kg every 8 weeks, increased if necessary up to 7.5 mg/kg every 8 weeks, alternatively increased if necessary to 3 mg/kg every 4 weeks, discontinue if no response by 12 weeks of initial infusion or after dose adjustment

Ankylosing spondylitis

► BY INTRAVENOUS INFUSION

- Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 6–8 weeks, discontinue if no response by 6 weeks of initial infusion

Psoriatric arthritis (in combination with methotrexate)

► BY INTRAVENOUS INFUSION

- Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, followed by 5 mg/kg every 8 weeks

Plaque psoriasis

► BY INTRAVENOUS INFUSION

- Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 14 weeks of initial infusion

IMPORTANT SAFETY INFORMATION

Adequate resuscitation facilities must be available when infliximab is used.

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infections
- **CAUTIONS** Demyelinating disorders (risk of exacerbation) · dermatomyositis · development of malignancy · hepatitis B virus—monitor for active infection · history of colon carcinoma (in inflammatory bowel disease) · history of dysplasia (in inflammatory bowel disease) · history of malignancy · history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection (discontinue if new serious infection develops) · risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-administration after interval exceeding 16 weeks not recommended)

CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Manufacturer advises to evaluate patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).
- **Hypersensitivity reactions** Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Abscess · alopecia · anaemia · arrhythmias · arthralgia · chest pain · chills · constipation · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · eye inflammation · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperhidrosis · hypertension · hypotension · increased risk of infection · infusion related reaction · insomnia · lymphadenopathy · myalgia · nausea · neutropenia · oedema · pain · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · vasodilation · vertigo
 - **Uncommon** Anxiety · chelitis · cholecystitis · confusion · drowsiness · healing impaired · heart failure · hypersensitivity · lupus-like syndrome · lymphocytosis · memory loss · neoplasms · nerve disorders · pancreatitis · peripheral ischaemia · pulmonary oedema · seborrhoea · seizure · syncope · thrombocytopenia
 - **Rare or very rare** Agranulocytosis · circulatory collapse · cyanosis · demyelinating disorders · granuloma · haemolytic anaemia · hepatitis B reactivation · meningitis · pancytopenia · pericardial effusion · sarcoidosis · severe cutaneous adverse reactions (SCARs) · transverse myelitis · vasculitis · vasospasm
 - **Frequency not known** Dermatomyositis exacerbated · hepatosplenic T-cell lymphoma (increased risk in inflammatory bowel disease) · myocardial infarction · myocardial ischaemia · vision loss
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after last dose.
- **PREGNANCY** Use only if essential.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **PRE-TREATMENT SCREENING**
 - Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
 - Monitor for infection before, during, and for 6 months after treatment.
 - All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be

available for immediate use (risk of hypersensitivity reactions).

- ▶ Monitor for symptoms of delayed hypersensitivity if re-administered after a prolonged period.
- ▶ Manufacturer advises periodic skin examination for non-melanoma skin cancer, particularly in patients with risk factors.

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Remicade*®), give intermittently in Sodium chloride 0.9%; reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (adults over 18 years who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution.

● **PRESCRIBING AND DISPENSING INFORMATION** Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

● **PATIENT AND CARER ADVICE** An alert card should be provided. Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop. Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop. Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Infliximab for plaque psoriasis in adults (January 2008)** NICE TA134
Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.
www.nice.org.uk/TA134
- ▶ **Infliximab for acute exacerbations of ulcerative colitis (December 2008)** NICE TA163
Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate.
www.nice.org.uk/TA163
- ▶ **Infliximab and adalimumab for Crohn's disease (May 2010)** NICE TA187
Infliximab is recommended for the treatment of severe active Crohn's disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn's disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.

Infliximab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, infliximab can be restarted.

www.nice.org.uk/TA187

- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195
Infliximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.
www.nice.org.uk/TA195
- ▶ **Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)** NICE TA199
Infliximab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Infliximab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

- ▶ **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015)** NICE TA329
Infliximab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Infliximab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/TA329

- ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375
Infliximab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:
 - disease is severe, that is, a disease activity score (DAS28) greater than 5.1, **and**,
 - disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).
 Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.
- Patients currently receiving infliximab whose disease does not meet the above criteria should have the option to

continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

- ▶ **TNF- α inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)**
NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs). Infliximab is recommended only if treatment is started with the least expensive infliximab product. Patients currently receiving infliximab should continue treatment with the same infliximab product until they and their clinician considers it appropriate to stop.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)- α inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF- α inhibitor, or in those whose disease has stopped responding after an initial response.
www.nice.org.uk/TA383

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

CAUTIONARY AND ADVISORY LABELS 10

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Apremilast

13-Apr-2017

- **DRUG ACTION** Apremilast inhibits the activity of phosphodiesterase type-4 (PDE4) which results in suppression of pro-inflammatory mediator synthesis and promotes anti-inflammatory mediators.

● INDICATIONS AND DOSE

Active psoriatic arthritis (in combination with disease-modifying antirheumatic drugs or alone) in patients who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug therapy | Moderate to severe chronic plaque psoriasis that has not responded to standard systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg daily on day 1, then 10 mg twice daily on day 2, then 10 mg in the morning and 20 mg in the evening on day 3, then 20 mg twice daily on day 4, then 20 mg in the morning and 30 mg in the evening on day 5, then maintenance 30 mg twice daily, doses should be taken approximately 12 hours apart; review treatment if no response within 24 weeks of initiation

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JANUARY 2017): APREMILAST (OTEZLA®): RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR

A review of evidence from clinical trials and postmarketing cases has suggested a causal association between apremilast and suicidal thoughts and behaviour.

- **CAUTIONS** Concomitant use of drugs likely to cause psychiatric symptoms · history of psychiatric illness · low body-weight—consider discontinuation if weight loss is unexplained or clinically significant
- **INTERACTIONS** → Appendix 1: apremilast
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · back pain · cough · depression · diarrhoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nausea · vomiting
 - ▶ **Uncommon** Gastrointestinal haemorrhage · rash · suicidal tendencies · weight decreased
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment.
- **PREGNANCY** Avoid—teratogenic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose if eGFR less than 30 mL/minute/1.73 m²; consult product literature for initial dose titration.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor body-weight regularly in patients underweight at the start of treatment.
 - ▶ Manufacturer advises monitor for psychiatric symptoms (including depression, suicidal ideation and behaviour)—discontinue treatment if new or worsening psychiatric symptoms are identified.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to notify the prescriber of any changes in behaviour or mood, and of any suicidal ideation.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - ▶ **Apremilast for treating active psoriatic arthritis (February 2017)** NICE TA433
Apremilast, alone or in combination with disease-modifying antirheumatic drugs (DMARDs), is recommended as an option for treating active psoriatic arthritis in adults only if:
 - they have peripheral arthritis with 3 or more tender joints and 3 or more swollen joints **and**
 - their disease has not responded to adequate trials of at least 2 standard DMARDs, given either alone or in combination **and**
 - the manufacturer provides apremilast with the discount agreed in the patient access scheme.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA433
 - ▶ **Apremilast for treating moderate to severe plaque psoriasis (November 2016)** NICE TA419
Apremilast is recommended as an option for treating chronic plaque psoriasis in patients whose disease has not responded to other systemic therapies, including

ciclosporin, methotrexate and PUVA, or when these treatments are contra-indicated or not tolerated, only if:

- the disease is severe, as defined by a total Psoriasis Area Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10 **and**
- treatment is stopped if the psoriasis has not responded adequately at 16 weeks (defined as a 75% reduction in the PASI score (PASI 75) from when treatment started or a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from start of treatment), **and**
- the manufacturer provides apremilast with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA419

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2015) that apremilast (Otezla[®]) is accepted for restricted use within NHS Scotland for the treatment of active psoriatic arthritis in patients who have had an inadequate response with at least two prior Disease Modifying Antirheumatic Drug (DMARD) therapies or who are intolerant to such therapies.

2 Hyperuricaemia and gout

Gout

Overview

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack. The management of gout in adolescents requires specialist supervision.

Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac sodium p. 1101, diclofenac potassium p. 1100, etoricoxib p. 1104, indometacin p. 1109, ketoprofen p. 1110, naproxen p. 1113 or sulindac p. 1116. Colchicine below is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin p. 121 is *not* indicated in gout. Allopurinol p. 1086, febuxostat p. 1087, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute monoarticular

gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab p. 824, a recombinant monoclonal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.

Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term ('interval') treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat alternatively the uricosuric drug sulfinpyrazone p. 1086 may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is *not* indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is *not* indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

Sulfinpyrazone can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment.

Benzbromarone (available from 'special-order' manufacturers or specialist importing companies) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless *not* indicated in gout.

ALKALOIDS > PLANT ALKALOIDS

Colchicine

• INDICATIONS AND DOSE

Acute gout

- ▶ BY MOUTH
- ▶ Adult: 500 micrograms 2–4 times a day until symptoms relieved, maximum 6 mg per course, do not repeat course within 3 days

Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs

- ▶ BY MOUTH
- ▶ Adult: 500 micrograms twice daily

continued →

Prophylaxis of familial Mediterranean fever (recurrent polyserositis)

► BY MOUTH

Adult: 0.5–2 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of moderate inhibitors of CYP3A4.
- Manufacturer advises reduce dose by 75% (to one quarter of usual dose) with concurrent use of potent inhibitors of CYP3A4 or P-glycoprotein inhibitors; avoid concurrent use in patients with hepatic or renal impairment.

- **UNLICENSED USE** BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurrent polyserositis) is an unlicensed indication.

- **CONTRA-INDICATIONS** Blood disorders

- **CAUTIONS** Cardiac disease · elderly · gastro-intestinal disease

- **INTERACTIONS** → Appendix 1: colchicine

SIDE-EFFECTS

- Common or very common Abdominal pain · diarrhoea · nausea · vomiting
- Frequency not known Agranulocytosis · alopecia · bone marrow disorders · gastrointestinal haemorrhage · kidney injury · liver injury · menstrual cycle irregularities · myopathy · nerve disorders · rash · sperm abnormalities · thrombocytopenia

- **PREGNANCY** Avoid—teratogenicity in *animal* studies.

- **BREAST FEEDING** Present in milk but no adverse effects reported. Manufacturers advise caution.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m².
Dose adjustments Reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m².

MEDICINAL FORMS

XANTHINE OXIDASE INHIBITORS**Allopurinol****INDICATIONS AND DOSE**

Prophylaxis of gout and of uric acid and calcium oxalate renal stones | Prophylaxis of hyperuricaemia associated with cancer chemotherapy

► BY MOUTH

- Adult: Initially 100 mg daily, for maintenance adjust dose according to plasma or urinary uric acid concentration, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in mild conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in mild conditions)

► BY MOUTH

- Adult: 100–200 mg daily, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in moderately severe conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in moderately severe conditions)

► BY MOUTH

- Adult: 300–600 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in severe conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in severe conditions)

► BY MOUTH

- Adult: 700–900 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

- **CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately

- **CAUTIONS** Ensure adequate fluid intake (2–3 litres/day) · for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

CAUTIONS, FURTHER INFORMATION Administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack.

- **INTERACTIONS** → Appendix 1: allopurinol

URICOSURICS**Sulfinpyrazone**

(Sulphinpyrazone)

INDICATIONS AND DOSE

Gout prophylaxis | Hyperuricaemia

► BY MOUTH

- Adult: Initially 100–200 mg daily, dose to be taken with food (or milk); increased to 600–800 mg daily over 2–3 weeks, 800 mg daily is rarely given; continue until serum uric acid concentration normal then reduce dose for maintenance (maintenance dose may be as low as 200 mg daily)

- **CONTRA-INDICATIONS** Acute gout attack · Acute porphyrias p. 1025 · history of blood disorders · peptic ulceration

- **CAUTIONS** Cardiac disease (may cause salt and water retention) · ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline during initial treatment

- **INTERACTIONS** → Appendix 1: sulfinpyrazone

- **SIDE-EFFECTS** Abdominal distress · acute kidney injury · agranulocytosis · allergic dermatitis · aplastic anaemia ·

• SIDE-EFFECTS

- **Common or very common** Rash (discontinue therapy; if rash mild re-introduce cautiously but discontinue immediately if recurrence)
- **Uncommon** Hypersensitivity · nausea · vomiting
- **Rare or very rare** Agranulocytosis · alopecia · angina pectoris · angioedema · angioimmunoblastic T-cell lymphoma · aplastic anaemia · asthenia · ataxia · boil · bradycardia · cataract · coma · depression · diabetes mellitus · drowsiness · erectile dysfunction · fever · gastrointestinal disorders · gynaecomastia · haemorrhage · hair colour changes · headache · hepatic disorders · hyperlipidaemia · hypertension · infertility male · maculopathy · malaise · oedema · paraesthesia · paralysis · peripheral neuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · stomatitis · taste altered · thrombocytopenia · vertigo · visual impairment
- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.

- **BREAST FEEDING** Present in milk—not known to be harmful.

- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose.

- **RENAL IMPAIRMENT**
Dose adjustments Max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

• MEDICINAL FORMS

Febuxostat

28-Sep-2016

• INDICATIONS AND DOSE**Treatment of chronic hyperuricaemia in gout**► **BY MOUTH**

- **Adult:** Initially 80 mg once daily, if after 2–4 weeks of initial dose, serum uric acid greater than 6 mg/100 mL then increase dose; increased if necessary to 120 mg once daily

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematologic malignancies► **BY MOUTH**

- **Adult:** 120 mg once daily, to be started 2 days before start of cytotoxic therapy and continued for 7–9 days, according to chemotherapy duration

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS (JUNE 2012)

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

- **CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately
- **CAUTIONS** Congestive heart failure · ischaemic heart disease · thyroid disorders · transplant recipients
CAUTIONS, FURTHER INFORMATION Administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack.

- **INTERACTIONS** → Appendix 1: febuxostat

• SIDE-EFFECTS

- **Common or very common** Diarrhoea · gout aggravated · headache · hepatic disorders · nausea · oedema · skin reactions
- **Uncommon** Altered smell sensation · appetite abnormal · arrhythmias · arthritis · bundle branch block · chest discomfort · cholelithiasis · constipation · cough · diabetes mellitus · dizziness · drowsiness · dry mouth · dyspnoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hemiparesis · hyperlipidaemia · hypertension · increased risk of infection · insomnia · joint disorders · muscle complaints · muscle weakness · musculoskeletal pain · nephrolithiasis · palpitations · proteinuria · renal failure · sensation abnormal · sexual dysfunction · taste altered · urinary disorders · vasodilation · vomiting · weight changes
- **Rare or very rare** Alopecia · angioedema · hyperhidrosis · hypersensitivity · musculoskeletal stiffness · nephritis tubulointerstitial · nervousness · oral ulceration · pancreatitis · pancytopenia · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · thirst · thrombocytopenia · tinnitus · vision blurred

- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT**
Dose adjustments Max. 80 mg daily in mild impairment. No dose information available in moderate or severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **PRE-TREATMENT SCREENING** Monitor liver function tests before treatment as indicated.
- **MONITORING REQUIREMENTS** Monitor liver function tests periodically during treatment as indicated.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- Febuxostat for the management of hyperuricaemia in patients with gout (December 2008) NICE TA164
Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness. www.nice.org.uk/TA164

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* issued similar advice to NICE guidance: Febuxostat for the management of hyperuricaemia in patients with gout (December 2008), in August 2010.

The *Scottish Medicines Consortium* has advised (June 2016) that febuxostat (*Adenuric*®) is accepted for restricted use within NHS Scotland for the prevention and treatment of hyperuricaemia in patients undergoing chemotherapy for haematological malignancies at intermediate to high risk of tumour lysis syndrome, only when allopurinol is not tolerated or contra-indicated.

• MEDICINAL FORMS

3 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 816 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 1131.

Neostigmine p. 1090 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 85 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 1091 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It

is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

Corticosteroids are established as treatment for *myasthenia gravis*; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis.

In *generalised myasthenia gravis* prednisolone p. 664 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Smaller doses of corticosteroid are usually required in *ocular myasthenia*. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In *generalised myasthenia gravis* azathioprine is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used. Ciclosporin p. 818, methotrexate p. 888, or mycophenolate mofetil p. 826 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

Acetylcholine-release enhancers

Amifampridine p. 1091 is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 830 is licensed for the improvement of walking in patients with Multiple sclerosis p. 828 who have a walking disability.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with Multiple sclerosis p. 828 or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 1092 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract p. 1092 containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with Multiple sclerosis p. 828 in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene sodium p. 1307 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam p. 340 can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses.

Tizanidine p. 1094 is an α_2 -adrenoceptor agonist indicated for spasticity associated with Multiple sclerosis p. 828 or spinal cord injury.

Other muscle relaxants

The clinical efficacy of methocarbamol p. 1093 and meprobamate p. 343 as muscle relaxants is **not** well established, although they have been included in compound analgesic preparations.

NEUROPROTECTIVE DRUGS

Riluzole

● INDICATIONS AND DOSE

To extend life in patients with amyotrophic lateral sclerosis, initiated by specialist experienced in the management of motor neurone disease

► BY MOUTH

► Adult: 50 mg twice daily

● **CONTRA-INDICATIONS** Acute porphyrias p. 1025

● **CAUTIONS** History of abnormal hepatic function (consult product literature for details) · interstitial lung disease

CAUTIONS, FURTHER INFORMATION

► Interstitial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.

● **INTERACTIONS** → Appendix 1: riluzole

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · pain · tachycardia · vomiting

► **Uncommon** Anaemia · angioedema · interstitial lung disease · pancreatitis

► **Frequency not known** Hepatitis · neutropenia

SIDE-EFFECTS, FURTHER INFORMATION White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.

● **PREGNANCY** Avoid—no information available.

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Avoid.

● **RENAL IMPAIRMENT** Avoid—no information available.

● PATIENT AND CARER ADVICE

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

Driving and skilled tasks Dizziness or vertigo may affect performance of skilled tasks (e.g. driving).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Riluzole for motor neurone disease (January 2001)** NICE TA20 Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.
www.nice.org.uk/TA20

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

Oral suspension

► **Teglutik** (Martindale Pharmaceuticals Ltd)

Riluzole 5 mg per 1 ml Teglutik 5mg/1ml oral suspension sugar-free | 300 ml [PoM] £100.00 DT = £100.00

Tablet

► **Riluzole (Non-proprietary)**

Riluzole 50 mg Riluzole 50mg tablets | 56 tablet [PoM] £320.00 DT = £15.89

► **Rilutek** (Sanofi)

Riluzole 50 mg Rilutek 50mg tablets | 56 tablet [PoM] £320.33 DT = £15.89

3.1 Muscular dystrophy

DRUGS FOR NEUROMUSCULAR DISORDERS

Ataluren

24-May-2017

● **DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

● INDICATIONS AND DOSE

Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)

► BY MOUTH

► Adult: (consult product literature)

● **INTERACTIONS** → Appendix 1: ataluren

● SIDE-EFFECTS

► **Common or very common** Appetite decreased · constipation · cough · enuresis · fever · flatulence · gastrointestinal discomfort · haemorrhage · headache · hypertension · hypertriglyceridaemia · nausea · pain · rash erythematous · vomiting · weight decreased

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

● **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and cholesterol and triglyceride concentrations at least annually.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 30 mL of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).

● **PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

Missed doses Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Ataluren for treating Duchenne muscular dystrophy with a nonsense mutation in the dystrophin gene (July 2016)** NICE HST3

Ataluren, within its marketing authorisation, is recommended for treating Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene in people aged 5 years and older who can walk, only when:

● the manufacturer provides ataluren with the discount agreed in the patient access scheme, **and**

- the conditions under which ataluren is made available are set out in the managed access agreement between the manufacturer and NHS England, which should include the conditions set out in sections 5.12–5.15 and 5.23 of the guidance.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/HST3

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2016) that ataluren (*Translarna*®) is **not** recommended for use within NHS Scotland for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older as the economic case was not demonstrated.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (August 2016) that the NICE HST advice for ataluren (*Translarna*®) should be implemented within NHS Wales.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Granules

- ▶ **Translarna** (PTC Therapeutics Ltd) ▼

Ataluren 125 mg Translarna 125mg granules for oral suspension sachets | 30 sachet [PoM] £2,532.00

Ataluren 250 mg Translarna 250mg granules for oral suspension sachets | 30 sachet [PoM] £5,064.00

Ataluren 1 gram Translarna 1,000mg granules for oral suspension sachets | 30 sachet [PoM] £20,256.00

Nusinersen

18-May-2018

- **DRUG ACTION** Nusinersen is an antisense oligonucleotide that increases the production of survival motor neurone (SMN) protein, thereby helping to compensate for the defect in the SMN1 gene found in 5q spinal muscular atrophy.

INDICATIONS AND DOSE

5q spinal muscular atrophy (initiated by a specialist)

- ▶ BY INTRATHECAL INJECTION

- ▶ Adult: Initially 12 mg for 4 doses, on days 0, 14, 28 and 63, then 12 mg every 4 months, for advice on missed doses—consult product literature

- **CAUTIONS** Risk factors for renal toxicity—monitor urine protein (preferably using a first morning urine specimen) · risk factors for thrombocytopenia and coagulation disorders—monitor platelet and coagulation profile before treatment
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C); may be stored (in the original carton, protected from light) at or below 30 °C, for up to 14 days.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Spinraza** (Biogen Idec Ltd) ▼

Nusinersen (as Nusinersen sodium) 2.4 mg per 1 ml Spinraza 12mg/5ml solution for injection vials | 1 vial [PoM] £75,000.00

3.2 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

ANTICHOLINESTERASES

Anticholinesterases

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.
 - **CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction
 - **CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia
 - **SIDE-EFFECTS** Abdominal cramps · diarrhoea · excessive tearing · gastrointestinal disorders · hypersalivation · muscle complaints · nausea · rash · vomiting
- Overdose** Signs of overdose include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
 - **BREAST FEEDING** Amount probably too small to be harmful.

Neostigmine

(Neostigmine methylsulfate)

INDICATIONS AND DOSE

Treatment of myasthenia gravis

- ▶ BY MOUTH

- ▶ Adult: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)

Reversal of non-depolarising (competitive) neuromuscular blockade

- ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute

- **CAUTIONS** Glycopyrronium or atropine should also be given when reversing neuromuscular blockade
- **INTERACTIONS** → Appendix 1: neostigmine
- **RENAL IMPAIRMENT**
Dose adjustments May need dose reduction.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

Neostigmine (Non-proprietary)

Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule [PoM] £5.45 DT = £5.45

Tablet

Neostigmine (Non-proprietary)

Neostigmine bromide 15 mg Neostigmine 15mg tablets | 140 tablet [PoM] £120.52 DT = £120.52

F 1090

Pyridostigmine bromide

- **DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

INDICATIONS AND DOSE

Myasthenia gravis

INITIALLY BY MOUTH

- ▶ **Adult:** 30–120 mg, doses to be given at suitable intervals throughout day; (by mouth) usual dose 0.3–1.2 g daily in divided doses, it is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily

- **INTERACTIONS** → Appendix 1: pyridostigmine

RENAL IMPAIRMENT

Dose adjustments Reduce dose; excreted by kidney.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Pyridostigmine bromide (Non-proprietary)

Pyridostigmine bromide 60 mg Pyridostigmine bromide 60mg tablets | 200 tablet [PoM] £45.48 DT = £44.02

Pyridostigmine bromide 60 mg Mestinon 60mg tablets | 200 tablet [PoM] £45.57 DT = £44.02

CHOLINERGIC RECEPTOR STIMULATING DRUGS

Amifampridine

INDICATIONS AND DOSE

Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)

BY MOUTH

- ▶ **Adult:** Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

- **CONTRA-INDICATIONS** Congenital QT syndromes · epilepsy · uncontrolled asthma

- **CAUTIONS** Non-paraneoplastic form of Lambert-Eaton myasthenic syndrome

- **INTERACTIONS** → Appendix 1: amifampridine

- **SIDE-EFFECTS** Anxiety · arrhythmia · asthenia · asthma · bronchial secretion increased · cough · dizziness · drowsiness · gastrointestinal disorder · headache · movement disorders · palpitations · paraesthesia · Raynaud's phenomenon · seizure · sleep disorder · vision blurred

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution.

Dose adjustments In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days.

In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days.

- **RENAL IMPAIRMENT** Use with caution.

Dose adjustments In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days.

In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days.

- **MONITORING REQUIREMENTS** Clinical and ECG monitoring required at treatment initiation and yearly thereafter.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2012) that amifampridine phosphate (Firdapse®) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

3.3 Nocturnal leg cramps

Nocturnal leg cramps

Quinine salts

Quinine salts p. 608, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred.

3.4 Spasticity

Other drugs used for spasticity Dantrolene sodium, p. 1307
• Diazepam, p. 340

CANNABINOIDS

Cannabis extract

• INDICATIONS AND DOSE

Adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

- BY BUCCAL ADMINISTRATION
- Adult: (consult product literature)

• **CONTRA-INDICATIONS** Family history of psychosis • history of other severe psychiatric disorder • personal history of psychosis

• **CAUTIONS** History of epilepsy • significant cardiovascular disease

• **INTERACTIONS** → Appendix 1: cannabis extract

• SIDE-EFFECTS

► **Common or very common** Appetite abnormal • balance impaired • concentration impaired • constipation • depression • diarrhoea • disorientation • dizziness • drowsiness • dry mouth • dysarthria • euphoric mood • feeling drunk • malaise • memory loss • nausea • oral disorders • perception altered • taste altered • vertigo • vision blurred • vomiting

► **Uncommon** Abdominal pain upper • delusions • hallucinations • hypertension • palpitations • paranoia • pharyngitis • suicidal ideation • syncope • tachycardia • throat irritation

• **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.

• **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.

• **BREAST FEEDING** Avoid—present in milk.

• HEPATIC IMPAIRMENT

Monitoring Manufacturer advises more frequent monitoring in significant hepatic impairment—possible risk of prolonged or enhanced effect.

• RENAL IMPAIRMENT

Monitoring Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.

• **MONITORING REQUIREMENTS** Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.

• PATIENT AND CARER ADVICE

Driving and skilled tasks For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Propylene glycol

► **Sativex** (Bayer Plc)

Cannabidiol 2.5 mg per 1 dose, Dronabinol 2.7 mg per 1 dose Sativex oromucosal spray | 270 dose [PcM] £375.00 [CD4-1]

MUSCLE RELAXANTS > CENTRALLY ACTING

Baclofen

21-Nov-2016

• INDICATIONS AND DOSE

Pain of muscle spasm in palliative care

- BY MOUTH
- Adult: 5–10 mg 3 times a day

Hiccup due to gastric distension (in palliative care)

- BY MOUTH
- Adult: 5 mg twice daily

Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

- BY MOUTH
- Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)

- BY INTRATHECAL INJECTION
- Adult: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then *dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

IMPORTANT SAFETY INFORMATION

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

• CONTRA-INDICATIONS

- With intrathecal use Local infection • systemic infection
- With oral use Avoid oral route in active peptic ulceration

• CAUTIONS

GENERAL CAUTIONS Cerebrovascular disease • diabetes • elderly • epilepsy • history of peptic ulcer • hypertonic bladder sphincter • Parkinson's disease • psychiatric illness • respiratory impairment

SPECIFIC CAUTIONS

- With intrathecal use Coagulation disorders • malnutrition (increased risk of post-surgical complications) • previous spinal fusion procedure

• **INTERACTIONS** → Appendix 1: baclofen

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Asthenia • confusion • constipation • depression • diarrhoea • dizziness • drowsiness • dry mouth • euphoric mood • hallucination • headache • hyperhidrosis • hypotension • nausea • paraesthesia • respiratory disorders • sexual dysfunction • skin reactions • sleep disorders • urinary disorders • vision disorders • vomiting

- **Uncommon** Bradycardia · hypothermia · taste altered
- **Rare or very rare** Withdrawal syndrome

SPECIFIC SIDE-EFFECTS

- **Common or very common**
 - With intrathecal use Anxiety · appetite decreased · chills · dyspnoea · fever · hypersalivation · neuromuscular dysfunction · oedema · pain · pneumonia · seizure
 - With oral use Gastrointestinal disorder · muscle weakness · myalgia
- **Uncommon**
 - With intrathecal use Alopecia · deep vein thrombosis · dehydration · flushing · hypertension · ileus · memory loss · pallor · paranoia · suicidal tendencies
- **Rare or very rare**
 - With oral use Abdominal pain · hepatic function abnormal
- **Frequency not known**
 - With intrathecal use Scoliosis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies).

- **BREAST FEEDING** Present in milk—amount probably too small to be harmful.

HEPATIC IMPAIRMENT

- With oral use Manufacturer advises use with caution.

- **RENAL IMPAIRMENT** Excreted by the kidney.

Dose adjustments ► With oral use Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m² manufacturer advises use by mouth only if potential benefit outweighs risk.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

Palliative care For further information on the use of baclofen in palliative care, see www.palliativedrugs.com/formulary/en/baclofen.html.

PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tizanidine

• INDICATIONS AND DOSE

Spasticity associated with multiple sclerosis or spinal cord injury or disease

► BY MOUTH

- **Adult:** Initially 2 mg daily, then increased in steps of 2 mg daily in divided doses, increased at intervals of at least 3–4 days and adjust according to response; usual dose up to 24 mg daily in 3–4 divided doses; maximum 36 mg per day

• CAUTIONS Elderly

• INTERACTIONS → Appendix 1: tizanidine

• SIDE-EFFECTS

- **Common or very common** Arrhythmias · dizziness · drowsiness · dry mouth · fatigue · hypotension · rebound hypertension
- **Rare or very rare** Gastrointestinal disorder · hallucination · hepatic disorders · muscle weakness · nausea · sleep disorders
- **Frequency not known** Abdominal pain · accommodation disorder · anxiety · appetite decreased · confusion · headache · QT interval prolongation · skin reactions · vomiting · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be discontinued if liver enzymes are persistently raised—consult product literature.

• PREGNANCY Avoid (toxicity in *animal* studies).

• BREAST FEEDING Avoid (present in milk in *animal* studies).

• HEPATIC IMPAIRMENT Avoid in severe impairment; use in moderate impairment only if potential benefit outweighs risk.

• RENAL IMPAIRMENT Manufacturer advises caution.

• MONITORING REQUIREMENTS Monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue.

• TREATMENT CESSATION Avoid abrupt withdrawal (risk of rebound hypertension and tachycardia); to minimise risk, discontinue gradually and monitor blood pressure.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

paracetamol p. 438, but paracetamol is preferred, particularly in the elderly.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the *inflammatory arthritides* (e.g. rheumatoid arthritis) and in some cases of *advanced osteoarthritis*. NSAIDs can also be of benefit in the less well defined conditions of *back pain* and *soft-tissue disorders*.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen p. 1106 is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Dexibuprofen p. 1098 is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen p. 1113 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).

Fenoprofen p. 1105 is as effective as naproxen, and flurbiprofen p. 1106 may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen p. 1110 has anti-inflammatory properties similar to ibuprofen and has more side-effects.

Dexketoprofen p. 1099, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenic acid p. 1117 is as effective as naproxen; it has more side-effects than ibuprofen.

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac sodium p. 1101 and aceclofenac p. 1096 are similar in efficacy to naproxen.

Etodolac p. 1103 is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin p. 1109 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances.

Mefenamic acid p. 1111 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

4 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

05-Jun-2017

Therapeutic effects

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of

Meloxicam p. 1112 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone p. 1113 is comparable in effect to naproxen.

Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam p. 1115 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Sulindac p. 1116 is similar in tolerance to naproxen.

Tenoxicam p. 1117 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolfenamic acid p. 469 is licensed for the treatment of migraine.

Ketorolac trometamol p. 1144 and the selective inhibitor of cyclo-oxygenase-2, parecoxib p. 1303, are licensed for the short-term management of postoperative pain.

The selective inhibitors of cyclo-oxygenase-2, etoricoxib p. 1104 and celecoxib p. 1097, are as effective as non-selective NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 121 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen, diclofenac sodium, and diclofenac potassium p. 1100.

Asthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

NSAIDs and cardiovascular events

All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of aceclofenac, treatment advice has been updated in line with diclofenac, based on aceclofenac's structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the

need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam p. 1115, ketoprofen p. 1110, and ketorolac trometamol p. 1144 are associated with the highest risk; indometacin p. 1109, diclofenac, and naproxen p. 1113 are associated with intermediate risk, and ibuprofen p. 1106 with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a *lower* risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are *generally preferred*, to start at the *lowest recommended dose* and not to use more than one oral NSAID at a time.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness.

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

NSAIDs and alcohol

Alcohol increases the risk of gastro-intestinal haemorrhage associated with NSAIDs. Specialist sources recommend that concurrent use need not be avoided with moderate alcohol intake, but greater caution is warranted in those who drink more than the recommended daily limits.

Some cases of acute kidney injury have been attributed to use of NSAIDs and acute excessive alcohol consumption.

Low back pain and sciatica

08-Mar-2017

Description of condition

Low back pain is pain in the lumbosacral area of the back. It can be described as *non-specific*, *mechanical*, *musculoskeletal* or *simple* (if it is not associated with serious or potentially serious causes). Episodes of back pain do not usually last long, with rapid improvements in pain and disability seen within a few weeks to months.

Sciatica (*radicular pain* or *radiculopathy*) is neuropathic leg pain secondary to compressive lumbosacral nerve root pathology.

Non-drug treatment

EvGr Exercise programmes, manual therapy, and psychological therapies should be considered for managing low back pain with or without sciatica.

Spinal decompression may be considered in patients with sciatica when pain and function has not improved with non-surgical treatment (including drug treatment). 

Drug treatment

EvGr An oral NSAID (see Non-steroidal anti-inflammatory drugs p. 1094) should be considered for managing acute low back pain, taking into consideration the gastro-intestinal, cardio-renal and hepatic risks associated with NSAIDs; as well as the need for continued monitoring, and the possible need for gastroprotective treatment (see *NSAID-associated ulcers* under Peptic ulceration p. 71).

A weak opioid, either alone or with paracetamol p. 438, can be used to manage acute low back pain only if an NSAID is contra-indicated, not tolerated or ineffective (see *Opioid analgesics* under Analgesics p. 436). Paracetamol alone is ineffective for managing low back pain. **A**

EvGr Benzodiazepines are sometimes used to manage acute low back pain (particularly in loss of lordosis); however evidence to support their use is very weak. **E**

EvGr In patients with chronic low back pain who have had an inadequate response to non-drug treatment, NSAIDs should be considered as first-line therapy. Opioids should be the last treatment option considered and should be considered only in patients for whom other therapies have failed and only if the potential benefits outweigh the risks for individual patients. If indicated, opioids should only be prescribed for a limited period of time. Long term opioid therapy should be avoided.

Selective serotonin re-uptake inhibitors (SSRIs), serotonin and noradrenaline re-uptake inhibitors (SNRIs), tricyclic antidepressants, and antiepileptic drugs should **not** be offered for managing low back pain.

When non-surgical treatment is ineffective in patients with moderate and severe localised back pain arising from structures supplied by the medial branch nerve, radiofrequency denervation can be considered. **A**

Sciatica

Patients with sciatica may require specific treatment for Neuropathic pain p. 475.

EvGr Patients with acute and severe sciatica may benefit from treatment with epidural injections of local anaesthetic and/or corticosteroid. **A**

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Acetofenac

01-Jun-2016

• INDICATIONS AND DOSE

Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

- ▶ BY MOUTH
- ▶ Adult: 100 mg twice daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebrovascular disease • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • ischaemic heart disease • mild heart failure • peripheral arterial disease • severe heart failure
- **CAUTIONS** Allergic disorders • avoid in Acute porphyrias p. 1025 • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • history of

cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

• SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea • dizziness • gastrointestinal discomfort • nausea
 - ▶ **Uncommon** Constipation • gastrointestinal disorders • oral disorders • skin reactions • vomiting
 - ▶ **Rare or very rare** Anaemia • angioedema • bone marrow disorders • depression • drowsiness • dyspnoea • fatigue • haemolytic anaemia • haemorrhage • headache • heart failure • hepatic disorders • hyperkalaemia • hypersensitivity • hypertension • inflammatory bowel disease • leg cramps • nephrotic syndrome • neutropenia • oedema • palpitations • pancreatitis • paraesthesia • renal failure (more common in patients with pre-existing renal impairment) • respiratory disorders • severe cutaneous adverse reactions (SCARs) • sleep disorders • taste altered • thrombocytopenia • tinnitus • tremor • vasculitis • vasodilation • vertigo • visual impairment • weight increased
 - ▶ **Frequency not known** Acute coronary syndrome • agranulocytosis • asthma • confusion • hallucination • increased risk of arterial thromboembolism • increased risk of ischaemic stroke • malaise • meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • nephritis tubulointerstitial • optic neuritis • photosensitivity reaction • platelet aggregation inhibition • respiratory tract reaction
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
 - **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
 - **PREGNANCY** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.
 - **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
 - **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
Dose adjustments Initially 100 mg daily.
 - **RENAL IMPAIRMENT** Avoid if possible or use with caution; avoid in moderate to severe impairment.
Dose adjustments The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Acemetacin

DRUG ACTION Glycolic acid ester of indometacin.

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease | Pain and inflammation in other musculoskeletal disorders | Postoperative analgesia

BY MOUTH

- Adult: 120 mg daily in divided doses, then increased if necessary to 180 mg daily in divided doses, dose to be taken with food

CONTRA-INDICATIONS Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · ischaemic heart disease · parkinsonism · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

INTERACTIONS → Appendix 1: NSAIDs

SIDE-EFFECTS

- Common or very common** Anxiety · appetite decreased · central nervous system disorders · diarrhoea · dizziness · drowsiness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypersensitivity · malaise · nausea · skin reactions · vomiting
- Uncommon** Alopecia · eye discolouration · hepatic disorders · oedema
- Rare or very rare** Acute kidney injury (more common in patients with pre-existing renal impairment) · agranulocytosis · anaemia · angioedema · asthma · bone marrow disorders · coma · confusion · constipation · depression · enanthema · eyelid oedema · haemolytic anaemia · hallucination · hearing impairment · hyperglycaemia · hyperhidrosis · hyperkalaemia · hypersensitivity vasculitis · hypertension · inflammatory bowel disease · irritability · kidney injury (more common in patients with pre-existing renal impairment) · leucopenia · loss of consciousness · memory loss · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · muscle weakness · nephritis · tubulointerstitial · nephrotic syndrome · oral disorders · pancreatitis · photosensitivity reaction · psychiatric disorders · psychosis · renal papillary necrosis · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · shock · sleep disorders · tachycardia · taste

altered · thrombocytopenia · tremor · urinary disorder · urine abnormalities

- **Frequency not known** Circulatory collapse · dyspnoea · fertility decreased female · heart failure · increased risk of arterial thromboembolism · increased risk of infection · increased risk of ischaemic stroke · increased risk of myocardial infarction · optic neuritis · paraesthesia · respiratory tract reaction

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MONITORING REQUIREMENTS** During prolonged therapy ophthalmic and blood examinations particularly advisable.

PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

No licensed medicines listed.

Celecoxib

02-Jun-2017

INDICATIONS AND DOSE

Pain and inflammation in osteoarthritis

BY MOUTH

- **Adult:** 200 mg daily in 1–2 divided doses, then increased if necessary up to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

Pain and inflammation in rheumatoid arthritis

BY MOUTH

- **Adult:** 100 mg twice daily, then increased if necessary to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

Ankylosing spondylitis

BY MOUTH

- **Adult:** 200 mg daily in 1–2 divided doses, then increased if necessary up to 400 mg daily in 1–2 divided doses, discontinue if no improvement after 2 weeks on maximum dose

continued →

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of fluconazole.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebrovascular disease • inflammatory bowel disease • ischaemic heart disease • mild to severe heart failure • peripheral arterial disease
- **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • history of cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Angina pectoris • benign prostatic hyperplasia • cough • diarrhoea • dizziness • dysphagia • dyspnoea • fluid retention • gastrointestinal discomfort • gastrointestinal disorders • headache • hypersensitivity • hypertension • increased risk of infection • influenza like illness • injury • insomnia • irritable bowel syndrome • joint disorders • muscle tone increased • myocardial infarction • nausea • nephrolithiasis • oedema • skin reactions • vomiting • weight increased
 - ▶ **Uncommon** Anaemia • anxiety • arrhythmias • breast tenderness • burping • cerebral infarction • chest pain • conjunctivitis • constipation • depression • drowsiness • dysphonia • electrolyte imbalance • embolism and thrombosis • fatigue • haemorrhage • hearing impairment • heart failure • hepatic disorders • lipoma • lower limb fracture • muscle complaints • nocturia • oral disorders • palpitations • paraesthesia • respiratory disorders • vision blurred • vitreous floater
 - ▶ **Rare or very rare** Acute kidney injury (more common in patients with pre-existing renal impairment) • alopecia • angioedema • anosmia • ataxia • confusion • flushing • hallucination • intracranial haemorrhage • leucopenia • meningitis aseptic • menstrual disorder • myositis • nephritis tubulointerstitial • nephropathy • pancreatitis • pancytopenia • photosensitivity reaction • seizures • severe cutaneous adverse reactions (SCARs) • taste altered • thrombocytopenia • vasculitis
 - ▶ **Frequency not known** Infertility
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
 - Contra-indicated in patients with sulfonamide sensitivity.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies).
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
 - Dose adjustments** Halve initial dose in moderate impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MONITORING REQUIREMENTS** Monitor blood pressure before and during treatment.

£21.55 DT = £1.95

Celecoxib 200 mg Celebrex 200mg capsules | 30 capsule [PoM](#)

£21.55 DT = £1.69

Dexibuprofen

21-May-2018

● **INDICATIONS AND DOSE****Osteoarthritis**▶ **BY MOUTH**

- ▶ **Adult:** 600–900 mg daily in up to 3 divided doses; increased if necessary up to 1200 mg daily (max. per dose 400 mg)

Dysmenorrhoea▶ **BY MOUTH**

- ▶ **Adult:** 600–900 mg daily in up to 3 divided doses (max. per dose 400 mg)

Mild-to-moderate pain▶ **BY MOUTH**

- ▶ **Adult:** 600 mg daily in up to 3 divided doses; increased if necessary up to 1200 mg daily (max. per dose 400 mg), higher dose for short-term use for acute pain

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure
- **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • congestive heart failure • connective-tissue disorders • Crohn's disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension
- CAUTIONS, FURTHER INFORMATION**
 - ▶ High-dose dexibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose dexibuprofen (≥ 1.2 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea • dizziness • drowsiness • fatigue • gastrointestinal discomfort • headache • nausea • skin reactions • vertigo • vomiting

- **Uncommon** Angioedema · anxiety · gastrointestinal disorders · haemorrhage · hearing impairment · increased risk of infection · insomnia · oral disorders · respiratory disorders · vasculitis · vision disorders
- **Rare or very rare** Agranulocytosis · alopecia · asthma · blood disorder · bone marrow disorders · confusion · constipation · depression · fever · granulocytopenia · haemolytic anaemia · hepatic disorders · hypersensitivity · hypotension · inflammatory bowel disease · irritability · leucopenia · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · nephrotic syndrome · photosensitivity reaction · psychotic disorder · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · shock · tachycardia · thrombocytopenia
- **Frequency not known** Fluid retention · generalised oedema · glomerulonephritis · increased risk of arterial thromboembolism · renal impairment · renal papillary necrosis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk—but risk to infant minimal.

- **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring in mild-to-moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises reduce initial dose in mild-to-moderate impairment.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Reduce initial dose.

The lowest effective dose should be used for the shortest possible duration.

Monitoring Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

CAUTIONARY AND ADVISORY LABELS 21

- **Seractil** (Gebro Pharma GmbH)

Dexibuprofen 300 mg Seractil 300mg tablets | 60 tablet (PoM)
£9.47

- **Elderly:** 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours, initial max. 50 mg; maximum 75 mg daily

- **CONTRA-INDICATIONS** Active bleeding or bleeding disorders · active or recurrent gastro-intestinal haemorrhage · active or recurrent gastro-intestinal ulcer · chronic dyspepsia · Crohn's disease · history of NSAID-associated gastro-intestinal bleeding or perforation · known photoallergic or phototoxic reactions during treatment with ketoprofen or fibrates · severe dehydration · severe heart failure · ulcerative colitis · varicella infection

- **CAUTIONS** Allergic disorders · asthma · cerebrovascular disease · coagulation defects · congenital disorder of porphyrin metabolism · congestive heart failure · dehydration · elderly (risk of serious side-effects and fatalities) · following major surgery · haematopoietic disorders · history of cardiac disease · NSAIDs may cause fluid retention and oedema · history of gastro-intestinal disease · history of gastro-intestinal toxicity · ischaemic heart disease · mixed connective-tissue disorders · peripheral arterial disease · risk factors for cardiovascular events · systemic lupus erythematosus · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Common or very common** Diarrhoea · gastrointestinal discomfort · nausea · vomiting

- **Uncommon** Anxiety · asthenia · chills · constipation · dizziness · drowsiness · dry mouth · flushing · gastrointestinal disorders · headache · insomnia · malaise · pain · palpitations · skin reactions · vertigo

- **Rare or very rare** Angioedema · appetite decreased · dyspnoea · haemorrhage · hepatic disorders · hyperhidrosis · hypersensitivity · hypertension · hypotension · menstrual disorder · nephritis · nephrotic syndrome · neutropenia · oedema · pancreatitis · paraesthesia · photosensitivity reaction · polyuria · prostatic disorder · respiratory disorders · severe cutaneous adverse reactions (SCARs) · syncope · tachycardia · thrombocytopenia · tinnitus · vision blurred

- **Frequency not known** Acute kidney injury (more common in patients with pre-existing renal impairment) · agranulocytosis · anaemia · aplastic anaemia · haemolytic anaemia · inflammatory bowel disease · meningitis aseptic · oral ulceration · platelet aggregation inhibition · renal papillary necrosis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

Dose adjustments Reduce initial dose to max. 50 mg daily in mild to moderate impairment.

Dexketoprofen

23-Apr-2018

● INDICATIONS AND DOSE

Short-term treatment of mild to moderate pain including dysmenorrhoea

- **BY MOUTH**

- **Adult:** 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours; maximum 75 mg per day

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in moderate to severe impairment.

Dose adjustments Reduce initial dose to 50 mg daily.

The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

- **BY MOUTH**
- Child 14–17 years: 75–100 mg daily in 2–3 divided doses
- Adult: 75–150 mg daily in 2–3 divided doses

Acute gout

- **BY MOUTH**
- Adult: 75–150 mg daily in 2–3 divided doses

Postoperative pain

- **BY MOUTH**
- Child 9–13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
- Child 14–17 years: 75–100 mg daily in 2–3 divided doses
- Adult: 75–150 mg daily in 2–3 divided doses

Migraine

- **BY MOUTH**
- Adult: 50 mg, to be given at onset of migraine, then 50 mg after 2 hours if required, then 50 mg after 4–6 hours; maximum 200 mg per day

Fever in ear, nose, or throat infection

- **BY MOUTH**
- Child 9–17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

- **UNLICENSED USE** **Voltarol® Rapid** not licensed for use in children under 14 years or in fever.
- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

● INDICATIONS AND DOSE

Pain and inflammation in musculoskeletal disorders |

Acute gout

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 75–150 mg daily in 2–3 divided doses
- ▶ BY RECTUM
- ▶ Adult: 75–150 mg daily in divided doses

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 75–150 mg daily in 2–3 divided doses
- ▶ BY RECTUM
- ▶ Adult: 75–150 mg daily in divided doses

Postoperative pain

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 75–150 mg daily in 2–3 divided doses
- ▶ BY RECTUM
- ▶ Adult: 75–150 mg daily in divided doses

DICLOMAX RETARD®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 capsule once daily

DICLOMAX SR®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 capsule 1–2 times a day, alternatively 2 capsules once daily

MOTIFENE®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 capsule 1–2 times a day

VOLTAROL® 75MG SR TABLETS

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 tablet 1–2 times a day

VOLTAROL® EMULGEL

Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

- ▶ TO THE SKIN
- ▶ Adult: Apply 3–4 times a day, therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

VOLTAROL® RETARD

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

VOLTAROL® SOLUTION FOR INJECTION

Postoperative pain

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

Acute exacerbations of pain

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

Ureteric colic

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg, then 75 mg after 30 minutes if required

Acute postoperative pain (in hospital setting)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 75 mg, then 75 mg after 4–6 hours if required for maximum 2 days; maximum 150 mg per day

Prevention of postoperative pain (in hospital setting)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 25–50 mg, to be given after surgery over 15–60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

● CONTRA-INDICATIONS

- ▶ With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage
- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

● CAUTIONS

- ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

● INTERACTIONS → Appendix 1: NSAIDs

● SIDE-EFFECTS

SPECIFIC SIDE-EFFECTS

- ▶ Common or very common
 - ▶ With systemic use Appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · oedema · rash (discontinue) · skin reactions · vertigo · vomiting
- ▶ Uncommon
 - ▶ With systemic use Chest pain · heart failure · myocardial infarction · palpitations
- ▶ Rare or very rare
 - ▶ With systemic use Acute kidney injury · agranulocytosis · alopecia · anaemia · angioedema · anxiety · aplastic anaemia · asthma · confusion · constipation · Crohn's disease · depression · disorientation · drowsiness · dyspnoea · erectile dysfunction · haemolytic anaemia · haemorrhage · hearing impairment · hepatic disorders · hypersensitivity · hypertension · hypotension · irritability · leucopenia · memory loss · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · nephrotic syndrome · oral disorders ·

pancreatitis · paraesthesia · photosensitivity reaction · pneumonitis · proteinuria · psychotic disorder · renal papillary necrosis · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · shock · sleep disorders · stroke · taste altered · thrombocytopenia · tremor · vasculitis · vision disorders

► Frequency not known

- With systemic use Fertility decreased female · fluid retention · hallucination · malaise · optic neuritis · platelet aggregation inhibition

- With topical use Hair colour changes

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- With topical use Topical application of large amounts of diclofenac can result in systemic effects.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● CONCEPTION AND CONTRACEPTION

- With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● PREGNANCY

- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

● BREAST FEEDING

- With systemic use Use with caution during breast-feeding. Amount in milk too small to be harmful.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● HEPATIC IMPAIRMENT

- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT

- With systemic use Avoid if possible or use with caution. Avoid in severe impairment.
 - With intravenous use Avoid intravenous use if serum creatinine greater than 160 micromol/litre. Contra-indicated in moderate or severe renal impairment.
- Dose adjustments** ► With systemic use The lowest effective dose should be used for the shortest possible duration.
- Monitoring** ► With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion* (Voltarol®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes. For continuous infusion give at a rate of 5 mg/hour.
- With topical use For topical preparations, apply with gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Voltarol® dispersible tablets are more suitable for **short-term** use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months).

Diclofenac sodium 25 mg Voltarol 25mg suppositories | 10 suppository [PoM] £1.24 DT = £1.24

Diclofenac sodium 50 mg Voltarol 50mg suppositories | 10 suppository [PoM] £2.04 DT = £2.04

Diclofenac sodium 100 mg Voltarol 100mg suppositories | 10 suppository [PoM] £3.64 DT = £3.64

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

► Voltarol (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 25 mg per 1 mL Voltarol 75mg/3mL solution for injection ampoules | 10 ampoule [PoM] £9.91 DT = £9.91

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21 (does not apply to Motifene® 75 mg), 25

EXCIPIENTS: May contain Propylene glycol

► Diclomax Retard (Galen Ltd)

Diclofenac sodium 100 mg Diclomax Retard 100mg capsules | 28 capsule [PoM] £8.20 DT = £8.20

► Diclomax SR (Galen Ltd)

Diclofenac sodium 75 mg Diclomax SR 75mg capsules | 56 capsule [PoM] £11.40 DT = £11.40

► Motifene (Daiichi Sankyo UK Ltd)

Diclofenac sodium 75 mg Motifene 75mg modified-release capsules | 56 capsule [PoM] £8.00 DT = £8.00

Gel

► Voltarol Emulgel (GlaxoSmithKline Consumer Healthcare)

Diclofenac diethylammonium 11.6 mg per 1 gram Voltarol 1.16% Emulgel | 100 gram [PoM] £5.63 DT = £5.63

Diclofenac sodium with misoprostol

The properties listed below are those particular to the combination only. For the properties of the components please consider, diclofenac sodium p. 1101, misoprostol p. 77.

● INDICATIONS AND DOSE

ARTHROTEC® 50/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

- Adult: 1 tablet 2–3 times a day, take with food

ARTHROTEC® 75/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

► BY MOUTH

- Adult: 1 tablet twice daily, take with food

MISOFEN® 50/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

► BY MOUTH

- Adult: 1 tablet 2–3 times a day, take with food

MISOFEN® 75/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

► BY MOUTH

- Adult: 1 tablet twice daily, take with food

- **UNLICENSED USE** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the combination preparations of diclofenac and misoprostol.

- **INTERACTIONS** → Appendix 1: NSAIDs

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

Misoprostol 200 microgram, Diclofenac sodium 75 mg Arthrotec 75 gastro-resistant tablets | 60 tablet [PoM](#) £15.83 DT = £15.83

► Misofen (Morningside Healthcare Ltd)

Misoprostol 200 microgram, Diclofenac sodium 50 mg Misofen 50mg/200microgram gastro-resistant tablets | 60 tablet [PoM](#) £11.98 DT = £11.98

Misoprostol 200 microgram, Diclofenac sodium 75 mg Misofen 75mg/200microgram gastro-resistant tablets | 60 tablet [PoM](#) £15.83 DT = £15.83

Etodolac

● INDICATIONS AND DOSE

Pain and inflammation in rheumatoid arthritis and osteoarthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 300–600 mg daily in 1–2 divided doses

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 600 mg daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous

NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · angioedema · aplastic anaemia · asthenia · asthma · bilirubinuria · bronchospasm · chills · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fever · gastrointestinal discomfort · gastroduodenal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · insomnia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritic syndrome · nephritis tubulointerstitial · nephrotoxicity · nervousness · neutropenia · oedema · optic neuritis · oral ulceration · palpitations · pancreatitis · paraesthesia · photosensitivity reaction · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · tremor · urinary disorders · vasculitis · vertigo · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
Dose adjustments The lowest effective dose should be used for the shortest possible duration.
Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● MEDICINAL FORMS

Etoricoxib

23-Nov-2016

● INDICATIONS AND DOSE

Pain and inflammation in osteoarthritis

▶ BY MOUTH

- ▶ Child 16–17 years: 30 mg once daily, increased if necessary to 60 mg once daily
- ▶ Adult: 30 mg once daily, increased if necessary to 60 mg once daily

Pain and inflammation in rheumatoid arthritis |

Ankylosing spondylitis

▶ BY MOUTH

- ▶ Child 16–17 years: 60 mg once daily, increased if necessary to 90 mg once daily
- ▶ Adult: 60 mg once daily, increased if necessary to 90 mg once daily

Acute gout

▶ BY MOUTH

- ▶ Child 16–17 years: 120 mg once daily for maximum 8 days
- ▶ Adult: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · asthenia · bronchospasm · constipation · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · increased risk of infection · influenza like illness · nausea · oedema · oral ulceration · palpitations · skin reactions · vomiting
 - ▶ **Uncommon** Alertness decreased · anaemia · angina pectoris · anxiety · appetite abnormal · cerebrovascular insufficiency · chest pain · congestive heart failure · conjunctivitis · cough · depression · drowsiness · dry mouth · dyspnoea · flushing · haemorrhage · hallucination · hyperkalaemia · hypersensitivity · insomnia · irritable bowel syndrome · leucopenia · myocardial infarction · pancreatitis · proteinuria · renal failure (more common in patients with pre-existing renal impairment) · sensation abnormal · taste altered · thrombocytopenia · tinnitus · vasculitis · vertigo · vision blurred · weight increased

- ▶ **Rare or very rare** Angioedema · confusion · hepatic disorders · muscle complaints · severe cutaneous adverse reactions (SCARs) · shock
- ▶ **Frequency not known** Nephritis tubulointerstitial · nephropathy

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
Dose adjustments Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution.
▶ In adults Avoid if eGFR less than 30 mL/minute/1.73 m².
▶ In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
Dose adjustments The lowest effective dose should be used for the shortest possible duration.
Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

Felbinac

- **DRUG ACTION** Felbinac is an active metabolite of the NSAID fenbufen.

● INDICATIONS AND DOSE

Relief of pain in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

► TO THE SKIN

- **Adult:** Apply 2–4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal haemorrhage (two or more distinct episodes) · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · not for use with occlusive dressings · peripheral arterial disease · risk factors for cardiovascular events · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported) · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS** Bronchospasm · gastrointestinal disorder · hypersensitivity · paraesthesia · photosensitivity reaction · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

- **BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Deterioration in renal function has also been reported after topical use.

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children.

- **PATIENT AND CARER ADVICE** For topical preparations patients and carers should be advised to wash hands immediately after use.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS**
No licensed medicines listed.

Flurbiprofen

• INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

► BY MOUTH

- Child 12-17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
- Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

Dysmenorrhoea

► BY MOUTH

- Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
- Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
 - **Common or very common** Haemorrhage
 - **Frequency not known** Agranulocytosis · angioedema · aplastic anaemia · asthma · bronchospasm · confusion ·

constipation · Crohn's disease · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · platelet aggregation inhibition · renal failure (more common in patients with pre-existing renal impairment) · respiratory tract reaction · severe cutaneous adverse reactions (SCARs) · skin reactions · stroke · thrombocytopenia · tinnitus · vertigo · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Ibuprofen

• INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Mild to moderate pain including dysmenorrhoea | Postoperative analgesia | Migraine | Dental pain

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 1.6 g once daily, dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3–5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 6–11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 1–3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

Pain and inflammation

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic arthritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor's advice only)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- ▶ TO THE SKIN
- Adult: Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

FENBID® FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- ▶ TO THE SKIN
- Adult: Apply up to 4 times a day, therapy should be reviewed after 14 days

IBUGEL® FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- ▶ TO THE SKIN
- Adult: Apply up to 3 times a day

- **UNLICENSED USE** Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

• **CONTRA-INDICATIONS**

- With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

• **CAUTIONS**

- With systemic use Allergic disorders (in adults) · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

CAUTIONS, FURTHER INFORMATION

- High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (≥ 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.

- **INTERACTIONS** → Appendix 1: NSAIDs

• **SIDE-EFFECTS**

- ▶ **Common or very common**
- With intravenous use Fluid retention · gastrointestinal disorders · haemorrhage · intraventricular haemorrhage · neutropenia · periventricular leukomalacia · renal impairment · thrombocytopenia
- ▶ **Uncommon**
- With oral use Gastrointestinal discomfort · headache · hypersensitivity · nausea · rash (discontinue) · skin reactions
- ▶ **Rare or very rare**
- With oral use Acute kidney injury · agranulocytosis · anaemia · angioedema · constipation · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal disorders · haemorrhage · hypotension · influenza like illness · leucopenia · liver disorder · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · oedema · oral disorders · pancytopenia · renal papillary necrosis · respiratory disorders · severe cutaneous adverse reactions (SCARs) · shock · tachycardia · throat pain · thrombocytopenia · vomiting
- ▶ **Frequency not known**
- With oral use Asthma · Crohn's disease · fertility decreased female · fluid retention · heart failure · hypertension · increased risk of arterial thromboembolism · renal failure (more common in patients with pre-existing renal impairment) · respiratory tract reaction
- With topical use Angioedema · asthma · bronchospasm · dyspnoea · gastrointestinal discomfort · hypersensitivity · rash (discontinue) · renal impairment · skin reactions · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

Overdose Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated followed by symptomatic measures are indicated if more than 100mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 1319.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

• PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

• BREAST FEEDING

- ▶ With oral use Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

• HEPATIC IMPAIRMENT

- ▶ With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

• RENAL IMPAIRMENT

- ▶ With oral use Avoid if possible or use with caution. Avoid in severe impairment.
- ▶ With topical use Deterioration in renal function has also been reported after topical use.

Dose adjustments ▶ With systemic use The lowest effective dose should be used for the shortest possible duration.

Monitoring ▶ With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include orange.

• PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ibuprofen for pain and inflammation www.medicinesforchildren.org.uk/ibuprofen-for-pain-and-inflammation

- ▶ With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity For topical preparations, patients or their carers should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

• PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Ibuprofen Oral Suspension Sugar-free may be prescribed. Ibuprofen Tablets may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Smaller pack sizes of gel preparations may be available on sale to the public. Oral preparations can be sold to the public in certain circumstances.

- Brands may include Nurofen Meltlets

Indometacin**(Indomethacin)****• INDICATIONS AND DOSE****Pain and moderate to severe inflammation in rheumatic disease and other musculoskeletal disorders**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 50–200 mg daily in divided doses
- BY RECTUM
- Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 75 mg 1–2 times a day

Acute gout

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 150–200 mg daily in divided doses
- BY RECTUM
- Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 75 mg 1–2 times a day

Dysmenorrhoea

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Up to 75 mg daily
- BY RECTUM
- Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 75 mg daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

• CAUTIONS**GENERAL CAUTIONS** Heart failure

SPECIFIC CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · ischaemic heart disease · parkinsonism · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- With rectal use Avoid rectal administration in haemorrhoids · avoid rectal administration in proctitis

- **INTERACTIONS** → Appendix 1: NSAIDs

• SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

Agranulocytosis · alopecia · anaphylactic reaction · angioedema · anxiety · appetite decreased · arrhythmias · asthma · blood disorder · bone marrow disorders · breast abnormalities · chest pain · coma · confusion · congestive heart failure · constipation · corneal deposits · depression · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dysarthria · erythema nodosum · eye disorder · eye pain · fatigue · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · gynaecomastia · haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · hepatic disorders · hyperglycaemia · hyperhidrosis · hyperkalaemia · hypotension · inflammatory bowel disease · insomnia · leucopenia · movement disorders · muscle weakness · nausea · nephritis tubulointerstitial · nephrotic syndrome · oedema · oral disorders · palpitations · pancreatitis · paraesthesia · peripheral neuropathy · photosensitivity reaction · platelet aggregation inhibition · psychiatric disorders · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · seizures · severe cutaneous adverse reactions (SCARs) · skin reactions · syncope · thrombocytopenia · urine abnormalities · vasculitis · vertigo · vision disorders · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Anaemia · dyspnoea · eosinophilia · malaise · pulmonary oedema · sigmoid lesion perforation

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MONITORING REQUIREMENTS** During prolonged therapy ophthalmic and blood examinations particularly advisable.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Suppository

▶ Indometacin (Non-proprietary)

Indometacin 100 mg Indometacin 100mg suppositories | 10 suppository [PoM] Σ DT = £17.61

▶ Indocid (Aspen Pharma Trading Ltd)

Indometacin 100 mg Indocid 100mg suppositories | 10 suppository [PoM] £17.61 DT = £17.61

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ Indometacin (Non-proprietary)

Indometacin 75 mg Indometacin 75mg modified-release capsules | 100 capsule [PoM] Σ DT = £8.65

▶ Berlid Retard (Tillomed Laboratories Ltd)

Indometacin 75 mg Berlid 75 Retard capsules | 100 capsule [PoM] £8.65 DT = £8.65

Capsule

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

▶ Uncommon

Diarrhoea
Rare or very rare Hypersensitivity · photosensitivity reaction

▶ Frequency not known

Angioedema

SPECIFIC SIDE-EFFECTS

▶ Common or very common

With oral use Gastrointestinal discomfort · nausea · vomiting

▶ Uncommon

With oral use Constipation · dizziness · drowsiness · fatigue · gastrointestinal disorders · headache · oedema · rash (discontinue) · skin reactions

With topical use Increased risk of infection · paraesthesia · skin reactions

▶ Rare or very rare

With oral use Asthma · haemorrhagic anaemia · hepatic disorders · pancreatitis · paraesthesia · shock · stomatitis · tinnitus · vision disorders · weight increased

With topical use Renal impairment

▶ Frequency not known

With oral use Acute kidney injury (more common in patients with pre-existing renal impairment) · agranulocytosis · alopecia · bone marrow failure · bronchospasm · confusion · Crohn's disease aggravated · depression · dyspnoea · fertility decreased female · haemorrhage · hallucination · heart failure · hypertension · increased risk of arterial thromboembolism · increased risk of ischaemic stroke · increased risk of myocardial infarction · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · mood altered · nephritic syndrome · nephritis tubulointerstitial · neutropenia · optic neuritis · rhinitis · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · vasodilation · vertigo
With topical use Eosinophilia · eyelid oedema · fever · gastrointestinal haemorrhage · lip swelling · peptic ulcer · vasculitis · wound complications

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● CONCEPTION AND CONTRACEPTION

With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● PREGNANCY

With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

Ketoprofen

15-May-2018

● INDICATIONS AND DOSE

Pain and mild inflammation in rheumatic disease and musculoskeletal conditions | Dysmenorrhoea | Acute gout

▶ BY MOUTH

Adult: 100–200 mg once daily

Relief of pain in rheumatic disease and musculoskeletal conditions

▶ TO THE SKIN

Adult: Apply 2–4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

POWERGEL®

Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

▶ TO THE SKIN

Adult: Apply 2–3 times a day for up to max. 10 days

● CONTRA-INDICATIONS

With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · severe heart failure

● CAUTIONS

With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical

• BREAST FEEDING

- With systemic use Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

• HEPATIC IMPAIRMENT

- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

• RENAL IMPAIRMENT

- With systemic use Avoid if possible or use with caution. Avoid in severe impairment.
 - With topical use Deterioration in renal function has also been reported after topical use.
- Dose adjustments** ▶ With systemic use The lowest effective dose should be used for the shortest possible duration.
- Monitoring** ▶ With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- DIRECTIONS FOR ADMINISTRATION** For topical preparations apply with gentle massage only.

- PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

- PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.
- Photosensitivity

- With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

- EXCEPTIONS TO LEGAL CATEGORY** Smaller pack sizes of gel preparations may be available on sale to the public.

Pain and inflammation in rheumatic disease | Ankylosing spondylitis

► BY MOUTH

- Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
- Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required
- Elderly: 7.5 mg once daily

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

► BY MOUTH

- Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily
- Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

- **UNLICENSED USE** Not licensed for use in children under 16 years.
- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
 - **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting
 - **Uncommon** Anaemia · angioedema · burping · dizziness · drowsiness · electrolyte imbalance · fluid retention · flushing · haemorrhage · hepatic disorders · hypersensitivity · oedema · skin reactions · stomatitis · vertigo
 - **Rare or very rare** Acute kidney injury · asthma · conjunctivitis · leucopenia · mood altered · nightmare · palpitations · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus · vision disorders
 - **Frequency not known** Agranulocytosis · confusion · fertility decreased female · heart failure · increased risk of arterial thromboembolism · nephritis tubulointerstitial · nephrotic syndrome · photosensitivity reaction · renal necrosis
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in *animal* studies—manufacturer advises avoid.
 - **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
 - **RENAL IMPAIRMENT** Avoid if possible or use with caution.
 - ▶ In adults Avoid if eGFR less than 25 mL/minute/1.73 m².
 - ▶ In children Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Orodispersible tablet

Meloxicam 15 mg Meloxicam 15mg tablets | 30 tablet **[PoM]** £4.00 DT = £0.91

Nabumetone

● INDICATIONS AND DOSE

Pain and inflammation in osteoarthritis and rheumatoid arthritis

▶ BY MOUTH

- ▶ Adult: 1 g once daily, dose to be taken at night
- ▶ Elderly: 0.5–1 g daily

Pain and inflammation in osteoarthritis and rheumatoid arthritis (severe and persistent symptoms)

▶ BY MOUTH

- ▶ Adult: 0.5–1 g, dose to be taken in the morning and 1 g, dose to be taken at night
- ▶ Elderly: 0.5–1 g daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · ear disorder · gastrointestinal discomfort · gastrointestinal disorders · nausea · oedema · skin reactions · tinnitus
- ▶ **Uncommon** Anxiety · asthenia · confusion · dizziness · drowsiness · dry mouth · dyspnoea · eye disorder ·

haemorrhage · headache · hyperhidrosis · insomnia · myopathy · oral disorders · paraesthesia · photosensitivity reaction · respiratory disorders · urinary tract disorder · visual impairment · vomiting

- ▶ **Rare or very rare** Alopecia · angioedema · hepatic disorders · hypersensitivity · menorrhagia · nephrotic syndrome · pancreatitis · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

- ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · asthma · Crohn's disease aggravated · depression · fertility decreased female · haemolytic anaemia · hallucination · heart failure · hypertension · increased risk of arterial thromboembolism · leucopenia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · neutropenia · optic neuritis · vertigo

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoided if possible or use with caution. Avoid in severe impairment.

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease

▶ BY MOUTH

- ▶ Adult: 0.5–1 g daily in 1–2 divided doses

Pain and inflammation in musculoskeletal disorders | Dysmenorrhoea

▶ BY MOUTH

- ▶ Adult: Initially 500 mg, then 250 mg every 6–8 hours as required, maximum dose after the first day 1.25 g daily

continued →

Acute gout

- BY MOUTH
- Adult: Initially 750 mg, then 250 mg every 8 hours until attack has passed

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure
- **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis • alopecia • angioedema • aplastic anaemia • asthma • cognitive impairment • concentration impaired • confusion • constipation • corneal opacity • depression • diarrhoea • dizziness • drowsiness • dyspnoea • erythema nodosum • fatigue • gastrointestinal discomfort • gastrointestinal disorders • glomerulonephritis • haemolytic anaemia • haemorrhage • hallucination • headache • hearing impairment • heart failure • hepatic disorders • hyperhidrosis • hyperkalaemia • hypersensitivity • hypertension • increased risk of arterial thromboembolism • infertility female • inflammatory bowel disease • malaise • meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • muscle weakness • myalgia • nausea • nephritis tubulointerstitial • nephropathy • neutropenia • oedema • optic neuritis • oral disorders • palpitations • pancreatitis • papillitis • papilloedema • paraesthesia • photosensitivity reaction • platelet aggregation inhibition • pulmonary oedema • rash pustular • renal failure (more common in patients with pre-existing renal impairment) • renal papillary necrosis • respiratory disorders • seizure • severe cutaneous adverse reactions (SCARs) • skin reactions • sleep disorders • thirst • thrombocytopenia • vasculitis • vertigo • visual impairment • vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments The lowest effective dose should be used for the shortest possible duration.
Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets.

Naproxen with esomeprazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1113, esomeprazole p. 78.

INDICATIONS AND DOSE

Patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective

► **BY MOUTH**

- Adult: 500/20 mg twice daily, dose expressed as x/y mg naproxen/esomeprazole

- **INTERACTIONS** → Appendix 1: NSAIDs • proton pump inhibitors
- **PRESCRIBING AND DISPENSING INFORMATION** Naproxen component is gastro-resistant.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 22, 25

▶ **Vimovo** (AstraZeneca UK Ltd)

Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg, Naproxen 500 mg Vimovo 500mg/20mg modified-release tablets | 60 tablet [PoM] £14.95 DT = £14.95

Piroxicam

● INDICATIONS AND DOSE

Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)

▶ BY MOUTH

Adult: Up to 20 mg once daily

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

▶ TO THE SKIN

Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

IMPORTANT SAFETY INFORMATION

CHMP ADVICE—PIROXICAM (JUNE 2007)

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

● CONTRA-INDICATIONS

- ▶ With systemic use Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding • history of gastro-intestinal perforation • history of gastro-intestinal ulceration • inflammatory bowel disease • severe heart failure

● CAUTIONS

- ▶ With systemic use Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension
- ▶ With topical use Avoid contact with eyes • avoid contact with inflamed or broken skin • avoid contact with mucous membranes • not for use with occlusive dressings • topical application of large amounts can result in systemic effects,

including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Gastrointestinal discomfort • gastrointestinal disorders • nausea • skin reactions
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Bronchospasm • dyspnoea • photosensitivity reaction

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With oral use Anaemia • appetite decreased • constipation • diarrhoea • dizziness • drowsiness • eosinophilia • headache • hearing impairment • hyperglycaemia • leucopenia • oedema • rash (discontinue) • thrombocytopenia • vertigo • vomiting • weight changes
- ▶ **Uncommon**
 - ▶ With oral use Hypoglycaemia • palpitations • stomatitis • vision blurred
- ▶ **Rare or very rare**
 - ▶ With oral use Nephritis tubulointerstitial • nephrotic syndrome • renal failure • renal papillary necrosis
- ▶ **Frequency not known**
 - ▶ With oral use Alopecia • angioedema • aplastic anaemia • confusion • depression • embolism and thrombosis • eye irritation • eye swelling • fertility decreased female • fluid retention • haemolytic anaemia • haemorrhage • hallucination • heart failure • hepatic disorders • hypersensitivity • hypertension • malaise • mood altered • nervousness • onycholysis • pancreatitis • paraesthesia • sleep disorders • vasculitis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- ▶ With topical use Topical application of large amounts can result in systemic effects.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION**
 - ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

● BREAST FEEDING

- ▶ With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT

- ▶ With systemic use Avoid if possible or use with caution.
- ▶ With topical use Deterioration in renal function has also been reported after topical use.

Dose adjustments ▶ With systemic use The lowest effective dose should be used for the shortest possible duration.
Monitoring ▶ With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing.
- ▶ With topical use For topical preparations apply with gentle massage only.
- **PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children.
- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.
 Photosensitivity
- ▶ With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- **LESS SUITABLE FOR PRESCRIBING**
- ▶ With oral use Piroxicam is less suitable for prescribing.

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Acute gout

▶ BY MOUTH

▶ Adult: 200 mg twice daily for maximum duration 7–10 days in peri-articular disorders, dose may be reduced according to response; acute gout should respond within 7 days; maximum 400 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease ·

coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · ensure adequate hydration · heart failure · history of renal stones · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Acute psychosis · agranulocytosis · alopecia · angioedema · appetite decreased · arrhythmia · asthenia · asthma · bone marrow disorders · cholecystitis · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dyspnoea · dysuria · eye disorder · fever · gastrointestinal discomfort · gastrointestinal disorders · gynaecomastia · haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · heart failure · hepatic disorders · hyperglycaemia · hyperhidrosis · hyperkalaemia · hypersensitivity · hypersensitivity vasculitis · hypertension · increased risk of arterial thromboembolism · increased risk of infection · insomnia · leucopenia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · mucosal abnormalities · muscle weakness · nausea · nephritis tubulointerstitial · nephrotic syndrome · nerve disorders · nervousness · neutropenia · oedema · oral disorders · palpitations · pancreatitis · paraesthesia · photosensitivity reaction · psychiatric disorder · renal impairment · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · syncope · taste altered · thrombocytopenia · urine abnormalities · urine discolouration · vertigo · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
Dose adjustments The lowest effective dose should be used for the shortest possible duration.
Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Tenoxicam

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease

- BY MOUTH
- Adult: 20 mg once daily
- BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 20 mg once daily as initial treatment for 1–2 days if oral administration not possible

Pain and inflammation in acute musculoskeletal disorders

- BY MOUTH
- Adult: 20 mg once daily for 7 days; maximum duration of treatment 14 days (including treatment by intravenous or intramuscular injection)
- BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 20 mg once daily as initial treatment for 1–2 days if oral administration not possible

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Constipation · Crohn's disease aggravated · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · nausea · vomiting
- **Uncommon** Fatigue · oedema · skin reactions
- **Rare or very rare** Asthma · bronchospasm · depression · dyspnoea · hyperglycaemia · nervousness · palpitations · pancreatitis · severe cutaneous adverse reactions (SCARs) · sleep disorders · vertigo · weight changes
- **Frequency not known** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · confusion · eosinophilia · fertility decreased female · haemolytic anaemia · hallucination · heart failure · hepatic disorders · hypersensitivity · hypertension · leucopenia · malaise · nail disorder · nephritis tubulointerstitial · nephropathy · paraesthesia · photosensitivity reaction · platelet aggregation inhibition · purpura non-thrombocytopenic · renal failure (more common in patients with pre-existing renal impairment) · thrombocytopenia · tinnitus · vasculitis · vision disorders

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Dizziness · dry mouth · oral disorders
- **Rare or very rare**
- With oral use Embolism and thrombosis · metabolic disorder
- **Frequency not known**
- With oral use Drowsiness · eye irritation · eye swelling
- With parenteral use Appetite decreased · increased risk of arterial thromboembolism · increased risk of ischaemic stroke · increased risk of myocardial infarction · meningitis aseptic (patients with connective-tissue disorders such as

systemic lupus erythematosus may be especially susceptible) · neutropenia · oral ulceration

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
 - **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
 - **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
 - **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in *animal* studies.
 - **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
 - **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● MEDICINAL FORMS

Tiaprofenic acid

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

- BY MOUTH
- Adult: 300 mg twice daily

IMPORTANT SAFETY INFORMATION

CSM ADVICE

Following reports of **severe cystitis** the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop.

Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

- **CONTRA-INDICATIONS** Active bladder disease (or symptoms) · active gastro-intestinal bleeding · active gastro-intestinal ulceration · active prostate disease (or

symptoms) · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · history of recurrent urinary-tract disorders (if urinary symptoms develop discontinue immediately and perform urine tests and culture) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · appetite decreased · asthma · bladder pain · bronchospasm · confusion · constipation · Crohn's disease aggravated · cystitis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · fertility decreased female · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · increased risk of arterial thromboembolism · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · skin reactions · sodium retention · thrombocytopenia · tinnitus · urinary disorders · urinary tract inflammation · vertigo · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
Dose adjustments Reduce dose in mild or moderate impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
Dose adjustments Reduce dose in mild or moderate impairment. The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

5 Soft tissue and joint disorders

5.1 Local inflammation of joints and soft tissue

Other drugs used for Local inflammation of joints and soft tissue Betamethasone, p. 660

CORTICOSTEROIDS

Corticosteroids, inflammatory disorders

Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment.

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone p. 663 up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone p. 664 may reduce the rate of joint destruction in moderate to severe *rheumatoid arthritis* of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisone p. 666 is also available for the treatment of moderate to severe rheumatoid arthritis.

Polymyalgia rheumatica and *giant cell (temporal) arteritis* are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyarthritis nodosa and *polymyositis* are usually treated with corticosteroids.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarthritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 604 or hydroxychloroquine sulfate p. 1062, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate below or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

Dexamethasone

21-Dec-2017

● INDICATIONS AND DOSE

Local inflammation of joints

- BY INTRA-ARTICULAR INJECTION
 - Adult: 0.3–3.3 mg, where appropriate, dose may be repeated at intervals of 3–21 days according to response, dose given according to size—consult product literature

Local inflammation of soft tissues

- BY LOCAL INFILTRATION
 - Adult: 1.7–5 mg, dose given according to size—consult product literature, where appropriate may be repeated at intervals of 3–21 days, use the 3.3 mg/mL injection preparation for this dose

- **INTERACTIONS** → Appendix 1: corticosteroids
- **PREGNANCY** Dexamethasone readily crosses the placenta.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - With systemic use Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

● MEDICINAL FORMS

5.2 Soft tissue disorders

Soft-tissue disorders

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Extravasation prevention

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch p. 217 distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

Extravasation management

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone p. 1119 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury.

Antihistamines and **analgesics** may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice.

Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the

offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase p. 1122. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dexrazoxane p. 915 is licensed for the treatment of anthracycline-induced extravasation.

Enzymes used in soft-tissue disorders

Collagenase

Collagenase below are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren's contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

Hyaluronidase

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

Rubefacients

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. **Topical NSAIDs** (e.g. felbinac p. 1105, ibuprofen p. 1106, ketoprofen p. 1110, and piroxicam p. 1115 may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

Capsaicin

A preparation containing capsaicin 0.025% p. 476 can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

ENZYMES

Collagenase

20-Sep-2017

● **INDICATIONS AND DOSE**

Dupuytren's contracture in patients with a palpable cord

▶ **BY INTRALESIONAL INJECTION**

- ▶ **Adult:** 580 micrograms, then 580 micrograms every 4 weeks if required, inject into palpable cord, maximum 3 injections per cord, maximum 8 injections in total and only one cord may be treated at a time

- **CONTRA-INDICATIONS** Avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage
- **CAUTIONS** Coagulation disorders • use of anticoagulants

• SIDE-EFFECTS

- ▶ **Common or very common** Axillary mass · dizziness · headache · hyperhidrosis · inflammation · joint disorders · lymphatic abnormalities · muscle complaints · nausea · pain · peripheral oedema · sensation abnormal · skin reactions
- ▶ **Uncommon** Abdominal pain upper · anxiety · breast abnormalities · disorientation · dyspnoea · eyelid oedema · facial swelling · fatigue · feeling hot · fever · haematoma · hypersensitivity · hypotension · influenza like illness · insomnia · irritability · ligament injury · limb discomfort · limb injury · local swelling · lymphangitis · malaise · monoplegia · muscle weakness · musculoskeletal discomfort · syncope · tendon disorders · thrombocytopenia · tremor · vomiting · wound complications

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Systemic absorption by mother negligible.

- **DIRECTIONS FOR ADMINISTRATION** Reconstitution and injected volumes vary with site of injection—consult product literature.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Collagenase clostridium histolyticum for treating Dupuytren's contracture (July 2017)** NICE TA459

For people not taking part in the ongoing clinical trial (HTA-15/102/04), collagenase clostridium histolyticum (CCH) is recommended as an option for treating Dupuytren's contracture with a palpable cord in patients only if the following apply:

- There is evidence of moderate disease (functional problems and metacarpophalangeal joint contracture of 30° to 60° and proximal interphalangeal joint contracture of less than 30° or first web contracture) plus up to 2 affected joints, **and**
- Percutaneous needle fasciotomy is not considered appropriate, but limited fasciectomy is considered appropriate by the treating hand surgeon, **and**
- The choice of treatment (CCH or limited fasciectomy) is made on an individual basis after discussion between the responsible hand surgeon and the patient about the risks and benefits of the treatments available, **and**
- One injection is given per treatment session by a hand surgeon in an outpatient setting.

Patients currently receiving CCH whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

Eye

Eye treatment: drug administration

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies

as a first-aid treatment. Sterile sodium chloride 0.9% solution p. 1134 is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

Certain eye drops, e.g. amphotericin p. 583, ceftazidime p. 519, cefuroxime p. 1137, colistimethate sodium p. 546, desferrioxamine mesilate p. 996, dexamethasone p. 1127, gentamicin p. 1136, and vancomycin p. 525 can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product is not suitable for a patient's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Eye preparations: control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiciliary use* should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some

beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 271 and hydalazine hydrochloride p. 180). Other drugs that may affect contact lens wear are isotretinoin p. 1234 (can cause conjunctival inflammation), aspirin p. 121 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 571 and sulfasalazine p. 42 (can discolour lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

Topical corticosteroids are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 1127 (*Ozurdex*®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing fluocinolone acetonide p. 1157 (*Iluvien*®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

Eye care, other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 1126, and sodium cromoglicate p. 1126.

Eye drops containing antihistamines, such as *antazoline* (with xylometazoline hydrochloride p. 1125 as *Otrivine-Antistin*®), azelastine hydrochloride p. 1125, epinastine hydrochloride p. 1125, ketotifen p. 1125, and olopatadine p. 1126, can be used for allergic conjunctivitis.

Sodium cromoglicate (sodium cromoglycate) and nedocromil sodium eye drops p. 1126 can be useful for vernal

keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac sodium eye drops p. 1144 are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

Ciclosporin p. 1130 is licensed for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

Cenegeerin p. 1130 is licensed for moderate to severe neurotrophic keratitis.

1.1 Allergic conjunctivitis

ANTIHISTAMINES

Antazoline with xylometazoline

● INDICATIONS AND DOSE

Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply 2–3 times a day for maximum 7 days
- ▶ Adult: Apply 2–3 times a day for maximum 7 days

- **CAUTIONS** Angle-closure glaucoma · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · phaeochromocytoma · urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines, sedating · sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Drowsiness · eye irritation · headache · hyperhidrosis · hypertension · mydriasis · nausea · palpitations · vascular disorders · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION Absorption of antazoline and xylometazoline may result in systemic side-effects.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Otrivine Antistin** (Thea Pharmaceuticals Ltd)
Xylometazoline hydrochloride 500 microgram per 1 ml,
Antazoline sulfate 5 mg per 1 ml Otrivine Antistin 0.5%/0.05% eye drops | 10 ml [P] £3.35 DT = £3.35

Azelastine hydrochloride

● INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day

Perennial conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
- ▶ Adult: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- ▶ **Common or very common** Eye irritation
- ▶ **Uncommon** Taste bitter

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Optilast** (Meda Pharmaceuticals Ltd)
Azelastine hydrochloride 500 microgram per 1 ml Optilast 0.05% eye drops | 8 ml [PoM] £6.40 DT = £6.40

Epinephrine hydrochloride

● INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply twice daily for maximum 8 weeks
- ▶ Adult: Apply twice daily for maximum 8 weeks

● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort
- ▶ **Uncommon** Dry eye · eye disorders · headache · nasal irritation · rhinitis · taste altered · visual impairment

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Relestat** (Allergan Ltd)
Epinephrine hydrochloride 500 microgram per 1 ml Relestat 500micrograms/ml eye drops | 5 ml [PoM] £9.90 DT = £9.90

Ketotifen

● INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 3-17 years: Apply twice daily
- ▶ Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort · eye disorders · eye inflammation
- ▶ **Uncommon** Conjunctival haemorrhage · drowsiness · dry eye · dry mouth · headache · skin reactions · vision disorders
- ▶ **Frequency not known** Asthma exacerbated · facial swelling · oedema

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Ketofall** (Scope Ophthalmics Ltd)
Ketotifen (as Ketotifen hydrogen fumarate) 250 microgram per 1 ml Ketofall 0.25mg/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £6.95
- ▶ **Zaditen** (Thea Pharmaceuticals Ltd)
Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml Zaditen 250micrograms/ml eye drops | 5 ml [PoM] £7.80 DT = £7.80

Olopatadine

● INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 3–17 years: Apply twice daily for maximum 4 months
- ▶ Adult: Apply twice daily for maximum 4 months

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · dry eye · eye discomfort · headache · nasal dryness · taste altered
- ▶ **Uncommon** Dizziness · eye disorders · eye inflammation · increased risk of infection · numbness · skin reactions · vision disorders
- ▶ **Frequency not known** Drowsiness · dyspnoea · malaise · nausea · vomiting

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Opatanol** (Novartis Pharmaceuticals UK Ltd)
Olopatadine (as Olopatadine hydrochloride) 1 mg per 1 ml Opatanol 1mg/ml eye drops | 5 ml [PoM] £4.68 DT = £4.68

MAST-CELL STABILISERS

Lodoxamide

● INDICATIONS AND DOSE

Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 4–17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
- ▶ Adult: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

● SIDE-EFFECTS

- ▶ **Common or very common** Dry eye · eye discomfort · eye disorders · vision disorders
- ▶ **Uncommon** Corneal deposits · dizziness · eye inflammation · headache · nausea
- ▶ **Rare or very rare** Nasal complaints · rash · taste altered
- ▶ **EXCEPTIONS TO LEGAL CATEGORY** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Alomide** (Novartis Pharmaceuticals UK Ltd)
Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml Alomide 0.1% eye drops | 10 ml [PoM] £5.21 DT = £5.21

Nedocromil sodium

● INDICATIONS AND DOSE

Seasonal and perennial conjunctivitis

- ▶ TO THE EYE
- ▶ Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis

Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child 6–17 years: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort · eye strain · taste altered

● MEDICINAL FORMS

No licensed medicines listed.

Sodium cromoglicate

(Sodium cromoglycate)

● INDICATIONS AND DOSE

Allergic conjunctivitis | Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

● SIDE-EFFECTS

Eye stinging

- ▶ **EXCEPTIONS TO LEGAL CATEGORY** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

▶ Sodium cromoglicate (Non-proprietary)

Sodium cromoglicate 20 mg per 1 ml Sodium cromoglicate 2% eye drops | 13.5 ml [PoM] £11.25 DT = £9.87

▶ Opticrom (Sanofi)

Sodium cromoglicate 20 mg per 1 ml Opticrom Aqueous 2% eye drops | 13.5 ml [PoM] £8.03 DT = £9.87

▶ Vividrin (Bausch & Lomb UK Ltd)

Sodium cromoglicate 20 mg per 1 ml Vividrin 2% eye drops | 13.5 ml [PoM] £10.95 DT = £9.87

1.2 Inflammatory eye conditions

Other drugs used for Inflammatory eye conditions

Adalimumab, p. 1073

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Nepafenac

06-Jun-2017

● INDICATIONS AND DOSE

Prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery | Reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- ▶ **CAUTIONS** Avoid sunlight · corneal epithelial breakdown (if evidence of, then discontinue immediately)

- ▶ **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- ▶ **Uncommon** Eye discomfort · eye disorders · eye inflammation
- ▶ **Rare or very rare** Allergic dermatitis · corneal deposits · dizziness · dry eye · headache · nausea

- **Frequency not known** Cutis laxa • vision disorders • vomiting

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2017) that nepafenac (*Nevanac*®) 3 mg/mL eye drops are accepted for use within NHS Scotland for the reduction in risk of postoperative macular oedema associated with cataract surgery in diabetic patients.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Nevanac** (Novartis Pharmaceuticals UK Ltd)

Nepafenac 1 mg per 1 ml Nevanac 1mg/ml eye drops | 5 ml [PoM]
£14.92 DT = £14.92

Nepafenac 3 mg per 1 ml Nevanac 3mg/ml eye drops | 3 ml [PoM]
£14.92 DT = £14.92

CORTICOSTEROIDS

Betamethasone

21-Dec-2017

• INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE USING EYE DROP
 - Child: Apply every 1–2 hours until controlled then reduce frequency
 - Adult: Apply every 1–2 hours until controlled then reduce frequency
- TO THE EYE USING EYE OINTMENT
 - Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops
 - Adult: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Vision disorders

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Betnesol** (RPH Pharmaceuticals AB)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT = £2.32

- **Vistamethasone** (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £1.02 | 10 ml [PoM] £1.16 DT = £2.32

Eye ointment

- **Betamethasone (Non-proprietary)**

Betamethasone sodium phosphate 1 mg per 1 gram Betamethasone 0.1% eye ointment | 3 gram [PoM] £3.48 DT = £1.41

- **Betnesol** (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 3 gram [PoM] £1.41 DT = £1.41

Combinations available: **Betamethasone with neomycin**, p. 1129

Dexamethasone

21-Dec-2017

• INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE USING EYE DROP
 - Child: Apply 4–6 times a day
 - Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

Short term local treatment of inflammation (severe conditions)

- TO THE EYE USING EYE DROP
 - Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only) | Visual impairment due to diabetic macular oedema in adults who are pseudophakic, or who are insufficiently responsive to, or unsuitable for non-corticosteroid therapy (specialist use only) | For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only)

- BY INTRAVITREAL INJECTION

- Adult: 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pre-treatment, administration and repeat dosing, consult product literature

- **UNLICENSED USE** *Maxidex*® not licensed for use in children under 2 years. *Dropodex*® not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

- **CONTRA-INDICATIONS**

- With intravitreal use Active ocular herpes simplex • active or suspected ocular infection • active or suspected periocular infection • rupture of the posterior lens capsule in patients with aphakia, iris or transscleral fixated intra-ocular lens or anterior chamber intra-ocular lens • uncontrolled advanced glaucoma

- **CAUTIONS**

- With intravitreal use history of ocular viral infection (including herpes simplex) • posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) • retinal vein occlusion with significant retinal ischaemia

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS**

- **Common or very common** Eye discomfort
- **Uncommon**
 - When used by eye (topical) Photophobia • taste altered
- With intravitreal use Retinitis necrotising
- **PREGNANCY** Dexamethasone readily crosses the placenta.
- With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING**
- With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **MONITORING REQUIREMENTS**

- With intravitreal use Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule

tear or iris defect monitor for implant migration to allow for; early diagnosis and management.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011)** NICE TA229
Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion. Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:
 - treatment with laser photocoagulation has not been beneficial, or
 - treatment with laser photocoagulation is not considered suitable because of the extent of macular haemorrhage.

www.nice.org.uk/TA229

- ▶ **Dexamethasone intravitreal implant for treating diabetic macular oedema (July 2015)** NICE TA349
Dexamethasone intravitreal implant is recommended as an option for treating diabetic macular oedema only if:
 - the implant is to be used in an eye with an intraocular (pseudophakic) lens and
 - the diabetic macular oedema does not respond to non-corticosteroid treatment, or such treatment is unsuitable.

www.nice.org.uk/TA349

- ▶ **Adalimumab and dexamethasone for treating non-infectious uveitis (July 2017)** NICE TA460
Dexamethasone intravitreal implant is recommended as an option for treating non-infectious uveitis in the posterior segment of the eye in patients, only if there is:
 - active disease (that is, current inflammation in the eye), and
 - worsening vision with a risk of blindness.
 Patients currently receiving dexamethasone whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA460

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that dexamethasone intravitreal implant (*Ozurdex*®) is accepted for restricted use within NHS Scotland for the treatment of patients with macular oedema following central retinal vein occlusion, and in patients with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

- **MEDICINAL FORMS**

- **SIDE-EFFECTS** Eye discomfort · increased risk of infection · taste altered · visual impairment
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose prednisolone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

► Prednisolone (Non-proprietary)

Prednisolone sodium phosphate 5 mg per 1 ml Minims prednisolone sodium phosphate 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £12.25 DT = £12.25

► Pred Forte (Allergan Ltd)

Prednisolone acetate 10 mg per 1 ml Pred Forte 1% eye drops | 5 ml [PoM] £1.82 DT = £1.82 | 10 ml [PoM] £3.66 DT = £3.66

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
► Predsol (RPH Pharmaceuticals AB)

Prednisolone sodium phosphate 5 mg per 1 ml Predsol 0.5% ear/eye drops | 10 ml [PoM] £2.00 DT = £2.00

Rimexolone

21-Dec-2017

● INDICATIONS AND DOSE

Local treatment of postoperative inflammation (short term use)

- TO THE EYE
- Adult: Apply 4 times a day for 2 weeks, treatment to begin 24 hours after surgery

Local treatment of steroid-responsive inflammation (short term use)

- TO THE EYE
- Adult: Apply in at least 4 times a day divided doses for up to 4 weeks

Uveitis (short term use)

- TO THE EYE
- Adult: Apply every 1 hour during the day time for week 1, then apply every 2 hours for week 2, then apply 4 times a day for week 3, then apply twice daily for the first 4 days of week 4, then apply once daily for the remaining 3 days of week 4

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

● SIDE-EFFECTS

- Common or very common Eye discomfort · vision disorders
- Uncommon Dry eye · eye disorders · eye inflammation · headache · taste altered
- Frequency not known Increased risk of eye infections · optic nerve damage

● MEDICINAL FORMS

No licensed medicines listed.

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1127.

● INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)

- TO THE EYE USING EYE DROP
- Adult: Apply up to 6 times a day

- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin eye-drops are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Betnesol-N (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

Dexamethasone with framycetin sulfate and gramicidin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1127, framycetin sulfate p. 1160.

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
- Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

- **LESS SUITABLE FOR PRESCRIBING** Sofradex® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

► Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml Sofradex ear/eye drops | 8 ml [PoM] £7.50

Dexamethasone with hypromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1127.

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE USING EYE DROP
- Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

continued →

Local treatment of inflammation (short-term)

► TO THE EYE USING EYE OINTMENT

- Adult: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), woolfat and related substances (including lanolin)

- **Maxitrol** (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram Maxitrol eye ointment | 3.5 gram [PoM] £1.44

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- **Maxitrol** (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 ml, Hypromellose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml Maxitrol eye drops | 5 ml [PoM] £1.68

Dexamethasone with tobramycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1127, tobramycin p. 1137.

• **INDICATIONS AND DOSE****Local treatment of inflammation (short-term)**

► TO THE EYE

- Adult: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with tobramycin eye-drops are less suitable for prescribing.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Tobradex** (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 ml, Tobramycin 3 mg per 1 ml Tobradex 3mg/ml / 1mg/ml eye drops | 5 ml [PoM] £5.37 DT = £5.37

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS**Ciclosporin**

(Cyclosporin)

01-Sep-2016

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

• **INDICATIONS AND DOSE**

Severe keratitis in dry eye disease that has not responded to treatment with tear substitutes (initiated by a specialist)

► TO THE EYE

- Adult: Apply 1 drop once daily, to be applied to the affected eye(s) at bedtime, review treatment at least every 6 months

- **CONTRA-INDICATIONS** Active or suspected ocular or peri-ocular infection
- **CAUTIONS** Glaucoma—limited information available · history of ocular herpes—no information available

- **INTERACTIONS** → Appendix 1: ciclosporin

• **SIDE-EFFECTS**

- **Common or very common** Eye discomfort · eye disorders · eye inflammation · vision blurred

- **Uncommon** Eye deposit · ophthalmic herpes zoster

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—limited information.

- **DIRECTIONS FOR ADMINISTRATION** Keep eyes closed for 2 minutes after using *Ikervis*® eye drops, to increase local drug action and reduce systemic absorption.

• **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- Ciclosporin for treating dry eye disease that has not improved despite treatment with artificial tears (December 2015)

NICE TA369

Ciclosporin (*Ikervis*®) is recommended as an option for treating dry eye disease that has not improved despite treatment with tear substitutes.

www.nice.org.uk/TA369

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment

Eye drops

- **Ikervis** (Santen UK Ltd)

Ciclosporin 1 mg per 1 ml Ikervis 0.1% eye drops 0.3ml unit dose | 30 unit dose [PoM] £72.00 DT = £72.00

NERVE GROWTH FACTORS**Cenegermin**

13-Dec-2017

- **DRUG ACTION** Cenegermin is a recombinant form of human nerve growth factor which allows restoration of corneal integrity; endogenous human nerve growth factor is involved in the differentiation and maintenance of neurons.

• **INDICATIONS AND DOSE**

Moderate or severe neurotrophic keratitis (specialist use only)

► TO THE EYE

- Adult: Apply 1 drop 6 times a day, to be applied every 2 hours, starting in the morning and completing within 12 hours; treatment should be continued for 8 weeks

- **CONTRA-INDICATIONS** Eye infection—resolve before initiating treatment (if an infection occurs during treatment, cenegermin should be suspended until infection resolution) · patients requiring immediate corneal surgery (assess for risk of corneal melting or impending perforation before initiating treatment)

- **CAUTIONS** Ocular cancer—manufacturer recommends monitor for cancer progression before and after treatment

• **SIDE-EFFECTS**

- **Common or very common** Eye disorders · eye inflammation · eye pain · headache · photophobia

- **Uncommon** Corneal abscess

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that other topical ophthalmic preparations should be administered at least 15 minutes before or after use.

- **HANDLING AND STORAGE** For information on storage of cenegermin, consult product literature.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be counselled on how to administer cenegermin eye drops.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- ▶ **Oxervate** (Dompe UK Ltd) ▼

Cenegermin 20 microgram per 1 ml Oxervate 20micrograms/ml eye drops preservative free | 1 ml [PoM] (Hospital only)

1.2a Anterior uveitis

ANTIMUSCARINICS

Antimuscarinics (eye)

- **CAUTIONS** Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdose · mydriasis can precipitate acute angle-closure glaucoma (usually in those aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber) · mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) (in children) · neonates at increased risk of systemic toxicity
- **SIDE-EFFECTS** Arrhythmias · conjunctivitis (on prolonged administration) · dry mouth · dry skin · eye oedema (on prolonged administration) · flushing · hyperaemia (on prolonged administration) · gastrointestinal disorders · urinary disorders
- **PATIENT AND CARER ADVICE** Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

MEDICINAL FORMS

Forms available from special-order manufacturers include: eye drops

2 Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren's syndrome) often responds to tear replacement therapy or pilocarpine p. 1149 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation.

Hypromellose p. 1133 is the traditional choice of treatment for tear deficiency. It may need to be instilled

frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 1134 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 1135, with or without trehalose, are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 1134 are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride 5% eye drops are used for the short-term treatment of corneal oedema in adults.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

OCULAR LUBRICANTS

Acetylcysteine

07-Feb-2017

● INDICATIONS AND DOSE

Tear deficiency | Impaired or abnormal mucus production

- ▶ TO THE EYE
- ▶ Adult: Apply 3–4 times a day

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

3 Eye infections

Eye, infections

Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis.

Corneal ulcer and *keratitis* require specialist treatment and may call for hospital admission for intensive therapy.

Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

Antibacterials for eye infections

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 1139 has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 1137, levofloxacin p. 1138, moxifloxacin p. 1138, and ofloxacin p. 1138; the aminoglycosides, gentamicin below and tobramycin p. 1137 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 1137 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isonate p. 1139 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Cefuroxime p. 1137 can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery.

With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye'

which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- *Eye ointment*, apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals for eye infections

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals for eye infections

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 1140 or ganciclovir p. 1140. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. See systemic treatment of CMV retinitis.

3.1 Bacterial eye infection

ANTIBACTERIALS > AMINOGLYCOSIDES

Gentamicin

11-Dec-2017

• INDICATIONS AND DOSE

Bacterial eye infections

► TO THE EYE

- **Child:** Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient
- **Adult:** Apply 1 drop at least every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- **INTERACTIONS** → Appendix 1: aminoglycosides

- **PRESCRIBING AND DISPENSING INFORMATION** Eye drops may be sourced as a manufactured special or from specialist importing companies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride

► Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] £2.63 DT = £2.47

Tobramycin

22-Nov-2016

● INDICATIONS AND DOSE

Local treatment of infections

► TO THE EYE

- Child 1-17 years: Apply twice daily for 6-8 days
- Adult: Apply twice daily for 6-8 days

Local treatment of infections (severe infection)

► TO THE EYE

- Child 1-17 years: Apply 4 times a day for first day, then apply twice daily for 5-7 days
- Adult: Apply 4 times a day for first day, then apply twice daily for 5-7 days

- **INTERACTIONS** → Appendix 1: aminoglycosides

No licensed medicines listed.

ANTIBACTERIALS > CEPHALOSPORINS, SECOND-GENERATION

Cefuroxime

● INDICATIONS AND DOSE

APROKAM[®] INTRACAMERAL INJECTION

Prophylaxis of endophthalmitis after cataract surgery

► BY INTRACAMERAL INJECTION

- Adult: 1 mg, dose to be injected into the anterior chamber of the eye at the end of cataract surgery

● CAUTIONS

APROKAM[®] INTRACAMERAL INJECTION Combined operations with cataract surgery · complicated cataracts · reduced corneal endothelial cells (less than 2000) · severe risk of infection · severe thyroid disease

- **INTERACTIONS** → Appendix 1: cephalosporins

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

● NATIONAL FUNDING/ACCESS DECISIONS

APROKAM[®] INTRACAMERAL INJECTION

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2016) that cefuroxime (Aprokam[®]) is accepted for use within NHS Scotland for antibiotic prophylaxis of postoperative endophthalmitis after cataract surgery.

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (August 2017) that cefuroxime (Aprokam[®]) is recommended as an option for use within NHS Wales for the antibiotic prophylaxis of postoperative endophthalmitis after cataract surgery.

3.2 Viral eye infection

3.2a Ophthalmic herpes simplex

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex infection (local treatment)

- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing
- ▶ Adult: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

● INTERACTIONS → Appendix 1: aciclovir

● SIDE-EFFECTS

- ▶ Common or very common Eye inflammation · eye pain

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

- ▶ **Zovirax** (GlaxoSmithKline UK Ltd)
Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram **[PoM]** £9.34 DT = £9.34

Ganciclovir

31-May-2018

● INDICATIONS AND DOSE

Acute herpetic keratitis

- ▶ TO THE EYE
- ▶ Adult: Apply 5 times a day until healing complete, then apply 3 times a day for a further 7 days, treatment does not usually exceed 21 days

● INTERACTIONS → Appendix 1: ganciclovir

● SIDE-EFFECTS

- ▶ Common or very common Eye stinging · punctate keratitis

● ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

● CONCEPTION AND CONTRACEPTION

As teratogenicity and impaired fertility observed in animal studies with *oral* and *intravenous* ganciclovir, manufacturer advises women of childbearing potential should use effective contraception during treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment.

● PREGNANCY

Manufacturer advises avoid unless no suitable alternative—limited information available.

● BREAST FEEDING

Manufacturer advises avoid unless no suitable alternative—limited information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ganciclovir 1.5 mg per 1 gram Virgan 0.15% eye gel | 5 gram **[PoM]** £19.99 DT = £19.99

4 Eye procedures

Mydriatics and cycloplegics

Overview

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5% below (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride 1% p. 1131 (action up to 24 hours) or atropine sulfate p. 1131 (action up to 7 days).

Phenylephrine hydrochloride p. 1141 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 1131 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

Other drugs used for Eye procedures Apraclonidine, p. 1153

ANTIMUSCARINICS

F 1131

Tropicamide

● INDICATIONS AND DOSE

Funduscopy

- ▶ TO THE EYE
- ▶ Child: 0.5% eye drops to be applied 20 minutes before examination
- ▶ Adult: (consult product literature)

● INTERACTIONS → Appendix 1: tropicamide

● PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

Combinations available: *Phenylephrine with tropicamide*, p. 1142 · *Tropicamide with phenylephrine and lidocaine*, p. 1142

ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

Povidone-iodine

● INDICATIONS AND DOSE

Cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

► TO THE EYE

► Adult: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

- **CONTRA-INDICATIONS** Concomitant use of ocular antimicrobial drugs · concomitant use of ocular formulations containing mercury-based preservatives · preterm neonates

● SIDE-EFFECTS

► **Rare or very rare** Eye erythema · punctate keratitis
► **Frequency not known** Cytotoxicity · eye discolouration

- **BREAST FEEDING** Avoid regular or excessive use.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye lotion

Eye drops

► **Povidone iodine** (Bausch & Lomb UK Ltd)

Povidone-iodine 50 mg per 1 ml Minims povidone iodine 5% eye drops 0.4ml unit dose | 20 unit dose [PoM] £16.00

DIAGNOSTIC AGENTS > DYES

Fluorescein sodium

● INDICATIONS AND DOSE

Detection of lesions and foreign bodies

► TO THE EYE USING EYE DROP

► Adult: Use sufficient amount to stain damaged areas

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► **Fluorescein sodium** (Bausch & Lomb UK Ltd)

Fluorescein sodium 10 mg per 1 ml Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose [P] £9.25

Fluorescein sodium 20 mg per 1 ml Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose [P] £9.25

MIOTICS > PARASYMPATHOMIMETICS

Acetylcholine chloride

● INDICATIONS AND DOSE

Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis

► TO THE EYE

► Adult: (consult product literature)

- **CAUTIONS** Asthma · gastro-intestinal spasm · heart failure · hyperthyroidism · parkinsonism · peptic ulcer · urinary-tract obstruction

- **SIDE-EFFECTS** Bradycardia · corneal decompensation · corneal oedema · dyspnoea · flushing · hyperhidrosis · hypotension
- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Avoid unless potential benefit outweighs risk—no information available.

● MEDICINAL FORMS

Irrigation

► **Miochol-E** (Bausch & Lomb UK Ltd)

Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial [PoM] £7.28

► **Miphtel** (Farmigee S.p.A.)

Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule [PoM] £43.68 (Hospital only)

SYMPATHOMIMETICS > VASOCONSTRICTOR

Phenylephrine hydrochloride

● INDICATIONS AND DOSE

Mydriasis

► TO THE EYE

► Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

► Adult: Apply 1 drop, to be administered before procedure, then apply 1 drop after 60 minutes if required, a drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

- **CONTRA-INDICATIONS** 10% strength eye drops in children · 10% strength eye drops in elderly · aneurysms · cardiovascular disease · hypertension · thyrotoxicosis

- **CAUTIONS** Asthma · cerebral arteriosclerosis (in adults) · corneal epithelial damage · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · diabetes (avoid eye drops in long standing diabetes) · mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber · mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber · ocular hyperaemia · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Arrhythmias · conjunctivitis allergic · eye discomfort · hypertension · myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) · palpitations · periorbital pallor (in children) · vision disorders

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Disodium edetate, sodium metabisulfite

► **Phenylephrine hydrochloride** (Bausch & Lomb UK Ltd)

Phenylephrine hydrochloride 25 mg per 1 ml Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose [P] £11.87

Phenylephrine hydrochloride 100 mg per 1 ml Minims phenylephrine hydrochloride 10% eye drops 0.5ml unit dose | 20 unit dose [P] £11.87

Phenylephrine with tropicamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride p. 1141, tropicamide p. 1140.

INDICATIONS AND DOSE

Pre-operative mydriasis | Diagnostic procedures when monotherapy insufficient

► TO THE EYE

► Adult: One insert to be applied into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

• **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor · tropicamide

• **DIRECTIONS FOR ADMINISTRATION** Patients with severe dry eyes may require a drop of saline to improve insert tolerance.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ophthalmic insert

► **Mydrasert** (Thea Pharmaceuticals Ltd)

Tropicamide 28 mg, Phenylephrine hydrochloride

5.4 mg Mydrasert 5.4mg/0.28mg ophthalmic inserts | 20 insert [PoM] £84.00

Tropicamide with phenylephrine and lidocaine

17-Aug-2017

INDICATIONS AND DOSE

Mydriasis and intraocular anaesthesia during cataract surgery

► BY INTRACAMERAL INJECTION

► Adult: 0.2 mL for 1 dose, to be injected slowly at the start of the surgical procedure

DOSE EQUIVALENCE AND CONVERSION

► Each 0.2 mL dose of **Mydrane**® solution for injection contains 0.04 mg of tropicamide, 0.62 mg of phenylephrine hydrochloride and 2 mg of lidocaine hydrochloride.

• **CONTRA-INDICATIONS** Cataract surgery combined with vitrectomy · history of acute, narrow-angle glaucoma · shallow anterior chamber

• **CAUTIONS** Conditions where systemic exposure to phenylephrine or lidocaine could be harmful (consult product literature) · risk of floppy iris syndrome (consult product literature)

• **INTERACTIONS** → Appendix 1: antiarrhythmics · sympathomimetics, vasoconstrictor · tropicamide

SIDE-EFFECTS

► **Uncommon** Headache · hyperaemia · hypertension · keratitis

• **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with known hypersensitivity to amide-type anaesthetics or atropine derivatives.

• **PREGNANCY** Manufacturer advises avoid (systemic uptake after administration cannot be excluded)—insufficient data available for phenylephrine and tropicamide in pregnancy; lidocaine crosses the placenta but is not known to be harmful in *animal* studies.

• **BREAST FEEDING** Manufacturer advises avoid—no data available for phenylephrine or tropicamide; lidocaine present in milk in small amount.

• **PRE-TREATMENT SCREENING** Manufacturer advises patients must have demonstrated, at a previous visit, a satisfactory pupil dilation with topical mydriatic treatment.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should be counselled about the effects on driving and skilled tasks.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Disodium edetate

► **Mydrane** (Thea Pharmaceuticals Ltd)

Tropicamide 200 microgram per 1 ml, Phenylephrine hydrochloride 3.1 mg per 1 ml, Lidocaine hydrochloride 10 mg per 1 ml Mydrane 0.2mg/ml / 3.1mg/ml / 10mg/ml solution for injection 0.6ml ampoules | 20 ampoule [PoM] £119.95

4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Cefuroxime p. 1137, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as diclofenac sodium p. 1144, flurbiprofen p. 1144, ketorolac trometamol p. 1144, and nepafenac p. 1126, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 1143 is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac sodium and flurbiprofen are also used to prevent miosis during ocular surgery.

Apraclonidine p. 1153, an α_2 -adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylcholine chloride p. 1141, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate p. 1135 and balanced salt solution are used during surgical procedures on the eye.

Povidone-iodine p. 1141 is used for peri-ocular and conjunctival antiseptics before ocular surgery to support postoperative infection control.

Ocular local anaesthetics

Oxybuprocaine hydrochloride below and tetracaine below are widely used topical local anaesthetics. Proxymetacaine hydrochloride below causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 1143 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride p. 1312, with or without adrenaline/epinephrine p. 1313, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

ANAESTHETICS, LOCAL

Fluorescein with lidocaine

● INDICATIONS AND DOSE

Local anaesthesia

5 Glaucoma and ocular hypertension

Glaucoma

Overview

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant

loss of visual-field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are important for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Acute angle-closure glaucoma

Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

Beta-blockers for glaucoma

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in *primary open-angle glaucoma*, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol below, levobunolol hydrochloride p. 1146, and timolol maleate p. 1146.

Prostaglandin analogues and prostamides for glaucoma

The prostaglandin analogues latanoprost p. 1150, tafluprost p. 1151 and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

Sympathomimetics for glaucoma

Brimonidine tartrate, a selective α_2 -adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other anti-glaucoma therapy.

Apraclonidine p. 1153 is another α_2 -adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery. Apraclonidine may not provide additional benefit in patients already using two drugs that suppress the production of aqueous humour.

Carbonic anhydrase inhibitors and systemic drugs for glaucoma

The **carbonic anhydrase inhibitors**, acetazolamide p. 1147, brinzolamide p. 1147, and dorzolamide p. 1148, reduce intra-

ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue or the α_2 -adrenoceptor agonist, brimonidine tartrate p. 1153. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The **osmotic diuretics**, intravenous hypertonic mannitol p. 228 or glycerol by mouth are useful short-term ocular hypotensive drugs.

Miotics for glaucoma

Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

Pilocarpine p. 1149, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

BETA-ADRENOCEPTOR BLOCKERS

Betaxolol

● INDICATIONS AND DOSE

Primary open-angle glaucoma

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers • bradycardia • heart block
- **CAUTIONS** Patients with corneal disease
- **CAUTIONS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.
- **INTERACTIONS** → Appendix 1: beta blockers, selective
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Eye discomfort • eye disorders • vision disorders
 - ▶ **Uncommon** Dry eye • eye inflammation • rhinitis
 - ▶ **Rare or very rare** Cataract • rhinorrhoea • skin reactions
 - ▶ **Frequency not known** Angioedema • hypersensitivity
- **SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bexatolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Betaxolol (Non-proprietary)

Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betaxolol 0.5% eye drops | 5 ml [PoM] £1.90 DT = £1.90

▶ Betoptic (Novartis Pharmaceuticals UK Ltd)

Betaxolol (as Betaxolol hydrochloride) 2.5 mg per 1 ml Betoptic 0.25% suspension eye drops | 5 ml [PoM] £2.66 DT = £2.66

Betoptic 0.25% eye drops suspension 0.25ml unit dose | 50 unit dose [PoM] £13.77 DT = £13.77

Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betoptic 0.5% eye drops | 5 ml [PoM] £1.90 DT = £1.90

Levobunolol hydrochloride

● INDICATIONS AND DOSE

Primary open-angle glaucoma

- ▶ TO THE EYE
- ▶ Adult: Apply 1–2 times a day

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block

- **CAUTIONS** Patients with corneal disease

CAUTIONS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort · eye inflammation
- ▶ **Frequency not known** Dry eye · eye disorders · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose (Levobunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

▶ Betagan (Allergan Ltd)

Levobunolol hydrochloride 5 mg per 1 ml Betagan 0.5% eye drops | 5 ml [PoM] £1.85 DT = £1.85
Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.98

Timolol maleate

● INDICATIONS AND DOSE

Reduction of intra-ocular pressure in primary open-angle glaucoma

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

TIMOPTOL-LA[®]

Reduction of intra-ocular pressure in primary open-angle glaucoma

- ▶ TO THE EYE
- ▶ Adult: Apply once daily

TIOPEX[®]

Reduction of intra-ocular pressure in primary open-angle glaucoma

- ▶ TO THE EYE
- ▶ Adult: Apply once daily, to be applied in the morning

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block

- **CAUTIONS** Consider also cautions listed for systemically administered beta blockers · patients with corneal disease

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort · eye disorders · eye inflammation · vision disorders
- ▶ **Rare or very rare** Angioedema

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- **BREAST FEEDING** Manufacturer advises avoidance.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● NATIONAL FUNDING/ACCESS DECISIONS

TIOPEX[®]

Scottish Medicines Consortium (SMC) Decisions

- ▶ When used by eye The *Scottish Medicines Consortium* has advised (February 2014) that timolol gel eye drops (TiopeX[®]) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye gel

EXCIPIENTS: May contain Benzododecinium bromide

▶ Timoptol-LA (Santen UK Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT = £3.12

Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT = £3.12

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Timolol maleate (Non-proprietary)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml [PoM] £0.78 DT = £0.78

Timolol (as Timolol maleate) 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml [PoM] £0.80 DT = £0.80

▶ Eysano (Aspire Pharma Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Eysano 2.5mg/ml eye drops | 5 ml [PoM] £8.45 DT = £8.45

Timolol (as Timolol maleate) 5 mg per 1 ml Eysano 5mg/ml eye drops | 5 ml [PoM] £9.65 DT = £9.65

▶ Timoptol (Santen UK Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol 0.25% eye drops | 5 ml [PoM] £3.12 DT = £0.78

Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol 0.5% eye drops | 5 ml [PoM] £3.12 DT = £0.80

Timoptol Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £9.65 DT = £9.65

▶ TiopeX (Thea Pharmaceuticals Ltd)

Timolol (as Timolol maleate) 1 mg per 1 gram TiopeX 1mg/g eye gel 0.4g unit dose | 30 unit dose [PoM] £7.49 DT = £7.49

Combinations available: *Bimatoprost with timolol*, p. 1150 · *Brimonidine with timolol*, p. 1154 · *Brinzolamide with timolol*, p. 1148 · *Dorzolamide with timolol*, p. 1149 · *Latanoprost with timolol*, p. 1151 · *Tafuprost with timolol*, p. 1152 · *Travoprost with timolol*, p. 1152

CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

● INDICATIONS AND DOSE

Reduction of intra-ocular pressure in open-angle glaucoma | Reduction of intra-ocular pressure in secondary glaucoma | Reduction of intra-ocular pressure perioperatively in angle-closure glaucoma

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

Glaucoma

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 250–500 mg daily

Epilepsy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

- **CONTRA-INDICATIONS** Adrenocortical insufficiency · hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma

- **CAUTIONS** Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · elderly · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi

- **INTERACTIONS** → Appendix 1: acetazolamide

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Haemorrhage · metabolic acidosis · nephrolithiasis · sensation abnormal
- ▶ **Uncommon** Bone marrow disorders · depression · dizziness · electrolyte imbalance · hearing impairment · hepatic disorders · leucopenia · nausea · renal colic · renal impairment · renal lesions · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urinary tract discomfort · urine abnormalities · vomiting
- ▶ **Rare or very rare** Anaphylactic reaction · appetite changes · confusion · diarrhoea · fatigue · fever · flushing · headache · irritability · libido decreased · paralysis · photosensitivity reaction · seizure
- ▶ **Frequency not known** Agranulocytosis · drowsiness · myopia · polyuria · taste altered · thirst

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
 - ▶ With oral use Osteomalacia
- ▶ **Rare or very rare**
 - ▶ With oral use Ataxia · hyperglycaemia · hypoglycaemia · renal tubular necrosis
- ▶ **Frequency not known**
 - ▶ With oral use Agitation

SIDE-EFFECTS, FURTHER INFORMATION Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering bicarbonate.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in *animal* studies).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.

- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3

▶ **Acetazolamide (Non-proprietary)**

Acetazolamide 250 mg Acetazolamide 250mg tablets | 112 tablet **[PoM]** £75.36 DT = £16.86

Powder for solution for injection▶ **Diamox (AMCO)**

Acetazolamide 500 mg Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial **[PoM]** £17.71

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

▶ **Diamox SR (AMCO)**

Acetazolamide 250 mg Diamox SR 250mg capsules | 30 capsule **[PoM]** £16.66 DT = £16.66

▶ **Eytazox (Teva UK Ltd)**

Acetazolamide 250 mg Eytazox 250mg modified-release capsules | 30 capsule **[PoM]** £16.60 DT = £16.66

Brinzolamide

● **INDICATIONS AND DOSE**

Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily, then increased if necessary up to 3 times a day

- **CONTRA-INDICATIONS** Hyperchloraemic acidosis

- **CAUTIONS** Renal tubular immaturity or abnormality · systemic absorption follows topical application

- **INTERACTIONS** → Appendix 1: brinzolamide

● **SIDE-EFFECTS**

- ▶ **Common or very common** Eye discomfort · eye disorders · taste altered · vision disorders
- ▶ **Uncommon** Arrhythmias · asthenia · cardio-respiratory distress · chest discomfort · cough · depression · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · epistaxis · eye deposit · eye inflammation · feeling abnormal · foreign body in eye · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · memory loss · motor dysfunction · muscle complaints · nasal complaints · nausea · nervousness · oral disorders · oropharyngeal pain · pain · palpitations · renal pain · scleral discolouration · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · throat complaints · vomiting
- ▶ **Rare or very rare** Alopecia · angina pectoris · drowsiness · irritability · optic nerve disorder · respiratory disorders · tinnitus
- ▶ **Frequency not known** Appetite decreased · arthralgia · asthma · hypertension · malaise · peripheral oedema · tremor · urinary frequency increased · vertigo

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Use only if benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Brinzolamide (Non-proprietary)

Brinzolamide 10 mg per 1 ml Brinzolamide 10mg/ml eye drops | 5 ml [PoM] £6.92 DT = £1.89

► Azopt (Novartis Pharmaceuticals UK Ltd)

Brinzolamide 10 mg per 1 ml Azopt 10mg/ml eye drops | 5 ml [PoM] £6.92 DT = £1.89

Brinzolamide with brimonidine

27-Sep-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1147, brimonidine tartrate p. 1153.

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma and in ocular hypertension when monotherapy is inadequate

► TO THE EYE

► Adult: Apply 1 drop twice daily

- **INTERACTIONS** → Appendix 1: brimonidine · brinzolamide

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

CAUTIONARY AND ADVISORY LABELS 3

EXCIPIENTS: May contain Benzalkonium chloride, propylene glycol

► Simbrinza (Novartis Pharmaceuticals UK Ltd)

Brimonidine tartrate 2 mg per 1 ml, Brinzolamide 10 mg per 1 ml Simbrinza 10mg/ml / 2mg/ml eye drops | 5 ml [PoM] £9.23 DT = £9.23

Brinzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1147, timolol maleate p. 1146.

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate

► TO THE EYE

► Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective · brinzolamide

MEDICINAL FORMS

MIOTICS > PARASYMPATHOMIMETICS

Pilocarpine

- **DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

● INDICATIONS AND DOSE

Primary angle-closure glaucoma | Some secondary glaucomas

- ▶ TO THE EYE
- ▶ Adult: Apply up to 4 times a day

- **CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment · acute iritis · anterior uveitis · conditions where pupillary constriction is undesirable · some forms of secondary glaucoma (where pupillary constriction is undesirable)

- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · marked vasomotor instability · Parkinson's disease · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction

- **INTERACTIONS** → Appendix 1: pilocarpine

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · headache · hyperhidrosis · hypersalivation · nausea · skin reactions · vision disorders · vomiting
- ▶ **Frequency not known** Bradycardia · bronchospasm · conjunctival vascular congestion · eye disorder (long term use) · hypotension · pain · paraesthesia · pulmonary oedema · sensitisation · vitreous haemorrhage
- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.
- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).

- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Pilocarpine (Non-proprietary)

Pilocarpine hydrochloride 10 mg per 1 ml Pilocarpine hydrochloride 1% eye drops | 10 ml [PoM] £20.78 DT = £19.95

Pilocarpine hydrochloride 20 mg per 1 ml Pilocarpine hydrochloride 2% eye drops | 10 ml [PoM] £21.52 DT = £19.88

Pilocarpine hydrochloride 40 mg per 1 ml Pilocarpine hydrochloride 4% eye drops | 10 ml [PoM] £27.20 DT = £23.14

▶ Pilocarpine nitrate (Bausch & Lomb UK Ltd)

Pilocarpine nitrate 20 mg per 1 ml Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose [PoM] £12.47

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

Bimatoprost

● INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

- ▶ TO THE EYE
- ▶ Adult: Apply once daily, to be administered preferably in the evening

- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · predisposition to bradycardia · predisposition to hypotension · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

• SIDE-EFFECTS

- **Common or very common** Dry eye · eye discolouration · eye discomfort · eye disorders · eye inflammation · headache · hypertension · hypertrichosis · skin reactions · vision disorders
- **Uncommon** Asthenia · dizziness · madarosis · nausea · retinal haemorrhage
- **Frequency not known** Asthma · bradycardia · dyspnoea · hypotension · reactivation of infection

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—no information available.

- **RENAL IMPAIRMENT** Use with caution—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

• PATIENT AND CARER ADVICE

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

• NATIONAL FUNDING/ACCESS DECISIONS

LUMIGAN®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2013) that bimatoprost 300 micrograms/mL preservative-free eye drops (*Lumigan*® single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzalkonium chloride.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Bimatoprost (Non-proprietary)

Bimatoprost 300 microgram per 1 ml Bimatoprost 300micrograms/ml eye drops | 3 ml [PoM] £10.30 DT = £10.30

► Eyreida (Aspire Pharma Ltd)

Bimatoprost 300 microgram per 1 ml Eyreida 0.3mg/ml eye drops | 3 ml [PoM] £11.71

► Lumigan (Allergan Ltd)

Bimatoprost 100 microgram per 1 ml Lumigan 100micrograms/ml eye drops | 3 ml [PoM] £11.71 DT = £11.71 | 9 ml [PoM] £35.13

Bimatoprost 300 microgram per 1 ml Lumigan 300micrograms/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £13.75 DT = £13.75

► Sturiban (Actavis UK Ltd)

Bimatoprost 300 microgram per 1 ml Sturiban 0.3mg/ml eye drops | 3 ml [PoM] £9.27 DT = £10.30 | 9 ml [PoM] £27.81

Bimatoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, bimatoprost p. 1149, timolol maleate p. 1146.

• INDICATIONS AND DOSE

Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

► TO THE EYE

► Adult: Apply once daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

• NATIONAL FUNDING/ACCESS DECISIONS

GANFORT® SINGLE USE

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2013) that *Ganfort*® unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► *Ganfort* (Allergan Ltd)

Bimatoprost 300 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml *Ganfort* 0.3mg/ml / 5mg/ml eye drops | 3 ml [PoM] £14.16 DT = £14.16 | 9 ml [PoM] £38.15
 Ganfort 0.3mg/ml / 5mg/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £17.94 DT = £17.94

Latanoprost

• INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

► TO THE EYE

► Adult: Apply once daily, to be administered preferably in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)

Following reformulation of *Xalatan*®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpes simplex keratitis · history of recurrent herpetic keratitis associated with prostaglandin analogues

- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · do not use within 5 minutes of thiomersal-containing preparations · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma

(no experience of use) · peri-operative period of cataract surgery · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

● SIDE-EFFECTS

- ▶ **Common or very common** Eye discolouration · eye discomfort · eye disorders · eye inflammation · vision disorders
- ▶ **Uncommon** Dry eye · rash
- ▶ **Rare or very rare** Asthma · chest pain · dyspnoea · unstable angina
- ▶ **Frequency not known** Arthralgia · dizziness · headache · myalgia · ophthalmic herpes simplex · palpitations

● **PREGNANCY** Manufacturer advises avoid.

● **BREAST FEEDING** May be present in milk—manufacturer advises avoid.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

● NATIONAL FUNDING/ACCESS DECISIONS

MONOPOST®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2013) that *Monopost*® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Latanoprost (Non-proprietary)

Latanoprost 50 microgram per 1 ml Latanoprost 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT = £1.53

▶ Medizol (Medicom Healthcare Ltd)

Latanoprost 50 microgram per 1 ml Medizol 0.005% eye drops | 2.5 ml [PoM] £1.40 DT = £1.53

▶ Monopost (Thea Pharmaceuticals Ltd)

Latanoprost 50 microgram per 1 ml Monopost 50micrograms/ml eye drops 0.2ml unit dose | 30 unit dose [PoM] £8.49 DT = £8.49 | 90 unit dose [PoM] £25.47 DT = £25.47

▶ Xalatan (Pfizer Ltd)

Latanoprost 50 microgram per 1 ml Xalatan 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT = £1.53

● **INTERACTIONS** → Appendix 1: beta blockers, non-selective

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Latanoprost with timolol (Non-proprietary)

Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Latanoprost 50micrograms/ml / Timolol 5mg/ml eye drops | 2.5 ml [PoM] £14.32 DT = £2.44

▶ Xalacom (Pfizer Ltd)

Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Xalacom eye drops | 2.5 ml [PoM] £14.32 DT = £2.44

Tafuprost

● INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

▶ TO THE EYE

- ▶ **Adult:** Apply once daily, to be administered preferably in the evening

● **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

● SIDE-EFFECTS

▶ **Common or very common** Dry eye · eye discolouration · eye discomfort · eye disorders · eye inflammation · headache · vision disorders

▶ **Uncommon** Hypertrichosis

▶ **Frequency not known** Asthma exacerbated · dyspnoea

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Use with caution—no information available.

● **RENAL IMPAIRMENT** Use with caution—no information available.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tafuprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

● MEDICINAL FORMS

► **Travoprost with timolol (Non-proprietary)**

Travoprost 40 microgram per 1 ml, Timolol (as Timolol maleate)
5 mg per 1 ml Travoprost 40micrograms/ml / Timolol 5mg/ml eye drops | 2.5 ml (PoM) £13.95 DT = £13.95

► **DuoTrav** (Novartis Pharmaceuticals UK Ltd)

Travoprost 40 microgram per 1 ml, Timolol (as Timolol maleate)
5 mg per 1 ml DuoTrav 40micrograms/ml / 5mg/ml eye drops | 2.5 ml (PoM) £13.95 DT = £13.95 | 7.5 ml (PoM) £39.68

Travoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, travoprost above, timolol maleate p. 1146.

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Apraclonidine

- **DRUG ACTION** Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

● INDICATIONS AND DOSE

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

► TO THE EYE

- Adult: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

► TO THE EYE

- Adult: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

- **CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease
- **CAUTIONS** Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Parkinson's syndrome · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangitis obliterans · vasovagal attack
- **INTERACTIONS** → Appendix 1: apraclonidine
- **SIDE-EFFECTS**
 - **Common or very common** Eye disorders
 - **Uncommon** Bradycardia · conjunctival haemorrhage · diarrhoea · dry eye · eye discomfort · eye inflammation · gastrointestinal discomfort · irritability · libido decreased · nasal dryness · palpitations · postural hypotension · sensation abnormal · sleep disorders · syncope · vision disorders · vomiting
 - **Rare or very rare** Chest pain · dry mouth · fatigue · headache · hyperhidrosis · pain in extremity · pruritus · taste altered · temperature sensation altered
- SIDE-EFFECTS, FURTHER INFORMATION** Since systemic absorption may follow topical application, see clonidine hydrochloride p. 144.
- Ocular intolerance** Manufacturer advises withdrawal if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **MONITORING REQUIREMENTS**
 - Monitor intra-ocular pressure and visual fields.
 - Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► **Iopidine** (Novartis Pharmaceuticals UK Ltd)

Apraclonidine (as Apraclonidine hydrochloride) 5 mg per

1 ml Iopidine 5mg/ml eye drops | 5 ml [PoM] £10.88 DT = £10.88

Apraclonidine (as Apraclonidine hydrochloride) 10 mg per

1 ml Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose [PoM]

£77.85 DT = £77.85

Brimonidine tartrate

12-Jul-2017

- **DRUG ACTION** Brimonidine, an alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

● INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate | Ocular hypertension in patients for whom beta-blockers are inappropriate | Adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy

► TO THE EYE

- Adult: Apply twice daily

- **CAUTIONS** Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangitis obliterans
- **INTERACTIONS** → Appendix 1: brimonidine
- **SIDE-EFFECTS**
 - **Common or very common** Asthenia · dizziness · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · gastrointestinal disorder · headache · hypersensitivity · respiratory disorders · sensation of foreign body · skin reactions · taste altered · vascular disorders · vision disorders
 - **Uncommon** Arrhythmias · nasal dryness · palpitations
 - **Rare or very rare** Dyspnoea · hypertension · hypotension · insomnia · syncope
 - **Frequency not known** Face oedema · vasodilation
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

► **Brymont** (Blumont Pharma Ltd)

Brimonidine tartrate 2 mg per 1 ml Brymont 2mg/ml eye drops | 5 ml [PoM] £2.27 DT = £1.13

Combinations available: **Brinzolamide with brimonidine**, p. 1148

Brimonidine with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brimonidine tartrate p. 1153, timolol maleate p. 1146.

● INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective · brimonidine

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Combigan** (Allergan Ltd)

Brimonidine tartrate 2 mg per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml **Combigan eye drops** | 5 ml [PoM] £10.00 DT = £10.00 | 15 ml [PoM] £27.00

6 Retinal disorders

6.1 Macular degeneration

Subfoveal choroidal neovascularisation

Treatment

Aflibercept p. 1154, pegaptanib sodium and ranibizumab p. 1155 are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion, and diabetic macular oedema; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion.

ANTINEOVASCULARISATION DRUGS >

VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

06-Dec-2017

- **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels.

● INDICATIONS AND DOSE

Neovascular (wet) age-related macular degeneration (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: Initially 2 mg once a month for 3 months, then 2 mg every 2 months, review treatment frequency after 12 months

Macular oedema secondary to retinal vein occlusion (specialist use only)

- ▶ BY INTRAVITREAL INJECTION

▶ Adult: Initially 2 mg once a month until maximum visual acuity is achieved or there are no signs of disease activity (discontinue treatment if no improvement in visual and anatomic outcomes)

Diabetic macular oedema (specialist use only)

- ▶ BY INTRAVITREAL INJECTION

▶ Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

Myopic choroidal neovascularisation (specialist use only)

- ▶ BY INTRAVITREAL INJECTION

▶ Adult: 2 mg for 1 dose, if visual or anatomic outcomes indicate that disease persists, additional doses may be administered; the interval between 2 doses should be greater than 1 month

- **CONTRA-INDICATIONS** Clinical signs of irreversible ischaemic visual function loss · ocular or periocular infection · severe intra-ocular inflammation
- **CAUTIONS** Active systemic infection · diabetic patients with uncontrolled hypertension · discontinue treatment if stage 3 or 4 macular holes develop—consult product literature for full details · discontinue treatment in the event of a retinal break—consult product literature for full details · discontinue treatment in the event of rhegmatogenous retinal detachment—consult product literature for full details · patients at risk of retinal pigment epithelial tear · poorly controlled glaucoma · recent history of myocardial infarction · recent history of stroke · recent history of transient ischaemic attack
- **CAUTIONS, FURTHER INFORMATION** Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **INTERACTIONS** → Appendix 1: aflibercept

● SIDE-EFFECTS

- ▶ **Common or very common** Cataract · eye discomfort · eye disorders · eye inflammation · haemorrhage · retinal pigment epithelial tear · vision disorders
- ▶ **Uncommon** Lens opacity

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor intra-ocular pressure following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013) NICE TA294
 - Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:
 - it is used in accordance with the recommendations for ranibizumab in NICE TA 155 and

- the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme

www.nice.org.uk/guidance/TA294

- **Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014) NICE TA305**

Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/TA305

- **Aflibercept for treating diabetic macular oedema (July 2015) NICE TA346**

Aflibercept solution for injection is recommended as an option for treating visual impairment caused by diabetic macular oedema only if:

- the eye has a central retinal thickness of 400 micrometres or more at the start of treatment **and**
- the manufacturer provides aflibercept with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/TA346

- **Aflibercept for treating visual impairment caused by macular oedema after branch retinal vein occlusion (September 2016) NICE TA409**

Aflibercept is recommended, within its marketing authorisation, as an option for treating visual impairment in adults caused by macular oedema after branch retinal vein occlusion, only if the manufacturer provides aflibercept with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/TA409

- **Aflibercept for treating choroidal neovascularisation (November 2017) NICE TA486**

Aflibercept is recommended, within its marketing authorisation, as an option for treating visual impairment because of myopic choroidal neovascularisation in adults, only if the manufacturer provides aflibercept with the discount agreed in the patient access scheme.

If patients and their clinicians consider both aflibercept and ranibizumab to be suitable treatments, the least costly should be used, taking into account anticipated administration costs, dosage and price per dose.

www.nice.org.uk/guidance/TA486

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that aflibercept (Eylea[®]) is accepted for use within NHS Scotland in adults for the treatment of visual impairment due to myopic choroidal neovascularisation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Eylea** (Bayer Plc)

Aflibercept 40 mg per 1 ml Eylea 2nm/50 microlitres solution for injection | 1 vial (POM) £816.00

Ranibizumab

• INDICATIONS AND DOSE

Neovascular (wet) age-related macular degeneration (specialist use only)

- **BY INTRAVITREAL INJECTION**

- **Adult:** 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months, thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

Diabetic macular oedema | Macular oedema secondary to retinal vein occlusion (specialist use only)

- **BY INTRAVITREAL INJECTION**

- **Adult:** Initially 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections), thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

Choroidal neovascularisation secondary to pathologic myopia (specialist use only)

- **BY INTRAVITREAL INJECTION**

- **Adult:** Initially 500 micrograms, to be administered as a single injection into the affected eye, monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required, if necessary subsequent doses may be given at least 1 month apart

Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation (specialist use only)

- **BY INTRAVITREAL INJECTION**

- **Adult:** 500 micrograms, to be administered at least 30 minutes after laser photocoagulation

- **CONTRA-INDICATIONS** Ocular or periocular infection · severe intra-ocular inflammation · signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

- **CAUTIONS** Active systemic infection · diabetic macular oedema due to type 1 diabetes (limited information available) · diabetic patients with HbA_{1c} over 12% · history of stroke · history of transient ischaemic attack · patients at risk of retinal pigment epithelial tear · previous intravitreal injections · proliferative diabetic retinopathy · retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular holes develop) · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **INTERACTIONS** → Appendix 1: ranibizumab

• SIDE-EFFECTS

- **Common or very common** Anaemia · anxiety · arthralgia · cataract · cough · dry eye · eye discomfort · eye disorders · eye inflammation · haemorrhage · headache · hypersensitivity · increased risk of infection · lens opacity · nausea · retinal pigment epithelial tear · vision disorders
- **Uncommon** Corneal deposits
- **Frequency not known** Arterial thromboembolism

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor intra-ocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection.
 - ▶ Monitor visual acuity, see individual indications and dose for frequency.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Ranibizumab for treating choroidal neovascularisation associated with pathological myopia (November 2013)** NICE TA298
Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.
www.nice.org.uk/TA298
 - ▶ **Ranibizumab for the treatment of visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013)** NICE TA283
Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:
 - following central retinal vein occlusion **or**
 - following branch retinal vein occlusion only if treatment with laser photocoagulation has not been beneficial, or when laser photocoagulation is not suitable because of the extent of macular haemorrhage **and**
 - only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274.
www.nice.org.uk/TA283
 - ▶ **Ranibizumab for the treatment of diabetic macular oedema (February 2013)** NICE TA274
Ranibizumab is recommended as an option for the treatment of visual impairment due to diabetic macular oedema only if:
 - the eye has a central retinal thickness of 400 micrometres or more at the start of treatment **and**
 - the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).
 Patients currently receiving ranibizumab for treating visual impairment due to diabetic macular oedema whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA274
 - ▶ **Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012)** NICE TA155
Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:
 - the best corrected visual acuity is between 6/12 and 6/96;
 - there is no permanent structural damage to the central fovea;
 - the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
 - there is evidence of recent disease progression;
 - the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy.

www.nice.org.uk/TA155

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2007) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration.

The *Scottish Medicines Consortium* has advised (October 2011 and April 2013) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Lucentis** (Novartis Pharmaceuticals UK Ltd)

Ranibizumab 10 mg per 1 ml Lucentis 2.3mg/0.23ml solution for injection vials | 1 vial [POM] £551.00 (Hospital only)
Lucentis 1.65mg/0.165ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [POM] £551.00

PHOTOSENSITISERS

Verteporfin

- **DRUG ACTION** Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

INDICATIONS AND DOSE

Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)

▶ BY INTRAVENOUS INFUSION

▶ Adult: 6 mg/m², dose to be given over 10 minutes

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **CAUTIONS** Avoid extravasation • biliary obstruction • photosensitivity
- **INTERACTIONS** → Appendix 1: verteporfin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia • dizziness • dyspnoea • headache • hypercholesterolaemia • hypersensitivity • infusion related reaction • nausea • photosensitivity reaction • syncope • vision disorders
 - ▶ **Uncommon** Eye inflammation • fever • haemorrhage • hyperaesthesia • hypertension • pain • retinal detachment • skin reactions
 - ▶ **Rare or very rare** Malaise • retinal ischaemia
 - ▶ **Frequency not known** Myocardial infarction • retinal pigment epithelial tear
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (teratogenic in *animal* studies).
- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.
- **HEPATIC IMPAIRMENT** Use with caution in moderate hepatic impairment. Avoid in severe hepatic impairment.

- **DIRECTIONS FOR ADMINISTRATION** For information on administration and light activation, consult product literature.

For *intravenous infusion* (Visudyne[®]), give intermittently in Glucose 5%; reconstitute each 15 mg with 7 ml water for injections to produce a 2 mg/ml solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion.

- **PATIENT AND CARER ADVICE** Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Verteporfin photodynamic therapy for wet age-related macular degeneration (September 2003)** NICE TA68 Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.

Photodynamic therapy is **not** recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation *except* in clinical studies.

www.nice.org.uk/TA68

CORTICOSTEROIDS

Fluocinolone acetonide

21-Dec-2017

• INDICATIONS AND DOSE

Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)

- ▶ **BY INTRAVITREAL INJECTION**
- ▶ **Adult:** 190 micrograms, to be administered into the affected eye

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

- **CONTRA-INDICATIONS** Active or suspected ocular infection • active or suspected peri-ocular infection • pre-existing glaucoma
- **CAUTIONS** Raised baseline intra-ocular pressure
- **INTERACTIONS** → Appendix 1: fluocinolone
- **SIDE-EFFECTS**
- ▶ **Common or very common** Cataract • eye discomfort • glaucoma • haemorrhage • vision blurred
- ▶ **Uncommon** Eye disorders • headache

- ▶ **Frequency not known** Thromboembolism
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **MONITORING REQUIREMENTS**
- ▶ Monitor for raised intra-ocular pressure (particularly if raised at baseline), retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure.
- ▶ Monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months).
- **DIRECTIONS FOR ADMINISTRATION** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013)** NICE TA301 Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:
 - the implant is to be used in an eye with an intra-ocular (pseudophakic lens) **and**
 - the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.

www.nice.org.uk/TA301

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that fluocinolone acetonide intravitreal implant (*Iluvien*[®]) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), **and** retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

▶ **Iluvien** (Alimera Sciences Ltd)

6.3 Optic neuropathy

DRUGS FOR METABOLIC DISORDERS > ANTIOXIDANTS

Idebenone

31-May-2017

- **DRUG ACTION** Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

• INDICATIONS AND DOSE

Leber's Hereditary Optic Neuropathy (initiated by a specialist)

- ▶ **BY MOUTH**
- ▶ **Adult:** 300 mg 3 times a day

• SIDE-EFFECTS

- ▶ **Common or very common** Cough · diarrhoea · increased risk of infection · pain
- ▶ **Frequency not known** Agranulocytosis · anaemia · anxiety · appetite decreased · azotaemia · delirium · dizziness · dyspepsia · hallucination · headache · hepatitis · leucopenia · malaise · movement disorders · nausea · neutropenia · porriomania · seizure · skin reactions · stupor · thrombocytopenia · urine discolouration · vomiting

SIDE-EFFECTS, FURTHER INFORMATION The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as this may mask colour changes due to other causes (e.g. renal or blood disorders).

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2017) that idebenone (*Raxone*®) is accepted for restricted use within NHS Scotland for the treatment of visual impairment in patients with Leber's Hereditary Optic Neuropathy (LHON) who are not yet blind i.e. they do not meet the UK criteria to be registered as severely sight impaired. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Ear

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as aluminium acetate solution p. 1164. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 1161 or **clioquinol**) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 1161 may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;

- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 438 or ibuprofen p. 1106, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 544 is the drug of choice; ciprofloxacin p. 548 (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid cream or ointment is then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, systemic antibacterial can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.

Otitis media with effusion

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

Chronic otitis media

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 539 (or erythromycin p. 530 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 1137 or ofloxacin eye drops p. 1138 used in the ear [unlicensed use] or ear drops p. 1161 [both unlicensed; available from 'special-order' manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in patients with chronic suppurative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only **by specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; sodium bicarbonate ear drops p. 1164 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation.

Docusate sodium p. 1164 or urea hydrogen peroxide p. 1165 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

21-Dec-2017

● **INDICATIONS AND DOSE**

Eczematous inflammation in otitis externa | Mild bacterial or fungal infections in otitis externa

- TO THE EAR
- Child 2-17 years: 2–3 drops twice daily for 7–10 days, to be instilled into the ear
- Adult: 2–3 drops twice daily for 7–10 days, to be instilled into the ear

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

● **CONTRA-INDICATIONS** Iodine sensitivity

● **CAUTIONS** Avoid prolonged use · manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

● **SIDE-EFFECTS** Paraesthesia · skin reactions

● **PATIENT AND CARER ADVICE** Clioquinol stains skin and clothing

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

► **Flumetasone pivalate with clioquinol (Non-proprietary)**

Flumetasone pivalate 200 microgram per 1 ml, Clioquinol 10 mg per 1 ml | Flumetasone 0.02% / Clioquinol 1% ear drops | 7.5 ml [PoM] £11.34 DT = £11.34 | 10 ml [PoM] £15.13 DT = £15.13

Prednisolone

21-Dec-2017

● **INDICATIONS AND DOSE**

Eczematous inflammation in otitis externa

- TO THE EAR
- Child: Apply 2–3 drops every 2–3 hours, frequency to be reduced when relief obtained
- Adult: Apply 2–3 drops every 2–3 hours, frequency to be reduced when relief obtained

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

● **CONTRA-INDICATIONS** Avoid alone in the presence of untreated infection (combine with suitable anti-infective)

● **CAUTIONS** Avoid prolonged use

● **SIDE-EFFECTS** Local reaction

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Predsol** (RPH Pharmaceuticals AB)
Prednisolone sodium phosphate 5 mg per 1 ml | Predsol 0.5% ear/eye drops | 10 ml [PoM] £2.00 DT = £2.00

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone above.

● **INDICATIONS AND DOSE**

Eczematous inflammation in otitis externa

- TO THE EAR USING EAR DROPS
- Child: Apply 2–3 drops 3–4 times a day
- Adult: Apply 2–3 drops 3–4 times a day

● **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1159) · perforated tympanic membrane (although may be used by specialists, see Ear p. 1159)

● **CAUTIONS** Avoid prolonged use

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Betnesol-N (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

Dexamethasone with ciprofloxacin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, ciprofloxacin p. 1161.

INDICATIONS AND DOSE

Acute otitis media in patients with tympanostomy tubes

▶ TO THE EAR

Adult: Apply 4 drops twice daily for 7 days

Acute otitis externa

▶ TO THE EAR

Adult: Apply 4 drops twice daily for 7 days

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

- **CONTRA-INDICATIONS** Fungal ear infections · viral ear infections
- **CAUTIONS** Avoid prolonged use
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **PATIENT AND CARER ADVICE** Manufacturer advises counselling on administration.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (July 2017) that dexamethasone with ciprofloxacin (*Cilodex*®) is accepted for restricted use within NHS Scotland for the treatment of acute otitis media in patients with tympanostomy tubes (AOMT).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Cilodex (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 ml, Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml Cilodex ear drops | 5 ml [PoM] £6.12 DT = £6.12

Dexamethasone with framycetin sulfate and gramicidin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, framycetin sulfate p. 1160.

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

▶ TO THE EAR

Child: 2–3 drops 3–4 times a day

▶ Adult: 2–3 drops 3–4 times a day

IMPORTANT SAFETY INFORMATION

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

▶ Otimize (Teva UK Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram, Acetic acid glacial 20 mg per 1 gram Otimize ear spray | 5 ml [PoM] £3.27

Hydrocortisone with neomycin and polymyxin B sulfate

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, neomycin sulfate p. 1161.

● INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child 3-17 years: Apply 3 drops 3–4 times a day for 7 days (review treatment if there is no clinical improvement)
- ▶ Adult: Apply 3 drops 3–4 times a day for 7 days (review treatment if there is no clinical improvement)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

● SIDE-EFFECTS

- ▶ Rare or very rare Headache · paraesthesia · skin reactions · telangiectasia

- **RENAL IMPAIRMENT** Manufacturer advises avoid prolonged, unsupervised use.

Dose adjustments Manufacturer advises reduce dose.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates

- ▶ **Otosporin** (Phoenix Labs Ltd)

Hydrocortisone 10 mg per 1 ml, Neomycin sulfate 3400 unit per 1 ml, Polymyxin B sulfate 10000 unit per 1 ml Otosporin ear drops | 10 ml [PoM] £7.45

DERMATOLOGICAL DRUGS > ASTRINGENTS

Aluminium acetate

● INDICATIONS AND DOSE

Inflammation in otitis externa

- ▶ TO THE EAR
- ▶ Adult: To be inserted into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

- **DIRECTIONS FOR ADMINISTRATION** For ear drops 8%—dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared.

● MEDICINAL FORMS

Forms available from special-order manufacturers include: ear drops

- **SIDE-EFFECTS** Dry ear

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

- ▶ **Sodium bicarbonate (Non-proprietary)**

Sodium bicarbonate 50 mg per 1 ml Sodium bicarbonate 5% ear drops | 10 ml £1.23–£1.25

SOFTENING DRUGS

Almond oil

● INDICATIONS AND DOSE

Removal of earwax

- ▶ TO THE EAR
- ▶ Child: Allow drops to warm to room temperature before use (consult product literature)
- ▶ Adult: Allow drops to warm to room temperature before use (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

- ▶ **Almond oil (Non-proprietary)**

Almond oil 1 ml per 1 ml Almond oil liquid | 50 ml £0.95 DT = £0.95 | 70 ml £0.85 | 200 ml £2.68 | 500 ml £11.90

Arachis oil with chlorobutanol

● INDICATIONS AND DOSE

Removal of earwax

- ▶ TO THE EAR
- ▶ Adult: (consult product literature)

- **SIDE-EFFECTS** Skin reactions
- **LESS SUITABLE FOR PRESCRIBING** Arachis (peanut) oil with chlorobutanol ear drops are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

- ▶ **Cerumol** (Thornton & Ross Ltd)

Chlorobutanol 50 mg per 1 ml, Arachis oil 573 mg per 1 ml Cerumol ear drops | 11 ml [P] £2.05

Docusate sodium

20-Apr-2016

(Diocetyl sodium sulphosuccinate)

● INDICATIONS AND DOSE

Removal of ear wax

- ▶ TO THE EAR
- ▶ Adult: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING** Ear drops less suitable for prescribing.

2 Removal of earwax

BICARBONATE

Sodium bicarbonate

● INDICATIONS AND DOSE

Removal of earwax (with 5% ear drop solution)

- ▶ TO THE EAR
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

EXCIPIENTS: May contain Propylene glycol

▶ **Molcer** (Wallace Manufacturing Chemists Ltd)

Docusate sodium 50 mg per 1 ml Molcer ear drops | 15 ml £5.60

▶ **Waxsol** (Meda Pharmaceuticals Ltd)

Docusate sodium 5 mg per 1 ml Waxsol ear drops | 10 ml £1.95
DT = £1.95

Olive oil

INDICATIONS AND DOSE

Removal of earwax

▶ TO THE EAR

- ▶ **Child:** Apply twice daily for several days (if wax is hard and impacted)
- ▶ **Adult:** Apply twice daily for several days (if wax is hard and impacted)

- **DIRECTIONS FOR ADMINISTRATION** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Allow ear drops to warm to room temperature before use.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

▶ **Earol** (HL Healthcare Ltd)

Earol olive oil ear spray | 10 ml

Ear drops

▶ **St George's** (St Georges Medical Ltd)

Olive oil ear drops | 10 ml £1.40 | 20 ml £2.70

Urea hydrogen peroxide

INDICATIONS AND DOSE

Softening and removal of earwax

▶ TO THE EAR

- ▶ **Adult:** (consult product literature)

- **PATIENT AND CARER ADVICE** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.
- **LESS SUITABLE FOR PRESCRIBING** Urea-hydrogen peroxide ear drops are less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

▶ **Exterol** (Dermal Laboratories Ltd)

Urea hydrogen peroxide 50 mg per 1 gram Exterol 5% ear drops | 8 ml £1.75 DT = £2.89

▶ **Otex** (Dendron Ltd)

Urea hydrogen peroxide 50 mg per 1 gram Otex 5% ear drops | 8 ml £2.89 DT = £2.89

Nose

Nose

31-Oct-2017

Rhinitis

Rhinitis is often self-limiting. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% solution p. 1008 may be used as a douche or 'sniff' following endonasal surgery.

Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 276) or topical **nasal corticosteroids**; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal **corticosteroids**; sodium cromoglicate p. 1173 is an alternative, but may be less effective. The topical antihistamine azelastine hydrochloride p. 1169 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 268 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorrhoea.

Very disabling symptoms occasionally justify the use of **systemic corticosteroids** for short periods, for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 1170, budesonide p. 1171, fluticasone p. 1171, or sodium cromoglicate p. 1173 may be considered.

Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of **warm moist air** may be useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 294).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride nasal drops below is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 1167 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide p. 1169.

Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis; see elimination of nasal staphylococci.

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 1168 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of methicillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

1 Nasal congestion

SYMPATHOMIMETICS > VASOCONSTRICTOR**Ephedrine hydrochloride****• INDICATIONS AND DOSE****Nasal congestion | Sinusitis affecting the maxillary antrum****► BY INTRANASAL ADMINISTRATION**

- Child 12–17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
- Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

IMPORTANT SAFETY INFORMATION**CHM/MHRA ADVICE**

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- CAUTIONS** Avoid excessive or prolonged use • cardiovascular disease (in children) • diabetes mellitus • elderly • hypertension • hyperthyroidism • ischaemic heart disease (in adults) • prostatic hypertrophy (risk of acute urinary retention) (in adults)
- INTERACTIONS** ► Appendix 1: sympathomimetics, vasoconstrictor
- SIDE-EFFECTS**
 - **Common or very common** Anxiety • headache • insomnia • nausea
 - **Frequency not known** Appetite decreased • arrhythmia • circulation impaired • dermatitis • dizziness • drug dependence • drug tolerance • dry mouth • dyspnoea • hallucination • hyperglycaemia • hyperhidrosis • hypersalivation • hypertension • hypokalaemia • hypotension • irritability • muscle weakness • mydriasis • pain • palpitations • paranoia • piloerection • rebound congestion • syncope • thirst • tremor • urinary disorders • vasoconstriction • vasodilation • vomiting
- PREGNANCY** Manufacturer advises avoid.
- BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- PRESCRIBING AND DISPENSING INFORMATION** For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary**
Ephedrine nasal drops may be prescribed.
 - EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nasal drops**► Ephedrine hydrochloride (Non-proprietary)**

Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml [P] £1.90–£1.94 DT = £1.90

Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml [P] £1.94–£2.01 DT = £1.94

Pseudoephedrine hydrochloride

● INDICATIONS AND DOSE

Congestion of mucous membranes of upper respiratory tract

► BY MOUTH

- Child 6–11 years: 30 mg 3–4 times a day
- Child 12–17 years: 60 mg 3–4 times a day
- Adult: 60 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS** Diabetes · heart disease · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (in adults) · raised intra-ocular pressure (in children) · susceptibility to angle-closure glaucoma (in adults)
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angle closure glaucoma · anxiety · arrhythmias · circulation impaired · dry mouth · hallucination · headache · hypertension · irritability · nausea · palpitations · psychotic disorder · skin reactions · sleep disorders · tremor · urinary retention · vomiting
- **PREGNANCY** Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- **BREAST FEEDING** May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
- **LESS SUITABLE FOR PRESCRIBING** Pseudoephedrine hydrochloride is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** *Galpseud*® and *Sudafed*® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

- **Galpseud** (Thornton & Ross Ltd)
Pseudoephedrine hydrochloride 60 mg Galpseud 60mg tablets | 24 tablet [PoM] £2.25 | 100 tablet [PoM] £5.42 DT = £5.42

- **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)
Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60mg tablets | 12 tablet [P] £2.43

Xylometazoline hydrochloride

- **DRUG ACTION** Xylometazoline is a sympathomimetic.

● INDICATIONS AND DOSE

Nasal congestion

► BY INTRANASAL ADMINISTRATION USING NASAL DROPS

- Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
- Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
- Adult: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

► BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

- Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril
- Adult: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

IMPORTANT SAFETY INFORMATION

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute retention) (in adults) · rebound congestion
- **CAUTIONS, FURTHER INFORMATION**
 - **Rebound congestion** Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Cardiovascular effects · headache · hypersensitivity · nasal dryness · nausea · paraesthesia · visual impairment
- **SIDE-EFFECTS, FURTHER INFORMATION** Use of decongestants in infants and children under 6 years has been associated with agitated psychosis, ataxia, hallucinations, and even death—avoid.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.46 DT = £2.18

► **Sudafed Mucus Relief** (McNeil Products Ltd)

Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Mucus Relief 0.1% nasal spray | 15 ml [GSL] £2.76

► **Sudafed Non-Drowsy Decongestant (xylometazoline)** (McNeil Products Ltd)

Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Blocked Nose 0.1% spray | 15 ml [GSL] £2.76

Nasal drops

► **Otrivine** (GlaxoSmithKline Consumer Healthcare)

Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Child nasal drops | 10 ml [P] £1.91 DT = £1.91

Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Adult 0.1% nasal drops | 10 ml [GSL] £2.18 DT = £2.18

2 Nasal infection

Sinusitis (acute)

31-Oct-2017

Description of condition

Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses. Acute sinusitis (rhinosinusitis) is a self-limiting condition usually triggered by a viral upper-respiratory tract infection such as the 'common cold'. Occasionally, acute sinusitis may become complicated by a bacterial infection (see *Antibacterial therapy for acute sinusitis* in Nose infections, antibacterial therapy p. 506).

Patients with acute sinusitis usually present with symptoms of nasal blockage or congestion, nasal discharge, dental or facial pain or pressure, and reduction or loss of the sense of smell.

Symptoms usually improve within 2 to 3 weeks without requiring treatment.

Rarely, acute sinusitis may lead to orbital, intracranial or skeletal complications (e.g. periorbital cellulitis, symptoms or signs of meningitis).

Aims of treatment

Treatment is aimed at managing symptoms including pain, fever, and nasal congestion as well as treatment of bacterial infection if present.

Treatment

[EvGr] Patients presenting with symptoms for around 10 days or less, should be given advice about the usual duration of acute sinusitis, self-care of pain or fever with paracetamol p. 438 or ibuprofen p. 1106, and when to seek medical help. Patients should be reassured that antibiotics are usually not required. Some patients may try nasal saline or nasal decongestants, however there is limited evidence to show they help to relieve nasal congestion.

Patients presenting with symptoms for around 10 days or more with no improvement could be considered for treatment with a high-dose nasal corticosteroid, such as mometasone furoate p. 1172 [unlicensed use] or fluticasone p. 1171 [unlicensed use] for 14 days. Supply of a back-up

antibiotic prescription could be considered and used if symptoms do not improve within 7 days, or if they worsen rapidly or significantly.

If the patient is systemically very unwell, has signs and symptoms of a more serious illness or condition, or is at high-risk of complications, an immediate antibiotic should be given. (see *Antibacterial therapy for acute sinusitis* in Nose infections, antibacterial therapy p. 506).

[EvGr] Patients presenting with symptoms of acute sinusitis associated with a severe systemic infection or with orbital or intracranial complications should be referred to hospital. (A)

ANTIBACTERIALS > AMINOGLYCOSIDES

Chlorhexidine with neomycin

• INDICATIONS AND DOSE

Eradication of nasal carriage of staphylococci

► BY INTRANASAL ADMINISTRATION

► Child: Apply 4 times a day for 10 days

► Adult: Apply 4 times a day for 10 days

Preventing nasal carriage of staphylococci

► BY INTRANASAL ADMINISTRATION

► Child: Apply twice daily

► Adult: Apply twice daily

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

► **Naseptin** (Alliance Pharmaceuticals Ltd)

Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram [PoM] £2.03 DT = £2.24

ANTIBACTERIALS > OTHER

Mupirocin

• INDICATIONS AND DOSE

BACTROBAN NASAL®

For eradication of nasal carriage of staphylococci, including methicillin-resistant *Staphylococcus aureus* (MRSA)

► BY INTRANASAL ADMINISTRATION

► Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

► Adult: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

• SIDE-EFFECTS

► **Common or very common** Skin reactions

► **Uncommon** Nasal mucosal disorder

► **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

► **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nasal ointment

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)
Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram [PoM] £4.24 DT = £4.24

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1170,

INDICATIONS AND DOSE

Nasal infection

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril
- ▶ Adult: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin
- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (RPH Pharmaceuticals AB)
Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

3 Nasal inflammation, nasal polyps and rhinitis

Other drugs used for Nasal inflammation, nasal polyps and rhinitis Desloratadine, p. 279 · Fexofenadine hydrochloride, p. 280 · Ketotifen, p. 285 · Rupatadine, p. 282

ANTIHISTAMINES > NON-SEDATING

Azelastine hydrochloride

INDICATIONS AND DOSE

Allergic rhinitis

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 6–17 years: 1 spray twice daily, to be administered into each nostril
- ▶ Adult: 1 spray twice daily, to be administered into each nostril

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 spray equivalent to 140 micrograms.

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS

- ▶ **Common or very common** Taste bitter
- ▶ **Uncommon** Nasal irritation

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

- ▶ **Rhinolast** (Meda Pharmaceuticals Ltd)
Azelastine hydrochloride 140 microgram per 1 actuation Rhinolast 140micrograms/dose nasal spray | 22 ml [PoM] £10.50 DT = £10.50

Combinations available: **Fluticasone with azelastine**, p. 1172

ANTIMUSCARINICS

Ipratropium bromide

22-Jan-2018

INDICATIONS AND DOSE

Rhinorrhoea associated with allergic and non-allergic rhinitis

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12–17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
- ▶ Adult: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS** Avoid spraying near eyes · bladder outflow obstruction · cystic fibrosis · prostatic hyperplasia (in adults) · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: ipratropium
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Gastrointestinal motility disorder · nasal complaints · throat complaints
 - ▶ **Uncommon** Corneal oedema · eye disorders · eye pain · respiratory disorders · vision disorders
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to atropine or its derivatives.
- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.
- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Rinatec** (Boehringer Ingelheim Ltd)
Ipratropium bromide 21 microgram per 1 dose Rinatec 21micrograms/dose nasal spray | 180 dose [PoM] £6.54 DT = £6.54

CORTICOSTEROIDS

Corticosteroids (intranasal)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CAUTIONS** Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

CAUTIONS, FURTHER INFORMATION

- Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

• SIDE-EFFECTS

- ▶ **Common or very common** Altered smell sensation · amenorrhoea · anxiety · behaviour abnormal · cognitive impairment · Cushing's syndrome · dyspepsia · electrolyte imbalance · epistaxis · hair changes · headache · healing impaired · hypertension · increased risk of infection · mood altered · nasal complaints · nausea · osteoporosis · skin reactions · sleep disorder · taste altered · throat irritation · voice alteration
- ▶ **Uncommon** Adrenal suppression · cataract · diabetic control impaired · glaucoma · osteonecrosis · pancreatitis · peptic ulcer · psychotic disorder · thromboembolism · vision blurred
- ▶ **Rare or very rare** Bronchospasm paradoxical · nasal septum perforation (more common following nasal surgery) · telangiectasia
- ▶ **Frequency not known** Growth retardation (uncommon in children) · local reaction · pneumonia (in patients with COPD)

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

- **MONITORING REQUIREMENTS** The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Beclometasone dipropionate
(Beclomethasone dipropionate)

04-Jan-2016

• INDICATIONS AND DOSE

Prophylaxis and treatment of allergic and vasomotor rhinitis

- ▶ **BY INTRANASAL ADMINISTRATION**
- ▶ Child 6-17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
- ▶ Adult: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

- **INTERACTIONS** → Appendix 1: corticosteroids

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ **Beclometasone dipropionate (Non-proprietary)**

Beclometasone dipropionate 50 microgram per 1 dose Beclometasone 50micrograms/dose nasal spray | 200 dose [PoM] £ DT = £2.55 | 200 dose [P] £2.55 DT = £2.55

▶ **Beconase** (GlaxoSmithKline UK Ltd, Omega Pharma Ltd)

Beclometasone dipropionate 50 microgram per 1 dose Beconase Aqueous 50micrograms/dose nasal spray | 200 dose [PoM] £2.63 DT = £2.55

Beconase Hayfever 50micrograms/dose nasal spray | 180 dose [P] £7.11

Beconase Hayfever Relief for Adults 50micrograms/dose nasal spray | 100 dose [GSL] £5.16

F 1170

Budesonide

21-Dec-2017

- **DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

INDICATIONS AND DOSE

Allergic rhinitis | Nasal polyps

▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 6-17 years: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduce dose when control achieved
- ▶ Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduce dose when control achieved

Prophylaxis and treatment of allergic and vasomotor rhinitis

▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 12-17 years: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved
- ▶ Adult: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved

Nasal polyps

▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 12-17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril
- ▶ Adult: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

RHINOCORT AQUA®

Rhinitis

▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered into each nostril; reduced to 64 micrograms once daily when control achieved. Use for maximum 3 months, doses to be administered into each nostril

Nasal polyps

▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: 64 micrograms twice daily for up to 3 months, dose to be administered into each nostril

- **UNLICENSED USE** Rhinocort Aqua® is not licensed for use in children.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Disodium edetate, polysorbates, potassium sorbate

▶ Budesonide (Non-proprietary)

Budesonide 64 microgram per 1 dose Budesonide 64micrograms/dose nasal spray | 120 dose [PoM] £4.77 DT = £4.77

Budesonide 64 microgram per 1 dose Rhinocort Aqua 64 nasal spray | 120 dose [PoM] £3.77 DT = £4.77

F 1170

Fluticasone

21-Dec-2017

INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

▶ BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

- ▶ Child 4-11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- ▶ Child 12-17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
- ▶ Adult: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

Nasal polyps

▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS

- ▶ Child 16-17 years: 200 micrograms 1-2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4-6 weeks, (200 micrograms is equivalent to approximately 6 drops)
- ▶ Adult: 200 micrograms 1-2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4-6 weeks, (200 micrograms is equivalent to approximately 6 drops)

AVAMYS® SPRAY

Prophylaxis and treatment of allergic rhinitis

▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 6-11 years: 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- ▶ Child 12-17 years: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to

continued →

27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

- ▶ **Adult:** 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Avamys*[®] spray: 1 spray equivalent to 27.5 micrograms.

- **INTERACTIONS** → Appendix 1: corticosteroids

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.

Treatment of dry mouth

Overview

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit

pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, *Aqualor*®, *Biotène Oralbalance*® gel or *Xerotin*® can be used for any condition giving rise to a dry mouth. *BioXtra*®, *Glandosane*®, *Saliva Orthana*®, and *Saliveze*®, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. *Salivix*® pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine tablets p. 1174 are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

LUBRICANTS

Artificial saliva products

● **ARTIFICIAL SALIVA PRODUCTS**

AS SALIVA ORTHANA® LOZENGES

Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

● **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- ▶ BY MOUTH
- ▶ Adult: 1 lozenge as required, allow to dissolve slowly in the mouth

- **PRESCRIBING AND DISPENSING INFORMATION** *AS Saliva Orthana*® lozenges do not contain fluoride.

AS Saliva Orthana lozenges (A S Pharma Ltd)

30 lozenge(ACBS) • NHS indicative price = £3.50 • Drug Tariff (Part VIIIa Category C) price = £3.50

AS SALIVA ORTHANA® SPRAY

Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

● **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- ▶ BY MOUTH
- ▶ Adult: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

AS Saliva Orthana® Oral Spray may be prescribed.

BIOXTRA® GEL

Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

● **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy | Dry mouth as a result of sicca syndrome

- ▶ BY MOUTH
- ▶ Adult: Apply as required, apply to oral mucosa

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

BioXtra® Gel may be prescribed.

BioXtra Dry Mouth oral gel (R.I.S. Products Ltd)

40 ml • NHS indicative price = £3.94 • Drug Tariff (Part IXa)

BIOTENE ORALBALANCE®

Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Adult: Apply as required, apply to gums and tongue

- **PATIENT AND CARER ADVICE** Avoid use with toothpastes containing detergents (including foaming agents).

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Biotene Oralbalance® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

Biotene Oralbalance dry mouth saliva replacement gel (GlaxoSmithKline Consumer Healthcare) **Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg** 50 gram • NHS indicative price = £4.46 • Drug Tariff (Part IXa)

GLANDOSANE®

Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- BY MOUTH
- Adult: Apply as required, spray onto oral and pharyngeal mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Glandosane® Aerosol Spray may be prescribed.

Glandosane synthetic saliva spray lemon (Fresenius Kabi Ltd) 50 ml • NHS indicative price = £5.68

Glandosane synthetic saliva spray natural (Fresenius Kabi Ltd) 50 ml • NHS indicative price = £5.68

Glandosane synthetic saliva spray peppermint (Fresenius Kabi Ltd) 50 ml • NHS indicative price = £5.68

ORALIEVE GEL

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Adult: Apply as required, particularly at night, to oral mucosa

- **PRESCRIBING AND DISPENSING INFORMATION** Contains traces of milk protein and egg white protein.

SST®

Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts

- BY MOUTH
- Adult: 1 tablet as required, allow tablet to dissolve slowly in the mouth

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Saliva Stimulating Tablets.

SST saliva stimulating tablets (Sinclair IS Pharma Plc) 100 tablet • NHS indicative price = £4.86 • Drug Tariff (Part IXa)

SALIVEZE®

Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- BY MOUTH
- Adult: Apply 1 spray as required, spray onto oral mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Saliveze® Oral Spray may be prescribed.

Saliveze mouth spray (Wyvern Medical Ltd) 50 ml (ACBS) • NHS indicative price = £3.50

SALIVIX®

Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH USING PASTILLES
- Adult: 1 unit as required, suck pastille

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Salivix® Pastilles may be prescribed as Artificial Saliva Pastilles.

Salivix pastilles (Galen Ltd) 50 pastille • NHS indicative price = £3.55 • Drug Tariff (Part IXa)

XEROTIN®

Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Adult: 1 spray as required

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Xerotin® Oral Spray may be prescribed as Artificial Saliva Oral Spray.

Xerotin spray (SpePharm UK Ltd) 100 ml • NHS indicative price = £6.86 • Drug Tariff (Part IXa)

PARASYMPATHOMIMETICS**Pilocarpine**

- **INDICATIONS AND DOSE**

Xerostomia following irradiation for head and neck cancer

- BY MOUTH
- Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

Dry mouth and dry eyes in Sjögren's syndrome

- BY MOUTH
- Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

- **CONTRA-INDICATIONS** Acute iritis · chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance) · uncontrolled asthma (increased bronchial secretions and increased airways resistance) · uncontrolled cardiorenal disease
- **CAUTIONS** Asthma (avoid if uncontrolled) · biliary-tract disease · cardiovascular disease (avoid if uncontrolled) · cholelithiasis · chronic obstructive pulmonary disease (avoid if uncontrolled) · cognitive disturbances · maintain adequate fluid intake to avoid dehydration associated with excessive sweating · peptic ulceration · psychiatric disturbances · risk of increased renal colic · risk of increased urethral smooth muscle tone · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: pilocarpine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · conjunctivitis · constipation · diarrhoea · dizziness · excessive tearing · eye pain · flushing · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · hypersensitivity · hypertension · increased risk of infection · nausea · palpitations · skin reactions · urinary disorders · vision disorders · vomiting
 - ▶ **Uncommon** Gastrointestinal disorders
 - ▶ **Frequency not known** Affective disorder · agitation · arrhythmias · atrioventricular block · chills · confusion · hallucination · hypotension · memory loss · psychiatric disorder · respiratory distress · shock · tremor
- **PREGNANCY** Avoid—smooth muscle stimulant; toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** **Dose adjustments** Reduce initial oral dose in moderate or severe cirrhosis.
- **RENAL IMPAIRMENT** Manufacturer advises caution with tablets.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline

mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 1177 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1176, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine below is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine

● INDICATIONS AND DOSE

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

▶ BY MOUTH USING MOUTHWASH

▶ Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

▶ Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

Denture stomatitis

▶ MOUTHWASH

▶ Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

Oral hygiene and plaque inhibition and gingivitis

▶ BY MOUTH USING DENTAL GEL

▶ Child: Apply 1–2 times a day, to be brushed on the teeth

▶ Adult: Apply 1–2 times a day, to be brushed on the teeth

Oral candidiasis | Management of aphthous ulcers

▶ BY MOUTH USING DENTAL GEL

▶ Child: Apply 1–2 times a day, to affected areas

▶ Adult: Apply 1–2 times a day, to affected areas

continued →

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

► BY MOUTH USING OROMUCOSAL SPRAY

- Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
- Adult: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

Bladder irrigation and catheter patency solutions

► BY INTRAVESICAL INSTILLATION

- Adult: (consult product literature)

- **UNLICENSED USE** *Corsodyl*® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

● **SIDE-EFFECTS**

- Common or very common Dry mouth · hypersensitivity · oral disorders · taste altered

SIDE-EFFECTS, FURTHER INFORMATION If desquamation occurs with mucosal irritation, discontinue treatment.

Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle as required
- ▶ Adult: Rinse or gargle as required

- **DIRECTIONS FOR ADMINISTRATION** Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

- **PRESCRIBING AND DISPENSING INFORMATION** No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

- ▶ In children The RCPCH and NPPG recommend that, when a liquid special of sodium chloride is required, the following strength is used: 5 mmol/mL.

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Compound Sodium Chloride Mouthwash may be prescribed.

- **MEDICINAL FORMS**

No licensed medicines listed.

2.1 Dental caries

Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is

necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

VITAMINS AND TRACE ELEMENTS

Sodium fluoride

- **INDICATIONS AND DOSE**

Prophylaxis of dental caries for water content less than 300micrograms/litre (0.3 parts per million) of fluoride ion

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6 months–2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 3–5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 6–17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)
- ▶ Adult: 1 mg daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content between 300 and 700micrograms/litre (0.3–0.7 parts per million) of fluoride ion

- ▶ BY MOUTH USING TABLETS
- ▶ Child 3–5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 6–17 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Adult: 500 micrograms daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content above 700micrograms/litre (0.7 parts per million) of fluoride ion

- ▶ Child 6 months–17 years: Supplements not advised
- ▶ Adult: Supplements not advised

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: Rinse or gargle 10 mL daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
- ▶ These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; **182**: 6–7).

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

- ▶ BY MOUTH USING PASTE
- ▶ Child 10–17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
- ▶ Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

- ▶ BY MOUTH USING PASTE
- ▶ Child 16–17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
- ▶ Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

EN-DE-KAY® FLUORINSE

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL

- **CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated
- **SIDE-EFFECTS** Dental fluorosis
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
 - ▶ With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE Brush teeth for 3 minutes before spitting out.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE Brush teeth for 1 minute before spitting out.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.

● PATIENT AND CARER ADVICE

Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE Patients or carers should be given advice on how to administer sodium fluoride toothpaste.

Avoid drinking or rinsing mouth for 30 minutes after use.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Tablets may be prescribed as Sodium Fluoride Tablets.

Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 1.1%.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 0.619%.

Dental information

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

Oral ulceration and inflammation

Ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also *Chemotherapy induced mucositis and myelosuppression* under Cytotoxic drugs p. 865). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer.

Simple mouthwashes

A **saline** mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 1175 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase.

Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone **oromucosal tablets** p. 1181 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 1180 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betametasone soluble tablets p. 1180 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 1118), is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine hydrochloride 5% ointment below or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% solution as spray can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Preparations on sale to the public: many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—the correct proprietary name should be ascertained as many products have very similar names but different active ingredients.

Benzydamine hydrochloride p. 1180 and flurbiprofen p. 1180 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 1181 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

Other preparations

Doxycycline p. 1182 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis

Low-dose doxycycline (*Periostat*®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal infections, antibacterial therapy p. 1182. See also Mouthwashes and other preparations for oropharyngeal use p. 1175 for mouthwashes used for oral hygiene and plaque inhibition.

ANAESTHETICS, LOCAL

Lidocaine hydrochloride

(Lignocaine hydrochloride)

● INDICATIONS AND DOSE

Dental practice

- ▶ BY BUCCAL ADMINISTRATION USING OINTMENT
- ▶ Adult: Rub gently into dry gum

Relief of pain in oral lesions

- ▶ TO THE LESION USING OINTMENT
- ▶ Adult: Apply as required, rub sparingly and gently on affected areas

XYLOCAINE®

Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation

- ▶ TO MUCOUS MEMBRANES
- ▶ Adult: Up to 20 doses

Dental practice

- ▶ TO MUCOUS MEMBRANES
- ▶ Adult: 1–5 doses

Maxillary sinus puncture

- ▶ TO MUCOUS MEMBRANES
- ▶ Adult: 3 doses

Relief of pain in oral lesions

- ▶ TO THE LESION
- ▶ Adult: Apply thinly to the ulcer using a cotton bud

- **UNLICENSED USE** Spray not licensed for the relief of pain in oral lesions.
- **CAUTIONS** Avoid anaesthesia of the pharynx before meals—risk of choking · can damage plastic cuffs of endotracheal tubes
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **ALLERGY AND CROSS-SENSITIVITY**
 - ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary
 - Lidocaine ointment 5% may be prescribed.
 - Spray may be prescribed as Lidocaine Spray 10%.
- **XYLOCAINE®** May be prescribed as lidocaine spray 10%.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - VERSATIS®**
 - Scottish Medicines Consortium (SMC) Decisions**
 - The *Scottish Medicines Consortium* has advised (July 2008) that *Versatis*® is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

- ▶ **Lidocaine hydrochloride (Non-proprietary)**

Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment
| 15 gram  £6.50 DT = £6.18

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Benzydamine hydrochloride

● INDICATIONS AND DOSE

Painful inflammatory conditions of oropharynx

- ▶ TO THE LESION USING MOUTHWASH
 - ▶ Child 13–17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
 - ▶ Adult: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
- ▶ TO THE LESION USING OROMUCOSAL SPRAY
 - ▶ Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
 - ▶ Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
 - ▶ Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area
 - ▶ Child 1 month–5 years (body-weight 16 kg and above): 4 sprays every 1.5–3 hours, to be administered onto the affected area
 - ▶ Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
 - ▶ Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area
 - ▶ Adult: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

- **INTERACTIONS** → Appendix 1: NSAIDs

● **SIDE-EFFECTS**

- **Uncommon** Oral disorders
- ▶ **Rare or very rare** Photosensitivity reaction · respiratory disorders · skin reactions

● **MEDICINAL FORMS**

For preparations see inhaled beclometasone, p. 257.

Betamethasone

21-Dec-2017

● **INDICATIONS AND DOSE****Oral ulceration**

- ▶ **TO THE LESION USING SOLUBLE TABLETS**
- ▶ Child 12–17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
- ▶ Adult: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- **UNLICENSED USE** Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

- **CONTRA-INDICATIONS** Untreated local infection
- **INTERACTIONS** → Appendix 1: corticosteroids
- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone soluble tablets (administration).
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Betamethasone Soluble Tablets 500 micrograms may be prescribed for oral ulceration.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

▶ Betamethasone (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate)

500 microgram Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet [PoM] £51.12 DT = £51.12

Hydrocortisone

21-Dec-2017

● INDICATIONS AND DOSE

Oral and perioral lesions

- ▶ TO THE LESION USING BUCCAL TABLET
- ▶ Child 1 month–11 years: Only on medical advice
- ▶ Child 12–17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
- ▶ Adult: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

- **UNLICENSED USE** Hydrocortisone mucoadhesive buccal tablets licensed for use in children (under 12 years—on medical advice only).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See *Corticosteroids, general use* p. 656.

- **CONTRA-INDICATIONS** Untreated local infection
- **INTERACTIONS** → Appendix 1: corticosteroids
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Muco-adhesive buccal tablet

▶ Hydrocortisone (Non-proprietary)

Hydrocortisone (as Hydrocortisone sodium succinate)

2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet [P] £8.30 DT = £7.70

SALICYLIC ACID AND DERIVATIVES

Choline salicylate

● INDICATIONS AND DOSE

Mild oral and perioral lesions

- ▶ TO THE LESION
- ▶ Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- ▶ Adult: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

- **CONTRA-INDICATIONS** Children under 16 years

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning · not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures (in adults)

- **INTERACTIONS** → Appendix 1: choline salicylate

- **SIDE-EFFECTS** Bronchospasm

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.

4 Oropharyngeal bacterial infections

Oropharyngeal infections, antibacterial therapy

Pericoronitis

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 533, or *alternatively*, amoxicillin p. 539
- *Suggested duration of treatment* 3 days or until symptoms resolve.

Gingivitis (acute necrotising ulcerative)

Antibacterial required only if systemic features of infection.

- Metronidazole, or *alternatively*, amoxicillin
- *Suggested duration of treatment* 3 days or until symptoms resolve.

Abscess (periapical or periodontal)

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or *alternatively*, metronidazole
- *Suggested duration of treatment* 5 days.

Periodontitis

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or *alternatively in adults and children over 12 years*, doxycycline p. 555

Throat infections

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 538
- In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 537, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 540). **Avoid** amoxicillin if possibility of glandular fever.
- *Suggested duration of treatment* 10 days.
- If penicillin-allergic, clarithromycin p. 529 (or azithromycin p. 528 or erythromycin p. 530)
- *Suggested duration of treatment* 10 days

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

5 Oropharyngeal fungal infections

Oropharyngeal fungal infections

Overview

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection.

Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 1184 or miconazole below may be needed. Fluconazole p. 584 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

Denture stomatitis

Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

Chronic hyperplastic candidiasis

Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole to eliminate candidal overlay. Patients should avoid the use of tobacco.

Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream p. 1199 or fusidic acid ointment p. 561; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 1218 can be used.

Immunocompromised patients

See advice on prevention of fungal infections in *Immunocompromised patients* under Antifungals, systemic use p. 580.

Drugs used in oropharyngeal candidiasis

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 586 can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient's partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Miconazole

11-Oct-2017

● INDICATIONS AND DOSE

Oral candidiasis

- ▶ BY MOUTH USING ORAL GEL
- ▶ Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
- ▶ Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

Intestinal candidiasis

- ▶ BY MOUTH USING ORAL GEL
- ▶ Child 4 months-17 years: 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
- ▶ Adult: 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

- **UNLICENSED USE** Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.
- **CONTRA-INDICATIONS** Infants with impaired swallowing reflex
- **CAUTIONS** Avoid in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dry mouth · nausea · oral disorders · regurgitation · skin reactions
 - ▶ **Uncommon** Taste altered
 - ▶ **Frequency not known** Angioedema · choking (in children) · diarrhoea · hepatitis · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Miconazole Oromucosal Gel may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

6 Oropharyngeal viral infections

Oropharyngeal viral infections

Management

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzydamine hydrochloride p. 1180. The use of chlorhexidine mouthwash p. 1175 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 623 is required. Valaciclovir p. 625 and famciclovir p. 625 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.

Skin conditions, management

Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic* and *lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

Suitable quantities of dermatological preparations to be prescribed for specific areas of the body		
Area of body	Creams and Ointments	Lotions
Face	15–30 g	100 ml
Both hands	25–50 g	200 ml
Scalp	50–100 g	200 ml
Both arms or both legs	100–200 g	200 ml
Trunk	400 g	500 ml
Groins and genitalia	15–25 g	100 ml
These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table.		

Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexamium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated.

Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin;

recommended bath additive quantities for children reflect this.

MHRA/CHM update (April 2016): Fire risk with paraffin-based skin emollients on dressings and clothing

When patients are being treated with a paraffin-based emollient product that is covered by a dressing or clothing, there is a danger that smoking or using a naked flame could cause dressings or clothing to catch fire.

Patients should be advised not to smoke, use naked flames (or be near people who are smoking or using naked flames), or go near anything that may cause a fire while emollients are in contact with their medical dressings or clothing. Patients' clothing and bedding should be changed regularly—preferably daily—because emollients soak into fabric and can become a fire hazard.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 1202 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 1213 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 1197 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

DERMATOLOGICAL DRUGS > BARRIER PREPARATIONS

Barrier creams and ointments

• INDICATIONS AND DOSE

For use as a barrier preparation

- TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

EXCIPIENTS: May contain Woolfat and related substances (including lanolin)

► Barrier creams and ointments (Non-proprietary)

Cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram Zinc and Castor oil ointment | 100 gram [GSL](#) £1.46 | 500 gram [GSL](#) £4.99–£5.38 DT = £5.38

Zinc and Castor oil cream | 100 gram [GSL](#) £1.46

► Brands may include Metanium

Spray

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), woolfat and related substances (including lanolin)

► **Sprilon** (J M Loveridge Ltd)Dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram
Sprilon aerosol spray | 115 gram [GSL] £8.90 DT = £8.90**Cream**

EXCIPIENTS: May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, woolfat and related substances (including lanolin)

► **Conotrane** (LEO Pharma)Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram
Conotrane cream | 100 gram [GSL] £0.88 DT = £0.88 | 500 gram [GSL] £3.51► **Drapolene** (Supra Enterprises Ltd)Benzalkonium chloride 100 microgram per 1 gram, Cetrimide 2 mg per 1 gram
Drapolene cream | 100 gram [GSL] £1.76 | 200 gram [GSL] £2.86 | 350 gram [GSL] £4.28► **Siopel** (Derma UK Ltd)Cetrimide 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram
Siopel cream | 50 gram [GSL] £4.65► **Sudocrem** (Teva UK Ltd)Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzyl benzoate 10.1 mg per 1 gram, Wool fat hydrous 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram
Sudocrem antiseptic healing cream | 30 gram [GSL] £1.45 | 60 gram [GSL] £1.45 | 125 gram [GSL] £2.15 | 250 gram [GSL] £3.67 | 400 gram [GSL] £5.25**DERMATOLOGICAL DRUGS > EMOLLIENTS****Emollient bath and shower products, antimicrobial-containing**

31-Aug-2016

● **INDICATIONS AND DOSE****DERMOL® 200 SHOWER EMOLLIENT****Dry and pruritic skin conditions including eczema and dermatitis**► **TO THE SKIN**

- Child: To be applied to the skin or used as a soap substitute
- Adult: To be applied to the skin or used as a soap substitute

DERMOL® 600 BATH EMOLLIENT**Dry and pruritic skin conditions including eczema and dermatitis**► **TO THE SKIN**

- Child 1-23 months: 5-15 mL/bath, not to be used undiluted
- Child 2-17 years: 15-30 mL/bath, not to be used undiluted
- Adult: Up to 30 mL/bath, not to be used undiluted

DERMOL® WASH EMULSION**Dry and pruritic skin conditions including eczema and dermatitis**► **TO THE SKIN**

- Child: To be applied to the skin or used as a soap substitute
- Adult: To be applied to the skin or used as a soap substitute

EMULSIDERM®**Dry skin conditions including eczema and ichthyosis**► **TO THE SKIN**

- Child 1-23 months: 5-10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- Child 2-17 years: 7-30 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- Adult: 7-30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

OILATUM® PLUS**Topical treatment of eczema, including eczema at risk from infection**► **TO THE SKIN**

- Child 6-11 months: 1 mL/bath, not to be used undiluted
- Child 1-17 years: 1-2 capfuls/bath, not to be used undiluted
- Adult: 1-2 capfuls/bath, not to be used undiluted

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 1186.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10-20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● **PRESCRIBING AND DISPENSING INFORMATION**

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Bath additive

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Acetylated lanolin alcohols, isopropyl palmitate, polysorbates

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Bath additive

EXCIPIENTS: May contain Butylated hydroxytoluene, fragrances, propylene glycol

▶ **Balneum** (Almirall Ltd)

Laurumacrogols 150 mg per 1 gram, Soya oil 829.5 mg per 1 gram Balneum Plus bath oil | 500 mL [GSL] £6.66

Soya oil 847.5 mg per 1 gram Balneum 84.75% bath oil | 500 mL [GSL] £5.38 DT = £5.38 | 1000 mL [GSL] £10.39 DT = £10.39

▶ **Zeroneum** (Thornton & Ross Ltd)

Soya oil 833.5 mg per 1 gram Zeroneum 83.35% bath additive | 500 mL £4.48

Emollient bath and shower products, tar-containing

17-Aug-2016

● **INDICATIONS AND DOSE****POLYTAR EMOLLIENT®**

Psoriasis, eczema, atopic and pruritic dermatoses

▶ TO THE SKIN

- ▶ Adult: 2–4 capfuls/bath, add 15–30 mL to an adult-size bath; soak for 20 minutes

PSORIDERM® EMULSION

Psoriasis

▶ TO THE SKIN

- ▶ Adult: Up to 30 mL/bath, use 30 mL in adult-size bath, soak for 5 minutes

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be

improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Bath additive

EXCIPIENTS: May contain Isopropyl palmitate, polysorbates

▶ **Psoriderm** (Dermal Laboratories Ltd)

Coal tar distilled 400 mg per 1 mL Psoriderm Emulsion 40% bath additive | 200 mL [P] £2.74

Emollient creams and ointments, antimicrobial-containing

17-Aug-2016

● **INDICATIONS AND DOSE**

Dry and pruritic skin conditions including eczema and dermatitis

▶ TO THE SKIN

- ▶ Child: To be applied to the skin or used as a soap substitute
- ▶ Adult: To be applied to the skin or used as a soap substitute

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

See Emollient and barrier preparations p. 1186.

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

▶ **Dermol** (Dermal Laboratories Ltd)

Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 100 mg per 1 gram, Liquid paraffin 100 mg per 1 gram Dermol cream | 100 gram [P] £2.86 | 500 gram [P] £6.63

2 Infections of the skin

Skin infections

Antibacterial preparations for the skin

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis.

Erysipelas, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid p. 561; mupirocin p. 1197 should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as flucloxacillin p. 544 (or clarithromycin p. 529 in penicillin allergy) should be used. Mild antiseptics can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be **avoided** on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulfate p. 1195, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 510. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins p. 1196), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone-iodine p. 1241, chlorhexidine p. 1241, or alcohol can be used; their use should be discussed with the local microbiologist.

Retapamulin p. 1197 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Tedizolid p. 563 is licensed for the treatment of acute bacterial skin and skin structure infections.

Silver sulfadiazine p. 1196 is used in the treatment of infected burns.

Antibacterial preparations also used systemically

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 1182 for further information on angular cheilitis.

Metronidazole p. 1196 is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Antifungal preparations for the skin

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

Dermatophytoses

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete's foot), or nail (tinea unguium). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1197, econazole nitrate p. 1198, ketoconazole p. 1198, and miconazole p. 1199 are all effective. Terbinafine cream p. 1200 is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1200 and the **undecenoates**. **Compound benzoic acid ointment** (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete's foot containing **tolnaftate** are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1199 or tioconazole p. 1199 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo. Alternatively, **selenium sulfide** shampoo [unlicensed indication] can be used as a lotion (diluting with

a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole nitrate, ketoconazole, and miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole nitrate, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin p. 1184 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 584; systemic treatment with terbinafine is **not appropriate** for refractory candidiasis.

Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*.

Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 1214) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertrigo associated with candida.

Antiviral preparations for the skin

Aciclovir cream p. 1203 is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster (shingles)*.

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

Parasitidal preparations for the skin

Suitable quantities of parasitidal preparations

Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)		50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	
Body (crab lice)	30–60 g	100 mL	
These amounts are usually suitable for an adult for single application.			

Scabies

Permethrin p. 1203 is used for the treatment of *scabies (Sarcoptes scabiei)*; malathion p. 1202 can be used if permethrin is inappropriate.

Benzyl benzoate p. 1202 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 593 (available on a named patient basis from 'special-order' manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone; further doses may be required.

Application

Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching

The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1230 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

Head lice

Dimeticone p. 1202 is effective against head lice (*Pediculus humanus capitis*). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

MHRA/CHM advice: Head lice eradication products: risk of serious burns if treated hair is exposed to open flames or other sources of ignition (March 2018)

Some products for the eradication of head lice infestations are combustible/flammable when on the hair and can ignite and cause serious harm in the presence of an open flame or other source of ignition such as when lighting cigarettes.

Patients and carers should be advised on the safe and correct use of head lice eradication treatments and if appropriate, should be advised that they should not smoke

around treated hair and that it should be kept away from open flames or other sources of ignition, including in the morning after overnight application until hair is washed.

Wet combing methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice

Permethrin and malathion are used to eliminate *crab lice* (*Phthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

2.1 Bacterial skin infections

ANTIBACTERIALS > AMINOGLYCOSIDES

Neomycin sulfate

• INDICATIONS AND DOSE

Bacterial skin infections

► TO THE SKIN

- Child: Apply up to 3 times a day, for short-term use only
- Adult: Apply up to 3 times a day, for short-term use only

• UNLICENSED USE

- In children *Neomycin Cream BPC*—no information available.

• CONTRA-INDICATIONS Neonates

- **CAUTIONS** If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, the elderly, and in those with renal impairment.

• INTERACTIONS → Appendix 1: neomycin

- **SIDE-EFFECTS** Sensitisation (cross sensitivity with other aminoglycosides may occur)

- **RENAL IMPAIRMENT** Ototoxicity may be a hazard if large areas of skin are treated.

- **LESS SUITABLE FOR PRESCRIBING** Neomycin sulfate cream is less suitable for prescribing.

• MEDICINAL FORMS

Forms available from special-order manufacturers include: cream

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

● INDICATIONS AND DOSE

ACEA®

Acute inflammatory exacerbation of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 8 weeks, to be applied thinly

ANABACT®

Malodorous fungating tumours and malodorous gravitational and decubitus ulcers

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROGEL®

Acute inflammatory exacerbation of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

Malodorous fungating tumours

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROSA®

Acute exacerbation of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for up to 8 weeks, to be applied thinly

ROSICED®

Inflammatory papules and pustules of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 6 weeks (longer if necessary)

ROZEX® CREAM

Inflammatory papules, pustules and erythema of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 3–4 months

ROZEX® GEL

Inflammatory papules, pustules and erythema of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 3–4 months

ZYOMET®

Acute inflammatory exacerbation of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

- **CAUTIONS** Avoid exposure to strong sunlight or UV light
- **INTERACTIONS** → Appendix 1: metronidazole
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, gel

Gel

EXCIPIENTS: May contain Benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), propylene glycol

Metronidazole 7.5 mg per 1 gram Rozex 0.75% cream | 30 gram [PoM] £6.60 DT = £6.60 | 40 gram [PoM] £9.88 DT = £9.88

ANTIBACTERIALS > POLYMYXINS

Polymyxins

● INDICATIONS AND DOSE

Bacterial skin infections

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily, may be applied more frequently if required

- **CAUTIONS** If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment.

- **INTERACTIONS** → Appendix 1: polymyxins

- **SIDE-EFFECTS** Sensitisation

● MEDICINAL FORMS

No licensed medicines listed.

ANTIBACTERIALS > SULFONAMIDES

Silver sulfadiazine

● INDICATIONS AND DOSE

Prophylaxis and treatment of infection in burn wounds

- ▶ TO THE SKIN
- ▶ Child: Apply daily, may be applied more frequently if very exudative
- ▶ Adult: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries

- ▶ TO THE SKIN
- ▶ Child: Apply every 2–3 days, consult product literature for details
- ▶ Adult: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily or on alternate days

As an adjunct to short-term treatment of infection in leg ulcers

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative

● UNLICENSED USE

- ▶ In children No age range specified by manufacturer.
- **CONTRA-INDICATIONS** Not recommended for neonates
- **CAUTIONS** G6PD deficiency

CAUTIONS, FURTHER INFORMATION

- ▶ Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides if large areas of skin are treated.

- **INTERACTIONS** → Appendix 1: silver sulfadiazine

● SIDE-EFFECTS

- ▶ Common or very common Leucopenia · skin reactions
- ▶ Rare or very rare Argyria (following treatment of large areas of skin or long term use) · renal failure

SIDE-EFFECTS, FURTHER INFORMATION Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sensitivity to sulfonamides.
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution if significant impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if significant impairment.
- **MONITORING REQUIREMENTS** Monitor for leucopenia.
- **DIRECTIONS FOR ADMINISTRATION** Apply with sterile applicator.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- ▶ **Flamazine** (Smith & Nephew Healthcare Ltd)

Sulfadiazine silver 10 mg per 1 gram Flamazine 1% cream | 20 gram [PoM] £2.91 | 50 gram [PoM] £3.85 DT = £3.85 | 250 gram [PoM] £10.32 DT = £10.32 | 500 gram [PoM] £18.27 DT = £18.27

ANTIBACTERIALS > OTHER

Mupirocin

● INDICATIONS AND DOSE

Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)

- ▶ TO THE SKIN
- ▶ Child: Apply up to 3 times a day for up to 10 days
- ▶ Adult: Apply up to 3 times a day for up to 10 days

- **UNLICENSED USE** Mupirocin ointment licensed for use in children (age range not specified by manufacturer). *Bactroban*® cream not recommended for use in children under 1 year.

● SIDE-EFFECTS

- ▶ Common or very common Skin reactions
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe

impairment because it contains macrogols (polyethylene glycol).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

- ▶ **Mupirocin (Non-proprietary)**

Mupirocin 20 mg per 1 gram Mupirocin 2% ointment | 15 gram [PoM] £12.50 DT = £5.26

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin 20 mg per 1 gram Bactroban 2% ointment | 15 gram [PoM] £5.26 DT = £5.26

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% cream | 15 gram [PoM] £5.26 DT = £5.26

Retapamulin

● INDICATIONS AND DOSE

Superficial bacterial skin infection caused by *Staphylococcus aureus* and *Streptococcus pyogenes* (if resistant to first line topical antibacterials)

- ▶ TO THE SKIN
- ▶ Child 9 months–17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days
- ▶ Adult: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 100 cm² or lesion length 10 cm, review treatment if no response within 2–3 days

- **CONTRA-INDICATIONS** Contact with eyes · contact with mucous membranes

● SIDE-EFFECTS

- ▶ Uncommon Contact dermatitis

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2008) that retapamulin (*Altargo*®) is **not** recommended for use within NHS Scotland for the treatment of superficial skin infections.

● MEDICINAL FORMS

No licensed medicines listed.

2.2 Fungal skin infections

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

● INDICATIONS AND DOSE

Fungal skin infections

- ▶ TO THE SKIN
- ▶ Child: Apply 2–3 times a day
- ▶ Adult: Apply 2–3 times a day

- **CAUTIONS** Contact with eyes and mucous membranes should be avoided

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS** Oedema · pain · paraesthesia · skin reactions
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

- **PRESCRIBING AND DISPENSING INFORMATION** Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

Fungal nail infections

- ▶ BY TRANSUNGUAL APPLICATION
- **Child 12–17 years:** Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
- **Adult:** Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
- **CAUTIONS** Avoid contact with ears · avoid contact with eyes and mucous membranes · use with caution in child likely to suck affected digits
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Nail discolouration · skin reactions
- **PATIENT AND CARER ADVICE** Avoid nail varnish or artificial nails during treatment.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - ▶ In adults Amorolfine nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfine 5% and a pack size of 3 mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Medicated nail lacquer

CAUTIONARY AND ADVISORY LABELS 10

▶ Amorolfine (Non-proprietary)

Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml Amorolfine 5% medicated nail lacquer | 5 ml [PoM] £16.21 DT = £6.14

▶ Loceryl[®] (Galderma (UK) Ltd)

Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml Loceryl 5% medicated nail lacquer | 2.5 ml [PoM] £7.26 | 5 ml [PoM] £9.08 DT = £6.14

▶ Omicur[®] (Morningside Healthcare Ltd)

Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml Omicur 5% medicated nail lacquer | 2.5 ml [PoM] £9.09 | 5 ml [PoM] £9.09 DT = £6.14

Griseofulvin

• INDICATIONS AND DOSE

Tinea pedis

- ▶ TO THE SKIN
- ▶ Adult: Apply 400 micrograms once daily, apply to an area approximately 13 cm²; increased if necessary to 1.2 mg once daily for maximum treatment duration of 4 weeks, allow each spray to dry between application

- **CAUTIONS** Avoid contact with eyes and mucous membranes
- **INTERACTIONS** → Appendix 1: griseofulvin
- **SIDE-EFFECTS** Paraesthesia · skin irritation · stinging
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Grisol AF** (Transdermal Ltd)

Griseofulvin 10 mg per 1 gram Grisol AF 1% spray | 20 ml  £4.00

Terbinafine

23-Apr-2018

• INDICATIONS AND DOSE

Tinea pedis

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day for up to 1 week, to be applied thinly
- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 2–6 weeks

Tinea corporis

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 4 weeks

Tinea cruris

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 2–4 weeks

Dermatophyte infections of the nails

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)

Cutaneous candidiasis | Pityriasis versicolor

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

● CAUTIONS

- ▶ With oral use Autoimmune disease (risk of lupus-erythematosus-like effect) · psoriasis (risk of exacerbation)
- ▶ With topical use Contact with eyes and mucous membranes should be avoided

- **INTERACTIONS** → Appendix 1: terbinafine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Appetite decreased · arthralgia · diarrhoea · gastrointestinal discomfort · gastrointestinal disorder · headache · myalgia · nausea
- ▶ **Uncommon**
- ▶ With oral use Taste altered · weight decreased
- ▶ **Rare or very rare**
- ▶ With oral use Agranulocytosis · alopecia · cutaneous lupus erythematosus · dizziness · hepatic disorders · malaise · neutropenia · photosensitivity reaction · sensation abnormal · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia · vertigo
- ▶ **Frequency not known**
- ▶ With oral use Anaemia · anxiety · depressive symptom · fatigue · fever · hearing impairment · influenza like illness · pancreatitis · pancytopenia · rhabdomyolysis · serum sickness-like reaction · smell altered · vasculitis · vision disorders

SIDE-EFFECTS, FURTHER INFORMATION

Liver toxicity With oral use; discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).

Serious skin reactions With oral use; discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).

● PREGNANCY

- ▶ With topical use Manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects.

- ▶ With oral use Manufacturer advises use only if potential benefit outweighs risk—no information available.

● BREAST FEEDING

- ▶ With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest.

- ▶ With oral use Avoid—present in milk.

● HEPATIC IMPAIRMENT

- ▶ With oral use Manufacturer advises avoid—elimination reduced.

● RENAL IMPAIRMENT

- ▶ **Dose adjustments** ▶ With oral use Use half normal dose if eGFR less than 50 mL/minute/1.73 m² and no suitable alternative available.

● MONITORING REQUIREMENTS

- ▶ With oral use Monitor hepatic function before treatment and then periodically after 4–6 weeks of treatment—discontinue if abnormalities in liver function tests.

● PATIENT AND CARER ADVICE

- ▶ With oral use Manufacturer advises that patients should immediately report any signs or symptoms suggestive of liver dysfunction such as pruritus, unexplained persistent nausea, decreased appetite, anorexia, jaundice, vomiting, fatigue, right upper abdominal pain, dark urine, or pale stools. Patients with these symptoms should discontinue taking terbinafine and the patient's liver function should be immediately evaluated.

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

BENZOATES

Benzoic acid with salicylic acid

INDICATIONS AND DOSE

Ringworm (tinea)

TO THE SKIN

- Child: Apply twice daily
- Adult: Apply twice daily

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Avoid broken or inflamed skin • avoid contact with eyes • avoid contact with mucous membranes

CAUTIONS, FURTHER INFORMATION

- **Salicylate toxicity** Salicylate toxicity may occur particularly if applied on large areas of skin.

- **SIDE-EFFECTS** Hypersensitivity • skin burning sensation (mild) • skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be discontinued if side effects are severe.

- **PRESCRIBING AND DISPENSING INFORMATION** Benzoic Acid Ointment, Compound, BP has also been referred to as Whitfield's ointment.

MEDICINAL FORMS

Forms available from special-order manufacturers include: cream, ointment

SALICYLIC ACID AND DERIVATIVES

Boric acid with salicylic acid and tannic acid

INDICATIONS AND DOSE

Fungal nail infection, particularly tinea

BY TRANSUNGUAL APPLICATION

- Child 5-17 years: Apply twice daily, and after washing
- Adult: Apply twice daily, and after washing

- **CAUTIONS** Avoid broken or inflamed skin · contact with eyes and mucous membranes should be avoided · use with caution in children likely to suck affected digits

CAUTIONS, FURTHER INFORMATION

- Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin.
- **SIDE-EFFECTS** Stinging
- **PREGNANCY** Avoid.
- **MEDICINAL FORMS**
No licensed medicines listed.

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HEAD LICE ERADICATION PRODUCTS: RISK OF SERIOUS BURNS IF TREATED HAIR IS EXPOSED TO OPEN FLAMES OR OTHER SOURCES OF IGNITION (MARCH 2018)

See Skin infections p. 1193.

- **CAUTIONS** Avoid contact with eyes · children under 6 months, medical supervision required
- **SIDE-EFFECTS** Alopecia · dyspnoea · eye irritation · hypersensitivity · scalp changes · skin reactions

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

- **Hedrin** (Thornton & Ross Ltd)
Dimeticone 40 mg per 1 gram Hedrin 4% lotion | 50 ml [P] £3.28 DT = £3.28 | 150 ml [P] £7.62 DT = £7.62
- **Lyclear (dimeticone)** (Omega Pharma Ltd)
Dimeticone 40 mg per 1 gram Lyclear lotion | 100 ml [X]

Cutaneous spray solution

- **Hedrin** (Thornton & Ross Ltd)
Dimeticone 40 mg per 1 gram Hedrin 4% spray | 120 ml [GSL] £7.85

2.3 Parasitic skin infections

Other drugs used for Parasitic skin infections Ivermectin, p. 593

PARASITICIDES

Benzyl benzoate

INDICATIONS AND DOSE

Scabies

- TO THE SKIN
- Adult: Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

- **CAUTIONS** Avoid contact with eyes and mucous membranes · children (not recommended) · do not use on broken or secondarily infected skin
- **SIDE-EFFECTS** Skin burning sensation (especially on genitalia and excoriations) · skin reactions
- **BREAST FEEDING** Suspend feeding until product has been washed off.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Benzyl Benzoate Application, BP consists of benzyl benzoate 25% in an emulsion basis.

Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears. Note—dilution to reduce irritant effect also reduces efficacy.

- **LESS SUITABLE FOR PRESCRIBING** Benzyl benzoate is less suitable for prescribing.
- **MEDICINAL FORMS**

Forms available from special-order manufacturers include: liquid

Dimeticone

06-Apr-2018

INDICATIONS AND DOSE

Head lice

- TO THE SKIN
- Child: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)
- Adult: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

Malathion

06-Apr-2018

INDICATIONS AND DOSE

Head lice

- TO THE SKIN
- Child: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours
- Adult: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours

Crab lice

- TO THE SKIN
- Child: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight
- Adult: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight

Scabies

- TO THE SKIN
- Child: Apply once weekly for 2 doses, apply preparation over whole body, and wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated
- Adult: Apply once weekly for 2 doses, apply preparation over whole body, and wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HEAD LICE ERADICATION PRODUCTS: RISK OF SERIOUS BURNS IF TREATED HAIR IS EXPOSED TO OPEN FLAMES OR OTHER SOURCES OF IGNITION (MARCH 2018)

See Skin infections p. 1193.

- **CAUTIONS** Alcoholic lotions **not** recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice · avoid contact with eyes · children under 6 months, medical supervision required · do not use lotion more than once a week for 3 consecutive weeks · do not use on broken or secondarily infected skin

- **SIDE-EFFECTS** Angioedema · eye swelling · hypersensitivity · skin reactions
- **PRESCRIBING AND DISPENSING INFORMATION** For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears.

3 Inflammatory skin conditions

3.1 Eczema and psoriasis

Eczema

Types and management

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 1218) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See *Wound management products and elasticated garments* for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response p. 1206 for the role of topical pimecrolimus p. 1221 and tacrolimus p. 1222 in atopic eczema.

Infection

Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema and requires treatment with topical or systemic **antibacterial drugs**. Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug is indicated.

Management of other features of eczema

Lichenification, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing **ichthammol** paste p. 1218 (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** and ichthammol can be useful in some cases of *chronic eczema*.

A *non-sedating antihistamine* may be of some value in relieving severe itching or urticaria associated with eczema. A *sedating* antihistamine can be used if itching causes sleep disturbance.

Exudative ('weeping') eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 1240 can be used in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system. Alitretinoin p. 1226 is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Seborrhoeic dermatitis

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast *Malassezia* and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 1198 or coal tar p. 1219) and combinations of mild corticosteroids with suitable antimicrobials are used.

Psoriasis

Management

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Emollients, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in *inflammatory psoriasis* and in *plaque psoriasis of palms and soles*, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs involves the use of **vitamin D analogues**, coal tar p. 1219, dithranol p. 1219, and the retinoid tazarotene p. 1227. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic

acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

Facial, flexural and genital psoriasis can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcipotriol p. 1228 or tacalcitol p. 1228 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol p. 1227 is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1221 or tacrolimus p. 1222 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes ('short contact'). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

Tazarotene, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless.

A topical **corticosteroid** is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Phototherapy

Phototherapy is available in specialist centres under the supervision of a dermatologist. **Ultraviolet B (UVB)** radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment

Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (such as ciclosporin p. 818 and methotrexate p. 888).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin p. 1225, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is *psoriasis*, but it is also used in disorders of keratinisation such as severe *Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing,

the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

Topical treatment

The vitamin D and analogues, calcipotriol p. 1227, calcitriol p. 1228, and tacalcitol p. 1228 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

Eczema and psoriasis, drugs affecting the immune response

Overview

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus p. 1221 by topical application is licensed for *mild to moderate atopic eczema*. Tacrolimus p. 1222 is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin p. 818 by mouth can be used for *severe psoriasis* and for *severe eczema*. Azathioprine p. 816 or mycophenolate mofetil p. 826 are used for severe refractory eczema [unlicensed indication]. Dupilumab p. 1223 is licensed for the treatment of moderate to severe atopic eczema in patients requiring systemic therapy. Dimethyl fumarate p. 833 is licensed for the treatment of moderate to severe plaque psoriasis.

Methotrexate p. 888 can be used for *severe psoriasis*, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 993 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept p. 1078, adalimumab p. 1073, and infliximab p. 1082 inhibit the activity of tumour necrosis factor (TNF α). They are used for *severe plaque psoriasis* either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Secukinumab p. 1066 and ixekizumab p. 1224 inhibit the activity of interleukin-17A, brodalumab p. 1222 inhibits the activity of interleukin-17RA and guselkumab p. 1224 inhibits the activity of interleukin-23. They are used for *moderate to severe plaque psoriasis* in patients who are candidates for systemic therapy. Secukinumab is also licensed for psoriatic arthritis and ankylosing spondylitis. Ustekinumab p. 1069 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for *severe plaque psoriasis* that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications.

Adalimumab is also licensed for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in patients who have had inadequate response to conventional systemic therapy. Adalimumab, etanercept, infliximab, ixekizumab and ustekinumab are also licensed for psoriatic arthritis.

Other drugs used for Eczema and psoriasis Apremilast, p. 1084

CORTICOSTEROIDS

Topical corticosteroids

Overview

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are **not** recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in *psoriasis* because, although they may suppress the *psoriasis* in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular *psoriasis*). See the role of topical corticosteroids in the treatment of *psoriasis*.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus*, *lichen simplex chronicus*, *hypertrophic lichen planus*, and *palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *keloid scars*, *hypertrophic lichen planus*, or *localised alopecia areata*.

Perioral lesions

Hydrocortisone cream 1% p. 1213 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 1218 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

Choice of formulation

Water-miscible corticosteroid *creams* are suitable for moist or weeping lesions whereas *ointments* are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. *Lotions* may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene* or *hydrocolloid dressings* increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or

salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent'; the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

Absorption through the skin

Mild and *moderately potent* topical corticosteroids are associated with few side-effects but care is required in the use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body	
Area of body	Creams and Ointments
Face and neck	15 to 30 g
Both hands	15 to 30 g
Scalp	15 to 30 g
Both arms	30 to 60g
Both legs	100 g
Trunk	100 g
Groins and genitalia	15 to 30 g
These amounts are usually suitable for an adult for a single daily application for 2 weeks	

Compound preparations

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1250 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

Mild

- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

Mild with antimicrobials

- Canesten HC
- Dakta cort
- Econacort
- Fucidin H
- Nystaform-HC
- Terra-Cortril
- Timodine

Moderate

- Betnovate-RD

- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralanum Plain

Moderate with antimicrobials

- Trimovate

Moderate with urea:

- Alphaderm

Potent

- Beclometasone dipropionate 0.025%
- Betamethasone valerate 0.1%
- Betacap
- Betesil
- Bettamousse
- Betnovate
- Cutivate
- Diprosone
- Elocon
- Hydrocortisone butyrate
- Locoid
- Locoid Crelo
- Metosyn
- Mometasone furoate 0.1%
- Nerisone
- Synalar

Potent with antimicrobials

- Aureocort
- Betamethasone and clioquinol
- Betamethasone and neomycin
- Fucibet
- Lotriderm
- Synalar C
- Synalar N

Potent with salicylic acid

- Diprosalic

Very potent

- Clarelux
- Dermovate
- Etrivex
- Nerisone Forte

Very potent with antimicrobials

- Clobetasol with neomycin and nystatin

Use in children

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should **not** necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient's condition.

Corticosteroids (topical)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periorcular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CONTRA-INDICATIONS** Acne · perioral dermatitis · potent corticosteroids in widespread plaque psoriasis · rosacea (in adults) · untreated bacterial, fungal or viral skin lesions
- **CAUTIONS** Avoid prolonged use (particularly on the face) · cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use · dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) · infection · keep away from eyes · use potent or very potent topical corticosteroids under specialist supervision (in children) · use potent or very potent topical corticosteroids under specialist supervision in psoriasis (can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity) (in adults)
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Adrenal suppression · skin reactions · telangiectasia
 - ▶ **Rare or very rare** Hypertrichosis · skin depigmentation (may be reversible)
 - ▶ **Frequency not known** Local reaction · vasodilation
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use. In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.
- **DIRECTIONS FOR ADMINISTRATION** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a *fingertip unit* (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.
- ▶ In children ‘Wet-wrap bandaging’ increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.
- **PRESCRIBING AND DISPENSING INFORMATION** The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

Clobetasol propionate

● INDICATIONS AND DOSE

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids | Psoriasis

► TO THE SKIN

- Child 1–17 years: Apply 1–2 times a day for up to 4 weeks, to be applied thinly
- Adult: Apply 1–2 times a day for up to 4 weeks, to be applied thinly, maximum 50 g of 0.05% preparation per week

POTENCY

- Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

ETRIVEX®

Moderate scalp psoriasis

► TO THE SKIN

- Adult: Apply once daily maximum duration of treatment 4 weeks, to be applied thinly then rinsed off after 15 minutes; frequency of application should be reduced after clinical improvement

- **UNLICENSED USE** *Dermovate*® not licensed for use in children under 1 year.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.

Scalp application Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

Foam

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with clioquinol

18-Nov-2015

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1209.

● INDICATIONS AND DOSE

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

POTENCY

- ▶ Betamethasone (as valerate) 0.1% with clioquinol cream and ointment: potent.

- **UNLICENSED USE** Betamethasone and clioquinol preparations is not licensed for use in children under 1 year.
- **PATIENT AND CARER ADVICE** Stains clothing. Patients or carers should be counselled on application of betamethasone with clioquinol preparations.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Betamethasone with clioquinol (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram Betamethasone valerate 0.1% / Clioquinol 3% ointment | 30 gram [PoM] £38.88 DT = £38.88

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- ▶ **Betamethasone with clioquinol (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram Betamethasone valerate 0.1% / Clioquinol 3% cream | 30 gram [PoM] £38.88 DT = £38.88

Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1209, clotrimazole p. 1197.

● INDICATIONS AND DOSE

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

POTENCY

- ▶ Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

- **UNLICENSED USE** Lotriderm® not licensed for use in children under 12 years.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

▶ **Lotiderm** (Merck Sharp & Dohme Ltd)

Betamethasone dipropionate 640 microgram per 1 gram,
Clotrimazole 10 mg per 1 gram Lotiderm cream | 30 gram [PoM]
£6.34 DT = £6.34

Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1209, fusidic acid p. 561.

INDICATIONS AND DOSE

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

▶ TO THE SKIN

- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

POTENCY

- ▶ Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

- **UNLICENSED USE** *Fucibet® Lipid Cream* is not licensed for use in children under 6 years.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, hydroxybenzoates (parabens)

▶ **Betamethasone with fusidic acid (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,
Fusidic acid 20 mg per 1 gram Betamethasone valerate 0.1% /
Fusidic acid 2% cream | 30 gram [PoM] £6.38 DT = £6.38 |
60 gram [PoM] £12.76 DT = £12.76

▶ **Fucibet** (LEO Pharma)

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,
Fusidic acid 20 mg per 1 gram Fucibet cream | 30 gram [PoM]
£6.38 DT = £6.38 | 60 gram [PoM] £12.76 DT = £12.76
Fucibet Lipid cream | 30 gram [PoM] £6.74 DT = £6.38

▶ **Xemacort** (Mylan)

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,
Fusidic acid 20 mg per 1 gram Xemacort cream | 30 gram [PoM]
£6.05 DT = £6.38 | 60 gram [PoM] £12.45 DT = £12.76

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1209, neomycin sulfate p. 1195.

INDICATIONS AND DOSE

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- ▶ TO THE SKIN USING OINTMENT, OR TO THE SKIN USING CREAM
- ▶ Child 2-17 years: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

POTENCY

- ▶ Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone with neomycin cream and ointment (application).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

▶ **Betamethasone with neomycin (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,
Neomycin sulfate 5 mg per 1 gram Betamethasone valerate 0.1% /
Neomycin 0.5% ointment | 30 gram [PoM] £38.88 DT = £31.36 |
100 gram [PoM] £97.00 DT = £104.52

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

▶ **Betamethasone with neomycin (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,
Neomycin sulfate 5 mg per 1 gram Betamethasone valerate 0.1% /
Neomycin 0.5% cream | 30 gram [PoM] £38.88 DT = £31.36 |
100 gram [PoM] £97.00 DT = £104.52

Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1209, salicylic acid p. 1250.

INDICATIONS AND DOSE

DIPROSALIC® OINTMENT

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

▶ TO THE SKIN

- ▶ Child: Apply 1–2 times a day, max. 60 g per week
- ▶ Adult: Apply 1–2 times a day, max. 60 g per week

POTENCY

- ▶ For *Diprosalic®* ointment: betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

DIPROSALIC® SCALP APPLICATION

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

▶ TO THE SKIN

- ▶ Child: Apply 1–2 times a day, apply a few drops
- ▶ Adult: Apply 1–2 times a day, apply a few drops

POTENCY

- ▶ For *Diprosalic®* scalp application: betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

- **PATIENT AND CARER ADVICE**

DIPROSALIC® OINTMENT Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.

DIPROSALIC® SCALP APPLICATION Patients or carers should be counselled on application of betamethasone and salicylic acid scalp application.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

Ointment

CAUTIONARY AND ADVISORY LABELS 28

▶ **Diprosalic** (Merck Sharp & Dohme Ltd)

Betamethasone (as Betamethasone dipropionate)

500 microgram per 1 gram, Salicylic acid 30 mg per
1 gram Diprosalic 0.05%/3% ointment | 30 gram [PoM] £3.18 DT =
£3.18 | 100 gram [PoM] £9.14 DT = £9.14

Liquid

CAUTIONARY AND ADVISORY LABELS 28
EXCIPIENTS: May contain Disodium edetate

- **Diprosalic** (Merck Sharp & Dohme Ltd)
Betamethasone (as Betamethasone dipropionate)
500 microgram per 1 mL, Salicylic acid 20 mg per 1 mL Diprosalic
0.05%/2% scalp application | 100 mL [PoM] £10.10 DT = £10.10

Clobetasol propionate with neomycin sulfate and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 1210, neomycin sulfate p. 1195.

• INDICATIONS AND DOSE

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas associated with infection and unresponsive to less potent corticosteroids | Psoriasis associated with infection

- TO THE SKIN
- Adult: (consult product literature)

POTENCY

- Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

- **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Clobetasol 500microgram / Neomycin 5mg / Nystatin 100,000units/g ointment | 30 gram [PoM] £87.00 DT = £87.00

Cream

CAUTIONARY AND ADVISORY LABELS 28

- **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Clobetasol 500microgram / Neomycin 5mg / Nystatin 100,000units/g cream | 30 gram [PoM] £87.00 DT = £87.00

Clobetasone butyrate with nystatin and oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasone butyrate p. 1210, oxytetracycline p. 557.

• INDICATIONS AND DOSE

Steroid-responsive dermatoses where candidal or bacterial infection is present

- TO THE SKIN
- Adult: (consult product literature)

POTENCY

- Clobetasone butyrate 0.05% with nystatin and oxytetracycline cream: moderate.

- **PATIENT AND CARER ADVICE** Stains clothing.

• MEDICINAL FORMS

Forms available from special-order manufacturers include: cream

Fluocinolone acetonide with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1212.

• INDICATIONS AND DOSE

Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection

- TO THE SKIN
- Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

POTENCY

- Clioquinol 3% with fluocinolone acetonide 0.025% cream and ointment: potent

- **PATIENT AND CARER ADVICE** Patient counselling is advised for clioquinol with fluocinolone acetonide cream and ointment (application). Ointment stains clothing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol, woolfat and related substances (including lanolin)

- **Synalar C** (Reig Jofre UK Ltd)
Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 30 mg per 1 gram Synalar C ointment | 15 gram [PoM] £2.66

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

- **Synalar C** (Reig Jofre UK Ltd)
Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 30 mg per 1 gram Synalar C cream | 15 gram [PoM] £2.66

Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1212, neomycin sulfate p. 1195.

• INDICATIONS AND DOSE

Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection

- TO THE SKIN
- Child 1–17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
- Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

POTENCY

- Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol, woolfat and related substances (including lanolin)

- ▶ **Synalar N** (Reig Jofre UK Ltd)
Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram Synalar N ointment | 30 gram [PoM] £4.36

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

- ▶ **Synalar N** (Reig Jofre UK Ltd)
Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram Synalar N cream | 30 gram [PoM] £4.36

Hydrocortisone with benzalkonium chloride, dimeticone and nystatin

15-Mar-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1213, dimeticone p. 1202.

● INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas associated with infection

▶ TO THE SKIN

- ▶ Child: Apply 3 times a day until lesion has healed, to be applied thinly
- ▶ Adult: Apply 3 times a day until lesion has healed, to be applied thinly

POTENCY

▶ Benzalkonium with dimeticone, hydrocortisone acetate 0.5%, and nystatin cream: mild.

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid

- ▶ **Timodine** (Alliance Pharmaceuticals Ltd)
Benzalkonium chloride 1 mg per 1 gram, Hydrocortisone 5 mg per 1 gram, Dimeticone 350 100 mg per 1 gram, Nystatin 100000 unit per 1 gram Timodine cream | 30 gram [PoM] £3.37

Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1213, chlorhexidine p. 1241.

● INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas

▶ TO THE SKIN

- ▶ Child: To be applied thinly (consult product literature)
- ▶ Adult: To be applied thinly (consult product literature)

POTENCY

- ▶ Hydrocortisone 0.5% with chlorhexidine hydrochloride 1% and nystatin cream: mild
- ▶ Hydrocortisone 1% with chlorhexidine hydrochloride 1% and nystatin ointment: mild

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on application of chlorhexidine hydrochloride with hydrocortisone and nystatin preparations.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Hydrocortisone with chlorhexidine hydrochloride and nystatin (Non-proprietary)**

Chlorhexidine acetate 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000units/g / Chlorhexidine acetate 1% / Hydrocortisone 1% ointment | 30 gram [PoM] £5.29 DT = £5.29

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Hydrocortisone with chlorhexidine hydrochloride and nystatin (Non-proprietary)**

Hydrocortisone 5 mg per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000units/g / Chlorhexidine hydrochloride 1% / Hydrocortisone 0.5% cream | 30 gram [PoM] £5.29 DT = £5.29

Hydrocortisone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1213, clotrimazole p. 1197.

● INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas (associated with fungal infection)

▶ TO THE SKIN

- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

POTENCY

- ▶ Clotrimazole with hydrocortisone 1% cream: mild

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clotrimazole with hydrocortisone cream.
- **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube is on sale to the public for the treatment of athlete's foot and fungal infection of skin folds with associated inflammation in patients 10 years and over.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Canesten HC** (Bayer Plc)

Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten HC cream | 30 gram [PoM] £2.42 DT = £2.42

Hydrocortisone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1213, fusidic acid p. 561.

● INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas

▶ TO THE SKIN

- ▶ Child: To be applied thinly (consult product literature)
- ▶ Adult: To be applied thinly (consult product literature)

POTENCY

- ▶ Hydrocortisone with fusidic acid cream: mild

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with fusidic acid preparations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, potassium sorbate

- ▶ **Fucidin H (Fusidic acid / Hydrocortisone)** (LEO Pharma)

Hydrocortisone acetate 10 mg per 1 gram, Fusidic acid 20 mg per 1 gram Fucidin H cream | 30 gram [PoM] £6.02 DT = £6.02 | 60 gram [PoM] £12.05 DT = £12.05

Hydrocortisone with miconazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1213, miconazole p. 1199.

INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas associated with infections

- ▶ TO THE SKIN

- ▶ Adult: (consult product literature)

POTENCY

- ▶ Hydrocortisone 1% with miconazole cream and ointment: mild

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with miconazole preparations.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

May be prescribed as Miconazole and Hydrocortisone Cream or Ointment for max. 7 days.

- **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube of hydrocortisone with miconazole cream is on sale to the public for the treatment of athlete's foot and candidal intertrigo.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Daktacort** (Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort ointment | 30 gram [PoM] £2.50 DT = £2.50

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, disodium edetate

- ▶ **Daktacort** (McNeil Products Ltd, Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort 2%/1% cream | 30 gram [PoM] £2.49 DT = £2.49

Hydrocortisone with oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1213, oxytetracycline p. 557.

INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas

- ▶ TO THE SKIN

- ▶ Child 12-17 years: (consult product literature)

- ▶ Adult: (consult product literature)

POTENCY

- ▶ Hydrocortisone 1% with oxytetracycline ointment: mild.

- **CONTRA-INDICATIONS** Children under 12 years

- **PREGNANCY** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child's teeth.

- **BREAST FEEDING** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

- **PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Terra-Cortril** (Intrapharm Laboratories Ltd)

Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as Oxytetracycline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram [PoM] £5.01 DT = £5.01

DERMATOLOGICAL DRUGS > ANTI-INFECTIVES

Ichthammol

INDICATIONS AND DOSE

Chronic lichenified eczema

- ▶ TO THE SKIN

- ▶ Child 1-17 years: Apply 1-3 times a day

- ▶ Adult: Apply 1-3 times a day

UNLICENSED USE

- ▶ In children No information available.

SIDE-EFFECTS

- ▶ Skin irritation

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

Liquid

- ▶ **Ichthammol (Non-proprietary)**

Ichthammol 1 mg per 1 mg Ichthammol liquid | 100 gram [GSL] £11.42 DT = £11.42 | 500 gram [GSL] £34.27

Ichthammol with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

INDICATIONS AND DOSE

Chronic lichenified eczema

- ▶ TO THE SKIN

- ▶ Adult: (consult product literature)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

Impregnated dressing

- ▶ **Ichthopaste** (Evolan Pharma AB)

Ichthopaste bandage 7.5cm × 6m | 1 bandage £3.75

DERMATOLOGICAL DRUGS > ANTRACEN DERIVATIVES

Dithranol

(Anthralin)

● INDICATIONS AND DOSE

Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

DITHROCREAM[®]

Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

MICANOL[®]

Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

- **CONTRA-INDICATIONS** Acute and pustular psoriasis · hypersensitivity
- **CAUTIONS** Avoid sensitive areas of skin · avoid use near eyes
- **SIDE-EFFECTS** Skin reactions
- **PREGNANCY** No adverse effects reported.
- **BREAST FEEDING** No adverse effects reported.
- **DIRECTIONS FOR ADMINISTRATION** When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.
- **MICANOL[®]** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.
- **PRESCRIBING AND DISPENSING INFORMATION** Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.
- **PATIENT AND CARER ADVICE** Dithranol can stain the skin, hair and fabrics.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- ▶ **Dithrocream** (Dermal Laboratories Ltd)

Dithranol 1 mg per 1 gram Dithrocream 0.1% cream | 50 gram [P] £3.77

Dithranol 2.5 mg per 1 gram Dithrocream 0.25% cream | 50 gram [P] £4.04

Dithranol 5 mg per 1 gram Dithrocream 0.5% cream | 50 gram [P] £4.66

Dithranol 10 mg per 1 gram Dithrocream HP 1% cream | 50 gram [P] £5.42

Dithranol 20 mg per 1 gram Dithrocream 2% cream | 50 gram [PoM] £6.79

Combinations available: *Coal tar with dithranol and salicylic acid*, p. 1220

Dithranol with salicylic acid and zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol above, salicylic acid p. 1250.

● INDICATIONS AND DOSE

Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: (consult local protocol)

● MEDICINAL FORMS

Forms available from special-order manufacturers include: ointment, paste

DERMATOLOGICAL DRUGS > TARS

Coal tar

● INDICATIONS AND DOSE

Psoriasis | Chronic atopic eczema

- ▶ TO THE SKIN USING PASTE
- ▶ Child: Apply 1–3 times a day, start application with low-strength preparations
- ▶ Adult: Apply 1–3 times a day, start application with low-strength preparations
- ▶ TO THE SKIN
- ▶ Child: 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child's bath. Use Coal Tar Solution BP
- ▶ Adult: 100 mL/bath, to be added to an adult sized bath. Use Coal Tar Solution BP

ALPHOSYL 2 IN 1[®] SHAMPOO

Psoriasis | Seborrhoeic dermatitis | Scaling | Itching

- ▶ TO THE SKIN
- ▶ Adult: Apply every 2–3 days

Dandruff

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a week as required

EXOREX[®] LOTION

Psoriasis

- ▶ TO THE SKIN
- ▶ Adult: Apply 2–3 times a day, to be applied to skin or scalp; in elderly, lotion can be diluted with a few drops of water before applying

- **CONTRA-INDICATIONS** Avoid broken or inflamed skin · avoid eye area · avoid genital area · avoid mucosal areas · avoid rectal area · infection · sore, acute, or pustular psoriasis
- **CAUTIONS** Application to face · application to skin flexures
- **SIDE-EFFECTS** Photosensitivity reaction · skin reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Coal Tar Solution BP contains coal tar 20%, Strong Coal Tar Solution BP contains coal tar 40%.
- **HANDLING AND STORAGE** Use suitable chemical protection gloves for extemporaneous preparation. May stain skin, hair and fabric.
- **PATIENT AND CARER ADVICE** May stain skin, hair and fabric.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste

Bath additive

► **Psoriderm** (Dermal Laboratories Ltd)

Coal tar distilled 400 mg per 1 ml Psoriderm Emulsion 40% bath additive | 200 ml [P] £2.74

Cutaneous emulsion

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

► **Exorex** (Teva UK Ltd)

Coal tar solution 50 mg per 1 gram Exorex lotion | 100 ml [GSL] £8.11 DT = £8.11 | 250 ml [GSL] £16.24 DT = £16.24

Shampoo

EXCIPIENTS: May contain Fragrances, hydroxybenzoates (parabens)

► **Coal tar (Non-proprietary)**

Coal tar extract 20 mg per 1 gram Coal tar extract 2% shampoo | 125 ml [GSL] [S] DT = £3.90 | 250 ml [GSL] [S] DT = £5.86

► Brands may include Alphasyl 2 in 1, Neutrogena T/Gel Therapeutic, Polytar Scalp

Coal tar with calamine

31-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1219.

INDICATIONS AND DOSE

Psoriasis | Chronic atopic eczema (occasionally)

► TO THE SKIN

► Adult: Apply 1–2 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 1186.

● **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Calamine and Coal Tar Ointment BP, consists of calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g.

MEDICINAL FORMS

No licensed medicines listed.

Coal tar with coconut oil and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1219, salicylic acid p. 1250.

INDICATIONS AND DOSE

Scaly scalp disorders | Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap

► TO THE SKIN USING SHAMPOO

► Child: Apply daily as required

► Adult: Apply daily as required

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Shampoo

► **Capasal** (Dermal Laboratories Ltd)

Salicylic acid 5 mg per 1 gram, Coal tar distilled 10 mg per 1 gram, coconut oil 10 mg per 1 gram Caspal Therapeutic shampoo | 250 ml [P] £4.69

Coal tar with dithranol and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1219, dithranol p. 1219, salicylic acid p. 1250.

INDICATIONS AND DOSE

Subacute and chronic psoriasis

► TO THE SKIN

► Child: Apply up to twice daily

► Adult: Apply up to twice daily

● **UNLICENSED USE** *Psorin*® is licensed for use in children (age range not specified by manufacturer).

MEDICINAL FORMS

Forms available from special-order manufacturers include: ointment

Coal tar with lecithin

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1219.

INDICATIONS AND DOSE

PSORIDERM® CREAM

Psoriasis

► TO THE SKIN

► Child: Apply 1–2 times a day, cream to be applied to the skin or scalp

► Adult: Apply 1–2 times a day, cream to be applied to the skin or scalp

PSORIDERM® SCALP LOTION

Scalp psoriasis

► TO THE SKIN

► Child: Apply as required

► Adult: Apply as required

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Isopropyl palmitate, propylene glycol

► **Psoriderm** (Dermal Laboratories Ltd)

Lecithin 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram Psoriderm cream | 225 ml [P] £9.42

Shampoo

EXCIPIENTS: May contain Disodium edetate

► **Psoriderm** (Dermal Laboratories Ltd)

Lecithin 3 mg per 1 ml, Coal tar distilled 25 mg per 1 ml Psoriderm scalp lotion | 250 ml [P] £4.74

Coal tar with salicylic acid

26-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1219, salicylic acid p. 1250.

INDICATIONS AND DOSE

Psoriasis | Chronic atopic eczema

► TO THE SKIN USING OINTMENT

► Adult: Apply 1–2 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 1186.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Coal Tar and Salicylic Acid Ointment, BP consists of coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate '80' 4 g, liquid paraffin 7.6 g.

• MEDICINAL FORMS

Forms available from special-order manufacturers include: ointment

Coal tar with salicylic acid and precipitated sulfur

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1219, salicylic acid p. 1250.

• INDICATIONS AND DOSE

COCOIS[®] OINTMENT

Scaly scalp disorders including psoriasis, eczema, seborrheic dermatitis and dandruff

- ▶ **INITIALLY TO THE SKIN USING SCALP OINTMENT**
- ▶ Child 6–11 years: Medical supervision required
- ▶ Child 12–17 years: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
- ▶ Adult: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

SEBCO[®] OINTMENT

Scaly scalp disorders including psoriasis, eczema, seborrheic dermatitis and dandruff

- ▶ **TO THE SKIN USING SCALP OINTMENT**
- ▶ Child 6–11 years: Medical supervision required
- ▶ Child 12–17 years: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
- ▶ Adult: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

▶ Cocois (RPH Pharmaceuticals AB)

Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram Cocois ointment | 40 gram [GSL] £6.22 | 100 gram [GSL] £11.69

▶ Sebco (Derma UK Ltd)

Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram Sebco ointment | 40 gram [GSL] £6.20 | 100 gram [GSL] £11.67

Coal tar with zinc oxide

26-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1219.

• INDICATIONS AND DOSE

Psoriasis | Chronic atopic eczema

- ▶ **TO THE SKIN**
- ▶ Child: Apply 1–2 times a day

- ▶ Adult: Apply 1–2 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 1186.

- **PRESCRIBING AND DISPENSING INFORMATION** No preparations available—when prepared extemporaneously, the BP states Zinc and Coal Tar Paste, BP consists of zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%.

• MEDICINAL FORMS

Forms available from special-order manufacturers include: ointment, paste

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Pimecrolimus

• INDICATIONS AND DOSE

Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)

- ▶ **TO THE SKIN**
- ▶ Adult: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)

- ▶ **TO THE SKIN**
- ▶ Adult: Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

- **UNLICENSED USE** Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.
- **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eyes · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site
- **CAUTIONS** Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** → Appendix 1: pimecrolimus
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Increased risk of infection
 - ▶ **Rare or very rare** Skin discolouration
 - ▶ **Frequency not known** Skin papilloma
- **PREGNANCY** Manufacturer advises avoid; toxicity in animal studies following systemic administration.
- **BREAST FEEDING** Manufacturer advises caution; ensure infant does not come in contact with treated areas.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82

Topical pimecrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged

2–16 years. Pimecrolimus should be used within its licensed indications.

www.nice.org.uk/TA82

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 4, 11, 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

► **Elidel** (Meda Pharmaceuticals Ltd)

Pimecrolimus 10 mg per 1 gram Elidel 1% cream | 30 gram [PoM]
£19.69 DT = £19.69 | 60 gram [PoM] £37.41 DT = £37.41 |
100 gram [PoM] £59.07 DT = £59.07

Tacrolimus

19-Mar-2018

DRUG ACTION Tacrolimus is a calcineurin inhibitor.

INDICATIONS AND DOSE

Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)

► TO THE SKIN

► **Adult:** Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)

► TO THE SKIN

► **Adult:** Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated under specialist supervision)

► TO THE SKIN

► **Adult:** Apply twice daily until symptoms resolve, 0.1% ointment to be applied thinly, reduce to once daily or switch to 0.03% ointment if condition allows, maximum duration of treatment 4 weeks

● **UNLICENSED USE** Short-term treatment of facial, flexural, or genital psoriasis is unlicensed.

● **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions • application under occlusion • avoid contact with eyes • avoid contact with mucous membranes • congenital epidermal barrier defects • generalised erythroderma • immunodeficiency • infection at treatment site

● **CAUTIONS** UV light (avoid excessive exposure to sunlight and sunlamps)

● **INTERACTIONS** → Appendix 1: tacrolimus

SIDE-EFFECTS

► **Common or very common** Alcohol intolerance • increased risk of infection • sensation abnormal • skin reactions

► **Uncommon** Lymphadenopathy

► **Frequency not known** Malignancy • neoplasms

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.

● **PREGNANCY** Manufacturer advises avoid unless essential; toxicity in *animal* studies following systemic administration.

● **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).

● **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82**

Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical tacrolimus is recommended as an option for the second-line treatment for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.

www.nice.org.uk/guidance/TA82

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2010) that tacrolimus 0.1% ointment (*Protopic*®) is accepted for restricted use within NHS Scotland for the prevention of flares in patients aged 16 years and over with moderate-to-severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 4, 11, 28

EXCIPIENTS: May contain Beeswax

► **Protopic** (LEO Pharma)

Tacrolimus (as Tacrolimus monohydrate) 1 mg per 1 gram Protopic 0.1% ointment | 30 gram [PoM] £25.92 DT = £25.92 | 60 gram [PoM] £47.28 DT = £47.28

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

Brodalumab

22-Jan-2018

● **DRUG ACTION** Brodalumab is a recombinant human monoclonal antibody that binds with high affinity to interleukin-17RA and blocks the activity of pro-inflammatory cytokines.

INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis (under expert supervision)

► BY SUBCUTANEOUS INJECTION

► **Adult:** 210 mg every week for 3 doses, followed by 210 mg every 2 weeks, consider discontinuing treatment if no response after 16 weeks

● **CONTRA-INDICATIONS** Active Crohn's disease • clinically significant active infection

● **CAUTIONS** Chronic infection • history of Crohn's disease (monitor for exacerbations) • history of depressive disorders (discontinue if new or worsening symptoms develop) • history of recurrent infection • history of suicidal ideation or behaviour (discontinue if new or worsening symptoms develop)

CAUTIONS, FURTHER INFORMATION

► **Infection** Manufacturer advises to consider anti-tuberculosis therapy for patients with latent tuberculosis before starting treatment with brodalumab.

Manufacturer advises patients should be brought up-to-date with current immunisation schedule before initiating treatment.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

► **Common or very common** Arthralgia · diarrhoea · fatigue · headache · increased risk of infection · myalgia · nausea · oropharyngeal pain

► **Uncommon** Conjunctivitis

► **Frequency not known** Meningitis cryptococcal · suicidal tendencies

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 12 weeks after stopping treatment.

● **PREGNANCY** Manufacturer advises avoid—limited information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are tender, bruised, or affected by psoriasis. Patients may self-administer *Kyntheum*®, after appropriate training in subcutaneous injection technique.

● **PRESCRIBING AND DISPENSING INFORMATION** Brodalumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

● **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be given training in subcutaneous injection technique. Manufacturer advises patients and their carers should seek medical advice if new or worsening symptoms of depression, suicidal ideation, or behaviour occur; they should also be advised to report signs and symptoms of infection.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Brodalumab for treating moderate to severe plaque psoriasis (March 2018) NICE TA511**

Brodalumab is recommended as an option for treating plaque psoriasis in adults, only if:

- the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, and
- the disease has not responded to other systemic therapies, including ciclosporin, methotrexate and PUVA (psoralen and long-wave ultraviolet A radiation), or these options are contra-indicated or not tolerated, and
- the manufacturer provides the drug with the discount agreed in the patient access scheme.

Stop brodalumab at 12 weeks if the psoriasis has not responded adequately, defined as:

- a 75% reduction in the PASI score (PASI 75) from when treatment started, or
- a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding

arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta511

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1283/17

The *Scottish Medicines Consortium* has advised (updated May 2018) that brodalumab (*Kyntheum*®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► *Kyntheum* (LEO Pharma) ▼

Brodalumab 140 mg per 1 ml Kyntheum 210mg/1.5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [POM] £1,280.00

Dupilumab

15-Jan-2018

● **DRUG ACTION** Dupilumab is a recombinant human monoclonal antibody that inhibits interleukin-4 and interleukin-13 signaling; these cytokines are involved in atopic eczema.

● **INDICATIONS AND DOSE**

Moderate-to-severe atopic eczema (specialist use only)

► **BY SUBCUTANEOUS INJECTION**

► **Adult:** Initially 600 mg, followed by 300 mg every 2 weeks, the initial dose should be administered as two consecutive 300 mg injections at different injection sites, review treatment if no response after 16 weeks

● **CAUTIONS** Asthma—consult product literature · helminth infection

CAUTIONS, FURTHER INFORMATION

► **Helminth infection** Dupilumab may influence the immune response to helminth infections. Resolve pre-existing infection before initiating treatment; suspend treatment if resistant infection develops during therapy.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

► **Common or very common** Eosinophilia · eye inflammation · eye pruritus · headache · oral herpes

► **Rare or very rare** Serum sickness-like reaction

SIDE-EFFECTS, FURTHER INFORMATION Side-effects reported with or without concomitant corticosteroids.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—limited information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to inject into the thigh or abdomen (except for the 5 cm around the navel), or upper arm (if not self-administered); rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer *Dupixent*® after appropriate training in preparation and administration.

● **PRESCRIBING AND DISPENSING INFORMATION**

Manufacturer advises to record the brand name and batch number after each administration.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); pre-filled syringes may be kept at room temperature (max. 25°C) for max. 14 days.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dupilumab 150 mg per 1 ml Dupixent 300mg/2ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM]
£1,264.89

Guselkumab

26-Feb-2018

- DRUG ACTION** Guselkumab is a recombinant human monoclonal antibody that binds selectively to interleukin-23 and blocks the activity of pro-inflammatory cytokines.

INDICATIONS AND DOSE**Moderate-to-severe plaque psoriasis (specialist use only)**► **BY SUBCUTANEOUS INJECTION**

- **Adult:** Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 8 weeks, consider discontinuation if no response after 16 weeks

- CONTRA-INDICATIONS** Clinically significant active infection
- CAUTIONS** Risk of infection
- CAUTIONS, FURTHER INFORMATION**
 - **Risk of infection** Manufacturer advises consider anti-tuberculosis therapy before initiation of guselkumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed.
 - Manufacturer advises consider completion of appropriate immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of guselkumab).
- INTERACTIONS** → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS**
 - **Common or very common** Arthralgia · diarrhoea · headache · increased risk of infection · urticaria
- CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 12 weeks after treatment.
- PREGNANCY** Manufacturer advises avoid—no information available.
- BREAST FEEDING** Manufacturer advises avoid during treatment and for up to 12 weeks after discontinuing treatment—no information available.
- PRE-TREATMENT SCREENING** Manufacturer advises that patients should be evaluated for tuberculosis infection before treatment.
- MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of active tuberculosis during and after treatment.
- DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Tremfya®, after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises to record the brand name and batch number after each administration.
- HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light.
- PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek medical attention if signs or symptoms of infection occur (monitor closely and suspend treatment if infection is clinically significant or unresponsive to treatment).

Self-administration Manufacturer advises patients may self-administer following training in subcutaneous injection technique.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ixekizumab

26-Jun-2017

- DRUG ACTION** Ixekizumab is a human monoclonal antibody that binds to interleukin-17A and inhibits the release of pro-inflammatory cytokines and chemokines.

INDICATIONS AND DOSE**Moderate-to-severe plaque psoriasis (under expert supervision) | Psoriatic arthritis with concomitant moderate-to-severe plaque psoriasis (under expert supervision)**► **BY SUBCUTANEOUS INJECTION**

- **Adult:** Initially 160 mg for 1 dose, followed by 80 mg after 2 weeks, then 80 mg every 2 weeks for 5 further doses (at weeks 4, 6, 8, 10 and 12), then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16–20 weeks

Psoriatic arthritis (under expert supervision)► **BY SUBCUTANEOUS INJECTION**

- **Adult:** Initially 160 mg for 1 dose, then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16–20 weeks

- CONTRA-INDICATIONS** Active infections (including active tuberculosis)
- CAUTIONS** Chronic infection—monitor carefully and discontinue if serious, unresponsive infection develops · Crohn's disease · ulcerative colitis
- CAUTIONS, FURTHER INFORMATION**
 - **Severe hypersensitivity reactions** Severe hypersensitivity reactions have been reported—discontinue treatment immediately if symptoms occur.
 - **Latent tuberculosis** Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting ixekizumab.
 - **Inflammatory bowel disease** Manufacturer advises to monitor closely for exacerbation.
- INTERACTIONS** → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS**
 - **Common or very common** Increased risk of infection · nausea · oropharyngeal pain
 - **Uncommon** Conjunctivitis · neutropenia · skin reactions · thrombocytopenia
 - **Frequency not known** Angioedema · dyspnoea · hypersensitivity (occasionally late-onset) · inflammatory bowel disease
- CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 10 weeks after treatment in women of childbearing potential.
- PREGNANCY** Manufacturer advises avoid—limited information available.
- BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that show psoriasis; injection sites may be alternated. Patients may

self-administer *Taltz*[®], after appropriate training in subcutaneous injection technique.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).

- **PATIENT AND CARER ADVICE**

Self-administration If appropriate, patients and their carers should be given training in subcutaneous injection technique.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Ixekizumab for treating moderate to severe plaque psoriasis (April 2017) NICE TA442**

Ixekizumab is recommended as an option for treating plaque psoriasis only if:

- the disease is severe, defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of 10 or more;
 - the disease has not responded to standard systemic therapies (e.g. ciclosporin, methotrexate and PUVA) or these treatments are contra-indicated or not tolerated, and
 - the manufacturer provides ixekizumab with the discount agreed in the patient access scheme
- Ixekizumab should be discontinued if there is an inadequate response at 12 weeks.

Patients currently receiving ixekizumab, whose disease does not meet the above criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA442

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2017) that ixekizumab (*Taltz*[®]) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis only in patients who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

Acitretin

- **DRUG ACTION** Acitretin is a metabolite of etretinate.

- **INDICATIONS AND DOSE**

Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) | Palmoplantar pustular psoriasis (under expert supervision) | Severe congenital ichthyosis (under expert supervision)

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

Severe Darier's disease (keratosis follicularis) (under expert supervision)

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

- **CONTRA-INDICATIONS** Hyperlipidaemia

- **CAUTIONS** Avoid excessive exposure to sunlight and unsupervised use of sunlamps · diabetes (can alter glucose tolerance—initial frequent blood glucose checks) · do not donate blood during and for 2 years after stopping therapy (teratogenic risk) · in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) · investigate atypical musculoskeletal symptoms

- **INTERACTIONS** → Appendix 1: retinoids

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · arthralgia · brittle nails · conjunctivitis · diarrhoea · dry mouth · gastrointestinal disorder · haemorrhage · hair texture abnormal · headache · increased risk of infection · mucosal abnormalities · myalgia · nausea · oral disorders · peripheral oedema · skin reactions · thirst · vomiting · xerophthalmia
- ▶ **Uncommon** Dizziness · hepatic disorders · photosensitivity reaction · vision disorders
- ▶ **Rare or very rare** Bone pain · exostosis · idiopathic intracranial hypertension · peripheral neuropathy
- ▶ **Frequency not known** Angioedema · capillary leak syndrome · drowsiness · dysphonia · flushing · glucose tolerance impaired · granuloma · hearing impairment · hyperhidrosis · malaise · pyogenic granuloma · retinoic acid syndrome · taste altered

SIDE-EFFECTS, FURTHER INFORMATION

Exostosis Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which acitretin is a metabolite) and premature epiphyseal closure in children.

Benign intracranial hypertension Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used.

Pregnancy prevention In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

- **PREGNANCY** Avoid—teratogenic.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of further impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment; increased risk of toxicity.

- **MONITORING REQUIREMENTS**

- ▶ Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.

- ▶ Check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months.

● **PRESCRIBING AND DISPENSING INFORMATION**

Prescribing for women of child-bearing potential Each prescription for acitretin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription.

- **PATIENT AND CARER ADVICE** Females of child-bearing potential must be advised on pregnancy prevention. A patient information leaflet should be provided.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

Alitretinoin

● **INDICATIONS AND DOSE**

Severe chronic hand eczema refractory to potent topical corticosteroids

▶ **BY MOUTH**

- ▶ Adult (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

Severe chronic hand eczema refractory to potent topical corticosteroids in patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease

▶ **BY MOUTH**

- ▶ Adult (prescribed by or under supervision of a consultant dermatologist): Initially 10 mg once daily, increased if necessary up to 30 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to 10 mg once daily with concurrent use of potent inhibitors of CYP3A4, CYP2C8 and moderate inhibitors of CYP2C9.

- **CONTRA-INDICATIONS** Hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism

- **CAUTIONS** Avoid blood donation during treatment and for at least 1 month after stopping treatment · dry eye syndrome · history of depression

- **INTERACTIONS** → Appendix 1: retinoids

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · conjunctivitis · depression · dizziness · dry eye · dry mouth · eye irritation · fatigue · flushing · headache · hypercholesterolaemia · hypertension · hypertriglyceridaemia (risk of pancreatitis if triglycerides above 9mmol/litre) · joint disorders · myalgia · nausea · oral disorders · skin reactions · tinnitus · vomiting
- ▶ **Uncommon** Bone disorders · cataract · dyspepsia · epistaxis · vision disorders
- ▶ **Rare or very rare** Idiopathic intracranial hypertension · nail disorder · photosensitivity reaction · vasculitis

- ▶ **Frequency not known** Inflammatory bowel disease · mood altered · peripheral oedema · suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Dry eyes Dry eyes may respond to lubricating eye ointment or tear replacement therapy.

Benign intracranial hypertension Discontinue treatment if headache, nausea, vomiting, papilloedema, or visual disturbances occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used.

Pregnancy prevention In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle.

Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods.

Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- **PREGNANCY** Avoid—teratogenic.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia.

● **PRESCRIBING AND DISPENSING INFORMATION**

Prescribing for women of child-bearing potential Each prescription for alitretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription.

Alitretinoin is **teratogenic** and must **not** be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

Conception and contraception Women of child-bearing potential must be counselled on pregnancy prevention.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009)** NICE TA177

Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.

www.nice.org.uk/TA177

Tazarotene

INDICATIONS AND DOSE

Mild to moderate plaque psoriasis affecting up to 10% of skin area

► TO THE SKIN

► Adult: Apply once daily usually for up to 12 weeks, apply in the evening

● **CAUTIONS** Avoid contact with eczematous skin · avoid contact with eyes · avoid contact with face · avoid contact with hair-covered scalp · avoid contact with inflamed skin · avoid contact with intertriginous areas

● **INTERACTIONS** → Appendix 1: retinoids

SIDE-EFFECTS

► **Common or very common** Paraesthesia · skin reactions · stinging

SIDE-EFFECTS, FURTHER INFORMATION Local irritation is more common with higher concentration and may require treatment interruption.

● **CONCEPTION AND CONTRACEPTION** Effective contraception required (oral progestogen-only contraceptives not considered effective).

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment). Do not apply emollients or cosmetics within 1 hour of application. Wash hands immediately after use.

MEDICINAL FORMS

SALICYLIC ACID AND DERIVATIVES

Salicylic acid with zinc oxide

INDICATIONS AND DOSE

Hyperkeratotic skin disorders

► TO THE SKIN

► Adult: Apply twice daily

● **CAUTIONS** Avoid broken skin · avoid inflamed skin

CAUTIONS, FURTHER INFORMATION

► Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin.

● **SIDE-EFFECTS** Skin reactions

● **PRESCRIBING AND DISPENSING INFORMATION** Zinc and Salicylic Acid Paste BP is also referred to as Lassar's Paste. When prepared extemporaneously, the BP states Zinc and

Salicylic Acid Paste, BP (Lassar's Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

MEDICINAL FORMS

Forms available from special-order manufacturers include: paste

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Calcipotriol

INDICATIONS AND DOSE

Plaque psoriasis

► TO THE SKIN USING OINTMENT

► Adult: Apply 1–2 times a day, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 100 g per week

Scalp psoriasis

► TO THE SKIN USING SCALP LOTION

► Adult: Apply twice daily, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 60 mL per week

● **CONTRA-INDICATIONS** Calcium metabolism disorders

● **CAUTIONS** Avoid excessive exposure to sunlight and sunlamps · avoid use on face · erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia)

● **INTERACTIONS** → Appendix 1: vitamin D substances

SIDE-EFFECTS

► **Common or very common** Skin reactions

► **Uncommon** Increased risk of infection

► **Rare or very rare** Hypercalcaemia · hypercalciuria · photosensitivity reaction

● **PREGNANCY** Manufacturers advise avoid unless essential.

● **BREAST FEEDING** No information available.

PATIENT AND CARER ADVICE

Advice on application Patient information leaflet for *Dovonex*® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

MEDICINAL FORMS

Tacalcitol

• INDICATIONS AND DOSE

Plaque psoriasis

► TO THE SKIN

- Adult: Apply once daily, preferably at bedtime, maximum 10 g ointment or 10 mL lotion daily, when lotion and ointment used together, maximum total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

- **CONTRA-INDICATIONS** Calcium metabolism disorders
- **CAUTIONS** Avoid eyes - erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia) - if used in conjunction with UV treatment
- **CAUTIONS, FURTHER INFORMATION**
 - UV treatment If tacalcitol is used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime.
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS**
 - Uncommon Skin reactions
 - Frequency not known Hypercalcaemia
- **PREGNANCY** Manufacturer advises avoid unless no safer alternative—no information available.
- **BREAST FEEDING** Manufacturer advises avoid application to breast area; no information available on presence in milk.

- **MONITORING REQUIREMENTS** Monitor serum calcium if risk of hypercalcaemia.
- **PATIENT AND CARER ADVICE** Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

4 Perspiration

4.1 Hyperhidrosis

Hyperhidrosis

16-May-2017

Overview

Aluminium chloride hexahydrate p. 1229 is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

Limited evidence suggests that oxybutynin hydrochloride p. 760 [unlicensed indication] can be used to treat hyperhidrosis in patients whose symptoms are not adequately managed through lifestyle modifications and antiperspirants.

In more severe cases specialists use glycopyrronium bromide below as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. *Botox*® contains botulinum toxin type A complex p. 403 and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment.

ANTIMUSCARINICS

Glycopyrronium bromide

(Glycopyrrolate)

13-Sep-2017

• INDICATIONS AND DOSE

Iontophoretic treatment of hyperhidrosis

► TO THE SKIN

- Adult: Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature)

- **CONTRA-INDICATIONS** Infections affecting the treatment site
- **CONTRA-INDICATIONS, FURTHER INFORMATION** Contra-indications applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.
- **CAUTIONS** Cautions applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.
- **SIDE-EFFECTS** Abdominal discomfort - eating disorder - pain - paraesthesia - urinary disorder

SIDE-EFFECTS, FURTHER INFORMATION The possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects are unlikely with topical use.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for iontophoresis

Glycopyrronium bromide 1 mg per 1 mg Glycopyrronium bromide powder for solution for iontophoresis | 3 gram [POM] £327.00

DERMATOLOGICAL DRUGS > ASTRINGENTS

Aluminium chloride hexahydrate

INDICATIONS AND DOSE

Hyperhidrosis affecting axillae, hands or feet

► TO THE SKIN

- Adult: Apply once daily, apply liquid formulation at night to dry skin, wash off the following morning, reduce frequency as condition improves—do not bathe immediately before use

Hyperhidrosis | Bromidrosis | Intertrigo | Prevention of tinea pedis and related conditions

► TO THE SKIN

- Adult: Apply powder to dry skin

- CAUTIONS** Avoid contact with eyes • avoid contact with mucous membranes • avoid use on broken or irritated skin • do not shave axillae or use depilatories within 12 hours of application

- SIDE-EFFECTS** Skin reactions

- PATIENT AND CARER ADVICE** Avoid contact with clothing.

- EXCEPTIONS TO LEGAL CATEGORY** A 30 mL pack of aluminium chloride hexahydrate 20% is on sale to the public.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

CAUTIONARY AND ADVISORY LABELS 15

► Aluminium chloride hexahydrate (Non-proprietary)

Aluminium chloride 200 mg per 1 ml Aluminium chloride 20% solution | 60 ml [P] [S] DT = £2.51

► Anhydrol (Dermal Laboratories Ltd)

Aluminium chloride 200 mg per 1 ml Anhydrol Forte 20% solution | 60 ml [P] £2.51 DT = £2.51

Aluminium chloride 200 mg per 1 ml Driclor 20% solution | 75 ml [P] £3.01 DT = £3.01

exerts a cooling effect on the skin. Local antipruritics have a role in the treatment of pruritus in palliative care.

Preparations containing crotonitron p. 1230 are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% p. 1230 is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine p. 196 is the treatment of choice.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause hypersensitivity. For *insect stings* and *insect bites*, a short course of a topical corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

Other drugs used for Pruritus Alimemazine tartrate, p. 282 • Cetirizine hydrochloride, p. 279 • Chlorphenamine maleate, p. 283 • Coal tar with calamine, p. 1220 • Hydroxyzine hydrochloride, p. 284 • Levocetirizine hydrochloride, p. 280

ANTIPRURITICS

Calamine with zinc oxide

31-Aug-2016

INDICATIONS AND DOSE

Pruritus

► TO THE SKIN

- Child: (consult product literature)
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 1186.

- CONTRA-INDICATIONS** Avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)

- LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

5 Pruritus

Topical local antipruritics

Overview

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An **emollient** may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. Levomenthol cream p. 1230 can be used to relieve pruritus; it

Crotamiton

● INDICATIONS AND DOSE

Pruritus (including pruritus after scabies)

- TO THE SKIN
- Child 1 month-2 years (on doctor's advice only): Apply once daily
- Child 3-17 years: Apply 2-3 times a day
- Adult: Apply 2-3 times a day

● CONTRA-INDICATIONS

Acute exudative dermatoses

● CAUTIONS

Avoid use in buccal mucosa · avoid use near eyes · avoid use on broken skin · avoid use on very inflamed skin · use on doctor's advice for children under 3 years

● PREGNANCY

Manufacturer advises avoid, especially during the first trimester—no information available.

● BREAST FEEDING

No information available; avoid application to nipple area.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)

► Eurax (GlaxoSmithKline Consumer Healthcare)

Crotamiton 100 mg per 1 gram Eurax 10% cream | 30 gram [GSL]
£2.50 DT = £2.50 | 100 gram [GSL] £4.35 DT = £4.35

Doxepin

● INDICATIONS AND DOSE

Pruritus in eczema

- TO THE SKIN
- Child 12-17 years: Apply up to 3 g 3-4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day
- Adult: Apply up to 3 g 3-4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day

● CAUTIONS

Avoid application to large areas · cardiac arrhythmias · mania · severe heart disease · susceptibility to angle-closure glaucoma · urinary retention

● INTERACTIONS

→ Appendix 1: tricyclic antidepressants

● SIDE-EFFECTS

Constipation · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dyspepsia · fever · headache · nausea · paraesthesia · skin reactions · suicidal tendencies · taste altered · urinary retention · vision blurred · vomiting

● PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING

Manufacturer advises use only if potential benefit outweighs risk.

● HEPATIC IMPAIRMENT

Manufacturer advises caution in severe liver disease.

● PATIENT AND CARER ADVICE

A patient information leaflet should be provided.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.

£3.85 | 500 gram £14.99-£15.97 DT = £16.97

6 Rosacea and acne

Rosacea and Acne

Acne

Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

Mild to moderate acne is generally treated with topical preparations. Systemic treatment with oral antibacterials is generally used for *moderate to severe acne* or where topical

preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyprindiol p. 1232 (cyproterone acetate with ethinylestradiol); it is for women only.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin p. 1234 for administration by mouth.

Acne: topical preparations

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide p. 1233 or to a topical retinoid. Alternatively, topical application of an antibacterial such as erythromycin p. 530 or clindamycin p. 1232 may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed.

Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid p. 1233 has antimicrobial and anticomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

Topical antibacterials for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin p. 914. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant *propionibacteria*);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

Some manufacturers of topical antibacterial preparations for acne advise that preparations containing alcohol are not suitable for use with benzoyl peroxide.

Topical retinoids and related preparations for acne

Topical tretinoin, its isomer isotretinoin, and adapalene p. 1234 (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued

until no new lesions develop. Isotretinoin is given by mouth in severe acne.

Other topical preparations for acne

Preparations containing aluminium oxide are not considered beneficial in acne.

A topical preparation of nicotinamide p. 1237 is available for inflammatory acne.

Acne: oral preparations

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomedonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline p. 557 or tetracycline p. 557 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 555 and lymecycline p. 556 are alternatives to tetracycline.

Although minocycline p. 556 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin in a twice daily dose is an alternative for the management of acne but *propionibacteria* strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 563 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

Oral retinoid for acne

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must **not** be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin p. 1234 use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

Rosacea

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1237 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1233, topical ivermectin p. 1237 or to topical metronidazole p. 1196. Alternatively oral administration of oxytetracycline p. 557 or tetracycline p. 557, or erythromycin p. 530, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 555 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

6.1 Acne

ANTI-ANDROGENS

Co-cyprindiol

02-Mar-2017

● INDICATIONS AND DOSE

Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials |

Moderately severe hirsutism

► BY MOUTH

- Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · presence or history of liver tumours · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease or for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia—seek specialist advice · inflammatory bowel disease including Crohn's disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- **Venous thromboembolism** There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.
- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives
- **SIDE-EFFECTS**
- **Rare or very rare** Cholelithiasis · photosensitivity reactions · systemic lupus erythematosus (SLE)
- **Frequency not known** Abdominal cramps · amenorrhoea (on discontinuation) · breast abnormalities · cervical erosion · chorea · contact lens intolerance · depression · fluid retention · headache · hepatic impairment · hepatic neoplasm · hypertension · irritability · leg cramps · libido disorder · lipid metabolism change · melasma · menstrual disorder · nausea · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · vulvovaginal disorders · visual impairment · vomiting
- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.
- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (until liver function returns to normal.)
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

● MEDICINAL FORMS

Isotretinoin

03-Nov-2017

● **INDICATIONS AND DOSE****Topical treatment of mild to moderate acne**

- TO THE SKIN
- Adult: Apply 1-2 times a day, to be applied thinly

Severe acne (under expert supervision) | Acne which is associated with psychological problems (under expert supervision) | Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision) | Acne with scarring (under expert supervision) | Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)

- BY MOUTH

- Adult: Initially 500 micrograms/kg daily in 1-2 divided doses, increased if necessary to 1 mg/kg daily for 16-24 weeks, repeat treatment course after a period of

at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ISOTRETINOIN (ROACUTANE®): RARE REPORTS OF ERECTILE DYSFUNCTION AND DECREASED LIBIDO (OCTOBER 2017)

An EU-wide review has concluded that on rare occasions, oral isotretinoin, indicated for severe acne, may cause sexual side-effects, including erectile dysfunction and decreased libido.

● CONTRA-INDICATIONS

- ▶ With oral use Hyperlipidaemia · hypervitaminosis A
- ▶ With topical use Perioral dermatitis · rosacea

● CAUTIONS

- ▶ With oral use Avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression · monitor for depression
- ▶ With topical use Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid in severe acne involving large areas · avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck · personal or familial history of skin cancer

● INTERACTIONS → Appendix 1: retinoids

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Common or very common Skin reactions
- ▶ Rare or very rare Photosensitivity reaction

SPECIFIC SIDE-EFFECTS

▶ Common or very common

- ▶ With oral use Alopecia · anaemia · arthralgia · back pain · cheilitis · dry eye · eye discomfort · eye inflammation · haemorrhage · headache · increased risk of infection · myalgia · nasal dryness · neutropenia · proteinuria · skin fragility (trauma may cause blistering) · thrombocytopenia · thrombocytosis

▶ Rare or very rare

- ▶ With oral use Anxiety · arthritis · behaviour abnormal · bone disorders · bronchospasm · cataract · corneal opacity · depression · diabetes mellitus · dizziness · drowsiness · dry throat · gastrointestinal disorders · glomerulonephritis · hair changes · hearing impairment · hepatitis · hoarseness · hyperhidrosis · hyperuricaemia · idiopathic intracranial hypertension · inflammatory bowel disease · lymphadenopathy · malaise · mood altered · nail dystrophy · nausea · pancreatitis · psychotic disorder · pyogenic granuloma · seizure · suicidal tendencies · tendinitis · vasculitis · vision disorders

▶ Frequency not known

- ▶ With oral use Rhabdomyolysis · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

Psychiatric side-effects could require expert referral.

● CONCEPTION AND CONTRACEPTION

Pregnancy prevention

- ▶ With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.
- ▶ With topical use Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

● PREGNANCY Contra-indicated in pregnancy (teratogenic).

● BREAST FEEDING Avoid.

● HEPATIC IMPAIRMENT

- ▶ With oral use Avoid—further impairment may occur.

● RENAL IMPAIRMENT

Dose adjustments ▶ With oral use In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

● MONITORING REQUIREMENTS

- ▶ With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

● PRESCRIBING AND DISPENSING INFORMATION Isotretinoin is an isomer of tretinoin.

● PATIENT AND CARER ADVICE

- ▶ With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.

- ▶ With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

● **PREGNANCY** Contra-indicated in pregnancy.

● **BREAST FEEDING** Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.

● **PATIENT AND CARER ADVICE** If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

● MEDICINAL FORMS

Ivermectin

17-May-2017

● INDICATIONS AND DOSE

Papulopustular rosacea

► TO THE SKIN

- Adult: Apply daily for up to 4 months, the treatment course may be repeated; discontinue if no improvement after 3 months

- **INTERACTIONS** → Appendix 1: ivermectin

● SIDE-EFFECTS

- Common or very common Skin reactions

- **PREGNANCY** Manufacturer advises avoid—limited information but toxicity following oral use in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—limited information but present in milk following oral use.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply thinly to the face only, avoiding contact with eyes, lips and mucosa.

- **PATIENT AND CARER ADVICE** Wash hands immediately after use.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2015) that ivermectin (*Soolantra*®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe inflammatory lesions of rosacea (papulopustular) where a topical treatment is considered appropriate.

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (April 2016) that ivermectin (*Soolantra*®) is recommended as an option for use within NHS Wales for the topical treatment of inflammatory lesions of rosacea (papulopustular) in adult patients.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ivermectin 10 mg per 1 gram Soolantra 10mg/g cream | 30 gram [PoM] £18.29

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Brimonidine tartrate

12-Jul-2017

- **DRUG ACTION** Brimonidine, an alpha₂-adrenoceptor agonist, is used to reduce erythema in rosacea by cutaneous vasoconstriction.

● INDICATIONS AND DOSE

Facial erythema in rosacea

► TO THE SKIN

- Adult: Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks, max. 1 g of gel per day

DOSE EQUIVALENCE AND CONVERSION

- 1 g of gel contains 5 mg of brimonidine tartrate (equivalent to 3.3 mg of brimonidine).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BRIMONIDINE GEL (*MIRVASO*®): RISK OF SYSTEMIC CARDIOVASCULAR EFFECTS (JUNE 2017)

Systemic cardiovascular effects including bradycardia, hypotension, and dizziness have been reported after application of brimonidine gel. To minimise the possibility of systemic absorption, it is important to avoid application to irritated or damaged skin, including after laser therapy.

MHRA/CHM ADVICE: BRIMONIDINE GEL (*MIRVASO*®): RISK OF EXACERBATION OF ROSACEA (NOVEMBER 2016)

Symptom exacerbation has been reported very commonly in patients treated with brimonidine gel. Treatment should be initiated with a small amount of gel (less than the maximum dose) for at least 1 week, then increased gradually, based on tolerability and response. Patients should be counselled on the importance of not exceeding the maximum daily dose, and advised to stop treatment and seek medical advice if symptoms worsen during treatment.

- **CAUTIONS** Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangitis obliterans
- **INTERACTIONS** → Appendix 1: brimonidine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · dry mouth · flushing · headache · skin reactions
 - ▶ **Uncommon** Angioedema · eyelid oedema · feeling hot · nasal congestion · paraesthesia · peripheral coldness
 - ▶ **Rare or very rare** Bradycardia · hypotension
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
- **DIRECTIONS FOR ADMINISTRATION** Avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated or damaged skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin.
- **PATIENT AND CARER ADVICE** Patients should be advised on administration of gel.
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (December 2014) that brimonidine (*Mirvaso*®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe persistent facial erythema associated with rosacea in adult patients.

● MEDICINAL FORMS

Brimonidine (as Brimonidine tartrate) 3 mg per 1 gram Mirvaso 3mg/g gel | 30 gram [PoM] £33.69 DT = £33.69

Cradle cap in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil p. 1239, corticosteroids, anabolic steroids, androgens, danazol p. 725, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflornithine p. 1239 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1232 may be effective for moderately severe hirsutism. Metformin hydrochloride p. 678 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

Androgenetic alopecia

Finasteride p. 769 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

Other drugs used for Scalp and hair conditions Coal tar, p. 1219 · Coal tar with lecithin, p. 1220 · Coal tar with salicylic acid and precipitated sulfur, p. 1221

▶ **Adult:** Apply as required

7 Scalp and hair conditions

Scalp and hair conditions

Overview

Dandruff is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as **pyrithione zinc** (which are widely available) and selenium p. 1239 may have beneficial effects. Shampoos containing **tar** extracts may be useful and they are also used in *psoriasis*. Ketoconazole shampoo p. 1198 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used.

Shampoos containing coal tar with salicylic acid p. 1220 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in *Psoriasis* p. 1204 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Shampoo

- ▶ **Dermax** (Dermal Laboratories Ltd)
Benzalkonium chloride 5 mg per 1 ml Dermax Therapeutic 0.5% shampoo | 250 ml [P] £5.69

VITAMINS AND TRACE ELEMENTS

Selenium

INDICATIONS AND DOSE

Seborrhoeic dermatitis | Dandruff

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child 5-17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required
- ▶ Adult: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

Pityriasis versicolor

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Adult: Apply once daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

- **UNLICENSED USE** The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

- **INTERACTIONS** → Appendix 1: selenium

- **PATIENT AND CARER ADVICE** Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Minoxidil 50 mg per 1 gram Regaine for Men Extra Strength 5% scalp foam | 60 gram [GSL] £23.33 | 180 gram [GSL] £50.01

7.2 Hirsutism

Other drugs used for Hirsutism Co-cyprindiol, p. 1232

ANTIPROTOZOALS

Eflornithine

- **DRUG ACTION** An antiprotazoal drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

INDICATIONS AND DOSE

Adjunct to laser treatment for facial hirsutism in women

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily, to be applied thinly, discontinue use if no improvement after 4 months of treatment

• SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · increased risk of infection · paraesthesia · skin reactions
- ▶ **Uncommon** Face oedema · flushing · hair changes · oral disorders · skin haemorrhage
- ▶ **Rare or very rare** Skin neoplasm
- **PREGNANCY** Toxicity in *animal studies*—manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **PATIENT AND CARER ADVICE** Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after eflornithine, do not wash treated area for 4 hours after application.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Ceteostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

▶ **Vaniqua** (Almirall Ltd)

Eflornithine (as Eflornithine monohydrate chloride) 115 mg per 1 gram Vaniqua 11.5% cream | 60 gram [PoM] £56.87 DT = £56.87

8 Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1241 or povidone-iodine p. 1241, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent.

Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1243, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate below solution 1 in 10000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available

from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin sulfate p. 1195 or lanolin.

ANTISEPTICS AND DISINFECTANTS

Potassium permanganate

• INDICATIONS AND DOSE

Cleansing and deodorising suppurating eczematous reactions and wounds

▶ TO THE SKIN

▶ **Adult:** For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

• **CAUTIONS** Irritant to mucous membranes

• **DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.

• **PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Tablet for cutaneous solution

▶ **Potassium permanganate (Non-proprietary)**

8.1 Minor cuts and abrasions

Minor cuts and abrasions

Management

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine p. 1243 may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1243 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

ANTISEPTICS AND DISINFECTANTS > OTHER

Glycerol with magnesium sulfate and phenol

• INDICATIONS AND DOSE

Treat carbuncles and boils

- ▶ TO THE SKIN
- ▶ Adult: To be applied under dressing

- **DIRECTIONS FOR ADMINISTRATION** Paste should be stirred before use.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Paste

- ▶ **Glycerol with magnesium sulfate and phenol (Non-proprietary)**
Phenol 5 mg per 1 gram, Magnesium sulfate dried 450 mg per 1 gram, Glycerol 550 mg per 1 gram | Magnesium sulfate paste | 25 gram [GSL] £0.76–£1.24 | 50 gram [GSL] £0.91–£2.48 DT = £2.48

DERMATOLOGICAL DRUGS > COLLODIONS

Castor oil with collodion and colophony

• INDICATIONS AND DOSE

Used to seal minor cuts and wounds that have partially healed

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has an allergy to colophony in elastic adhesive plasters and tape.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Flexible collodion

- ▶ **Castor oil with collodion and colophony (Non-proprietary)**

0.5 gram • NHS indicative price = £5.50 • Drug Tariff (Part IXa)

9 Skin disfigurement

Camouflagers

Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, and with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

• CAMOUFLAGES

10 Sun protection and photodamage

Sunscreen

Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption*, *solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *lupus erythematosus* and may aggravate *rosacea* and some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly** and **frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

Ingredient nomenclature in sunscreen preparations	
rINN	INCI
amiloxate	isoamyl p-methoxycinnamate
avobenzene	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenol methoxyphenyl triazine
bisotrizole	methylene bis-benzotriazolyl tetramethylbutylphenol
ecamsule	terephthalylidene dicamphor sulfonic acid
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (or ethylhexyl) methoxycinnamate
octocriene	octocrylene
oxybenzone	benzophenone-3
The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF	

Borderline substances

Anthelios® XL SPF 50+ Melt-in cream; *Sunsense*® Ultra; *Uvistat*® Lipscreen SPF 50; and *Uvistat*® Suncream SPF 30 and 50 (see *Borderline substances*) are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed

Photodamage

Overview

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac sodium gel p. 1246 is suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream p. 1246 is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil with salicylic acid p. 1246 is available for the treatment of low or moderately thick hyperkeratotic actinic keratosis. Imiquimod p. 1249 is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. A short course of ingenol mebutate p. 1247 is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. Photodynamic therapy in combination with methyl-5-aminolevulinate cream (Metvix®, available from Galderma) or 5-aminolaevulinic acid gel (Ameluz®, available from Spirit Healthcare) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Diclofenac sodium

● INDICATIONS AND DOSE

SOLARAZE®

Actinic keratosis

► TO THE SKIN

- Adult: Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day

- **CAUTIONS** Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Common or very common** Conjunctivitis · muscle tone increased · oedema · rash (discontinue) · sensation abnormal · skin reactions
- **Uncommon** Abdominal pain · alopecia · diarrhoea · eye pain · haemorrhage · lacrimation disorder · nausea · seborrhoea
- **Rare or very rare** Asthma · hypersensitivity · photosensitivity reaction · rash pustular · renal failure
- **Frequency not known** Hair colour changes

SIDE-EFFECTS, FURTHER INFORMATION Topical application of large amounts of diclofenac can result in systemic effects.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

- **BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

- **EXCEPTIONS TO LEGAL CATEGORY** Various pack sizes of gel preparations may be available on sale to the public.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Benzyl alcohol, fragrances, propylene glycol
► **Solaraze** (Almirall Ltd)

Diclofenac sodium 30 mg per 1 gram Solaraze 3% gel | 50 gram [PoM] £38.30 DT = £38.30 | 100 gram [PoM] £76.60

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Fluorouracil

● INDICATIONS AND DOSE

Superficial malignant and pre-malignant skin lesions

► TO THE SKIN USING CREAM

- Adult: Apply 1–2 times a day for 3–4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm² (e.g. 23 cm × 23 cm) treated at one time, alternative regimens may be used in some settings

- **CAUTIONS** Avoid contact with eyes and mucous membranes · do not apply to bleeding lesions

- **INTERACTIONS** → Appendix 1: fluorouracil

● SIDE-EFFECTS

- **Common or very common** Alopecia · diarrhoea · nausea · skin reactions · stomatitis · thrombocytopenia · vomiting
- **Uncommon** Dizziness · headache
- **Rare or very rare** Abdominal pain · chills · fever · haemorrhagic diarrhoea · leucocytosis · mucositis · neutropenia · pancytopenia · skin irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) · skin ulcer
- **Frequency not known** Conjunctival irritation · excessive tearing · keratitis · taste altered

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Manufacturers advise avoid (teratogenic).

- **BREAST FEEDING** Manufacturers advise avoid.

- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

► **Efudix** (Meda Pharmaceuticals Ltd)

Fluorouracil 50 mg per 1 gram Efudix 5% cream | 40 gram [PoM] £32.90 DT = £32.90

Fluorouracil with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1250.

● INDICATIONS AND DOSE

Low or moderately thick hyperkeratotic actinic keratosis

► TO THE SKIN

- Adult: Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm² (e.g. 5 cm × 5 cm)

- **INTERACTIONS** → Appendix 1: fluorouracil

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cutaneous solution

PROTEIN KINASE C ACTIVATORS

Ingenol mebutate

● INDICATIONS AND DOSE

Actinic keratosis on face and scalp

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily for 3 days, use the 150 microgram/g gel

Actinic keratosis on trunk and extremities

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily for 2 days, use the 500 microgram/g gel

- **CAUTIONS** Avoid contact with broken skin · avoid contact with eyes · avoid contact with inside of ears · avoid contact with inside of nostrils · avoid contact with lips · avoid occlusive dressings on treated area

● SIDE-EFFECTS

- ▶ **Common or very common** Headache · infection · local reaction · oedema · pain · skin reactions
- ▶ **Uncommon** Paraesthesia · skin ulcer

- **PREGNANCY** Not absorbed from skin, but manufacturer advises avoid.

- **BREAST FEEDING** Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.

- **DIRECTIONS FOR ADMINISTRATION** One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Picato** (LEO Pharma)

Ingenol mebutate 150 microgram per 1 gram Picato
150micrograms/g gel | 1.41 gram [PoM] £65.00

Ingenol mebutate 500 microgram per 1 gram Picato
500micrograms/g gel | 0.94 gram [PoM] £65.00

11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

Overview

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

HEPARINOIDS

Heparinoid

● INDICATIONS AND DOSE

Superficial thrombophlebitis | Bruising | Haematoma

- ▶ TO THE SKIN
- ▶ Adult: Apply up to 4 times a day

- **CONTRA-INDICATIONS** Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes
- **LESS SUITABLE FOR PRESCRIBING** Hirudoid® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

- ▶ **Hirudoid** (Thornton & Ross Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% cream | 50 gram [P]
£3.99 DT = £3.99

Gel

EXCIPIENTS: May contain Fragrances, propylene glycol

- ▶ **Hirudoid** (Thornton & Ross Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram [P] £3.99
DT = £3.99

12 Warts and calluses

Warts and calluses

Overview

Warts (verrucae) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid p. 1250, formaldehyde p. 1249, glutaraldehyde p. 1249 or silver nitrate p. 1249 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of *corns* and *calluses*. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin p. 1248 (the major active ingredient of podophyllum) may be used for *soft, non-keratinised* external anogenital warts. Patients with a limited number of external warts or *keratinised* lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream p. 1249 is licensed for the treatment of external anogenital warts; it may be used for both *keratinised* and *non-keratinised* lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis. Camellia sinensis ointment p. 1248 is licensed for the treatment of external anogenital warts.

Inosine pranobex p. 622 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Camellia sinensis

03-May-2017

- **DRUG ACTION** Camellia sinensis is an extract from green tea leaves. The exact mechanism of action is not known; non-clinical studies have shown inhibition of the growth of activated keratinocytes, and anti-oxidative effects at the site of application.

● INDICATIONS AND DOSE

Warts (external genital and perianal) in immunocompetent patients

▶ TO THE LESION

- ▶ Adult: Apply up to 250 mg 3 times a day until complete clearance of warts (maximum 16 weeks), do not exceed treatment period even if new warts develop; maximum 750 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ 250 mg is equivalent to 0.5 cm of ointment.

- **CAUTIONS** Avoid broken skin • avoid contact with eyes • avoid contact with lips • avoid contact with mouth • avoid contact with nostrils • avoid inflamed skin • uncircumcised males (risk of phimosis) • vulvar region

● SIDE-EFFECTS

- ▶ **Uncommon** Balanoposthitis • increased risk of infection • lymphatic abnormalities • necrosis • painful sexual intercourse • phimosis • skin reactions • urinary disorders
- ▶ **Frequency not known** Urinary tract stenosis • vaginal discharge

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises *Catephen*® may weaken condoms and vaginal diaphragms—alternative methods of contraception should be considered.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises risk to infant cannot be excluded—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply to each wart, ensuring a thin layer is left on the wart. It is not necessary to wash off the ointment from the area before next application.

- **PATIENT AND CARER ADVICE** Manufacturer advises the ointment should be washed off before sexual activity. Manufacturer advises female patients using tampons should insert tampon before applying the ointment.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2016) that camellia sinensis (green tea) leaf extract (*Catephen*®) is accepted for restricted use within NHS Scotland for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2016) that green tea leaf extract (camellia sinensis), (*Catephen*®), is recommended for restricted use within NHS Wales for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

- ▶ **Catephen** (KoRa Healthcare)

Camellia sinensis extract 100 mg per 1 gram Catephen 10% ointment | 15 gram [PoM] £39.00

● INDICATIONS AND DOSE

ALDARA[®]

Warts (external genital and perianal)

▶ TO THE LESION

- ▶ **Adult:** Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

Superficial basal cell carcinoma

▶ TO THE LESION

- ▶ **Adult:** Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment

continued →

Actinic keratosis

- TO THE LESION
- Adult: Apply 3 times a week for 4 weeks, to be applied to lesion at night, assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses

ZYCLARA®**Actinic keratosis**

- TO THE SKIN
- Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day

- **CAUTIONS** Autoimmune disease · avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with nostrils · avoid open wounds · immunosuppressed patients · not suitable for internal genital warts · uncircumcised males (risk of phimosis or stricture of foreskin)

● **SIDE-EFFECTS**

- **Common or very common** Appetite decreased · arthralgia · asthenia · headaches · increased risk of infection · lymphadenopathy · myalgia · nausea · pain
- **Uncommon** Anorectal disorder · chills · conjunctival irritation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysuria · erectile dysfunction · eyelid oedema · face oedema · fever · flushing · gastrointestinal discomfort · genital pain · hyperhidrosis · inflammation · influenza like illness · insomnia · irritability · laryngeal pain · malaise · nasal congestion · painful sexual intercourse · paraesthesia · penis disorder · skin reactions · skin ulcer · tinnitus · uterovaginal prolapse · vomiting · vulvovaginal disorders
- **Rare or very rare** Autoimmune disorder exacerbated
- **Frequency not known** Alopecia · cutaneous lupus erythematosus · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** May damage latex condoms and diaphragms.

- **PREGNANCY** No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

- **BREAST FEEDING** No information available.

● **DIRECTIONS FOR ADMINISTRATION**

ZYCLARA® ► **Important** Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.

ALDARA® ► **Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Immunoglobulins

04-Oct-2017

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1255 and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and *Clinical Guidelines for Immunoglobulin Use*, www.gov.uk/dh.

Further information on the use of immunoglobulins is included in Public Health England's *Immunoglobulin Handbook* www.gov.uk/phe, and in the Department of Health's publication, *Immunisation against Infectious Disease*, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1257 which is available from

BPI, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1257 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1255 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS).

In Wales all immunoglobulins are available from the *Welsh Blood Service* (WBS).

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service* (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10%–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A virus** (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for *intravenous administration* is used as *replacement therapy* for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, consult *Clinical Guidelines for Immunoglobulin Use* (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 1279 is recommended for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for prophylaxis in travellers.

Public Health England recommends the use of normal immunoglobulin in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases

of hepatitis A) who are 60 years of age or over, have chronic liver disease (including chronic hepatitis B or C infection), or HIV infection (with a CD4 count < 200 cells per microlitre), or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts with chronic liver disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

Measles

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1284 for prophylaxis following exposure to measles.

Rubella

Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1284.

Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see *Immunoglobulin Handbook* (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1255 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

Hepatitis B immunoglobulin

Disease-specific hepatitis B immunoglobulin p. 1255 ('HBIG') is available for use in association with hepatitis B vaccine p. 1280 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

Rabies immunoglobulin

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 1257 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 1285 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

Tetanus immunoglobulin

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1257 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 533 and wound cleansing, should also be used for the treatment of established cases of tetanus.

Varicella-zoster immunoglobulin

Varicella-zoster immunoglobulin p. 1257 (VZIG) is recommended for individuals who are at increased risk of severe varicella (neonates, pregnant women and immunosuppressed individuals with varicella-zoster virus immunoglobulin G antibody less than 150 mIU/mL) and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox (varicella) or shingles (herpes zoster) during the infectious period.

Immunosuppressed patients receiving regular intravenous immunoglobulin replacement therapy only require varicella-zoster immunoglobulin if the most recent dose was administered more than 3 weeks before exposure.

Immunosuppressed patients on long term aciclovir p. 623 or valaciclovir p. 625 prophylaxis will require a temporary increase in their dose following exposure; for patients within 12 months of a stem cell transplant, varicella-zoster immunoglobulin should also be considered.

Important: for full details consult *Guidance for issuing varicella-zoster immunoglobulin (VZIG) and Immunisation against infectious disease* from Public Health England (www.gov.uk).

Anti-D (Rh₀) immunoglobulin

Anti-D (Rh₀) immunoglobulin p. 1254 is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh₀) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh₀) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh₀) immunoglobulin is also given when significant foeto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D (Rh₀) immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

Use of routine *antenatal* anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a

sensitising event early in the same pregnancy. Similarly, *postpartum* anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh₀) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

MMR vaccine

Measles, mumps and rubella vaccine, live may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh₀) immunoglobulin

• INDICATIONS AND DOSE

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatible blood transfusion

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

RHOPHYLAC®

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatible blood transfusion

- ▶ BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CONTRA-INDICATIONS** Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients • treatment of idiopathic thrombocytopenia purpura in splenectomised patients

- **CAUTIONS** Immunoglobulin A deficiency • possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

- ▶ **MMR vaccine** MMR vaccine may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

• SIDE-EFFECTS

- ▶ **Uncommon** Chills • fever • headache • malaise • skin reactions
- ▶ **Rare or very rare** Arthralgia • dyspnoea • hypersensitivity • hypotension • nausea • tachycardia • vomiting
- ▶ **Frequency not known** Intravascular haemolysis

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156**
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.
www.nice.org.uk/TA156

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **D-Gam** (Bio Products Laboratory Ltd)
Anti-D (Rh₀) immunoglobulin 500 unit D-Gam Anti-D immunoglobulin 500unit solution for injection vials | 1 vial [PoM] £33.75
Anti-D (Rh₀) immunoglobulin 1500 unit D-Gam Anti-D immunoglobulin 1,500unit solution for injection vials | 1 vial [PoM] £58.00
- ▶ **Rhophylac** (CSL Behring UK Ltd)
Anti-D (Rh₀) immunoglobulin 750 unit per 1 ml Rhophylac 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £46.50

Hepatitis B immunoglobulin

● INDICATIONS AND DOSE

Prophylaxis against hepatitis B infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

Prevention of hepatitis B in haemodialysed patients

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Prophylaxis against re-infection of transplanted liver

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin
- ▶ Adult (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

- **CAUTIONS** IgA deficiency · interference with live virus vaccines

● SIDE-EFFECTS

- ▶ **Uncommon** Abdominal pain upper · headache
- ▶ **Rare or very rare** Cardiac discomfort · fatigue · hypersensitivity · hypertension · hypotension · muscle

spasms · nasopharyngitis · oropharyngeal pain · palpitations · skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION** Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Hepatitis B immunoglobulin (Non-proprietary)

- ▶ **Hepatitis B immunoglobulin human 200 unit** Hepatitis B immunoglobulin human 200unit solution for injection vials | 1 vial [PoM] £150.00
- ▶ **Hepatitis B immunoglobulin human 500 unit** Hepatitis B immunoglobulin human 500unit solution for injection vials | 1 vial [PoM] £300.00
- ▶ **Zutectra** (Biotest (UK) Ltd)
Zutectra 500units/1ml solution for injection pre-filled syringes | 5 syringe [PoM] £1,500.00

Solution for infusion

Hepatec CP 500units/10ml solution for infusion vials | 1 vial [PoM] £275.00
Hepatec CP 5000units/100ml solution for infusion vials | 1 vial [PoM] £2,750.00
- ▶ **Omri-Hep-B** (Imported (Israel))
Hepatitis B immunoglobulin human 50 unit per 1 ml Omri-Hep-B 500units/100ml solution for infusion vials | 1 vial [PoM] £

Normal immunoglobulin

● INDICATIONS AND DOSE

To control outbreaks of hepatitis A

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 500 mg

Rubella in pregnancy, prevention of clinical attack

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 750 mg

Antibody deficiency syndromes

- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: (consult product literature)

SUBGAM[®]

Hepatitis A prophylaxis in outbreaks

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 750 mg

● UNLICENSED USE

SUBGAM[®] *Subgam[®]* is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

- **CONTRA-INDICATIONS** Patients with selective IgA deficiency who have known antibody against IgA

PRIVIGEN® Hyperprolinaemia (contains L-proline)
FLEBOGAMMA® DIF Hereditary fructose intolerance (contains sorbitol)
HIZENTRA® Hyperprolinaemia (contains L-proline)
GAMMAPLEX® Hereditary fructose intolerance (contains sorbitol)

- **CAUTIONS** Agammaglobulinaemia with or without IgA deficiency · hypogammaglobulinaemia with or without IgA deficiency · interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

- Interference with live virus vaccines Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given at **least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

OCTAGAM® Falsely elevated results with blood glucose testing systems (contains maltose)

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Dizziness · fatigue · gastrointestinal discomfort · headache · hypotension · myalgia · nausea · pain · skin reactions
- **Uncommon** Paraesthesia
- **SPECIFIC SIDE-EFFECTS**
- **Common or very common**
 - With intramuscular use Chills
 - With subcutaneous use Diarrhoea · drowsiness
- **Uncommon**
 - With intramuscular use Feeling hot
- **Rare or very rare**
 - With intramuscular use Arthralgia · musculoskeletal stiffness · peripheral coldness · tremor
- **Frequency not known**
 - With intramuscular use Chest discomfort · dyspnoea · facial swelling · fever · flushing · hyperhidrosis · hypertension · malaise · oral paraesthesia · pallor · tachycardia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

- **MONITORING REQUIREMENTS** Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

• DIRECTIONS FOR ADMINISTRATION

Preparations for subcutaneous use May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route **not** for patients with thrombocytopenia or other bleeding disorders.

GAMUNEX® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

KIOVIG® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

- **PRESCRIBING AND DISPENSING INFORMATION** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.
 - With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the

preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

Rabies immunoglobulin

● INDICATIONS AND DOSE

Post-exposure prophylaxis against rabies infection

- **BY LOCAL INFILTRATION, OR BY INTRAMUSCULAR INJECTION**
- **Child:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)
- **Adult:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

● **CAUTIONS** IgA deficiency · interference with live virus vaccines

● SIDE-EFFECTS

- **Rare or very rare** Arthralgia · chills · fatigue · fever · headache · hypersensitivity · hypotension · influenza like illness · malaise · nausea · skin reactions · tachycardia · vomiting

● **PRESCRIBING AND DISPENSING INFORMATION** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.

Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

● **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● MEDICINAL FORMS

IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

Bezlotoxumab

18-Aug-2017

- **DRUG ACTION** Bezlotoxumab is a human monoclonal antitoxin antibody; it binds to *Clostridium difficile* toxin B and neutralises its activity, preventing recurrence of *Clostridium difficile* infection.

● INDICATIONS AND DOSE

Prevention of recurrence of *Clostridium difficile* infection in patients at high risk of reinfection

► BY INTRAVENOUS INFUSION

► **Adult:** 10 mg/kg for 1 dose, to be administered during the course of antibacterial therapy for *Clostridium difficile* infection

● SIDE-EFFECTS

► **Common or very common** Dizziness · dyspnoea · fatigue · fever · headache · hypertension · infusion related reaction · nausea

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (Zinplava®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose to a concentration of 1–10 mg/mL with infusion fluid; give over 60 minutes via a central venous catheter or peripheral catheter using a low-protein binding filter (0.2–0.5 micron).

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

► **Zinplava** (Merck Sharp & Dohme Ltd) ▼

Bezlotoxumab 25 mg per 1 mL Zinplava 1g/40mL concentrate for solution for infusion vials | 1 vial (PoM) £2,470.00

Botulism antitoxin

- **DRUG ACTION** A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

● INDICATIONS AND DOSE

Post exposure prophylaxis of botulism

► BY INTRAMUSCULAR INJECTION

► **Adult:** (consult product literature)

- **SIDE-EFFECTS** Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- **PRE-TREATMENT SCREENING** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

- **PRESCRIBING AND DISPENSING INFORMATION** Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

● MEDICINAL FORMS

No licensed medicines listed.

Diphtheria antitoxin

(Dip/Ser)

● INDICATIONS AND DOSE

Passive immunisation in suspected cases of diphtheria

► BY INTRAVENOUS INFUSION

► **Adult:** Dose should be given without waiting for bacteriological confirmation (consult product literature)

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- **Hypersensitivity** Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

● SIDE-EFFECTS

- **Common or very common** Hypersensitivity

- **PRE-TREATMENT SCREENING** Diphtheria antitoxin is derived from horse serum and reactions are common; tests for hypersensitivity should be carried out before use.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Diphtheria antitoxin (Non-proprietary)**

3 Tuberculosis diagnostic test

DIAGNOSTIC AGENTS

Tuberculin purified protein derivative (Tuberculin PPD)

● INDICATIONS AND DOSE

Mantoux test

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 2 units for one dose
- ▶ Adult: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 10 units for 1 dose
- ▶ Adult: 10 units for 1 dose

DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- ▶ 10 units is equivalent to 0.1 mL of 100 units/mL strength.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ Mantoux test Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from ImmForm (SSI brand).

The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ▶ **Tuberculin purified protein derivative (Non-proprietary)**

Tuberculin purified protein derivative 20 tuberculin unit per 1 mL Tuberculin PPD RT 23 SSI 20 tuberculin units/mL solution for injection 1.5mL vials | 1 vial 

Tuberculin purified protein derivative 100 tuberculin unit per 1 mL Tuberculin PPD RT 23 SSI 100 tuberculin units/mL solution for injection 1.5mL vials | 1 vial 

- a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
- detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
- extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook (including updates since 2013) are available at www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from **local health organisations** or from **ImmForm** (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

For the most up to date immunisation schedule consult 'The complete routine immunisation schedule', available at www.gov.uk

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* type b, meningococcal C, and hepatitis B after primary immunisation.

Vaccines and HIV infection

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired; use of normal immunoglobulin should be considered after exposure to measles), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella-zoster immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus;

and the following inactivated vaccines:

- anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

4 Vaccination

Vaccines

16-Aug-2017

Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

Routine immunisation schedule

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only	<ul style="list-style-type: none"> ► Bacillus Calmette-Guérin vaccine p. 1273 (at birth, see <i>BCG vaccine</i>, below) ► Hepatitis B vaccine p. 1280 (at birth, see <i>Hepatitis B vaccine</i>, below)
2 months	<ul style="list-style-type: none"> ► Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1273 (<i>Infanrix hexa</i>®). First dose ► Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1275 First dose ► Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1277 First dose ► Rotavirus vaccine p. 1286 First dose
3 months	<ul style="list-style-type: none"> ► Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1273 (<i>Infanrix hexa</i>®). Second dose ► Rotavirus vaccine p. 1286 Second dose
4 months	<ul style="list-style-type: none"> ► Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1273 (<i>Infanrix hexa</i>®). Third dose ► Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1275 Second dose ► Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1277 Second dose
12–13 months	<ul style="list-style-type: none"> ► Measles, mumps and rubella vaccine, live p. 1284 First dose ► Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1275 Single booster dose ► Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1277 Single booster dose ► Haemophilus influenzae type b with meningococcal group C vaccine p. 1275 Single booster dose
2–8 years (including children in school years 1, 2, 3 and 4)	<ul style="list-style-type: none"> ► Influenza vaccine p. 1282 Each year from September. Note: Flu nasal spray is recommended (<i>Fluenz Tetra</i>®). If contra-indicated and child is in clinical risk group, use inactivated flu vaccine
Between 3 years and 4 months, and 5 years	<ul style="list-style-type: none"> ► Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1272 Single booster dose. Note: Preferably allow interval of at least 3 years after completing primary course ► Measles, mumps and rubella vaccine, live p. 1284 Second dose
11–14 years (females only). First dose of HPV vaccine will be offered to females aged 12–13 years of age in England, Wales, and Northern Ireland, and 11–13 years of age in Scotland.	<ul style="list-style-type: none"> ► Human papillomavirus vaccines p. 1282 2 doses; second dose 6–24 months after first dose. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, since 2012, only <i>Gardasil</i>® is offered as part of the national immunisation programme; for those females who started the schedule with <i>Cervarix</i>® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with <i>Gardasil</i>®.
13–15 years	<ul style="list-style-type: none"> ► Meningococcal groups A with C and W135 and Y vaccine p. 1276 Single booster dose
13–18 years	<ul style="list-style-type: none"> ► Diphtheria with poliomyelitis and tetanus vaccine p. 1273 Single booster dose. Note: Can be given at the same time as the dose of meningococcal group A with C and W135 and Y vaccine at 13–15 years of age.
During adult life, women of child-bearing age susceptible to rubella	<ul style="list-style-type: none"> ► Measles, mumps and rubella vaccine, live p. 1284 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation.
Pregnant women	<ul style="list-style-type: none"> ► Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1272 (<i>Boostrix-IPV</i>®) 1 dose from the 16th week of pregnancy, preferably after the fetal anomaly scan (weeks 18–20) ► Influenza vaccine p. 1282 (inactivated), Single dose administered from September, regardless of the stage of pregnancy
Under 25 years, those entering university who are at risk of meningococcal disease	<ul style="list-style-type: none"> ► Meningococcal groups A with C and W135 and Y vaccine p. 1276 Single dose. Note: Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine p. 1276 over the age of 10 years
During adult life, if not previously immunised	<ul style="list-style-type: none"> ► Diphtheria with poliomyelitis and tetanus vaccine p. 1273
65 years	<ul style="list-style-type: none"> ► Pneumococcal polysaccharide vaccine p. 1277
From 65 years	<ul style="list-style-type: none"> ► Influenza vaccine p. 1282 Each year from September
70 years	<ul style="list-style-type: none"> ► Varicella-zoster vaccine p. 1287 Single dose

HIV-positive individuals should **not** receive:

- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought)

The above advice differs from that for other immunocompromised patients; *Immunisation Guidelines for HIV-infected Adults* issued by British HIV Association (BHIVA)

are available at www.bhiva.org and, *Immunisation of HIV-infected Children* issued by *Children's HIV Association* (CHIVA) are available at www.chiva.org.uk

Vaccines and asplenia

The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type b with meningococcal group C vaccine p. 1275;
- Influenza vaccine p. 1282;
- Meningococcal groups A with C and W135 and Y vaccine p. 1276 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1275;
- pneumococcal polysaccharide vaccine.

Children first diagnosed under 1 year of age should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type b with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

Children first diagnosed between 1 and 2 years of age should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type b with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

Children first diagnosed over 2 years of age should be vaccinated according to the Immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type b with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.

Vaccines and antisera availability

Anthrax vaccine p. 1273 and yellow fever vaccine, live p. 1287, botulism antitoxin p. 1258, diphtheria antitoxin p. 1258, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Poisoning, emergency treatment p. 1319.

Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department
Public Health England
Wellington House
133–155 Waterloo Road
London
SE1 8UG
vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff
CF14 4XW
(029) 2074 2979

In Northern Ireland:

Pharmacy and Medicines Management Centre
Northern Health and Social Care Trust
Beech House
Antrim Hospital Site
Bush Road
Antrim
BT41 2RL
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine

Anthrax vaccine is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *B. anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis. Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

BCG vaccine

Bacillus Calmette-Guérin vaccine p. 1273 should be given intradermally by operators skilled in the technique.

The expected reaction to successful Bacillus Calmette-Guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should **not** be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculo-protein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients) at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.gov.uk/phe.

Bladder instillations of BCG are licensed for the management of bladder carcinoma.

See also Tuberculosis p. 567 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

Tuberculosis Diagnostic Agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

In the *Mantoux test*, the diagnostic dose is administered by intradermal injection of tuberculin purified protein derivative (PPD) p. 1259.

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantiferON® TB Gold* and *T-SPOT® TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.gov.uk/phe.

Botulism antitoxin

A polyvalent botulism antitoxin p. 1258 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Cholera vaccine

Cholera vaccine (oral) p. 1274 contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

Diphtheria vaccine

Diphtheria-containing vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years, vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1273 (*Infanrix hexa*®) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises

of 3 doses of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine**.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive **either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria** [low dose], **tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine**. Individuals aged over 10 years should receive **adsorbed diphtheria** [low dose], **tetanus, and poliomyelitis (inactivated) vaccine**.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Diphtheria-containing vaccines for children over 10 years and adults

A **low dose** of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** should be administered.

Contacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. **Adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

Haemophilus influenzae type b conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. *Haemophilus influenzae type b* vaccine immunisation is given in combination with diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis vaccine (*Infanrix hexa*®), as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae* type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine

(combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of *Haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, children born before August 2017 should be given 3 doses of the combined vaccine they were started on. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

Invasive *Haemophilus influenzae* type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of *haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of *haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

See also use of rifampicin p. 571 in the prevention of secondary cases of *Haemophilus influenzae* type b disease.

Hepatitis A vaccine

Hepatitis A vaccine p. 1279 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas;
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix[®] can also be used.

Public Health England recommends the use of intramuscular normal immunoglobulin p. 1255 in addition to hepatitis A vaccine for prevention of infection in close

contacts (of confirmed cases of hepatitis A) who are 60 years of age or over, have chronic liver disease, or HIV infection, or who are immunosuppressed. For further guidance, see Immunoglobulins p. 1252.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

Hepatitis B vaccine

Hepatitis B vaccine p. 1280 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto an adjuvant. It is made biosynthetically using recombinant DNA technology.

From August 2017, vaccination against hepatitis B is recommended as part of the **routine immunisation schedule**. Primary immunisation (see *Routine immunisation schedule*) requires 3 doses, administered at intervals of 1 month from the age of 2 months, to be given as part of the combined diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and *haemophilus influenzae* type b vaccine p. 1273 (*Infanrix hexa*[®]).

As part of the **selective neonatal immunisation programme**, vaccination is recommended for neonates whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers). Hepatitis B vaccination is started immediately after birth with a dose of the monovalent hepatitis B vaccine (no later than 24 hours after delivery), followed by a second dose at 4 weeks; the routine immunisation combination vaccine (*Infanrix hexa*[®]) at weeks 8, 12 and 16; and a further dose of the monovalent hepatitis B vaccine at one year of age.

Neonates born to highly infectious mothers should also receive hepatitis B immunoglobulin p. 1255 at the same time as the first dose of monovalent hepatitis B vaccine, but administered at a different site—more detailed guidance is given in the handbook *Immunisation against Infectious Disease* (www.gov.uk/government/publications/hepatitis-b-the-green-book-chapter-18).

Following **significant exposure to hepatitis B** (e.g. through needle-stick injury or unprotected sex) and for **pre-exposure prophylaxis in high-risk groups**, an 'accelerated schedule' using the single, monovalent hepatitis B vaccine is recommended immediately, with the second dose given 1 month after the initial dose, and the third dose given 2 months after the initial dose. For those at continued high risk following exposure, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook *Immunisation against Infectious Disease*.

Specific hepatitis B immunoglobulin can also be indicated for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection. If hepatitis B immunoglobulin is indicated, it should be given as soon as possible, ideally at the same time or within 24 hours of the first dose of vaccine, but not after seven days have elapsed since exposure. See also *Hepatitis B immunoglobulin* in Immunoglobulins p. 1252.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;

- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients' tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Following a primary course of immunisation, most people do not require a reinforcing dose of a hepatitis B-containing vaccine. A single booster dose should be offered to healthcare workers approximately five years after primary immunisation, to patients on renal dialysis with anti-HBs levels below 10mIU/mL, and at the time of a subsequent significant exposure.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

A combined hepatitis A and B vaccine p. 1278 is also available.

Human papillomavirus vaccine

Human papillomavirus vaccine is available as a bivalent vaccine (*Cervarix*®) or a quadrivalent vaccine (*Gardasil*®). Since 2012, only *Gardasil*® is offered as part of the national immunisation programme. *Cervarix*® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. *Gardasil* is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

Females receiving their first dose aged 15 years or older require a 3-dose schedule (see *Cervarix*® and *Gardasil*®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

If a 3-dose course of vaccination had been started before September 2014 in a female aged under 15 years, then where possible this should be completed; the interrupted course should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Under the national programme in England, females remain eligible to receive the human papillomavirus vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 1282 in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: *adult and child over 20 kg*, 20 mg or more daily; *child under 20 kg*, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status);
- morbid obesity (BMI of 40 kg/m² and above).

Seasonal influenza vaccine (inactivated) is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to health and social care workers who are directly involved in patient care.

Unless contra-indicated, the live influenza vaccine, administered as a nasal spray (*Fluenz Tetra*®), is preferred in children aged 2–17 years because it provides a higher level of protection than the inactivated influenza vaccine. In the 2017/2018 national influenza immunisation programme,

seasonal influenza vaccine will also be offered to all children aged 2–8 years on 31 August 2017 (including those in school years 1, 2, 3 and 4) and to all primary school-aged children in former primary school pilot areas.

Information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.gov.uk/phe.

Japanese encephalitis vaccine

Japanese encephalitis vaccine p. 1283 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org).

Measles, Mumps and Rubella vaccine

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine, live p. 1284 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live p. 1284 by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in *seronegative women of child-bearing age* (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously *unimmunised and seronegative post-partum women* (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts

of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C.

Meningococcal group C conjugate vaccine protects only against infection by serogroup C and **Meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

A **meningococcal group B vaccine**, *Bexsero*[®], is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B and is recommended in the Immunisation Schedule. *Bexsero*[®] contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation

Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type b with meningococcal group C vaccine p. 1275) and a second dose

given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 1276) (see Immunisation Schedule).

Meningococcal group B vaccine provides protection against infection by serogroup B of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see *Immunisation Schedule* above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 1275 followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type b with meningococcal group C vaccine) followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine p. 1276; a booster dose is not required.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts

For advice on the immunisation of *laboratory workers* and *close contacts* of cases of meningococcal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

Pertussis vaccine

Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with a combination vaccine of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1273 (*Infanrix hexa*[®]).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1–10 years who have not received a *pertussis-containing* vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; *Boostrix-IPV*[®]) between 16 and 32 weeks of pregnancy. Public Health England has advised (2016) that the vaccine is probably best offered after the fetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects

Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Pneumococcal vaccine

The pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1277 and the pneumococcal polysaccharide vaccine p. 1277 protect against infection with *Streptococcus pneumoniae* (pneumococcus). Both vaccines contain polysaccharide from capsular pneumococci. The pneumococcal polysaccharide vaccine contains purified polysaccharide from **23 capsular types** of pneumococci, whereas the pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either **10 capsular types** (*Synflorix*®) or **13 capsular types** (*Prevenar 13*®), and the polysaccharide is conjugated to protein.

Prevenar 13®, is the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) used in the childhood immunisation schedule. The recommended schedule consists of 3 doses: the first at 2 months of age, the second at 4 months of age, and the third at 12–13 months of age (see *Immunisation Schedule*).

The 23-valent pneumococcal polysaccharide vaccine is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years or in at-risk groups aged 2 years or over;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes severe asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological conditions;
- complement disorders;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: *adult and child over 20 kg*, 20 mg or more daily; *child under 20 kg*, 1 mg/kg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease;
- at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; patients should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Government, Health Protection Division (Tel (0131) 244 2879).

Choice of vaccine

Children under 2 years at increased risk of pneumococcal infection (see list) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1277 at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine p. 1277 after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine

(adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine.

Revaccination

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

Poliomyelitis vaccine

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated** poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see *Immunisation schedule*). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see *Immunisation schedule*). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must **not** be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

Rabies vaccine

Rabies vaccine p. 1285 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis

Immunisation should be offered to those at high risk of exposure to rabies— laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England's Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine p. 1285 for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given

between day 3–7. Rabies immunoglobulin p. 1257 is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proved that the individual was not at risk.

Rotavirus vaccine

Rotavirus vaccine p. 1286 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with *immunosuppressed* close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

Smallpox vaccine

Limited supplies of **smallpox vaccine** are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, *Guidelines for smallpox response and management in the post-eradication era* should be consulted at www.gov.uk/phe.

Tetanus vaccine

Tetanus vaccine contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses (see *Routine immunisation schedule*). Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school.

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses (see *Diphtheria-containing vaccines for children over 10 years and adults*).

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury

should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Wounds

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)
- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine, inactivated p. 1286 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

Typhoid vaccine

Typhoid vaccine p. 1277 is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* for oral use. Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic, especially if staying with or visiting local people;
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely
- laboratory personnel who, in the course of their work, may be exposed to *Salmonella typhi*.

Typhoid vaccination is not a substitute for scrupulous personal hygiene.

Capsular **polysaccharide** typhoid vaccine is usually given by *intramuscular injection*. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

Oral typhoid vaccine is a **live attenuated** vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

Varicella-zoster vaccine

The live varicella-zoster vaccine p. 1287, *Varilrix*® and *Varivax*®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy;

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

National shingles immunisation programme

The aim of the national shingles immunisation programme is to lower the incidence and severity of shingles in older people using the high potency, live varicella-zoster vaccine, *Zostavax*®. It is recommended that vaccination is routinely offered to people aged 70 years. A catch-up programme has also been rolled out (since 2013) in those aged 70–79 years, as this age group is likely to have the greatest benefit from vaccination.

In the 2016–2017 immunisation programme, varicella-zoster vaccine is recommended in adults who were 70 or 78 years of age on 1st September 2016. Patients who were eligible for vaccination in the first 3 years of the programme but have not been vaccinated against *herpes zoster* remain eligible until their 80th birthday; this includes patients who were aged 71–73 or 79 on 1st September 2016. Patients who have reached 80 years are no longer eligible for vaccination. A single dose of *Zostavax*® is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although *Zostavax*® is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella-zoster immunoglobulin p. 1257 is used to protect susceptible individuals at increased risk of severe varicella infection (see Immunoglobulins p. 1252).

Yellow fever vaccine

Yellow fever vaccine, live p. 1287 is indicated for those travelling or living in areas where infection is endemic and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Vaccines for travel

Immunisation for travel

See advice on Malaria, treatment p. 602.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** or **tuberculosis** should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, www.dh.gov.uk).

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world.

Protection against **hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is recommended and it is likely to be effective even if given shortly before departure; Public Health England recommends travellers can be vaccinated with hepatitis A vaccine up to the day of travel, and no longer recommends the use of normal immunoglobulin for travel prophylaxis. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against **rabies** is recommended for travellers to enzootic areas on long

journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a **tetanus** booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on **diphtheria**, on **Japanese encephalitis**, and on **tick-borne encephalitis** is included in *Health Information for Overseas Travel*.

Food hygiene

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org.

The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for *healthcare professionals* regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

VACCINES

Vaccines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED NOVEMBER 2017)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF- α) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF- α inhibitors and other immunosuppressive biological medicines in utero, PHE advise that any live attenuated vaccination (e.g. BCG vaccine) should be deferred until the infant is age 6 months;
- PHE advise if there is any doubt as to whether an infant due to receive a live attenuated vaccine may be immunosuppressed due to the mother's therapy, including exposure through breast-feeding, specialist advice should be sought.

• CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

• CAUTIONS Acute illness • minor illnesses

CAUTIONS, FURTHER INFORMATION Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

- ▶ Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: **adults**, at least 40 mg daily for more than 1 week; **children**, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child* (2002)(available at www.rcpch.ac.uk).

- ▶ Predisposition to neurological problems When there is a personal or family history of *febrile* convulsions, there is an

increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist.

Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

• SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased • arthralgia • diarrhoea • dizziness • fatigue • fever • headache • irritability • lymphadenopathy (uncommon in children) • malaise • myalgia • nausea • skin reactions • vomiting

- ▶ **Uncommon** Hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).

- **PREGNANCY** Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

- **BREAST FEEDING** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.

- **DIRECTIONS FOR ADMINISTRATION** If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also *Bacillus Calmette-Guérin vaccine* p. 1273, and *Cautions*, further information in measles, mumps and rubella vaccine, live p. 1284.

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with **bleeding disorders** such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

The Department of Health has advised *against the use of jet guns* for vaccination owing to the risk of transmitting blood borne infections, such as HIV.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

- **HANDLING AND STORAGE** Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

VACCINES > BACTERIAL AND VIRAL VACCINES, COMBINED

F 1271

Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

● INDICATIONS AND DOSE

Primary immunisation

- BY INTRAMUSCULAR INJECTION
- Child 2 months–9 years: 0.5 mL every month for 3 doses

- **UNLICENSED USE** *Infanrix-IPV+ Hib*® not licensed for use in children over 36 months; *Pediacel*® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

● SIDE-EFFECTS

- **Common or very common** Crying abnormal · drowsiness · restlessness
- **Uncommon** Cough · extensive swelling of vaccinated limb · increased risk of infection · rhinorrhoea
- **Frequency not known** Anaphylactoid reaction · angioedema · apnoea · hypotonic-hyporesponsiveness episode · seizure

SIDE-EFFECTS, FURTHER INFORMATION The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis. Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and suspension for suspension for injection

- **Infanrix-IPV + Hib** (GlaxoSmithKline UK Ltd)

Infanrix-IPV + Hib vaccine powder and suspension for suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £27.86

Diphtheria with pertussis, poliomyelitis vaccine and tetanus

● INDICATIONS AND DOSE

First booster dose

- BY INTRAMUSCULAR INJECTION
- Child 3–9 years: 0.5 mL, to be given 3 years after primary immunisation

Vaccination of pregnant women against pertussis (using low dose vaccines)

- BY INTRAMUSCULAR INJECTION
- Females of childbearing potential: 0.5 mL for 1 dose

● SIDE-EFFECTS

- **Common or very common** Abdominal pain (uncommon in children)
- **Uncommon** Apathy (in children) · asthma · chills · drowsiness (very common in children) · dry throat (in children) · extensive swelling of vaccinated limb (very common in children) · oral herpes · pain · paraesthesia · sleep disorder (in children)
- **Frequency not known** Anaphylactoid reaction · angioedema · asthenia · hypotonic-hyporesponsiveness episode · seizure

SIDE-EFFECTS, FURTHER INFORMATION The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis. Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- **PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

- **PRESCRIBING AND DISPENSING INFORMATION** Pregnant women should be vaccinated using low dose vaccines (brands may include *Boostrix-IPV*® or *Repevax*®).

Available as part of childhood immunisation schedule from health organisations or ImmForm.

Available for vaccination of pregnant women from ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- **Boostrix-IPV** (GlaxoSmithKline UK Ltd)
Boostrix-IPV suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £22.74
- **Repevax** (Sanofi Pasteur)
Repevax vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.00

F 1271

Diphtheria with poliomyelitis and tetanus vaccine

● INDICATIONS AND DOSE

Primary immunisation

► BY INTRAMUSCULAR INJECTION

- Child 10–17 years: 0.5 mL every month for 3 doses
- Adult: 0.5 mL every month for 3 doses

Booster doses

► BY INTRAMUSCULAR INJECTION

- Child 10–17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
- Adult: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine

● SIDE-EFFECTS

- Common or very common Vertigo
- Frequency not known Abdominal pain · asthenia · chills · face oedema · influenza like illness · nerve disorders · pallor · seizure · shock · syncope · vaccination reactions

● **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

► Revaxis (Sanofi Pasteur)

Revaxis vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.80 DT = £7.80

F 1271

Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine

12-Oct-2017

● INDICATIONS AND DOSE

Primary immunisation (first dose)

► BY DEEP INTRAMUSCULAR INJECTION

- Child 2 months: 0.5 mL for 1 dose

Primary immunisation (second dose)

► BY DEEP INTRAMUSCULAR INJECTION

- Child 3 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of first dose

Primary immunisation (third dose)

► BY DEEP INTRAMUSCULAR INJECTION

- Child 4 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of second dose

● SIDE-EFFECTS

- Common or very common Anxiety · crying abnormal
 - Uncommon Cough · drowsiness · extensive swelling of vaccinated limb · increased risk of infection
 - Rare or very rare Anaphylactoid reaction · angioedema · apnoea · dermatitis · hypotonic-hyporesponsiveness episode · seizure · swelling · thrombocytopenia
- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and suspension for suspension for injection

Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5ml ampoules | 5 ampoule [PoM] 

F 1271

Bacillus Calmette-Guérin vaccine (BCG Vaccine)

- **DRUG ACTION** BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of immunity to *M. tuberculosis*.

● INDICATIONS AND DOSE

Immunisation against tuberculosis

► BY INTRADERMAL INJECTION

- Child 1–11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided

continued →

- ▶ Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**
- ▶ Adult: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**

● **CONTRA-INDICATIONS** Generalised septic skin conditions **CONTRA-INDICATIONS, FURTHER INFORMATION**

A lesion-free site should be used to administer BCG vaccine to patients with eczema.

● **CAUTIONS**

CAUTIONS, FURTHER INFORMATION BCG vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

● **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Increased risk of infection · osteitis
- **PRE-TREATMENT SCREENING** Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculin (see tuberculin purified protein derivative p. 1259). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.
- **DIRECTIONS FOR ADMINISTRATION**
Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb \equiv 0.1 mL injection, 3 mm bleb \equiv 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.
- **PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Bacillus calmette-guérin vaccine (Non-proprietary)**
Bacillus Calmette-Guérin vaccine powder and solvent for suspension for injection vials | 10 vial [\[PoM\]](#) [\[X\]](#)

primary course should be restarted, immunisation should be completed at least one week before potential exposure

- ▶ Child 6-17 years: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- ▶ Adult: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

Booster

▶ **BY MOUTH**

- ▶ Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
- ▶ Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
- ▶ Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

● **CONTRA-INDICATIONS** Acute gastro-intestinal illness

● **INTERACTIONS** → Appendix 1: cholera vaccine

● **SIDE-EFFECTS**

- ▶ **Uncommon** Gastrointestinal discomfort · gastrointestinal disorders
- ▶ **Rare or very rare** Chills · cough · dehydration · drowsiness · hyperhidrosis · increased risk of infection · insomnia · pulmonary reaction · syncope · taste altered · throat pain
- ▶ **Frequency not known** Angioedema · asthenia · dyspnoea · hypertension · influenza like illness · lymphadenitis · pain · paraesthesia · sputum increased
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ In children Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2-5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.
- ▶ In adults Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

- **PATIENT AND CARER ADVICE** Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is **essential**.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

F 1271

Haemophilus influenzae type b with meningococcal group C vaccine

● INDICATIONS AND DOSE

Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae* type b component) and primary immunisation against *Neisseria meningitidis*

► BY INTRAMUSCULAR INJECTION

► Child 12–13 months: 0.5 mL for 1 dose

Immunisation against *Neisseria meningitidis* in an unimmunised patient

► BY INTRAMUSCULAR INJECTION

► Child 1–9 years: 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against *Haemophilus influenzae* type b) | Booster dose after recovery from *Haemophilus influenzae* type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

► BY INTRAMUSCULAR INJECTION

► Child 1–9 years: 0.5 mL for 1 dose

Booster dose after recovery from *Haemophilus influenzae* type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)

► BY INTRAMUSCULAR INJECTION

► Child 1–17 years: 0.5 mL for 1 dose

► Adult: 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

► BY INTRAMUSCULAR INJECTION

► Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type b vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)

► BY INTRAMUSCULAR INJECTION

► Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)

► Adult: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine

● **UNLICENSED USE** Not licensed for use in patients over 2 years.

● SIDE-EFFECTS

► Common or very common Drowsiness

► Uncommon Crying

► Rare or very rare Abdominal pain · insomnia

► Frequency not known Anaphylactoid reaction · febrile seizure · meningism (but no evidence that vaccine causes meningococcal C meningitis) · muscle tone decreased

● **PRESCRIBING AND DISPENSING INFORMATION** Available as part of the childhood immunisation schedule from ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► **Menitorix** (GlaxoSmithKline UK Ltd)

Menitorix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial (PoM) £37.76

F 1271

Meningococcal group B vaccine (rDNA, component, adsorbed)

19-Oct-2017

● INDICATIONS AND DOSE

BEXSERO®

Immunisation against *Neisseria meningitidis*, primary immunisation

► BY DEEP INTRAMUSCULAR INJECTION

► Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 438.

► Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 438.

Immunisation against *Neisseria meningitidis*, primary immunisation booster dose

► BY DEEP INTRAMUSCULAR INJECTION

► Child 12–23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)

► BY DEEP INTRAMUSCULAR INJECTION

► Child 6–11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)

► Child 12–23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12–24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)

► Child 2–10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)

► Child 11–17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

► Adult: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

TRUMENBA®

Immunisation against *Neisseria meningitidis*, primary immunisation

► BY INTRAMUSCULAR INJECTION

► Child 10–17 years: 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature

► Adult: 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed continued →

by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature

• SIDE-EFFECTS

- ▶ **Common or very common** Crying abnormal (in children) · drowsiness (in children) · eating disorder (in children)
- ▶ **Uncommon** Eczema (in children) · seizures (in children) · vascular disorders (in children)
- ▶ **Frequency not known** Extensive swelling of vaccinated limb · hypotonic-hyporesponsiveness episode (in children)

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Kanamycin

- ▶ **Bexsero** (GlaxoSmithKline UK Ltd) ▼
Bexsero vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.00
- ▶ **Trumenba** (Pfizer Ltd) ▼
Trumenba vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.00

Meningococcal group C vaccine

• INDICATIONS AND DOSE

Patients with confirmed serogroup C disease (who have previously been immunised)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital
- ▶ Adult 18-24 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

• SIDE-EFFECTS

- ▶ **Common or very common** Anxiety (in children) · cough (in children) · crying (in children) · drowsiness (in children) · gastrointestinal discomfort (in children) · hyperhidrosis (in children) · increased risk of infection (in children)
- ▶ **Uncommon** Chills · eyelid oedema (in children) · flushing (in children) · influenza like illness (rare in children) · joint stiffness (in children)
- ▶ **Rare or very rare** Circulatory collapse (in children)
- ▶ **Frequency not known** Angioedema · apnoea · asthenia (uncommon in children) · dyspnoea · hypotonic-hyporesponsiveness episode · immune thrombocytopenic purpura · meningism (but no evidence that vaccine causes meningococcal C meningitis) · musculoskeletal stiffness (uncommon in children) · nasal congestion (uncommon in children) · oedema (uncommon in children) · pain (very common in children) · respiratory disorders (uncommon in children) · seizures (uncommon in children) · sensation abnormal (uncommon in children) · sleep disorders (very common in children) · Stevens-Johnson syndrome · syncope (uncommon in children)

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from www.immform.dh.gov.uk.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **NeisVac-C** (Pfizer Ltd)
NeisVac-C vaccine suspension for injection 0.5mL pre-filled syringes | 10 pre-filled disposable injection [PoM] £187.50

Meningococcal groups A with C and W135 and Y vaccine

• INDICATIONS AND DOSE

MENVEO®

Primary immunisation against *Neisseria meningitidis*

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 13-15 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
- ▶ Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure to prevent invasive disease

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3-11 months: 0.5 mL every month for 2 doses, dose preferably injected into deltoid region
- ▶ Child 1-17 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region
- ▶ Adult: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult 18-24 years: 0.5 mL for 1 dose

NIMENRIX®

Primary immunisation against *Neisseria meningitidis*

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 13-15 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
- ▶ Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in child 12-23 months), then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection
- ▶ Adult: 0.5 mL for 1 dose, to be injected preferably into deltoid region, then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult 18-24 years: 0.5 mL for 1 dose

• UNLICENSED USE

MENVEO® Menveo® is not licensed for use in children under 2 years.

• SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness

- **Uncommon** Crying · insomnia · numbness · pain in extremity
- **Frequency not known** Extensive swelling of vaccinated limb

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Menveo** (GlaxoSmithKline UK Ltd)
Menveo vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £30.00

1271

Pneumococcal polysaccharide conjugate vaccine (adsorbed)

● INDICATIONS AND DOSE

PREVENAR 13®

Primary immunisation against pneumococcal infection (first dose)

- BY INTRAMUSCULAR INJECTION
- Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (second dose)

- BY INTRAMUSCULAR INJECTION
- Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (booster dose)

- BY INTRAMUSCULAR INJECTION
- Child 12-13 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)

- BY INTRAMUSCULAR INJECTION
- Child 12 months-4 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfunction (who have not been vaccinated or not completed the primary course)

- BY INTRAMUSCULAR INJECTION
- Child 12 months-4 years: 0.5 mL every 2 months for 2 doses, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

SYNFLORIX®

Immunisation against pneumococcal infection

- BY INTRAMUSCULAR INJECTION
- Child 6 weeks-4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

● UNLICENSED USE

PREVENAR 13® The dose in BNF publications may differ from that in product literature.

- **CONTRA-INDICATIONS** Concomitant use of high potency varicella-zoster vaccine (*Zostavax*®) with pneumococcal polysaccharide vaccine (in adults)

● SIDE-EFFECTS

- **Common or very common** Drowsiness
- **Uncommon** Apnoea · crying abnormal · extensive swelling of vaccinated limb

- **Rare or very rare** Angioedema · hypotonic-hyporesponsiveness episode · Kawasaki disease · seizure

● PRESCRIBING AND DISPENSING INFORMATION

PREVENAR 13® Available as part of childhood immunisation schedule from ImmForm www.immform.dh.gov.uk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- **Prevenar** (Pfizer Ltd)
Prevenar 13 vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £49.10 | 10 pre-filled disposable injection [PoM] £491.00

Synflorix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £27.60

1271

Pneumococcal polysaccharide vaccine

● INDICATIONS AND DOSE

Immunisation against pneumococcal infection

- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Child 2-17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

Immunisation in patients at increased risk of pneumococcal disease

- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Child 2-4 years: 0.5 mL for 1 dose, dose should be administered after the second birthday or at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed)
- Child 5-17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

- **SIDE-EFFECTS** Angioedema · arthritis · asthenia · chills · febrile seizure · haemolytic anaemia · hypersensitivity · leucocytosis · lymphadenitis · nerve disorders · paraesthesia · peripheral oedema · thrombocytopenia

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Pneumococcal polysaccharide vaccine (Non-proprietary)**
Pneumococcal polysaccharide vaccine solution for injection 0.5ml vials | 1 vial [PoM] £8.32

1271

Typhoid vaccine

● INDICATIONS AND DOSE

Immunisation against typhoid fever in children at high risk of typhoid fever

- BY INTRAMUSCULAR INJECTION
- Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

Immunisation against typhoid fever

- BY INTRAMUSCULAR INJECTION
- Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
- Adult: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection

continued →

► BY MOUTH

- Child 6–17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)
- Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)

● **UNLICENSED USE** Not licensed for use in children under 2 years.

● **CONTRA-INDICATIONS**

- With oral use Acute gastro-intestinal illness

● **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**► **Common or very common**

- With oral use Gastrointestinal discomfort · influenza like illness

► **Rare or very rare**

- With oral use Asthenia · back pain · chills · flatulence · paraesthesia

► **Frequency not known**

- With parenteral use Abdominal pain · asthma · serum sickness · shock · syncope

● **DIRECTIONS FOR ADMINISTRATION** Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

● **HANDLING AND STORAGE** It is important to store capsules in a refrigerator.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Combinations available: *Hepatitis A with typhoid vaccine*, p. 1280

VACCINES > VIRAL VACCINES**Hepatitis A and B vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1279, hepatitis B vaccine p. 1280.

● **INDICATIONS AND DOSE****AMBIRIX®****Immunisation against hepatitis A and hepatitis B infection (primary course)**► **BY INTRAMUSCULAR INJECTION**

- Child 1–15 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX® ADULT**Immunisation against hepatitis A and hepatitis B infection (primary course)**► **BY INTRAMUSCULAR INJECTION**

- Child 16–17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- Adult: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Immunisation against hepatitis A and hepatitis B**infection—accelerated schedule for travellers departing within 1 month**► **BY INTRAMUSCULAR INJECTION**

- Child 16–17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- Adult: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX® PAEDIATRIC**Immunisation against hepatitis A and hepatitis B infection (primary course)**► **BY INTRAMUSCULAR INJECTION**

- Child 1–15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

IMPORTANT SAFETY INFORMATION

Ambirix® and *Twinrix®* are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.

● **PRESCRIBING AND DISPENSING INFORMATION**

TWINRIX® PAEDIATRIC Primary course should be completed with *Twinrix®* (single component vaccines given at appropriate intervals may be used for booster dose).

TWINRIX® ADULT Primary course should be completed with *Twinrix®* (single component vaccines given at appropriate intervals may be used for booster dose).

AMBIRIX® Primary course should be completed with *Ambirix®* (single component vaccines given at appropriate intervals may be used for booster dose).

Hepatitis A vaccine

INDICATIONS AND DOSE

AVAXIM®

Immunisation against hepatitis A infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ **Child 16–17 years:** Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ **Adult:** Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

HAVRIX MONODOSE®

Immunisation against hepatitis A infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ **Child 1–15 years:** Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ▶ **Child 16–17 years:** Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ▶ **Adult:** Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

VAQTA® ADULT

Immunisation against hepatitis A infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ **Adult:** Initially 1 mL for 1 dose, then 1 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

VAQTA® PAEDIATRIC

Immunisation against hepatitis A infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ **Child 1–17 years:** Initially 0.5 mL for 1 dose, then 0.5 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

SIDE-EFFECTS

- ▶ **Common or very common** Asthenia (uncommon in children) • pain (uncommon in children)
- ▶ **Uncommon** Anxiety (in children) • chills (in adults) • cough • crying (in children) • ear pain (rare in children) • gastrointestinal discomfort • gastrointestinal disorders (rare in children) • increased risk of infection (in adults) • influenza like illness (rare in children) • muscle weakness (in adults) • musculoskeletal stiffness (rare in children) • nasal complaints • paraesthesia (rare in children) • respiratory disorders (rare in children) • sensation of tightness (rare in children) • temperature sensation altered (rare in children) • vasodilation (rare in children)
- ▶ **Rare or very rare** Allergic rhinitis (in children) • apathy (in adults) • asthma (in children) • ataxia (in children) • burping (in children) • chest pain • constipation (in children) • dehydration (in children) • drowsiness (uncommon in children) • dry mouth (in adults) • eye discomfort • gait abnormal (in children) • infantile spitting up (in children) • menstrual disorder (in adults) • migraine (in adults) • muscle complaints (in adults) • oral ulceration (in adults) • oropharyngeal pain (in children) • photophobia (in adults) • screaming (in children) • sleep disorders (uncommon in children) • sweat changes • synovitis (in children) • throat oedema (in adults) • tremor (in adults) • vertigo (in adults) • watering eye (in adults)
- ▶ **Frequency not known** Guillain-Barre syndrome • thrombocytopenia

■ 1271

Hepatitis B vaccine

● INDICATIONS AND DOSE

ENGERIX B®

Immunisation against hepatitis B infection

► BY INTRAMUSCULAR INJECTION

- Child 1 month–15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16–17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred

site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

► BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month–15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16–17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection, alternative accelerated schedule

► BY INTRAMUSCULAR INJECTION

- Child 11–15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule in exceptional cases, e.g. for travellers departing within 1 month)

► BY INTRAMUSCULAR INJECTION

- Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

► BY INTRAMUSCULAR INJECTION

- Child 1 month–15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16–17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

► BY INTRAMUSCULAR INJECTION

- Child 1 month–15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

FENDRIX®

Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)

► BY INTRAMUSCULAR INJECTION

- Child 15–17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBVAXPRO®

Immunisation against hepatitis B infection

► BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month–15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16–17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

► BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month–15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16–17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Neonate born to hepatitis B surface antigen-positive mother

► BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms every month for 3 doses, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Chronic haemodialysis patients

► BY INTRAMUSCULAR INJECTION

- Child 16–17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

• SIDE-EFFECTS

- **Common or very common** Drowsiness · gastrointestinal disorder
- **Uncommon** Influenza like illness
- **Rare or very rare** Sensation abnormal
- **Frequency not known** Anaphylactoid reaction · angioedema · apnoea · arthritis · encephalitis · encephalopathy · hypotension · meningitis · multiple sclerosis · muscle weakness · nerve disorders · paralysis · seizure · thrombocytopenia · vasculitis

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Thiomersal

► **Engerix B** (GlaxoSmithKline UK Ltd)

Hepatitis B virus surface antigen 20 microgram per 1 ml Engerix B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.67

Engerix B 20micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.99 | 10 pre-filled disposable injection [PoM] £129.92

► **Fendrix** (GlaxoSmithKline UK Ltd)

Hepatitis B virus surface antigen 40 microgram per 1 ml Fendrix 20micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £38.10

► **HBVAXPRO** (Merck Sharp & Dohme Ltd)

HBVAXPRO 5micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £8.95

Hepatitis B virus surface antigen 40 microgram per 1 ml HBVAXPRO 40micrograms/1ml vaccine suspension for injection vials | 1 vial [PoM] £27.60

£ 1271

Human papillomavirus vaccines

02-Mar-2017

• INDICATIONS AND DOSE

CERVARIX®

Prevention of premalignant genital lesions and cervical cancer

► BY INTRAMUSCULAR INJECTION

► Child 9-14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5-7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

► Child 15-17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1-2.5 months for 1 dose, then 0.5 mL after 5-12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

► Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1-2.5 months for 1 dose, then 0.5 mL after 5-12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

GARDASIL®

Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

► BY INTRAMUSCULAR INJECTION

► Child 9-14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- Child 15-17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)

► BY INTRAMUSCULAR INJECTION

- Child 9-14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

• UNLICENSED USE

► **GARDASIL®** Two dose schedule not licensed for use in girls aged 14 years.

• SIDE-EFFECTS

- **Common or very common** Pain in extremity
- **Rare or very rare** Bronchospasm
- **Frequency not known** Acute disseminated encephalomyelitis · anaphylactoid reaction · asthenia · chills · Guillain-Barre syndrome · immune thrombocytopenic purpura · syncope

► **PREGNANCY** Not known to be harmful, but vaccination should be postponed until completion of pregnancy.

► **PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► **Cervarix** (GlaxoSmithKline UK Ltd)
Cervarix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £80.50

► **Gardasil** (Merck Sharp & Dohme Ltd)
Gardasil vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £86.50

£ 1271

Influenza vaccine

• INDICATIONS AND DOSE

Annual immunisation against seasonal influenza

► BY INTRAMUSCULAR INJECTION

- Child 6 months-17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

► BY INTRADERMAL INJECTION

- Adult 18–59 years: 9 micrograms for 1 dose, dose to be injected into deltoid region
- Adult 60 years and over: 15 micrograms for 1 dose, dose to be injected into deltoid region

► BY INTRANASAL ADMINISTRATION

- Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)

► BY INTRAMUSCULAR INJECTION

- Child 6 months–9 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, after at least 4 weeks

► BY INTRANASAL ADMINISTRATION

- Child 2–9 years: 0.1 mL for 1 dose, followed by 0.1 mL for 1 dose, after at least 4 weeks. 0.1 mL dose to be administered to each nostril

- **UNLICENSED USE** Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.

OPTAFLU® Not licensed for use in children and adolescents under 18 years.

FLUVIRIN® Not licensed for use in children under 4 years.

- **CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

FLUENZ TETRA® Active wheezing · concomitant use with antiviral therapy for influenza · severe asthma

CONTRA-INDICATIONS, FURTHER INFORMATION

- Concomitant use with antiviral therapy for influenza · Avoid influenza antiviral agents for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the influenza antiviral agent.

ENZIRA® Child under 5 years—increased risk of febrile convulsions

- **CAUTIONS** Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

ENZIRA® Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

- **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**► **Common or very common**

- With intradermal or intramuscular use Chills · hyperhidrosis · pain

- With intranasal use Nasal complaints

► **Uncommon**

- With intranasal use Epistaxis · face oedema

► **Rare or very rare**

- With intradermal or intramuscular use Nerve disorders · paraesthesia

► **Frequency not known**

- With intradermal or intramuscular use Angioedema · encephalomyelitis · febrile seizure · nervous system disorder · shock · thrombocytopenia · vasculitis
- With intramuscular use Extensive swelling of vaccinated limb · presyncope · syncope
- With intranasal use Guillain-Barre syndrome

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with

uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY** Inactivated vaccines not known to be harmful.

FLUENZ TETRA® Avoid in pregnancy.

- **BREAST FEEDING** Inactivated vaccines not known to be harmful.

FLUENZ TETRA® Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION**

FLUARIX TETRA® Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**

FLUENZ TETRA® Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Imuvac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.59 | 10 pre-filled disposable injection [PoM] £65.90

- **Influvac Sub-unit** (Mylan)

Influvac Sub-unit vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £5.22 | 10 pre-filled disposable injection [PoM] £52.20

■ 1271

Japanese encephalitis vaccine

- **INDICATIONS AND DOSE**

Immunisation against Japanese encephalitis

- BY INTRAMUSCULAR INJECTION

- Child 2 months–2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders

- Child 3–17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders

- Adult: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders

continued →

Booster dose

- BY INTRAMUSCULAR INJECTION
- Adult: 0.5 mL after 1–2 years, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders, for those at continued risk, the booster dose should be given 1 year after completing the primary course

• SIDE-EFFECTS

- **Common or very common** Influenza like illness (frequency not known in children)
- **Uncommon** Abdominal pain (frequency not known in children) • asthma (in adults) • chills (in adults) • hyperhidrosis (in adults) • migraine (in adults) • musculoskeletal stiffness (in adults) • vertigo (in adults)
- **Rare or very rare** Dyspnoea (in adults) • eyelid oedema (in adults) • neuritis (in adults) • pain in extremity (in adults) • palpitations (in adults) • paraesthesia (in adults) • peripheral oedema (in adults) • tachycardia (in adults) • taste altered (in adults) • thrombocytopenia (in adults)
- **Frequency not known** Cough (in children)
- **PREGNANCY** Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection► **Japanese encephalitis vaccine (Non-proprietary)**

- Japanese encephalitis GCVC vaccine solution for injection 1mL vials | 1 vial 
- Japanese encephalitis GCVC vaccine solution for injection 20mL vials | 1 vial 
- Japanese encephalitis GCVC vaccine solution for injection 10mL vials | 1 vial

- **Ixiaro** (Valneva UK Ltd)
Ixiaro vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection  £59.50

F 1271

Measles, mumps and rubella vaccine, live

• INDICATIONS AND DOSE**Primary immunisation against measles, mumps, and rubella (first dose)**

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Child 12–13 months: 0.5 mL for 1 dose

Primary immunisation against measles, mumps, and rubella (second dose)

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Child 40 months–5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose) | Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Child 6 months–17 years: (consult product literature or local protocols)
- Adult: (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in children under 9 months.

IMPORTANT SAFETY INFORMATION**MMR VACCINATION AND BOWEL DISEASE OR AUTISM**

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

- **CAUTIONS** Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation

CAUTIONS, FURTHER INFORMATION

- **Administration with other vaccines** MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines

• SIDE-EFFECTS

- **Uncommon** Increased risk of infection • rhinorrhoea
- **Frequency not known** Anaphylactoid reaction • angioedema • arthritis • ataxia • cough • encephalopathy • eye inflammation • meningitis aseptic • nerve deafness • nerve disorders • oculomotor nerve paralysis • oedema • panniculitis • papillitis • paraesthesia • regional lymphadenopathy • respiratory disorders • seizures • Stevens–Johnson syndrome • subacute sclerosing panencephalitis • syncope • throat pain • thrombocytopenia • vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days. Febrile seizures occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection).

Idiopathic thrombocytopenic purpura Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing

before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. Samples should be sent to the Virus Reference Laboratory of the Health Protection Agency.

Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

- **ALLERGY AND CROSS-SENSITIVITY** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.
- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

► 1271

Rabies vaccine

• INDICATIONS AND DOSE

Pre-exposure prophylaxis

► BY INTRAMUSCULAR INJECTION

- Child: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel
- Adult: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)

► BY INTRAMUSCULAR INJECTION

- Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies
- Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region, the frequency of booster doses may alternatively be determined

according to plasma-concentration of antirabies antibodies

Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)

► BY INTRAMUSCULAR INJECTION

- Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants
- Adult: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region

Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)

► BY INTRAMUSCULAR INJECTION

- Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary
- Adult (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region, rabies immunoglobulin is not necessary

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)

► BY INTRAMUSCULAR INJECTION

- Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk
- Adult (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

- **INTERACTIONS** → Appendix 1: rabies vaccine

• SIDE-EFFECTS

- **Common or very common** Asthenia · gastrointestinal discomfort
- **Rare or very rare** Anaphylactic shock · angioedema · chills · encephalitis · Guillain-Barre syndrome · hyperhidrosis · paraesthesia · presyncope · syncope · vertigo
- **PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

EXCIPIENTS: May contain Neomycin

► **Rabies vaccine (Non-proprietary)**

Verorab powder and solvent for suspension for injection 0.5ml vials | 1 vial [PoM] 

Rabies vaccine powder and solvent for suspension for injection 1ml vials | 1 vial [PoM] £40.84

Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin

► **Rabipur** (GlaxoSmithKline UK Ltd)

Rabipur vaccine powder and solvent for solution for injection 1ml vials | 1 vial [PoM] £34.56

Rabipur vaccine powder and solvent for solution for injection 1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £34.56

11-Dec-2017

Rotavirus vaccine

- **DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

• INDICATIONS AND DOSE

Immunisation against gastro-enteritis caused by rotavirus

► BY MOUTH

- Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

IMPORTANT SAFETY INFORMATION

PUBLIC HEALTH ENGLAND: UPDATE TO GREEN BOOK (OCTOBER 2017)

Public Health England advises that immunisation with live vaccines should be delayed until 6 months of age in children born to mothers who received immunosuppressive biological therapy during pregnancy. In practice, this means that children born to mothers who were on immunosuppressive biological therapy during pregnancy will not be eligible to receive rotavirus vaccine.

- **CONTRA-INDICATIONS** History of intussusception · predisposition to intussusception · severe combined immunosuppression
- **CONTRA-INDICATIONS, FURTHER INFORMATION**
 - Immunosuppression With the exception of severe combined immunodeficiency (and children born to mothers who received immunosuppressive biological therapy during pregnancy, see *Important safety information*), rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.
- **CAUTIONS** Diarrhoea (postpone vaccination) · immunosuppressed close contacts · vomiting (postpone vaccination)
- **CAUTIONS, FURTHER INFORMATION** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.
- **INTERACTIONS** → Appendix 1: live vaccines
- **SIDE-EFFECTS**
 - **Uncommon** Abdominal pain · dermatitis · gastrointestinal disorders
 - **Frequency not known** Apnoea · gastroenteritis · haematochezia

- **PATIENT AND CARER ADVICE** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

• MEDICAL FORMS

► **Rotarix** (GlaxoSmithKline UK Ltd)

Rotarix vaccine live oral suspension 1.5ml pre-filled syringes | 1 unit dose [PoM] £34.76

Rotarix vaccine live oral suspension 1.5ml tube | 1 tube [PoM] £34.76

11-Dec-2017

Tick-borne encephalitis vaccine, inactivated

• INDICATIONS AND DOSE

Initial immunisation against tick-borne encephalitis

► BY INTRAMUSCULAR INJECTION

- Child 1–15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Child 16–17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

Immunisation against tick-borne encephalitis, booster doses

► BY INTRAMUSCULAR INJECTION

- Child 1–17 years: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)
- Adult: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region (consult product literature)

● SIDE-EFFECTS

- ▶ **Common or very common** Restlessness (in children) · sleep disorder (in children)
- ▶ **Rare or very rare** Asthenia · autoimmune disorder (in adults) · chills (uncommon in children) · demyelination (in adults) · drowsiness (in adults) · dyspnoea · eye pain · gait abnormal · gastrointestinal discomfort (uncommon in children) · hyperhidrosis · increased risk of infection · influenza like illness · joint swelling (in adults) · meningism · meningitis aseptic (in adults) · motor dysfunction · musculoskeletal stiffness · nerve disorders · oedema · pain · seizures · sensory disorder · tachycardia (in adults) · tinnitus · vertigo · vision disorders
- **ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Gentamicin, neomycin

▶ **TicoVac** (Pfizer Ltd)

TicoVac Junior vaccine suspension for injection 0.25ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £28.00
TicoVac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £32.00

1271

Varicella-zoster vaccine

● INDICATIONS AND DOSE

VARILRIX®

Prevention of varicella infection (chickenpox)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 1-17 years: 0.5 mL every 4-6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh
- ▶ Adult: 0.5 mL every 4-6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh

VARIVAX®

Prevention of varicella infection (chickenpox)

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
- ▶ Child 13-17 years: 0.5 mL every 4-8 weeks for 2 doses, to be administered preferably into the deltoid region
- ▶ Adult: 0.5 mL every 4-8 weeks for 2 doses, to be administered preferably into the deltoid region

Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1-12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh in young children)

ZOSTAVAX®

Prevention of herpes zoster (shingles)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult 70-79 years: 0.65 mL for 1 dose, to be administered preferably into the deltoid region

- **CAUTIONS** Post-vaccination close contact with susceptible individuals

CAUTIONS, FURTHER INFORMATION Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related

cutaneous rash develops within 4-6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- ▶ Administration with MMR vaccine Varicella-zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines

● SIDE-EFFECTS

- ▶ **Uncommon** Cough · drowsiness · increased risk of infection
- ▶ **Rare or very rare** Abdominal pain · conjunctivitis · Kawasaki disease · seizure · stroke · thrombocytopenia · vasculitis

- **CONCEPTION AND CONTRACEPTION** Avoid pregnancy for 3 months after vaccination.

● PRESCRIBING AND DISPENSING INFORMATION

ZOSTAVAX® Advice in the BNF may differ from that in product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

EXCIPIENTS: May contain Gelatin, neomycin

▶ **Varivax** (Merck Sharp & Dohme Ltd)

Varivax vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial [PoM] £30.28

▶ **Zostavax** (Merck Sharp & Dohme Ltd)

Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin

▶ **Varilrix** (GlaxoSmithKline UK Ltd)

Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £27.31

1271

Yellow fever vaccine, live

● INDICATIONS AND DOSE

Immunisation against yellow fever

▶ BY DEEP SUBCUTANEOUS INJECTION

- ▶ Child 6-8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
- ▶ Child 9 months-17 years: 0.5 mL for 1 dose
- ▶ Adult: 0.5 mL for 1 dose

- **CONTRA-INDICATIONS** Children under 6 months · history of thymus dysfunction

- **CAUTIONS** Individuals over 60 years—greater risk of vaccine-associated adverse effects (in adults)

CAUTIONS, FURTHER INFORMATION

- ▶ Administration with MMR vaccine Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · crying (in children) · drowsiness (in children)
- ▶ **Uncommon** Abdominal pain
- ▶ **Rare or very rare** Rhinitis · yellow fever vaccine-associated neurotropic disease · yellow fever vaccine-associated viscerotropic disease
- ▶ **Frequency not known** Anaphylactoid reaction · angioedema · influenza like illness · paraesthesia

SIDE-EFFECTS, FURTHER INFORMATION Very rare vaccine-associated adverse effects may occur, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

- **ALLERGY AND CROSS-SENSITIVITY** Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.
- **PREGNANCY** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.
- **BREAST FEEDING** Avoid; seek specialist advice if exposure to virus cannot be avoided.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

General anaesthesia

Anaesthesia (general)

Overview

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction'); lower doses may be required in premedicated patients.

Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to

predicted plasma-drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia

Propofol p. 1291, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive care.

Thiopental sodium p. 335 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1291 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1305 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 340 or midazolam p. 336.

Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for storage and administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1293 is being administered.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isflurane p. 1293 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1293 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1294 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox[®], Equanox[®]) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1297 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1307 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice

Overview

Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 340 and temazepam p. 481 are effective anxiolytics for dental treatment in adults.

For details of sedation, anaesthesia, and resuscitation in dental practice see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Standards for Conscious Sedation in the Provision of Dental Care*; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2015 <https://www.rcseng.ac.uk/-/media/files/rcs/library-and-publications/non-journal-publications/dental-sedation-report.pdf>.

Surgery and long-term medication

Overview

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients in Diabetes, surgery and medical illness p. 675.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 132 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 772; for advice on hormone replacement therapy, see Sex hormones p. 734. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride p. 463. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of

anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

ANAESTHETICS, GENERAL > INTRAVENOUS ANAESTHETICS

Etomidate

● INDICATIONS AND DOSE

Induction of anaesthesia

► BY SLOW INTRAVENOUS INJECTION

- Adult: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)
- Elderly: 150–200 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)

IMPORTANT SAFETY INFORMATION

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Acute circulatory failure (shock) · adrenal insufficiency · Avoid in Acute porphyrias p. 1025 · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia

CAUTIONS, FURTHER INFORMATION

- Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

- **INTERACTIONS** → Appendix 1: etomidate

● SIDE-EFFECTS

- **Common or very common** Apnoea · hypotension · movement disorders · nausea · respiratory disorders · skin reactions · vascular disorders · vomiting
- **Uncommon** Arrhythmias · cough · hiccups · hypersalivation · hypertension · muscle rigidity · neuromuscular dysfunction · nystagmus
- **Frequency not known** Adrenal insufficiency · atrioventricular block · cardiac arrest · embolism and thrombosis · seizures · shock · Stevens-Johnson syndrome · trismus

SIDE-EFFECTS, FURTHER INFORMATION

Pain on injection Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.

Extraneous muscle movements Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose in liver cirrhosis.
- **DIRECTIONS FOR ADMINISTRATION** To be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be

very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Propylene glycol

- **Hypnomidate** (Piramal Critical Care Ltd)

Etomidate 2 mg per 1 ml Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule **[PoM]** £6.90

Emulsion for injection

- **Etomidate-Lipuro** (B.Braun Medical Ltd)

Etomidate 2 mg per 1 ml Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule **[PoM]** £16.09

Propofol

● INDICATIONS AND DOSE

Induction of anaesthesia using 0.5% or 1% injection

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response, for debilitated patients use dose for 55 years and over
- Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Induction of anaesthesia using 2% injection

► BY INTRAVENOUS INFUSION

- Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
- Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Maintenance of anaesthesia using 1% injection

► INITIALLY BY INTRAVENOUS INFUSION

- Adult: Usual dose 4–12 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
- Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response

Maintenance of anaesthesia using 2% injection

► BY INTRAVENOUS INFUSION

- Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly
- Elderly: Usual dose 3–6 mg/kg/hour

Sedation of ventilated patients in intensive care using 1% or 2% injection

► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

► BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

continued →

Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

▶ INITIALLY BY INTRAVENOUS INFUSION

- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 1% injection

▶ INITIALLY BY INTRAVENOUS INFUSION

- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 2% injection

▶ INITIALLY BY INTRAVENOUS INFUSION

- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

IMPORTANT SAFETY INFORMATION

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Acute circulatory failure (shock) · cardiac impairment · cardiovascular disease · elderly · epilepsy · fixed cardiac output · hypotension · hypovolaemia · raised intracranial pressure · respiratory impairment
- **INTERACTIONS** → Appendix 1: propofol
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Apnoea · arrhythmias · headache · hypotension · nausea · vomiting
 - ▶ **Uncommon** Thrombosis
 - ▶ **Rare or very rare** Epileptiform seizure (may be delayed) · pancreatitis · post procedural complications · pulmonary oedema · sexual disinhibition · urine discolouration
 - ▶ **Frequency not known** Drug use disorders · dyskinesia · euphoric mood · heart failure · hepatomegaly · hyperkalaemia · hyperlipidaemia · metabolic acidosis · renal failure · respiratory depression · rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia Bradycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.

Pain on injection Pain on injection can be reduced by intravenous lidocaine.

Propofol infusion syndrome Prolonged infusion of propofol doses exceeding 4mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

- **PREGNANCY** May depress neonatal respiration if used during delivery.
- Dose adjustments** Max. dose for maintenance of anaesthesia 6 mg/kg/hour.

- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.
- **DIRECTIONS FOR ADMINISTRATION** Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% **emulsion** for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% **emulsion** for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (*Diprivan*®) or (*Propofol-Lipuro*®) or Sodium chloride 0.9% (*Propofol-Lipuro*® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% **emulsion** for infusion; do not dilute.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Emulsion for infusion▶ **Propofol (Non-proprietary)**

Propofol 10 mg per 1 ml Propofol 500mg/50ml emulsion for infusion vials | 1 vial [PoM] £3.00 (Hospital only)
Propofol-Lipuro 1% emulsion for infusion 50ml vials | 10 vial [PoM] £97.56 (Hospital only)
Propofol 1g/100ml emulsion for infusion vials | 1 vial [PoM] £4.00 (Hospital only)

Propofol 20 mg per 1 ml Propofol 1g/50ml emulsion for infusion vials | 1 vial [PoM] £3.50 (Hospital only)

▶ **Diprivan** (Aspen Pharma Trading Ltd)

Propofol 10 mg per 1 ml Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £10.68
Propofol 20 mg per 1 ml Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.16

Emulsion for injection▶ **Propofol (Non-proprietary)**

Propofol 10 mg per 1 ml Propofol 200mg/20ml emulsion for injection vials | 5 vial [PoM] £4.00 (Hospital only)

▶ **Diprivan** (Aspen Pharma Trading Ltd)

Propofol 10 mg per 1 ml Diprivan 1% emulsion for injection 20ml ampoules | 5 ampoule [PoM] £15.36 (Hospital only)

▶ **Propofol-Lipuro** (B.Braun Melsungen AG)

Propofol 5 mg per 1 ml Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoule [PoM] £15.15

ANAESTHETICS, GENERAL > VOLATILE LIQUID ANAESTHETICS**Volatile halogenated anaesthetics****IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Susceptibility to malignant hyperthermia
- **CAUTIONS** Can trigger malignant hyperthermia • raised intracranial pressure (can increase cerebrospinal pressure)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Agitation • apnoea • arrhythmias • chills • coagulation disorder • conjunctivitis • cough • dizziness • drowsiness • fever • headache • hepatic disorders • hypersalivation • hypertension • hypotension • nausea • respiratory disorders • temperature regulation disorders • vomiting
 - ▶ **Uncommon** Asthma • atrioventricular block • confusion • hypoxia • muscle complaints • myocardial infarction • myocardial ischaemia • vasodilation
 - ▶ **Frequency not known** Abdominal pain • asthenia • breath holding • carboxyhaemoglobinaemia • cardiac arrest • chest discomfort • cognitive impairment • delirium • dyspnoea • dystonia • electrolyte imbalance • haemorrhage • heart failure • ileus • intracranial pressure increased • malaise • metabolic acidosis • mood altered (that can last several days) • myoglobinuria • nephritis • tubulointerstitial • oedema • pancreatitis • QT interval prolongation • rhabdomyolysis • seizure • shock • skin reactions • ventricular dysfunction • visual acuity decreased
- **ALLERGY AND CROSS-SENSITIVITY** Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.
- **DIRECTIONS FOR ADMINISTRATION** Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

F 1292

Desflurane

● INDICATIONS AND DOSE

Induction of anaesthesia (but not recommended)

- ▶ **BY INHALATION**
- ▶ **Adult:** 4–11 %, to be inhaled through specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** 2–6 %, to be inhaled through a specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or oxygen-enriched air)

- ▶ **BY INHALATION**
- ▶ **Adult:** 2.5–8.5 %, to be inhaled through a specifically calibrated vaporiser

- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

▶ Desflurane (Non-proprietary)

Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml [PoM] (Hospital only)

F 1292

Isoflurane

● INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1 % may be required when given with oxygen alone

Maintenance of anaesthesia in caesarean section (in nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** 0.5–0.75 %, to be administered using specifically calibrated vaporiser

- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

▶ Isoflurane (Non-proprietary)

Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml [PoM] £35.29 (Hospital only)
Isoflurane volatile liquid | 250 ml [P] £47.50 (Hospital only)

▶ AErane (Baxter Healthcare Ltd)

Isoflurane 1 ml per 1 ml AErane volatile liquid | 250 ml [P] (Hospital only)

Nitrous oxide

● INDICATIONS AND DOSE

Maintenance of anaesthesia in conjunction with other anaesthetic agents

- ▶ **BY INHALATION**
- ▶ **Adult:** 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia

- ▶ **BY INHALATION**
- ▶ **Adult:** Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient's needs

IMPORTANT SAFETY INFORMATION

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Entrapped air following recent underwater dive • pneumothorax • presence of intracranial air after head injury • recent intra-ocular gas injection

CAUTIONS, FURTHER INFORMATION Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

- **INTERACTIONS** → Appendix 1: nitrous oxide
- **SIDE-EFFECTS** Abdominal distension • addiction • agranulocytosis • disorientation • dizziness • euphoric mood • megaloblastic anaemia • middle ear damage • myeloneuropathy • nausea • paraesthesia • sedation • subacute combined cord degeneration • tympanic membrane perforation • vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **MONITORING REQUIREMENTS**
 - ▶ Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.
 - ▶ Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.
- **DIRECTIONS FOR ADMINISTRATION** For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox[®], Equanox[®]) is used.
- **HANDLING AND STORAGE** Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-effects).

1 Anaesthesia adjuvants

Pre-medication and peri-operative drugs

Drugs that affect gastric pH

Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A **H₂-receptor antagonist** can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; 'clear' (non-particulate) antacids such as sodium citrate p. 770 are preferred.

Antimuscarinic drugs

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 1090 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 1291 and suxamethonium chloride p. 1297.

Atropine sulfate p. 1295 is now rarely used for premedication but still has an emergency role in the

treatment of vagotonic side-effects. Atropine sulfate may have a role in acute arrhythmias after myocardial infarction.

Hyoscine hydrobromide p. 433 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 1296 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

Phenothiazines do not effectively reduce secretions when used alone.

Sedative drugs

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a **benzodiazepine**. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1328 is used to antagonise the effects of benzodiazepines.

Diazepam p. 340 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 481 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 335 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 336 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Other drugs for sedation

Dexmedetomidine p. 1306 and clonidine hydrochloride p. 144 are α_2 -adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride

[unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1329. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Doxapram hydrochloride p. 297 is a central and respiratory stimulant but is of limited value in anaesthesia.

ANTIMUSCARINICS

F 759

Atropine sulfate

● INDICATIONS AND DOSE

Bradycardia due to acute massive overdosage of beta-blockers

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 40 micrograms/kg (max. per dose 3 mg)
- ▶ Adult: 3 mg

Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
- ▶ Adult: 2 mg every 5–10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Adult: 0.6–1.2 mg daily, dose to be taken at night

Premedication

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
- ▶ Adult: 300–600 micrograms, to be administered immediately before induction of anaesthesia
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 12–17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
- ▶ Adult: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

Intra-operative bradycardia

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies
- ▶ Adult: 300–600 micrograms, larger doses may be used in emergencies

continued →

Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 12–17 years: 0.6–1.2 mg
- ▶ Adult: 0.6–1.2 mg

Excessive bradycardia associated with beta-blocker use

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 0.6–2.4 mg in divided doses (max. per dose 600 micrograms)

Bradycardia following myocardial infarction (particularly if complicated by hypotension)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 500 micrograms every 3–5 minutes; maximum 3 mg per course

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **INTERACTIONS** → Appendix 1: atropine
- **SIDE-EFFECTS**
 - ▶ Common or very common
 - ▶ With intravenous use Anhidrosis · anxiety · bronchial secretion decreased · dysphagia · gastrointestinal disorders · hallucination · hyperthermia · movement disorders · speech disorder · taste loss · thirst · urticaria · visual impairment
 - ▶ Rare or very rare
 - ▶ With intravenous use Angina pectoris · arrhythmias · hypertensive crisis · seizure
 - ▶ Frequency not known
 - ▶ With intravenous use Insomnia
 - ▶ With oral use Angle closure glaucoma · bronchial secretion altered · chest pain · dysphagia · fever · increased gastric reflux · thirst
- **PREGNANCY** Not known to be harmful; manufacturer advises caution.
- **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.
- **MONITORING REQUIREMENTS**
 - ▶ Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.
- **LESS SUITABLE FOR PRESCRIBING** Atropine tablets less suitable for prescribing. Any clinical benefit as a gastrointestinal antispasmodic is outweighed by atropinic side-effects.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

1.1 Neuromuscular blockade

Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 1090. Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium bromide p. 1299, rocuronium bromide p. 1300, and vecuronium bromide p. 1300, and the **benzylisoquinolinium** group, comprising atracurium besilate p. 1298, cisatracurium p. 1299, and mivacurium p. 1299.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride below. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

Depolarising neuromuscular blocking drugs

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

NEUROMUSCULAR BLOCKING DRUGS > DEPOLARISING

Suxamethonium chloride (Succinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

● INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery and intubation

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1–1.5 mg/kg

- **UNLICENSED USE** Doses of suxamethonium in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy · family history of malignant hyperthermia · hyperkalaemia · low plasma-cholinesterase activity (including severe liver disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · prolonged immobilisation (risk of hyperkalaemia) · severe burns
- **CAUTIONS** Cardiac disease · neuromuscular disease · raised intra-ocular pressure (avoid in penetrating eye injury) · respiratory disease · severe sepsis (risk of hyperkalaemia)
- **INTERACTIONS** → Appendix 1: suxamethonium
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · bradycardia (may occur with repeated doses) · flushing · muscle contractions involuntary · myoglobinaemia · myoglobinuria · rash
 - ▶ **Rare or very rare** Apnoea · cardiac arrest · hypersensitivity · malignant hyperthermia · respiratory disorders · trismus
- **SIDE-EFFECTS, FURTHER INFORMATION** Premedication with atropine reduces bradycardia associated with suxamethonium use.
- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- **PREGNANCY** Mildly prolonged maternal neuromuscular blockade may occur.
- **BREAST FEEDING** Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother recovered from neuromuscular block.
- **HEPATIC IMPAIRMENT** Prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ▶ **Suxamethonium chloride (Non-proprietary)**
Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride 100mg/2ml solution for injection ampoules | 10 ampoule (PoM) £28.80–£50.00
- ▶ **Anectine** (Aspen Pharma Trading Ltd)
Suxamethonium chloride 50 mg per 1 ml Anectine 100mg/2ml solution for injection ampoules | 5 ampoule (PoM) £3.57

NEUROMUSCULAR BLOCKING DRUGS > NON-DEPOLARISING

Non-depolarising neuromuscular blocking drugs

IMPORTANT SAFETY INFORMATION

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CAUTIONS** Burns (resistance can develop, increased doses may be required) · cardiovascular disease (reduce rate of administration) · electrolyte disturbances (response unpredictable) · fluid disturbances (response

unpredictable) · hypothermia (activity prolonged, lower doses required) · myasthenia gravis (activity prolonged, lower doses required) · neuromuscular disorders (response unpredictable)

SIDE-EFFECTS

- ▶ **Common or very common** Flushing · hypotension
- ▶ **Uncommon** Bronchospasm · hypersensitivity · skin reactions · tachycardia
- ▶ **Rare or very rare** Circulatory collapse · muscle weakness · myopathy (after prolonged use in intensive care) · shock
- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- **PREGNANCY** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.
- **BREAST FEEDING** Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

above

Atracurium besilate

(Atracurium besylate)

INDICATIONS AND DOSE

Neuromuscular blockade (short to intermediate duration) for surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

Neuromuscular blockade during intensive care

INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

SIDE-EFFECTS

- ▶ **Rare or very rare** Cardiac arrest
- ▶ **Frequency not known** Seizure

SIDE-EFFECTS, FURTHER INFORMATION Hypotension, skin flushing, and bronchospasm is associated with histamine release. Manufacturer advises minimising effects of histamine release by administering over 1 minute in patients with cardiovascular disease or sensitivity to hypotension.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tracrium[®]; Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Atracurium besilate (Non-proprietary)

Atracurium besilate 10 mg per 1 ml Atracurium besilate 250mg/25ml solution for injection vials | 1 vial [PoM] £16.50 (Hospital only)

Atracurium besilate 25mg/2.5ml solution for injection ampoules | 5 ampoule [PoM] £9.25 (Hospital only) | 5 ampoule [PoM] £9.25 Atracurium besilate 50mg/5ml solution for injection ampoules | 5 ampoule [PoM] £17.50 (Hospital only) | 5 ampoule [PoM] £17.50

▶ Tracrium (Aspen Pharma Trading Ltd)

Atracurium besilate 10 mg per 1 ml Tracrium 250mg/25ml solution for injection vials | 2 vial [PoM] £25.81

Tracrium 25mg/2.5ml solution for injection ampoules | 5 ampoule [PoM] £8.28

Tracrium 50mg/5ml solution for injection ampoules | 5 ampoule [PoM] £15.02

Cisatracurium

INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

▶ INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes, alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stabilisation

Neuromuscular blockade (intermediate duration) during intensive care

▶ INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 150 micrograms/kg, initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

● SIDE-EFFECTS

- ▶ Common or very common Bradycardia

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Nimbex*[®], *Nimbex Forte*[®]), give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Cisatracurium (Non-proprietary)

Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Cisatracurium besilate 20mg/10ml solution for injection ampoules | 5 ampoule [PoM] £32.09

Cisatracurium besilate 20mg/10ml solution for injection vials | 5 vial [PoM] £37.75 (Hospital only)

Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Cisatracurium besilate 150mg/30ml solution for injection vials | 1 vial [PoM] £45.00 (Hospital only) | 1 vial [PoM] £26.43–£29.54

▶ Nimbex (Aspen Pharma Trading Ltd)

Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Nimbex 20mg/10ml solution for injection ampoules | 5 ampoule [PoM] £37.75

Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Nimbex Forte 150mg/30ml solution for injection vials | 1 vial [PoM] £31.09

Mivacurium

INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery and intubation

▶ INITIALLY BY INTRAVENOUS INJECTION

- Adult: 70–250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6–7 micrograms/kg/minute

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **CAUTIONS** Burns (low plasma cholinesterase activity; dose titration required) • elderly

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

● SIDE-EFFECTS

- ▶ Uncommon Erythema

● HEPATIC IMPAIRMENT

- Dose adjustments Reduce dose in severe impairment.

● RENAL IMPAIRMENT

- Dose adjustments Clinical effect prolonged in renal failure—reduce dose according to response.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Mivacron (Aspen Pharma Trading Ltd)

Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacron 10mg/5ml solution for injection ampoules | 5 ampoule [PoM] £13.95 Mivacron 20mg/10ml solution for injection ampoules | 5 ampoule [PoM] £22.57

Pancuronium bromide

INDICATIONS AND DOSE

Neuromuscular blockade (long duration) during surgery and intubation

▶ BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg, then 20 micrograms/kg as required

Neuromuscular blockade (long duration) during intensive care

▶ BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

- **SIDE-EFFECTS** Apnoea • arrhythmia • hypersalivation • increased cardiac output • miosis

SIDE-EFFECTS, FURTHER INFORMATION Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia.

- **HEPATIC IMPAIRMENT** Possibly slower onset, higher dose requirement, and prolonged recovery time.
- **RENAL IMPAIRMENT** Use with caution; prolonged duration of block.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Pancuronium bromide (Non-proprietary)

Pancuronium bromide 2 mg per 1 mL Pancuronium bromide 4mg/2mL solution for injection ampoules | 10 ampoule [PoM] £50.00 (Hospital only)

F 1298

Rocuronium bromide

INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 600 micrograms/kg; (by intravenous injection) maintenance 150 micrograms/kg, alternatively (by intravenous infusion) maintenance 300–600 micrograms/kg/hour, adjusted according to response
- ▶ **Elderly:** Initially 600 micrograms/kg; (by intravenous injection) maintenance 75–100 micrograms/kg, alternatively (by intravenous infusion) maintenance up to 400 micrograms/kg/hour, adjusted according to response

Neuromuscular blockade (intermediate duration) during intensive care

INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 600 micrograms/kg, initial dose is optional; (by intravenous infusion) maintenance 300–600 micrograms/kg/hour for first hour, then (by intravenous infusion), adjusted according to response

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Angioedema · face oedema · hypersensitivity · malignant hyperthermia · paralysis · rash erythematous
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce maintenance dose; prolonged paralysis.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Rocuronium bromide (Non-proprietary)

Rocuronium bromide 10 mg per 1 mL Rocuronium bromide 50mg/5mL solution for injection ampoules | 10 ampoule [PoM] £24.00
Rocuronium bromide 50mg/5mL solution for injection vials | 10 vial [PoM] £28.00–£30.00
Rocuronium bromide 100mg/10mL solution for injection vials | 10 vial [PoM] £57.00–£57.90

Esmeron (Merck Sharp & Dohme Ltd)

Rocuronium bromide 10 mg per 1 mL Esmeron 50mg/5mL solution for injection vials | 10 vial [PoM] £28.92 (Hospital only)

F 1298

Vecuronium bromide

INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** 80–100 micrograms/kg; (by intravenous injection) maintenance 20–30 micrograms/kg, adjusted according to response, max. 100 micrograms/kg in caesarian section, alternatively (by intravenous infusion) maintenance 0.8–1.4 micrograms/kg/minute, adjusted according to response

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Angioedema · face oedema · hypersensitivity · paralysis · rash erythematous
- **HEPATIC IMPAIRMENT** Use with caution in significant impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** Reconstitute each vial with 5 mL Water for Injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections. For *continuous intravenous infusion*, dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.
- **MEDICINAL FORMS**
No licensed medicines listed.

1.2 Neuromuscular blockade reversal

Neuromuscular blockade reversal

Neuromuscular blockade reversal

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 1296 or alternatively atropine sulfate p. 1295, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade

Sugammadex p. 1301 is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide or vecuronium bromide. In

practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

ANTICHOLINESTERASES

Neostigmine with glycopyrronium bromide

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 1090, glycopyrronium bromide p. 246.

● INDICATIONS AND DOSE

Reversal of non-depolarising neuromuscular blockade

► BY INTRAVENOUS INJECTION

- Adult: 1–2 mL, repeated if necessary, alternatively 0.02 mL/kg, repeated if necessary; maximum 2 mL per course

- **INTERACTIONS** → Appendix 1: glycopyrronium · neostigmine

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over 10–30 seconds.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Neostigmine with glycopyrronium bromide (Non-proprietary)**
Glycopyrronium bromide 500 microgram per 1 mL, Neostigmine metilsulfate 2.5 mg per 1 mL Neostigmine 2.5mg/1mL / Glycopyrronium bromide 500micrograms/1mL solution for injection ampoules | 10 ampoule [PoM] £11.50

ANTIDOTES AND CHELATORS

Sugammadex

● INDICATIONS AND DOSE

Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium

► BY INTRAVENOUS INJECTION

- Adult: Initially 2–4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details

Immediate reversal of neuromuscular blockade induced by rocuronium

► BY INTRAVENOUS INJECTION

- Adult: 16 mg/kg (consult product literature)

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS** Cardiovascular disease (recovery may be delayed) · elderly (recovery may be delayed) · pre-existing coagulation disorders · recurrence of neuromuscular blockade— monitor respiratory function until fully recovered · use of anticoagulants (unrelated to surgery) · wait 24 hours before re-administering rocuronium · wait 24 hours before re-administering vecuronium
- **INTERACTIONS** → Appendix 1: sugammadex
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · arrhythmias · cough · dizziness · headache · nausea · skin reactions · taste altered · vomiting
 - **Uncommon** Hypersensitivity
 - **Frequency not known** Bronchospasm
- **PREGNANCY** Use with caution—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium*, has advised (February 2013) that sugammadex (*Bridion*®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

► **Bridion** (Merck Sharp & Dohme Ltd)

Sugammadex (as Sugammadex sodium) 100 mg per 1 mL Bridion 500mg/5mL solution for injection vials | 10 vial [PoM] £1,491.00 (Hospital only)
Bridion 200mg/2mL solution for injection vials | 10 vial [PoM] £596.40 (Hospital only)

1.3 Peri-operative analgesia

Peri-operative analgesia

Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain. Acemetacin p. 1097, diclofenac sodium p. 1101, diclofenac potassium p. 1100, flurbiprofen p. 1106, ibuprofen p. 1106, ketoprofen p. 1110, paracetamol p. 438, parecoxib p. 1303, and ketorolac trometamol p. 1144 are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac sodium can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac sodium and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac trometamol is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. See general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 1294.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 1304, fentanyl p. 451, and remifentanyl p. 1304 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl

should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanyl should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

ANAESTHETICS, LOCAL

15

Anaesthesia

Bupivacaine with fentanyl

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1309, fentanyl p. 451.

• INDICATIONS AND DOSE

During labour (once epidural block established)

► BY CONTINUOUS LUMBAR EPIDURAL INFUSION

- Adult: 10–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 16–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours

Postoperative pain (once epidural block established)

► BY CONTINUOUS EPIDURAL INFUSION

- Adult: 4–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 8–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours, to be administered by thoracic, upper abdominal or lower abdominal epidural infusion

• INTERACTIONS → Appendix 1: anaesthetics, local · opioids

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for infusion

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Ketorolac trometamol

• INDICATIONS AND DOSE

Short-term management of moderate to severe acute postoperative pain only

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- Adult (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
- Elderly: Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day

- **CONTRA-INDICATIONS** Active or history of gastro-intestinal bleeding · active or history of gastro-intestinal ulceration · coagulation disorders · complete or partial syndrome of nasal polyps · confirmed or suspected cerebrovascular bleeding · dehydration · following operations with high risk of haemorrhage or incomplete haemostasis · haemorrhagic diatheses · history of gastro-intestinal perforation · hypovolaemia · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · angioedema · anxiety · aplastic anaemia · appetite decreased · asthenia · asthma · azotaemia · bradycardia · burping · chest pain · concentration impaired · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · euphoric mood · fever · flank pain · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · heart failure · hepatic disorders · hyperhidrosis · hyperkinesia · hypersensitivity · hypertension · hypotension · infertility female · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · musculoskeletal disorder · myalgia · myocardial infarction · nausea · nephritis · tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral disorders · pallor · palpitations · pancreatitis · paraesthesia · perforation · photosensitivity reaction · platelet aggregation inhibition · psychotic disorder · pulmonary oedema · renal impairment · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · sleep disorders · stroke · taste altered · thinking abnormal · thirst · thrombocytopenia · ulcer · urinary disorders · vertigo · visual impairment · vomiting · weight increased · wound haemorrhage

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection. **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over at least 15 seconds.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Ketorolac trometamol (Non-proprietary)

Ketorolac trometamol 30 mg per 1 ml Ketorolac 30mg/1ml solution for injection ampoules | 5 ampoule **[PoM]** £4.00 (Hospital only) | 5 ampoule **[PoM]** £4.00 | 6 ampoule **[PoM]** £6.56

▶ Toradol (Atrahs Pharma UK Ltd)

Ketorolac trometamol 30 mg per 1 ml Toradol 30mg/1ml solution for injection ampoules | 5 ampoule **[PoM]** £5.36

Parecoxib

- **DRUG ACTION** Parecoxib is a selective inhibitor of cyclo-oxygenase-2.

● INDICATIONS AND DOSE

Short-term management of acute postoperative pain

- ▶ **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
- ▶ **Elderly (body-weight up to 50 kg):** Initially 20 mg; maximum 40 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · elderly (risk of serious side-effects and fatalities) · following coronary artery bypass graft surgery · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- ▶ **Common or very common** Agitation · back pain · constipation · dizziness · gastrointestinal discomfort · gastrointestinal disorders · hyperhidrosis · hypertension · hypokalaemia · hypotension · increased risk of infection · insomnia · nausea · numbness · peripheral oedema · post procedural complications · renal impairment · respiratory disorders · skin reactions · vomiting
- ▶ **Uncommon** Appetite decreased · arrhythmias · arthralgia · asthenia · cerebrovascular insufficiency · dry mouth · ear pain · embolism and thrombosis · hyperglycaemia · myocardial infarction · thrombocytopenia
- ▶ **Rare or very rare** Hypersensitivity · pancreatitis · perioral swelling
- ▶ **Frequency not known** Angioedema · cardiovascular event · circulatory collapse · congestive heart failure · dyspnoea · hepatitis · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contra-indicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

Dose adjustments Halve dose in moderate impairment (max. 40 mg daily).

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2003) that parecoxib is **not** recommended for use within NHS Scotland.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ Dynastat (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder and solvent for solution for injection vials | 5 vial **[PoM]** £28.34

Powder for solution for injection

▶ Dynastat (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder for solution for injection vials | 10 vial **[PoM]** £49.60

ANALGESICS > OPIOIDS

F 441

Alfentanil

● INDICATIONS AND DOSE

Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures

► BY INTRAVENOUS INJECTION

- Adult: Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures

► BY INTRAVENOUS INJECTION

- Adult: Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures

► BY INTRAVENOUS INFUSION

- Adult: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

Assisted ventilation: analgesia and suppression of respiratory activity during intensive care for up to 4 days

► BY INTRAVENOUS INFUSION

- Adult: Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- Repeated intra-operative doses Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

- **INTERACTIONS** → Appendix 1: opioids

● **SIDE-EFFECTS**

- **Common or very common** Apnoea · chills · fatigue · hypertension · movement disorders · muscle rigidity
- **Uncommon** Arrhythmia · coma · hiccups · hypercapnia · pain · post procedural complications · respiratory disorders · skin reactions
- **Rare or very rare** Agitation · crying · epistaxis · vascular pain
- **Frequency not known** Cardiac arrest · cough · disorientation · fever · loss of consciousness · seizure

SIDE-EFFECTS, FURTHER INFORMATION Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Present in milk—withhold breast-feeding for 24 hours.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **DIRECTIONS FOR ADMINISTRATION** 5 mg/mL injection to be diluted before use. For *continuous or intermittent*

intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection► **Alfentanil (Non-proprietary)**

Alfentanil (as Alfentanil hydrochloride) 500 microgram per

1 ml Alfentanil 1mg/2ml solution for injection ampoules |

10 ampoule [PoM] £5.95 [CD2]

Alfentanil 25mg/50ml solution for injection vials | 1 vial [PoM] £14.90 [CD2]

Alfentanil 5mg/10ml solution for injection ampoules |

5 ampoule [PoM] £13.90 [CD2]

Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Alfentanil 5mg/1ml solution for injection ampoules | 10 ampoule [PoM] £21.95 DT = £23.19 [CD2]

► **Rapifen** (Piramal Critical Care Ltd)

Alfentanil (as Alfentanil hydrochloride) 500 microgram per

1 ml Rapifen 5mg/10ml solution for injection ampoules |

5 ampoule [PoM] £14.50 [CD2]

Rapifen 1mg/2ml solution for injection ampoules | 10 ampoule [PoM] £6.34 [CD2]

Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Rapifen

Intensive Care 5mg/1ml solution for injection ampoules |

10 ampoule [PoM] £23.19 DT = £23.19 (Hospital only) [CD2]

Papaveretum with hyoscine hydrobromide

The properties listed below are those particular to the combination only. For the properties of the components please consider, papaveretum p. 462, hyoscine hydrobromide p. 433.

● **INDICATIONS AND DOSE****Premedication**

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 0.5–1 mL

- **INTERACTIONS** → Appendix 1: hyoscine · opioids

- **LESS SUITABLE FOR PRESCRIBING** Hyoscine hydrobromide with papaveretum is less suitable for prescribing.

● **MEDICINAL FORMS**

No licensed medicines listed.

F 441

Remifentanil

● **INDICATIONS AND DOSE****Analgesia and enhancement of anaesthesia at induction (initial bolus injection)**

► BY INTRAVENOUS INJECTION

- Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose

► BY INTRAVENOUS INFUSION

- Adult: 30–60 micrograms/kg/hour, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)

► BY INTRAVENOUS INJECTION

- Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose

► BY INTRAVENOUS INFUSION

- Adult: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, in light anaesthesia additional doses can be given by intravenous injection every 2–5 minutes during the intravenous infusion

Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia

► BY INTRAVENOUS INFUSION

- Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

Assisted ventilation: analgesia and sedation in intensive-care patients (for max 3 days)

► BY INTRAVENOUS INFUSION

- Adult: Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–44.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients

► BY INTRAVENOUS INFUSION

- Adult: Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

Cardiac surgery

- Adult: (consult product literature)

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Remifentanyl doses in BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Analgesia in conscious patients

- **INTERACTIONS** → Appendix 1: opioids

● SIDE-EFFECTS

- **Common or very common** Apnoea · muscle rigidity · post procedural complications

- **Uncommon** Hypoxia

- **Rare or very rare** Cardiac arrest

- **Frequency not known** Agitation · atrioventricular block · hypertension · seizure

SIDE-EFFECTS, FURTHER INFORMATION In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by plasma esterases; it has short duration of action which is independent of dose and duration of infusion.

Muscle rigidity Remifentanyl can cause muscle rigidity that can be managed by the use of neuromuscular blocking drugs.

- **PREGNANCY** No information available.

- **BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.

● RENAL IMPAIRMENT

Dose adjustments No dose adjustment necessary in renal impairment.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (Ultiva®), give continuously in Glucose 5% or Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).

● PRESCRIBING AND DISPENSING INFORMATION

Remifentanyl should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Remifentanyl (Non-proprietary)

Remifentanyl (as Remifentanyl hydrochloride) 1 mg Remifentanyl 1mg powder for concentrate for solution for injection vials | 5 vial [PoM] £25.60 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 2 mg Remifentanyl 2mg powder for concentrate for solution for injection vials | 5 vial [PoM] £51.13 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 5 mg Remifentanyl 5mg powder for concentrate for solution for injection vials | 5 vial [PoM] £127.90 (Hospital only) [CD2]

► Ultiva (Aspen Pharma Trading Ltd)

Remifentanyl (as Remifentanyl hydrochloride) 1 mg Ultiva 1mg powder for solution for injection vials | 5 vial [PoM] £25.58 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 2 mg Ultiva 2mg powder for solution for injection vials | 5 vial [PoM] £51.15 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 5 mg Ultiva 5mg powder for solution for injection vials | 5 vial [PoM] £127.88 (Hospital only) [CD2]

1.4 Peri-operative sedation

Conscious sedation for clinical procedures

Overview

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be *monitored carefully*; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

ANAESTHETICS, GENERAL ► NMDA RECEPTOR ANTAGONISTS

Ketamine

● INDICATIONS AND DOSE

Induction and maintenance of anaesthesia for short procedures

► BY INTRAMUSCULAR INJECTION

- Adult: Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

continued →

► BY INTRAVENOUS INJECTION

- **Adult:** Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

Diagnostic manoeuvres and procedures not involving intense pain

► BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 4 mg/kg

Induction and maintenance of anaesthesia for long procedures

► BY INTRAVENOUS INFUSION

- **Adult:** Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/mL; maintenance 10–45 micrograms/kg/minute, adjusted according to response

IMPORTANT SAFETY INFORMATION

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · eclampsia · head trauma · hypertension · pre-eclampsia · raised intracranial pressure · severe cardiac disease · stroke

- **CAUTIONS** Acute circulatory failure (shock) · cardiovascular disease · dehydration · elderly · fixed cardiac output · hallucinations · head injury · hypertension · hypovolaemia · increased cerebrospinal fluid pressure · intracranial mass lesions · nightmares · predisposition to seizures · psychotic disorders · raised intra-ocular pressure · respiratory tract infection · thyroid dysfunction

- **INTERACTIONS** → Appendix 1: ketamine

● **SIDE-EFFECTS**

- **Common or very common** Anxiety · behaviour abnormal · confusion · diplopia · hallucination · muscle tone increased · nausea · nystagmus · skin reactions · sleep disorders · tonic clonic movements · vomiting
- **Uncommon** Appetite decreased · arrhythmias · hypotension · respiratory disorders
- **Rare or very rare** Apnoea · cystitis · cystitis haemorrhagic · delirium · dysphoria · flashback · hypersalivation
- **Frequency not known** Drug-induced liver injury

SIDE-EFFECTS, FURTHER INFORMATION Incidence of hallucinations can be reduced by premedication with a benzodiazepine (such as midazolam).

- **PREGNANCY** May depress neonatal respiration if used during delivery.

- **BREAST FEEDING** Avoid for at least 12 hours after last dose.

● **HEPATIC IMPAIRMENT**

Dose adjustments Consider dose reduction.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia. For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection► **Ketamine (Non-proprietary)**

Ketamine (as Ketamine hydrochloride) 50 mg per 1 mL Ketamine 500mg/10mL solution for injection vials | 10 vial **[PoM]** £70.00 **[CD2]**

Ketamin 100mg/2mL solution for injection ampoules | 10 ampoule **[PoM]** **[S]** **[CD2]**

► **Ketalar (Pfizer Ltd)**

Ketamine (as Ketamine hydrochloride) 10 mg per 1 mL Ketalar 200mg/20mL solution for injection vials | 1 vial **[PoM]** £5.06 (Hospital only) **[CD2]**

Ketamine (as Ketamine hydrochloride) 50 mg per 1 mL Ketalar 500mg/10mL solution for injection vials | 1 vial **[PoM]** £8.77 (Hospital only) **[CD2]**

HYPNOTICS, SEDATIVES AND ANXIOLYTICS >

NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Dexmedetomidine● **INDICATIONS AND DOSE****Maintenance of sedation during intensive care**

► BY INTRAVENOUS INFUSION

- **Adult:** 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour

IMPORTANT SAFETY INFORMATION

Dexmedetomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Acute cerebrovascular disorders · second- or third-degree AV block (unless pacemaker fitted) · uncontrolled hypotension

- **CAUTIONS** Abrupt withdrawal after prolonged use · bradycardia · ischaemic heart disease · malignant hyperthermia · severe cerebrovascular disease (especially at higher doses) · severe neurological disorders · spinal cord injury

- **INTERACTIONS** → Appendix 1: dexmedetomidine

● **SIDE-EFFECTS**

- **Common or very common** Agitation · arrhythmias · dry mouth · hyperglycaemia · hypertension · hyperthermia · hypoglycaemia · hypotension · myocardial infarction · myocardial ischaemia · nausea · respiratory depression · vomiting

- **Uncommon** Abdominal distension · apnoea · atrioventricular block · drug ineffective · dyspnoea · hallucination · hypoalbuminaemia · metabolic acidosis · thirst

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Dose reduction may be required.

● **MONITORING REQUIREMENTS**

- Monitor cardiac function.
- Monitor respiratory function in non-intubated patients.

- **DIRECTIONS FOR ADMINISTRATION** To be diluted before use. For *intravenous infusion* given continuously in Glucose

5% or Sodium chloride 0.9%, dilute to a concentration of 4 micrograms/mL.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Dexdor** (Orion Pharma (UK) Ltd)

Dexmedetomidine (as Dexmedetomidine hydrochloride)

100 microgram per 1 ml Dexdor 1mg/10ml concentrate for solution

for infusion vials | 4 vial [PoM] £313.20 (Hospital only)

Dexdor 400micrograms/4ml concentrate for solution for infusion vials

| 4 vial [PoM] £125.28 (Hospital only)

Dexdor 200micrograms/2ml concentrate for solution for infusion

ampoules | 5 ampoule [PoM] £78.30 (Hospital only) |

25 ampoule [PoM] £391.50 (Hospital only)

2 Malignant hyperthermia

MUSCLE RELAXANTS > DIRECTLY ACTING

Dantrolene sodium

- **DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

• INDICATIONS AND DOSE

Malignant hyperthermia

► BY RAPID INTRAVENOUS INJECTION

- Adult: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course

Chronic severe spasticity of voluntary muscle

► BY MOUTH

- Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

• CONTRA-INDICATIONS

- With oral use Acute muscle spasm • avoid when spasticity is useful, for example, locomotion

• CAUTIONS

- With intravenous use Avoid extravasation (risk of tissue necrosis)
- With oral use Females (hepatotoxicity) • history of liver disorders (hepatotoxicity) • if doses greater than 400 mg daily (hepatotoxicity) • impaired cardiac function • impaired pulmonary function • patients over 30 years (hepatotoxicity) • therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

- **INTERACTIONS** → Appendix 1: dantrolene

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain • hepatic disorders • nausea • respiratory disorders • skin reactions • speech disorder • vomiting
- **Uncommon** Crystalluria • hyperhidrosis
- **Frequency not known** Arrhythmias • dizziness • drowsiness

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Appetite decreased • chills • confusion • depression • eosinophilia • fever • headache • insomnia • nervousness • pericarditis • visual impairment
- **Uncommon**
- With oral use Constipation • dysphagia • haemorrhage • heart failure aggravated • urinary disorders

► Frequency not known

- With intravenous use Gastrointestinal haemorrhage • heart failure • pulmonary oedema • seizure
- With oral use Asthenia • diarrhoea • dyspnoea • hypertension • malaise

• PREGNANCY

- With intravenous use Use only if potential benefit outweighs risk.
- With oral use Avoid use in chronic spasticity—embryotoxic in animal studies.

• BREAST FEEDING

- With intravenous use Present in milk—use only if potential benefit outweighs risk.
- With oral use Present in milk—manufacturer advises avoid use in chronic spasticity.

- **HEPATIC IMPAIRMENT** Avoid—may cause severe liver damage (injection may be used in an emergency for malignant hyperthermia).

• MONITORING REQUIREMENTS

- With oral use Test liver function before and at intervals during therapy.

• PATIENT AND CARER ADVICE

Hepatotoxicity ► With oral use Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

Driving and skilled tasks ► With oral use Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Powder for solution for injection

Local anaesthesia

Anaesthesia (local)

Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1309 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for

continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Levobupivacaine p. 1311, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 1312 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 221) is about 90 minutes.

Prilocaine hydrochloride p. 1316 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1317 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1318, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration by injection

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should **never** be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential.

Vasoconstrictors in combination with local anaesthetics

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is **not** advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics **articaine** and mepivacaine hydrochloride p. 1315 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

Toxicity induced by local anaesthesia

For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity below.

Severe local anaesthetic-induced cardiovascular toxicity

Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as *Intralipid*[®] [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.

ANAESTHETICS, LOCAL**Adrenaline with articaine hydrochloride****(Carticaine hydrochloride with epinephrine)****● INDICATIONS AND DOSE****Infiltration anaesthesia in dentistry**

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **CONTRA-INDICATIONS** Application to damaged skin · application to the middle ear (may cause ototoxicity) · complete heart block · injection into infected tissues · injection into inflamed tissues · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block)

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Arrhythmias · arteriosclerosis · cardiovascular disease · cerebrovascular disease · cor pulmonale · debilitated patients (consider dose reduction) · diabetes mellitus · elderly (consider dose reduction) · epilepsy · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · hypovolaemia · impaired cardiac conduction · impaired respiratory function · ischaemic heart disease · myasthenia gravis · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · shock · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

- ▶ Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- **INTERACTIONS** → Appendix 1: articaine · sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Face oedema · gingivitis · headache · nausea · sensation abnormal

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The toxicity mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be

unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● ALLERGY AND CROSS-SENSITIVITY

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Avoid breast-feeding for 48 hours after administration.

- **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

- ▶ **Septanest** (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 mL, Articaine hydrochloride 40 mg per 1 mL Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge [PoM] £24.95

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 mL, Articaine hydrochloride 40 mg per 1 mL Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge [PoM] £24.95

Bupivacaine hydrochloride**● INDICATIONS AND DOSE****Surgical anaesthesia, lumbar epidural block**

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 75–150 mg, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia, field block

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, thoracic epidural block

- ▶ BY THORACIC EPIDURAL

- ▶ Adult: 12.5–50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, caudal epidural block

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, major nerve block

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

Acute pain, intra-articular block

- ▶ BY INTRA-ARTICULAR INJECTION

- ▶ Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

Acute pain, thoracic epidural block

- ▶ BY CONTINUOUS EPIDURAL INFUSION

- ▶ Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

continued →

Acute pain, labour

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- Adult: 6.25–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Acute pain, lumbar epidural block

- ▶ INITIALLY BY LUMBAR EPIDURAL
- Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg, repeated when required at intervals of at least 30 minutes, dose administered by intermittent injection using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, field block

- ▶ BY REGIONAL ADMINISTRATION
- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

MARCAIN HEAVY®**Intrathecal anaesthesia for surgery**

- ▶ BY INTRATHECAL INJECTION
- Adult: 10–20 mg

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Cardiovascular disease · cerebral atheroma · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypertension · hypotension · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · myocardial depression may be more severe and more resistant to treatment · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · urinary retention · vomiting
- ▶ **Uncommon** Neurotoxicity
- ▶ **Rare or very rare** Arachnoiditis · cardiac arrest · diplopia · nerve disorders · paraplegia · paresis · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of

excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● ALLERGY AND CROSS-SENSITIVITY

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.

Dose adjustments Use lower doses for intrathecal use during late pregnancy.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection▶ **Bupivacaine hydrochloride (Non-proprietary)**

Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine 25mg/10ml (0.25%) solution for injection vials | 10 vial [PoM] [S]
Bupivacaine 0.25% solution for injection 10ml Sure-Amp ampoules | 20 ampoule [PoM] £17.50

Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 0.5% solution for injection 10ml Sure-Amp ampoules | 20 ampoule [PoM] £18.30

Bupivacaine 100mg/20ml (0.5%) solution for injection vials | 10 vial [PoM] [S]

Bupivacaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule [PoM] £17.58

Levobupivacaine

● INDICATIONS AND DOSE

Acute postoperative pain

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute labour pain

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 15–25 mg, repeated at intervals of at least 15 minutes, dose administered using a 2.5 mg/mL (0.25%) solution; maximum 400 mg per day
- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 5–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Surgical anaesthesia, peripheral nerve block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, peribulbar nerve block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 37.5–112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia for caesarean section

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 75–150 mg, to be given over 15–20 minutes, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution
- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution
- ▶ BY LOCAL INFILTRATION
- ▶ Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · back pain · dizziness · fever · headache · hypotension · nausea · vomiting
- ▶ **Frequency not known** Angioedema · apnoea · arrhythmias · asthma · atrioventricular block · bladder disorder · cardiac arrest · drowsiness · eye disorders · faecal incontinence · flushing · loss of consciousness · muscle twitching · muscle weakness · nerve disorders · neurological injury · oral hypoaesthesia · paralysis · priapism · respiratory disorders · seizure · sensation abnormal · skin reactions · sneezing · sweat changes · syncope · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. Systemic toxicity can occur due to inadvertent intravascular injection. The onset of toxicity can be unpredictable and delayed. Monitor as

per local protocol for at least 30 minutes after administration.

● ALLERGY AND CROSS-SENSITIVITY

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in *animal* studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **DIRECTIONS FOR ADMINISTRATION** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.

● PRESCRIBING AND DISPENSING INFORMATION

Levobupivacaine is an isomer of bupivacaine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Chirocaine** (AbbVie Ltd)

Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 mL Chirocaine 25mg/10mL solution for injection ampoules | 10 ampoule [PoM] £14.11 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 mL Chirocaine 75mg/10mL solution for injection ampoules | 10 ampoule [PoM] £24.23 (Hospital only)

Infusion

- ▶ **Chirocaine** (AbbVie Ltd)

Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 mL Chirocaine 125mg/100mL infusion bags | 24 bag [PoM] £174.22

Chirocaine 250mg/200mL infusion bags | 12 bag [PoM] £

Lidocaine hydrochloride (Lignocaine hydrochloride)

● INDICATIONS AND DOSE

Infiltration anaesthesia

- ▶ **BY LOCAL INFILTRATION**

- ▶ **Adult:** Dose to be given according to patient's weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

Intravenous regional anaesthesia and nerve block

- ▶ **BY REGIONAL ADMINISTRATION**

- ▶ **Adult:** Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis) | Lubricant in cystoscopy | Lubricant in proctoscopy

- ▶ **TO THE SKIN USING OINTMENT**

- ▶ **Adult:** Apply 1–2 mL as required, avoid long-term use

Sore nipples from breast-feeding

- ▶ **TO THE SKIN USING OINTMENT**

- ▶ **Adult:** Apply using gauze and wash off immediately before next feed

LMX 4[®]

Anaesthesia before venous cannulation or venepuncture

- ▶ **TO THE SKIN**

- ▶ **Child 1–2 months:** Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
- ▶ **Child 3–11 months:** Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- ▶ **Child 1–17 years:** Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- ▶ **Adult:** Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

VERSATIS[®]

Postherpetic neuralgia

- ▶ **TO THE SKIN**

- ▶ **Adult:** Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

XYLOCAINE[®]

During delivery in obstetrics

- ▶ **TO THE SKIN**

- ▶ **Adult:** Up to 20 doses

IMPORTANT SAFETY INFORMATION

- ▶ When used by local infiltration

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

● CONTRA-INDICATIONS

- ▶ When used by regional administration All grades of atrioventricular block · application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · severe myocardial depression · should not be applied to damaged skin · sino-atrial disorders

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ When used by regional administration Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

● CAUTIONS

- When used by regional administration Acute porphyrias p. 1025 (consider infusion with glucose for its anti-porphyrinogenic effects) · children (consider dose reduction) · congestive cardiac failure (consider lower dose) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · post cardiac surgery (consider lower dose) · shock

● INTERACTIONS → Appendix 1: antiarrhythmics**● SIDE-EFFECTS**

- With parenteral use Anxiety · arrhythmias · atrioventricular block · cardiac arrest · circulatory collapse · confusion · dizziness · drowsiness · euphoric mood · headache · hypotension (may lead to cardiac arrest) · loss of consciousness · methaemoglobinemia · muscle twitching · myocardial contractility decreased · nausea · neurological effects · nystagmus · pain · psychosis · respiratory disorders · seizure · sensation abnormal · temperature sensation altered · tinnitus · tremor · vision blurred · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinemia Methylthionium chloride is licensed for the acute symptomatic treatment of drug-induced methaemoglobinemia.

● ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- PREGNANCY** Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

- BREAST FEEDING** Present in milk but amount too small to be harmful.

- HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.

- RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

● MONITORING REQUIREMENTS

- With systemic use Monitor ECG and have resuscitation facilities available.

● NATIONAL FUNDING/ACCESS DECISIONS
VERSATIS®**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (July 2008) that *Versatis®* is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, liquid, ointment

Solution for injection**▶ Lidocaine hydrochloride (Non-proprietary)**

Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule [PoM] £7.00
Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule [PoM] £11.21

Lidocaine 100mg/10ml (1%) solution for injection ampoules |

10 ampoule [PoM] £4.40 DT = £4.40

Lidocaine 100mg/10ml (1%) solution for injection Sure-Amp ampoules

| 20 ampoule [PoM] £8.80

Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial [PoM] £19.00

Lidocaine 200mg/20ml (1%) solution for injection ampoules |

10 ampoule [PoM] £7.00-£9.63 DT = £9.63

Lidocaine 50mg/5ml (1%) solution for injection ampoules |

10 ampoule [PoM] £2.59-£3.10 DT = £2.59

Lidocaine 20mg/2ml (1%) solution for injection ampoules |

10 ampoule [PoM] £3.50 DT = £2.20

Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules |

20 ampoule [PoM] £6.00

Lidocaine hydrochloride 20 mg per 1 ml Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule [PoM] £2.70-£3.80 DT = £2.70

Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial [PoM] £19.50

Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco

ampoules | 20 ampoule [PoM] £14.95

Lidocaine 40mg/2ml (2%) solution for injection ampoules |

10 ampoule [PoM] £4.00 DT = £2.37

Lidocaine 100mg/5ml (2%) solution for injection Sure-Amp ampoules

| 20 ampoule [PoM] £6.00

Lidocaine 400mg/20ml (2%) solution for injection ampoules |

10 ampoule [PoM] £8.00-£9.90 DT = £9.90

Medicated plaster

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol

- ▶ **Versatis** (Grunenthal Ltd)

Lidocaine 50 mg per 1 gram Versatis 700mg medicated plasters | 30 plaster [PoM] £72.40 DT = £72.40

Cream

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

- ▶ **LMX 4** (Ferndale Pharmaceuticals Ltd)

Lidocaine 40 mg per 1 gram LMX 4 cream | 5 gram [P] £2.98 DT = £2.98 | 30 gram [P] £14.90 DT = £14.90

Ointment

- ▶ **Lidocaine hydrochloride (Non-proprietary)**

Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment | 15 gram [P] £6.50 DT = £6.18

Spray

- ▶ **Xylocaine** (Aspen Pharma Trading Ltd)

Lidocaine 10 mg per 1 actuation Xylocaine 10mg/dose spray sugar-free | 50 ml [P] £6.29 DT = £6.29

Lidocaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1312, adrenaline/epinephrine p. 221.

● INDICATIONS AND DOSE**Local anaesthesia**

- ▶ **BY LOCAL INFILTRATION**

- ▶ **Adult:** Dosed according to the type of nerve block required (consult product literature)

IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **INTERACTIONS** → Appendix 1: antiarrhythmics · sympathomimetics, vasoconstrictor

● PROFESSION SPECIFIC INFORMATION**Dental information**

A variety of lidocaine injections with adrenaline is available in dental cartridges.

Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

EXCIPIENTS: May contain Sulfités

► Lignospan Special (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Lignospan Special 2% injection 2.2ml cartridges | 50 cartridge [PoM] £21.95
Lignospan Special 2% injection 1.8ml cartridges | 50 cartridge [PoM] £21.95

► Rexocaine (Henry Schein Ltd)

Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Rexocaine 2% injection 2.2ml cartridges | 50 cartridge [PoM] £23.29

► Xylocaine with Adrenaline (Aspen Pharma Trading Ltd)

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 10 mg per 1 ml Xylocaine 1% with Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £9.66 DT = £9.66

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Xylocaine 2% with Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £8.85 DT = £8.85

Lidocaine with cetrimide

27-Apr-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1312.

• INDICATIONS AND DOSE

Anaesthesia and disinfection in dental practice

- TO MUCOUS MEMBRANES USING OROMUCOSAL SPRAY
- Adult: 10–20 mg, no more than 30 mg should be applied to the same quadrant of the buccal cavity—consult product literature, dose expressed as lidocaine

Anaesthesia in dental practice

- TO MUCOUS MEMBRANES USING DENTAL GEL
- Adult: Apply 100–500 mg, use cotton pellet for application to dried mucosa, dose expressed as weight of gel

DOSE EQUIVALENCE AND CONVERSION

- 1 metered dose of Xylonor® spray is equivalent to 10 mg of lidocaine.
- 2 millimetres of Xylonor® gel is approximately equivalent to 100 mg of gel (approximately equivalent to 5 mg of lidocaine).

- **CAUTIONS** Sepsis (risk of rapid systemic absorption) • traumatised mucosa (risk of rapid systemic absorption)

- **INTERACTIONS** → Appendix 1: antiarrhythmics

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oromucosal gel

► Xylonor (Septodont Ltd)

Cetrimide 1.5 mg per 1 gram, Lidocaine 50 mg per 1 gram Xylonor 5% gel sugar-free | 15 gram [PoM] £4.00

Spray

► Xylonor (Septodont Ltd)

Cetrimide 100 microgram per 1 gram, Lidocaine 10 mg per 1 gram Xylonor 10% spray sugar-free | 36 gram [PoM] £20.15

Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1312, phenylephrine hydrochloride p. 188.

• INDICATIONS AND DOSE

Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose

- BY INTRANASAL ADMINISTRATION

- Adult: Up to 8 sprays

- **INTERACTIONS** → Appendix 1: antiarrhythmics • sympathomimetics, vasoconstrictor

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

► Lidocaine with phenylephrine (Non-proprietary)

Phenylephrine hydrochloride 5 mg per 1 ml, Lidocaine hydrochloride 50 mg per 1 ml Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml [PoM] £12.90 DT = £12.90

Lidocaine with prilocaline

14-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1312, prilocaline hydrochloride p. 1316.

• INDICATIONS AND DOSE

Anaesthesia before minor skin procedures including venepuncture

- TO THE SKIN

- Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day

- Child 3-11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day

- Child 1-11 years: Apply 1–5 hours before procedure, a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day

- Child 12-17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

- Adult: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

Anaesthesia on genital skin before injection of local anaesthetics

- TO THE SKIN

- Adult: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure

Anaesthesia before surgical treatment of lesions on genital mucosa

► TO THE SKIN

- Adult: Apply up to 10 g, to be applied 5–10 minutes before procedure

Anaesthesia before cervical curettage

► TO THE SKIN

- Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer

► TO THE SKIN

- Adult: Apply up to 10 g for 30–60 minutes, to be applied under occlusive dressing

- **CONTRA-INDICATIONS** Use in child less than 37 weeks corrected gestational age

- **INTERACTIONS** → Appendix 1: anaesthetics, local · antiarrhythmics

● **PATIENT AND CARER ADVICE**

- **Denela** (Teva UK Ltd)

Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Denela 5% cream | 5 gram [P] £2.84–£3.29 | 25 gram [P] £12.99 | 30 gram [P] £14.75 DT = £12.30

- **Emla** (Aspen Pharma Trading Ltd)

Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Emla 5% cream | 5 gram [P] £2.25–£2.99 | 25 gram [P] £11.70 | 30 gram [P] £12.30 DT = £12.30

- **Nulbia** (Glenmark Pharmaceuticals Europe Ltd)

Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Nulbia 5% cream | 5 gram [P] £1.58 | 25 gram [P] £7.88 | 30 gram [P] £8.61 DT = £12.30

Mepivacaine hydrochloride● **INDICATIONS AND DOSE****Infiltration anaesthesia and nerve block in dentistry**

- Child 3–17 years: Consult expert dental sources
- Adult: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

● **SIDE-EFFECTS**

- **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting

- **Uncommon** Neurotoxicity

- **Rare or very rare** Arachnoiditis · cardiac arrest · diplopia · nerve disorders · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● **ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use with caution in early pregnancy.

- **BREAST FEEDING** Use with caution.

- **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.

- **RENAL IMPAIRMENT** Use with caution; increased risk of side-effects.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Scandonest plain** (Septodont Ltd)

Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge [Pom] £21.95

Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride above, adrenaline/epinephrine p. 221.

● **INDICATIONS AND DOSE****Infiltration anaesthesia and nerve block in dentistry**

- BY LOCAL INFILTRATION

- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a

concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **INTERACTIONS** → Appendix 1: anaesthetics, local · sympathomimetics, vasoconstrictor

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfités

- ▶ **Scandonest special** (Septodont Ltd)

Adrenaline 10 microgram per 1 mL, Mepivacaine hydrochloride 20 mg per 1 mL Scandonest special 2% solution for injection 2.2mL cartridges | 50 cartridge [PoM] £21.95

Prilocaine hydrochloride

● INDICATIONS AND DOSE

DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

CITANEST 1% ®

Infiltration anaesthesia | Nerve block

- ▶ **BY REGIONAL ADMINISTRATION**

- ▶ **Adult:** 100–200 mg/minute, alternatively may be given in incremental doses; dose adjusted according to site of administration and response, and in elderly and debilitated patients (smaller doses may be required); maximum 400 mg per course

PRILOTEKAL ®

Spinal anaesthesia

- ▶ **BY INTRATHECAL INJECTION**

- ▶ **Adult:** Usual dose 40–60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acquired methaemoglobinemia · anaemia · application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · congenital methaemoglobinemia · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Injection site** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · severe or untreated hypertension · shock
- **INTERACTIONS** → Appendix 1: anaesthetics, local

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting
- ▶ **Uncommon** Neurotoxicity
- ▶ **Rare or very rare** Cardiac arrest · methaemoglobinemia · nerve disorders
- ▶ **Frequency not known** Diplopia · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

Methaemoglobinemia Methaemoglobinemia can be treated with an intravenous injection of methylthioninium chloride.

● ALLERGY AND CROSS-SENSITIVITY

- ▶ **Hypersensitivity and cross-sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported).

Dose adjustments Use lower doses for intrathecal use during late pregnancy.

- **BREAST FEEDING** Present in milk but not known to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

Dose adjustments Lower doses may be required for intrathecal anaesthesia.

- **RENAL IMPAIRMENT** Use with caution.

Dose adjustments Lower doses may be required for intrathecal anaesthesia.

● NATIONAL FUNDING/ACCESS DECISIONS

PRILOTEKAL ®

Scottish Medicines Consortium (SMC) Decisions

- ▶ **With intrathecal use** The *Scottish Medicines Consortium* has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (*Prilotekal*®) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Citanest** (Aspen Pharma Trading Ltd)

Ropivacaine hydrochloride

● INDICATIONS AND DOSE

Acute pain, peripheral nerve block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 10–20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

Acute pain, field block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 2–200 mg, dose administered using a 2 mg/mL (0.2%) solution

Acute pain, lumbar epidural block

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

Acute labour pain

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 12–20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Acute postoperative pain

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Postoperative pain, thoracic epidural block

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 12–28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Surgical anaesthesia, field block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, major nerve block (brachial plexus block)

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)

- ▶ BY THORACIC EPIDURAL
- ▶ Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia for caesarean section

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, lumbar epidural block

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 113–200 mg, dose administered using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

● INDICATIONS AND DOSE

Anaesthesia before venepuncture or venous cannulation

➤ TO THE SKIN

- Child 1 month-4 years: Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
- Child 5-17 years: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
- Adult: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

- **CONTRA-INDICATIONS** Should not be applied to damaged skin

- **INTERACTIONS** → Appendix 1: anaesthetics, local

- **SIDE-EFFECTS** Oedema · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION The systemic toxicity of local anaesthetics mainly involves the central nervous system; systemic side effects unlikely as minimal absorption following topical application.

- **ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less

Poisoning, emergency treatment

Overview

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either **TOXBASE** or the **UK National Poisons Information Service** be consulted when there is doubt about the degree of risk or about management.

Hospital admission

Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 121, iron, paracetamol p. 438, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, *Lomotil*®) p. 66; the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the **UK National Poisons Information Service** on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from **TOXBASE** or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information

should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The **National Poisons Information Service** should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 1008 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amfetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis,

or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

Convulsions during poisoning

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 335 or diazepam (preferably as emulsion) p. 340 should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 336 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam can be administered as a rectal solution.

Methaemoglobinaemia

Drug- or chemical-induced methaemoglobinaemia should be treated with methylthioninium chloride p. 1331 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinaemia.

Poison removal and elimination

Prevention of absorption

Given by mouth, charcoal, activated p. 1326 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

Active elimination techniques

Repeated doses of charcoal, activated by mouth *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of

charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should **not** be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalisation of the urine for salicylates.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of *emesis* (e.g. with ipecacuanha) is **not** recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

Alcohol, acute intoxication

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Aspirin poisoning

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Patients whose plasma-paracetamol concentrations are on or above the **treatment line** should be treated with acetylcysteine by intravenous infusion.

The prognostic accuracy after 15 hours is uncertain, but a plasma-paracetamol concentration on or above the treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of Medicines and Healthcare products Regulatory Agency

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

Opioid poisoning

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1329 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone.

Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment

with sodium bicarbonate p. 1006 or magnesium sulfate p. 1019, or both. Arrhythmias may occur for up to 12 hours.

Paracetamol poisoning

In cases of **intravenous paracetamol poisoning** contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol p. 438 may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1330 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative

if intravenous access is not possible—contact the National Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

Acute overdose

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Patients who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 1326 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Patients at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line ('treatment line') joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in patients:

- whose plasma-paracetamol concentration falls on or above the *treatment line* on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the *treatment line* on the paracetamol treatment graph, provided that the patient is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the *treatment line* on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

'Staggered' overdose, uncertain time of overdose, or therapeutic excess

A 'staggered' overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a 'staggered' overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g.

carbamazepine p. 309, efavirenz p. 632, nevirapine p. 633, phenobarbital p. 331, phenytoin p. 321, primidone p. 332, rifabutin p. 564, rifampicin p. 571, St John's wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient's risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

Acetylcysteine dose and administration

For paracetamol overdosage, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine, for adults and children of body-weight 40 kg and over, in terms of the volume of acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to glucose Intravenous Infusion 5% p. 1009.

First infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare first infusion
40–49 kg	34 mL
50–59 kg	42 mL
60–69 kg	49 mL
70–79 kg	57 mL
80–89 kg	64 mL
90–99 kg	72 mL
100–109 kg	79 mL
≥110 kg	83 mL (max. dose)

First infusion (based on an acetylcysteine dose of approx. 150 mg/kg)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 200 mL Glucose Intravenous Infusion 5%; infuse over 1 hour.

Second infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare second infusion
40–49 kg	12 mL
50–59 kg	14 mL
60–69 kg	17 mL
70–79 kg	19 mL
80–89 kg	22 mL
90–99 kg	24 mL
100–109 kg	27 mL
≥110 kg	28 mL (max. dose)

Second infusion (based on an acetylcysteine dose of approx. 50 mg/kg; start immediately after completion of first infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 500 mL Glucose Intravenous Infusion 5%; infuse over 4 hours.

Third infusion

Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare third infusion
40–49 kg	23 mL
50–59 kg	28 mL
60–69 kg	33 mL
70–79 kg	38 mL
80–89 kg	43 mL
90–99 kg	48 mL
100–109 kg	53 mL
≥110 kg	55 mL (max. dose)

Third infusion (based on an acetylcysteine dose of approx. 100 mg/kg; start immediately after completion of second infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose Intravenous Infusion 5%; infuse over 16 hours.

Antidepressant poisoning

Tricyclic and related antidepressants

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs)

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see *Convulsions*). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarial poisoning

Overdose with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include

arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotic poisoning

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 406 or diazepam (emulsion preferred) p. 340.

Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1326 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepine poisoning

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1328 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

Beta blockers poisoning

Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions.

Acute massive overdose must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 1131 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 707 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not available, intravenous isoprenaline (available from 'special-order' manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

Calcium-channel blockers poisoning

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 1014 or calcium gluconate p. 1014 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts poisoning

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 996, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium poisoning

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within

1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

Stimulant-drug poisoning

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 340 or lorazepam p. 335; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy

Ecstasy (methylenedioxymethamphetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methylenedioxymethamphetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline poisoning

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 430 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 1025 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Cyanide poisoning

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1327 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should **not** be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1327 followed by sodium thiosulfate p. 1327 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin (*Cyanokit*®—no other preparation of hydroxocobalamin is suitable) p. 994 can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol poisoning

Fomepizole (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, **ethanol** (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metal poisoning

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases poisoning

Carbon monoxide

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow **oxygen** 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 228. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, and ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray poisoning

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agent poisoning

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing pralidoxime chloride p. 1327 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticide poisoning

Organophosphorus insecticides

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1295 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The

bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with **adrenaline/epinephrine p. 221**. Indications for European viper snake venom antiserum treatment p. 1331 include *systemic envenoming*, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of *severe envenoming* (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of *systemic envenoming* persist contact the National Poisons Information Service. Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

European viper snake venom antiserum is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible.

Anaphylactic reactions require immediate treatment with intramuscular **adrenaline/epinephrine**; self-administered intramuscular adrenaline/epinephrine (e.g. *EpiPen*®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an **oral antihistamine** or a **topical corticosteroid** may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o'-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE.

The **National Poisons Information Service** (Tel: 0344 892 0111) will provide specialist advice on all aspects of poisoning day and night.

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

• INDICATIONS AND DOSE

Reduction of absorption of poisons in the gastro-intestinal system

► BY MOUTH

► Neonate: 1 g/kg.

► Child 1 month–11 years: 1 g/kg (max. per dose 50 g)

► Child 12–17 years: 50 g

► Adult: 50 g

Active elimination of poisons

► BY MOUTH

► Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.

► Child 1 month–11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy

► Child 12–17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

► Adult: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

Accelerated elimination of teriflunomide

► BY MOUTH USING GRANULES

► Adult: 50 g every 12 hours for 11 days

Accelerated elimination of leflunomide (washout procedure)

► BY MOUTH USING GRANULES

► Adult: 50 g 4 times a day for 11 days

• UNLICENSED USE

► In adults Activated charcoal doses in BNF may differ from those in product literature.

• **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration—ensure airway protected) · reduced gastrointestinal motility (risk of obstruction)

• **SIDE-EFFECTS** Bezoar · constipation · diarrhoea · gastrointestinal disorders

• **DIRECTIONS FOR ADMINISTRATION** Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Charcodote** (Teva UK Ltd)

Activated charcoal **200 mg per 1 ml** Charcodote 200mg/ml oral suspension sugar-free | 250 ml **P** £11.88

Granules

- ▶ **Carbomix** (Kent Pharmaceuticals Ltd)

Activated charcoal **813 mg per 1 gram** Carbomix 81.3% granules sugar-free | 50 gram **P** £11.90

2 Chemical toxicity

2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

Dicobalt edetate

INDICATIONS AND DOSE

Severe poisoning with cyanides

- ▶ BY INTRAVENOUS INJECTION

- ▶ **Child:** Consult the National Poisons Information Service

- ▶ **Adult:** 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity

- **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness

- **SIDE-EFFECTS** Reflex tachycardia · vomiting

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Dicobalt edetate (Non-proprietary)**

Dicobalt edetate **15 mg per 1 ml** Dicobalt edetate 300mg/20ml solution for injection ampoules | 6 ampoule **PoM** £117.20

Sodium nitrite

16-Mar-2018

INDICATIONS AND DOSE

Poisoning with cyanides (used in conjunction with sodium thiosulfate)

- ▶ BY INTRAVENOUS INJECTION

- ▶ **Child:** Consult the National Poisons Information Service

- ▶ **Adult:** 300 mg

- **SIDE-EFFECTS** Arrhythmias · dizziness · headache · hypotension · palpitations

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Sodium nitrite (Non-proprietary)**

Sodium nitrite **30 mg per 1 ml** Sodium nitrite 300mg/10ml solution for injection vials | 1 vial **PoM** **S**

Sodium thiosulfate

16-Mar-2018

INDICATIONS AND DOSE

Poisoning with cyanides

- ▶ BY INTRAVENOUS INJECTION

- ▶ **Child:** Consult the National Poisons Information Service

- ▶ **Adult:** 12.5 g, to be given over 10 minutes, dose may be repeated in severe cyanide poisoning

DOSE EQUIVALENCE AND CONVERSION

- ▶ 12.5 g equates to 50 mL of a 25% solution or 25 mL of a 50% solution.

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ▶ **Sodium thiosulfate (Non-proprietary)**

Sodium thiosulfate **250 mg per 1 ml** Sodium thiosulfate 12.5g/50ml solution for injection vials | 1 vial **PoM** **S**

2.2 Organophosphorus toxicity

Other drugs used for Organophosphorus toxicity Atropine sulfate, p. 1295

ANTIDOTES AND CHELATORS

Pralidoxime chloride

INDICATIONS AND DOSE

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Child:** Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
- ▶ **Adult:** Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

- **UNLICENSED USE** Pralidoxime chloride doses may differ from those in product literature. Licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Poisoning with carbamates · poisoning with organophosphorus compounds without anticholinesterase activity

- **CAUTIONS** Myasthenia gravis

- **SIDE-EFFECTS** Dizziness · drowsiness · headache · hyperventilation · muscle weakness · nausea · tachycardia · visual impairment

- **RENAL IMPAIRMENT** Use with caution.

- **DIRECTIONS FOR ADMINISTRATION** The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.

- ▶ In children *For intravenous infusion*, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres).

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Protopam (imported (United States))

Pralidoxime chloride 1 gram Protopam Chloride 1g powder for solution for injection vials | 6 vial **[PoM]** 

3 Drug toxicity

3.1 Benzodiazepine toxicity

ANTIDOTES AND CHELATORS > BENZODIAZEPINE ANTAGONISTS

Flumazenil

● INDICATIONS AND DOSE

Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300–600 micrograms; maximum 1 mg per course

Reversal of sedative effects of benzodiazepines in intensive care

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course

Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after injection)

▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection) 300 micrograms, adjusted according to response

IMPORTANT SAFETY INFORMATION

Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

- **CAUTIONS** Avoid rapid injection following major surgery · avoid rapid injection in high-risk or anxious patients · benzodiazepine dependence (may precipitate withdrawal symptoms) · elderly · ensure neuromuscular blockade cleared before giving · head injury (rapid reversal of benzodiazepine sedation may cause convulsions) · history of panic disorders (risk of recurrence) · prolonged benzodiazepine therapy for epilepsy (risk of convulsions) · short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · diplopia · dry mouth · eye disorders · flushing · headache · hiccups · hyperhidrosis · hyperventilation · hypotension · insomnia · nausea · palpitations · paraesthesia · speech disorder · tremor · vertigo · vomiting
- ▶ **Uncommon** Abnormal hearing · arrhythmias · chest pain · chills · cough · dyspnoea · nasal congestion · seizure (more common in patients with epilepsy)
- ▶ **Frequency not known** Withdrawal syndrome

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** **Dose adjustments** Carefully titrate dose.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Flumazenil (Non-proprietary)

Flumazenil 100 microgram per 1 ml Flumazenil 500micrograms/5ml solution for injection ampoules | 5 ampoule **[PoM]** £65.50–£70.00

3.2 Digoxin toxicity

ANTIDOTES AND CHELATORS > ANTIBODIES

Digoxin-specific antibody

● INDICATIONS AND DOSE

Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary

▶ BY INTRAVENOUS INFUSION

- ▶ Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
- ▶ Adult: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

● DIRECTIONS FOR ADMINISTRATION

- ▶ In adults For *intravenous infusion (DigiFab®)*, given intermittently in Sodium chloride 0.9%. Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ DigiFab (BTG International Ltd)

Digoxin-specific antibody fragments 40 mg DigiFab 40mg powder for solution for infusion vials | 1 vial **[PoM]** £750.00 (Hospital only)

3.3 Heparin toxicity

ANTIDOTES AND CHELATORS

Protamine sulfate

● INDICATIONS AND DOSE

Overdosage with intravenous injection of unfractionated heparin

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg

Overdosage with intravenous infusion of unfractionated heparin

► BY INTRAVENOUS INJECTION

- Adult: 25–50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute

Overdosage with subcutaneous injection of unfractionated heparin

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 100 units heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course

Overdosage with subcutaneous injection of low molecular weight heparin

► BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg

- **CAUTIONS** Excessive doses can have an anticoagulant effect
- **SIDE-EFFECTS**
- **Rare or very rare** Hypertension · pulmonary oedema non-cardiogenic
- **Frequency not known** Acute pulmonary vasoconstriction · back pain · bradycardia · circulatory collapse · dyspnoea · fatigue · feeling hot · flushing · nausea · pulmonary hypertension · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).
- **MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.
- **PRESCRIBING AND DISPENSING INFORMATION** The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection► **Protamine sulfate (Non-proprietary)**

Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules | 5 ampoule [PoM] 
 Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule [PoM] £49.55

3.4 Opioid toxicity

OPIOID RECEPTOR ANTAGONISTS

Naloxone hydrochloride

● **INDICATIONS AND DOSE****Overdosage with opioids**

► BY INTRAVENOUS INJECTION

- Child 1 month–11 years: Initially 100 micrograms/kg (max. per dose 2 mg), if no response, repeat at intervals of 1 minute to a max. of 2 mg, then review diagnosis;

further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action

- Child 12–17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action
- Adult: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action
- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes
- Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes

Overdosage with opioids in a non-medical setting

► BY INTRAMUSCULAR INJECTION

- Adult: 400 micrograms every 2–3 minutes, each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up; to be injected into deltoid region or anterolateral thigh

Reversal of postoperative respiratory depression

► INITIALLY BY INTRAVENOUS INJECTION

- Child 1 month–11 years: 1 microgram/kg, repeated every 2–3 minutes if required
- Child 12–17 years: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours
- Adult: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

PHARMACOKINETICS

- Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

- **UNLICENSED USE** Naloxone doses in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Doses used in acute opioid overdose may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

- **CAUTIONS** Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported) · maternal physical dependence on opioids (may precipitate withdrawal in newborn) · pain · physical dependence on opioids (precipitates withdrawal)

CAUTIONS, FURTHER INFORMATION

- ▶ Titration of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · dizziness · headache · hypertension · hypotension · nausea · vomiting
 - ▶ **Uncommon** Diarrhoea · dry mouth · hyperhidrosis · hyperventilation · pain · tremor
 - ▶ **Rare or very rare** Anxiety · cardiac arrest · erythema multiforme · pulmonary oedema · seizure
 - ▶ **Frequency not known** Analgesia reversed · asthenia · chills · death · dyspnoea · fever · irritability · nasal complaints · piloerection · withdrawal syndrome · yawning
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Not orally bioavailable.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
 - ▶ With intravenous use in adults For *intravenous infusion* (Minijet[®] Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Naloxone hydrochloride (Non-proprietary)

Naloxone hydrochloride 20 microgram per 1 mL Naloxone 40micrograms/2mL solution for injection ampoules | 10 ampoule [PoM] £55.00

Naloxone hydrochloride 400 microgram per 1 mL Naloxone 400micrograms/1mL solution for injection ampoules | 10 ampoule [PoM] £41.00-£53.70

Naloxone hydrochloride 1 mg per 1 mL Naloxone 2mg/2mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.80

over 16 hours, dose to be administered in 14 mL/kg glucose 5%

- ▶ **Child (body-weight 20-39 kg):** Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- ▶ **Child (body-weight 40 kg and above):** 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%
- ▶ **Adult (body-weight 40 kg and above):** 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdose.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: INTRAVENOUS ACETYLCYSTEINE FOR PARACETAMOL OVERDOSE: REMINDER OF AUTHORISED DOSE REGIMEN; POSSIBLE NEED FOR CONTINUED TREATMENT (JANUARY 2017)

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

Continued treatment (given at the dose and rate as used in the third infusion) may be necessary depending on the clinical evaluation of the individual patient.

- **CAUTIONS** Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) · atopy · may slightly increase INR · may slightly increase prothrombin time
- **SIDE-EFFECTS** Acidosis · anaphylactoid reaction · angioedema · anxiety · arrhythmias · cardiac arrest · chest discomfort · cough · cyanosis · eye pain · eye swelling · generalised seizure · hyperhidrosis · hypertension · hypotension · joint disorders · malaise · nausea · pain facial · respiratory disorders · skin reactions · syncope · thrombocytopenia · vasodilation · vision blurred · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Anaphylactoid reactions can be managed by suspending treatment and initiating appropriate management. Treatment may then be restarted at lower rate.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ In children Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.
 - ▶ In adults For *intravenous infusion* (Parvolex[®]), give continuously in Glucose 5% or Sodium chloride 0.9%. Glucose Intravenous Infusion 5% is the preferred fluid; Sodium Chloride Intravenous Infusion 0.9% is an alternative if Glucose Intravenous Infusion 5% is unsuitable.

3.5 Paracetamol toxicity

ANTIDOTES AND CHELATORS

Acetylcysteine

03-Apr-2018

● INDICATIONS AND DOSE

Paracetamol overdose

▶ BY INTRAVENOUS INFUSION

- ▶ **Child (body-weight up to 20 kg):** Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Acetylcysteine (Non-proprietary)

Acetylcysteine 200 mg per 1 mL Acetylcysteine 2g/10mL solution for infusion ampoules | 10 ampoule [PoM] £21.26-£24.99 DT = £21.26

Parvolex (Phoenix Labs Ltd)

Acetylcysteine 200 mg per 1 mL Parvolex 2g/10mL concentrate for solution for infusion ampoules | 10 ampoule [PoM] £22.50 DT = £21.26

4 Methaemoglobinaemia

ANTIDOTES AND CHELATORS

Methylthioninium chloride

(Methylene blue)

INDICATIONS AND DOSE

Drug- or chemical-induced methaemoglobinaemia

BY SLOW INTRAVENOUS INJECTION

Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

Aniline- or dapsone-induced methaemoglobinaemia

BY SLOW INTRAVENOUS INJECTION

Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

● **CAUTIONS** Chlorate poisoning (reduces efficacy of methylthioninium) • G6PD deficiency (seek advice from National Poisons Information Service) • methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) • pulse oximetry may give false estimation of oxygen saturation

● **INTERACTIONS** → Appendix 1: methylthioninium chloride

SIDE-EFFECTS

► **Common or very common** Abdominal pain • anxiety • chest pain • dizziness • headache • hyperhidrosis • nausea • pain in extremity • paraesthesia • skin reactions • taste altered • urine discolouration • vomiting

► **Frequency not known** Aphasia • arrhythmias • confusion • faeces discoloured • fever • haemolytic anaemia • hyperbilirubinaemia (in infants) • hypertension • hypotension • mydriasis • tremor

● **PREGNANCY** No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

● **BREAST FEEDING** Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.

● **RENAL IMPAIRMENT** **Dose adjustments** Use with caution in severe impairment; dose reduction may be required.

DIRECTIONS FOR ADMINISTRATION

► In children For intravenous injection, may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Methylthioninium chloride (Non-proprietary)

Methylthioninium chloride 5 mg per 1 mL Methylthioninium chloride Proveblue 50mg/10mL solution for injection ampoules | 5 ampoule [PoM] £196.89

5 Snake bites

IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

European viper snake venom antiserum

INDICATIONS AND DOSE

Systemic envenoming from snake bites | Marked local envenoming

BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Child: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

Adult: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

Severe systemic envenoming from snake bites in patients presenting with clinical features

BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

Adult: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

● **DIRECTIONS FOR ADMINISTRATION** By intravenous injection given over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).

● **PRESCRIBING AND DISPENSING INFORMATION** To order, email immform@dh.gsi.gov.uk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

European viper snake venom antiserum (Non-proprietary)

European viper snake venom antiserum 100 mg per 1 mL Viper venom antiserum, European (equine) 1g/10mL solution for injection vials | 1 vial [PoM] 

Appendix 1

Interactions

Changes have been made to the interactions content in BNF publications. For more information, see www.bnf.org/new-bnf-interactions/.

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse reactions to drugs p. 12), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another. Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function.

Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They might be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs.

Affecting absorption The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

Affecting distribution *Due to changes in protein binding:* To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces

more than transient potentiation because this increased concentration of free drug will usually be eliminated.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

Induction or inhibition of drug transporter proteins: Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

Affecting metabolism Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g. glucuronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug's metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer of CYP3A4, ketoconazole is potent inhibitor of CYP3A4, and midazolam is a substrate of CYP3A4. Carbamazepine reduces midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

Less is known about the enzymes involved in phase II reactions. These include UDP-glucuronyltransferases which, for example, might be induced by rifampicin, resulting in decreased metabolism of mycophenolate (a substrate for this enzyme) to its active form, mycophenolic acid.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.

Relative importance of interactions

Levels of severity: Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

Severe—the result may be a life-threatening event or have a permanent detrimental effect.

Moderate—the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be life-threatening or result in long-term effects.

Mild—the result is unlikely to cause concern or incapacitate the majority of patients.

Unknown—used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome.

Levels of evidence: Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

Study—for interactions where the information is based on formal study including those for other drugs with same mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).

Anecdotal—interactions based on either a single case report or a limited number of case reports.

Theoretical—interactions that are predicted based on sound theoretical considerations. The information may have been derived from *in vitro* studies or based on the way other members in the same class act.

Action messages: Each interaction describes the effect that occurs, and the action to be taken, either based on manufacturer’s advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. **Pharmacodynamic interactions**, with the exception of interactions with drugs that may prolong the QT interval, do not have an action message included as these will depend on individual patient circumstances.

Appendix 1 structure

1 Drugs

Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.

Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer’s advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

2 Drug classes

The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3 Supplementary information

If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

4 Pharmacodynamic effects

Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the

1 Drug entry

- Details of interaction between **drug entry** and another **drug** or **drug class**. Action statement. [Severity] Evidence
 - Details of interaction between **drug entry** and another **drug** or **drug class**. Action statement. [Severity] Evidence
- Also see TABLE 1

TABLE 1
Name of pharmacodynamic effect
Explanation of the effect

Drug	Drug	Drug
Drug	Drug	Drug

list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.

Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.

TABLE 1**Drugs that cause hepatotoxicity**

The following is a list of some drugs that cause hepatotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alcohol (beverage)	dantrolene	itraconazole	minocycline	tetracycline
alectinib	demeclocycline	leflunomide	oxytetracycline	tigecycline
asparaginase	didanosine	lenalidomide	paracetamol	trabectedin
atorvastatin	doxycycline	lomipatide	pegaspargase	valproate
carbamazepine	flucloxacillin	lymecycline	pravastatin	vincristine
clavulanic acid	fluconazole	mercaptopurine	rosuvastatin	
crisantaspase	fluvastatin	methotrexate	simvastatin	
dactinomycin	isoniazid	micalfungin	sulfasalazine	

TABLE 2**Drugs that cause nephrotoxicity**

The following is a list of some drugs that cause nephrotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

aceclofenac	ceftaroline	etodolac	methotrexate	telavancin
acemetacin	ceftazidime	etoricoxib	nabumetone	tenofovir disoproxil
aciclovir	ceftibiprole	fenoprofen	naproxen	tenoxicam
amikacin	ceftriaxone	flurbiprofen	neomycin	tiaprofenic acid
amphotericin	cefuroxime	foscarnet	oxaliplatin	tobramycin
bacitracin	celecoxib	ganciclovir	parecoxib	tolfenamic acid
capreomycin	ciclosporin	gentamicin	pemetrexed	trimethoprim
carboplatin	cisplatin	ibuprofen	penicillamine	valaciclovir
cefaclor	colistimethate (particularly intravenous)	ifosfamide	pentamidine	valganciclovir
cefadroxil	dexibuprofen	indometacin	piroxicam	vancomycin
cefalexin	dexketoprofen	ketoprofen	polymyxins	zidovudine
cefixime	diclofenac	ketorolac	streptomycin	zoledronic acid
cefotaxime		mefenamic acid	sulindac	
cefradine		meloxicam	tacrolimus	

TABLE 3**Drugs with anticoagulant effects**

The following is a list of drugs that have anticoagulant effects. Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with antiplatelet effects (see table of drugs with antiplatelet effects) might also increase this risk.

acenocoumarol	dabigatran	fondaparinux	phenindione	urokinase
alteplase	dalteparin	glucose	rivaroxaban	warfarin
apixaban	danaparoid	heparin (unfractionated)	streptokinase	
argatroban	edoxaban	nicotinic acid	tecteplase	
bivalirudin	enoxaparin	omega-3-acid ethyl esters	tinzaparin	

TABLE 4**Drugs with antiplatelet effects**

The following is a list of drugs that have antiplatelet effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with anticoagulant effects (see table of drugs with anticoagulant effects) might also increase this risk.

abciximab	dapoxetine	etoricoxib	mefenamic acid	sulindac
aceclofenac	dasatinib	fenoprofen	meloxicam	tenoxicam
acemetacin	dexibuprofen	fluoxetine	nabumetone	tiaprofenic acid
anagrelide	dexketoprofen	flurbiprofen	naproxen	ticagrelor
aspirin	diclofenac	fluvoxamine	parecoxib	tirofiban
bevacizumab	dipyridamole	ibutinib	paroxetine	tolfenamic acid
cangrelor	duloxetine	ibuprofen	piroxicam	trastuzumab
celecoxib	epoprostenol	iloprost	prasugrel	trastuzumab emtansine
cilostazol	efitibatide	indometacin	regorafenib	venlafaxine
citalopram	escitalopram	ketoprofen	sertraline	vortioxetine
clopidogrel	etodolac	ketorolac	sulfapyrazone	

TABLE 5**Drugs that cause thromboembolism**

The following is a list of some drugs that cause thromboembolism (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

bleomycin	epoetin zeta	pentostatin	toremifene	vinflunine
cyclophosphamide	flutauracil	pomalidomide	trinemaxamic acid	vinorelbine
darbepoetin alfa	fluvastatin	raloxifene	tretinoin	
doxorubicin	lenalidomide	tamoxifen	vinblastine	
epoetin alfa	methotrexate	thalidomide	vincristine	
epoetin beta	mitomycin	tibolone	vindesine	

TABLE 6

Drugs that cause bradycardia

The following is a list of drugs that cause bradycardia (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol	carvedilol	fentanyl	nadolol	rivastigmine
alectinib	celiprolol	flingolimod	nebivolol	selegiline
alfentanil	cisatracurium	flecainide	neostigmine	sotalol
amiodarone	clonidine	galantamine	oxprenolol	sufentanil
apraclonidine	crizotinib	ivabradine	pasireotide	thalidomide
atenolol	digoxin	labetalol	pindolol	timolol
betaxolol	diltiazem	levobunolol	propranolol	tizanidine
bisoprolol	donepezil	methadone	pyridostigmine	verapamil
brimonidine	esmolol	metoprolol	remifentanyl	

TABLE 7

Drugs that cause first dose hypotension

The following is a list of some drugs that can cause first-dose hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alfuzosin	eprosartan	isosorbide dinitrate	prazosin	trandolapril
azilsartan	fosinopril	isosorbide mononitrate	quinapril	valsartan
candesartan	glyceryl trinitrate	lisinopril	ramipril	
captopril	imidapril	losartan	tamsulosin	
doxazosin	indoramin	olmesartan	telmisartan	
enalapril	irbesartan	perindopril	terazosin	

TABLE 8

Drugs that cause hypotension

The following is a list of some drugs that cause hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol	chlorpromazine	haloperidol	moxisylyte	riociguat
alcohol (beverage)	chlorthalidone	hydralazine	moxonidine	risperidone
alfuzosin	clevipidine	hydrochlorothiazide	nadolol	ropinirole
aliskiren	clomipramine	hydroflumethiazide	nebivolol	rotigotine
alprostadil	clonidine	imidapril	nicardipine	sacubitril
amantadine	clopamide	imipramine	nicorandil	sapropterin
amitriptyline	clozapine	indapamide	nifedipine	selegiline
amlodipine	cyclopenthiazide	indoramin	nimodipine	sevoflurane
apomorphine	dapagliflozin	irbesartan	nitrous oxide	sildenafil
apraclonidine	desflurane	isocarboxazid	nortriptyline	sodium nitroprusside
aripiprazole	diazoxide	isoflurane	olanzapine	sodium oxybate
asenapine	diltiazem	isosorbide dinitrate	olmesartan	sotalol
atenolol	dipyridamole	isosorbide mononitrate	oxprenolol	spironolactone
avanafil	dosulepin	ketamine	paliperidone	sulpiride
azilsartan	doxazosin	labetalol	pergolide	tadalafil
baclofen	doxepin	lacidipine	pericyazine	tamsulosin
bendroflumethiazide	droperidol	lercanidipine	perindopril	telmisartan
benperidol	empagliflozin	levobunolol	perphenazine	terazosin
betaxolol	enalapril	levodopa	phenelzine	thiopental
bisoprolol	eplerenone	levomepromazine	pimozide	timolol
bortezomib	eprosartan	lisinopril	pindolol	tizanidine
brimonidine	esmolol	lofepramine	pramipexole	torasemide
bromocriptine	etomidate	lofexidine	prazosin	trandolapril
bumetanide	felodipine	losartan	prochlorperazine	tranylcypromine
cabergoline	flupentixol	loxapine	promazine	trifluoperazine
canagliflozin	fluphenazine	lurasidone	propofol	trimipramine
candesartan	fosinopril	methoxyflurane	propofol	valsartan
captopril	furosemide	methyldopa	quetiapine	varafenil
carvedilol	glyceryl trinitrate	metolazone	quinagolide	verapamil
celiprolol	guanethidine	metoprolol	quinapril	xipamide
chlorothiazide	guanfacine	minoxidil	ramipril	zuclopenthixol

TABLE 9**Drugs that prolong the QT interval**

The following is a list of some drugs that prolong the QT-interval (note that this list is not exhaustive). In general, manufacturers advise that the use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).

Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation include: domperidone, fingolimod, granisetron, ivabradine, mefloquine, mizolastine, palonosetron, and intravenous pentamidine. Most manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.

amifampridine	clarithromycin	fluphenazine	panobinostat	telavancin
amiodarone	clomipramine	haloperidol	pasireotide	tetrabenazine
amisulpride	crizotinib	hydroxyzine	pazopanib	tizanidine
anagrelide	dasatinib	inotuzumab ozogamicin	pimozide	tolterodine
apomorphine	delamanid	lapatinib	quinine	toremifene
arsenic trioxide	disopyramide	levomepromazine	ranolazine	vandetanib
artemether	dronedarone	lithium	ribociclib	varidenafil
artemimol	droperidol	lofedidine	risperidone	vemurafenib
bedaquiline	efavirenz	methadone	saquinavir	venlafaxine
bosutinib	erythromycin	moxifloxacin	sildenafil	vinflunine
cabozantinib	erythromycin	nilotinib	sorafenib	voriconazole
ceritinib	escitalopram	ondansetron	sotalol	zuclopenthixol
chlormpromazine	fluconazole	osimertinib	sulpiride	
citalopram		paliperidone	sunitinib	

TABLE 10**Drugs with antimuscarinic effects**

The following is a list of some drugs that have antimuscarinic effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of these effects occurring.

acclidinium	cyclopentolate	haloperidol	orphenadrine	tiotropium
amantadine	cyproheptadine	homatropine	oxybutynin	tolterodine
amitriptyline	darifenacin	hydroxyzine	perphenazine	trifluoperazine
atropine	dicycloverine	hyoscine	pimozide	trihexyphenidyl
baclofen	dimenhydrinate	imipramine	prochlorperazine	trimipramine
chlorthenamine	disopyramide	ipratropium	pricyclidine	tropicamide
chlormpromazine	dosulepin	levomepromazine	promethazine	trospium
clemastine	doxepin	lofepramine	propafenone	umeclidinium
clomipramine	fesoterodine	loxapine	propantheline	
clozapine	flavoxate	nefopam	propiverine	
cyclizine	glycopyrronium	nortriptyline	solifenacin	

TABLE 11**Drugs with CNS depressant effects**

The following is a list of some drugs with CNS depressant effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of CNS depressant effects, such as drowsiness, which might affect the ability to perform skilled tasks (see 'Drugs and Driving' in Guidance on Prescribing p. 1).

agomelatine	clomethiazole	isoflurane	moxonidine	quetiapine
alcohol (beverage)	clonazepam	ketamine	nabilone	remifentanyl
alfentanil	clonidine	ketotifen	nitrazepam	risperidone
alimemazine	clozapine	lamotrigine	nitrous oxide	ropivacaine
alprazolam	codeine	levetiracetam	olanzapine	sevoflurane
amisulpride	cyclizine	levomepromazine	oxazepam	sodium oxybate
apracloindine	cyproheptadine	lidocaine	oxycodone	sufentanil
aripiprazole	desflurane	lofedidine	paliperidone	sulpiride
articaïne	dexmedetomidine	loprazolam	papaveretum	tapentadol
asenapine	diamorphine	lorazepam	pentazocine	temazepam
baclofen	diazepam	lormetazepam	perampanel	tetracaine
benperidol	dihydrocodeine	loxapine	pericyazine	thalidomide
brimonidine	dipipanone	lurasidone	perphenazine	thiopental
bucizine	droperidol	melatonin	pethidine	tizanidine
bupivacaine	etomidate	mepivacaine	phenobarbital	tramadol
buprenorphine	fentanyl	meprobamate	pimozide	trazodone
cannabis extract	flupentixol	meptazinol	pizotifen	trifluoperazine
chloral hydrate	fluphenazine	methadone	pregabalin	venlafaxine
chlorthiazepoxide	flurazepam	methocarbamol	prilocaline	zaleplon
chlorthenamine	gabapentin	methoxyflurane	primidone	zolidem
chlormpromazine	guanfacine	mianserin	prochlorperazine	zopiclone
cinnarizine	haloperidol	midazolam	promazine	zuclopenthixol
clemastine	hydromorphone	mirtazapine	promethazine	
clobazam	hydroxyzine	morphine	propofol	

TABLE 12

Drugs that cause peripheral neuropathy

The following is a list of some drugs that cause peripheral neuropathy (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amiodarone	didanosine	isoniazid	phenytoin	vindesine
bortezomib	disulfiram	lamivudine	stavudine	vinflunine
brentuximab vedotin	docetaxel	metronidazole	thalidomide	vinorelbine
cabazitaxel	eribulin	nitrofurantoin	vinblastine	
cisplatin	fosphenytoin	paclitaxel	vincristine	

TABLE 13

Drugs that cause serotonin syndrome

The following is a list of some drugs that cause serotonin syndrome (note that this list is not exhaustive). See 'Serotonin Syndrome' and 'Monoamine-Oxidase Inhibitors' under Antidepressant drugs p. 355 for more information and for specific advice on avoiding monoamine-oxidase inhibitors during and after administration of other serotonergic drugs.

almotriptan	fentanyl	methadone	pethidine	tapentadol
bupropion	fluoxetine	methylthioninium chloride	phenelzine	tramadol
bupirone	fluvoxamine	mianserin	procabazine	tranylcypromine
citalopram	frovatriptan	mirtazapine	rasagiline	trazodone
clomipramine	granisetron	moclobemide	rizatriptan	tryptophan
dapoxetine	imipramine	naratriptan	saflinamide	venlafaxine
dexamfetamine	isocarboxazid	ondansetron	selegiline	vortioxetine
duloxetine	linezolid	palonosetron	sertraline	zolmitriptan
eletriptan	lisdexamfetamine	paroxetine	St John's Wort	
escitalopram	lithium	pentazocine	sumatriptan	

TABLE 14

Antidiabetic drugs

The following is a list of antidiabetic drugs (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase the risk of hypoglycaemia.

acarbose	dulaglutide	glimepiride	lixisenatide	saxagliptin
albiglutide	empagliflozin	glipizide	metformin	sitagliptin
alogliptin	exenatide	insulins	metglinide	tolbutamide
canagliflozin	glibenclamide	linagliptin	pioglitazone	vildagliptin
dapagliflozin	gliclazide	liraglutide	repaglinide	

TABLE 15

Drugs that cause myelosuppression

The following is a list of some drugs that cause myelosuppression (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

afatinib	carmustine	everolimus	nilotinib	rituximab
afibercept	ceritinib	fludarabine	nivolumab	ruxolitinib
alemtuzumab	cetuximab	fluorouracil	obinituzumab	siltuximab
amsacrine	chlorambucil	ganciclovir	ofatumumab	sorafenib
anakinra	cisplatin	gefitinib	olanzapine	sulfadiazine
arsenic trioxide	cladribine	gemcitabine	olaparib	sulfasalazine
asparaginase	clofarabine	hydroxycarbamide	olsalazine	sunitinib
axitinib	clozapine	ibrutinib	oxaliplatin	temozolomide
azacitidine	co-trimoxazole	idarubicin	paclitaxel	temsirolimus
azathioprine	crisantaspase	idelalisib	panitumumab	thalidomide
balsalazide	crizotinib	ifosfamide	panobinostat	thiotepa
belinimumab	cyclophosphamide	imatinib	pazopanib	tioguanine
bendamustine	cytarabine	interferon alfa	pegaspargase	topotecan
bevacizumab	dabrafenib	interferon beta	peginterferon alfa	trabectedin
bleomycin	dacarbazine	irinotecan	peginterferon beta-1a	trastuzumab emtansine
blinatumomab	dactinomycin	leflunomide	pemetrexed	treosulfan
bortezomib	dasatinib	lenalidomide	pentamidine	valganciclovir
bosutinib	daunorubicin	linezolid	pentostatin	vinblastine
brentuximab vedotin	decitabine	lomustine	pixantrone	vincristine
busulfan	deferiprone	melfalan	pomalidomide	vindesine
cabazitaxel	docetaxel	mercaptopurine	primiquine	vinflunine
cabozantinib	doxorubicin	methotrexate	procabazine	vinorelbine
canakinumab	epirubicin	mitomycin	propylthiouracil	vismodegib
capecitabine	eribulin	mitotane	pyrimethamine	zidovudine
carbimazole	estramustine	mitoxantrone	raltitrexed	
carboplatin	ethosuximide	mycophenolate	regorafenib	
carfilzomib	etoposide	nelarabine		

TABLE 16**Drugs that increase serum potassium**

The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia (hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone).

aceclofenac	dexketoprofen	fenoprofen	meloxicam	sulindac
acemetacin	diclofenac	flurbiprofen	nabumetone	tacrolimus
aliskiren	drospirenone	heparin (unfractionated)	naproxen	telmisartan
amiloride	enalapril	ibuprofen	olmesartan	tenoxicam
azilsartan	enoxaparin	imidapril	parecoxib	tiaprofenic acid
candesartan	eplerenone	indometacin	perindopril	tinzaparin
captopril	epoetin alfa	irbesartan	piroxicam	tolfenamic acid
celecoxib	epoetin beta	ketoprofen	potassium canrenoate	tolvaptan
ciclosporin	epoetin zeta	ketorolac	potassium chloride	trandolapril
dalteparin	eprosartan	lisinopril	quinapril	triamterene
darbepoetin alfa	etodolac	losartan	ramipril	trimethoprim
dexibuprofen	etoricoxib	mefenamic acid	spironolactone	valsartan

TABLE 17**Drugs that reduce serum potassium**

The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive and that other drugs can cause hypokalaemia in overdose). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval (see table of drugs that prolong the QT interval).

aminophylline	bumetanide	fludrocortisone	indapamide	salmeterol
amphotericin	chlorothiazide	formoterol	methylprednisolone	terbutaline
bambuterol	chlortalidone	furosemide	metolazone	theophylline
beclometasone	clopamide	hydrochlorothiazide	olodaterol	torasemide
bendroflumethiazide	cyclopenthiiazide	hydrocortisone	prednisolone	triamcinolone
betamethasone	deflazacort	hydroflumethiazide	prednisone	vilanterol
budesonide	dexamethasone	indacaterol	salbutamol	xipamide

TABLE 18**Drugs that cause hyponatraemia**

The following is a list of some drugs that reduce sodium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyponatraemia.

aceclofenac	clopamide	etodolac	indometacin	sertraline
acemetacin	cyclopenthiiazide	etoricoxib	ketoprofen	sodium picosulfate
amiloride	dapoxetine	fenoprofen	ketorolac	spironolactone
amitriptyline	desmopressin	fluoxetine	mefenamic acid	sulindac
bendroflumethiazide	dexibuprofen	flurbiprofen	meloxicam	tenoxicam
bumetanide	dexketoprofen	fluvoxamine	metolazone	tiaprofenic acid
carbamazepine	diclofenac	furosemide	nabumetone	tolfenamic acid
celecoxib	dosulepin	hydrochlorothiazide	naproxen	torasemide
chlorothiazide	doxepin	hydroflumethiazide	nortriptyline	triamterene
chlortalidone	duloxetine	ibuprofen	parecoxib	trimethoprim
citalopram	eplerenone	imipramine	paroxetine	trimipramine
clomipramine	escitalopram	indapamide	piroxicam	xipamide

TABLE 19**Drugs that cause ototoxicity**

The following is a list of some drugs that cause ototoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisplatin	oxaliplatin	torasemide	vindesine
bumetanide	furosemide	streptomycin	vancomycin	vinflunine
capreomycin	gentamicin	telavancin	vinblastine	vinorelbine
carboplatin	neomycin	tobramycin	vincristine	

TABLE 20**Drugs with neuromuscular blocking effects**

The following is a list of some drugs with neuromuscular blocking effects (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisatracurium	neomycin	pyridostigmine	tobramycin
atracurium	colistimethate	neostigmine	rocuronium	vecuronium
botulinum toxin type A	gentamicin	pancuronium	streptomycin	
botulinum toxin type B	mivacurium	polymyxins	suxamethonium	

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

Abacavir

- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **abacavir**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** (**tipranavir**) slightly decrease the exposure to **abacavir**. Avoid. [Severe] Study

Abatacept

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **abatacept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Abciximab → see TABLE 4 p. 1334 (antiplatelet effects)

Abiraterone

GENERAL INFORMATION Caution with concurrent chemotherapy—safety and efficacy not established.

- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles** (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- ▶ **Abiraterone** is predicted to increase the exposure to **beta blockers**, **selective** (**metoprolol**). [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- ▶ **Abiraterone** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **Abiraterone** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **Abiraterone** potentially increases the exposure to **venlafaxine**. [Severe] Theoretical

Acarbose → see TABLE 14 p. 1337 (antidiabetic drugs)

- ▶ **Acarbose** decreases the concentration of **digoxin**. [Moderate] Study
- ▶ **Pancreatin** is predicted to decrease the effects of **acarbose**. Avoid. [Moderate] Theoretical

ACE inhibitors → see TABLE 7 p. 1335 (first-dose hypotension), TABLE 8 p. 1335 (hypotension), TABLE 16 p. 1338 (increased serum potassium)

captopril - enalapril - fosinopril - imidapril - lisinopril - perindopril - quinapril - ramipril - trandolapril

- ▶ **ACE inhibitors** increase the risk of renal impairment when given with **alsikiren**. Use with caution or avoid **alsikiren** in selected patients, p. 179. [Severe] Study → Also see TABLE 8 p. 1335 → Also see TABLE 16 p. 1338
- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with **allopurinol**. [Severe] Anecdotal
- ▶ **ACE inhibitors** are predicted to increase the risk of anaemia and/or leucopenia when given with **azathioprine**. [Severe] Anecdotal
- ▶ **ACE inhibitors** are predicted to decrease the efficacy of **icatibant** and **icatibant** is predicted to decrease the efficacy of **ACE inhibitors**. Avoid. [Moderate] Theoretical
- ▶ **ACE inhibitors** are predicted to increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Anecdotal

- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with **sodium aurothiomalate**. [Severe] Anecdotal
- ▶ **Quinapril** (tablet) decreases the absorption of oral **tetracyclines** (**tetracycline**). Avoid. [Moderate] Study

Acetabuto → see beta blockers, selective

Acetofenac → see NSAIDs

Acemetacin → see NSAIDs

Acenocoumarol → see coumarins

Acetazolamide

- ▶ **Acetazolamide** potentially increases the risk of toxicity when given with **antiepileptics** (**valproate**). [Severe] Study
- ▶ **Acetazolamide** potentially increases the risk of overheating and dehydration when given with **antiepileptics** (**zonisamide**). Avoid in children. [Severe] Theoretical
- ▶ **Acetazolamide** increases the risk of severe toxic reaction when given with **aspirin** (high-dose). [Severe] Study
- ▶ **Acetazolamide** alters the concentration of **lithium**. [Severe] Anecdotal
- ▶ **Acetazolamide** is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical
- ▶ **Acetazolamide** increases the urinary excretion of **methotrexate**. [Moderate] Study

Aciclovir → see TABLE 2 p. 1334 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Aciclovir** increases the exposure to **aminophylline**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **aciclovir**. [Moderate] Theoretical
- ▶ **Aciclovir** is predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [Severe] Theoretical

Acitretin → see retinoids

Acidinium → see TABLE 10 p. 1336 (antimuscarinics)

Acrivastine → see antihistamines, non-sedating

Adalimumab → see monoclonal antibodies

Adapalene → see retinoids

Adefovir

- ▶ **Ataluren** increases the exposure to **adefovir**. [Moderate] Study

Adenosine → see antiarrhythmics

Adrenaline/epinephrine → see sympathomimetics, vasoconstrictor

Afatinib → see TABLE 15 p. 1337 (myelosuppression)

- ▶ **Antiarrhythmics** (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Antiepileptics** (**carbamazepine**) are predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ **Antifungals, azoles** (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Calcium channel blockers** (**verapamil**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **HIV-protease inhibitors** (**lopinavir**, **ritonavir**, **saquinavir**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Macrolides** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study

Aflibercept → see TABLE 15 p. 1337 (myelosuppression)

Agalsidase

- **Aminoglycosides** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antiarrhythmics (amiodarone)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antimalarials (chloroquine)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Hydroxychloroquine** is predicted to decrease the effects of agalsidase. [Moderate] Theoretical

Agomelatine → see TABLE 11 p. 1336 (CNS depressant effects)

- Dose adjustment might be necessary if smoking started or stopped during treatment.
- Caution with concomitant use of drugs associated with hepatic injury.

- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Combined hormonal contraceptives** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Leflunomide** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** very markedly increase the exposure to agomelatine. Avoid. [Severe] Study
- **Teriflunomide** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical

Albendazole

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of albendazole. [Moderate] Study
- **H₂ receptor antagonists (cimetidine)** decrease the clearance of albendazole. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** decrease the exposure to albendazole. [Moderate] Study
- **Albendazole** slightly decreases the exposure to **levamisole** and **levamisole** moderately decreases the exposure to **albendazole**. [Moderate] Study

Albiglutide → see TABLE 14 p. 1337 (antidiabetic drugs)

Alcohol (beverage) → see TABLE 1 p. 1334 (hepatotoxicity), TABLE 8 p. 1335 (hypotension), TABLE 11 p. 1336 (CNS depressant effects)

- **Alcohol (beverage)** potentially increases the risk of visual disturbances when given with **antiepileptics (retigabine)**. [Moderate] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **antifungals, azoles (ketoconazole)**. Avoid. [Moderate] Anecdotal
- **Alcohol (beverage)** causes serious, potentially fatal, CNS depression when given with **clomethiazole**. Avoid. [Severe] Study → Also see TABLE 11 p. 1336
- **Alcohol (beverage)** (in those who drink heavily) potentially decreases the anticoagulant effect of **coumarins**. [Severe] Study
- **Alcohol (beverage)** (excessive consumption) potentially increases the risk of gastrointestinal side-effects when given with **dimethyl fumarate**. Avoid. [Moderate] Theoretical
- **Alcohol (beverage)** causes an extremely unpleasant systemic reaction when given with **disulfiram**. Avoid for at least 24 hours before and up to 14 days after stopping treatment. [Severe] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **griseofulvin**. [Moderate] Anecdotal
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **levamisole**. [Moderate] Study
- **Alcohol (beverage)** (excessive consumption) potentially increases the risk of lactic acidosis when given with **metformin**. Avoid excessive alcohol consumption. [Moderate] Theoretical
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **metronidazole**. Avoid for at least 48 hours stopping treatment. [Moderate] Study

- **Alcohol (beverage)** causes rapid release of **opioids (hydromorphone, morphine)** (from extended-release preparations). Avoid. [Severe] Study → Also see TABLE 11 p. 1336
- **Alcohol (beverage)** (in those who drink heavily) causes severe liver damage when given with **paracetamol**. [Severe] Study → Also see TABLE 1 p. 1334
- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **pimecrolimus**. [Moderate] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **procarbazine**. [Moderate] Anecdotal
- **Alcohol (beverage)** potentially increases the concentration of **retinoids (acitretin)**. Avoid and for 2 months after stopping **acitretin**. [Moderate] Study
- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **tacrolimus**. [Moderate] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **tinidazole**. Avoid for 72 hours stopping treatment. [Moderate] Theoretical

Aldosterone antagonists → see TABLE 18 p. 1338 (hyponatraemia), TABLE 8 p. 1335 (hypotension), TABLE 16 p. 1338 (increased serum potassium)

eplerenone + spironolactone

- **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Theoretical
- **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical → Also see TABLE 18 p. 1338
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Aprepitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study → Also see TABLE 8 p. 1335
- **Cobicistat** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study
- **Eplerenone** very slightly increases the exposure to **digoxin**. [Mild] Study
- **Spironolactone** increases the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Idelalisib** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Imatinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study
- **Eplerenone** potentially increases the concentration of **lithium**. Avoid. [Moderate] Theoretical
- **Spironolactone** potentially increases the concentration of **lithium**. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study
- **Mitotane** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **Spironolactone** is predicted to decrease the effects of **mitotane**. Avoid. [Severe] Anecdotal
- **Netupitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 190. [Severe] Study

- ▶ **Nilotinib** is predicted to increase the exposure to **epplerenone**.

Adjust **epplerenone** dose, p. 190. [Severe] Study

- ▶ **Rifampicin** is predicted to decrease the exposure to **epplerenone**. Avoid. [Moderate] Theoretical

- ▶ **St John's Wort** is predicted to slightly decrease the exposure to **epplerenone**. Avoid. [Moderate] Study

Alectinib → see TABLE 6 p. 1335 (bradycardia), TABLE 1 p. 1334 (hepatotoxicity)

Alemtizumab → see monoclonal antibodies

Alendronic acid → see bisphosphonates

Alfacalcidol → see vitamin D substances

Alfentanil → see opioids

Alfuzosin → see alpha blockers

Alimemazine → see antihistamines, sedating

Aliskiren → see TABLE 8 p. 1335 (hypotension), TABLE 16 p. 1338 (increased serum potassium)

FOOD AND LIFESTYLE Avoid apple juice and orange juice as they greatly decrease aliskiren concentrations and plasma renin activity.

- ▶ **ACE inhibitors** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients, p. 179. [Severe] Study → Also see TABLE 8 p. 1335 → Also see TABLE 16 p. 1338

- ▶ **Angiotensin-II receptor antagonists** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients, p. 179. [Severe] Study → Also see TABLE 8 p. 1335 → Also see TABLE 16 p. 1338

- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **aliskiren**. [Severe] Study

- ▶ **Antiepileptics (carbamazepine)** decrease the exposure to **aliskiren**. [Moderate] Study

- ▶ **Antifungals, azoles (itraconazole)** markedly increase the exposure to **aliskiren**. Avoid. [Severe] Study

- ▶ **Antifungals, azoles (ketoconazole)** moderately increase the exposure to **aliskiren**. [Moderate] Study

- ▶ **Calcium channel blockers (verapamil)** moderately increase the exposure to **aliskiren**. [Moderate] Study → Also see TABLE 8 p. 1335

- ▶ **Ceritinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Ciclosporin** markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study → Also see TABLE 16 p. 1338

- ▶ **Eliglustat** is predicted to increase the exposure to **aliskiren**. Adjust dose. [Moderate] Study

- ▶ **Grapefruit juice** moderately decreases the exposure to **aliskiren**. Avoid. [Severe] Study

- ▶ **HIV-protease inhibitors (ritonavir, saquinavir)** are predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Lapatinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Aliskiren** slightly decreases the exposure to **loop diuretics (furosemide)**. [Moderate] Study → Also see TABLE 8 p. 1335

- ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **aliskiren**. [Moderate] Study

- ▶ **Mirabegron** is predicted to increase the exposure to **aliskiren**. [Mild] Theoretical

- ▶ **Ranolazine** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Rifampicin** decreases the exposure to **aliskiren**. [Moderate] Study

- ▶ **St John's Wort** decreases the exposure to **aliskiren**. [Moderate] Study

- ▶ **Statins (atorvastatin)** slightly to moderately increase the exposure to **aliskiren**. [Moderate] Study

- ▶ **Velpatasvir** is predicted to increase the exposure to **aliskiren**. [Severe] Theoretical

- ▶ **Vemurafenib** is predicted to increase the exposure to **aliskiren**. Use with caution and adjust dose. [Moderate] Theoretical

Altretinoin → see retinoids

Alkylating agents → see TABLE 15 p. 1337 (myelosuppression), TABLE 2 p. 1334 (nephrotoxicity), TABLE 5 p. 1334 (thromboembolism)

bendamustine • busulfan • carmustine • chlorambucil • cyclophosphamide • dacarbazine • estramustine • ifosfamide • lomustine • melphalan • temozolomide • thiotepa • treosulfan

- ▶ **Antacids** are predicted to decrease the absorption of **estramustine**. Avoid. [Moderate] Study

- ▶ **Antifungals, azoles (isavuconazole)** are predicted to increase the exposure to **cyclophosphamide**. [Moderate] Study

- ▶ **Antifungals, azoles (itraconazole)** increase the risk of busulfan toxicity when given with **busulfan**. Monitor and adjust dose. [Moderate] Study

- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **busulfan**. Use with caution and adjust dose. [Moderate] Theoretical

- ▶ **Oral calcium salts** decrease the absorption of **estramustine**. [Severe] Study

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **alkylating agents**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

- ▶ **Metronidazole** increases the risk of toxicity when given with **busulfan**. [Severe] Study

- ▶ **Paracetamol** is predicted to decrease the clearance of **busulfan**. [Moderate] Theoretical

- ▶ **Cyclophosphamide** (high-dose) increases the risk of toxicity when given with **pentostatin**. Avoid. [Severe] Anecdotal → Also see TABLE 15 p. 1337 → Also see TABLE 5 p. 1334

- ▶ **Rolapitant** is predicted to increase the exposure to **bendamustine**. Avoid or monitor. [Moderate] Study

- ▶ **Cyclophosphamide** increases the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Study

Allopurinol

- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with **allopurinol**. [Severe] Anecdotal

- ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **azathioprine**. Adjust **azathioprine** dose, p. 816. [Severe] Study

- ▶ **Allopurinol** is predicted to decrease the effects of **capecitabine**. Avoid. [Severe] Study

- ▶ **Allopurinol** moderately increases the exposure to **didanosine**. Avoid. [Severe] Study

- ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **mercaptopurine**. Adjust **mercaptopurine** dose, p. 887. [Severe] Study

- ▶ **Allopurinol** increases the risk of skin rash when given with **penicillins (amoxicillin, ampicillin)**. [Moderate] Study

- ▶ **Allopurinol** is predicted to increase the risk of hyperuricaemia when given with **pyrazinamide**. [Moderate] Theoretical

- ▶ **Thiazide diuretics** are predicted to increase the risk of hypersensitivity reactions when given with **allopurinol**. [Severe] Theoretical

Almotriptan → see TABLE 13 p. 1337 (serotonin syndrome)

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** increase the exposure to **almotriptan**. [Mild] Study

- ▶ **Cobicistat** increases the exposure to **almotriptan**. [Mild] Study

- ▶ **Almotriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. Ergotamine should be taken at least 24 hours before or 6 hours after **almotriptan**. [Severe] Theoretical

- ▶ **HIV-protease inhibitors** increase the exposure to **almotriptan**. [Mild] Study

- ▶ **Idelalisib** increases the exposure to **almotriptan**. [Mild] Study

- ▶ **Macrolides (clarithromycin)** increase the exposure to **almotriptan**. [Mild] Study

Agogliptin → see TABLE 14 p. 1337 (antidiabetic drugs)

Alpha blockers → see TABLE 7 p. 1335 (first-dose hypotension), TABLE 8 p. 1335 (hypotension)

alfuzosin • doxazosin • indoramin • prazosin • tamsulosin • terazosin

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical

- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **doxazosin**. [Moderate] Study

Alpha blockers (continued)

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **Aprepitant** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical → Also see TABLE 8 p. 1335
- ▶ **Cobicistat** is predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **Cobicistat** is predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
- ▶ **Crizotinib** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the effects of **indoramin**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1335
- ▶ **Netupitant** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
- ▶ **Alpha blockers** cause significant hypotensive effects when given with **phosphodiesterase type-5 inhibitors**. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. [\[Severe\]](#) Study → Also see TABLE 8 p. 1335
- ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **alfuzosin**. Avoid. [\[Moderate\]](#) Theoretical
- Alpha tocopherol** → see vitamin E substances
- Alpha tocopheryl acetate** → see vitamin E substances
- Alprazolam** → see TABLE 11 p. 1336 (CNS depressant effects)
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical → Also see TABLE 11 p. 1336
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** moderately increase the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **alprazolam**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Cobicistat** moderately increases the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study

- ▶ **Crizotinib** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** moderately increase the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
- ▶ **Idelalisib** moderately increases the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Alprazolam** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** moderately increase the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **alprazolam**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Nilotinib** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **SSRIs (fluvoxamine)** moderately increase the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **St John's Wort** moderately decreases the exposure to **alprazolam**. [\[Moderate\]](#) Study

Alprostadil → see TABLE 8 p. 1335 (hypotension)

Alteplase → see TABLE 3 p. 1334 (anticoagulant effects)

Aluminium hydroxide → see antacids

Amantadine → see dopamine receptor agonists

Ambrisentan

▶ **Ciclesporin** moderately increases the exposure to **ambrisentan**. Adjust **ambrisentan** dose, p. 184. [\[Moderate\]](#) Study

▶ **Rifampicin** transiently increases the exposure to **ambrisentan**.

[\[Moderate\]](#) Study

Amfetamines → see TABLE 13 p. 1337 (serotonin syndrome)

dexamfetamine · lisdexamfetamine

- ▶ **Amfetamines** are predicted to decrease the effects of **apraclonidine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Amfetamines** are predicted to increase the risk of side-effects when given with **atomoxetine**. [\[Severe\]](#) Theoretical
- ▶ **Dexamfetamine** decreases the effects of **guanethidine**. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to **amfetamines**. [\[Severe\]](#) Theoretical
- ▶ **Moclobemide** is predicted to increase the risk of a hypertensive crisis when given with **amfetamines**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1337
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with **amfetamines**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Anecdotal → Also see TABLE 13 p. 1337
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of severe hypertension when given with **amfetamines**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1337
- ▶ **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of severe hypertension when given with **amfetamines**. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1337
- ▶ **Nabilone** is predicted to increase the risk of cardiovascular side-effects when given with **amfetamines**. [\[Severe\]](#) Theoretical
- ▶ **Phenothiazines** are predicted to decrease the effects of **amfetamines**. [\[Moderate\]](#) Study
- ▶ **Amfetamines** are predicted to decrease the effects of **phenothiazines (chlorpromazine)**. [\[Moderate\]](#) Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **amfetamines**. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1337

Amifampridine → see TABLE 9 p. 1336 (QT-interval prolongation)

Amikacin → see aminoglycosides

Amiloride → see potassium-sparing diuretics

Aminoglycosides → see TABLE 2 p. 1334 (nephrotoxicity), TABLE 19 p. 1338 (ototoxicity), TABLE 20 p. 1338 (neuromuscular blocking effects)

amikacin • gentamicin • streptomycin • tobramycin

- ▶ **Aminoglycosides** are predicted to decrease the effects of **agalsidase**. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (miconazole)** potentially decrease the exposure to **tobramycin**. [Moderate] Anecdotal
- ▶ **Ataluren** is predicted to increase the risk of nephrotoxicity when given with intravenous **aminoglycosides**. Avoid. [Severe] Study
- ▶ **Aminoglycosides** increase the risk of hypocalcaemia when given with **bisphosphonates**. [Moderate] Anecdotal → Also see TABLE 2 p. 1334
- ▶ **Aminoglycosides** potentially increase the concentration of **digoxin**. Monitor and adjust dose. [Mild] Study
- ▶ **Loop diuretics** increase the risk of nephrotoxicity when given with **aminoglycosides**. Avoid. [Moderate] Study → Also see TABLE 19 p. 1338
- ▶ **Aminoglycosides** are predicted to decrease the effects of **neostigmine**. [Moderate] Theoretical → Also see TABLE 20 p. 1338
- ▶ **Aminoglycosides** are predicted to decrease the effects of **pyridostigmine**. [Moderate] Theoretical → Also see TABLE 20 p. 1338

Aminophylline → see TABLE 17 p. 1338 (reduced serum potassium)

FOOD AND LIFESTYLE Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

- ▶ **Aciclovir** increases the exposure to **aminophylline**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Aminophylline** is predicted to decrease the efficacy of **antiarrhythmics (adenosine)**. Separate administration by 24 hours. [Mild] Theoretical
- ▶ **Antiepileptics (fosphenytoin)** are predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Antiepileptics (phenytoin)** decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (primidone)** are predicted to increase the clearance of **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Antiepileptics (stiripentol)** are predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [Severe] Theoretical
- ▶ **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Aminophylline** increases the risk of agitation when given with **doxapram**. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **aminophylline**. Adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Interferons** are predicted to slightly increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Iron chelators (deferasirox)** are predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
- ▶ **Isoniazid** is predicted to affect the clearance of **aminophylline**. [Severe] Theoretical
- ▶ **Leflunomide** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Aminophylline** is predicted to decrease the concentration of **lithium**. [Moderate] Theoretical
- ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **aminophylline**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Aminophylline** is predicted to decrease the exposure to **macrolides (erythromycin)**. Adjust dose. [Severe] Study

- ▶ **Methotrexate** is predicted to decrease the clearance of **aminophylline**. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Pentoxifylline** is predicted to increase the concentration of **aminophylline**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Quinolones (ciprofloxacin, norfloxacin)** are predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Aminophylline** is predicted to slightly increase the exposure to **roflumilast**. Avoid. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** moderately to markedly increase the exposure to **aminophylline**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the concentration of **aminophylline**. [Severe] Theoretical
- ▶ **Sympathomimetics, vasoconstrictor (ephedrine)** increase the risk of side-effects when given with **aminophylline**. Avoid in children. [Moderate] Study
- ▶ **Teriflunomide** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Valaciclovir** is predicted to increase the exposure to **aminophylline**. [Severe] Anecdotal

Aminosalicylic acid

- ▶ **Aminosalicylic acid** is predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Aminosalicylic acid** is predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical

Amiodarone → see antiarrhythmics

Amisulpride → see TABLE 9 p. 1336 (QT-interval prolongation), TABLE 11 p. 1336 (CNS depressant effects)

- ▶ **Amisulpride** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Amisulpride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical

Amisulpride → see tricyclic antidepressants

Amiodipine → see calcium channel blockers

Amoxicillin → see penicillins

Amphotericin → see TABLE 2 p. 1334 (nephrotoxicity), TABLE 17 p. 1338 (reduced serum potassium)

- ▶ **Amphotericin** increases the risk of toxicity when given with **flucytosine**. [Severe] Study
- ▶ **Amphotericin** slightly increases the exposure to **amphotericin**. Avoid or monitor toxicity. [Moderate] Study
- ▶ **Sodium stibogluconate** increases the risk of cardiovascular side-effects when given with **amphotericin**. Separate administration by 14 days. [Severe] Study

Ampicillin → see penicillins

Amsacrine → see TABLE 15 p. 1337 (myelosuppression)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **amsacrine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Anaesthetics, local → see TABLE 11 p. 1336 (CNS depressant effects)

bupivacaine • levobupivacaine • mepivacaine • oxybuprocaine • prilocaine • proxymetacaine • ropivacaine • tetracaine

- ▶ **Aminosalicylic acid** is predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with **antiarrhythmics**. [Severe] Theoretical → Also see TABLE 11 p. 1336
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of

Anaesthetics, local (continued)

methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 1336

- ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Dapsone** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Metoclopramide** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Avoid. [Severe] Theoretical
- ▶ **Nitrates** are predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Avoid. [Severe] Theoretical
- ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Paracetamol** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Sodium nitroprusside** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **SSRIs (fluvoxamine)** decrease the clearance of **ropivacaine**. Avoid prolonged use. [Moderate] Study
- ▶ **Sulfonamides** potentially increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Anecdotal
- ▶ **Teriflunomide** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical

Anagrelide → see TABLE 9 p. 1336 (QT-interval prolongation), TABLE 4 p. 1334 (antiplatelet effects)

- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical → Also see TABLE 4 p. 1334

Anakinra → see TABLE 15 p. 1337 (myelosuppression)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anakinra**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Angiotensin-II receptor antagonists → see TABLE 7 p. 1335 (first-degree hypotension), TABLE 8 p. 1335 (hypotension), TABLE 16 p. 1338 (increased serum potassium)

azilsartan • candesartan • eprosartan • irbesartan • losartan • olmesartan • telmisartan • valsartan

- ▶ **Angiotensin-II receptor antagonists** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients, p. 179. [Severe] Study → Also see TABLE 8 p. 1335 → Also see TABLE 16 p. 1338
- ▶ **Angiotensin-II receptor antagonists** potentially increase the concentration of **lithium**. Monitor concentration and adjust dose. [Severe] Anecdotal

Antacids

aluminium hydroxide • magnesium carbonate • magnesium trisilicate

SEPARATION OF ADMINISTRATION Antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- ▶ **Antacids** are predicted to decrease the absorption of **alkylating agents (estramustine)**. Avoid. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **antiepileptics (gabapentin)**. **Gabapentin** should be taken 2 hours after **antacids**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **antifungals, azoles (itraconazole)** (capsule). **Antacids** should be taken 1 hour before or 2 hours after **itraconazole**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **antifungals, azoles (ketoconazole)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **antihistamines, non-sedating (fexofenadine)**. Separate administration by 2 hours. [Mild] Study
- ▶ **Antacids** decrease the absorption of **antimalarials (chloroquine)**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **antimalarials (proguanil)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **aspirin** (high-dose). [Moderate] Study
- ▶ **Antacids** decrease the absorption of **bisphosphonates (alendronic acid)**. **Alendronic acid** should be taken at least 30 minutes before **antacids**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **bisphosphonates (ibandronic acid)**. Avoid **antacids** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **bisphosphonates (sodium clodronate)**. Avoid **antacids** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **bosutinib**. **Bosutinib** should be taken at least 12 hours before **antacids**. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **ceritinib**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Oral aluminium hydroxide** decreases the absorption of **chenodeoxycholic acid**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **cholic acid**. Separate administration by 5 hours. [Mild] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **corticosteroids (deflazacort)**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **corticosteroids (dexamethasone)**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **dasatinib**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Aluminium hydroxide** is predicted to decrease the absorption of **deferiprone**. Avoid. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **digoxin**. Separate administration by 2 hours. [Mild] Study
- ▶ **Antacids** are predicted to decrease the absorption of **dipyridamole** (immediate release tablets). [Moderate] Theoretical
- ▶ **Antacids** moderately decrease the exposure to **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after **antacids**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **antacids**. [Severe] Study
- ▶ **Antacids** moderately decrease the exposure to **elvitegravir**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Aluminium hydroxide** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **erlotinib**. **Antacids** should be taken 4 hours before or 2 hours after **erlotinib**. [Moderate] Theoretical
- ▶ **Antacids** slightly to moderately decrease the exposure to **fibrates (gemfibrozil)**. [Moderate] Study
- ▶ **Antacids** are predicted to slightly decrease the exposure to **gefitinib**. [Moderate] Theoretical

- ▶ **Antacids** are predicted to decrease the absorption of **HIV-protease inhibitors (atazanavir)**. Atazanavir should be taken 2 hours before or 1 hour after **antacids**. [Severe] Theoretical
 - ▶ **Antacids** are predicted to decrease the absorption of **HIV-protease inhibitors (tipranavir)**. Separate administration by 2 hours. [Moderate] Study
 - ▶ **Antacids** decrease the absorption of **hydroxychloroquine**. Separate administration by at least 4 hours. [Moderate] Study
 - ▶ **Antacids** decrease the absorption of **iron (oral)**. **Iron (oral)** should be taken 1 hour before or 2 hours after **antacids**. [Moderate] Study
 - ▶ **Aluminium hydroxide** is predicted to decrease the exposure to **iron chelators (deferasirox)**. Avoid. [Moderate] Theoretical
 - ▶ **Antacids** are predicted to decrease the absorption of **lapatinib**. Avoid. [Moderate] Theoretical
 - ▶ **Antacids** are predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
 - ▶ **Antacids** decrease the exposure to **mycophenolate**. [Moderate] Study
 - ▶ **Antacids** are predicted to decrease the absorption of **nilotinib**. Separate administration by at least 2 hours. [Moderate] Theoretical
 - ▶ **Magnesium trisilicate** decreases the absorption of **nitrofurantoin**. [Moderate] Study
 - ▶ **Antacids** are predicted to decrease the absorption of **pazopanib**. **Pazopanib** should be taken 1 hour before or 2 hours after **antacids**. p. 962. [Moderate] Theoretical
 - ▶ **Antacids** decrease the absorption of **penicillamine**. Separate administration by 2 hours. [Mild] Study
 - ▶ **Antacids** decrease the absorption of **phenothiazines**. [Moderate] Anecdotal
 - ▶ **Antacids** increase the risk of metabolic alkalosis when given with **polystyrene sulfonate**. [Severe] Anecdotal
 - ▶ **Antacids** decrease the absorption of **quinolones**. **Quinolones** should be taken 2 hours before or 4 hours after **antacids**. [Moderate] Study
 - ▶ **Antacids** slightly decrease the exposure to **raltegravir**. Avoid. [Moderate] Study
 - ▶ **Antacids** decrease the absorption of **rifampicin**. **Rifampicin** should be taken 1 hour before **antacids**. [Moderate] Study
 - ▶ **Antacids** are predicted to decrease the exposure to **rilpivirine**. **Antacids** should be taken 2 hours before or 4 hours after **rilpivirine**. [Severe] Theoretical
 - ▶ **Antacids** slightly decrease the exposure to **riociguat**. **Antacids** should be taken 2 hours before or 1 hour after **riociguat**. [Mild] Study
 - ▶ **Antacids** moderately decrease the absorption of **statins (rosuvastatin)**. Separate administration by 2 hours. [Moderate] Study
 - ▶ **Antacids** decrease the absorption of **sulpiride**. Separate administration by 2 hours. [Moderate] Study
 - ▶ **Antacids** decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Study
 - ▶ **Antacids** are predicted to decrease the absorption of **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [Moderate] Anecdotal
 - ▶ **Antacids** are predicted to decrease the absorption of **ursodeoxycholic acid**. Separate administration by 2 hours. [Moderate] Theoretical
 - ▶ **Antacids** are predicted to decrease the concentration of **velpatasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- Antazoline** → see antihistamines, sedating
- Anthracyclines** → see TABLE 15 p. 1337 (myelosuppression), TABLE 5 p. 1334 (thromboembolism)
- daunorubicin • doxorubicin • epirubicin • idarubicin • mitoxantrone • pixantrone

GENERAL INFORMATION Caution is necessary with concurrent use of cardiotoxic drugs, or drugs that reduce cardiac contractility.

- ▶ **Calcium channel blockers (verapamil)** moderately increase the exposure to **doxorubicin**. [Moderate] Study

- ▶ **Ciclosporin** increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). [Severe] Study
 - ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **epirubicin**. Avoid. [Moderate] Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anthracyclines**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with **monoclonal antibodies (trastuzumab, trastuzumab emtansine)**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1337
 - ▶ **Rolapitant** is predicted to increase the exposure to anthracyclines (**doxorubicin, mitoxantrone**). Avoid or monitor. [Moderate] Study
- Antiarrhythmics** → see TABLE 6 p. 1335 (bradycardia), TABLE 12 p. 1337 (peripheral neuropathy), TABLE 9 p. 1336 (QT-interval prolongation), TABLE 11 p. 1336 (CNS depressant effects), TABLE 10 p. 1336 (antimuscarinics)

adenosine • amiodarone • disopyramide • dronedarone • flecainide • lidocaine • propafenone

- ▶ Amiodarone has a long half-life; there is potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.
- ▶ Since systemic absorption can follow topical application of **lidocaine**, the possibility of interactions should be borne in mind.

- ▶ Antiarrhythmics (**amiodarone, dronedarone**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Amiodarone** is predicted to decrease the effects of **agalsidase**. Avoid. [Moderate] Theoretical
- ▶ **Amiodarone** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose, p. 190. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose, p. 190. [Severe] Study
- ▶ Antiarrhythmics (**amiodarone, dronedarone**) are predicted to increase the exposure to **alisikiren**. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **alprazolam**. [Severe] Study
- ▶ **Aminophylline** is predicted to decrease the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Theoretical
- ▶ **Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with **antiarrhythmics**. [Severe] Theoretical → Also see TABLE 11 p. 1336
- ▶ Antiarrhythmics (**propafenone**) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (**amiodarone**). Monitor and adjust dose. [Severe] Theoretical
- ▶ Antiarrhythmics (**amiodarone**) increase the concentration of antiarrhythmics (**flecainide**). Adjust **flecainide** dose and monitor side effects. [Severe] Study → Also see TABLE 6 p. 1335 → Also see TABLE 9 p. 1336
- ▶ Antiarrhythmics (**propafenone**) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (**lidocaine**). [Moderate] Study
- ▶ Antiarrhythmics (**dronedarone**) are predicted to increase the exposure to antiarrhythmics (**propafenone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** increases the risk of bradycardia when given with **anticholinesterases, centrally acting**. [Moderate] Anecdotal → Also see TABLE 6 p. 1335
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **lidocaine**. [Severe] Anecdotal
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure

Antiarrhythmics (continued)

- to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [Severe] Study
- **Amiodarone** is predicted to slightly increase the concentration of **antiepileptics** (**fosphenytoin**, **phenytoin**). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 1337
 - **Antifungals, azoles** (**fluconazole**) are predicted to increase the exposure to **dronedaron**. [Severe] Theoretical → Also see TABLE 9 p. 1336
 - **Antifungals, azoles** (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
 - **Antifungals, azoles** (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **disopyramide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1336
 - **Antifungals, azoles** (**itraconazole**, **ketoconazole**, **voriconazole**) very markedly increase the exposure to **dronedaron**. Avoid. [Severe] Study → Also see TABLE 9 p. 1336
 - **Antifungals, azoles** (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
 - **Antifungals, azoles** (**miconazole**) are predicted to increase the exposure to **disopyramide**. Use with caution and adjust dose. [Severe] Theoretical
 - **Antifungals, azoles** (**posaconazole**) are predicted to increase the exposure to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [Severe] Theoretical
 - **Dronedaron** is predicted to increase the exposure to **antihistamines, non-sedating** (**fexofenadine**, **mizolastine**). [Severe] Theoretical
 - **Dronedaron** is predicted to increase the exposure to **antihistamines, non-sedating** (**rupatadine**). Avoid. [Moderate] Study
 - **Dronedaron** is predicted to increase the concentration of **antimalarials** (**piperaquine**). [Severe] Theoretical
 - **Dronedaron** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
 - **Aprepitant** increases the exposure to **dronedaron**. [Severe] Theoretical
 - **Aprepitant** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
 - **Dronedaron** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
 - **Dronedaron** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1336
 - Antiarrhythmics (**amiodarone**, **disopyramide**, **dronedaron**, **flecainide**, **lidocaine**) are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 1335 → Also see TABLE 9 p. 1336
 - **Propafenone** is predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective** (**labetalol**, **levobunolol**, **nadolol**, **oxprenolol**, **pindolol**, **sotalol**). Use with caution or avoid. [Severe] Study
 - **Propafenone** increases the risk of cardiovascular side-effects when given with **beta blockers, non-selective** (**propranolol**). Use with caution or avoid. [Severe] Study
 - **Propafenone** is predicted to increase the exposure to **beta blockers, non-selective** (**timolol**) and **beta blockers, non-selective** (**timolol**) are predicted to increase the risk of cardiodepression when given with **propafenone**. [Severe] Anecdotal
 - Antiarrhythmics (**amiodarone**, **disopyramide**, **dronedaron**, **flecainide**, **lidocaine**) are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 1335
 - **Propafenone** is predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, selective** (**acebutolol**, **atenolol**, **betaxolol**, **bisoprolol**, **celiprolol**, **esmolol**). Use with caution or avoid. [Severe] Study
 - **Propafenone** is predicted to increase the exposure to **beta blockers, selective** (**metoprolol**). [Moderate] Study
 - **Propafenone** is predicted to increase the exposure to **beta blockers, selective** (**nebivolol**) and **beta blockers, selective** (**nebivolol**) are predicted to increase the risk of

cardiodepression when given with **propafenone**. Avoid. [Severe] Theoretical

- **Bosentan** is predicted to decrease the exposure to **dronedaron**. [Severe] Theoretical
- **Dronedaron** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1336
- **Dronedaron** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study
- **Dronedaron** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 1336
- **Caffeine citrate** decreases the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Study
- **Calcium channel blockers** (**diltiazem**, **verapamil**) increase the exposure to **dronedaron** and **dronedaron** increases the exposure to **calcium channel blockers** (**diltiazem**, **verapamil**). [Moderate] Study
- **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- **Calcium channel blockers** (**verapamil**) increase the risk of cardiodepression when given with **flecainide**. [Severe] Anecdotal → Also see TABLE 6 p. 1335
- **Dronedaron** is predicted to increase the exposure to **calcium channel blockers** (**amlodipine**, **felodipine**, **lacidipine**, **lercanidipine**, **nicardipine**, **nifedipine**, **nimodipine**). Monitor and adjust dose. [Moderate] Study
- **Amiodarone** is predicted to increase the risk of cardiodepression when given with **calcium channel blockers** (**diltiazem**, **verapamil**). Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1335
- **Disopyramide** is predicted to increase the risk of cardiodepression when given with **calcium channel blockers** (**verapamil**). [Severe] Theoretical
- Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 1336
- **Amiodarone** increases the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Severe] Study
- **Dronedaron** increases the concentration of **ciclosporin**. [Severe] Study
- **Ciclosporin** increases the exposure to **dronedaron**. Avoid. [Severe] Theoretical
- **Cobicistat** very markedly increases the exposure to **dronedaron**. Avoid. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- **Dronedaron** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Dronedaron** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4, p. 1085. [Severe] Study
- **Dronedaron** is predicted to increase the exposure to **corticosteroids** (**methylprednisolone**). Monitor and adjust dose. [Moderate] Study
- **Amiodarone** increases the anticoagulant effect of **coumarins**. [Severe] Study
- **Propafenone** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- **Amiodarone** increases the exposure to **dabigatran**. Adjust **dabigatran** dose, p. 135. [Moderate] Study
- **Dronedaron** slightly increases the exposure to **dabigatran**. Avoid. [Severe] Study
- **Daclatasvir** is predicted to increase the risk of severe bradycardia or heart block when given with **amiodarone**. Refer to specialist literature. [Severe] Anecdotal
- **Dronedaron** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- **Darifenacin** is predicted to increase the concentration of **flecainide**. [Moderate] Theoretical
- **Dronedaron** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1336

- ▶ Antiarrhythmics (**amiodarone**, **dronedarone**) are predicted to moderately increase the exposure to **digoxin**. Monitor and adjust **digoxin** dose, p. 109. [Severe] Study → Also see TABLE 6 p. 1335
- ▶ **Propafenone** increases the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study
- ▶ **Dipyridamole** increases the exposure to **adenosine**. Avoid or adjust dose. [Severe] Study
- ▶ **Dronedarone** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Severe] Anecdotal
- ▶ **Dronedarone** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Amiodarone** slightly increases the exposure to **edoxaban**. [Severe] Study
- ▶ **Dronedarone** slightly increases the exposure to **edoxaban**. Adjust **edoxaban** dose, p. 125. [Severe] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **dronedarone**. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ Antiarrhythmics (**dronedarone**, **propafenone**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedarone**). Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ Antiarrhythmics (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 759. [Mild] Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical
- ▶ **Dronedarone** potentially increases the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Grapefruit juice** increases the exposure to **amiodarone**. Avoid. [Moderate] Study
- ▶ **Grapefruit juice** moderately increases the exposure to **dronedarone**. Avoid. [Severe] Study
- ▶ **Grapefruit juice** increases the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 349. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **amiodarone**. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **flecainide**. Monitor and adjust dose. [Mild] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **lidocaine**. Monitor and adjust dose. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **amiodarone**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **disopyramide**. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **HIV-protease inhibitors** very markedly increase the exposure to **dronedarone**. Avoid. [Severe] Study → Also see TABLE 9 p. 1336
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lidocaine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Amiodarone** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose, p. 952. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4, p. 952. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **amiodarone**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** very markedly increases the exposure to **dronedarone**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dronedarone**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 210. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 292. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 1336
- ▶ **Ledipasvir** increases the risk of severe bradycardia or heart block when given with **amiodarone**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **Amiodarone** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **loperamide**. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **lurasidone**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** very markedly increase the exposure to **dronedarone**. Avoid. [Severe] Study → Also see TABLE 9 p. 1336
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **lidocaine**. [Moderate] Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to moderately increase the exposure to **dronedarone**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedarone**). Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Dronedarone** increases the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 64. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **dronedarone**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **NSAIDs (celecoxib)** are predicted to increase the exposure to antiarrhythmics (**flecainide**, **propafenone**). Monitor and adjust dose. [Moderate] Theoretical

Antiarrhythmics (continued)

- ▶ **Dronedaron** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose, p. 973. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **opioids** (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodaron** is predicted to increase the concentration of **opioids** (**fentanyl**). [Moderate] Theoretical → Also see TABLE 6 p. 1335
- ▶ **Dronedaron** is predicted to increase the exposure to **opioids** (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Dronedaron** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ Antiarrhythmics (**amiodaron**, **dronedaron**) are predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Dronedaron** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Propafenone** is predicted to increase the anticoagulant effect of **phenindione**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**avanafil**). Adjust **avanafil** dose, p. 794. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**sildenafil**). Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 794. [Moderate] Study → Also see TABLE 9 p. 1336
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**tadalafil**). [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**vardanafil**). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Dronedaron** potentially increases the exposure to **pibrentasvir**. [Moderate] Theoretical
- ▶ **Amiodaron** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Propafenone** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Quinolones** (**ciprofloxacin**) slightly increase the exposure to **lidocaine**. [Mild] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 1336
- ▶ **Amiodaron** is predicted to increase the exposure to **retinoids** (**alitretinoin**). Adjust **alitretinoin** dose, p. 1226. [Moderate] Theoretical
- ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **amiodaron**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Dronedaron** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 1336
- ▶ **Rifampicin** is predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **rivaroxaban**. Avoid. [Moderate] Theoretical
- ▶ **Rolapitant** is predicted to increase the exposure to **propafenone**. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ **Simeprevir** is predicted to increase the concentration of **amiodaron**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **Dronedaron** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Amiodaron** is predicted to increase the concentration of **sirolimus**. [Severe] Anecdotal
- ▶ **Dronedaron** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Sofosbuvir** is predicted to increase the risk of severe bradycardia or heart block when given with **amiodaron**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **SSRIs** (**fluvoxamine**) are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **SSRIs** (**italopram**, **escitalopram**, **fluoxetine**, **fluvoxamine**, **paroxetine**, **sertraline**). [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Dronedaron** is predicted to increase the exposure to **SSRIs** (**dapoxetine**). Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4, p. 801. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **dronedaron**. Avoid. [Severe] Theoretical
- ▶ **Amiodaron** is predicted to increase the risk of rhabdomyolysis when given with **statins** (**atorvastatin**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **statins** (**atorvastatin**). Monitor and adjust dose. [Severe] Study
- ▶ **Amiodaron** is predicted to increase the exposure to **statins** (**fluvastatin**). [Severe] Theoretical
- ▶ **Dronedaron** slightly increases the exposure to **statins** (**rosuvastatin**). Adjust dose. [Severe] Study
- ▶ **Amiodaron** increases the risk of rhabdomyolysis when given with **statins** (**simvastatin**). Adjust **simvastatin** dose, p. 203. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **statins** (**simvastatin**). Use with caution and adjust **simvastatin** dose, p. 203. [Severe] Study
- ▶ **Amiodaron** is predicted to increase the exposure to **sulfonylureas**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Lidocaine** is predicted to increase the effects of **suxamethonium**. [Moderate] Study
- ▶ **Amiodaron** is predicted to increase the concentration of **tacrolimus**. [Severe] Anecdotal
- ▶ **Dronedaron** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **taxanes** (**cabazitaxel**). [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **taxanes** (**paclitaxel**). [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- ▶ **Theophylline** decreases the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Study
- ▶ **Amiodaron** is predicted to increase the risk of thyroid dysfunction when given with **thyroid hormones**. Avoid. [Moderate] Study
- ▶ **Amiodaron** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Dronedaron** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ Antiarrhythmics (**amiodaron**, **dronedaron**) are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ Antiarrhythmics (**amiodaron**, **dronedaron**) are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **tricyclic antidepressants**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Propafenone** is predicted to increase the concentration of **tricyclic antidepressants**. [Moderate] Theoretical → Also see TABLE 10 p. 1336
- ▶ **Dronedaron** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Amiodaron** is predicted to increase the concentration of **velpatasvir**. Avoid or monitor. [Moderate] Theoretical

- ▶ **Amiodarone** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose, p. 974. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 1336
- ▶ **Dronedarone** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Anticholinesterases, centrally acting → see TABLE 6 p. 1335 (bradycardia)

- donepezil • galantamine • rivastigmine
 - ▶ **Antiarrhythmics (amiodarone)** increase the risk of bradycardia when given with **anticholinesterases, centrally acting**. [Moderate] Anecdotal → Also see TABLE 6 p. 1335
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [Moderate] Anecdotal → Also see TABLE 6 p. 1335
 - ▶ **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with **beta blockers, selective**. [Moderate] Anecdotal → Also see TABLE 6 p. 1335
 - ▶ **Bupropion** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** increase the risk of bradycardia when given with **anticholinesterases, centrally acting**. [Moderate] Anecdotal → Also see TABLE 6 p. 1335
 - ▶ **Cinacalcet** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **Anticholinesterases, centrally acting** are predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical → Also see TABLE 6 p. 1335
 - ▶ **Rifampicin** is predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Anticholinesterases, centrally acting** increase the effects of **suxamethonium**. [Moderate] Theoretical
 - ▶ **Terbinafine** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- Antiepileptics** → see TABLE 1 p. 1334 (hepatotoxicity), TABLE 18 p. 1338 (hyponaatraemia), TABLE 15 p. 1337 (myelosuppression), TABLE 12 p. 1337 (peripheral neuropathy), TABLE 11 p. 1336 (CNS depressant effects)
- brivaracetam • carbamazepine • eslicarbazepine • ethosuximide • fosphenytoin • gabapentin • lacosamide • lamotrigine • levetiracetam • oxcarbazepine • paraldehyde • perampanel • phenobarbital • phenytoin • pregabalin • primidone • retigabine • rufinamide • stiripentol • tiagabine • topiramate • valproate • vigabatrin • zonisamide

FOOD AND LIFESTYLE Avoid milk or dairy products, carbonated drinks, and fruit juices at the same time as stiripentol.

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **abacavir**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **Acetazolamide** potentially increases the risk of toxicity when given with **valproate**. [Severe] Study
- ▶ **Acetazolamide** potentially increases the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of **albendazole**. [Moderate] Study
- ▶ **Alcohol (beverage)** potentially increases the risk of visual disturbances when given with **retigabine**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical → Also see TABLE 18 p. 1338
- ▶ **Carbamazepine** decreases the exposure to **aliskiren**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1336
- ▶ **Fosphenytoin** is predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Phenobarbital** is predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Phenytoin** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Primidone** is predicted to increase the clearance of **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Stiripentol** is predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 1336
- ▶ **Phenytoin** is predicted to decrease the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **gabapentin**. **Gabapentin** should be taken 2 hours after **antacids**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to slightly increase the concentration of antiepileptics (**fosphenytoin, phenytoin**). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 1337
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **antiarrhythmics (lidocaine)**. [Severe] Anecdotal
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the efficacy of **antiarrhythmics (propafenone)**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **anticholinesterases, centrally acting (donepezil)**. [Mild] Study
- ▶ **Antiepileptics (carbamazepine)** decrease the concentration of antiepileptics (**brivaracetam**). [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the concentration of antiepileptics (**brivaracetam**). [Moderate] Study
- ▶ **Antiepileptics (lamotrigine)** potentially increase the concentration of antiepileptics (**carbamazepine**) and antiepileptics (**carbamazepine**) decrease the concentration of antiepileptics (**lamotrigine**). Adjust **lamotrigine** dose and monitor **carbamazepine** concentration, p. 316, p. 309. [Moderate] Study

Antiepileptics (continued)

- Antiepileptics (**phenobarbital**) affect the concentration of antiepileptics (**carbamazepine**) and antiepileptics (**carbamazepine**) increase the concentration of antiepileptics (**phenobarbital**). Adjust dose. [Moderate] Study
- Antiepileptics (**topiramate**) increase the risk of carbamazepine toxicity when given with antiepileptics (**carbamazepine**). [Moderate] Study
- Antiepileptics (**stiripentol**) increase the concentration of antiepileptics (**carbamazepine**, **phenobarbital**). Avoid in Dravet syndrome. [Severe] Study
- Antiepileptics (**carbamazepine**) slightly decrease the exposure to antiepileptics (**eslicarbazepine**, **oxcarbazepine**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**oxcarbazepine**) are predicted to increase the concentration of antiepileptics (**fosphenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**fosphenytoin**). [Severe] Study
- Antiepileptics (**carbamazepine**) affect the concentration of antiepileptics (**fosphenytoin**, **phenytoin**) and antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of antiepileptics (**carbamazepine**). Monitor and adjust dose. [Severe] Study
- Antiepileptics (**eslicarbazepine**) increase the exposure to antiepileptics (**fosphenytoin**, **phenytoin**) and antiepileptics (**fosphenytoin**, **phenytoin**) decrease the exposure to antiepileptics (**eslicarbazepine**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**valproate**) affect the concentration of antiepileptics (**fosphenytoin**, **phenytoin**) and antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of antiepileptics (**valproate**). [Severe] Study
- Antiepileptics (**vigabatrin**) decrease the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). [Mild] Study
- Antiepileptics (**fosphenytoin**) decrease the concentration of antiepileptics (**lamotrigine**). Monitor and adjust **lamotrigine** dose, p. 316. [Moderate] Study
- Antiepileptics (**phenobarbital**, **phenytoin**, **primidone**) decrease the concentration of antiepileptics (**lamotrigine**). Monitor and adjust **lamotrigine** dose, p. 316. [Moderate] Study → Also see TABLE 11 p. 1336
- Antiepileptics (**valproate**) increase the exposure to antiepileptics (**lamotrigine**). Adjust **lamotrigine** dose and monitor rash, p. 316. [Severe] Study
- Antiepileptics (**lamotrigine**) are predicted to increase the concentration of antiepileptics (**oxcarbazepine**) and antiepileptics (**oxcarbazepine**) are predicted to decrease the concentration of antiepileptics (**lamotrigine**). Monitor side effects and adjust dose. [Moderate] Study
- Antiepileptics (**carbamazepine**, **fosphenytoin**) are predicted to decrease the exposure to antiepileptics (**perampanel**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**oxcarbazepine**) decrease the concentration of antiepileptics (**perampanel**) and antiepileptics (**perampanel**) increase the concentration of antiepileptics (**oxcarbazepine**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to antiepileptics (**perampanel**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1336
- Antiepileptics (**phenytoin**) increase the concentration of antiepileptics (**phenobarbital**) and antiepileptics (**phenobarbital**) affect the concentration of antiepileptics (**phenytoin**). [Moderate] Study
- Antiepileptics (**fosphenytoin**) increase the concentration of antiepileptics (**phenobarbital**, **primidone**) and antiepileptics (**phenobarbital**, **primidone**) affect the concentration of antiepileptics (**fosphenytoin**). [Moderate] Study
- Antiepileptics (**oxcarbazepine**) are predicted to increase the concentration of antiepileptics (**phenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**phenytoin**). Avoid in Dravet syndrome. [Severe] Study

- Antiepileptics (**carbamazepine**) potentially decrease the concentration of antiepileptics (**primidone**) and antiepileptics (**primidone**) potentially decrease the concentration of antiepileptics (**carbamazepine**). Adjust dose. [Moderate] Anecdotal
- Antiepileptics (**phenytoin**) increase the concentration of antiepileptics (**primidone**) and antiepileptics (**primidone**) affect the concentration of antiepileptics (**phenytoin**). [Moderate] Study
- Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**primidone**). [Severe] Theoretical
- Antiepileptics (**valproate**) affect the concentration of antiepileptics (**primidone**). Monitor and adjust dose. [Severe] Study
- Antiepileptics (**carbamazepine**) slightly increase the clearance of antiepileptics (**retigabine**). [Moderate] Study
- Antiepileptics (**fosphenytoin**, **phenytoin**) are predicted to slightly increase the clearance of antiepileptics (**retigabine**). [Moderate] Study
- Antiepileptics (**valproate**) increase the exposure to antiepileptics (**rufinamide**). Adjust **rufinamide** dose, p. 324. [Moderate] Study
- Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the exposure to antiepileptics (**tiagabine**). Monitor and adjust **tiagabine** dose, p. 327. [Moderate] Study
- Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of antiepileptics (**topiramate**) and antiepileptics (**topiramate**) increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of antiepileptics (**topiramate**). [Mild] Study
- Antiepileptics (**phenobarbital**) decrease the concentration of antiepileptics (**valproate**) and antiepileptics (**valproate**) increase the concentration of antiepileptics (**phenobarbital**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**topiramate**) increase the risk of toxicity when given with antiepileptics (**valproate**). [Severe] Study
- Antiepileptics (**carbamazepine**) slightly to moderately decrease the concentration of antiepileptics (**zonisamide**) and antiepileptics (**zonisamide**) affect the concentration of antiepileptics (**carbamazepine**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**fosphenytoin**, **phenytoin**) slightly to moderately decrease the concentration of antiepileptics (**zonisamide**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of antiepileptics (**zonisamide**). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**topiramate**) potentially increase the risk of overheating and dehydration when given with antiepileptics (**zonisamide**). Avoid in children. [Severe] Theoretical
- Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
- Antifungals, azoles (**miconazole**) increase the risk of carbamazepine toxicity when given with **carbamazepine**. Monitor and adjust dose. [Severe] Anecdotal
- Antifungals, azoles (**miconazole**) increase the risk of phenytoin toxicity when given with **fosphenytoin**. Monitor and adjust dose. [Severe] Anecdotal
- Antifungals, azoles (**miconazole**) increase the risk of phenytoin toxicity when given with **phenytoin**. Monitor and adjust dose. [Severe] Anecdotal
- Carbamazepine** is predicted to decrease the efficacy of antifungals, azoles (**fluconazole**) and antifungals, azoles (**fluconazole**) increase the concentration of **carbamazepine**. Avoid or monitor **carbamazepine** concentration and adjust dose accordingly, p. 309. [Severe] Theoretical → Also see TABLE 1 p. 1334
- Antifungals, azoles (**fluconazole**) increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to antifungals, azoles (**isavuconazole**). Avoid. [Severe] Study

- ▶ **Fosphenytoin** very markedly decreases the exposure to **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **fosphenytoin**, p. 313. [Moderate] Study
- ▶ **Phenobarbital** decreases the concentration of **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **phenobarbital**, p. 331. [Moderate] Study
- ▶ **Phenytoin** very markedly decreases the exposure to **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **phenytoin**, p. 321. [Moderate] Study
- ▶ **Primidone** is predicted to decrease the concentration of **antifungals, azoles (itraconazole)**. [Moderate] Theoretical
