Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus p. 669 and Type 2 diabetes mellitus p. 671 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral, or antipsychotic drugs may also cause secondary diabetes.

Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence they hold, and whether they have diabetic complications (including episodes of hypoglycaemia). All drivers who are treated with insulin must inform the DVLA, with some exceptions for temporary treatment. Detailed guidance on notification requirements, eligibility to drive, and precautions required, is available from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive.

Advice from the DVLA

The DVLA recommends (2016) that drivers with diabetes need to be particularly careful to avoid hypoglycaemia and should be informed of the warning signs and actions to take. Drivers treated with insulin should always carry a glucose meter and blood-glucose strips when driving, and check their blood-glucose concentration no more than 2 hours before driving and every 2 hours while driving. More frequent self-monitoring may be required if, for any reason, there is a greater risk of hypoglycaemia, such as after physical activity or altered meal routine.

Blood-glucose should always be above 5 mmol/litre while driving. If blood-glucose falls to 5 mmol/litre or below, a snack should be taken. Drivers treated with insulin should ensure that a supply of fast-acting carbohydrate is always available in the vehicle. If blood-glucose is less than 4 mmol/Litre, or warning signs of hypoglycaemia develop, the driver should not drive. If already driving, the driver should:

- stop the vehicle in a safe place;

- switch off the engine, remove keys from the ignition, and move from the driver's seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood-glucose has returned to normal, before continuing journey.

Drivers must not drive if hypoglycaemia awareness has been lost and the DVLA must be notified; driving may resume if a medical report confirms that awareness has been regained.

Depending on the type of licence, notification and monitoring may also be necessary for drivers taking oral antidiabetic drugs, particularly those which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 686, repaglinide p. 687).

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Alcohol

Alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; specialist sources recommend that patients with diabetes should drink alcohol only in moderation, and when accompanied by food.

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is **not** recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and a blood-glucose concentration that does not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of *Polycal*® or as *Rapilose*® OGTT oral solution.

HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in *mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values	
IFCC-HbA1c (mmol/mol)	DCCT-HbA1c (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
69	8.5
75	9.0

Diagnosis

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes p. 669 and Type 2 diabetes p. 671 and is now also used for diagnosis of type 2 diabetes. [Evg](#) HbA1c should not be used for diagnosis in those with suspected

type 1 diabetes, in children, during pregnancy, or in women who are up to two months postpartum. It should also not be used for patients who have:

- had symptoms of diabetes for less than 2 months;
- a high diabetes risk and are acutely ill;
- treatment with medication that may cause hyperglycaemia;
- Acute pancreatic damage;
- end-stage chronic kidney disease;
- HIV infection.

HbA1c used for diagnosis of diabetes should be interpreted with caution in patients with abnormal haemoglobin, anaemia, altered red cell lifespan, or who have had a recent blood transfusion. [▲](#)

Monitoring

[EvGr](#) HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications and patients should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 671).

HbA1c should usually be measured in patients with type 1 diabetes every 3 to 6 months, and more frequently if blood-glucose control is thought to be changing rapidly. Patients with type 2 diabetes should be monitored every 3 to 6 months until HbA1c and medication are stable when monitoring can be reduced to every 6 months. [▲](#)

HbA1c monitoring is invalid for patients with disturbed erythrocyte turnover or for patients with a lack of, or abnormal haemoglobin. In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Type 1 diabetes

05-Jun-2017

Description of condition

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, neuropathy, premature cardiovascular disease, and peripheral arterial disease.

Typical features in adult patients presenting with type 1 diabetes are hyperglycaemia (random plasma-glucose concentration above 11 mmol/litre), ketosis, rapid weight loss, a body mass index below 25 kg/m², age younger than 50 years, and a personal/family history of autoimmune disease (though not all features may be present).

Aims of treatment

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications.

Disability from complications can often be prevented by early detection and active management of the disease (see Diabetic complications p. 674). [EvGr](#) The target for glycaemic control should be individualised for each patient,

considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, occupation and history of hypoglycaemia.

A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is recommended in patients with type 1 diabetes. Blood-glucose concentration should be monitored at least four times a day, including before each meal and before bed.

[▲](#) Patients should aim for:

- [EvGr](#) a fasting blood-glucose concentration of 5–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre at least 90 minutes after eating;
- a blood-glucose concentration of at least 5 mmol/litre when driving. [▲](#)

Overview

[EvGr](#) Type 1 diabetes requires insulin replacement, supported by active management of other cardiovascular risk factors, such as hypertension and high circulating lipids (see Diabetic complications p. 674). [▲](#) Insulin replacement therapy aims to recreate normal fluctuations in circulating insulin concentrations while supporting a flexible lifestyle with minimal restrictions. Flexible insulin therapy usually involves self-injecting multiple daily doses of insulin, with doses adjusted according to planned exercise, intended food intake and other factors, including current blood-glucose, which the patient needs to test on a regular basis.

[EvGr](#) Patients who have a BMI of 25 kg/m² or above (23 kg/m² or above for patients of South Asian or related ethnicity) who wish to improve their blood-glucose control while minimising their effective insulin dose, may benefit from metformin hydrochloride p. 678 [unlicensed indication] as an addition to insulin therapy.

Dietary control is important in both type 1 and type 2 diabetes and patients should receive advice from a dietician. Dietary advice should include information on weight control, cardiovascular risk, hyperglycaemic effects of different foods and appropriate changes in insulin doses according to food intake. Healthy eating can reduce cardiovascular risk and dietary modifications may be recommended to account for various associated features of diabetes such as excess weight and obesity, low body-weight, eating disorders, hypertension and renal failure. Patients with type 1 diabetes should be offered carbohydrate-counting training as part of a structured education programme. [▲](#)

Management of type 1 diabetes with insulin

[EvGr](#) All patients with type 1 diabetes require insulin therapy (see also Insulin p. 670). Treatment should be initiated and managed by clinicians with relevant expertise; there are several different types of regimens. [▲](#)

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

[EvGr] Patients with type 1 diabetes should be offered multiple daily injection basal-bolus insulin regimens as the **first-line choice**. Twice-daily insulin detemir p. 701 should be offered as the long-acting basal insulin therapy. Once-daily insulin glargine p. 701 may be prescribed if insulin detemir is not tolerated, or if a twice-daily regimen is not acceptable to the patient. Insulin detemir may also be offered as an alternative once-daily regimen.

Patients who are using alternative basal regimens may continue if agreed targets are being achieved; other basal insulin regimens should be considered only if the recommended regimens do not deliver agreed targets. Non-basal-bolus insulin regimens (e.g. twice-daily mixed [biphasic], basal-only, or bolus-only regimens) are **not** recommended for adults with *newly diagnosed* type 1 diabetes.

A rapid-acting insulin analogue is recommended as the bolus or mealtime insulin replacement, rather than soluble human insulin or animal insulin (rarely used). The rapid-acting insulin analogue should be injected before meals—routine use after meals should be discouraged. Patients who have a strong preference for an alternative mealtime insulin should be offered their preferred insulin.

Alternatively, if a multiple daily injection basal-bolus regimen is not possible, a twice-daily mixed insulin regimen should be considered if it is preferred.

In patients who are using a twice-daily *human* insulin mixed regimen and have hypoglycaemia that affects their quality of life, a trial of a twice-daily analogue mixed insulin regimen should be considered.

Continuous subcutaneous insulin infusion (insulin pump) therapy, should only be offered to adults who suffer disabling hypoglycaemia, or, who have high HbA1c concentrations (69 mmol/mol [8.5 %] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Insulin pump therapy should be initiated by a specialist team. **⚠**

Insulin requirements

[EvGr] The dosage of insulin must be determined individually for each patient and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet, exercise and alcohol intake), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison's disease or gastroparesis. **⚠**

Infection, stress, accidental or surgical trauma can all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, impaired renal function, and in certain endocrine disorders.

Risks of hypoglycaemia with insulin

[EvGr] Hypoglycaemia is an inevitable adverse effect of insulin treatment, and patients should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 707).

Impaired awareness of hypoglycaemia can occur when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. Patients' awareness of hypoglycaemia should be assessed annually using the Gold score or the Clarke score. **⚠**

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe

hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see *Driving under Diabetes* p. 668).

[EvGr] To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous blood-glucose monitoring should be considered. Patients should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. Relaxation of individualised blood-glucose targets should be avoided as a strategy to improve impaired awareness of symptoms. If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the patient should be referred to a specialist centre. **⚠**

There is conflicting evidence regarding reports that some patients may experience loss of awareness of hypoglycaemia after transfer from animal to human insulin; clinical studies do not confirm that human insulin decreases hypoglycaemia awareness.

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

[EvGr] Patients should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers.

⚠ Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be access online at:

- National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Insulin

05-Jun-2017

Overview

For recommended insulin regimens see Type 1 diabetes p. 669 and Type 2 diabetes p. 671.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40 %) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

EvGr Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered. Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration. **⚠**

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble insulin p. 670 (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 696, insulin glulisine p. 697 and insulin lispro p. 698).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 674 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

EvGr For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of *post-meal* injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia. **⚠**

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 699) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-acting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 669 and Type 2 diabetes below. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 698, biphasic insulin aspart p. 699 and biphasic insulin lispro p. 700).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15 % to 50 %. These preparations should be administered by subcutaneous injection immediately before a meal.

Long-acting insulin

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin p. 702, insulin zinc suspension p. 701, insulin detemir p. 701, insulin glargine p. 701, insulin degludec p. 700) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

Type 2 diabetes

05-Jun-2017

Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic

insulin production also occurs progressively over time, resulting in hyperglycaemia.

It is commonly associated with obesity, physical inactivity, raised blood pressure, dyslipidaemia and a tendency to develop thrombosis; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA1c at or below the target value set for each individual patient.

Overview

[EvGr] Weight loss, smoking cessation and regular exercise can help to reduce hyperglycaemia and reduce cardiovascular risk, and should be encouraged (with input from a dietitian where appropriate). Antidiabetic drugs should be prescribed to augment lifestyle interventions, when these changes are not adequate to control blood-glucose alone. **[A]**

Antidiabetic drugs

There are several classes of non-insulin antidiabetic drugs available for the treatment of type 2 diabetes. **[EvGr]** The choice of drug should be based on effectiveness, safety, tolerability and should also take into consideration the patient's comorbidities and concomitant medication. For recommended treatment regimens and the place in therapy of each drug, see *Drug treatment, antidiabetic drugs* (below).

[A] Metformin hydrochloride p. 678 has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. It does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia. **[EvGr]** The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side effects. Modified-release metformin hydrochloride should be offered if standard treatment is not tolerated. **[A]**

The **sulfonylureas** (glibenclamide p. 692, gliclazide p. 692, glimepiride p. 693, glipizide p. 693, tolbutamide p. 693) may cause hypoglycaemia; it is more likely with long-acting sulfonylureas such as glibenclamide, which have been associated with severe, prolonged and sometimes fatal cases of hypoglycaemia. Sulfonylureas are also associated with modest weight gain, probably due to increased plasma-insulin concentrations.

Acarbose p. 677 has a poorer anti-hyperglycaemic effect than many other antidiabetic drugs, including the sulfonylureas, metformin hydrochloride, and pioglitazone p. 694.

The meglitinides, nateglinide p. 686 and repaglinide p. 687, have a rapid onset of action and short duration of activity. These drugs can be used flexibly around mealtimes and adjusted to fit around individual eating habits which may be beneficial for some patients, but generally are a less preferred option than the sulfonylureas.

The thiazolidinedione, pioglitazone, is associated with several long-term risks and its ongoing benefit to the patient should be reviewed regularly and treatment stopped if response is insufficient (see *Important safety information* under pioglitazone).

The dipeptidylpeptidase-4 inhibitors (gliptins), alogliptin p. 679, linagliptin p. 680, sitagliptin p. 681, saxagliptin p. 680, and vildagliptin p. 682, do not appear to be associated

with weight gain and have less incidence of hypoglycaemia than the sulfonylureas.

The sodium glucose co-transporter 2 inhibitors, canagliflozin p. 687, dapagliflozin p. 689, and empagliflozin p. 690, may be suitable for some patients when first-line options are not appropriate; they are associated with a risk of diabetic ketoacidosis.

The glucagon-like peptide-1 receptor agonists, albiglutide p. 683, dulaglutide p. 683, exenatide p. 684, liraglutide p. 685 and lixisenatide p. 686, should be reserved for combination therapy when other treatment options have failed.

Polycystic ovary syndrome

[EvGr] Metformin hydrochloride (initiated by a specialist) is prescribed as an insulin sensitising drug in women with polycystic ovary syndrome who are not planning pregnancy [unlicensed indication] **[A]**. Long-term benefit or superiority over other treatment options has not been confirmed by good quality evidence. Metformin hydrochloride may improve short-term insulin sensitivity and reduce androgen concentrations, but there is insufficient supporting evidence that metformin improves weight gain, hirsutism, acne or regulation of the menstrual cycle. Treatment should only be initiated by a specialist. Metformin hydrochloride does not exert a hypoglycaemic action in non-diabetic patients except in overdose.

Drug treatment, antidiabetic drugs

[EvGr] Type 2 diabetes should initially be treated with a single oral antidiabetic drug. A target HbA1c concentration of 48 mmol/mol (6.5%) is generally recommended when type 2 diabetes is managed by diet and lifestyle alone or when combined with a single antidiabetic drug not associated with hypoglycaemia (such as metformin hydrochloride). Adults prescribed a single drug associated with hypoglycaemia (such as a sulphonylurea), or two or more antidiabetic drugs in combination, should usually aim for an HbA1c concentration of 53 mmol/mol (7.0%). Targets may differ and should be individualised and agreed with each patient.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for people who are older, frail, or where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

If HbA1c concentrations are poorly controlled despite treatment with a single drug (usually considered to be a rise of HbA1c to 58 mmol/mol (7.5%) or higher), the drug treatment should be intensified, alongside reinforcement of advice regarding diet, lifestyle, and adherence to drug treatment.

When two or more antidiabetic drugs are prescribed, an HbA1c concentration target of 53 mmol/mol (7.0%) is recommended for patients in which it is appropriate, but a relaxation of the target may be more appropriate in some individual cases (for example, those at high risk of the consequences of hypoglycaemia, poor life expectancy, or significant comorbidities). **[A]**

Initial treatment

[EvGr] Metformin hydrochloride is recommended as the first choice for initial treatment for all patients, due to its positive effect on weight loss, reduced risk of hypoglycaemic events and the additional long-term cardiovascular benefits associated with its use. **[A]**

If metformin is contra-indicated or not tolerated, see *Alternative non-metformin regimens* below.

First intensification of treatment

[EvGr] If metformin hydrochloride (alongside modification to diet) does not control HbA1c to below the agreed threshold, treatment should be intensified, and metformin hydrochloride combined with one of the following:

- a sulfonylurea (glibenclamide, gliclazide, glimepiride, glipizide, tolbutamide);

- Pioglitazone;
- a dipeptidylpeptidase-4 inhibitor (linagliptin, saxagliptin, sitagliptin, or vildagliptin);
- a sodium glucose co-transporter 2 inhibitor (canagliflozin, dapagliflozin or empagliflozin) only when sulfonylureas are contra-indicated or not tolerated, or if the patient is at significant risk of hypoglycaemia or its consequences. **A**

EvGr Elderly patients or those with renal impairment are at particular risk of hypoglycaemia; if a sulfonylurea is indicated, a shorter-acting sulfonylurea, such as gliclazide or tolbutamide should be prescribed. **E**

The place in therapy of alogliptin (a dipeptidylpeptidase-4 inhibitor) is not yet known.

Second intensification of treatment

EvGr If dual therapy is unsuccessful, treatment should be intensified again, and one of the following triple therapy regimens prescribed:

- Metformin hydrochloride p. 678 and a dipeptidylpeptidase-4 inhibitor and a sulfonylurea;
- Metformin hydrochloride and pioglitazone p. 694 and a sulfonylurea;
- Metformin hydrochloride and a sulfonylurea and one of the sodium glucose co-transporter 2 inhibitors;
- Metformin hydrochloride and pioglitazone and a sodium glucose co-transporter 2 inhibitor (canagliflozin p. 687 or empagliflozin p. 690; note that dapagliflozin is not recommended in a triple therapy regimen with pioglitazone).

Alternatively, it may be appropriate to start **insulin**-based treatment at this stage—see *Drug treatment, insulin*. **A**

Glucagon-like peptide-1 receptor agonists

EvGr If triple therapy with metformin hydrochloride and two other oral drugs is tried and is not effective, not tolerated or contra-indicated, a **glucagon-like peptide-1 receptor agonist** (exenatide p. 684, liraglutide p. 685 or lixisenatide p. 686) may be prescribed as part of a triple combination regimen with metformin hydrochloride and a sulfonylurea.

These should only be prescribed for patients who have a BMI of 35 kg/m² or above (adjusted for ethnicity) and who also have specific psychological or medical problems associated with obesity; or for those who have a BMI lower than 35 kg/m² but for whom insulin therapy would have significant occupational implications or if the weight loss associated with glucagon-like peptide-1 receptor agonists would benefit other significant obesity-related comorbidities.

After 6 months, the drug should be reviewed and only continued if there has been a beneficial metabolic response (a reduction of at least 11 mmol/mol [1.0 %] in HbA_{1c} and a weight loss of at least 3 % of initial body-weight). **A**

The place in therapy of the newer glucagon-like peptide-1 receptor agonists, albiglutide p. 683 and dulaglutide p. 683, is not yet known.

EvGr Insulin should only be prescribed in combination with a glucagon-like peptide-1 receptor agonist under specialist care advice and with ongoing support from a consultant-led multidisciplinary team. **A**

Alternative non-metformin regimens

EvGr If metformin is contra-indicated or not tolerated, initial treatment should be single therapy with:

- a dipeptidyl peptidase-4 inhibitor (linagliptin p. 680, saxagliptin p. 680, sitagliptin p. 681, or vildagliptin p. 682), or
- Pioglitazone, or
- a sulfonylurea (glibenclamide p. 692, gliclazide p. 692, glimepiride p. 693, glipizide p. 693, or tolbutamide p. 693). **A**

The sodium glucose co-transporter 2 inhibitors

canagliflozin, dapagliflozin p. 689, or empagliflozin are also

options for **monotherapy** when metformin is contra-indicated or not tolerated, only if a dipeptidylpeptidase-4 inhibitor would otherwise be prescribed and neither a sulfonylurea nor pioglitazone is appropriate.

EvGr Repaglinide p. 687 is also an effective alternative option for single therapy, but it has a limited role in treatment because, should an intensification of treatment be required, it is not licensed to be used in any combination other than with metformin hydrochloride; it would therefore require a complete change of treatment in those patients who have started it due to intolerance or contra-indication to metformin. **A**

Intensification

EvGr If the initial single drug does not control HbA_{1c} to below the agreed threshold, treatment should be intensified and one of the following dual combinations prescribed:

- a dipeptidylpeptidase-4 inhibitor and pioglitazone;
- a dipeptidylpeptidase-4 inhibitor and a sulfonylurea; or
- pioglitazone and a sulfonylurea.

If dual therapy does not provide adequate glucose control, insulin-based treatment should be considered—see *Drug treatment, insulin*. **A**

Drug treatment, insulin

EvGr When indicated for intensification, insulin (see also, Insulin p. 670) should be started with a structured support programme covering insulin dose titration, injection technique, self-monitoring, and knowledge of dietary effects and glucose control. Metformin hydrochloride should be continued unless it is contra-indicated or not tolerated. Other antidiabetic drugs should be reviewed and stopped if necessary.

Recommended insulin regimens include:

- human isophane insulin p. 699 injected once or twice daily, according to requirements;
- a human isophane insulin in combination with a short-acting insulin, administered either separately or as a pre-mixed (biphasic) human insulin preparation (this may be particularly appropriate if HbA_{1c} is 75 mmol/mol (9.0 %) or higher);
- Insulin detemir p. 701 or insulin glargine p. 701 as an alternative to human isophane insulin. This can be preferable if a *once daily* injection would be beneficial (for example if assistance is required to inject insulin), or if recurrent symptomatic hypoglycaemic episodes are problematic, or if the patient would otherwise need twice-daily human isophane insulin injections in combination with oral glucose-lowering drugs. Also consider switching to insulin detemir or insulin glargine from human isophane insulin if significant hypoglycaemia is problematic, or in patients who cannot use the device needed to inject human isophane insulin;
- biphasic preparations (pre-mixed) that include a short-acting human *analogue* insulin (rather than short-acting human *soluble insulin*) can be preferable for patients who prefer injecting insulin immediately before a meal, or if hypoglycaemia is a problem, or if blood-glucose concentrations rise markedly after meals.

Patients who are prescribed a basal insulin regimen (human isophane insulin, insulin detemir or insulin glargine) should be monitored for the need for short-acting insulin before meals (or a biphasic insulin preparation).

Patients who are prescribed a biphasic insulin should be monitored for the need for a further injection of short-acting insulin before meals or for a change to a basal-bolus regimen with human isophane insulin or insulin detemir or insulin glargine if blood-glucose control remains inadequate. **A**

Diabetic complications

See also

Diabetes p. 668
 Type 1 diabetes p. 669
 Type 2 diabetes p. 671

Diabetes and cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease. Other risk factors for cardiovascular disease such as smoking, hypertension, obesity, and hyperlipidaemia should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor, low-dose aspirin p. 121 and a lipid-regulating drug.

Diabetic nephropathy

Regular review of diabetic patients should include an annual test for urinary protein (using *Albustix*®) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*® or *Microbumintest*®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contraindications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor together with an angiotensin-II receptor antagonist.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes.

Diabetic neuropathy

Optimal diabetic control is beneficial for the management of *painful neuropathy* in patients with type 1 diabetes. Paracetamol p. 438 or a non-steroidal anti-inflammatory drug such as ibuprofen p. 1106 may relieve *mild to moderate* pain.

Duloxetine p. 364 is effective for the treatment of painful diabetic neuropathy; amitriptyline hydrochloride p. 369 [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline p. 374 [unlicensed use] may be better tolerated than amitriptyline hydrochloride. If treatment with amitriptyline hydrochloride or duloxetine is inadequate, treatment with pregabalin p. 322 should be tried. Combination therapy of duloxetine or amitriptyline hydrochloride with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 464, morphine p. 456, and oxycodone hydrochloride p. 459; however treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin p. 314 and carbamazepine p. 309 are sometimes used for the treatment of neuropathic pain. Capsaicin p. 476 cream 0.075% is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In *autonomic neuropathy* diabetic diarrhoea can often be managed by tetracycline p. 557 [unlicensed use], otherwise codeine phosphate p. 448 is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin p. 530 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] but this needs confirmation.

In *neuropathic postural hypotension* increased salt intake and the use of the mineralocorticoid fludrocortisone acetate p. 661 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 1106 and ephedrine hydrochloride p. 271 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide p. 85; side-effects are common. See also, the management of hyperhidrosis (Hyperhidrosis p. 1228).

In some patients with *neuropathic oedema*, ephedrine hydrochloride [unlicensed use] offers effective relief.

See also the management of Erectile dysfunction p. 793.

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group (available at www.diabetes.org.uk/Professionals/Position-statements-reports/Specialist-care-for-children-and-adults-and-complications/The-Management-of-Diabetic-Ketoacidosis-in-Adults/), should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL **sodium chloride 0.9%** by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, **sodium chloride 0.9%** should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include **potassium chloride** in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: **soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir p. 701 or insulin glargine p. 701) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, **glucose 10%** should be given by

intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the **sodium chloride 0.9% infusion**.

- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

Diabetes, surgery and medical illness

05-Jun-2017

Management of diabetes during surgery

Peri-operative management of blood-glucose concentrations depends on factors including the required duration of fasting, timing of surgery (morning or afternoon), usual treatment regimen (insulin, antidiabetic drugs or diet), prior glycaemic control, other co-morbidities, and the likelihood that the patient will be capable of self-managing their diabetes in the immediate post-operative period. [EvGr](#) All patients should have emergency treatment for hypoglycaemia written on their drug chart on admission. [E](#)

Note: The following recommendations provide general guidance for the management of diabetes during surgery. **Local protocols and guidelines should be followed where they exist.**

Use of insulin during surgery

Elective surgery—minor procedures in patients with good glycaemic control

[EvGr](#) Patients usually treated with insulin who have good glycaemic control (HbA1c less than 69 mmol/mol or 8.5%) and are undergoing *minor procedures*, can be managed during the operative period by adjustment of their usual insulin regimen, which should be adjusted depending on the type of insulin usually prescribed, following detailed local protocols (which should also include intravenous fluid management, monitoring and control of electrolytes and avoidance of hyperchloraemic metabolic acidosis). On the day before the surgery, the patient's usual insulin should be given as normal, other than once daily long-acting insulin analogues, which should be given at a dose reduced by 20%. [E](#)

Elective surgery—major procedures or poor glycaemic control

[EvGr](#) Patients usually treated with insulin, who are either undergoing *major procedures* (surgery requiring a long fasting period of more than one missed meal) or whose diabetes is poorly controlled, will usually require a variable rate intravenous insulin infusion (continued until the patient is eating/drinking and stabilised on their previous glucose-lowering medication).

The aim is to achieve and maintain glucose concentration within the usual target range (6–10 mmol/litre; but up to 12 mmol/litre is acceptable) by infusing a constant rate of glucose-containing fluid as a substrate, while also infusing insulin at a variable rate. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the *day before surgery*, once daily long-acting insulin analogues should be given at 80% of the usual dose; otherwise the patient's usual insulin should be given as normal;
- on the *day of surgery and throughout the intra-operative period*, once daily long-acting insulin analogues should be continued at 80% of the usual dose; all other insulin

should be stopped until the patient is eating and drinking again after surgery;

- on the *day of surgery*, start an intravenous substrate infusion of potassium chloride with glucose and sodium chloride p. 1007 (based on serum electrolytes which must be measured frequently), and infuse at a rate appropriate to the patient's fluid requirements. To prevent hypoglycaemia, this infusion must **not** be stopped while the insulin infusion is running;
- a variable rate intravenous insulin infusion of soluble human insulin p. 696 in sodium chloride 0.9% p. 1008 (made either according to locally agreed protocols or using prefilled syringes) should be given via a syringe pump at an initial infusion rate determined by bedside capillary blood-glucose measurement. Hourly blood-glucose measurement should be taken to ensure that the intravenous insulin infusion rate is correct for at least the first 12 hours; the insulin infusion rate should be adjusted according to local protocol to maintain blood-glucose concentrations within the usual target range (6–10 mmol/litre; up to 12 mmol/litre is acceptable);
- intravenous glucose 20% p. 1009 should be given if blood-glucose drops below 6 mmol/litre, and blood-glucose checked every hour, to prevent a drop below 4 mmol/litre. If blood-glucose drops below 4 mmol/litre, intravenous glucose 20% should be adjusted and blood-glucose checked every 15 minutes, until blood-glucose is above 6 mmol/litre (testing can then revert to hourly). If blood-glucose rises above 12 mmol/litre, check ketones and consider other signs of diabetic ketoacidosis (see Diabetic ketoacidosis p. 674).

Conversion back to a subcutaneous insulin should not begin until the patient can eat and drink without nausea or vomiting. Once the patient's previous insulin regimen is re-started, the usual insulin dose may require adjustment, as insulin requirements can change due to post-operative stress, infection or altered food intake.

Previous subcutaneous basal-bolus regimens, should be restarted when the first postoperative meal-time insulin dose is due (e.g. with breakfast or lunch); doses may need adjustment due to postoperative stress, infection or altered food intake. The variable rate intravenous insulin infusion and intravenous fluids should be continued until 30–60 minutes **after** the first meal-time short-acting insulin dose. If the patient was previously on a **long-acting insulin analogue**, this should have been continued throughout the operative period at 80% of the normal dose, and should now just continue at that same dose until the patient leaves hospital; only the short-acting insulin needs to be restarted as above.

Previous subcutaneous twice-daily mixed insulin regimens, should be restarted before breakfast or an evening meal (not at any other time). The variable rate intravenous insulin infusion should be maintained for 30–60 minutes after the first subcutaneous insulin dose has been given.

Patients who were **previously managed with a continuous subcutaneous insulin infusion** should be referred to a specialist team. The subcutaneous infusion should be restarted at the normal basal rate, not at bedtime, and the insulin infusion continued until the next meal bolus has been given.

Patients **not previously prescribed insulin**, who are to start a subcutaneous insulin regimen post-surgery, should have an insulin dose calculated with advice from a specialist diabetes team, considering the patient's sensitivity to insulin, degree of glycaemic control, weight, age, and the average hourly insulin dose used in the peri-operative period. [E](#)

Emergency surgery

[EvGr](#) Patients with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood-glucose,

blood or urinary ketone concentration, serum electrolytes and serum bicarbonate checked before surgery. If ketones are high or bicarbonate is low, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis p. 674 should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for *major elective surgery* (above). [E](#)

Use of antidiabetic drugs during surgery

[EvGr](#) Manipulation of antidiabetic drug may **not** be appropriate for all surgery or for all patients; particularly when fasting time is more than one missed meal, in patients with poor glycaemic control, and when there is risk of renal injury. In these cases, a *variable rate intravenous insulin infusion* p. 696 should be used as for *major elective surgery* (above), and usual antidiabetic medication adjusted in the peri-operative period. Insulin is almost always required in medical and surgical emergencies.

When insulin is required and given during surgery, acarbose p. 677, meglitinides, sulfonylureas, pioglitazone p. 694, dipeptidyl peptidase-4 inhibitors (gliptins) and sodium glucose co-transporter 2 inhibitors should be stopped once the insulin infusion is commenced and not restarted until the patient is eating and drinking normally. Glucagon-like peptide-1 receptor agonists can be continued as normal during the insulin infusion.

If elective *minor surgical procedures* only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

In suitable cases, acarbose, nateglinide p. 686 and repaglinide p. 687 can be continued with just the dose omitted on the morning of surgery if fasting (the morning dose may be given if the patient is not fasting and surgery is in the afternoon).

Pioglitazone, **dipeptidylpeptidase-4 inhibitors (gliptins)** and **glucagon-like peptide-1 receptor agonists** can be taken as normal during the whole peri-operative period.

Sodium glucose co-transporter 2 inhibitors should be omitted on the day of surgery and not restarted until the patient is stable; their use during periods of dehydration and acute illness is associated with an increased risk of developing diabetic ketoacidosis.

Sulfonylureas are associated with hypoglycaemia in the fasted state and therefore should always be omitted on the day of surgery until the patient is eating and drinking again. Capillary blood-glucose should be checked hourly. If hyperglycaemia occurs, an appropriate dose of subcutaneous rapid-acting insulin may be given. A second dose may be given 2 hours later, and a variable rate intravenous insulin infusion considered if hyperglycaemia persists.

Metformin hydrochloride p. 678 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. If only one meal will be missed during surgery, and the patient has an eGFR greater than 60 mL/minute/1.73m² and a low risk of acute kidney injury (and the procedure does not involve administration of contrast media), it may be possible to continue metformin hydrochloride throughout the peri-operative period—just the lunchtime dose should be omitted if the usual dose is prescribed three times a day.

If the patient will miss more than one meal or there is significant risk of the patient developing acute kidney injury, metformin hydrochloride should be stopped when the pre-operative fast begins. A variable rate intravenous insulin infusion should be started if the metformin hydrochloride dose is more than once daily. Otherwise insulin should only be started if blood-glucose concentration is greater than 12 mmol/litre on two consecutive occasions. Metformin

should not be recommenced until the patient is eating and drinking again, and normal renal function has been assured.

There is no need to stop metformin hydrochloride after contrast medium in patients missing only one meal or who have an eGFR greater than 60 mL/minute/1.73m². If contrast medium is to be used, and eGFR is less than 60 mL/minute/1.73m², metformin should be omitted on the day of the procedure and for the following 48 hours. [E](#)

Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as myocardial infarction, coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Sodium glucose co-transporter 2 inhibitors are associated with increased risk of developing diabetic ketoacidosis during periods of dehydration, stress, surgery, trauma, acute medical illness or any other catabolic state, and should be used with caution during these times. The MHRA has advised (2016) that these drugs should be temporarily stopped in patients who are hospitalised for acute serious illness until the patient is medically stable.

Diabetes, pregnancy and breast-feeding

01-Aug-2017

Description of condition

Diabetes in pregnancy is associated with increased risks to the woman (such as pre-eclampsia and rapidly worsening retinopathy), and to the developing fetus, compared with pregnancy in non-diabetic women. Effective blood-glucose control before conception and throughout pregnancy reduces (but does not eliminate) the risk of adverse outcomes such as miscarriage, congenital malformation, stillbirth, and neonatal death.

Management of pre-existing diabetes

[EvGr](#) Women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA1c level below 48 mmol/mol (6.5%) if possible without causing problematic hypoglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 993. [A](#)

Overview

Oral antidiabetic drugs

[EvGr](#) All oral antidiabetic drugs, except metformin hydrochloride p. 678, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Women with diabetes may be treated with metformin hydrochloride p. 678 [unlicensed in type 1 diabetes] as an adjunct or alternative to insulin in the preconception period and during pregnancy, when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride p. 678 can be continued, or glibenclamide p. 692 resumed, immediately after birth and during breast-feeding for those with pre-existing Type 2 diabetes p. 671. All other antidiabetic drugs should be avoided while breast-feeding. [A](#)

Insulin

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 696 and insulin lispro p. 698) can be associated with fewer episodes of hypoglycaemia, a

reduction in postprandial glucose excursions and an improvement in overall glycaemic control compared with regular human insulin.

EvGr Isophane insulin p. 699 is the first-choice for long-acting insulin during pregnancy, however in women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 701 or insulin glargine p. 701), it may be appropriate to continue using them throughout pregnancy.

Continuous subcutaneous insulin p. 696 infusion (insulin pump therapy) may be appropriate for pregnant women who have difficulty achieving glycaemic control with multiple daily injections of insulin p. 696 without significant disabling hypoglycaemia.

All women treated with insulin p. 696 during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant women with Type 1 diabetes p. 669 should also be prescribed glucagon p. 707 for use if needed.

Women with pre-existing diabetes treated with insulin p. 696 during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose. **A**

Medication for diabetic complications

EvGr Angiotensin-converting enzyme inhibitors and angiotensin II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed (see *Hypertension in pregnancy* under Hypertension p. 139). Statins should not be prescribed during pregnancy and should be discontinued before a planned pregnancy. **A**

Gestational diabetes

EvGr Women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride p. 678 may be prescribed [unlicensed use]. Insulin p. 696 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone. **A**

EvGr Women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin p. 696 immediately, with or without metformin hydrochloride p. 678, in addition to a change in diet and exercise.

Women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications such as macrosomia or hydramnios should be considered for immediate insulin p. 696 treatment, with or without metformin hydrochloride p. 678.

Glibenclamide p. 692 [unlicensed use] may be considered for women from 11 weeks gestation (after organogenesis) who cannot tolerate metformin, or for those in whom metformin is not effective and do not wish to have insulin therapy.

Women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth. **A**

Diabetes in pregnancy: management from preconception to the postnatal period. National Institute for Health and Care Excellence. Clinical guideline NG3. February 2015.

www.nice.org.uk/guidance/ng3

BLOOD GLUCOSE LOWERING DRUGS > ALPHA GLUCOSIDASE INHIBITORS

Acarbose

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

• INDICATIONS AND DOSE

Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

► **BY MOUTH**

- **Adult:** Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

- **CONTRA-INDICATIONS** Hernia · inflammatory bowel disease · predisposition to partial intestinal obstruction · previous abdominal surgery

- **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)

- **INTERACTIONS** → Appendix 1: acarbose

• SIDE-EFFECTS

- **Common or very common** Diarrhoea (may need to reduce dose) · gastrointestinal discomfort · gastrointestinal disorders

- **Uncommon** Nausea · vomiting

- **Rare or very rare** Hepatic disorders · oedema

- **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Antacids containing magnesium and aluminium salts unlikely to be beneficial for treating side effects.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.

- **PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Acarbose (Non-proprietary)**

Acarbose 50 mg Acarbose 50mg tablets | 90 tablet **[PoM]** £11.51 DT = £11.51

Acarbose 100 mg Acarbose 100mg tablets | 90 tablet **[PoM]** £19.03 DT = £19.03

- **Glucobay** (Bayer Plc)

Acarbose 50 mg Glucobay 50mg tablets | 90 tablet **[PoM]** £7.35 DT = £11.51

Acarbose 100 mg Glucobay 100mg tablets | 90 tablet **[PoM]** £13.50 DT = £19.03

BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

Metformin hydrochloride

06-Jun-2017

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- ▶ Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

Type 2 diabetes mellitus [reduction in risk or delay of onset]

- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ Adult 18–74 years: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, for further information on risk factors—consult product literature

Polycystic ovary syndrome

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

● UNLICENSED USE

- ▶ In adults [Evg] Based on clinical experience of increased side-effects, maximum dose for metformin immediate-release medicines in BNF Publications differs from product licence. (E) Not licensed for polycystic ovary syndrome.

- **CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)

- **CAUTIONS** Risk factors for lactic acidosis

CAUTIONS, FURTHER INFORMATION

- ▶ Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

- **INTERACTIONS** → Appendix 1: metformin

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea (usually transient) · gastrointestinal disorder · nausea · taste altered · vomiting
- ▶ **Rare or very rare** Hepatitis · lactic acidosis (discontinue) · skin reactions · vitamin B12 absorption decreased

SIDE-EFFECTS, FURTHER INFORMATION Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

● RENAL IMPAIRMENT

- ▶ In adults Manufacturer advises avoid if eGFR is less than 30 mL/minute/1.73 m².

- ▶ In children Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

Dose adjustments ▶ In children Manufacturer advises

consider dose reduction in moderate impairment.

- ▶ In adults Manufacturer advises reduce dose in moderate impairment—consult product literature.

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ In adults Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur.

Medicines for Children leaflet: Metformin for diabetes

● NATIONAL FUNDING/ACCESS DECISIONS

GLUCOPHAGE® SR

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2009) that *Glucophage® SR* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet

BLOOD GLUCOSE LOWERING DRUGS >

DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)

Alogliptin

30-Aug-2017

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- **BY MOUTH**
- **Adult:** 25 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.
- Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** History of pancreatitis • not recommended in moderate to severe heart failure (limited experience)

- **INTERACTIONS** → Appendix 1: alogliptin

● SIDE-EFFECTS

- **Common or very common** Abdominal pain • gastroesophageal reflux disease • headache • increased risk of infection • skin reactions
- **Frequency not known** Angioedema • hepatic function abnormal • pancreatitis acute • Stevens-Johnson syndrome
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m².

Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Vipidia** (Takeda UK Ltd) ▼

Alogliptin (as Alogliptin benzoate) 6.25 mg Vipidia 6.25mg tablets | 28 tablet [PoM] £26.60 DT = £26.60

Alogliptin (as Alogliptin benzoate) 12.5 mg Vipidia 12.5mg tablets | 28 tablet [PoM] £26.60 DT = £26.60

Alogliptin (as Alogliptin benzoate) 25 mg Vipidia 25mg tablets | 28 tablet [PoM] £26.60 DT = £26.60

Alogliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, alogliptin p. 679, metformin hydrochloride p. 678.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either pioglitazone or insulin

- BY MOUTH
- Adult: 1 tablet twice daily, based on patient's current metformin dose

● **INTERACTIONS** → Appendix 1: alogliptin · metformin

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- **Vipdomet** (Takeda UK Ltd) ▼
Alogliptin (as Alogliptin benzoate) 12.5 mg, Metformin hydrochloride 1 gram Vipdomet 12.5mg/1000mg tablets | 56 tablet [PoM] £26.60 DT = £26.60

Linagliptin

19-Sep-2017

● **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- BY MOUTH
- Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.

● **INTERACTIONS** → Appendix 1: linagliptin

● SIDE-EFFECTS

- **Uncommon** Cough · nasopharyngitis
- **Rare or very rare** Angioedema · skin reactions
- **Frequency not known** Pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

● **PREGNANCY** Avoid—no information available.

● **BREAST FEEDING** Avoid—present in milk in animal studies.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that linagliptin (*Trajenta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Trajenta** (Boehringer Ingelheim Ltd)
Linagliptin 5 mg Trajenta 5mg tablets | 28 tablet [PoM] £33.26 DT = £33.26

Linagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, linagliptin above, metformin hydrochloride p. 678.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- BY MOUTH
- Adult: 1 tablet twice daily, based on patient's current metformin dose

● **INTERACTIONS** → Appendix 1: linagliptin · metformin

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2015) that linagliptin plus metformin combination tablets (*Jentadueto*®) are accepted for restricted use within NHS Scotland for the treatment of adult patients with type 2 diabetes mellitus in combination with insulin, as an adjunct to diet and exercise to improve glycaemic control when a combination of insulin and metformin alone is inadequate. It is restricted to use in the treatment of patients for whom a combination of linagliptin and metformin is an appropriate choice of therapy and the fixed doses are considered appropriate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Saxagliptin

19-Sep-2017

● **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- BY MOUTH
- Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.

● **CAUTIONS** Elderly · history of pancreatitis

● **INTERACTIONS** → Appendix 1: saxagliptin

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · dizziness · fatigue · headache · increased risk of infection · skin reactions · vomiting

► **Uncommon** Pancreatitis

► **Rare or very rare** Angioedema

► **Frequency not known** Constipation · nausea

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
Dose adjustments Reduce dose to 2.5 mg once daily in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that saxagliptin (Onglyza[®]) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Onglyza (AstraZeneca UK Ltd)

Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg Onglyza 2.5mg tablets | 28 tablet [PoM] £31.60 DT = £31.60

Saxagliptin (as Saxagliptin hydrochloride) 5 mg Onglyza 5mg tablets | 28 tablet [PoM] £31.60 DT = £31.60

Saxagliptin with dapagliflozin

19-Jul-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 680, dapagliflozin p. 689.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin and/or a sulfonylurea with either saxagliptin or dapagliflozin

▶ BY MOUTH

- ▶ Adult 18–74 years: 5/10 mg once daily
- ▶ Adult 75 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulfonylurea may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg saxagliptin/dapagliflozin.

- **INTERACTIONS** → Appendix 1: dapagliflozin · saxagliptin

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate impairment; avoid in severe impairment.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2017) that saxagliptin with dapagliflozin 5 mg/10 mg (Qtern[®]) is accepted for restricted use within NHS Scotland for the treatment of patients with type 2 diabetes mellitus in

combination with metformin when the use of a sulfonylurea is inappropriate, only if:

- metformin and/or a sulfonylurea, in combination with dapagliflozin or saxagliptin, do not provide adequate glycaemic control; or
- the patient is already being treated with the free combination of dapagliflozin and saxagliptin.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Vildagliptin 50 mg, Metformin hydrochloride 850 mg Eucreas 50mg/850mg tablets | 60 tablet [PoM] £35.68 DT = £35.68

Vildagliptin 50 mg, Metformin hydrochloride 1 gram Eucreas 50mg/1000mg tablets | 60 tablet [PoM] £35.68 DT = £35.68

BLOOD GLUCOSE LOWERING DRUGS > GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

Albiglutide

01-Jun-2016

• **DRUG ACTION** Albiglutide is a GLP-1 (glucagon-like peptide-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy when treatment with metformin is considered inappropriate | Type 2 diabetes mellitus in combination with basal insulin and other oral glucose lowering agents

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: 30 mg once weekly, increased if necessary up to 50 mg once weekly, to be administered on the same day each week

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

• **CONTRA-INDICATIONS** Severe gastrointestinal disease—no information available

• **CAUTIONS** History of pancreatitis · moderate to severe heart failure—no information available

• **INTERACTIONS** → Appendix 1: albiglutide

• SIDE-EFFECTS

▶ **Common or very common** Arrhythmias · constipation · diarrhoea · dyspepsia · gastrointestinal disorders · hypoglycaemia · nausea · pneumonia · vomiting

▶ **Uncommon** Pancreatitis (discontinue)

▶ **Frequency not known** Appetite decreased

• **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential. Discontinue treatment at least one month before a planned pregnancy.

• **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

• **BREAST FEEDING** Manufacturer advises avoid—no information available.

• **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

• **HANDLING AND STORAGE** Store at 2–8°C. May be stored at temperatures up to 30°C for up to 4 weeks.

• **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer albiglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

Missed doses If a dose is missed it should be administered as soon as possible within 3 days; if more than 3 days have passed, the missed dose should not be taken and the next dose should be taken at the normal time.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2016) that albiglutide (*Eperzan*[®]) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control in combination with other glucose-lowering medicines when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as an alternative once weekly GLP-1 mimetic for use in combination with oral anti-diabetic agents as a third-line pre-insulin treatment option.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Eperzan** (GlaxoSmithKline UK Ltd) ▼

Albiglutide 30 mg Eperzan 30mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £71.00

Albiglutide 50 mg Eperzan 50mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £71.00

Dulaglutide

14-Jun-2016

• **DRUG ACTION** Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy if metformin inappropriate

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: 0.75 mg once weekly

continued →

Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

► BY SUBCUTANEOUS INJECTION

- Adult: 1.5 mg once weekly

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Severe gastro-intestinal disease—no information available
- **CAUTIONS** Congestive heart failure—no information available
- **INTERACTIONS** → Appendix 1: dulaglutide
- **SIDE-EFFECTS**
 - **Common or very common** Appetite decreased · atrioventricular block · burping · constipation · diarrhoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · hypoglycaemia · nausea · sinus tachycardia · vomiting
 - **Rare or very rare** Anaphylactic reaction · angioedema · pancreatitis acute (discontinue)
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment and end stage renal disease—no information available.
- **HANDLING AND STORAGE** Refrigerated storage is usually necessary (2 °C – 8 °C). Once in use, may be stored unrefrigerated for up to 14 days at a temperature not above 30 °C.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dulaglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.
- **Missed doses** If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2016) that dulaglutide (*Trulicity*®) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicines, when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as part of a triple therapy in people with inadequate glycaemic control on 2 oral anti-diabetic medicines, as an alternative GLP-1 mimetic option.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Trulicity** (Eli Lilly and Company Ltd) ▼

Dulaglutide 1.5 mg per 1 ml Trulicity 0.75mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.25 DT = £73.25

Dulaglutide 3 mg per 1 ml Trulicity 1.5mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.25 DT = £73.25

Exenatide

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination

- BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

- **Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

- BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES

- **Adult:** 2 mg once weekly

Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)

- BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

- **Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea may need to be reduced.

PHARMACOKINETICS

- Effect of modified-release exenatide injection (*Bydureon*®) may persist for 10 weeks after discontinuation.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastrointestinal disease
- **CAUTIONS** Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis
- **INTERACTIONS** → Appendix 1: exenatide
- **SIDE-EFFECTS**
 - **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · skin reactions · vomiting
 - **Uncommon** Alopecia · burping · drowsiness · hyperhidrosis · renal impairment · taste altered
 - **Frequency not known** Angioedema · pancreatitis acute
- **SIDE-EFFECTS, FURTHER INFORMATION** Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if diagnosed.
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** For *standard-release* injection, use with caution if eGFR 30–50 mL/minute/1.73 m². For *standard-release* injection, avoid if eGFR less than 30 mL/minute/1.73 m². For *modified-release* injection, avoid if eGFR less than 50 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose. Some oral medications should be taken at

least 1 hour before or 4 hours after exenatide injection—consult product literature for details. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.

Missed doses If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer **after** a meal.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2007) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The *Scottish Medicines Consortium* has also advised (February 2011) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.

The *Scottish Medicines Consortium* has advised (December 2011) that modified-release exenatide (*Bydureon*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

• MEDICINAL FORMS

Liraglutide

19-Jan-2018

- **DRUG ACTION** Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

SAXENDA®

Adjunct in weight management [in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m² or more, or in individuals with a BMI of 27 kg/m² or more in the presence of at least one weight-related co-morbidity]

▶ BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 0.6 mg once daily, then increased in steps of 0.6 mg, dose to be increased at intervals of at least 1 week; consider discontinuation if escalation to the next dose is not tolerated for 2 consecutive weeks.

Discontinue if at least 5% of initial body-weight has not been lost after 12 weeks at maximum dose; maximum 3 mg per day

VICTOZA®

Type 2 diabetes mellitus [monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs]

▶ BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary to 1.8 mg once daily, for information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or sulfonylurea may need to be reduced.

- **CONTRA-INDICATIONS** Diabetic gastroparesis · inflammatory bowel disease · severe congestive heart failure—no information available

SAXENDA® Concomitant use with other products for weight management · elderly 75 years or over (limited information) · obesity secondary to endocrinological or eating disorders

VICTOZA® Diabetic ketoacidosis

- **CAUTIONS** Thyroid disease

- **INTERACTIONS** → Appendix 1: liraglutide

• SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · burping · constipation · diarrhoea · dizziness · dry mouth · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · insomnia · nausea · taste altered · vomiting
- ▶ **Uncommon** Malaise · pancreatitis · tachycardia · urticaria
- ▶ **Rare or very rare** Renal impairment

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies (recommendation also supported by tertiary sources).
- **BREAST FEEDING** Manufacturer advises avoid—no information available; animal studies suggest that transfer into milk is low, but excretion into human milk not known (a tertiary source confirms lack of information in human lactation, but also states that risk to infants appears to be negligible. [EvGr] Blood glucose monitoring of the infant should be considered) ⚠.

• HEPATIC IMPAIRMENT

SAXENDA® Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.

VICTOZA® Manufacturer advises avoid in severe impairment.

• RENAL IMPAIRMENT

SAXENDA® Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—after first use can also be stored below 30°C and used within 1 month; keep cap on pen to protect from light.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop. Manufacturer advises patients and their carers should be informed of the potential risk of dehydration in relation to gastro-intestinal side-effects and advised to take precautions to avoid fluid depletion; they should also be

informed of the symptoms of cholelithiasis and cholecystitis, and of increased heart rate.

SAXENDA® Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liraglutide 6 mg per 1 ml Victoza 6mg/ml solution for injection 3ml pre-filled pen | 2 pre-filled disposable injection [PoM] £78.48 DT = £78.48 | 3 pre-filled disposable injection [PoM] £117.72

Combinations available: *Insulin degludec with liraglutide*, p. 700

Lixisenatide

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs

► BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastrointestinal disease

- **INTERACTIONS** → Appendix 1: lixisenatide

• SIDE-EFFECTS

- **Common or very common** Back pain · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · headache · increased risk of infection · nausea · vomiting
- **Uncommon** Urticaria

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—no information available.

- **RENAL IMPAIRMENT** Use with caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.

- **PATIENT AND CARER ADVICE** Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.

Missed doses If a dose is missed, inject within 1 hour before the next meal—do not administer after a meal.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2013) that lixisenatide (*Lyxumia*®) is accepted for restricted use within NHS Scotland for the treatment of

type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

BLOOD GLUCOSE LOWERING DRUGS > MEGLITINIDES

Nateglinide

- **DRUG ACTION** Nateglinide stimulates insulin secretion.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin when metformin alone inadequate

► BY MOUTH

- **Adult:** Initially 60 mg 3 times a day (max. per dose 180 mg), adjusted according to response, to be taken within 30 minutes before main meals

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** Debilitated patients · elderly · malnourished patients

CAUTIONS, FURTHER INFORMATION Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally).

- **INTERACTIONS** → Appendix 1: nateglinide

• SIDE-EFFECTS

- **Common or very common** Diarrhoea · gastrointestinal discomfort · hypoglycaemia · nausea
- **Uncommon** Vomiting
- **Rare or very rare** Skin reactions
- **Frequency not known** Appetite increased · dizziness · fatigue · muscle weakness · palpitations · sweating abnormal · tremor

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Caution in moderate hepatic impairment. Avoid in severe impairment—no information available.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

BLOOD GLUCOSE LOWERING DRUGS > SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

Canagliflozin

11-Apr-2017

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

► BY MOUTH

- Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises increase dose if tolerated to 300 mg once daily with concurrent use of rifampicin.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED MARCH 2017): INCREASED RISK OF LOWER-LIMB AMPUTATION (MAINLY TOES)

Canagliflozin may increase the risk of lower-limb amputation (mainly toes) in patients with type 2 diabetes. Preventive foot care is important for all patients with diabetes. The MHRA has issued the following advice while clinical trials are ongoing:

- consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene)
- carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
- monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer's recommendations
- advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discolouration, or new pain or tenderness
- start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as possible
- continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these

- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use canagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

● **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** Cardiovascular disease (risk of hypotension) · elderly (risk of hypotension) · elevated haematocrit · history of hypotension

CAUTIONS, FURTHER INFORMATION

- ▶ Volume depletion Correct hypovolaemia before starting treatment.
- **INTERACTIONS** → Appendix 1: canagliflozin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Balanoposthitis · constipation · dyslipidaemia · hypoglycaemia (in combination with insulin or sulphonylurea) · increased risk of infection · nausea · thirst · urinary disorders · urosepsis
 - ▶ **Uncommon** Dehydration · dizziness postural · hypotension · lower limb amputations · renal failure · skin reactions · syncope
 - ▶ **Rare or very rare** Anaphylactic reaction · angioedema · diabetic ketoacidosis

SIDE-EFFECTS, FURTHER INFORMATION Consider interrupting treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR less than 45 mL/minute/1.73 m².
Dose adjustments Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m² and existing canagliflozin treatment tolerated.
Monitoring Monitor renal function at least twice a year in moderate impairment.

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.
- **PATIENT AND CARER ADVICE** Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390
 Canagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise

be prescribed and a sulphonylurea or pioglitazone is not appropriate.

Patients currently receiving canagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA390

▶ **Canagliflozin in combination therapy for treating type 2 diabetes (June 2014) NICE TA315**

Canagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulphonylurea is contra-indicated or not tolerated or the patient has a significant risk of hypoglycaemia.

Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with metformin and a sulphonylurea or metformin and a thiazolidinedione.

Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

Dapagliflozin

18-May-2017

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

▶ BY MOUTH

- ▶ Adult 18-74 years: 10 mg once daily
- ▶ Adult 75 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use dapagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious

illnesses; treatment may be restarted once the patient's condition has stabilised

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** Cardiovascular disease (risk of hypotension) · elderly (risk of hypotension) · electrolyte disturbances · hypotension · raised haematocrit

CAUTIONS, FURTHER INFORMATION

- ▶ Volume depletion Correct hypovolaemia before starting treatment.

- **INTERACTIONS** → Appendix 1: dapagliflozin

● SIDE-EFFECTS

- ▶ **Common or very common** Back pain · balanoposthitis · dizziness · dyslipidaemia · hypoglycaemia (in combination with insulin or sulphonylurea) · increased risk of infection · rash · urinary disorders

- ▶ **Uncommon** Constipation · dry mouth · genital pruritus · hypovolaemia · renal impairment · thirst · vulvovaginal pruritus · weight decreased

- ▶ **Rare or very rare** Diabetic ketoacidosis

SIDE-EFFECTS, FURTHER INFORMATION Interrupt treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

Dose adjustments Initial dose 5 mg daily in severe impairment, increased according to response.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter.

- **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Dapagliflozin in combination therapy for treating type 2 diabetes (updated November 2016) NICE TA288

Dapagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if the patient is at significant risk of hypoglycaemia or its consequences, or if a sulphonylurea is contra-indicated or not tolerated.

Dapagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving dapagliflozin in a dual therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA288

- ▶ Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390

Dapagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulphonylurea or pioglitazone is not appropriate.

Patients currently receiving dapagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA390

- ▶ **Dapagliflozin in triple therapy for treating type 2 diabetes (November 2016) NICE TA418**
Dapagliflozin in a triple therapy regimen is recommended as an option for treating type 2 diabetes in adults, only in combination with metformin and a sulfonylurea.

Patients currently receiving dapagliflozin in other triple therapy regimens, whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA418

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that dapagliflozin (*Forxiga*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin, when treatment with metformin alone is inadequate and a sulfonylurea is inappropriate (December 2012), or in combination with insulin when treatment with insulin alone is inadequate (February 2014).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious

illnesses; treatment may be restarted once the patient's condition has stabilised

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Cardiovascular disease (increased risk of volume depletion) · complicated urinary tract infections—consider temporarily interrupting treatment · concomitant antihypertensive therapy (increased risk of volume depletion) · elderly patients aged over 75 years (increased risk of volume depletion) · heart failure · history of hypotension (increased risk of volume depletion) · patients at increased risk of volume depletion · predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

CAUTIONS, FURTHER INFORMATION

- ▶ **Volume depletion** Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.
- **INTERACTIONS** → Appendix 1: empagliflozin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Balanoposthitis · hypoglycaemia (in combination with insulin or sulphonylurea) · increased risk of infection · pruritus generalised · thirst · urinary disorders
 - ▶ **Uncommon** Hypovolaemia
 - ▶ **Rare or very rare** Diabetic ketoacidosis
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².
Dose adjustments Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.
- **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016)** NICE TA390
Empagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed **and** a sulphonylurea or pioglitazone is not appropriate.
Patients currently receiving empagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA390
- ▶ **Empagliflozin in combination therapy for treating type 2 diabetes (March 2015)** NICE TA336
Empagliflozin in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
 - a sulphonylurea is contra-indicated or not tolerated, **or**
 - the patient is at significant risk of hypoglycaemia or its consequences.

Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:

- metformin and a sulphonylurea **or**
- metformin and a thiazolidinedione.

Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

BLOOD GLUCOSE LOWERING DRUGS >

SULFONYLUREAS

Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
- **CONTRA-INDICATIONS** Presence of ketoacidosis
- **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) • elderly • G6PD deficiency
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea • gastrointestinal discomfort • hypoglycaemia • nausea
 - ▶ **Uncommon** Hepatic disorders • vomiting
 - ▶ **Rare or very rare** Agranulocytosis • erythrocytopenia • granulocytopenia • haemolytic anaemia • leucopenia • pancytopenia • thrombocytopenia
 - ▶ **Frequency not known** Allergic dermatitis (usually in the first 6–8 weeks of therapy) • constipation • visual impairment
- **HEPATIC IMPAIRMENT** Jaundice may occur.
Dose adjustments Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia.
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
- **PATIENT AND CARER ADVICE** The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.
Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

above

Glibenclamide

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

▶ BY MOUTH

- ▶ **Adult:** Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Appetite decreased • SIADH • taste metallic
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.
- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Glibenclamide (Non-proprietary)

Glibenclamide 2.5 mg Glibenclamide 2.5mg tablets | 28 tablet [PoM] £11.78 DT = £10.49

Gliclazide

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Adult:** Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult:** Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Anaemia • angioedema • dyspepsia • gastrointestinal disorder • hypersensitivity vasculitis • hyponatraemia • severe cutaneous adverse reactions (SCARs) • skin reactions
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

● INDICATIONS AND DOSE**Type 2 diabetes mellitus**

▶ BY MOUTH

- ▶ **Adult:** Initially 2.5–5 mg daily, adjusted according to response, dose to be taken shortly before breakfast or lunch, doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

● CAUTIONS**CAUTIONS, FURTHER INFORMATION**

- ▶ **Porphyria** Sulfonylureas should be avoided where possible in Acute porphyrias p. 1025 but glipizide is thought to be safe.
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS**
- ▶ **Uncommon** Dizziness · drowsiness · skin reactions · tremor · vision disorders
- ▶ **Frequency not known** Confusion · headache · hyponatraemia · malaise · photosensitivity reaction
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **HEPATIC IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.
- **RENAL IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Glipizide (Non-proprietary)**

Glipizide 5 mg Glipizide 5mg tablets | 28 tablet [PoM] £3.00 DT = £1.46 | 56 tablet [PoM] £2.92-£6.00

▶ **Minodiab** (Pfizer Ltd)

Glipizide 5 mg Minodiab 5mg tablets | 28 tablet [PoM] £1.26 DT = £1.46

F 692

Tolbutamide

● INDICATIONS AND DOSE**Type 2 diabetes mellitus**

▶ BY MOUTH

- ▶ **Adult:** 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: sulfonylureas

● SIDE-EFFECTS

- ▶ **Rare or very rare** Aplastic anaemia · blood disorder
- ▶ **Frequency not known** Alcohol intolerance · appetite abnormal · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · headache · hypersensitivity (usually in the first 6–8 weeks of therapy) · paraesthesia · photosensitivity reaction · tinnitus · weight increased

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

▶ Tolbutamide (Non-proprietary)

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet [PoM]
£34.88 DT = £4.56 | 112 tablet [PoM] £17.60-£18.24

BLOOD GLUCOSE LOWERING DRUGS > THIAZOLIDINEDIONES

Pioglitazone

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

INDICATIONS AND DOSE

Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)

▶ BY MOUTH

- ▶ Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed

after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

- **CONTRA-INDICATIONS** History of heart failure · previous or active bladder cancer · uninvestigated macroscopic haematuria

- **CAUTIONS** Cardiovascular disease or in combination with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer

CAUTIONS, FURTHER INFORMATION Substitute insulin during peri-operative period.

- **INTERACTIONS** → Appendix 1: pioglitazone

SIDE-EFFECTS

- ▶ **Common or very common** Bone fracture · increased risk of infection · numbness · visual impairment · weight increased

- ▶ **Uncommon** Bladder cancer · insomnia

- ▶ **Frequency not known** Macular oedema

SIDE-EFFECTS, FURTHER INFORMATION Rare reports of liver dysfunction; discontinue if jaundice occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Avoid.

- **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.

PATIENT AND CARER ADVICE

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

MEDICINAL FORMS

INSULINS

Insulins

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

● SIDE-EFFECTS

▶ **Common or very common** Oedema
▶ **Uncommon** Lipodystrophy · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

Overdose Overdose causes hypoglycaemia.

● PREGNANCY

Dose adjustments During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

● BREAST FEEDING

Dose adjustments During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

● HEPATIC IMPAIRMENT

Dose adjustments Insulin requirements may be decreased in patients with hepatic impairment.

● **RENAL IMPAIRMENT** The compensatory response to hypoglycaemia is impaired in renal impairment.

Dose adjustments Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary.

● MONITORING REQUIREMENTS

- ▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- ▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- ▶ In adults It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).
- ▶ In children It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- ▶ While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

● **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

● **PRESCRIBING AND DISPENSING INFORMATION** Show container to patient or carer and confirm the expected version is dispensed.

Units The word 'unit' should **not** be abbreviated.

● PATIENT AND CARER ADVICE

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks. Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS > RAPID-ACTING

F 695

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: According to requirements

Diabetic ketoacidosis | Diabetes during surgery

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

- **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- **Rare or very rare** Refraction disorder
- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.
- ▶ With intravenous use For *intravenous infusion* give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into 'dead space' of injection port of the infusion bag.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151** Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
 - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
 - whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

▶ **Humalog** (Eli Lilly and Company Ltd)

Insulin lispro 100 unit per 1 mL Humalog 100units/mL solution for injection 10mL vials | 1 vial [PoM] £16.61 DT = £16.61
Humalog 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £28.31 DT = £28.31

▶ **Humalog Junior KwikPen** (Eli Lilly and Company Ltd)

Insulin lispro 100 unit per 1 mL Humalog Junior KwikPen 100units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £29.46 DT = £29.46

▶ **Humalog KwikPen** (Eli Lilly and Company Ltd)

Insulin lispro 100 unit per 1 mL Humalog KwikPen 100units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £29.46 DT = £29.46

Insulin lispro 200 unit per 1 mL Humalog KwikPen 200units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £58.92

INSULINS > INTERMEDIATE-ACTING

F 695

Biphasic isophane insulin

(Biphasic Isophane Insulin Injection—intermediate acting)

INDICATIONS AND DOSE

Diabetes mellitus

▶ BY SUBCUTANEOUS INJECTION

▶ Child: According to requirements

▶ Adult: According to requirements

● **INTERACTIONS** → Appendix 1: insulins

● **SIDE-EFFECTS**

▶ **Rare or very rare** Angioedema

▶ **Frequency not known** Hypokalaemia · weight increased

● **PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin M3** (Eli Lilly and Company Ltd)
Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08
Humulin M3 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68
- ▶ **Humulin M3 KwikPen** (Eli Lilly and Company Ltd)
Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT = £21.70
- ▶ **Hypurin Porcine 30/70 Mix** (Wockhardt UK Ltd)
Insulin porcine (as Insulin soluble porcine) 30 unit per 1 ml, Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £46.95
Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £31.30
- ▶ **Insuman Comb 15** (Sanofi)
Insulin human (as Insulin soluble human) 15 unit per 1 ml, Insulin human (as Insulin isophane human) 85 unit per 1 ml Insuman Comb 15 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50
- ▶ **Insuman Comb 25** (Sanofi)
Insulin human (as Insulin soluble human) 25 unit per 1 ml, Insulin human (as Insulin isophane human) 75 unit per 1 ml Insuman Comb 25 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
Insuman Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80
Insuman Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50
- ▶ **Insuman Comb 50** (Sanofi)
Insulin human (as Insulin isophane human) 50 unit per 1 ml, Insulin human (as Insulin soluble human) 50 unit per 1 ml Insuman Comb 50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

Isohane insulin

(Isohane Insulin Injection; Isohane Protamine Insulin Injection; Isohane Insulin (NPH)—intermediate acting)

INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **PREGNANCY** Recommended where longer-acting insulins are needed.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin I** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68
Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08

- ▶ **Humulin I KwikPen** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT = £21.70
- ▶ **Hypurin Bovine Isohane** (Wockhardt UK Ltd)
Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml Hypurin Bovine Isohane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72
- ▶ **Hypurin Porcine Isohane** (Wockhardt UK Ltd)
Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isohane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £46.95
Hypurin Porcine Isohane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £31.30
- ▶ **Insulatard** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £7.48
- ▶ **Insulatard InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £20.40 DT = £21.70
- ▶ **Insulatard Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90 DT = £19.08
- ▶ **Insuman Basal** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £19.08
- ▶ **Insuman Basal SoloStar** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80 DT = £21.70

INSULINS INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

P 695

Biphasic insulin aspart (Intermediate-acting insulin)

INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 10 minutes before or soon after a meal, according to requirements
- ▶ Adult: Administer up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £29.89 DT = £29.89
- ▶ **NovoMix 30 Penfill** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79 DT = £28.79

Biphasic insulin lispro

(Intermediate-acting insulin)

• INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

- Child: Administer up to 15 minutes before or soon after a meal, according to requirements
- Adult: Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)
- **INTERACTIONS** → Appendix 1: insulins
- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► Humalog Mix25 (Eli Lilly and Company Ltd)

Insulin lispro 25 unit per 1 mL, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 mL Humalog Mix25 100units/mL suspension for injection 10mL vials | 1 vial [PoM] £16.61
Humalog Mix25 100units/mL suspension for injection 3mL cartridges | 5 cartridge [PoM] £29.46 DT = £29.46

► Humalog Mix25 KwikPen (Eli Lilly and Company Ltd)

Insulin lispro 25 unit per 1 mL, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 mL Humalog Mix25 KwikPen 100units/mL suspension for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98

► Humalog Mix50 (Eli Lilly and Company Ltd)

Insulin lispro 50 unit per 1 mL, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 mL Humalog Mix50 100units/mL suspension for injection 3mL cartridges | 5 cartridge [PoM] £29.46 DT = £29.46

► Humalog Mix50 KwikPen (Eli Lilly and Company Ltd)

Insulin lispro 50 unit per 1 mL, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 mL Humalog Mix50 KwikPen 100units/mL suspension for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98

INSULINS > LONG-ACTING

14-Mar-2017

Insulin degludec

(Recombinant human insulin analogue—long acting)

• INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

- Child 1–17 years: Dose to be given according to requirements
- Adult: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1: insulins

• SIDE-EFFECTS

- **Uncommon** Peripheral oedema

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

• NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) Decisions

- In adults The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is recommended as an option for restricted use within NHS Wales for the treatment of diabetes mellitus in adult patients where treatment with a basal insulin analogue is considered appropriate.
- In children The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is **not** recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Tresiba FlexTouch (Novo Nordisk Ltd)

Insulin human (as Insulin degludec) 100 unit per 1 mL Tresiba FlexTouch 100units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £46.60 DT = £46.60

Insulin human (as Insulin degludec) 200 unit per 1 mL Tresiba FlexTouch 200units/mL solution for injection 3mL pre-filled pen | 3 pre-filled disposable injection [PoM] £55.92 DT = £55.92

► Tresiba Penfill (Novo Nordisk Ltd)

Insulin human (as Insulin degludec) 100 unit per 1 mL Tresiba Penfill 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £46.60 DT = £46.60

Insulin degludec with liraglutide

02-Jun-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec above, liraglutide p. 685.

• INDICATIONS AND DOSE

As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics in combination with basal insulin

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

- **INTERACTIONS** → Appendix 1: insulins • liraglutide

- **PATIENT AND CARER ADVICE** Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2015) that insulin degludec with liraglutide (*Xultophy*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus to improve glycaemic control in combination with oral glucose-lowering medicinal products when these alone or combined with a GLP-1 receptor agonist or with basal insulin do not provide adequate glycaemic control.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Xultophy (Novo Nordisk Ltd) ▼

Liraglutide 3.6 mg per 1 mL, Insulin human (as Insulin degludec) 100 unit per 1 mL Xultophy 100units/mL / 3.6mg/mL solution for injection 3mL pre-filled pen | 3 pre-filled disposable injection [PoM] £95.53 DT = £95.53

Insulin detemir

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child 2–17 years: According to requirements
- Adult: According to requirements

● **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- **Uncommon** Refraction disorder
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 699 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Levemir FlexPen** (Novo Nordisk Ltd)
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £42.00 DT = £42.00
- **Levemir InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £44.85 DT = £42.00
- **Levemir Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00 DT = £42.00

695

Insulin glargine

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child 2–17 years: According to requirements
- Adult: According to requirements

TOUJEO®

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Adult: According to requirements

● **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- **Rare or very rare** Myalgia · sodium retention · taste altered
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that *Lantus*® preparations (April 2013) and *Toujeo*® (August

2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Abasaglar** (Eli Lilly and Company Ltd) ▼
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28 DT = £37.77
- **Abasaglar KwikPen** (Eli Lilly and Company Ltd) ▼
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £35.28 DT = £37.77
- **Lantus** (Sanofi)
Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £37.77 DT = £37.77
Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £37.77 DT = £37.77
Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM] £27.92 DT = £27.92
- **Toujeo** (Sanofi)
Insulin human (as Insulin glargine) 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection [PoM] £33.13 DT = £33.13

695

Insulin zinc suspension

(Insulin zinc suspension (mixed)—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: According to requirements
- Adult: According to requirements

● **INTERACTIONS** → Appendix 1: insulins

● **SIDE-EFFECTS** Hypokalaemia · weight increased

● **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 699 is recommended where longer-acting insulins are needed; insulin detemir above may also be considered.

● **PRESCRIBING AND DISPENSING INFORMATION** A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- **Hypurin Bovine Lente** (Wockhardt UK Ltd)
Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

Protamine zinc insulin

(Protamine zinc insulin injection—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: According to requirements
- Adult: According to requirements

● INTERACTIONS → Appendix 1: insulins

● SIDE-EFFECTS Hypokalaemia

● PREGNANCY Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 699 is recommended where longer-acting insulins are needed; insulin detemir p. 701 may also be considered.

● PRESCRIBING AND DISPENSING INFORMATION A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- **Hypurin Bovine Protamine Zinc** (Wockhardt UK Ltd)
Insulin bovine (as insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood **ketones** should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Other drugs used for Diabetes, diagnosis and monitoring

50 strip • NHS indicative price = £16.00 • Drug Tariff (Part IXr)

3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis: urinary glucose

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*® but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood glucose monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;

Meters and test strips

Meter (all <small>NHS</small>)	Type of monitoring	Compatible test strips	Test strip net price	Sensitivity range (mmol/litre)	Manufacturer

Hypodermic insulin injection pens

• HYPODERMIC INSULIN INJECTION PENS

AUTOPEN® 24

Autopen® 24 (for use with Sanofi- Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen 24 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd)
1 device • NHS indicative price = £16.71 • Drug Tariff (Part IXa)

Autopen 24 hypodermic insulin injection pen reusable for 3mL cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd)
1 device • NHS indicative price = £16.71 • Drug Tariff (Part IXa)

AUTOPEN® CLASSIC

Autopen® Classic (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen Classic hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd)
1 device • NHS indicative price = £16.96 • Drug Tariff (Part IXa)

Autopen Classic hypodermic insulin injection pen reusable for 3mL cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd)
1 device • NHS indicative price = £16.96 • Drug Tariff (Part IXa)

CLIKSTAR®

For use with **Lantus®**, **Apidra®**, and **Insuman®** 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units.

HUMAPEN® LUXURA HD

For use with **Humulin®** and **Humalog®** 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units.

HumaPen Luxura HD hypodermic insulin injection pen reusable for 3mL cartridge 0.5 unit dial up / range 1-30 units (Eli Lilly and Company Ltd)
1 device • NHS indicative price = £27.01 • Drug Tariff (Part IXa)

NOVOPEN® 4

For use with **Penfill®** 3-mL insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units.

NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units (Novo Nordisk Ltd)
1 device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units (Novo Nordisk Ltd)
1 device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

Needle free insulin delivery systems

• NEEDLE FREE INSULIN DELIVERY SYSTEMS

INSUJET®

For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units. Available as **starter set** (**Insulet®** device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key), **nozzle pack** (15 nozzles), **cartridge adaptor pack** (15 adaptors), or **vial adaptor pack** (15 adaptors).

Insulet starter set (Spirit Healthcare Ltd)

1 pack • NHS indicative price = £90.00 • Drug Tariff (Part IXa)

Urine glucose testing strips

• URINE GLUCOSE TESTING STRIPS

Diastix testing strips (Bayer Diagnostics Manufacturing Ltd)

GlucoRx KetoRx Sticks 2GK testing strips (GlucoRx Ltd)
50 strip • NHS indicative price = £2.25 • Drug Tariff (Part IXr)

Ketostix testing strips (Bayer Diagnostics Manufacturing Ltd)
50 strip • NHS indicative price = £3.06 • Drug Tariff (Part IXr)

Urine protein testing strips

• URINE PROTEIN TESTING STRIPS

Albustix testing strips (Siemens Medical Solutions Diagnostics Ltd)
50 strip • NHS indicative price = £4.10 • Drug Tariff (Part IXr)

Medi-Test Protein 2 testing strips (BHR Pharmaceuticals Ltd)
50 strip • NHS indicative price = £3.27 • Drug Tariff (Part IXr)

3.2 Hypoglycaemia

Hypoglycaemia

02-Jun-2017

Treatment of hypoglycaemia

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.

Proprietary products of quick-acting carbohydrate (e.g. *GlucoGel*®, *DextroGel*®, *GSF-Syrup*®, *Rapilose*® gel) are available on prescription for patients to keep on hand in case of hypoglycaemia.

Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of *Lucozade*® *Energy Original* (also, see note below), 100 mL of *Coca-Cola*®, 19 mL of *Ribena*® *Blackcurrant* (to be diluted).

Note: the carbohydrate content of some commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked. Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an 'if necessary' basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose **intravenous infusion 20% p. 1009** may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also, emergency management of hypoglycaemia in dental practice for further advice.

Chronic hypoglycaemia

Diazoxide p. 708, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

GLYCOGENOLYTIC HORMONES

Glucagon

• INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–1 year: 500 micrograms
- ▶ Child 2–17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- ▶ Child 2–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
- ▶ Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour
- ▶ Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

Diagnostic aid

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.
- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma · when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge) (in children)
- **INTERACTIONS** → Appendix 1: glucagon
- **SIDE-EFFECTS**
 - ▶ Common or very common Nausea
 - ▶ Uncommon Vomiting
 - ▶ Rare or very rare Abdominal pain · hypertension · hypotension · tachycardia
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children When administered by continuous intravenous infusion, do not add to infusion fluids containing calcium—precipitation may occur.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Glucagon for hypoglycaemia www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Glucagen Hypokit** (Novo Nordisk Ltd)
Glucagon hydrochloride 1 mg Glucagen Hypokit 1mg powder and solvent for solution for injection | 1 vial [POM] £11.52 DT = £11.52

3.2a Chronic hypoglycaemia

GLYCOGENOLYTIC HORMONES

Diazoxide

● INDICATIONS AND DOSE

Chronic intractable hypoglycaemia

► BY MOUTH

- Adult: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation
- **INTERACTIONS** → Appendix 1: diazoxide
- **SIDE-EFFECTS** Abdominal pain · albuminuria · appetite decreased (long term use) · arrhythmia · azotaemia · cardiomegaly · cataract · constipation · diabetic hyperosmolar coma · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal symptoms · fever · fluid retention · galactorrhoea · haemorrhage · headache · heart failure · hirsutism · hypoglycaemia · hyperuricaemia (long term use) · hypogammaglobulinaemia · hypotension · ileus · ketoacidosis · leucopenia · libido decreased · musculoskeletal pain · nausea · nephritic syndrome · oculogyric crisis · pancreatitis · parkinsonism · pulmonary hypertension · skin reactions · sodium retention · taste altered · thrombocytopenia · tinnitus · vision disorders · voice alteration (long term use) · vomiting
- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments Dose reduction may be required.
- **MONITORING REQUIREMENTS**
 - Monitor blood pressure.
 - Monitor white cell and platelet count during prolonged use.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- **Eudemine** (RPH Pharmaceuticals AB)

Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet [PoM] £46.45

Capsule

- **Diazoxide (Non-proprietary)**

Diazoxide 25 mg Proglycem 25 capsules | 100 capsule [PoM] 

Osteoporosis occurs most commonly in postmenopausal women, men over 50 years, and in patients taking long-term oral corticosteroids (glucocorticoids). Risk factors for osteoporosis include age, low body mass index (BMI), cigarette smoking, excess alcohol intake, lack of physical activity, vitamin D deficiency and low calcium intake, family history of hip fractures, a previous fracture at a site characteristic of osteoporotic fractures and early menopause. Some diseases are also known to be associated with osteoporosis such as rheumatoid arthritis and diabetes.

Aims of treatment

A combination of lifestyle changes and drug treatment aims to prevent bone fractures in patients with osteoporosis.

Lifestyle changes

EvGr Patients should be encouraged to increase their level of physical activity, stop smoking, maintain a normal BMI level (between 20–25 kg/m²), and reduce their alcohol intake to improve their bone health and reduce the risk of fragility fractures.

Patients at risk of osteoporosis should also ensure an adequate intake of calcium and vitamin D, preferably through increasing dietary intake.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and can benefit from supplements.  Elderly patients also have an increased risk of falls (see Prescribing in the elderly p. 28).

Drug treatment

Postmenopausal osteoporosis

The therapeutic options for the prevention and treatment of osteoporosis in postmenopausal women are the same.

EvGr Oral bisphosphonates, alendronic acid p. 710 and risedronate sodium p. 713 are considered as first-line choices for most patients with postmenopausal osteoporosis due to their broad spectrum of anti-fracture efficacy. Alendronic acid and risedronate sodium have been shown to reduce occurrence of vertebral, non-vertebral and hip fractures. Intravenous bisphosphonates (ibandronic acid p. 711 or zoledronic acid p. 715), denosumab p. 717, or raloxifene hydrochloride p. 736 are alternative options in women who are intolerant of oral bisphosphonates or in whom they are contra-indicated.

Hormone replacement therapy (HRT) is an additional option. The use of HRT for osteoporosis is generally restricted to younger postmenopausal women with menopausal symptoms who are at high risk of fractures. This is due to the risk of adverse effects such as cardiovascular disease and cancer in older postmenopausal women and women on long-term HRT therapy.

Teriparatide p. 716 is reserved for postmenopausal women with severe osteoporosis at very high risk for vertebral fractures. Its duration of treatment is limited to 24 months.

Glucocorticoid-induced osteoporosis

Glucocorticoid therapy is associated with bone loss and increased risk of fractures. The greatest rate of bone loss occurs early after initiation of glucocorticoids and increases with dose and duration of therapy. **EvGr** Bone-protection treatment should be started at the onset of therapy in patients who are at a high risk of fracture.

If glucocorticoid therapy is stopped, the need to continue bone-protection treatment should be reviewed. However, bone-protection treatment should be continued with long-term glucocorticoid therapy. Complex cases of glucocorticoid-induced osteoporosis should be referred to a specialist.

Women aged 70 years or over, or with a previous fragility fracture, or taking large doses of glucocorticoids (prednisolone ≥7.5 mg daily or equivalent) are at high risk of

4 Disorders of bone metabolism

Osteoporosis

20-Oct-2017

Description of condition

Osteoporosis is a progressive bone disease characterised by low bone mass measured by bone mineral density (BMD), and microarchitectural deterioration of bone tissue. This leads to an increased risk of fragility fractures as a result. Osteoporosis is considered severe if there have been one or more fragility fractures.

fractures and should be assessed for prophylactic bone-protection. Some younger patients, particularly those with a previous history of fracture or receiving high doses of glucocorticoids can also be considered for bone-protection treatment.

The therapeutic options for prophylaxis and treatment of glucocorticoid-induced osteoporosis are the same; oral bisphosphonates, alendronic acid, or risedronate sodium are first-line options. Intravenous zoledronic acid or teriparatide are alternatives in patients intolerant of oral bisphosphonates or in whom they are contra-indicated. [A](#)

Osteoporosis in men

[EvGr](#) Oral bisphosphonates, alendronic acid or risedronate sodium are recommended as first-line treatments for osteoporosis in men. Intravenous zoledronic acid or denosumab are alternatives in men who are intolerant of oral bisphosphonates or in whom they are contra-indicated; teriparatide is an additional option. [A](#)

Men having long-term androgen deprivation therapy for prostate cancer have an increased fracture risk. [EvGr](#) Fracture risk should be assessed when starting this therapy. A bisphosphonate can be offered to men with confirmed osteoporosis; denosumab is an alternative if bisphosphonates are contra-indicated or not tolerated. [A](#)

Bisphosphonates: treatment duration

[EvGr](#) There is some evidence to suggest that patients can benefit from a bisphosphonate-free period as their therapeutic effects last for some time after cessation of treatment.

Bisphosphonate treatment should be reviewed after 5 years of treatment with alendronic acid, risedronate sodium or ibandronic acid, and after 3 years of treatment with zoledronic acid. Patients over 75 years of age, or with a history of previous hip or vertebral fracture, or patients who have had one or more fragility fractures during treatment, or who are taking long-term glucocorticoid therapy can continue bisphosphonates beyond this period. [A](#)

Other drugs used for Disorders of bone metabolism
Calcitriol, p. 1050

ANABOLIC STEROIDS

Nandrolone

● INDICATIONS AND DOSE

Osteoporosis in postmenopausal women (but not recommended)

- BY DEEP INTRAMUSCULAR INJECTION
- Adult (female): 50 mg every 3 weeks.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 • male breast cancer • prostate cancer
- **CAUTIONS** Cardiac impairment • diabetes mellitus • epilepsy • hypertension • migraine • skeletal metastases (risk of hypercalcaemia)
- **INTERACTIONS** → Appendix 1: nandrolone
- **SIDE-EFFECTS** Clitoris enlarged • dysphonia • hepatic disorders • hepatic neoplasm • hirsutism • hypertension • libido increased • nausea • oedema • skin reactions • sodium retention • urine flow decreased • virilism (with high doses including voice changes - sometimes irreversible)
- **HEPATIC IMPAIRMENT** Use in severe hepatic impairment only if benefit outweighs risk.
- **RENAL IMPAIRMENT** Use with caution—may cause sodium and water retention.
- **MONITORING REQUIREMENTS** Monitor skeletal maturation in young patients.

- **LESS SUITABLE FOR PRESCRIBING** Nandrolone injection is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol

► **Deca-Durabolin** (Aspen Pharma Trading Ltd)

Nandrolone decanoate 50 mg per 1 ml Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule [PoM](#) £3.17 [CD4-2](#)

BISPHOSPHONATES

Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed*

Bisphosphonates: Dental Clinical Guidance, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM ADVICE: BIPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

• SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · arthralgia · asthenia · constipation · diarrhoea · dizziness · dysphagia · electrolyte imbalance · eye inflammation · fever · gastritis · gastrointestinal discomfort · headache · influenza like illness · malaise · myalgia · nausea · oesophageal ulcer (discontinue) · oesophagitis (discontinue) · pain · peripheral oedema · renal impairment · skin reactions · taste altered · vomiting
- ▶ **Uncommon** Anaphylactic reaction · angioedema · bronchospasm · oesophageal stenosis (discontinue) · osteonecrosis
- ▶ **Rare or very rare** Atypical femur fracture · Stevens-Johnson syndrome

• PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. Osteonecrosis of the external auditory canal Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

£ 709

Alendronic acid

(Alendronate)

14-Sep-2017

• INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis

- ▶ **BY MOUTH**
- ▶ Adult (female): 10 mg daily, alternatively 70 mg once weekly.

Treatment of osteoporosis in men

- ▶ **BY MOUTH**
- ▶ Adult (male): 10 mg daily.

Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy

- ▶ **BY MOUTH**
- ▶ Adult (female): 10 mg daily.

- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)

- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of

ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders

- **INTERACTIONS** → Appendix 1: bisphosphonates

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distension · gastrointestinal disorders · joint swelling · vertigo
- ▶ **Uncommon** Erythema · eye inflammation · haemorrhage
- ▶ **Rare or very rare** Femoral stress fracture · oropharyngeal ulceration · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 35 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution.

Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Bisphosphonates for treating osteoporosis (updated February 2018) NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on assessing the risk of fragility fractures (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Alendronic acid is recommended as an option for treating osteoporosis in patients, only if:

- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, and
- the 10-year probability of osteoporotic fragility fracture is at least 1%.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta464

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2016) that alendronic acid (*Binosto*[®]) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution**Alendronic acid (Non-proprietary)**

Alendronic acid 700 microgram per 1 ml Alendronic acid 70mg/100ml oral solution unit dose sugar free sugar-free | 4 unit dose [POM] £28.56 DT = £28.56

Effervescent tablet**Binosto** (Internis Pharmaceuticals Ltd)

Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet [POM] £22.80 DT = £22.80

Tablet**Alendronic acid (Non-proprietary)**

Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [POM] £3.25 DT = £1.38

Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [POM] £22.80 DT = £0.41

Fosamax Once Weekly (Merck Sharp & Dohme Ltd)

Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [POM] £22.80 DT = £0.41

Alendronic acid with colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 710, colecalciferol p. 1051.

INDICATIONS AND DOSE**Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency**

- ▶ BY MOUTH
- ▶ Adult (female): 1 tablet once weekly.

INTERACTIONS → Appendix 1: bisphosphonates · vitamin D substances**DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer alendronic acid with colecalciferol tablets.**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet**Alendronic acid with colecalciferol (Non-proprietary)**

Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg / Colecalciferol 70microgram tablets | 4 tablet [POM] £22.80 DT = £22.80

Fosavance (Merck Sharp & Dohme Ltd)

Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg Fosavance tablets | 4 tablet [POM] £22.80 DT = £22.80

Ibandronic acid

28-Sep-2017

F 709

INDICATIONS AND DOSE**Reduction of bone damage in bone metastases in breast cancer**

- ▶ INITIALLY BY MOUTH
- ▶ Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

Hypercalcaemia of malignancy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

Treatment of postmenopausal osteoporosis

- ▶ INITIALLY BY MOUTH
- ▶ Adult (female): 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

CONTRA-INDICATIONS**GENERAL CONTRA-INDICATIONS** Hypocalcaemia**SPECIFIC CONTRA-INDICATIONS**

- ▶ With oral use Abnormalities of the oesophagus · other factors which delay emptying (e.g. stricture or achalasia)
- ▶ **CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload)

INTERACTIONS → Appendix 1: bisphosphonates**SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Face oedema
- ▶ **Uncommon** Asthma exacerbated
- ▶ **Rare or very rare** Eye inflammation

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Bundle branch block · cataract · increased risk of infection · joint disorder · oral disorders · osteoarthritis · parathyroid disorder · thirst
- ▶ With oral use Acute phase reaction · muscle cramps · musculoskeletal stiffness
- ▶ **Uncommon**
- ▶ With intravenous use Acrochordon · affective disorder · altered smell sensation · anxiety · blood disorder · cardiovascular disorder · cerebrovascular disorder · cholelithiasis · cystitis · deafness · hyperaesthesia · hypothermia · injury · memory loss · migraine · muscle tone increased · myocardial ischaemia · neuralgia · palpitations · pelvic pain · pulmonary oedema · radiculopathy · renal cyst · sleep disorder · stridor · urinary retention · weight decreased
- ▶ **Rare or very rare**
- ▶ With intravenous use Hypersensitivity
- ▶ **PREGNANCY** Avoid.
- ▶ **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- ▶ **RENAL IMPAIRMENT** When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².
- ▶ **Dose adjustments** ▶ With intravenous use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.
- ▶ With oral use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly.

MONITORING REQUIREMENTS Monitor renal function and serum calcium, phosphate and magnesium.**DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or

standing; to be taken on an empty stomach at least 30 minutes (for most ibandronic acid tablets, 50 mg) or 1 hour (for *Bonviva*® tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

For intravenous infusion (*Bondronat*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Bisphosphonates for treating osteoporosis (updated February 2018)** NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on assessing the risk of fragility fractures (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

With oral use ibandronic acid is recommended as an option for treating osteoporosis in patients, only if:

- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, **and**
- the 10-year probability of osteoporotic fragility fracture is at least 1%.

With intravenous use ibandronic acid is recommended as an option for treating osteoporosis in patients, only if:

- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, **and**
- the 10-year probability of osteoporotic fragility fracture is at least 10%, **or**
- the 10-year probability of osteoporotic fragility fracture is at least 1% and the person has difficulty taking oral bisphosphonates (alendronic acid, ibandronic acid or risedronate sodium) or these drugs are contra-indicated or not tolerated.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

- ▶ **Quodixor** (Aspire Pharma Ltd)

Ibandronic acid (as Ibandronic sodium monohydrate) 150 mg Quodixor 150mg tablets | 1 tablet [PoM] £18.40 DT = £0.83

£ 709

Pamidronate disodium

(Formerly called
aminohydroxypropylenediphosphonate
disodium (APD))

● INDICATIONS AND DOSE

Hypercalcaemia of malignancy

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

Paget's disease of bone

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

- **CAUTIONS** Atypical femoral fractures · cardiac disease (especially in elderly) · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)

- **INTERACTIONS** → Appendix 1: bisphosphonates

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · chills · decreased leucocytes · drowsiness · electrolyte imbalance · flushing · hypertension · insomnia · paraesthesia · tetany · thrombocytopenia

- **Uncommon** Agitation · dyspnoea · eye inflammation · hypotension · muscle cramps · osteonecrosis · seizure
 - **Rare or very rare** Confusion · glomerulonephritis · haematuria · heart failure · nephritis tubulointerstitial · nephrotic syndrome · oedema · pulmonary oedema · reactivation of infections · renal disorder exacerbated · renal tubular disorder · respiratory disorders · visual hallucinations · xanthopsia
 - **Frequency not known** Atrial fibrillation
- SIDE-EFFECTS, FURTHER INFORMATION** Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.

● **RENAL IMPAIRMENT**

Dose adjustments Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk.

If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

● **MONITORING REQUIREMENTS**

- Monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes.
- Assess renal function before each dose.

● **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous infusion* (Aredia®; Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For Pamidronate disodium (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

● **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw). **Driving and skilled tasks** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Pamidronate disodium (Non-proprietary)**

Pamidronate disodium 3 mg per 1 mL Pamidronate disodium 15mg/5mL solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15 (Hospital only)

Pamidronate disodium 30mg/10mL solution for infusion vials | 1 vial [PoM] £55.00–£59.66 (Hospital only)

Pamidronate disodium 60mg/20mL solution for infusion vials | 1 vial [PoM] £110.00 (Hospital only)

Pamidronate disodium 90mg/30mL solution for infusion vials | 1 vial [PoM] £165.00 (Hospital only)

Pamidronate disodium 9 mg per 1 mL Pamidronate disodium 90mg/10mL solution for infusion vials | 1 vial [PoM] £170.45 (Hospital only)

Pamidronate disodium 15 mg per 1 mL Pamidronate disodium 60mg/4mL solution for infusion ampoules | 1 ampoule [PoM] £119.32
Pamidronate disodium 15mg/1mL solution for infusion ampoules | 4 ampoule [PoM] £119.32

Pamidronate disodium 90mg/6mL solution for infusion ampoules | 1 ampoule [PoM] £170.46

Pamidronate disodium 30mg/2mL solution for infusion ampoules | 2 ampoule [PoM] £119.32

Risedronate sodium

● **INDICATIONS AND DOSE**

Paget's disease of bone

- **BY MOUTH**
- **Adult:** 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

- **BY MOUTH**
- **Adult (female):** 5 mg daily, alternatively 35 mg once weekly.

Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women

- **BY MOUTH**
- **Adult (female):** 5 mg daily.

Treatment of osteoporosis in men at high risk of fractures

- **BY MOUTH**
- **Adult (male):** 35 mg once weekly.

● **CONTRA-INDICATIONS** Hypocalcaemia

● **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia)

● **INTERACTIONS** → Appendix 1: bisphosphonates

● **SIDE-EFFECTS**

- **Uncommon** Gastrointestinal disorders · iritis
- **Rare or very rare** Glossitis
- **Frequency not known** Amblyopia · apnoea · chest pain · corneal lesion · dry eye · hypersensitivity · hypersensitivity vasculitis · increased risk of infection · leg cramps · liver disorder · muscle weakness · neoplasms · nocturia · pain · tinnitus · toxic epidermal necrolysis · weight decreased

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- Correct hypocalcaemia before starting.
- Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.

● **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day **or**, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets.

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Bisphosphonates for treating osteoporosis (updated February 2018)** NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on assessing the risk of fragility fractures (CG146), which defines who is eligible for osteoporotic fracture risk assessment.

- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Risedronate sodium is recommended as an option for treating osteoporosis in patients, only if:

- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, **and**
- the 10-year probability of osteoporotic fragility fracture is at least 1%.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta464

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Risedronate sodium (Non-proprietary)

Risedronate sodium 5 mg Risedronate sodium 5mg tablets | 28 tablet [PoM] £24.78 DT = £18.85

Risedronate sodium 30 mg Risedronate sodium 30mg tablets | 28 tablet [PoM] £143.95 DT = £143.83

Risedronate sodium 35 mg Risedronate sodium 35mg tablets | 4 tablet [PoM] £19.12 DT = £0.58

► Actonel (Warner Chilcott UK Ltd, Teva UK Ltd)

Risedronate sodium 5 mg Actonel 5mg tablets | 28 tablet [PoM] £17.99 DT = £18.85

Risedronate sodium 30 mg Actonel 30mg tablets | 28 tablet [PoM] £143.95 DT = £143.83

Risedronate sodium 35 mg Actonel Once a Week 35mg tablets | 4 tablet [PoM] £19.12 DT = £0.58

Actonel 35mg tablets | 4 tablet [PoM] Σ DT = £0.58

Risedronate with calcium carbonate and colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium p. 713, calcium carbonate p. 1013, colecalciferol p. 1051.

• INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

► BY MOUTH

- Adult: 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle

- **INTERACTIONS** → Appendix 1: bisphosphonates · calcium salts · vitamin D substances

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** *Actonel Comb[®]* effervescent granules contain calcium carbonate 2.5 g (calcium 1 g or Ca^{2+} 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer calcium carbonate with colecalciferol and risedronate tablets and granules.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Actonel Combi 35mg tablets and 1000mg/880unit effervescent granules sachets | 4 week supply [PoM] £19.12

F 709

Sodium clodronate

• INDICATIONS AND DOSE

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

► BY MOUTH

- Adult: 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

LORON 520[®]

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

► BY MOUTH

- Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

- **CONTRA-INDICATIONS** Acute gastro-intestinal inflammatory conditions
- **CAUTIONS** Atypical femoral fractures · maintain adequate fluid intake during treatment
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS** Proteinuria · respiratory disorder
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m².
Dose adjustments Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73 m².
Use half normal dose if eGFR 10–30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

Zoledronic acid

28-Sep-2017

● INDICATIONS AND DOSE

ACLASTA®

Treatment of Paget's disease of bone

► BY INTRAVENOUS INFUSION

- Adult: 5 mg as a single dose, to be administered over at least 15 minutes, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis)

► BY INTRAVENOUS INFUSION

- Adult: 5 mg once yearly as a single dose, to be administered over at least 15 minutes, in patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D

ZOMETA® INFUSION

Reduction of bone damage in advanced malignancies involving bone

► BY INTRAVENOUS INFUSION

- Adult: 4 mg every 3–4 weeks, to be administered over at least 15 minutes, calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy

► BY INTRAVENOUS INFUSION

- Adult: 4 mg for 1 dose, to be administered over at least 15 minutes

- **CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload) · concomitant medicines that affect renal function

- **INTERACTIONS** → Appendix 1: bisphosphonates

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · chills · flushing
- **Uncommon** Anxiety · arrhythmias · chest pain · circulatory collapse · cough · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · haematuria · hyperhidrosis · hypertension · hypotension · leucopenia · muscle spasms · orbital inflammation · proteinuria · respiratory disorders · sensation abnormal · sleep disorder · stomatitis · syncope · thrombocytopenia · tremor · vision blurred · weight increased
- **Rare or very rare** Confusion · Fanconi syndrome acquired · osteonecrosis · pancytopenia
- **Frequency not known** Acute phase reaction

SIDE-EFFECTS, FURTHER INFORMATION Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—limited information available.

- **RENAL IMPAIRMENT** Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre). Avoid in Paget's disease, treatment of postmenopausal

osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m².

Dose adjustments In advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

● MONITORING REQUIREMENTS

- Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.
- Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Zometa®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line.

- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Bisphosphonates for treating osteoporosis (updated February 2018) NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on assessing the risk of fragility fractures (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Zoledronic acid is recommended as an option for treating osteoporosis in patients, only if:

- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, **and**
- the 10-year probability of osteoporotic fragility fracture is at least 10%, **or**
- the 10-year probability of osteoporotic fragility fracture is at least 1% and the person has difficulty taking oral bisphosphonates (alendronic acid, ibandronic acid or risedronate sodium) or these drugs are contra-indicated or not tolerated.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta464

ACLASTA®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2008) that in postmenopausal women Aclasta® is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist.

ZOMETA® INFUSION

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2003) that for the prevention of skeletal related events Zometa® is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

► **Aclasta** (Novartis Pharmaceuticals UK Ltd)

Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml Aclasta 5mg/100ml infusion bottles | 1 bottle [PoM] £253.38

► **Zometa** (Novartis Pharmaceuticals UK Ltd)

Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zometa 4mg/100ml infusion bottles | 1 bottle [PoM] £174.14

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Calcitonin (salmon) (Salcatonin)

● INDICATIONS AND DOSE

Hypercalcaemia of malignancy

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response
- BY INTRAVENOUS INFUSION
- Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

Paget's disease of bone

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

Prevention of acute bone loss due to sudden immobility

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

● **CONTRA-INDICATIONS** Hypocalcaemia

● **CAUTIONS** Heart failure · history of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)

● **INTERACTIONS** → Appendix 1: calcitonin (salmon)

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · arthralgia · diarrhoea · dizziness · fatigue · flushing · headache · musculoskeletal pain · nausea · secondary malignancy (long term use) · taste altered · vomiting
- **Uncommon** Hypersensitivity · hypertension · influenza like illness · oedema · polyuria · skin reactions · visual impairment
- **Rare or very rare** Bronchospasm · throat swelling · tongue swelling
- **Frequency not known** Hypocalcaemia · tremor

● **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

● **BREAST FEEDING** Avoid; inhibits lactation in animals.

● **RENAL IMPAIRMENT** Use with caution.

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give intermittently in Sodium chloride 0.9%. Diluted solution given without delay. Dilute in 500 ml give over at least 6 hours; glass or hard plastic containers

should not be used; some loss of potency on dilution and administration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Calcitonin (salmon) (Non-proprietary)**

Calcitonin (salmon) 50 unit per 1 ml Calcitonin (salmon) 50units/1ml solution for injection ampoules | 5 ampoule [PoM] £167.50

Calcitonin (salmon) 100 unit per 1 ml Calcitonin (salmon) 100units/1ml solution for injection ampoules | 5 ampoule [PoM] £220.00

Calcitonin (salmon) 200 unit per 1 ml Calcitonin (salmon) 400units/2ml solution for injection vials | 1 vial [PoM] £352.00

CALCIUM REGULATING DRUGS > PARATHYROID HORMONES AND ANALOGUES

Teriparatide

21-Feb-2018

● INDICATIONS AND DOSE

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis

► BY SUBCUTANEOUS INJECTION

► Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

● **CONTRA-INDICATIONS** Bone metastases · hyperparathyroidism · metabolic bone diseases · Paget's disease · pre-existing hypercalcaemia · previous radiation therapy to the skeleton · skeletal malignancies · unexplained raised alkaline phosphatase

● SIDE-EFFECTS

- **Common or very common** Anaemia · asthenia · chest pain · gastrointestinal disorders · headache · hypercholesterolaemia · hyperhidrosis · hypotension · muscle complaints · palpitations · sciatica · skin reactions · syncope · vomiting
- **Uncommon** Arthralgia · back pain · emphysema · hypercalcaemia · hyperuricaemia · nephrolithiasis · tachycardia · urinary disorders · weight increased
- **Rare or very rare** Oedema · renal impairment

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **RENAL IMPAIRMENT** Caution in moderate impairment; avoid if severe.

● **PRESCRIBING AND DISPENSING INFORMATION** Teriparatide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018)** NICE TA161

Teriparatide is recommended as an alternative treatment option for the secondary prevention of osteoporotic fragility fractures in postmenopausal women:

- who are unable to take alendronate and risedronate, or have a contra-indication to or are intolerant of alendronate and risedronate, or have had an unsatisfactory response to treatment with alendronate or risedronate, **and**
- who are 65 years or older and have a T-score of -4 standard deviations (SD) or below, or a T-score of -3.5 SD or below plus more than two fractures, or who are aged 55–64 years and have a T-score of -4 SD or below plus more than two fractures.

Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta161

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Forsteo** (Eli Lilly and Company Ltd)

Teriparatide 250 microgram per 1 ml Forsteo
20micrograms/80microlitres solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £271.88

DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

Denosumab

- **DRUG ACTION** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

● INDICATIONS AND DOSE

PROLIA®

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures

► BY SUBCUTANEOUS INJECTION

- Adult: 60 mg every 6 months, supplement with calcium and vitamin D

XGEVA®

Prevention of skeletal related events in patients with bone metastases from solid tumours

► BY SUBCUTANEOUS INJECTION

- Adult: 120 mg every 4 weeks, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

Treatment of giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in adults and skeletally mature adolescents

► BY SUBCUTANEOUS INJECTION

- Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW: MONITORING FOR HYPOCALCAEMIA—UPDATED RECOMMENDATIONS (SEPTEMBER 2014) AND DENOSUMAB: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

Osteonecrosis of the jaw

Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

Denosumab 120 mg (cancer indication)

- A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
 - Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery
- Denosumab 60 mg (osteoporosis indication)
- Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypocalcaemia

Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
 - within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
 - if suspected symptoms of hypocalcaemia occur
- All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

MHRA/CHM ADVICE: DENOSUMAB: REPORTS OF OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (JUNE 2017)

Osteonecrosis of the external auditory canal has been reported with denosumab and this should be considered in patients who present with ear symptoms including chronic ear infections or in those with suspected

cholesteatoma. Possible risk factors include steroid use and chemotherapy, with or without local risk factors such as infection or trauma. The MHRA recommends advising patients to report any ear pain, discharge from the ear, or an ear infection during denosumab treatment.

- **CONTRA-INDICATIONS** Hypocalcaemia
- **XGEVA®** Unhealed lesions from dental or oral surgery
- **CAUTIONS** Atypical femoral fractures · hypocalcaemia · osteonecrosis of the jaw—consider temporary interruption of treatment if occurs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · cataract · constipation · increased risk of infection · pain · sciatica · skin reactions
 - ▶ **Uncommon** Cellulitis (seek prompt medical attention)
 - ▶ **Rare or very rare** Atypical femur fracture · hypocalcaemia · osteonecrosis
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.
- **PREGNANCY** Avoid—toxicity in *animal* studies; risk of toxicity increases with each trimester—advise women who become pregnant during treatment to enrol in the manufacturer's Pregnancy Surveillance Programme (consult product literature).
- **BREAST FEEDING** Avoid (if women do decide to breast-feed during treatment, they should enrol in the manufacturer's Lactation Surveillance Programme—consult product literature).
- **RENAL IMPAIRMENT** Increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.
- **PATIENT AND CARER ADVICE**

Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist.

Hypocalcaemia All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

A patient reminder card should be provided (risk of osteonecrosis of the jaw).
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010) NICE TA204**
Denosumab is recommended as a treatment option for the *primary prevention* of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:
 - who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments **and**
 - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.
 Denosumab is recommended as a treatment option for the *secondary prevention* of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for

administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments.
www.nice.org.uk/TA204

- ▶ **Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012) NICE TA265**
Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:
 - bisphosphonates would otherwise be prescribed, **and**
 - the manufacturer provides denosumab with the discount agreed in the patient access scheme.
 Denosumab is **not** recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.
- Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA265
- PROLIA®**
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (November 2010) that denosumab (*Prolia*®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score < -2.5 and ≥ -4.0 and for whom bisphosphonates are unsuitable.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- Solution for injection**
 - ▶ **Prolia** (Amgen Ltd)
Denosumab 60 mg per 1 mL Prolia 60mg/1mL solution for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £183.00 DT = £183.00

5 Dopamine responsive conditions

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Dopamine-receptor agonists

Overview

Bromocriptine p. 414 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 924) are more effective.

Cabergoline p. 415 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

Quinagolide p. 719 has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum

pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

Quinagolide

- **DRUG ACTION** Quinagolide is a non-ergot dopamine D₂ agonist.

● INDICATIONS AND DOSE

Hyperprolactinaemia

► BY MOUTH

- **Adult:** Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks

- **UNLICENSED USE** Not licensed for the suppression of lactation.
- **CAUTIONS** Acute porphyrias p. 1025 · history of psychotic illness · history of serious mental disorders
CAUTIONS, FURTHER INFORMATION In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · appetite decreased · constipation · diarrhoea · dizziness · fatigue · flushing · headache · hypotension · insomnia · nasal congestion · nausea · oedema · syncope · vomiting
 - **Rare or very rare** Acute psychosis · drowsiness
- **ALLERGY AND CROSS-SENSITIVITY** Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypersensitivity to ergot alkaloids).
- **CONCEPTION AND CONTRACEPTION** Advise non-hormonal contraception if pregnancy not desired.
- **PREGNANCY** Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation.
- **HEPATIC IMPAIRMENT** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks**
 - Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6 Gonadotrophin responsive conditions

Gonadotrophins

Gonadotrophin-affecting drugs

Danazol p. 725 is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* [unlicensed indication].

Cetorelix p. 720 and ganirelix p. 720 are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuprorelin acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 927 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in

about 50% of women within 2 years of withdrawal of therapy but may be less severe.

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

Cetrorelix

● INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

► BY SUBCUTANEOUS INJECTION

- **Adult (female):** 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

● SIDE-EFFECTS

- **Common or very common** Ovarian hyperstimulation syndrome
- **Uncommon** Headache · hypersensitivity · nausea
- **PREGNANCY** Avoid in confirmed pregnancy.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe liver impairment.
- **RENAL IMPAIRMENT** Avoid in moderate or severe renal impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Cetrotide (Merck Serono Ltd)

Cetrorelix (as Cetrorelix acetate) 250 microgram Cetrotide
250microgram powder and solvent for solution for injection vials |
1 vial [PoM] £22.61

Ganirelix

● INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

► BY SUBCUTANEOUS INJECTION

- **Adult:** 250 micrograms once daily, dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction), dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy)

● SIDE-EFFECTS

- **Common or very common** Skin reactions
- **Uncommon** Headache · malaise · nausea
- **Rare or very rare** Dyspnoea · facial swelling · hypersensitivity
- **Frequency not known** Abdominal distension · ovarian hyperstimulation syndrome · pelvic pain
- **PREGNANCY** Avoid in confirmed pregnancy—toxicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe hepatic impairment.

- **RENAL IMPAIRMENT** Avoid in moderate to severe renal impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Fyremadel (Ferring Pharmaceuticals Ltd)

Ganirelix 500 microgram per 1 ml Fyremadel
250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £5

► Orgalutran (Merck Sharp & Dohme Ltd)

Ganirelix 500 microgram per 1 ml Orgalutran
250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £21.48

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-RELEASING HORMONES

Buserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

Endometriosis

► BY INTRANASAL ADMINISTRATION

- **Adult:** 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

► BY SUBCUTANEOUS INJECTION

- **Adult:** 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)
- **BY INTRANASAL ADMINISTRATION**
- **Adult:** 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in the midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Advanced prostate cancer

► INITIALLY BY SUBCUTANEOUS INJECTION

- **Adult:** 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

● CONTRA-INDICATIONS

- When used for endometriosis Hormone dependent tumours · undiagnosed vaginal bleeding · use longer than 6 months (do not repeat)
- When used for pituitary desensitisation Hormone dependent tumours · undiagnosed vaginal bleeding

- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Depression · mood altered
- **Rare or very rare** Hearing impairment · hypotension · leucopenia · pituitary tumour benign · thrombocytopenia
- **Frequency not known** Alopecia · anxiety · appetite change · breast abnormalities · broken nails · concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry eye · dysuria · embolism and thrombosis · fatigue · feeling of pressure behind the eyes · follicle recruitment increased · galactorrhoea · gastrointestinal discomfort · gynaecomastia · hair changes · headache · hot flush · hydropnephrosis · hyperhidrosis · increased risk of fracture · lymphostasis · memory loss · menopausal symptoms · menstrual cycle irregularities · muscle weakness in legs · musculoskeletal discomfort · nausea · oedema · osteoporosis · ovarian and fallopian tube disorders · pain · painful sexual intercourse · palpitations · paraesthesia · QT interval prolongation · sexual dysfunction · shock · skin reactions · sleep disorder · testicular atrophy · thirst · tumour activation temporary · uterine leiomyoma degeneration · vision disorders · vomiting · vulvovaginal disorders · weight changes

SPECIFIC SIDE-EFFECTS

- With intranasal use Altered smell sensation · epistaxis · hoarseness · nasal irritation · taste altered

SIDE-EFFECTS, FURTHER INFORMATION During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● DIRECTIONS FOR ADMINISTRATION

- With intranasal use Avoid use of nasal decongestants before and for at least 30 minutes after treatment.
- With subcutaneous use Rotate injection site to prevent atrophy and nodule formation.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buserelin nasal spray.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Suprecur** (Sanofi)
Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprecur 5.5mg/5.5ml solution for injection vials | 2 vial [PoM] £33.02
- **Suprefact** (Sanofi)

Spray

- **Suprecur** (Sanofi)
Buserelin (as Buserelin acetate) 150 microgram per 1 dose Suprecur 150micrograms/dose nasal spray | 168 dose [PoM] £105.16

- **Suprefact** (Sanofi)

Buserelin (as Buserelin acetate) 100 microgram per 1 dose Suprefact 100micrograms/dose nasal spray | 336 dose [PoM] £122.24

Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

ZOLADEX LA®

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

- BY SUBCUTANEOUS INJECTION
- Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

ZOLADEX®

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer

- BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

Endometriosis

- BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

Endometrial thinning before intra-uterine surgery

- BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

Before surgery in women who have anaemia due to uterine fibroids

- BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)

- BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in endometriosis (do not repeat)

- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease · risk of spinal cord compression in men · risk of ureteric obstruction in men
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · arthralgia · bone pain · breast abnormalities · depression · glucose tolerance impaired · gynaecomastia · headache · heart failure · hot flush · hyperhidrosis · mood altered · myocardial infarction · neoplasm complications · paraesthesia · sexual dysfunction · skin reactions · spinal cord compression · vulvovaginal disorders · weight increased
 - ▶ **Uncommon** Hypercalcaemia (in women) · ureteral obstruction
 - ▶ **Rare or very rare** Ovarian and fallopian tube disorders · pituitary haemorrhage · pituitary tumour · psychotic disorder
 - ▶ **Frequency not known** Abdominal cramps · body hair change · constipation · diarrhoea · fatigue · hepatic function abnormal · interstitial pneumonia · muscle complaints · nausea · nervousness · peripheral oedema (when used for gynaecological conditions) · premature menopause · pulmonary embolism · QT interval prolongation · sleep disorder · uterine leiomyoma degeneration · voice alteration · vomiting · vulvovaginal infection · withdrawal bleed
- SIDE-EFFECTS, FURTHER INFORMATION** Tumour flare can occur when androgen deprivation therapy is initiated.
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Men at risk of tumour 'flare' should be monitored closely during the first month of therapy for prostate cancer.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- ▶ **Uncommon** Alopecia · appetite abnormal · asthma exacerbated · breast pain · chills · constipation · diarrhoea · drowsiness · dry mouth · dyspnoea · embolism · gout · hypertension · muscle weakness · skin reactions · testicular disorders · tinnitus · vision disorders · vomiting · weight changes
- ▶ **Rare or very rare** Abnormal sensation in eye · chest pain · confusion · diabetes mellitus · difficulty standing · fever · flatulence · hypotension · influenza like illness · memory loss · musculoskeletal stiffness · nasopharyngitis · orthopnoea · osteoarthritis · taste altered · vertigo
- ▶ **Frequency not known** Angioedema · anxiety · bone disorders · malaise · QT interval prolongation

SIDE-EFFECTS, FURTHER INFORMATION During the initial stage increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● MONITORING REQUIREMENTS

- ▶ When used for Prostate cancer Men at risk of tumour 'flare' should be monitored closely during the first month of therapy.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● PRESCRIBING AND DISPENSING INFORMATION

DECAPEPTYL® SR 22.5MG Each vial includes an overage to allow accurate administration of a 22.5 mg dose.

DECAPEPTYL® SR 3MG Each vial includes an overage to allow accurate administration of 3 mg dose.

DECAPEPTYL® SR 11.25MG Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

● NATIONAL FUNDING/ACCESS DECISIONS**All Wales Medicines Strategy Group (AWMSG) Decisions**

The All Wales Medicines Strategy Group has advised (March 2017) that triptorelin (Decapeptyl® SR) is recommended as an option for use within NHS Wales as an adjuvant treatment to radiotherapy and as a neoadjuvant treatment prior to radiotherapy, in patients with high-risk localised or locally advanced prostate cancer.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

▶ **Decapeptyl SR** (Ipsen Ltd)

Triptorelin (as Triptorelin acetate) 3 mg Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial [PoM] £69.00 DT = £69.00

Triptorelin 11.25 mg Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £207.00 DT = £207.00

Triptorelin (as Triptorelin embonate) 22.5 mg Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial [PoM] £414.00 DT = £414.00

▶ **Gonapeptyl Depot** (Ferring Pharmaceuticals Ltd)

Triptorelin (as Triptorelin acetate) 3.75 mg Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £81.69

▶ **Salvacyl** (Ipsen Ltd)

Triptorelin 11.25 mg Salvacyl 11.25mg powder and solvent for injection vials | 1 vial [PoM] £248.00 DT = £207.00

6.1 Hereditary angioedema

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

Danazol

- **DRUG ACTION** Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogesterogenic activity.

● INDICATIONS AND DOSE

Endometriosis

▶ BY MOUTH

- ▶ **Adult:** 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment

▶ BY MOUTH

- ▶ **Adult:** 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

Hereditary angioedema

▶ BY MOUTH

- ▶ **Adult:** Initially 100–200 mg daily, dose to be reduced according to response, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- **UNLICENSED USE** Not licensed for use in hereditary angioedema.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · androgen-dependent tumours · thromboembolic disease · undiagnosed genital bleeding

- **CAUTIONS** Cardiac impairment (avoid if severe) · diabetes mellitus · elderly · epilepsy · history of thrombosis or thromboembolic disease · hypertension · lipoprotein disorder · migraine · polycythaemia

- **INTERACTIONS** → Appendix 1: danazol

- **SIDE-EFFECTS** Alopecia · aminolevulinic acid synthetase induction · anxiety · appetite increased · breast atrophy · carpal tunnel syndrome · clitoris enlarged · contact lens intolerance · cutaneous lupus erythematosus · depressed mood · dizziness · embolism and thrombosis · emotional lability · eosinophilia · epigastric pain · epilepsy

exacerbated · face oedema · fatigue · fever · fluid retention · flushing · glucose tolerance impaired · haematuria · headaches · hepatic disorders · hirsutism · hypertension · idiopathic intracranial hypertension · insulin resistance · joint disorders · leucopenia · libido disorder · menstrual cycle irregularities · muscle contractions involuntary · muscle cramps · myocardial infarction · nausea · neoplasms · pain · palpitations · pancreatitis · photosensitivity reaction · polycythaemia · respiratory disorders · seborrhoea · skin reactions · speech pitch disorder · spermatogenesis reduced · splenic peliosis · tachycardia · throat pain · thrombocytopenia · tremor · vertigo · vision disorders · voice alteration · vulvovaginal disorders · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Withdraw if virilisation effects occur—may be irreversible on continued use.

- **CONCEPTION AND CONTRACEPTION** Ensure patients with amenorrhoea are not pregnant. Non-hormonal contraceptive methods should be used, if appropriate.
- **PREGNANCY** Avoid; has weak androgenic effects and virilisation of female fetus reported.
- **BREAST FEEDING** No data available but avoid because of possible androgenic effects in infant.
- **HEPATIC IMPAIRMENT** Caution in hepatic impairment (avoid if severe).
- **RENAL IMPAIRMENT** Caution in renal impairment (avoid if severe).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

▶ **Danazol (Non-proprietary)**

Danazol 100 mg Danazol 100mg capsules | 28 capsule [PoM] £76.4-£18.40 [CD4-2]

Danazol 200 mg Danazol 200mg capsules | 56 capsule [PoM] £30.27-£66.20 [CD4-2]

▶ **Danol** (Sanofi)

Danazol 100 mg Danol 100mg capsules | 60 capsule [PoM] £16.38 DT = £16.38 [CD4-2]

Danazol 200 mg Danol 200mg capsules | 60 capsule [PoM] £32.43 DT = £32.43 [CD4-2]

7 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide p. 726 (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, follicle-stimulating hormone alone (as in

folliotropin), or chorionic gonadotrophin p. 727, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 750, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 731, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 727 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. **Gonadorelin analogues** are indicated in endometriosis and infertility and in breast and prostate cancer.

7.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

● INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 250 micrograms for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- ▶ Adult: 1 mg for 1 dose

Alternative to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- ▶ Adult: Initially 1 mg daily, alternatively initially 1 mg every 12 hours, (in acute cases), then reduced to 1 mg every 2–3 days, followed by 1 mg once weekly, alternatively 500 micrograms every 2–3 days

- **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure
- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Risk of anaphylaxis Should only be administered under medical supervision. Consult product literature.
 - ▶ Hypertension Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
 - ▶ Diabetes mellitus Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **SIDE-EFFECTS** Abdominal distension · abscess · adrenocortical unresponsiveness · angioedema · appetite increased · bone fractures · congestive heart failure · Cushing's syndrome · diabetes mellitus exacerbated · dizziness · dyspnoea · electrolyte imbalance · exophthalmos · fluid retention · flushing · gastrointestinal disorders · glaucoma · growth retardation · haemorrhage · headache · healing impaired · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity (may be more severe in patients susceptible to allergies, especially asthma) · hypertension · idiopathic intracranial hypertension exacerbated · increased risk of infection · leucocytosis · malaise · menstruation irregular · muscle weakness · myopathy · nausea · osteonecrosis · osteoporosis · pancreatitis · papilloedema · pituitary unresponsiveness · posterior subcapsular cataract · protein catabolism · psychiatric disorder · seizure · skin reactions · tendon rupture · thromboembolism · vasculitis necrotising · vertigo · vomiting · weight increased
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. **Monitoring** Monitor hepatic function closely during treatment.
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.

Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Synacthen** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [PoM] £38.00

Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Synacthen Depot** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [PoM] £346.28

7.2 Assessment of pituitary function

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES

Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

INDICATIONS AND DOSE

Assessment of pituitary function

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 100 micrograms for 1 dose

CAUTIONS Pituitary adenoma

SIDE-EFFECTS

- ▶ **Uncommon** Pain · skin reactions · swelling
- ▶ **Rare or very rare** Abdominal discomfort · bronchospasm · dizziness · eye erythema · flushing · headache · nausea · tachycardia
- ▶ **Frequency not known** Menorrhagia · sepsis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Gonadorelin (Non-proprietary)**
Gonadorelin (as Gonadorelin hydrochloride)
100 microgram Gonadorelin 100microgram powder and solvent for solution for injection vials | 1 vial [PoM] £75.00 (Hospital only)

7.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Choriogonadotropin alfa

(Human chorionic gonadotropin)

INDICATIONS AND DOSE

Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Active thromboembolic disorders · ectopic pregnancy in previous 3 months · hypothalamus malignancy · mammary malignancy · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · ovarian malignancy · pituitary malignancy · uterine malignancy

- **CAUTIONS** Acute porphyrias p. 1025

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · fatigue · headache · nausea · ovarian hyperstimulation syndrome · vomiting
- ▶ **Uncommon** Breast pain · depression · diarrhoea · irritability · restlessness
- ▶ **Rare or very rare** Rash · shock · thromboembolism

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Ovitrelle** (Merck Serono Ltd)
Choriogonadotropin alfa 500 microgram per 1 ml Ovitrelle 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £31.38 [CD4-2]
Ovitrelle 250micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £31.38 [CD4-2]

Chorionic gonadotrophin

(Human chorionic gonadotropin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

INDICATIONS AND DOSE

Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Androgen-dependent tumours

- **CAUTIONS** Asthma · cardiac impairment · epilepsy · migraine

- **SIDE-EFFECTS** Fatigue · fever · fluid retention · gynaecomastia · headache · hypersensitivity · mood altered · oedema · ovarian hyperstimulation syndrome · skin reactions · sodium retention

- **RENAL IMPAIRMENT** Use with caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Pregnyl** (Merck Sharp & Dohme Ltd)
Chorionic gonadotrophin human 1500 unit Pregnyl 1,500unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £2.12 [CD4-2]
Chorionic gonadotrophin human 5000 unit Pregnyl 5,000unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £3.15 [CD4-2]

Corifollitropin alfa

INDICATIONS AND DOSE

Controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 60 kg): 100 micrograms
- ▶ Adult (body-weight 60 kg and above): 150 micrograms

- **CONTRA-INDICATIONS** History of ovarian hyperstimulation syndrome · ovarian enlargement or cyst · polycystic ovarian syndrome · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause
- **CAUTIONS** Acute porphyrias p. 1025 · risk factors for thromboembolism · risk of ovarian hyperstimulation syndrome
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Breast abnormalities · fatigue · headache · nausea · ovarian and fallopian tube disorders · pelvic disorders
 - ▶ **Uncommon** Abdominal distension · back pain · constipation · diarrhoea · dizziness · hot flush · mood altered · premature ovulation · uterine pain · vomiting
 - ▶ **Frequency not known** Rash
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Avoid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Elonva** (Merck Sharp & Dohme Ltd)
Corifollitropin alfa 200 microgram per 1 ml Elonva
 100micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £638.00
Corifollitropin alfa 300 microgram per 1 ml Elonva
 150micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £638.00

Follitropin alfa

(Recombinant human follicle stimulating hormone)

INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

Hypogonadotrophic hypogonadism

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause
- **CAUTIONS** Acute porphyrias p. 1025 · history of tubal disease
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · diarrhoea · gastrointestinal discomfort · gynaecomastia · headache · nausea · ovarian and fallopian tube disorders · varicocele · vomiting · weight increased
 - ▶ **Rare or very rare** Asthma exacerbated · thromboembolism
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Follitropin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

PATIENT AND CARER ADVICE

Conception and contraception Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Puregon 300units/0.36ml solution for injection cartridges | 1 cartridge [PoM] £97.41

Follitropin delta

06-Sep-2017

- **DRUG ACTION** Follitropin delta is a recombinant human follicle stimulating hormone, which causes development of multiple mature follicles.

● INDICATIONS AND DOSE

Superovulation treatment for assisted conception (such as in vitro fertilisation) (initiated under specialist supervision)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Initial dosing based on serum anti-Müllerian hormone concentration and body-weight—consult product literature.

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 1025 · history of tubal disease (increased risk of ectopic pregnancy)

● SIDE-EFFECTS

- ▶ **Common or very common** Fatigue · headache · nausea · ovarian and fallopian tube disorders · pelvic disorders · uterine pain
- ▶ **Uncommon** Abdominal discomfort · breast abnormalities · constipation · diarrhoea · dizziness · drowsiness · mood swings · vaginal haemorrhage · vomiting
- ▶ **Rare or very rare** Thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION If ovarian hyperstimulation syndrome occurs, the patient should be advised to withhold hCG and avoid intercourse or use barrier contraceptive methods for at least 4 days.

- **PREGNANCY** Manufacturer advises avoid—not indicated during pregnancy.

- **BREAST FEEDING** Manufacturer advises avoid—not indicated during breastfeeding.

- **MONITORING REQUIREMENTS** Manufacturer advises regular monitoring of ovarian response with ultrasound alone, or in combination with serum estradiol levels. Frequent monitoring of follicular development is required to reduce the risk of ovarian hyperstimulation syndrome during treatment, and for at least 2 weeks after triggering of final follicular maturation—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer recommends the cartridge should be used with the *Rekovelle*® injection pen. The first injection should be performed under direct medical supervision; self-administration should only be performed by patients who are well motivated, adequately trained and have access to expert advice.

- **PRESCRIBING AND DISPENSING INFORMATION** Follitropin delta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator.

● PATIENT AND CARER ADVICE

Conception and contraception Manufacturer advises that patients planning to conceive should be warned that there is a risk of multiple pregnancy.

Menotrophin

• INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult (female): Adjusted according to response.

Hypogonadotrophic hypogonadism

- BY DEEP INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 1025 · history of tubal disease

• SIDE-EFFECTS

- **Common or very common** Gastrointestinal discomfort · headache · nausea · ovarian hyperstimulation syndrome · pelvic pain · vomiting
- **Uncommon** Deep vein thrombosis

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

• PRESCRIBING AND DISPENSING INFORMATION

Menotrophin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1

• PATIENT AND CARER ADVICE

Conception and contraception Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► **Menopur** (Ferring Pharmaceuticals Ltd)

Menotrophin 75 unit Menopur 75unit powder and solvent for solution for injection vials | 1 vial [PoM] £18.02 | 10 vial [PoM] £180.18

Menotrophin 150 unit Menopur 150unit powder and solvent for solution for injection vials | 10 vial [PoM] £360.36

Menotrophin 600 unit Menopur 600unit powder and solvent for solution for injection vials | 1 vial [PoM] £144.14

Menotrophin 1200 unit Menopur 1,200unit powder and solvent for solution for injection vials | 1 vial [PoM] £288.29

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GROWTH HORMONE RECEPTOR ANTAGONISTS

Pegvisomant

19-Dec-2017

- **DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

● INDICATIONS AND DOSE

Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) • liver disease

● SIDE-EFFECTS

- **Common or very common** Arthralgia • arthritis • asthenia • constipation • diarrhoea • dizziness • drowsiness • dyslipidaemia • dyspnoea • eye pain • fever • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • headaches • hyperglycaemia • hypertension • hypoglycaemia • influenza like illness • lipohypertrophy • myalgia • nausea • numbness • oedema • skin reactions • sleep disorders • sweat changes • tremor • vomiting • weight increased
 - **Uncommon** Apathy • confusion • dry mouth • eye strain • feeling abnormal • healing impaired • hunger • leucocytosis • leucopenia • libido increased • memory loss • Meniere's disease • oral disorders • panic attack • polyuria • proteinuria • renal impairment • taste altered • thrombocytopenia
 - **Frequency not known** Anger • angioedema • laryngospasm
- SIDE-EFFECTS, FURTHER INFORMATION** Rotate injection sites to avoid lipohypertrophy.

- **CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2017) that pegvisomant (*Somavert*®) is accepted for use within NHS Scotland for the treatment of patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise IGF-1 [insulin-like growth factor 1] concentrations or was not tolerated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (November 2017) that pegvisomant (*Somavert*®) is recommended as an option for use within NHS Wales for the treatment of patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise insulin-like growth factor-1 (IGF-1) concentrations or was not tolerated. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Somavert (Pfizer Ltd)

Pegvisomant 10 mg Somavert 10mg powder and solvent for solution for injection vials | 30 vial [PoM] £1,500.00 (Hospital only)

Pegvisomant 15 mg Somavert 15mg powder and solvent for solution for injection vials | 30 vial [PoM] £2,250.00 (Hospital only)

Pegvisomant 20 mg Somavert 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £100.00 (Hospital only) | 30 vial [PoM] £3,000.00 (Hospital only)

Pegvisomant 25 mg Somavert 25mg powder and solvent for solution for injection vials | 30 vial [PoM] £3,750.00 (Hospital only)

Pegvisomant 30 mg Somavert 30mg powder and solvent for solution for injection vials | 30 vial [PoM] £4,500.00 (Hospital only)

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatropin

(Recombinant Human Growth Hormone)

● INDICATIONS AND DOSE

Gonadal dysgenesis (Turner syndrome)

► BY SUBCUTANEOUS INJECTION

- **Adult:** 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

Deficiency of growth hormone

► BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

DOSE EQUIVALENCE AND CONVERSION

- Dose formerly expressed in units; somatropin 1 mg ≡ 3 units.

- **CONTRA-INDICATIONS** Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) • not to be used after renal

transplantation · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome

- **INTERACTIONS** → Appendix 1: somatotropin

● SIDE-EFFECTS

- ▶ **Common or very common** Carpal tunnel syndrome · fluid retention · headache · joint disorders · lipatrophy · myalgia · paraesthesia
- ▶ **Uncommon** Gynaecomastia · idiopathic intracranial hypertension
- ▶ **Rare or very rare** Hyperglycaemia · hyperinsulinism · hypothyroidism · osteonecrosis of femur · pancreatitis · slipped capital femoral epiphysis
- ▶ **Frequency not known** Leukaemia · musculoskeletal stiffness · oedema

SIDE-EFFECTS, FURTHER INFORMATION Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.

- **BREAST FEEDING** No information available. Absorption from milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipatrophy.

10 mg vial for use with *Zomafet Vision X®* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION For use with *one.click®* autoinjector device or *cool.click®* needle-free autoinjector device or *easypod®* autoinjector device (non-NHS but available free of charge from clinics).

GENOTROPIN® PREPARATIONS Cartridges are for use with *Genotropin®* Pen device (non-NHS but available free of charge from clinics).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Somatropin for the treatment of growth failure in children (May 2010) NICE TA188**

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

- ▶ **Somatropin for adults with growth hormone deficiency (August 2003) NICE TA64**

Somatropin is recommended in adults **only** if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved.

Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient's physician consider it appropriate.

Treatment with somatotropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

8 Sex hormone responsive conditions

Endometriosis

19-Sep-2017

Description of condition

Endometriosis is the growth of endometrial-like tissue outside the uterus. Endometriosis is a condition affecting women mainly of reproductive age and, although its exact cause is unknown, it is an oestrogen-dependent condition and is associated with menstruation. Endometriosis is typically associated with symptoms such as pelvic pain, painful periods and subfertility. Women with endometriosis report pain, which can be frequent, chronic and severe, as well as tiredness, more sick days, and a significant physical, sexual, psychological and social impact. Endometriosis is an important cause of subfertility and this can also have a significant effect on quality of life.

Women may also have endometriosis without symptoms, so it is difficult to know how common the disease is in the population. It is also unclear whether endometriosis is always progressive or can remain stable or improve with time.

Aims of treatment

The aim of treatment is to reduce the severity of symptoms, improve the quality of life, and to improve fertility if this is affected.

Drug treatment

Management options for endometriosis include drug treatment and surgery. Most drug treatments for endometriosis work by suppressing ovarian function and are contraceptive. Surgical treatment aims to remove or destroy endometriotic lesions. The choice of treatment depends on the woman's preferences and priorities in terms of pain management and fertility.

[EvGr] A short trial (such as 3 months) of paracetamol or an NSAID alone or in combination should be considered for first-line management of endometriosis-related pain. If pain relief is inadequate, consider other forms of pain management and referral for further assessment.

Hormonal treatment (with a combined oral contraceptive or a progestogen) should be offered to women with suspected, confirmed or recurrent endometriosis. The patient should be informed that hormonal treatment for endometriosis can reduce pain and has no permanent

negative effect on subsequent fertility. If initial hormonal treatment for endometriosis is not effective, not tolerated or is contra-indicated, the woman should be referred to a gynaecologist or specialist endometriosis service for possible further treatment, which could include other hormonal treatments or surgery. [A](#) For use of drugs to treat neuropathic pain, see Neuropathic pain.

Surgery

[EvGr](#) Women with suspected or confirmed endometriosis should be asked about their symptoms, preferences and priorities with respect to pain and fertility, to guide surgical decision-making. For deep endometriosis involving the bowel, bladder or ureter, gonadotropin-releasing hormones given for 3 months before surgery should be considered. Excision rather than ablation should be considered to treat endometriomas, taking into account the woman's desire for fertility and her ovarian reserve. After laparoscopic excision or ablation of endometriosis, consider hormonal treatment (with, for example, a combined hormonal contraceptive), to prolong the benefits of surgery and manage symptoms.

A hysterectomy may be indicated if, for example, the woman has adenomyosis or heavy menstrual bleeding that has not responded to other treatments. [A](#)

Surgical management if fertility is a priority

[EvGr](#) If fertility is a priority, the management of endometriosis-related subfertility should have multidisciplinary involvement with input from a fertility specialist. Women with endometriosis who are trying to conceive should not be offered hormonal treatment, because it does not improve spontaneous pregnancy rates. [A](#)

Sex hormones

Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity *natural oestrogens* (estradiol p. 738 (oestradiol), estrone (oestron), and estril p. 813 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol p. 742 (ethinyl-oestradiol) and mestranol). Tibolone p. 743 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal

atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 144 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of breast cancer

It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

HRT Risks

Risk	Age range (years)	Background incidence per 1000 women in Europe not using HRT		Additional cases per 1000 women using oestrogen only HRT (estimated)		Additional cases per 1000 women using combined (oestrogen-progesterone) HRT (estimated)	
		Over 5 years	Over 10 years	For 5 years' use	For 10 years' use	For 5 years' use	For 10 years' use
Breast cancer ¹	50-59	10	20	2	6	6	24
	60-69	15	30	3	9	9	36
Endometrial cancer ^{2,3}	50-59	2	4	4	32	NS	NS
	60-69	3	6	6	48	NS	NS
Ovarian cancer	50-59	2	4	<1	1	<1	1
	60-69	3	6	<1	2	<1	2
Venous thromboembolism ^{4,5}	50-59	5	—	2	—	7	—
	60-69	8	—	2	—	10	—
Stroke ⁶	50-59	4	—	1	—	1	—
	60-69	9	—	3	—	3	—
Coronary heart disease ^{7,8}	70-79	29-44	—	NS	—	15	—

Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference. Taken from MHRA/CHM (*Drug Safety* 2007; 1 (2): 2-6) available at www.gov.uk/drug-safety-update

- 1 Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
- 2 Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
- 3 The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progesterone for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progesterone eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
- 4 Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
- 5 Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
- 6 Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
- 7 Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
- 8 There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

Risk of coronary heart disease

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Choice

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progesterone for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progesterone (or one which provides both oestrogenic and progesterogenic activity in a single preparation). Continuous combined preparations or tibolone are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis,

endometrial foci may remain despite hysterectomy and the addition of a progesterone should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

Surgery

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT

Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness,

- motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment

Ethinylestradiol

Ethinylestradiol p. 742 (ethinylloestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

Raloxifene

Raloxifene hydrochloride below is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Progestogens and progesterone receptor modulators

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 791) and testosterone analogues (norethisterone p. 747 and norgestrel). The newer progestogens (desogestrel p. 786, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 787 is the active isomer of norgestrel and has twice its potency. Progesterone p. 748 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 725 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid p. 110 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 1111; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are **not** recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 121 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy

In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

Oral contraception

Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.

Cancer

Progestogens also have a role in neoplastic disease.

Progesterone receptor modulators

Ulipristal acetate p. 785 is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive.

Heavy menstrual bleeding

EvG Ulipristal acetate (up to four courses) is recommended in patients with heavy menstrual bleeding associated with uterine fibroids of a diameter of 3 cm or more, and a haemoglobin level of 102 g/litre or below; ulipristal acetate may also be considered if the haemoglobin level is greater than 102 g/litre.

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Raloxifene hydrochloride

28-Sep-2017

• INDICATIONS AND DOSE

Treatment and prevention of postmenopausal osteoporosis

- BY MOUTH
- Adult: 60 mg once daily

Breast cancer [chemoprevention in postmenopausal women at moderate to high risk] (initiated under specialist supervision)

- BY MOUTH
- Adult: 60 mg once daily for 5 years

- **UNLICENSED USE** Not licensed for chemoprevention of breast cancer in the UK. Licensed for this indication in USA.
- **CONTRA-INDICATIONS** Cholestasis · endometrial cancer · history of venous thromboembolism · undiagnosed uterine bleeding
- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · breast cancer (manufacturer advises avoid during treatment for breast cancer) · history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) · risk factors for stroke · risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
- **INTERACTIONS** → Appendix 1: raloxifene
- **SIDE-EFFECTS**
 - **Common or very common** Influenza · leg cramps · peripheral oedema · vasodilation
 - **Uncommon** Embolism and thrombosis
 - **Rare or very rare** Breast abnormalities · gastrointestinal discomfort · gastrointestinal disorder · headaches · nausea · rash · thrombocytopenia · vomiting
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Raloxifene for the primary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018)** NICE TA160

Raloxifene is **not** recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women.

Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta160

- ▶ **Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018)** NICE TA161

Raloxifene is recommended as an alternative treatment option for the secondary prevention of osteoporotic fragility fractures in postmenopausal women:

- who are unable to comply with the special instructions for the administration of alendronate and risendronate, or have a contra-indication to or are intolerant of alendronate and risendronate, **and**
- have a combination of T-score, age and number of independent clinical risk factors for fracture, as indicated in the full NICE guidance.

Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta161

● MEDICINAL FORMS

Raloxifene hydrochloride 60 mg Razylan 60mg tablets | 28 tablet [PoM] £17.06 DT = £3.42

OESTROGENS

Conjugated oestrogens (equine)

10-May-2018

● INDICATIONS AND DOSE

PREMARIN® TABLETS

Menopausal symptoms

▶ BY MOUTH

- ▶ Adult: 0.3–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Postmenopausal osteoporosis prophylaxis

▶ BY MOUTH

- ▶ Adult: 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndromes (or monitor

closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndromes (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 1025 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules (closely monitor breast status—risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease (closely monitor breast status—risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease reported · migraine · migraine-like headaches · presence of antiphospholipid antibodies (increased risk of thrombotic events) · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of breast cancer

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of breast cancer It is estimated that using *all* types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- ▶ Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma,

otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · arthralgia · breast abnormalities · depression · leg cramps · menstrual cycle irregularities · vaginal discharge · weight changes
 - ▶ **Uncommon** Anxiety · cervical abnormalities · contact lens intolerance · dizziness · embolism and thrombosis · gallbladder disorder · gastrointestinal discomfort · headaches · hirsutism · libido disorder · mood altered · nausea · oedema · skin reactions · vulvovaginal candidiasis
 - ▶ **Rare or very rare** Angioedema · asthma exacerbated · cerebrovascular insufficiency · chorea exacerbated · colitis ischaemic · epilepsy exacerbated · galactorrhoea · glucose tolerance impaired · hypocalcaemia · jaundice cholestatic · myocardial infarction · neoplasms · pancreatitis · pelvic pain · vomiting
 - ▶ **Frequency not known** Endometrial hyperplasia · erythema nodosum

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- **PREGNANCY** Manufacturer advises avoid—not indicated during pregnancy.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

Estradiol

● INDICATIONS AND DOSE

BEDOL[®]

Menopausal symptoms | Osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

CLIMAVAL[®]

Menopausal symptoms (if patient has had a hysterectomy)

- ▶ BY MOUTH
- ▶ Adult: 1–2 mg daily

ELLESTE SOLO[®] MX

Menopausal symptoms

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 40, subsequently adjust according to response

Osteoporosis prophylaxis

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each

cycle in women with a uterus, initiate therapy with *MX* 80, subsequently adjust according to response

ELLESTE-SOLO® 1-MG

Menopausal symptoms

► BY MOUTH

- Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ELLESTE-SOLO® 2-MG

Menopausal symptoms not controlled with lower strength | Osteoporosis prophylaxis

► BY MOUTH

- Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ESTRADERM MX®

Menopausal symptoms

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX*25 for first 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX*50; subsequently adjust according to response

ESTRADOT®

Menopausal symptoms

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 25 patch for 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 50 patch; subsequently adjust according to response

EVOREL®

Menopausal symptoms | Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with *Evorel* 50 patch; subsequently adjust according to response; dose may be reduced to *Evorel* 25 patch after first month if necessary for menopausal symptoms only

FEMSEVEN®

Menopausal symptoms | Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *FemSeven* 50 patches for the first few months, subsequently adjust according to response

OESTROGEL®

Menopausal symptoms

► TO THE SKIN

- Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

Osteoporosis prophylaxis

► TO THE SKIN

- Adult: Apply 1.5 mg once daily continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

DOSE EQUIVALENCE AND CONVERSION

- For *Oestrogel*®: 2 measures is equivalent to estradiol 1.5 mg.

PROGYNova®

Menopausal symptoms

► BY MOUTH

- Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

► BY MOUTH

- Adult: 2 mg daily continuously, to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

PROGYNova® TS

Menopausal symptoms | Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *Progynova TS* 50, subsequently adjust according to response, women receiving *Progynova TS* 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

SANDRENA®

Menopausal symptoms

► TO THE SKIN

- Adult: Apply 1 mg once daily, to be applied over area 1–2 times size of hand; with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

ZUMENON®

Menopausal symptoms

► BY MOUTH

- Adult: Initially 1 mg daily, to be started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), increased if necessary to 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

► BY MOUTH

- Adult: 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndrome (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 1025 · diabetes (increased risk of heart disease) · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia; factors predisposing to thromboembolism · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of breast cancer It is estimated that using *all* types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In *women who have predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause,

studies suggest a lower relative risk compared with older women.

- ▶ Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Headaches · nausea · skin reactions
- ▶ **Uncommon** Hypertension
- ▶ **SPECIFIC SIDE-EFFECTS**
- ▶ **Common or very common**
- ▶ With oral use Asthenia · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · menstrual cycle irregularities · muscle complaints · pelvic pain · weight changes
- ▶ With transdermal use Abdominal pain · breast abnormalities · menstrual cycle irregularities · uterine disorders · vaginal discharge · weight changes

▶ **Uncommon**

- ▶ With oral use Anxiety · back pain · breast abnormalities · cervical abnormalities · cystitis-like symptom · depression · dizziness · embolism and thrombosis · erythema nodosum · gallbladder disorder · oedema · palpitations · peripheral vascular disease · tumour growth · visual impairment · vulvovaginal candidiasis
- ▶ With transdermal use Asthenia · breast neoplasm benign · depression · flatulence · increased risk of infection · leiomyoma · mood swings · venous thromboembolism · vertigo · vomiting

▶ **Rare or very rare**

- ▶ With oral use Angioedema · cerebrovascular insufficiency · chorea · contact lens intolerance · haemolytic anaemia · hepatic disorders · hirsutism · malaise · myocardial infarction · sexual dysfunction · steepening of corneal curvature · vaginal discharge · vomiting
- ▶ With transdermal use Epilepsy exacerbated · galactorrhoea · glucose tolerance impaired · libido disorder
- ▶ **Frequency not known**
- ▶ With oral use Carbohydrate metabolism change · epilepsy exacerbated · hypertriglyceridaemia · increased risk of coronary artery disease · neoplasms · pancreatitis · systemic lupus erythematosus (SLE)

SIDE-EFFECTS, FURTHER INFORMATION

Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary.

Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

- **PREGNANCY** Not known to be harmful.
 - **BREAST FEEDING** Avoid; adverse effects on lactation.
 - **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
 - **MONITORING REQUIREMENTS**
 - ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
 - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.
 - **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With transdermal use Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under armpits. If patch falls off in bath allow skin to cool before applying new patch.
 - **PATIENT AND CARER ADVICE**
 - ▶ With transdermal use Patient counselling is advised for estradiol patches (administration).
 - ▶ With topical use Patient counselling is advised for estradiol gels (administration).
- OESTROGEL®** Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.
- SANDRENA®** Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

Gel

EXCIPIENTS: May contain Propylene glycol

- ▶ **Oestrogel** (Besins Healthcare (UK) Ltd)
Estradiol 600 microgram per 1 gram Oestrogel Pump-Pack 0.06% gel | 80 gram [PoM] £4.80 DT = £4.80
- ▶ **Sandrena** (Orion Pharma (UK) Ltd)
Estradiol (as Estradiol hemihydrate) 500 microgram Sandrena 500microgram gel sachets | 28 sachet [PoM] £5.08 DT = £5.08
Estradiol (as Estradiol hemihydrate) 1 mg Sandrena 1mg gel sachets | 28 sachet [PoM] £5.85 DT = £5.85 | 91 sachet [PoM] £17.57

Combinations available: *Estradiol with drospirenone*, p. 744 • *Estradiol with dydrogesterone*, p. 744 • *Estradiol with levonorgestrel*, p. 745 • *Estradiol with medroxyprogesterone*, p. 745 • *Estradiol with norethisterone*, p. 745 • *Estradiol with norgestrel*, p. 747

Estradiol with estriol and estrone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 738, estriol p. 813.

● INDICATIONS AND DOSE

Menopausal symptoms | Osteoporosis prophylaxis

- ▶ **BY MOUTH**
- ▶ **Adult:** 1–2 tablets daily continuously or cyclically (21 days out of 28), started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

MEDICINAL FORMS

No licensed medicines listed.

Ethinylestradiol

(Ethinylloestradiol)

INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency | Osteoporosis prophylaxis if other drugs cannot be used

BY MOUTH

- Adult (female): 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progesterone for 12–14 days per cycle in women with intact uterus.

Female hypogonadism

BY MOUTH

- Adult (female): 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progesterone therapy.

Menstrual disorders

BY MOUTH

- Adult (female): 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progesterone, added either throughout the cycle or from day 15 to 25.

Palliative treatment of prostate cancer

BY MOUTH

- Adult (male): 0.15–1.5 mg daily.

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Acute porphyrias p. 1025 · Dubin-Johnson and Rotor syndromes (or monitor closely) · gallstones · heart disease associated with pulmonary hypertension · heart disease associated with risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer · history of haemolytic uraemic syndrome · liver disease (where liver function tests have failed to return to normal) · migraine with aura · oestrogen-dependent cancer · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · thrombophilic disorder · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · cardiovascular disease (sodium retention with oedema, thromboembolism) · Crohn's disease · diabetes (increased risk of heart disease) · gene mutations associated with breast cancer (e.g. BRCA 1) · history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of severe depression (especially if induced by hormonal contraceptive) · hyperprolactinaemia (seek specialist advice) · hypophyseal tumours · increased risk of gall-bladder disease · inflammatory bowel disease · migraine (migraine-like headaches) · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed

oestrogens may increase risk of developing endometrial cancer · risk factors for arterial disease · risk factors for migraine · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- Risk of venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - *obesity*—body mass index $\geq 30 \text{ kg/m}^2$ (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - *history of superficial thrombophlebitis*;
 - *age over 35 years* (avoid if over 50 years);
 - *smoking*.
- Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:
 - *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
 - *diabetes mellitus* (avoid if diabetes complications present);
 - *hypertension*—blood pressure above *systolic* 140 mmHg or *diastolic* 90 mmHg (avoid if blood pressure above *systolic* 160 mmHg or *diastolic* 95 mmHg); (In adolescents, avoid if blood pressure very high);
 - *smoking* (avoid if smoking 40 or more cigarettes daily);
 - *age over 35 years* (avoid if over 50 years);
 - *obesity* (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).
- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS** Breast abnormalities · cervical mucus increased · cholelithiasis · contact lens intolerance · depression · electrolyte imbalance · embolism and thrombosis · erythema nodosum · feminisation · fluid retention · headaches · hypertension · jaundice cholestatic · metrorrhagia · mood altered · myocardial infarction · nausea · neoplasms · skin reactions · stroke · uterine disorders · vomiting · weight change

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progesterone is taken for 12–14 days of each

28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

► Ethinylestradiol (Non-proprietary)

Ethinylestradiol 2 microgram Ethinylestradiol 2microgram tablets | 100 tablet [PoM] £200.00

Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet [PoM] £200.00 DT = £200.00

Ethinylestradiol 50 microgram Ethinylestradiol 50microgram tablets | 21 tablet [PoM] £200.00 DT = £200.00

Tibolone

● INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) | Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

- BY MOUTH
- Adult: 2.5 mg daily

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Acute porphyrias p. 1025 · Dubin-Johnson and Rotor syndrome (or monitor closely) · history of breast cancer · history of cardiovascular disease · history of cerebrovascular disease · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · history of thromboembolism · history of thrombophlebitis · hormone-dependent tumours · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · uninvestigated or undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism
- **CAUTIONS** Diabetes (increased risk of heart disease) · epilepsy · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of liver disease · hypertriglyceridaemia · hypophyseal tumours · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of stroke
- **CAUTIONS, FURTHER INFORMATION**
 - Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid

antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: tibolone
- **SIDE-EFFECTS**
 - **Common or very common** Breast abnormalities · cervical dysplasia · endometrial thickening · gastrointestinal discomfort · genital abnormalities · hair growth abnormal · increased risk of infection · pelvic pain · postmenopausal haemorrhage · vaginal discharge · vaginal haemorrhage · weight increased
 - **Uncommon** Oedema · skin reactions
 - **Frequency not known** Arthralgia · dementia · depression · dizziness · erythema nodosum · gallbladder disorder · headaches · increased risk of ischaemic stroke · myalgia · neoplasms · vision disorders

SIDE-EFFECTS, FURTHER INFORMATION

Vaginal bleeding Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

Reasons to withdraw treatment Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- **PREGNANCY** Avoid; toxicity in *animal* studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal.
- **RENAL IMPAIRMENT**

Monitoring Patients with renal impairment should be closely monitored (risk of fluid retention).
- **PRESCRIBING AND DISPENSING INFORMATION** Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive.

Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding).

If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

● MEDICINAL FORMS

FEMSEVEN CONTI®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch once weekly continuously

FEMSEVEN SEQUI®

Menopausal symptoms in women with a uterus

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch once weekly for 2 weeks, phase 1 patches to be applied, then apply 1 patch once weekly for 2 weeks, phase 2 patches to be applied, subsequent courses are repeated without interval

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **PATIENT AND CARER ADVICE** Patient counselling is advised for estradiol with levonorgestrel patches (application).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

- ▶ **FemSeven Conti** (Teva UK Ltd)
Levonorgestrel 7 microgram per 24 hour, Estradiol 50 microgram per 24 hour FemSeven Conti patches | 4 patch [PoM] £15.48 | 12 patch [PoM] £44.12

- ▶ **FemSeven Sequi** (Teva UK Ltd)
FemSeven Sequi patches | 4 patch [PoM] £13.18 | 12 patch [PoM] £37.54

Estradiol with medroxyprogesterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 738, medroxyprogesterone acetate p. 791.

- **INDICATIONS AND DOSE**

INDIVINA® TABLETS

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 3 years previously |

Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 3 years previously

- ▶ BY MOUTH
- ▶ Adult: Initially 1/2.5 mg daily taken continuously, adjust according to response, to be started at end of scheduled bleed if changing from cyclical HRT

TRIDESTRA®

Menopausal symptoms in women with a uterus |

Osteoporosis prophylaxis in women with a uterus

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 70 days, white tablet to be taken, then 1 tablet daily for 14 days, blue tablet to be taken, then 1 tablet daily for 7 days, yellow tablet to be taken, subsequent courses are repeated without interval

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Indivina** (Orion Pharma (UK) Ltd)
Estradiol valerate 1 mg, Medroxyprogesterone acetate 2.5 mg Indivina 1mg/2.5mg tablets | 84 tablet [PoM] £20.58 DT = £20.58
Estradiol valerate 2 mg, Medroxyprogesterone acetate 5 mg Indivina 2mg/5mg tablets | 84 tablet [PoM] £20.58 DT = £20.58
Estradiol valerate 1 mg, Medroxyprogesterone acetate 5 mg Indivina 1mg/5mg tablets | 84 tablet [PoM] £20.58 DT = £20.58
- ▶ **Tridestra** (Orion Pharma (UK) Ltd)
Tridestra tablets | 91 tablet [PoM] £20.49

Estradiol with norethisterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 738, norethisterone p. 747.

- **INDICATIONS AND DOSE**

CLIMAGEST® 1-MG

Menopausal symptoms

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, grey tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, white tablet to be taken, subsequent courses are repeated without interval continued →

CLIMAGEST® 2-MG

Menopausal symptoms (if symptoms not controlled with lower strength)

► BY MOUTH

- Adult: 1 tablet daily for 16 days, blue tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, white tablet to be taken, subsequent courses are repeated without interval

CLIMESSE®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

► BY MOUTH

- Adult: 1 tablet daily continuously

CLINORETTE®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

► BY MOUTH

- Adult: 1 tablet daily for 16 days, white tablets to be taken, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, pink tablets to be taken, subsequent courses repeated without interval

ELLESTE-DUET® 1-MG

Menopausal symptoms

► BY MOUTH

- Adult: 1 tablet daily for 16 days, white tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, green tablets to be taken, subsequent courses are repeated without interval

ELLESTE-DUET® 2-MG

Menopausal symptoms | Osteoporosis prophylaxis

► BY MOUTH

- Adult: 1 tablet daily for 16 days, orange tablet to be taken, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, grey tablet to be taken, subsequent courses are repeated without interval

ELLESTE-DUET® CONTI

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

► BY MOUTH

- Adult: 1 tablet daily continuous basis, if changing from cyclical HRT begin treatment at the end of scheduled bleed

EVOREL® CONTI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously

EVOREL® SEQUI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly for 2 weeks, Evorel® 50 patch to be applied and started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), then apply 1 patch twice weekly, Evorel® Conti patch to be applied, subsequent courses are repeated without interval.

KLIOFEM®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

► BY MOUTH

- Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

KLIOVANCE®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

► BY MOUTH

- Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

NOVOFEM®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

► BY MOUTH

- Adult: 1 tablet daily for 16 days, red tablets to be taken, then 1 tablet daily for 12 days, white tablets to be taken, subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

NUVELLE® CONTINUOUS

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

► BY MOUTH

- Adult: 1 tablet daily continuously, if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

TRISEQUENS®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

► BY MOUTH

- Adult: 1 tablet daily for 12 days, blue tablets to be taken, followed by 1 tablet daily for 10 days, white tablet to be taken, then 1 tablet daily for 6 days, red tablet to be taken, subsequent courses are repeated without interval

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **PATIENT AND CARER ADVICE**

EVOREL® SEQUI Patients and carers should be advised on the application of Evorel® Sequi patches.

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 738.

● INDICATIONS AND DOSE**CYCLO-PROGYNOVA® 2MG TABLETS****Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 11 days, white tablet to be taken; start on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 10 days, brown tablet to be taken, followed by a 7-day tablet free interval

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

● SIDE-EFFECTS

- ▶ **Common or very common** Gastrointestinal discomfort · haemorrhage · headaches · menstrual cycle irregularities · nausea · skin reactions · weight changes
- ▶ **Uncommon** Breast abnormalities · depressed mood · dizziness · erythema nodosum · oedema · palpitations · visual impairment
- ▶ **Rare or very rare** Anxiety · contact lens intolerance · fatigue · hirsutism · muscle cramps · sexual dysfunction · vaginal discharge · vomiting
- ▶ **Frequency not known** Angioedema · dementia · gallbladder disorder · myocardial infarction · neoplasms · stroke · venous thromboembolism

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablets

- ▶ **Cyclo-Progynova** (Meda Pharmaceuticals Ltd)
Cyclo-Progynova 2mg tablets | 21 tablet [PoM] £3.11

PROGESTOGENS**Norethisterone****● INDICATIONS AND DOSE****Endometriosis**

- ▶ BY MOUTH
- ▶ Adult: 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

Dysfunctional uterine bleeding (to arrest bleeding) | Menorrhagia (to arrest bleeding)

- ▶ BY MOUTH
- ▶ Adult: 5 mg 3 times a day for 10 days

Dysfunctional uterine bleeding (to prevent bleeding) | Menorrhagia (to prevent bleeding)

- ▶ BY MOUTH
- ▶ Adult: 5 mg twice daily, to be taken from day 19 to day 26 of cycle

Dysmenorrhoea

- ▶ BY MOUTH
- ▶ Adult: 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

Premenstrual syndrome (but not recommended)

- ▶ BY MOUTH
- ▶ Adult: 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

Postponement of menstruation

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Breast cancer

- ▶ BY MOUTH
- ▶ Adult: 40 mg daily, increased if necessary to 60 mg daily

Short-term contraception

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

● CONTRA-INDICATIONS

- ▶ **GENERAL CONTRA-INDICATIONS** Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS

- ▶ With oral use Acute porphyrias p. 1025 · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS

- ▶ **GENERAL CAUTIONS** Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

- ▶ When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies

- With intramuscular use for contraception Disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

- Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

● INTERACTIONS → Appendix 1: norethisterone

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Menstrual cycle irregularities
- Uncommon Breast tenderness · depression
- Frequency not known Hepatic cancer · skin reactions · thromboembolism · weight change

SPECIFIC SIDE-EFFECTS

- Common or very common
 - With intramuscular use Dizziness · haemorrhage · headache · hypersensitivity · nausea
- Uncommon
 - With intramuscular use Abdominal distension
- Frequency not known
 - With oral use Appetite change · fatigue · gastrointestinal disorder · headaches · hypertension · libido disorder · nervousness

● PREGNANCY

- With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.

- BREAST FEEDING Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

- With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- HEPATIC IMPAIRMENT When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.

- RENAL IMPAIRMENT Use with caution in non-contraceptive indications.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the

menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

Missed oral contraceptive pill The following advice is recommended: If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Solution for injection

Progesterone

06-Jun-2017

● INDICATIONS AND DOSE

CRINONE[®] VAGINAL GEL

Infertility due to inadequate luteal phase

► BY VAGINA

- Adult: 1 applicatorful daily, to be started either after documented ovulation or on day 18–21 of cycle, in vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

CYCLOGEST[®] PESSARIES

Premenstrual syndrome | Post-natal depression

► BY VAGINA, OR BY RECTUM

- Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of

menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

GESTONE[®] SOLUTION FOR INJECTION

Dysfunctional uterine bleeding

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation, to be administered into buttocks

Recurrent miscarriage due to inadequate luteal phase (but not recommended) or following in vitro fertilisation or gamete intra-fallopian transfer

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy, to be administered into buttocks; maximum 200 mg per day

LUBION[®]

Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

LUTIGEST[®]

Luteal support as part of an Assisted Reproductive Technology (ART) treatment programme

► BY VAGINA

- Adult: 100 mg 3 times a day, to be started the day after oocyte retrieval, and continued for 30 days once pregnancy is confirmed

UTROGESTAN[®] CAPSULES

Progestogenic opposition of oestrogen HRT

► BY MOUTH

- Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

UTROGESTAN[®] VAGINAL CAPSULES

Supplementation of luteal phase during assisted reproductive technology (ART) cycles

► BY VAGINA

- Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 • avoid in patients with a history of liver tumours • breast cancer (unless progestogens are being used in the management of this condition) • genital cancer (unless progestogens are being used in the management of this condition) • history during pregnancy of idiopathic jaundice • history during pregnancy of pemphigoid gestationis • history during pregnancy of severe pruritus • history of thromboembolism • incomplete miscarriage • missed miscarriage • severe arterial disease • thrombophlebitis • undiagnosed vaginal bleeding

- **CAUTIONS** Asthma • cardiac dysfunction • conditions that may worsen with fluid retention • diabetes (progestogens can decrease glucose tolerance—monitor patient closely) • epilepsy • history of depression • hypertension • migraine • susceptibility to thromboembolism (particular caution with high dose)

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Drowsiness • menstrual cycle irregularities

SPECIFIC SIDE-EFFECTS

- **Common or very common**
 - With oral use Headache
 - With vaginal use Breast pain • gastrointestinal discomfort
- **Uncommon**
 - With oral use Breast pain • constipation • diarrhoea • dizziness • jaundice cholestatic • skin reactions • vomiting
- **Rare or very rare**
 - With oral use Depression • nausea
- **Frequency not known**
 - With intramuscular use Alopecia • breast changes • cervical abnormalities • depression • fever • hirsutism • insomnia • jaundice cholestatic • nausea • oedema • protein catabolism • skin reactions • weight increased
 - With rectal use Diarrhoea • flatulence
 - With vaginal use Leakage of the pessary base • vulvovaginal pain

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dublin-Johnson or Rotor Syndromes), infective hepatitis (until liver function returns to normal) and liver tumours.

- **RENAL IMPAIRMENT** Use with caution.

● DIRECTIONS FOR ADMINISTRATION

- With oral use Capsules should be taken at bedtime on an empty stomach.

● PATIENT AND CARER ADVICE

- With oral use Patient counselling is advised for progesterone capsules (administration).

● NATIONAL FUNDING/ACCESS DECISIONS

LUTIGEST[®]

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that progesterone (*Lutigest*[®]) is accepted for use within NHS Scotland for luteal support as part of an assisted reproductive technology (ART) treatment program for infertile women. This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

UTROGESTAN[®] VAGINAL CAPSULES

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2017) that micronised progesterone (*Utrogestan Vaginal*[®]) is accepted for use within NHS Scotland for supplementation of the luteal phase during Assisted Reproductive Technology cycles in women. This advice is contingent upon the continuing availability of the Patient Access Scheme in Scotland or a list price that is equivalent or lower.

- **LESS SUITABLE FOR PRESCRIBING** Progesterone pessaries are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Pessary

8.1a Anti-oestrogens

OVULATION STIMULANTS

Clomifene citrate

(Clomiphene citrate)

08-Feb-2018

- **DRUG ACTION** Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

● **INDICATIONS AND DOSE****Female infertility due to ovulatory dysfunction**► **BY MOUTH**

- **Adult (female):** 50 mg once daily for 5 days, to be started at any time if no recent uterine bleeding or on or around the fifth day of cycle if progesterogen-induced bleeding is planned or if spontaneous uterine bleeding occurs, then 100 mg once daily if required for 5 days, this second course to be given at least 30 days after the first course, only in the absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended (beyond a total of 6 cycles).

IMPORTANT SAFETY INFORMATION

The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer).

- **CONTRA-INDICATIONS** Abnormal uterine bleeding of undetermined cause · hormone-dependent tumours · ovarian cysts
- **CAUTIONS** Ectopic pregnancy · incidence of multiple births increased (consider ultrasound monitoring) · ovarian hyperstimulation syndrome · polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) · uterine fibroids
- **SIDE-EFFECTS** Abdominal distension · after images · alopecia · angioedema · anxiety · breast tenderness · cataract · cerebral thrombosis · depression · disorientation · dizziness · fatigue · headache · hot flush · hypertriglyceridaemia · insomnia · jaundice cholestatic · menstrual cycle irregularities · mood altered · nausea · neoplasms · nervous system disorders · optic neuritis · ovarian and fallopian tube disorders · palpitations · pancreatitis · paraesthesia · psychosis · seizure · skin reactions · speech disorder · stroke · syncope · tachycardia · uterine disorders · vertigo · vision disorders (discontinue and initiate ophthalmological examination) · vomiting

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Possible effects on fetal development.
- **BREAST FEEDING** May inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.
- **PATIENT AND CARER ADVICE**
Conception and contraception Patients planning to conceive should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet► **Clomifene citrate (Non-proprietary)**

Clomifene citrate 50 mg Clomifene 50mg tablets | 30 tablet [PoM] £10.15 DT = £10.15

► **Clomid** (Sanofi)

Clomifene citrate 50 mg Clomid 50mg tablets | 30 tablet [PoM] £10.15 DT = £10.15

8.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon*[®], which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

Anti-androgens**Cyproterone acetate**

Cyproterone acetate p. 753 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

Dutasteride and finasteride

Dutasteride p. 769 and finasteride p. 769 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 765 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some *aplastic anaemias*. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

ANDROGENS**Androgens**

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · elderly · epilepsy · hypertension · ischaemic heart disease · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **SIDE-EFFECTS**
 - **Common or very common** Headache · skin reactions
 - **Uncommon** Alopecia · gynaecomastia · nausea
 - **Frequency not known** Fluid retention · jaundice · sexual dysfunction
- SIDE-EFFECTS, FURTHER INFORMATION** Stop treatment or reduce dose if severe polycythaemia occurs.
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Caution—potential for fluid retention.
- **MONITORING REQUIREMENTS**
 - Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.
 - Monitor prostate and PSA in men over 45 years.
- **PATIENT AND CARER ADVICE** Androgenic effects in women Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

Testosterone

19-Apr-2018

● INDICATIONS AND DOSE**TESTIM[®]**

Hypogonadism due to testosterone deficiency in men

- **BY TRANSDERMAL APPLICATION**
- **Adult:** Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For **Testim[®]**: one tube of 5 g contains 50 mg testosterone.

TESTOGEL[®] 16.2MG/G

Hypogonadism due to androgen deficiency in men

- **BY TRANSDERMAL APPLICATION**
- **Adult:** Apply 40.5 mg once daily; increased in steps of 20.25 mg, adjusted according to response; maximum 81 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For **Testogel[®]** 16.2mg/g: one pump actuation delivers 1.25 g of gel containing 20.25 mg of testosterone.

TESTOGEL[®] 50MG/5G

Hypogonadism due to androgen deficiency in men

- **BY TRANSDERMAL APPLICATION**
- **Adult:** Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For **Testogel[®]** 50mg/5g: one sachet of 5 g contains 50 mg of testosterone.

TOSTRAN[®]

Hypogonadism due to testosterone deficiency in men

- **BY TRANSDERMAL APPLICATION**
- **Adult:** Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For **Tostran[®]**: 1 g of gel contains 20 mg testosterone.

- **CAUTIONS** Thrombophilia—increased risk of thrombosis
- **SIDE-EFFECTS**
 - **Common or very common** Hypertension
 - **Uncommon** Peripheral oedema · vasodilation
 - **Rare or very rare** Azoospermia
 - **Frequency not known** Anxiety · electrolyte imbalance · emotional lability · hirsutism · muscle cramps · paraesthesia · priapism · prostate abnormalities · prostate cancer · seborrhoea · weight increased
- **DIRECTIONS FOR ADMINISTRATION** Avoid skin contact with gel application sites to prevent testosterone transfer to

other people, especially pregnant women and children—consult product literature.

TESTIM® Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.

TESTOGEL® 16.2MG/G Apply thin layer of gel on clean, dry, healthy skin over right and left upper arms and shoulders. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, and cover the site with clothing once gel dried; avoid shower or bath for at least 2 hours.

TESTOGEL® 50MG/5G Apply thin layer of gel on clean, dry, healthy skin as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.

TOSTRAN® Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer testosterone gel.

Testosterone undecanoate 40 mg Restandol 40mg Testocaps | 30 capsule [PoM] £8.55 [CD4-2] | 60 capsule [PoM] £17.10 DT = £17.10 [CD4-2]

8.2a Male sex hormone antagonism

ANTI-ANDROGENS

Cyproterone acetate

● INDICATIONS AND DOSE

Hyper-sexuality in males | Sexual deviation in males

- **BY MOUTH**
- **Adult:** 50 mg twice daily, to be taken after food

Prevention of tumour flare with initial gonadorelin analogue therapy

- **BY MOUTH**
- **Adult (male):** 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred

- **BY MOUTH**
- **Adult (male):** 200–300 mg daily in 2–3 divided doses.

Hot flushes with gonadorelin analogue therapy or after orchidectomy

- **BY MOUTH**
- **Adult (male):** Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

- **CONTRA-INDICATIONS** In hypersexuality, Dubin-Johnson syndrome • in hypersexuality, history of thromboembolic disorders • in hypersexuality, liver-disease • in hypersexuality, malignant diseases • in hypersexuality, previous or existing liver tumours • in hypersexuality, Rotor syndrome • in hypersexuality, severe depression • in hypersexuality, severe diabetes (with vascular changes) • in hypersexuality, sickle-cell anaemia • in hypersexuality, wasting diseases • meningioma or history of meningioma

- **CAUTIONS** Diabetes mellitus • in prostate cancer, severe depression • in prostate cancer, sickle-cell anaemia • ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

● SIDE-EFFECTS

- **Common or very common** Depressed mood • dyspnoea • fatigue • gynaecomastia • hepatic disorders • hot flush • hyperhidrosis • nipple pain • restlessness • weight change
- **Uncommon** Skin reactions
- **Rare or very rare** Galactorrhoea • neoplasms
- **Frequency not known** Adrenocortical suppression • anaemia • azoospermia • hair changes • hypotrichosis • osteoporosis • sebaceous gland underactivity (may clear acne) • thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Avoid (unless used for prostate cancer)—dose-related toxicity.

● MONITORING REQUIREMENTS

- Monitor blood counts initially and throughout treatment.
- Monitor adrenocortical function regularly.
- Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► **Thyrogen** (Genzyme Therapeutics Ltd)

Thyrotropin alfa 900 microgram Thyrogen 900microgram powder for solution for injection vials | 2 vial [PoM] £583.04

primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium p. 756 daily, may be used in a *blocking-replacement regimen*; therapy is usually given for 18 months. The blocking-replacement regimen is **not** suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 149 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 148 is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 662 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Antithyroid drugs in pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 154

9.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole below is the most commonly used drug. Propylthiouracil p. 755 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

● INDICATIONS AND DOSE

Hyperthyroidism

► BY MOUTH

- Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

► BY MOUTH

- Adult: 40–60 mg daily, therapy usually given for 18 months

DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

- **CONTRA-INDICATIONS** Severe blood disorders

- **INTERACTIONS** → Appendix 1: carbimazole

• SIDE-EFFECTS

- **Rare or very rare** Bone marrow disorders · haemolytic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- **Frequency not known** Agranulocytosis · alopecia · angioedema · dyspepsia · eosinophilia · fever · gastrointestinal disorder · generalised lymphadenopathy · haemorrhage · headache · hepatic disorders · insulin autoimmune syndrome · leucopenia · malaise · myopathy · nausea · nerve disorders · neutropenia · salivary gland enlargement · skin reactions · taste loss
- **PREGNANCY** Carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Carbimazole (Non-proprietary)

Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet [PoM]

ANTITHYROID DRUGS > THIOURACILS

Propylthiouracil

• INDICATIONS AND DOSE

Hyperthyroidism

► BY MOUTH

- Adult: Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose

DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **INTERACTIONS** → Appendix 1: propylthiouracil

• SIDE-EFFECTS

- **Rare or very rare** Agranulocytosis · bone marrow disorders · glomerulonephritis acute · hearing impairment · leucopenia · thrombocytopenia · vomiting
- **Frequency not known** Alopecia · arthralgia · arthritis · encephalopathy · fever · gastrointestinal disorder · haemorrhage · headache · hepatic disorders · hypoproteinaemia · interstitial pneumonitis · lupus-like syndrome · lymphadenopathy · myopathy · nausea · nephritis · skin reactions · taste altered · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function. **Monitoring** Monitor infant's thyroid status.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT**
Dose adjustments Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m².
Use half normal dose if eGFR less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

VITAMINS AND TRACE ELEMENTS

Iodide with iodine

• INDICATIONS AND DOSE

Thyrotoxicosis (pre-operative)

- BY MOUTH USING ORAL SOLUTION
- Adult: 0.1–0.3 mL 3 times a day

- **CAUTIONS** Children · not for long-term treatment
- **SIDE-EFFECTS** Conjunctivitis · depression (long term use) · erectile dysfunction (long term use) · excessive tearing · headache · hypersensitivity · increased risk of infection · influenza-like illness · insomnia (long term use) · rash · salivary gland pain
- **PREGNANCY** Neonatal goitre and hypothyroidism.
- **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.
- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.
- **MEDICINAL FORMS**
No licensed medicines listed.

9.2 Hypothyroidism

Thyroid hormones

Overview

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium below (thyroxine sodium) is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.

Liothyronine sodium p. 757 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 662, and treatment of infection; assisted ventilation is often required.

THYROID HORMONES

Levothyroxine sodium

(Thyroxine sodium)

• INDICATIONS AND DOSE

Hypothyroidism

- BY MOUTH
- Adult 18–49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

- Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hypothyroidism in patients with cardiac disease | Severe hypothyroidism

- BY MOUTH
- Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

- BY MOUTH
- Adult: 50–150 micrograms daily therapy usually given for 18 months

- **CONTRA-INDICATIONS** Thyrotoxicosis
- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)
- **CAUTIONS, FURTHER INFORMATION**
 - Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.
- **INTERACTIONS** → Appendix 1: thyroid hormones
- **SIDE-EFFECTS** Angina pectoris · anxiety · arrhythmias · arthralgia · diarrhoea · dyspnoea · fever · flushing · headache · hyperhidrosis · insomnia · malaise · menstruation irregular · muscle spasms · muscle weakness · oedema · palpitations · skin reactions · thyrotoxic crisis · tremor · vomiting · weight decreased
- **SIDE-EFFECTS, FURTHER INFORMATION** Initial dosage in patients with cardiovascular disorders—if metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
Dose adjustments Levothyroxine requirement may increase during pregnancy.
Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet► **Levothyroxine sodium (Non-proprietary)**

Levothyroxine sodium anhydrous 12.5 microgram Levothyroxine sodium 12.5 microgram tablets | 28 tablet (Pb) £2.80–£14.00 DT = £13.60

Levothyroxine sodium anhydrous 25 microgram Levothyroxine sodium 25microgram tablets | 28 tablet [PoM] £3.05 DT = £1.87 | 500 tablet [PoM] £41.61-£56.25

Levothyroxine sodium 25microgram tablets lactose free | 100 tablet [PoM] [X]

Levothyroxine sodium anhydrous 50 microgram Levothyroxine sodium 50microgram tablets lactose free | 100 tablet [PoM] [X]
Levothyroxine sodium 50microgram tablets | 28 tablet [PoM] £1.50 DT = £0.97 | 1000 tablet [PoM] £38.93-£55.71

Levothyroxine sodium anhydrous 75 microgram Levothyroxine sodium 75microgram tablets | 28 tablet [PoM] £2.10-£4.00 DT = £2.73

Levothyroxine sodium anhydrous 100 microgram Levothyroxine sodium 100microgram tablets lactose free | 100 tablet [PoM] [X]
Levothyroxine sodium 100microgram tablets | 28 tablet [PoM] £1.50 DT = £0.96 | 1000 tablet [PoM] £38.93-£56.07

• **Eltroxin** (AMCO)

Levothyroxine sodium anhydrous 25 microgram Eltroxin 25microgram tablets | 28 tablet [PoM] £2.54 DT = £1.87

Levothyroxine sodium anhydrous 50 microgram Eltroxin 50microgram tablets | 28 tablet [PoM] £1.77 DT = £0.97

Levothyroxine sodium anhydrous 100 microgram Eltroxin 100microgram tablets | 28 tablet [PoM] £1.78 DT = £0.96

Oral solution

• **Levothyroxine sodium (Non-proprietary)**

Levothyroxine sodium anhydrous 5 microgram per 1 ml Levothyroxine sodium 25micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £118.63 DT = £94.94

Levothyroxine sodium anhydrous 10 microgram per 1 ml Levothyroxine sodium 50micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £91.22 DT = £89.66

Levothyroxine sodium anhydrous 20 microgram per 1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £165.00 DT = £164.88

Capsule

• **Levothyroxine sodium (Non-proprietary)**

Levothyroxine sodium anhydrous 25 microgram Tirosint 25microgram capsules | 28 capsule [PoM] [X]

Levothyroxine sodium anhydrous 50 microgram Tirosint 50microgram capsules | 28 capsule [PoM] [X]

Levothyroxine sodium anhydrous 100 microgram Tirosint 100microgram capsules | 28 capsule [PoM] [X]

Liothyronine sodium

(L-Tri-iodothyronine sodium)

• **INDICATIONS AND DOSE**

Hypothyroidism

► **BY MOUTH**

- **Adult:** Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

Hypothyroid coma

► **BY SLOW INTRAVENOUS INJECTION**

- **Adult:** 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

DOSE EQUIVALENCE AND CONVERSION

- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

• **CONTRA-INDICATIONS** Thyrotoxicosis

- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) ·

predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

CAUTIONS, FURTHER INFORMATION

- **Cardiovascular disorders** Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

- **INTERACTIONS** → Appendix 1: thyroid hormones

• **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Alopecia · angina pectoris (more common at excessive dosage) · arrhythmia (more common at excessive dosage) · diarrhoea (more common at excessive dosage) · heat intolerance · muscle cramps · muscle weakness · palpitations (more common at excessive dosage) · tachycardia (more common at excessive dosage) · vomiting (more common at excessive dosage)
- **Frequency not known** Agitation · fever · flushing · headache · hyperhidrosis · insomnia (more common at excessive dosage) · oedema · restlessness (more common at excessive dosage) · skin reactions · tremor (more common at excessive dosage) · weight decreased

SPECIFIC SIDE-EFFECTS

- **Rare or very rare**
- With intravenous use Menstruation irregular

SIDE-EFFECTS, FURTHER INFORMATION Initial dosage in patients with cardiovascular disorders—if metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Dose adjustments Liothyronine requirement may increase during pregnancy.

Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION**
Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

Tablet

► **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 20 microgram Liothyronine 20microgram tablets | 28 tablet [PoM] £258.20 DT = £246.69

► **Iraksin** (Morningside Healthcare Ltd)

Liothyronine sodium 20 microgram Iraksin 20microgram tablets | 28 tablet [PoM] £249.98 DT = £246.69

Powder for solution for injection

► **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials | 5 vial [PoM] £1,425.00

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine p. 364 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 760 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 762 are comparable to those of modified-release oxybutynin hydrochloride. Flavoxate hydrochloride p. 760 has less marked side-effects but it is also less effective. Darifenacin p. 759, fesoterodine fumarate p. 759, propiverine hydrochloride p. 762, solifenacin succinate p. 761, and trospium chloride p. 761 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 85 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine hydrochloride p. 372 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 763, a selective β_3 agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome.

Purified bovine collagen implant (*Contigen*®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

See also Nocturnal enuresis in children below.

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

[EvGr] For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. 

Non Drug Treatment

[EvGr] Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in

children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 653, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. 

Drug Treatment

EvGr Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn **gradually** at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 760 or tolterodine tartrate p. 762 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 372 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

ANTIMUSCARINICS

Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · prostatic enlargement (in adults) · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Acute myocardial infarction (in adults) · arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · elderly (especially if frail) · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to

angle-closure glaucoma · prostatic hyperplasia (in adults) · pyrexia · ulcerative colitis

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · nausea · palpitations · skin reactions · tachycardia · urinary disorders · vision disorders · vomiting
- ▶ **Uncommon** Angioedema
- ▶ **Rare or very rare** Confusion (more common in elderly)
- **PATIENT AND CARER ADVICE**
- ▶ **Driving and skilled tasks** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

ANTIMUSCARINICS > URINARY

Darifenacin

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Incontinence

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

- **INTERACTIONS** → Appendix 1: darifenacin

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · dry eye · nasal dryness
- ▶ **Uncommon** Asthenia · bladder pain · cough · diarrhoea · dyspnoea · erectile dysfunction · flatulence · hyperhidrosis · hypertension · increased risk of infection · injury · insomnia · oedema · oral ulceration · pruritus · taste altered · thinking abnormal · urinary tract disorder · visual impairment

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises caution.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Max. 7.5 mg daily in moderate impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

- ▶ **Emselex** (Merus Labs Luxco S.a.R.L.)

Darifenacin (as Darifenacin hydrobromide) 7.5 mg Emselex 7.5mg modified-release tablets | 28 tablet **[PoM]** £25.48 DT = £25.48

Darifenacin (as Darifenacin hydrobromide) 15 mg Emselex 15mg modified-release tablets | 28 tablet **[PoM]** £25.48 DT = £25.48

Fesoterodine fumarate

08-May-2017

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urge incontinence

- ▶ **BY MOUTH**
- ▶ **Adult:** 4 mg once daily, increased if necessary up to 8 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. 4 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have hepatic or renal impairment.

continued →

- ▶ For dose adjustments with concurrent use of moderate inhibitors of CYP3A4 in patients with hepatic or renal impairment, consult product literature.

● **INTERACTIONS** → Appendix 1: fesoterodine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · dry eye · gastrointestinal discomfort · insomnia · throat complaints
- ▶ **Uncommon** Cough · fatigue · gastrointestinal disorders · nasal dryness · taste altered · urinary disorders · urinary tract infection · vertigo

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
Dose adjustments Manufacturer advises increase dose cautiously in mild impairment; max. 4 mg daily in moderate impairment.

● **RENAL IMPAIRMENT**

Dose adjustments Increase dose cautiously if eGFR 30–80 mL/minute/1.73m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73m².

● **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2008) that fesoterodine (*Toviaz*®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

Fesoterodine fumarate 4 mg Toviaz 4mg modified-release tablets | 28 tablet [PoM] £25.78 DT = £25.78

Fesoterodine fumarate 8 mg Toviaz 8mg modified-release tablets | 28 tablet [PoM] £25.78 DT = £25.78

759

Flavoxate hydrochloride

● **INDICATIONS AND DOSE**

Urinary frequency | Urinary incontinence | Dysuria | Urinary urgency | Bladder spasm due to catheterisation, cystoscopy, or surgery

- ▶ **BY MOUTH**
- ▶ **Adult:** 200 mg 3 times a day

● **CONTRA-INDICATIONS** Gastro-intestinal haemorrhage

● **INTERACTIONS** → Appendix 1: flavoxate

● **SIDE-EFFECTS** Diarrhoea · dysphagia · eosinophilia · fatigue · hyperpyrexia · hypersensitivity · leucopenia · nervousness · vertigo

● **PREGNANCY** Manufacturer advises avoid unless no safer alternative.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3

▶ **Urispas** (Recordati Pharmaceuticals Ltd)

Flavoxate hydrochloride 200 mg Urispas 200 tablets | 90 tablet [PoM] £11.67 DT = £11.67

759

Oxybutynin hydrochloride

● **INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ **Child 5–11 years:** Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day

▶ **Child 12–17 years:** Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day

▶ **Adult:** Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day

▶ **Elderly:** Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**

▶ **Child 5–17 years:** Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

▶ **Adult:** Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

Urinary frequency | Urinary urgency | Urinary incontinence

▶ **BY TRANSDERMAL APPLICATION USING PATCHES**

▶ **Adult:** Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

Nocturnal enuresis associated with overactive bladder

▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ **Child 5–17 years:** 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime

▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**

▶ **Child 5–17 years:** Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

▶ Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lytrinel*® XL

● **CAUTIONS** Acute porphyrias p. 1025

● **INTERACTIONS** → Appendix 1: oxybutynin

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

▶ **Common or very common** Diarrhoea

▶ **Uncommon** Urticaria

SPECIFIC SIDE-EFFECTS

▶ **Common or very common**

▶ **With oral use** Dry eye

▶ **With transdermal use** Gastrointestinal discomfort · increased risk of infection

▶ **Uncommon**

▶ **With oral use** Abdominal discomfort · appetite decreased · dysphagia

▶ **With transdermal use** Back pain · hot flush · injury

► **Frequency not known**

- With oral use Anxiety · arrhythmia · cognitive disorder · depressive symptom · disorientation · drug dependence · gastrointestinal disorders · glaucoma · hallucination · heat stroke · hypohidrosis · mydriasis · nightmare · paranoia · photosensitivity reaction · seizure · urinary tract infection

● **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturers advise avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **DIRECTIONS FOR ADMINISTRATION** Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).

● **PRESCRIBING AND DISPENSING INFORMATION**

- In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms www.medicinesforchildren.org.uk/oxybutynin-for-daytime-urinary-symptoms

Patients or carers should be given advice on how to administer oxybutynin transdermal patches.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (July 2005) that *Kentera*® should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

1.2 Urinary retention**Urinary retention**

31-May-2017

Description of condition

Urinary retention is the inability to voluntarily urinate. It may be secondary to urethral blockage, drug treatment (such as use of antimuscarinic drugs, sympathomimetics, tricyclic antidepressants), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, neurogenic causes, or it may occur postpartum or postoperatively.

Acute urinary retention is a medical emergency characterised by the abrupt development of the inability to pass urine (over a period of hours).

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by a residual volume greater than one litre or associated with the presence of a distended or palpable bladder.

Urinary retention due to benign prostatic hyperplasia

The most common cause of urinary retention in men is benign prostatic hyperplasia. Men with an enlarged prostate can have lower urinary tract symptoms associated with obstruction, such as urinary retention (acute or chronic), frequency, urgency or nocturia.

Treatment

Treatment of urinary retention depends on the underlying condition. Catheterisation is used to relieve acute painful urinary retention or when no cause can be found. Surgical procedures or dilatation are often used to correct mechanical outflow obstructions.

Acute urinary retention

[EvGr] Acute retention is painful and requires immediate treatment by catheterisation. Before the catheter is removed an alpha-adrenoceptor blocker (such as alfuzosin hydrochloride below, doxazosin p. 765, tamsulosin hydrochloride p. 767, prazosin p. 766, indoramin p. 766 or terazosin p. 768) should be given for at least two days to manage acute urinary retention. **⚠**

Chronic urinary retention

[EvGr] In patients with chronic urinary retention, intermittent bladder catheterisation should be offered before an indwelling catheter. Catheters may be used as a long-term solution where persistent urinary retention is causing incontinence, infection, or renal dysfunction and a surgical solution is not feasible. **⚠** Their use is associated with an increased risk of adverse events including recurrent urinary infections, trauma to the urethra, pain, and stone formation.

[EvGr] In men who have symptoms that are bothersome, drug treatment should only be offered when other conservative management options have failed. Men with moderate-to-severe symptoms should be offered an alpha-adrenoceptor blocker (alfuzosin hydrochloride, doxazosin, tamsulosin hydrochloride or terazosin). Treatment should initially be reviewed after 4–6 weeks and then every 6–12 months. **⚠**

The parasympathomimetic bethanechol chloride p. 768 increases detrusor muscle contraction. It is licensed for acute postoperative, postpartum and neurogenic urinary retention but its use has largely been superseded by catheterisation.

Urinary retention due to benign prostatic hyperplasia

In patients with benign prostatic hyperplasia, treatment is influenced by the severity of symptoms and their effect on the patient's quality of life. **[EvGr]** Watchful waiting is suitable for men with symptoms that are not troublesome and in those who have not yet developed complications of benign prostatic hyperplasia such as renal impairment, urinary retention or recurrent infection.

The recommended treatment of benign prostatic hyperplasia is usually an alpha-adrenoceptor blocker. The α_1 -selective adrenoceptor blockers relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

In patients with an enlarged prostate, a raised prostate specific antigen concentration, and who are considered to be at high risk of progression (such as the elderly), a 5 α -reductase inhibitor (such as finasteride p. 769 or dutasteride p. 769) should be used. A combination of an alpha-adrenoceptor blocker and a 5 α -reductase inhibitor can be offered if symptoms remain a problem.

Surgery is recommended for men with more severe symptoms that do not respond to drug therapy, or who have complications such as acute urinary retention, haematuria, renal failure, bladder calculi or recurrent urinary-tract infection. **⚠**

Related drugs

Other drugs used for urinary retention: neostigmine p. 1090, pyridostigmine bromide p. 1091.

ALPHA-ADRENOCEPTOR BLOCKERS**Alfuzosin hydrochloride****• INDICATIONS AND DOSE****Benign prostatic hyperplasia****► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 2.5 mg 3 times a day; maximum 10 mg per day
- Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 10 mg once daily

Acute urinary retention associated with benign prostatic hyperplasia**► BY MOUTH USING MODIFIED-RELEASE TABLETS**

- Elderly: 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

- **CONTRA-INDICATIONS** Avoid if history of micturition syncope
• avoid if history of postural hypotension

- **CAUTIONS** Acute heart failure • concomitant antihypertensives (reduced dosage and specialist supervision may be required) • discontinue if angina worsens • elderly • history of QT-interval prolongation • patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome)

- **INTERACTIONS** → Appendix 1: alpha blockers

• SIDE-EFFECTS

- **Common or very common** Asthenia • diarrhoea • dizziness • dry mouth • headache • malaise • nausea • postural hypotension • vertigo • vomiting
- **Uncommon** Abdominal pain • arrhythmias • chest pain • drowsiness • flushing • oedema • palpitations • rhinitis • skin reactions • syncope • visual impairment
- **Rare or very rare** Angina pectoris • angioedema
- **Frequency not known** Cerebral ischaemia • floppy iris syndrome • hepatic disorders • neutropenia • priapism • thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

- **HEPATIC IMPAIRMENT** Avoid modified-release preparations.

Dose adjustments Initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe.

- **RENAL IMPAIRMENT** Manufacturers advise avoid use of modified-release preparations if eGFR less than 30 mL/minute/1.73 m² as limited experience.

Dose adjustments Initial dose 2.5 mg twice daily and adjust according to response.

- **PATIENT AND CARER ADVICE** Patient should be counselled on the first dose effect.

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

INDICATIONS AND DOSE

Hypertension

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

Benign prostatic hyperplasia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- CONTRA-INDICATIONS** History of micturition syncope (in patients with benign prostatic hypertrophy) · history of postural hypotension · monotherapy in patients with overflow bladder or anuria
- CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · heart failure · pulmonary oedema due to aortic or mitral stenosis

- INTERACTIONS** → Appendix 1: alpha blockers

SIDE-EFFECTS

- Common or very common** Arrhythmias · asthenia · chest pain · cough · cystitis · dizziness · drowsiness · dry mouth · dyspnoea · gastrointestinal discomfort · headache · hypotension · increased risk of infection · influenza like

illness · muscle complaints · nausea · oedema · pain · palpitations · skin reactions · urinary disorders · vertigo

- Uncommon** Angina pectoris · anxiety · appetite abnormal · arthralgia · constipation · depression · diarrhoea · gastrointestinal disorders · gout · haemorrhage · insomnia · myocardial infarction · sensation abnormal · sexual dysfunction · stroke · syncope · tinnitus · tremor · vomiting · weight increased

- Rare or very rare** Alopecia · bronchospasm · flushing · gynaecomastia · hepatic disorders · leucopenia · malaise · muscle weakness · thrombocytopenia · vision blurred
- Frequency not known** Floppy iris syndrome

- PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

- BREAST FEEDING** Accumulates in milk in *animal* studies—manufacturer advises avoid.

- HEPATIC IMPAIRMENT** Use with caution. Manufacturer advises avoid in severe impairment—no information available.

- PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

Indoramin

• INDICATIONS AND DOSE

Hypertension

- BY MOUTH
- Adult: Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

Benign prostatic hyperplasia

- BY MOUTH
- Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
- Elderly: 20 mg daily may be adequate, dose to be taken at night

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- **CONTRA-INDICATIONS** Established heart failure · history micturition syncope (when used for benign prostatic hyperplasia) · history of postural hypotension (when used for benign prostatic hyperplasia)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · control incipient heart failure before initiating indoramin · elderly · epilepsy (convulsions in animal studies) · history of depression · Parkinson's disease (extrapyramidal disorders reported)
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
 - Rare or very rare Parkinson's disease exacerbated
 - Frequency not known Depression · dizziness · drowsiness · dry mouth · ejaculation failure · fatigue · headache · nasal congestion · weight increased
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PATIENT AND CARER ADVICE** Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

► Congestive heart failure (rarely used)

- BY MOUTH
- Adult: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

► Raynaud's syndrome (but efficacy not established)

- BY MOUTH
- Adult: Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily

Benign prostatic hyperplasia

- BY MOUTH
- Adult: Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- **CONTRA-INDICATIONS** History of micturition syncope · history of postural hypotension · not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose hypotension
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
 - Common or very common Asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · headache · nasal congestion · nausea · nervousness · oedema · palpitations · postural hypotension · sexual dysfunction · skin reactions · syncope · urinary disorders · vertigo · vision blurred · vomiting
 - Uncommon Angina pectoris · arrhythmias · arthralgia · epistaxis · eye pain · eye redness · gastrointestinal discomfort · hyperhidrosis · paraesthesia · sleep disorders · tinnitus
 - Rare or very rare Alopecia · fever · flushing · gynaecomastia · hallucination · hepatic function abnormal · pain · pancreatitis · vasculitis
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.
- **HEPATIC IMPAIRMENT** Dose adjustments Initially 500 micrograms daily; increased with caution.
- **RENAL IMPAIRMENT** Dose adjustments Initially 500 micrograms daily in moderate to severe impairment; increased with caution.
- **PATIENT AND CARER ADVICE** First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely. Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

Prazosin

• INDICATIONS AND DOSE

Hypertension

- BY MOUTH
- Adult: Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet▶ **Hypovase** (Pfizer Ltd)

Prazosin (as Prazosin hydrochloride) 500 microgram Hypovase 500microgram tablets | 60 tablet **[PoM]** £2.69 DT = £2.69

Prazosin (as Prazosin hydrochloride) 1 mg Hypovase 1mg tablets | 60 tablet **[PoM]** £3.46 DT = £3.46

Tamsulosin hydrochloride**INDICATIONS AND DOSE****Benign prostatic hyperplasia**▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ **Adult:** 400 micrograms once daily

● **CONTRA-INDICATIONS** History of micturition syncope · history of postural hypotension

● **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · elderly

● **INTERACTIONS** → Appendix 1: alpha blockers

SIDE-EFFECTS

▶ **Common or very common** Dizziness · sexual dysfunction

▶ **Uncommon** Asthenia · constipation · diarrhoea · headache · nausea · palpitations · postural hypotension · rhinitis · skin reactions · vomiting

▶ **Rare or very rare** Angioedema · Stevens-Johnson syndrome · syncope

▶ **Frequency not known** Dry mouth · epistaxis · vision disorders

● **HEPATIC IMPAIRMENT** Avoid in severe impairment.

● **RENAL IMPAIRMENT** Use with caution if eGFR less than 10 mL/minute/1.73 m².

PATIENT AND CARER ADVICE

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

● **EXCEPTIONS TO LEGAL CATEGORY** Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Modified-release tablet

Tamsulosin with solifenacin

The properties listed below are those particular to the combination only. For the properties of the components please consider, tamsulosin hydrochloride p. 767, solifenacin succinate p. 761.

● INDICATIONS AND DOSE

Moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective

► BY MOUTH

► Adult (male): 1 tablet daily.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises max. 1 *Vesomni*® tablet daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment, severe renal impairment, are poor metabolisers of CYP2D6, or in patients also taking a potent inhibitor of CYP2D6.

● **INTERACTIONS** → Appendix 1: alpha blockers · solifenacin

● HEPATIC IMPAIRMENT

Dose adjustments Max. 1 *Vesomni*® tablet daily in moderate impairment.

● RENAL IMPAIRMENT

Dose adjustments Max. 1 *Vesomni*® tablet daily if eGFR less than 30 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

► *Vesomni* (Astellas Pharma Ltd)

Tamsulosin hydrochloride 400 microgram, Solifenacin succinate 6 mg *Vesomni* 6mg/0.4mg modified-release tablets | 30 tablet [PoM](#) £27.62 DT = £27.62

Terazosin

● INDICATIONS AND DOSE

Mild to moderate hypertension

► BY MOUTH

► Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy

Benign prostatic hyperplasia

► BY MOUTH

► Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

● **CONTRA-INDICATIONS** History of micturition syncope (in benign prostatic hyperplasia) · history of postural hypotension (in benign prostatic hyperplasia)

● **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose

CAUTIONS, FURTHER INFORMATION First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.

● **INTERACTIONS** → Appendix 1: alpha blockers

● **SIDE-EFFECTS** Angioedema · anxiety · arrhythmias · arthritis · asthenia · chest pain · conjunctivitis · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · epistaxis · fever · flatulence · gastrointestinal discomfort · gout · headache · hyperhidrosis · increased risk of infection · insomnia · joint

disorders · myalgia · nasal congestion · nausea · oedema · pain · palpitations · paraesthesia · postural hypotension · sexual dysfunction · skin reactions · syncope · thrombocytopenia · tinnitus · urinary disorders · vasodilation · vertigo · vision disorders · vomiting · weight increased

● **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

● **BREAST FEEDING** No information available.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for terazosin tablets (initial dose).
First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

● MEDICINAL FORMS

5 α -REDUCTASE INHIBITORS**Dutasteride**

- **DRUG ACTION** A specific inhibitor of the enzyme 5 α -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

INDICATIONS AND DOSE**Benign prostatic hyperplasia**► **BY MOUTH**

- **Adult:** 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

- **INTERACTIONS** → Appendix 1: dutasteride

SIDE-EFFECTS

- **Common or very common** Breast disorder · sexual dysfunction
- **Uncommon** Alopecia · hypertrichosis
- **Frequency not known** Angioedema · depressed mood · hypersensitivity · localised oedema · skin reactions · testicular disorders
- **CONCEPTION AND CONTRACEPTION** Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises that patients should be regularly evaluated for prostate cancer.
- **EFFECT ON LABORATORY TESTS** May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling leaking capsules of dutasteride.
- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

Finasteride

20-Jul-2017

- **DRUG ACTION** A specific inhibitor of the enzyme 5 α -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

INDICATIONS AND DOSE**Benign prostatic hyperplasia**► **BY MOUTH**

- **Adult:** 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

Androgenetic alopecia in men► **BY MOUTH**

- **Adult:** 1 mg daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RARE REPORTS OF DEPRESSION AND SUICIDAL THOUGHTS (MAY 2017)

The MHRA has received reports of depression and, in rare cases, suicidal thoughts in men taking finasteride (*Propecia*®) for male pattern hair loss; depression is also associated with *Proscar*® for benign prostatic hyperplasia. Patients should be advised to stop finasteride immediately and inform a healthcare professional if they develop depression.

- **CAUTIONS** Obstructive uropathy

SIDE-EFFECTS

- **Common or very common** Sexual dysfunction
- **Uncommon** Breast abnormalities · skin reactions
- **Frequency not known** Angioedema · depression · infertility male · palpitations · testicular pain
- **CONCEPTION AND CONTRACEPTION** Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- **EFFECT ON LABORATORY TESTS** Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.
- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Finasteride is not prescribable in NHS primary care for the treatment of androgenetic alopecia in men.

1.3 Urological pain

Urological pain

Treatment

The acute pain of *ureteric colic* may be relieved with pethidine hydrochloride p. 463. **Diclofenac** by injection or as suppositories is also effective and compares favourably with pethidine hydrochloride; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

Lidocaine hydrochloride gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. Sodium bicarbonate p. 1006 is used as a urinary alkalinising agent in some metabolic and renal disorders.

ALKALISING DRUGS

Citric acid with potassium citrate

● INDICATIONS AND DOSE

Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine

- BY MOUTH USING ORAL SOLUTION
- Adult: 10 mL 3 times a day, diluted well with water

- **CAUTIONS** Cardiac disease • elderly
- **INTERACTIONS** → Appendix 1: potassium citrate
- **SIDE-EFFECTS** Hyperkalaemia • nausea • vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL.
- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

- **Citric acid with potassium citrate (Non-proprietary)**
Citric acid monohydrate 50 mg per 1 mL, Potassium citrate 300 mg per 1 mL Potassium citrate mixture | 200 mL [GSL] £1.36-£1.38 DT = £1.36 | 200 mL [P] £1.38 DT = £1.36

Sodium citrate

● INDICATIONS AND DOSE

Bladder washouts

- Adult: (consult product literature)

Relief of discomfort in mild urinary-tract infections

- BY MOUTH
- Adult: (consult product literature)

MICOLETTE®

Constipation

- BY RECTUM
- Child 3-17 years: 5–10 mL for 1 dose
- Adult: 5–10 mL for 1 dose

MICRALAX®

Constipation

- BY RECTUM
- Child 3-17 years: 5 mL for 1 dose
- Adult: 5 mL for 1 dose

RELAXIT®

Constipation

- BY RECTUM
- Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
- Child 3-17 years: 5 mL for 1 dose
- Adult: 5 mL for 1 dose

● CONTRA-INDICATIONS

- With rectal use Acute gastro-intestinal conditions

● CAUTIONS

- With oral use Cardiac disease (in adults) • elderly • hypertension (in adults) • patients on a sodium-restricted diet (in adults)
- With rectal use Debilitated patients (in adults) • sodium and water retention in susceptible individuals

- **INTERACTIONS** → Appendix 1: sodium citrate

- **SIDE-EFFECTS** Polyuria

● PREGNANCY

- With oral use Use with caution.

● RENAL IMPAIRMENT

- With oral use In patients with fluid retention, avoid antacids containing large amounts of sodium.

- **PRESCRIBING AND DISPENSING INFORMATION** Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Granules

Sodium citrate 90 mg per 1 ml Relaxit Micro-enema 5ml | 12 enema £5.21

TERPENES

Anethol with borneol, camphene, cineole, fenchone and pinene

● INDICATIONS AND DOSE

Urolithiasis for the expulsion of calculi

- ▶ BY MOUTH
- ▶ Adult: 1–2 capsules 3–4 times a day, to be taken before food

- **LESS SUITABLE FOR PRESCRIBING** Preparation is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Rowatinox** (Meadow Laboratories Ltd)
Cineole 3 mg, Anethol 4 mg, Fenchone 4 mg, Borneol 10 mg, Camphene 15 mg, Pinene 31 mg Rowatinox capsules | 50 capsule [PoM] £7.35

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 1175 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 1008 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/mL p. 583 may be of value in mycotic infections in adults.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% p. 770 may also be helpful.

Bladder cancer

Bladder instillations of doxorubicin hydrochloride p. 876 and mitomycin p. 895 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 877 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride is also used for some papillary tumours.

Instillation of BCG (Bacillus Calmette-Guérin p. 932), a live attenuated strain derived from *Mycobacterium bovis* is licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

Urological surgery

Glycine irrigation solution 1.5% below is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1175, lidocaine hydrochloride p. 1312.

● INDICATIONS AND DOSE

Urethral sounding and catheterisation

- ▶ BY URETHRAL APPLICATION
- ▶ Adult: 6–11 mL

Cystoscopy

- ▶ BY URETHRAL APPLICATION
- ▶ Adult: 11 mL, then 6–11 mL if required

- **INTERACTIONS** → Appendix 1: antiarrhythmics

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- ▶ **Instillagel** (CliniMed Ltd)
Chlorhexidine gluconate 500 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Instillagel gel | 60 ml [P] £14.05 DT = £14.05 | 110 ml [P] £15.76 DT = £15.76

IRRIGATING SOLUTIONS

Glycine

● INDICATIONS AND DOSE

Bladder irrigation during urological surgery | Irrigation for transurethral resection of the prostate gland and bladder tumours

- ▶ Adult: (consult product literature)

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ Urological surgery There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.
- **SIDE-EFFECTS** Cardiovascular disorder • electrolyte depletion • fluid overload • pulmonary disorder • seizure • vision blurred

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Combined Oral Contraceptives Monophasic 21-day preparations

3 Contraception

Contraceptives, hormonal

Overview

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Choice

The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 779, ethinylestradiol with drospirenone p. 780, and ethinylestradiol with gestodene p. 780 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 778 is in the combined oral contraceptive *Qlaira*®. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting

progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;

- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate p. 791 (*Depo-Provera*®, *SAYANA PRESS*®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such

patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems *Mirena*®, *Jaydess*® and *Levosert*® release levonorgestrel p. 787 directly into the uterine cavity. *Mirena*® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. *Jaydess*® and *Levosert*® are licensed for contraception, and *Levosert*® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Contraceptives, non-hormonal

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 793 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms.

Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (*Gyne Fix®*) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants

Products such as petroleum jelly (*Vaseline®*), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Emergency contraception

01-Sep-2017

Overview

[EvGr] Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse. It does not replace effective regular contraception.

Women who do not wish to conceive should be offered emergency contraception after unprotected sexual intercourse that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after unprotected intercourse from day 21 after childbirth (unless the criteria for lactational amenorrhoea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to women if their regular contraception has been compromised or has been used incorrectly. **[A]**

Emergency contraceptive methods

Copper intra-uterine devices

[EvGr] Insertion of a copper intra-uterine device (see intra-uterine contraceptive devices (copper) p. 784) is the most effective form of emergency contraception and should be offered (if appropriate) to all women who have had unprotected sexual intercourse and do not want to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse or up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle. Antibacterial cover should be considered for copper intra-uterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs. **[A]**

Hormonal methods

[EvGr] Hormonal emergency contraceptives (includes levonorgestrel p. 787 and ulipristal acetate p. 785) should be offered as soon as possible after unprotected intercourse if a copper intra-uterine device is not appropriate or is not acceptable to the patient; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy. Hormonal emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used

between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours (5 days) of unprotected intercourse. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception.

It is possible that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel; if BMI is greater than 26 kg/m² or body-weight is greater than 70 kg, it is recommended that either ulipristal acetate or a double dose of levonorgestrel [unlicensed indication] (see *Emergency contraception* under levonorgestrel) is given. It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line hormonal emergency contraceptive for a woman who has had unprotected intercourse 96–120 hours ago (even if she has also had unprotected intercourse within the last 96 hours). It should also be considered first line for a woman who has had unprotected sexual intercourse within the last 5 days if it is likely to have taken place during the 5 days before the estimated day of ovulation. **[A]**

Hormonal emergency contraception interactions

See Contraceptives, interactions below.

Starting hormonal contraception after emergency hormonal contraception

Emergency hormonal contraception methods do **not** provide ongoing contraception. **[EvGr]** After taking levonorgestrel, women should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Women should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception. Women must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective. **[A]**

The copper intra-uterine device immediately provides effective ongoing contraception.

Emergency Contraception. The Faculty of Sexual and Reproductive Healthcare. Clinical guidance. March 2017. www.fsrh.org/standards-and-guidance/documents/ceu-clinical-guidance-emergency-contraception-march-2017

Contraceptives, interactions

06-Jun-2017

Overview

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 309, eslicarbazepine acetate, nevirapine p. 633, oxcarbazepine p. 319, phenytoin p. 321, phenobarbital p. 331, primidone p. 332, ritonavir p. 646, St John's Wort, topiramate p. 328 and, above all, rifabutin p. 564 and rifampicin p. 571) and possibly also griseofulvin p. 590. **[EvGr]** A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists. **[A]**

Combined hormonal contraceptives interactions

[EvGr] Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 791 and

norethisterone p. 747) or intra-uterine devices (levonorgestrel p. 787; see also Contraceptives, non-hormonal p. 774). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed: 

Short course (2 months or less) of an enzyme-inducing drug

 Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. 

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

 Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period. 

Long-term course (over 2 months) of rifampicin or rifabutin

An alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

 It is recommended that no additional contraceptive precautions are required when *combined* oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman. 

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 540, doxycycline p. 555) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes.

 The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. 

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes.  The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not

affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 790 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug. 

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 785 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping).  A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions* under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers. 

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied.  Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended.

Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle.  Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

 Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antigluccorticoid effect of ulipristal acetate. 

Useful Resources

Drug interactions with hormonal contraception. The Faculty of Sexual and Reproductive Healthcare. Clinical guidance. January 2018.
www.fsrh.org/standards-and-guidance/current-clinical-guidance/drug-interactions

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history

of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- **Risk of venous thromboembolism** There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- **Risk factors for venous thromboembolism** Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - *obesity*; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - *history of superficial thrombophlebitis*;
 - *age over 35 years* (avoid if over 50 years);
 - *smoking*.

Nomegestrol ²	Not known—insufficient data
¹ Combined with ethinylestradiol	² Combined with estradiol

- **Risk factors for arterial disease** Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension*; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
- *smoking* (avoid if smoking 40 or more cigarettes daily);
- *age over 35 years* (avoid if over 50 years);
- *obesity* (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

• SIDE-EFFECTS

- **Common or very common** Acne · fluid retention · headaches · menstrual cycle irregularities · nausea · weight increased
- **Uncommon** Alopecia · hypertension
- **Rare or very rare** Venous thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be

localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. **21-day combined preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations.

Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®). After abortion or miscarriage Start same day.

• PATIENT AND CARER ADVICE

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should

be omitted (in the case of ED tablets the inactive ones should be omitted).

Missed doses The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

F 776

Dienogest with estradiol valerate

• INDICATIONS AND DOSE

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

▶ BY MOUTH

- ▶ Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of inactive tablets, tablets should be taken at approximately the same time each day

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

• SIDE-EFFECTS

- ▶ **Common or very common** Breast abnormalities · gastrointestinal discomfort · headaches · increased risk of infection
- ▶ **Uncommon** Appetite increased · cervical abnormalities · crying · depression · diarrhoea · dizziness · fatigue · haemorrhage · hot flush · hyperhidrosis · mood altered · muscle spasms · neoplasms · oedema · ovarian and fallopian tube disorders · painful sexual intercourse · pelvic disorders · sexual dysfunction · skin reactions · sleep disorders · uterine cramps · vomiting · vulvovaginal disorders · weight decreased
- ▶ **Rare or very rare** Aggression · anxiety · arterial thromboembolism · asthma · chest pain · cholecystitis chronic · concentration impaired · constipation · contact lens intolerance · dry eye · dry mouth · dyspnoea · eye swelling · fever · galactorrhoea · gastrooesophageal reflux disease · genital discharge · hair changes · hypertriglyceridaemia · hypotension · lymphadenopathy · malaise · myocardial infarction · pain · palpitations · paraesthesia · seborrhoea · sensation of pressure · urinary tract pain · vascular disorders · vertigo

• DIRECTIONS FOR ADMINISTRATION

Changing to *Qlaira*® Start the first active *Qlaira*® tablet on the day after taking the last active tablet of the previous brand.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*®, refer to product literature.

Missed doses A missed pill for a patient taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ethinylestradiol with etonogestrel

● INDICATIONS AND DOSE

Contraception | Menstrual symptoms

- BY VAGINA
- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● DIRECTIONS FOR ADMINISTRATION

Changing method of contraception to vaginal ring Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used

correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle. Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly.

Missed doses

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Vaginal delivery system

- ▶ **Uncommon** Appetite increased · dyslipidaemia · insomnia · lactation disorders · oedema · photosensitivity reaction · sexual dysfunction
- ▶ **Rare or very rare** Embolism and thrombosis · gallbladder disorders · genital discharge · neoplasms · stroke · swelling
- ▶ **Frequency not known** Anger · angioedema · cervical dysplasia · colitis · contact lens intolerance · erythema nodosum · hepatic disorders · hyperglycaemia · hypertensive crisis · intracranial haemorrhage · myocardial infarction · pulmonary artery thrombosis · taste altered

- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive
Changing from combined oral contraception

Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer patches.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed doses

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

- ▶ **Evra** (Janssen-Cilag Ltd)

Ethinylestradiol 33.9 microgram per 24 hour, Norelgestromin 203 microgram per 24 hour Evra transdermal patches | 9 patch [PoM] £19.51 DT = £19.51

3.2 Contraception, devices

Other drugs used for Contraception, devices

Levonorgestrel, p. 787

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

● INDICATIONS AND DOSE

Contraception

- ▶ BY INTRA-UTERINE ADMINISTRATION
- ▶ Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS**

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diathermy · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson's disease
- **CAUTIONS** Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
- ▶ **CAUTIONS, FURTHER INFORMATION**
 - ▶ Risk of infection The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If

results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- **SIDE-EFFECTS** Device complications · epilepsy (on insertion) · haemorrhage (on insertion) · hypersensitivity · menstrual cycle irregularities · pain (on insertion—alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection exacerbated · presyncope (on insertion) · uterine injuries
- SIDE-EFFECTS, FURTHER INFORMATION** Advise the patient to seek medical attention promptly in case of significant symptoms—very small risk of uterine perforation, ectopic pregnancy and pelvic inflammatory disease.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - TT380® SLIMLINE** For uterine length 6.5–9 cm; replacement every 10 years.
 - LOAD® 375** For uterine length over 7 cm; replacement every 5 years.

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

12-Apr-2018

- **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

• INDICATIONS AND DOSE

Pre-operative and intermittent treatment of moderate to severe symptoms of uterine fibroids

- **BY MOUTH**
- **Adult:** 5 mg once daily for up to 3 months starting during the first week of menstruation, courses may be repeated if necessary, re-treatment should start no sooner than during the first week of the second menstruation following completion of the first course; max. 4 courses

Emergency contraception

- **BY MOUTH**
- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: *ESMYA*® (ULIPRISTAL ACETATE) FOR UTERINE FIBROIDS: DO NOT INITIATE OR RE-START TREATMENT; MONITOR LIVER FUNCTION IN CURRENT AND RECENT USERS (MARCH 2018)

Temporary safety measures are in place while an EU review investigates the link between cases of serious liver injury, including 4 cases requiring liver transplantation, and *Esmya*® for uterine fibroids.

The MHRA recommends the following until the EU review is completed:

- do not initiate new treatment courses, including in women who have completed prior courses;
- perform liver function tests at least once a month in women currently taking *Esmya*® and again 2–4 weeks after stopping;
- check transaminase levels immediately in current or recent users who present with signs or symptoms suggestive of liver injury and stop treatment in any woman who develops transaminase levels more than 2 times the upper limit of normal—closely monitor and

refer for specialist hepatology evaluation as clinically indicated;

- advise women using *Esmya*® about the signs and symptoms of liver injury and tell them to seek immediate medical attention if they occur.

• CONTRA-INDICATIONS

- ▶ When used for uterine fibroids Breast cancer · cervical cancer · ovarian cancer · undiagnosed vaginal bleeding · uterine cancer · vaginal bleeding not caused by uterine fibroids

• CAUTIONS Uncontrolled severe asthma

• INTERACTIONS → Appendix 1: ulipristal

• SIDE-EFFECTS

- ▶ **Common or very common** Back pain · breast tenderness · dizziness · fatigue · gastrointestinal discomfort · headaches · menstrual cycle irregularities · mood altered · myalgia · nausea · pelvic pain · vomiting
- ▶ **Uncommon** Anxiety · appetite disorder · chills · concentration impaired · diarrhoea · drowsiness · dry mouth · fever · flatulence · hot flush · increased risk of infection · insomnia · libido disorder · malaise · skin reactions · vision disorders · vulvovaginal disorders
- ▶ **Rare or very rare** Abnormal sensation in eye · disorientation · dry throat · eye erythema · genital pruritus · ovarian cyst ruptured · painful sexual intercourse · syncope · taste altered · thirst · tremor · vertigo

• **CONCEPTION AND CONTRACEPTION** When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira*®) and 9 days for oral progestogen-only contraceptives. When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.

• **PREGNANCY** Limited information available when used as an emergency contraceptive. Manufacturer advises avoid for uterine fibroids—no information available.

• **BREAST FEEDING** In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk. When used for uterine fibroids, manufacturer advises avoid—no information available.

• HEPATIC IMPAIRMENT

▶ When used for Emergency contraception Manufacturer advises avoid in severe impairment—no information available.

▶ When used for Uterine fibroids MHRA advises avoid—see Important safety information for further information.

• RENAL IMPAIRMENT

▶ When used for Uterine fibroids Manufacturer advises avoid in severe impairment unless patient is closely monitored—no information available.

• MONITORING REQUIREMENTS

▶ When used for Uterine fibroids Manufacturer advises to perform liver function tests at least monthly during treatment—discontinue if serum transaminases exceed 2 times the upper limit of normal; an additional test, 2–4 weeks after treatment has stopped, is also advised. Manufacturer advises periodic monitoring of the endometrium following repeated intermittent treatment.

• PATIENT AND CARER ADVICE

- ▶ When used for Emergency contraception If vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
 - that their next period may be early or late;
 - that a barrier method of contraception needs to be used until the next period;

- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

Treatment free intervals

- ▶ When used for Uterine fibroids The prescriber should explain the requirement for treatment free intervals.

Missed doses

- ▶ When used for Uterine fibroids If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet **POm** £114.13 DT = £114.13

3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only Norethisterone, p. 747

PROGESTOGENS

Desogestrel

• INDICATIONS AND DOSE

Contraception

▶ BY MOUTH

- ▶ Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'

• **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

• **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

CAUTIONS, FURTHER INFORMATION

- ▶ Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

• **INTERACTIONS** → Appendix 1: desogestrel

• SIDE-EFFECTS

- ▶ **Common or very common** Breast abnormalities · depressed mood · headache · libido decreased · menstrual cycle

irregularities · mood altered · nausea · skin reactions · weight increased

- ▶ **Uncommon** Alopecia · contact lens intolerance · fatigue · ovarian cyst · vomiting · vulvovaginal infection
- ▶ **Rare or very rare** Erythema nodosum
- ▶ **Frequency not known** Angioedema · embolism and thrombosis · neoplasms

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestogen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

● PATIENT AND CARER ADVICE

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue

normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Levonorgestrel

16-Apr-2018

● INDICATIONS AND DOSE

Emergency contraception

▶ BY MOUTH

- ▶ Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time), alternatively 3 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time). Higher dose should be considered for patients with body-weight over 70 kg or BMI over 26 kg/m²

Contraception

▶ BY MOUTH

- ▶ Females of childbearing potential: 30 micrograms daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a "missed pill"

JAYDESS® 13.5MG INTRA-UTERINE DEVICE

Contraception

▶ BY INTRA-UTERINE ADMINISTRATION

- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of

continued →

menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

KYLEENA® 19.5MG INTRA-UTERINE DEVICE

Contraception

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery and not before uterus is fully involuted; effective for 5 years

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery and not before uterus is fully involuted; effective for 4 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

- **UNLICENSED USE** [EvGr] Dose for emergency contraception in patients with body-weight over 70 kg or BMI over 26 kg/m² differs from product licence. Use for emergency contraception between 72–96 hours after coitus differs from product licence. **A**
- With oral use in children Consult product literature for licensing status of individual preparations.
- With vaginal use in children Not licensed for use in women under 18 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;

- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

● CONTRA-INDICATIONS

- With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute malignancies affecting the blood (use with caution in remission) · acute vaginitis · distorted uterine cavity · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · increased risk factors for pelvic infections · infected abortion during the previous three months · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · unexplained uterine bleeding · unresolved cervical intraepithelial neoplasia · uterine or cervical malignancy
- With oral use Acute porphyrias p. 1025
- When used for contraception with oral use History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS

GENERAL CAUTIONS Risk factors for ectopic pregnancy (including previous ectopic pregnancy, tubal surgery or pelvic infection)

SPECIFIC CAUTIONS

- With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · acute venous thromboembolism (consider removal) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · jaundice (consider removal) · marked increase of blood pressure (consider removal) · menorrhagia (progestogen intra-uterine system might be preferable) · migraine (consider removal) · nulliparity · severe arterial disease (consider removal) · severe cervical stenosis · severe headache (consider removal) · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
 - When used for contraception with oral use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
 - When used for emergency contraception with oral use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes
- CAUTIONS, FURTHER INFORMATION** An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.
- Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually

transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

- ▶ Use as a contraceptive in co-morbidities
- ▶ With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1: levonorgestrel

• SIDE-EFFECTS

▶ Common or very common

- ▶ With intra-uterine use Back pain · breast abnormalities · depression · device expulsion · gastrointestinal discomfort · headaches · hirsutism · increased risk of infection · libido decreased · menstrual cycle irregularities · nausea · nervousness · ovarian cyst · pelvic disorders · skin reactions · uterine haemorrhage (on insertion) · vaginal haemorrhage (on insertion) · vulvovaginal disorders · weight increased
- ▶ With oral use Breast tenderness · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · haemorrhage · headaches · menstrual cycle irregularities · nausea · vomiting

▶ Uncommon

- ▶ With intra-uterine use Alopecia · endometritis · oedema · uterine rupture

▶ Rare or very rare

- ▶ With oral use Face oedema · pelvic pain · skin reactions

▶ Frequency not known

- ▶ With oral use Cerebrovascular insufficiency · depressed mood · diabetes mellitus · embolism and thrombosis · neoplasms · sexual dysfunction · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

With intra-uterine use There is no evidence of an association between the levonorgestrel intra-uterine system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of its use should be by a specialist in contraception and in consultation with the patients' cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including referring them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3–6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

• PREGNANCY

- ▶ With oral use Not known to be harmful.
- ▶ With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

• HEPATIC IMPAIRMENT

- ▶ With intra-uterine use or oral use for Contraception Manufacturer advises avoid in liver tumour.
- ▶ With oral use for Contraception or Emergency contraception Manufacturer advises avoid in severe impairment.
- ▶ With intra-uterine use Manufacturer advises avoid in severe impairment—no information available; avoid in acute hepatic diseases.

• MONITORING REQUIREMENTS

- ▶ With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

• PRESCRIBING AND DISPENSING INFORMATION

Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

JAYDESS® 13.5MG INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

KYLEENA® 19.5MG INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle, or in case of irregular menses, and if there is intercourse within 7 days.

LEVONELLE® ONE STEP Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

• PATIENT AND CARER ADVICE

Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine

- ▶ With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours

contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- ▶ With oral use for Emergency contraception Manufacturer advises if vomiting occurs within 3 hours of taking levonorgestrel, a replacement dose should be taken immediately.

When prescribing or supplying hormonal emergency contraception, women should be advised:

- that their next period may be early or late;
 - that a barrier method of contraception needs to be used until the next period;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
 - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).
 - ▶ With intra-uterine use Counsel women on the signs, symptoms and risks of perforation and ectopic pregnancy.
- Missed doses** When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

• NATIONAL FUNDING/ACCESS DECISIONS

KYLEENA® 19.5MG INTRA-UTERINE DEVICE

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2018) that levonorgestrel (Kyleena®) is accepted for use within NHS Scotland as a contraceptive device for up to 5 years.

- **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle® One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Other drugs used for Contraception, parenteral progestogen-only Norethisterone, p. 747

PROGESTOGENS

Etonogestrel

27-Sep-2016

• INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

- ▶ BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

- ▶ BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

- ▶ BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

- ▶ BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **UNLICENSED USE** *Nexplanon*® not licensed for use in females outside of the age range 18–40 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2016): *NEXPLANON*® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULATURE AND LUNG

There have been rare reports of *Nexplanon*® implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- **INTERACTIONS** → Appendix 1: etonogestrel

SIDE-EFFECTS

- **Common or very common** Abdominal pain · alopecia · anxiety · appetite increased · breast abnormalities · depressed mood · dizziness · emotional lability · fatigue · flatulence · headaches · hot flush · increased risk of infection · influenza like illness · libido decreased · menstrual cycle irregularities · nausea · ovarian cyst · pain · skin reactions · weight changes
- **Uncommon** Arthralgia · constipation · diarrhoea · drowsiness · dysuria · fever · galactorrhoea · genital abnormalities · hypertrichosis · insomnia · myalgia · oedema · vomiting · vulvovaginal discomfort
- **Frequency not known** Abscess · angioedema · embolism and thrombosis · haemorrhage · insulin resistance · neoplasms · paraesthesia · seborrhoea

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

Medroxyprogesterone acetate

24-May-2017

INDICATIONS AND DOSE**Dysfunctional uterine bleeding**

► BY MOUTH

- Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

Secondary amenorrhoea

► BY MOUTH

- Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

Mild to moderate endometriosis

► BY MOUTH

- Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

Progestogenic opposition of oestrogen HRT

► BY MOUTH

- Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

Endometrial cancer | Renal cell cancer

► BY MOUTH

- Adult: 200–600 mg daily

Breast cancer

► BY MOUTH

- Adult: 0.4–1.5 g daily

Contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), continued →

injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraceptive)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: (consult product literature)

Hot flushes caused by long-term androgen suppression in men with prostate cancer

► BY MOUTH

- Adult: 20 mg once daily initially for 10 weeks, evaluate effect at the end of the treatment period

- **UNLICENSED USE** [EvGr] Not licensed for the treatment of hot flushes caused by long-term androgen suppression in men. ⚠

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1025 · severe arterial disease · undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS

- With intramuscular use or subcutaneous use History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable
- With oral use Breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history of liver tumours

● CAUTIONS

GENERAL CAUTIONS Possible risk of breast cancer

SPECIFIC CAUTIONS

- With intramuscular use or subcutaneous use History during pregnancy in disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus
- With oral use Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

- **INTERACTIONS** → Appendix 1: medroxyprogesterone

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Alopecia · breast abnormalities · depression · dizziness · fluid retention · insomnia · menstrual cycle irregularities · nausea · sexual dysfunction · skin reactions · weight changes
- **Uncommon** Drowsiness · embolism and thrombosis · fever · galactorrhoea · hirsutism · muscle spasms · tachycardia

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Appetite increased · cervical abnormalities · constipation · fatigue · headache · hyperhidrosis · hypersensitivity · nervousness · oedema · tremor · vomiting
- With parenteral use Anxiety · asthenia · gastrointestinal discomfort · headaches · mood altered · pain · vulvovaginal infection
- **Uncommon**
- With oral use Congestive heart failure · corticoid-like effects · diabetes mellitus exacerbated · diarrhoea · dry mouth · euphoric mood · hypercalcaemia
- With parenteral use Appetite abnormal · arthralgia · hot flush · hypertension · ovarian cyst · painful sexual intercourse · uterine haemorrhage · varicose veins · vertigo · vulvovaginal disorders
- **Rare or very rare**
- With oral use Cerebral infarction · jaundice · malaise · myocardial infarction

- With parenteral use Breast cancer · lipodystrophy

► Frequency not known

- With oral use Adrenergic-like effects · cataract diabetic · concentration impaired · confusion · glycosuria · palpitations · visual impairment (discontinue if papilloedema or retinal vascular lesions)
- With parenteral use Hepatic disorders · osteoporosis · osteoporotic fractures · seizure

SIDE-EFFECTS, FURTHER INFORMATION

With oral use In general, side effects may be more common with high doses such as those used in malignant disease.

With parenteral use Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

● CONCEPTION AND CONTRACEPTION

- With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

● PREGNANCY

- With oral use Avoid—genital malformations and cardiac defects reported.
- With intramuscular use or subcutaneous use Not known to be harmful.

- **BREAST FEEDING** Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.

- With intramuscular use or subcutaneous use The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

- **HEPATIC IMPAIRMENT** Avoid in liver tumour.

- With oral use Avoid in hepatic impairment.
- With intramuscular use or subcutaneous use Caution in severe liver disease and recurrent cholestatic jaundice.

● RENAL IMPAIRMENT

- When used for Mild to moderate endometriosis or Progestogenic opposition of oestrogen HRT or Dysfunctional uterine bleeding or Secondary amenorrhoea Use with caution.

● PATIENT AND CARER ADVICE

- With intramuscular use or subcutaneous use Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Climanor** (ReSource Medical UK Ltd)

Medroxyprogesterone acetate 5 mg Climanor 5mg tablets | 28 tablet [PoM] £3.27

- **Provera** (Pfizer Ltd)

Medroxyprogesterone acetate 2.5 mg Provera 2.5mg tablets | 30 tablet [PoM] £1.84 DT = £1.84

Medroxyprogesterone acetate 5 mg Provera 5mg tablets | 10 tablet [PoM] £1.23 DT = £1.23 | 100 tablet [PoM] £12.32

Medroxyprogesterone acetate 10 mg Provera 10mg tablets | 10 tablet [PoM] £2.47 | 90 tablet [PoM] £22.16 DT = £22.16 | 100 tablet [PoM] £24.73

Medroxyprogesterone acetate 100 mg Provera 100mg tablets | 60 tablet [PoM] £29.98 | 100 tablet [PoM] £49.94 DT = £49.94
Medroxyprogesterone acetate 200 mg Provera 200mg tablets | 30 tablet [PoM] £29.65 DT = £29.65
Medroxyprogesterone acetate 400 mg Provera 400mg tablets | 30 tablet [PoM] £58.67 DT = £58.67

Suspension for injection

- ▶ **Depo-Provera** (Pfizer Ltd)
Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.01 DT = £6.01
- ▶ **Sayana Press** (Pfizer Ltd)
Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £6.90

3.6 Contraception, spermicidal

SPERMICIDALS

Noxoxinol

● INDICATIONS AND DOSE

Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

- ▶ BY VAGINA
- ▶ Females of childbearing potential: (consult product literature)

- **SIDE-EFFECTS** Genital erosion · increased risk of HIV infection · pain · paraesthesia · skin reactions · vaginal redness

SIDE-EFFECTS, FURTHER INFORMATION High frequency use of the spermicide noxoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.

- **CONCEPTION AND CONTRACEPTION** No evidence of harm to latex condoms and diaphragms.
- **PREGNANCY** Toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid

- ▶ **Gygel** (Marlborough Pharmaceuticals Ltd)
Noxoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 30 gram [GSL] £4.25 | 81 gram [GSL] £11.00

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

06-Mar-2017

Description of condition

Erectile dysfunction (impotence) is the persistent inability to attain and maintain an erection that is sufficient to permit satisfactory sexual performance. It can have physical or psychological causes. Erectile dysfunction can also be a side-effect of drugs such as antihypertensives, antidepressants, antipsychotics, cytotoxic drugs and recreational drugs (including alcohol).

Risk factors for erectile dysfunction include sedentary lifestyle, obesity, smoking, hypercholesterolaemia and

metabolic syndrome. Erectile dysfunction increases the risk of cardiovascular disease. All men with unexplained erectile dysfunction should be evaluated for the presence of cardiovascular risk factors and any identified risk should be addressed.

Drug treatment

[EvGr] The recommended approach for the management of erectile dysfunction is a combination of drug treatment and lifestyle changes (including regular exercise, reduction in body mass index, smoking cessation, and reduced alcohol consumption).

An oral phosphodiesterase type-5 inhibitor is the first-line drug treatment for erectile dysfunction, regardless of the cause. [A] These drugs act by increasing the blood flow to the penis. They do not initiate an erection—sexual stimulation is required.

The choice of oral phosphodiesterase type-5 inhibitor depends on the frequency of intercourse and response to treatment. [EvGr] Avanafil p. 794, sildenafil p. 794 and vardenafil p. 797 are short-acting drugs and are suitable for occasional use as required. Tadalafil p. 796 is a longer-acting drug. It can be used as required, but can also be used as a regular lower daily dose to allow for spontaneous (rather than scheduled) sexual activity or in those who have frequent sexual activity. A patient with erectile dysfunction should receive six doses of an individual phosphodiesterase type-5 inhibitor at the maximum dose (with sexual stimulation) before being classified as a non-responder. Patients who fail to respond to the maximum dose of at least two different phosphodiesterase type-5 inhibitors should be referred to a specialist.

Intracavernosal, intraurethral or topical application of alprostadil p. 798 (prostaglandin E₁) is recommended as second-line therapy under careful medical supervision. Intracavernosal or intraurethral preparations can also be used to aid diagnosis. [A]

Priapism associated with alprostadil

Manufacturers advise that patients should seek medical help if a prolonged erection lasting four hours or more occurs; application of an ice pack to the upper-inner thigh (alternating between the left and right thighs every two minutes for up to ten minutes) may result in reflex opening of the venous valves.

If priapism has lasted more than six hours, treatment should not be delayed; manufacturer advises management as follows:

- Initial therapy by penile aspiration: using aseptic technique, 20–50mL of blood should be aspirated using a 19–21 gauge butterfly needle inserted into the *corpus cavernosum*; if necessary the procedure may be repeated on the opposite side;
- Lavage: if initial aspiration is unsuccessful, a second 19–21 gauge butterfly needle can be inserted into the opposite *corpus cavernosum*; sterile physiological saline can be injected through the first needle and drained through the second;
- If aspiration and lavage are unsuccessful, intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors can be given, with continuous monitoring of blood pressure and pulse—see phenylephrine hydrochloride p. 800 [unlicensed indication], adrenaline/epinephrine p. 799 [unlicensed indication], and metaraminol p. 187 [unlicensed indication]. Extreme **caution** is required in patients with coronary heart disease, hypertension, cerebral ischaemia and in patients taking a monoamine-oxidase inhibitor (facilities for managing hypertensive crisis should be available when administered to patients taking MAOIs);
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle;

- If administration of a sympathomimetic drug is unsuccessful, urgent referral for surgical management is required.

Prescribing on the NHS

Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIII B of the Drug Tariff (Part XIB of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at:

National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff.

Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm.

Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/.

Related drugs

Other drugs used for Erectile dysfunction: aviptadil with phentolamine mesilate p. 800.

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Avanafil

22-Feb-2017

• INDICATIONS AND DOSE

Erectile dysfunction

► BY MOUTH

- Adult: Initially 100 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Erectile dysfunction in patients on alpha-blocker therapy

► BY MOUTH

- Adult: Initially 50 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. 100 mg once every 48 hours with concurrent use of moderate inhibitors of CYP3A4.

- **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg (no information available) · blood pressure >170/100 mmHg · hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · life-threatening arrhythmia in previous 6 months · mild to severe heart failure · patients in whom vasodilation or sexual activity are inadvisable · recent history of myocardial infarction · recent history of stroke · recent unstable angina

- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

• SIDE-EFFECTS

- **Common or very common** Headaches · nasal complaints · vasodilation
- **Uncommon** Asthenia · dizziness · drowsiness · dyspnoea exertional · gastrointestinal discomfort · muscle complaints · nausea · pain · palpitations · respiratory disorders · vision blurred · vomiting
- **Rare or very rare** Akathisia · angina pectoris · chest pain · diarrhoea · dry mouth · emotional disorder · gastritis ·

genital pruritus · gout · haematuria · hypertension · increased risk of infection · influenza like illness · insomnia · penis disorder · peripheral oedema · rash · seasonal allergy · sexual dysfunction · tachycardia · urinary frequency increased · weight increased

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
Dose adjustments Use lowest effective initial dose in mild to moderate impairment, adjusted according to response.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Onset of effect may be delayed if taken with food.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2015) that avanafil (*Spedra*®) is **not** recommended for use within NHS Scotland, for treatment of erectile dysfunction in men as the clinical and economic analysis presented was not sufficiently robust.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (July 2015) that avanafil (*Spedra*®) is recommended as an option for use within NHS Wales for the treatment of erectile dysfunction in men.

NHS restrictions *Spedra*® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XIB of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Spedra** (A. Menarini Farmaceutica Internazionale SRL) ▼

Avanafil 50 mg Spedra 50mg tablets | 4 tablet [PoM] £10.94 DT = £10.94 | 8 tablet [PoM] £19.70 DT = £19.70

Avanafil 100 mg Spedra 100mg tablets | 4 tablet [PoM] £14.08 DT = £14.08 | 8 tablet [PoM] £26.26 DT = £26.26

Avanafil 200 mg Spedra 200mg tablets | 4 tablet [PoM] £21.90 DT = £21.90 | 8 tablet [PoM] £39.40 DT = £39.40

Sildenafil

20-Jul-2017

• INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

► BY MOUTH

- Adult: 20 mg 3 times a day

► BY INTRAVENOUS INJECTION

- Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

Erectile dysfunction

► BY MOUTH

- Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

Digital ulcers [associated with systemic sclerosis]

► BY MOUTH

- Adult: 25 mg 3 times a day, increased to 50 mg 3 times a day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- When used for Erectile dysfunction Manufacturer advises a starting dose of 25 mg with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises

if concurrent use of ritonavir is unavoidable, the max. dose should not exceed 25 mg within 48 hours.

- ▶ With oral use for Pulmonary arterial hypertension
Manufacturer advises reduce dose to 20 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 20 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).
- ▶ With intravenous use for Pulmonary arterial hypertension
Manufacturer advises reduce dose to 10 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 10 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).

- **UNLICENSED USE**  Sildenafil is used for the treatment of digital ulcer,  but is not licensed for this indication.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) · patients in whom vasodilation or sexual activity are inadvisable · recent unstable angina
- ▶ When used for pulmonary arterial hypertension Sick-cell anaemia

● CAUTIONS

GENERAL CAUTIONS Active peptic ulceration · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction

SPECIFIC CAUTIONS

- ▶ When used for erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- ▶ When used for pulmonary arterial hypertension Anatomical deformation of the penis · autonomic dysfunction · hypotension (avoid if systolic blood pressure below 90 mmHg) · intravascular volume depletion · predisposition to priapism · pulmonary veno-occlusive disease

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dry mouth · eye discomfort · gastrointestinal discomfort · haemorrhage · myalgia · vertigo · vision disorders
- ▶ **Uncommon** Haematospermia · hypotension
- ▶ **Rare or very rare** Optic neuropathy (discontinue if sudden visual impairment occurs) · retinal occlusion

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Alopecia · anaemia · anxiety · cough · diarrhoea · eye erythema · fever · flushing · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nasal congestion · night sweats · pain · sensation abnormal · skin reactions · tremor
- ▶ With oral use Dizziness · headache · nasal complaints · nausea · vasodilation
- ▶ **Uncommon**
- ▶ With intravenous use Gynaecomastia
- ▶ With oral use Arrhythmias · chest pain · drowsiness · dry eye · eye disorders · eye inflammation · fatigue · feeling hot · gastroesophageal reflux disease · hearing impairment ·

hypertension · numbness · pain in extremity · palpitations · rash · rhinitis · sinus congestion · vomiting

▶ Rare or very rare

- ▶ With oral use Acute coronary syndrome · arteriosclerotic retinopathy · cerebrovascular insufficiency · glaucoma · irritability · oral hypoesthesia · priapism · scleral discolouration · seizure · severe cutaneous adverse reactions (SCARs) · sudden cardiac death · syncope · throat tightness

▶ Frequency not known

- ▶ With intravenous use Sexual dysfunction · sudden hearing loss
- **PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

Dose adjustments In pulmonary arterial hypertension, if usual dose not tolerated, reduce *oral* dose to 20 mg twice daily and *intravenous* dose to 10 mg twice daily.

For erectile dysfunction, use initial dose of 25 mg.

● RENAL IMPAIRMENT

Dose adjustments Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m².

In pulmonary hypertension, if usual dose not tolerated, reduce *oral* dose to 20 mg twice daily and *intravenous* dose to 10 mg twice daily.

● TREATMENT CESSATION

- ▶ When used for Pulmonary arterial hypertension Consider gradual withdrawal.

● PATIENT AND CARER ADVICE

- ▶ When used for Erectile dysfunction Onset of effect may be delayed if taken with food.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2010) that sildenafil tablets (*Revatio*®) is accepted for restricted use within NHS Scotland and should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

The *Scottish Medicines Consortium* has advised (March 2011) that sildenafil injection (*Revatio*®) is accepted for restricted use within NHS Scotland for patients with pulmonary arterial hypertension who are currently prescribed oral sildenafil and are temporarily unable to take oral medicine, and should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

NHS restrictions *Viagra*® is not prescribable in NHS primary care for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Sildenafil (Non-proprietary)

Sildenafil (as Sildenafil citrate) 20 mg Sildenafil 20mg tablets | 90 tablet  £379.38-£424.01 DT = £446.33

Tadalafil

20-Jul-2017

● INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

► BY MOUTH

► Adult: 40 mg once daily

Erectile dysfunction

► BY MOUTH

► Adult: Initially 10 mg (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, continuous daily use not recommended; maximum 1 dose per day

Erectile dysfunction; for patients who anticipate sexual activity at least twice a week

► BY MOUTH

► Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response

Benign prostatic hyperplasia

► BY MOUTH

► Adult: 5 mg once daily

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS History of non-arteritic anterior ischaemic optic neuropathy

SPECIFIC CONTRA-INDICATIONS

- When used for benign prostatic hyperplasia or erectile dysfunction Hypotension (avoid if systolic blood pressure below 90 mmHg) · mild to severe heart failure · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · recent stroke · uncontrolled arrhythmias · uncontrolled hypertension · unstable angina
- When used for pulmonary arterial hypertension Acute myocardial infarction in past 90 days

● CAUTIONS

- When used for benign prostatic hyperplasia or erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) ·

cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

- When used for pulmonary arterial hypertension Anatomical deformation of the penis · aortic and mitral valve disease · congestive cardiomyopathy · coronary artery disease · hereditary degenerative retinal disorders · hypotension (avoid if systolic blood pressure below 90 mmHg) · left ventricular dysfunction · life-threatening arrhythmias · pericardial constriction · predisposition to priapism · pulmonary veno-occlusive disease · uncontrolled hypertension

● **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

● SIDE-EFFECTS

- **Common or very common** Flushing · gastrointestinal discomfort · headaches · myalgia · nasal congestion · pain
- **Uncommon** Arrhythmias · chest pain · dizziness · dyspnoea · eye pain · fatigue · gastroesophageal reflux disease · haemorrhage · hypertension · hypotension · nausea · oedema · palpitations · skin reactions · tinnitus · vision disorders · vomiting
- **Rare or very rare** Acute coronary syndrome · angioedema · cerebrovascular insufficiency · eye erythema · eye swelling · haematospermia · hyperhidrosis · memory loss · optic neuropathy (discontinue if sudden visual impairment occurs) · priapism · retinal occlusion · seizure · Stevens-Johnson syndrome · sudden cardiac death · sudden hearing loss (discontinue drug and seek medical advice) · syncope

● **PREGNANCY** Manufacturer advises avoid.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● HEPATIC IMPAIRMENT

- When used for Pulmonary arterial hypertension Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.

- When used for Benign prostatic hyperplasia or Erectile dysfunction Manufacturer advises caution in severe impairment and for regular once-daily dosing—no information available.

Dose adjustments

- When used for Pulmonary arterial hypertension Manufacturer advises use initial dose of 20 mg once daily in mild-to-moderate impairment.
- When used for Erectile dysfunction Manufacturer advises maximum dose of 10 mg for intermittent use.

● RENAL IMPAIRMENT

- When used for Pulmonary arterial hypertension Manufacturer advises avoid in severe impairment.
- When used for Erectile dysfunction or Benign prostatic hyperplasia Manufacturer advises avoid regular once-daily dosing in severe impairment.

Dose adjustments

- When used for Pulmonary arterial hypertension Manufacturer advises initial dose of 20 mg once daily in mild-to-moderate impairment; dose may be increased to 40 mg once daily if tolerated.
- When used for Erectile dysfunction Manufacturer advises maximum dose of 10 mg for intermittent use in severe impairment.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2012) that tadalafil (*Adcirca*®) is accepted for restricted use within NHS Scotland for adults with pulmonary arterial hypertension and should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland. **NHS restrictions** *Cialis*® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of

the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

● INDICATIONS AND DOSE

Erectile dysfunction

► BY MOUTH USING TABLETS

► Adult: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

► BY MOUTH USING ORODISPERSIBLE TABLET

► Adult: 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

Erectile dysfunction (patients on alpha-blocker therapy)

► BY MOUTH USING TABLETS

► Adult: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

DOSE EQUIVALENCE AND CONVERSION

► *Levitra*® 10 mg orodispersible tablets and *Levitra*® 10 mg film coated tablets are **not** bioequivalent.

● **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg; hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · previous history of non-arteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina

● **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) · susceptibility to prolongation of QT interval

● **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

● SIDE-EFFECTS

- **Common or very common** Dizziness · flushing · gastrointestinal discomfort · headache · nasal congestion
- **Uncommon** Allergic oedema · angioedema · arrhythmias · back pain · diarrhoea · drowsiness · dry mouth · dyspnoea · eye discomfort · eye disorders · gastrointestinal disorders · hearing impairment · malaise · muscle complaints · muscle tone increased · nausea · palpitations · sensation abnormal · sinus congestion · skin reactions · sleep disorder · vertigo · vision disorders · vomiting
- **Rare or very rare** Angina pectoris · anxiety · chest pain · conjunctivitis · haemorrhage · hypertension · hypotension · memory loss · myocardial infarction · photosensitivity reaction · priapism · seizure · syncope
- **Frequency not known** Haematospermia · optic neuropathy (discontinue if sudden visual impairment occurs) · QT interval prolongation

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment. Orodispersible tablets not suitable for patients with moderate hepatic impairment.
Dose adjustments Initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment).

● **RENAL IMPAIRMENT** Orodispersible tablets not suitable if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m².

● PRESCRIBING AND DISPENSING INFORMATION

Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2011) that vardenafil orodispersible tablets (*Levitra*®) are accepted for restricted use within NHS Scotland for treatment of erectile dysfunction in men for whom an orodispersible tablet is an appropriate formulation.

NHS restrictions *Levitra*® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

LEVITRA® ORODISPERSIBLE TABLETS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2011) that vardenafil orodispersible tablets (*Levitra*®) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Orodispersible tablet

EXCIPIENTS: May contain Aspartame

► *Levitra* (Bayer Plc)

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg *Levitra* 10mg orodispersible tablets sugar-free | 4 tablet [PoM] £19.67 DT = £19.67

Tablet

► *Levitra* (Bayer Plc)

Vardenafil (as Vardenafil hydrochloride trihydrate) 5 mg *Levitra* 5mg tablets | 4 tablet [PoM] £8.32 DT = £8.32 | 8 tablet [PoM] £16.63

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg *Levitra* 10mg tablets | 4 tablet [PoM] £14.78 DT = £14.78 | 8 tablet [PoM] £29.57

Vardenafil (as Vardenafil hydrochloride trihydrate)

20 mg *Levitra* 20mg tablets | 4 tablet [PoM] £24.30 DT = £24.30 | 8 tablet [PoM] £48.60

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES > PROSTAGLANDINS

Alprostadil

20-Jul-2017

• INDICATIONS AND DOSE

Erectile dysfunction (initiated under specialist supervision)

- BY URETHRAL APPLICATION
- Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week

Aid to diagnosis of erectile dysfunction

- BY URETHRAL APPLICATION
- Adult: 500 micrograms for 1 dose

Erectile dysfunction

- TO THE SKIN
- Adult: Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

CAVERJECT®

Erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

- BY INTRACAVERNOSAL INJECTION
- Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

CAVERJECT® DUAL CHAMBER

Erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of

5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

- BY INTRACAVERNOSAL INJECTION
- Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

VRIDAL® DUO

Neurogenic erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

• CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) • not for use with other agents for erectile dysfunction • predisposition to prolonged erection (as in thrombocythemia, polycythemia, sickle cell anaemia, multiple myeloma or leukaemia) • urethral application contra-indicated in balanitis • urethral application contra-indicated in severe curvature • urethral application contra-indicated in severe hypospadias • urethral application contra-indicated in urethral stricture • urethral application contra-indicated in urethritis

SPECIFIC CONTRA-INDICATIONS

- With topical use Balanitis • severe curvature • severe hypospadias • urethral stricture • urethritis

- **CAUTIONS** Anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie's disease develop) • priapism (patients should be instructed to report any erection lasting 4 hours or longer)
- **INTERACTIONS** → Appendix 1: alprostadil
- **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intracavernosal use Haemorrhage • muscle spasms • penile disorders • sexual dysfunction • skin reactions
 - ▶ With topical use Balanoposthitis • genital abnormalities • penile disorders • rash • sexual dysfunction • urinary tract pain
 - ▶ With urethral use Dizziness • haemorrhage • headache • hypotension • muscle spasms • penile disorders • sexual dysfunction • urethral burning
 - ▶ **Uncommon**
 - ▶ With intracavernosal use Asthenia • balanoposthitis • dry mouth • extrasystole • hyperhidrosis • hypotension • increased risk of infection • inflammation • mydriasis • nausea • oedema • pelvic pain • peripheral vascular disease • presyncope • scrotal disorders • sensation abnormal • spermatocele • testicular disorders • urinary disorders • vascular disorders • vasodilation
 - ▶ With topical use Dizziness • hyperaesthesia • hypotension • muscle rigidity • pain in extremity • scrotal pain • syncope • urinary tract disorders
 - ▶ With urethral use Balanoposthitis • hyperhidrosis • increased risk of infection • leg pain • nausea • pelvic pain • perineal pain • peripheral vascular disease • scrotal disorders • sensation abnormal • skin reactions • spermatocele • syncope • testicular disorders • urinary disorders • vascular disorders • vasodilation
 - ▶ **Frequency not known**
 - ▶ With intracavernosal use Myocardial ischaemia • stroke
- **CONCEPTION AND CONTRACEPTION**
 - ▶ With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.
 - ▶ With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intracavernosal use The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
 - ▶ With urethral use During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.
- **PATIENT AND CARER ADVICE** Patients should be instructed to report any erection lasting 4 hours or longer.
- ▶ With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions *Caverject*®, *Viridal*® Duo, *Vitaros*® and *MUSE*® are not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under *How to use BNF publications*.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Stick

▶ *Muse* (Meda Pharmaceuticals Ltd)

Alprostadil 250 microgram *Muse* 250microgram urethral sticks | 1 applicator [PoM] £11.30 DT = £11.30 | 6 applicator [PoM] £67.79

Alprostadil 500 microgram *Muse* 500microgram urethral sticks | 1 applicator [PoM] £11.30 DT = £11.30 | 6 applicator [PoM] £67.79

Alprostadil 1 mg *Muse* 1000microgram urethral sticks | 1 applicator [PoM] £11.56 DT = £11.56 | 6 applicator [PoM] £65.67

Cream

▶ *Vitaros* (Ferring Pharmaceuticals Ltd)

Alprostadil 3 mg per 1 gram *Vitaros* 3mg/g cream | 4 applicator [PoM] £40.00

Powder and solvent for solution for injection

▶ *Caverject* (Pfizer Ltd)

Alprostadil 10 microgram *Caverject* 10microgram powder and solvent for solution for injection vials | 1 vial [PoM] £9.24 DT = £9.24
Caverject Dual Chamber 10microgram powder and solvent for solution for injection | 2 pre-filled disposable injection [PoM] £14.70

Alprostadil 20 microgram *Caverject* Dual Chamber 20microgram powder and solvent for solution for injection | 2 pre-filled disposable injection [PoM] £19.00

Caverject 20microgram powder and solvent for solution for injection vials | 1 vial [PoM] £11.94 DT = £11.94

Alprostadil 40 microgram *Caverject* 40microgram powder and solvent for solution for injection vials | 1 vial [PoM] £21.58 DT = £21.58

▶ *Viridal* (UCB Pharma Ltd)

Alprostadil 10 microgram *Viridal* Duo Starter Pack 10microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £20.13 (Hospital only)

Viridal Duo Continuation Pack 10microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £16.55

Alprostadil 20 microgram *Viridal* Duo Starter Pack 20microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £24.54 (Hospital only)

Viridal Duo Continuation Pack 20microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £21.39

Alprostadil 40 microgram *Viridal* Duo Starter Pack 40microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £29.83 (Hospital only)

Viridal Duo Continuation Pack 40microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £27.22

SYMPATHOMIMETICS > VASOCONSTRICTOR

Adrenaline/epinephrine

27-Sep-2017

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta; effects); it can cause peripheral vasodilation (a beta; effect) or vasoconstriction (an alpha effect).

INDICATIONS AND DOSE

Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)

▶ BY INTRACAVERNOSAL INJECTION

- ▶ **Adult:** 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution, **Important:** if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

- **UNLICENSED USE** The use of adrenaline for the treatment of priapism is an unlicensed indication.
- **CAUTIONS** Arteriosclerosis • arrhythmias • cerebrovascular disease • cor pulmonale • diabetes mellitus • elderly • hypercalcaemia • hyperreflexia • hypertension • hyperthyroidism • hypokalaemia • ischaemic heart disease • obstructive cardiomyopathy • occlusive vascular disease • organic brain damage • phaeochromocytoma • prostate

disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angina pectoris · angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · confusion · dizziness · dry mouth · dyspnoea · headache · hepatic necrosis · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension (increased risk of cerebral haemorrhage) · hypokalaemia · insomnia · intestinal necrosis · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitations · peripheral coldness · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · renal necrosis · soft tissue necrosis · tremor · urinary disorders · vomiting
- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

EXCIPIENTS: May contain Sulfites

► **Adrenaline/epinephrine (Non-proprietary)**

Adrenaline 1 mg per 1 ml Adrenaline (base) 10mg/10ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £87.62

Adrenaline (base) for anaphylaxis 1mg/1ml (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £10.40

Adrenaline (base) 1mg/1ml (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £10.40

Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml Adrenaline (base) 5mg/5ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £85.07

Adrenaline (base) 500micrograms/0.5ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £67.72 DT = £67.72

Adrenaline (base) 1mg/1ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £6.01 DT = £6.01

Metaraminol

• INDICATIONS AND DOSE

Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)

- BY INTRACAVERNOSAL INJECTION
- Adult: 1 mg every 15 minutes

- **UNLICENSED USE** Use for priapism is an unlicensed indication.
- **CONTRA-INDICATIONS** Hypertension
- **CAUTIONS** Associated with fatal hypertensive crises · cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
 - **Common or very common** Headache · hypertension
 - **Rare or very rare** Skin exfoliation · soft tissue necrosis
 - **Frequency not known** Abscess · arrhythmias · nausea · palpitations · peripheral ischaemia
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.

- **DIRECTIONS FOR ADMINISTRATION** For intracavernosal injection, dilute 1 mg (0.1 mL of 10 mg/mL) metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5 mL injections.

• MEDICINAL FORMS

VASODILATORS > PERIPHERAL VASODILATORS

Aviptadil with phentolamine mesilate

13-Sep-2017

- **DRUG ACTION** Phentolamine is a short-acting alpha-adrenoceptor antagonist that acts directly on vascular smooth muscle, resulting in vasodilatation; aviptadil is a vasoactive intestinal polypeptide that acts as a smooth muscle relaxant.

• INDICATIONS AND DOSE

Erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: 25/2000 micrograms, frequency of injection should not exceed once daily or three times weekly, duration of erection should not exceed 1 hour

DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y micrograms of aviptadil/phentolamine.

- **CONTRA-INDICATIONS** Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · not for use with other agents for erectile dysfunction · patients for whom sexual activity is inadvisable · penile implants · predisposition to priapism (e.g. in sickle cell anaemia or trait, multiple myeloma, or leukemia)
- **CAUTIONS** Concomitant treatment with anticoagulants (potential increased risk of bleeding) · history of psychiatric disorder or addiction (potential for abuse) · severe cardiovascular disease · severe cerebrovascular disease
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Bruising · flushing
 - ▶ **Uncommon** Dizziness · haematoma · headache · palpitations · tachycardia
 - ▶ **Rare or very rare** Angina pectoris · myocardial infarction · penile fibrosis (following multiple injections) · penile nodules · sexual dysfunction
- **MONITORING REQUIREMENTS** Manufacturer advises monitor regularly (e.g. every 3 months), particularly in the initial stages of self-injection therapy; careful examination of the penis is recommended to detect signs of penile fibrosis or Peyronie's disease—discontinue treatment in patients who develop penile angulation, cavernosal fibrosis, or Peyronie's disease.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that the initial injections of *Invicorp*® must be administered by medically trained personnel; self-administration may only be undertaken after proper training.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be instructed to report any erection lasting 4 hours or longer.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2017) that aviptadil with phentolamine (*Invicorp*®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of erectile dysfunction due to neurogenic, vasculogenic, psychogenic, or mixed aetiology in adult males who have failed on oral therapies (oral phosphodiesterase type-5 inhibitors) and other non-injectable formulations of erectile dysfunction medications.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (July 2017) that aviptadil with phentolamine (*Invicorp*®) is recommended as an option for the symptomatic treatment of erectile dysfunction in adult males due to neurogenic, vasculogenic, psychogenic, or mixed aetiology that has not responded to oral phosphodiesterase type-5 inhibitor therapy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Invicorp** (Evolan Pharma AB)
Aviptadil 71.43 microgram per 1 ml, Phentolamine mesilate 5.71 mg per 1 ml Invicorp 25micrograms/2mg/0.35ml solution for injection ampoules | 2 ampoule [PoM] £19.00 | 5 ampoule [PoM] £47.50

4.2 Premature ejaculation

Premature ejaculation

01-Aug-2017

Description of condition

Premature ejaculation is a common male sexual disorder characterised by brief ejaculatory latency, loss of control, and psychological distress.

Treatment

[EvGr] Non-drug treatment (including psychosexual counselling, education, and behavioural treatments) are recommended in patients for whom premature ejaculation causes few (if any) problems or in patients who prefer not to take drug treatment. These techniques can also be used in addition to a drug treatment.

For patients with life-long premature ejaculation, drug treatment is the recommended approach. **[A]** Dapoxetine below, a short-acting selective serotonin re-uptake inhibitor, is licensed to be used when required for this condition (not continuous daily use).

[EvGr] Other selective serotonin re-uptake inhibitors (citalopram p. 361, fluoxetine p. 362, fluvoxamine maleate p. 363, escitalopram p. 361, paroxetine p. 363, sertraline p. 364 [unlicensed indications]) and the tricyclic antidepressant clomipramine [unlicensed indication] have been widely used as regular, daily treatment. Caution is suggested in prescribing selective serotonin re-uptake inhibitors for young adolescents with premature ejaculation, and to men who also have a depressive disorder, particularly when associated with suicidal ideation. Ejaculation delay may start a few days after the start of treatment, but it is more evident after 1 to 2 weeks, since receptor desensitisation requires time to occur.

If premature ejaculation is secondary to Erectile dysfunction p. 793, the erectile dysfunction should be treated first. **[A]**

Topical anaesthetic preparations for the management of premature ejaculation are available without prescription.

SELECTIVE SEROTONIN RE-UP TAKE INHIBITORS

Dapoxetine

- **DRUG ACTION** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

INDICATIONS AND DOSE

Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes

▶ BY MOUTH

- ▶ **Adult:** Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 30 mg with concurrent use of moderate inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 60 mg.

continued →

- ▶ Manufacturer advises avoid with concurrent use of potent inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 30 mg.

- **CONTRA-INDICATIONS** History of bipolar disorder · history of mania · history of severe depression · history of syncope · significant cardiac disease · uncontrolled epilepsy
- **CAUTIONS** Bleeding disorders · epilepsy (discontinue if convulsions develop) · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: SSRIs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · asthenia · concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · gastrointestinal disorders · headache · hypotension · mood altered · nausea · paraesthesia · sexual dysfunction · sinus congestion · sleep disorders · sweat changes · syncope · tinnitus · tremor · vasodilation · vision blurred · vomiting · yawning
 - ▶ **Uncommon** Akathisia · arrhythmias · behaviour abnormal · confusion · depression · eye pain · feeling abnormal · feeling hot · hypertension · level of consciousness decreased · mydriasis · pruritus · taste altered · thinking abnormal · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if psychiatric disorder develops.
- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².
- **PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.
- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- **PATIENT AND CARER ADVICE**
 - Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

Induction of abortion

Gemeprost p. 807, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol p. 807 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone p. 806 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour

Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (*Syntocinon*®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol is given orally [unlicensed route] or vaginally for the induction of labour.

NICE Guidance, Induction of labour (updated July 2008), available at www.nice.org.uk/guidance/CG70.

Prevention and treatment of haemorrhage

Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (*Syntometrine*®) given intramuscularly, the dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (*Syntometrine*®) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony or
- ergometrine by intramuscular injection or
- ergometrine by slow intravenous injection (use with caution—risk of hypertension) or
- ergometrine with oxytocin (*Syntometrine*®) by intramuscular injection

Carboprost p. 805 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Misoprostol [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine maleate, and carboprost are not available or are inappropriate.

Mifepristone

For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]).

5 Obstetrics

Obstetrics

20-Sep-2017

Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 804, carbocetoin p. 805, ergometrine maleate p. 805, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

Ectopic pregnancy

Systemic methotrexate p. 888 [unlicensed indication] is used for the management of ectopic pregnancy.

Myometrial relaxants

Tocolytic drugs postpone *premature labour* and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban p. 806, is licensed for the inhibition of uncomplicated premature labour *between 24 and 33 weeks* of gestation. Atosiban may be preferable to a beta₂ agonist because it has fewer side effects. The dihydropyridine calcium-channel blocker nifedipine p. 162 also has fewer side-effects than a beta₂ agonist.

The beta₂ agonists salbutamol p. 252 and terbutaline sulfate p. 254 are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short acting beta₂ agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring.

Indometacin p. 1109, a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta₂ agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

5.1 Induction of labour

Other drugs used for Induction of labour Misoprostol, p. 807

PROSTAGLANDINS AND OXYTOCINS

Dinoprostone

● INDICATIONS AND DOSE

PROPESS®

Cervical ripening and induction of labour at term

► BY VAGINA

- Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

PROSTIN E2® VAGINAL GEL

Induction of labour

► BY VAGINA

- Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; maximum 3 mg per course

Induction of labour (unfavourable primigravida)

► BY VAGINA

- Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required, after 6 hours; maximum 4 mg per course

PROSTIN E2® VAGINAL TABLETS

Induction of labour

► BY VAGINA

- Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours, to be given if labour not established; maximum 6 mg per course

DOSE EQUIVALENCE AND CONVERSION

- Prostin E2 Vaginal tablets and Vaginal Gel are not bioequivalent.

- **CONTRA-INDICATIONS** Active cardiac disease • active pulmonary disease • avoid extra-amniotic route in cervicitis or vaginitis • fetal distress • fetal malpresentation • grand multiparas • history of caesarean section • history of difficult or traumatic delivery • history of major uterine surgery • major cephalopelvic disproportion • multiple pregnancy • placenta praevia or unexplained vaginal bleeding during pregnancy • ruptured membranes • untreated pelvic infection
- **CAUTIONS** Effect of oxytocin enhanced • history of asthma • history of epilepsy • history of glaucoma and raised intra-ocular pressure • hypertension • risk factors for disseminated intravascular coagulation • uterine rupture • uterine scarring
- **SIDE-EFFECTS**
 - **Uncommon** Amniotic cavity infection • febrile disorders • headache • hypotension • pruritus • uterine atony • vaginal burning
 - **Rare or very rare** Disseminated intravascular coagulation
 - **Frequency not known** Abdominal pain • diarrhoea • genital oedema • nausea • uterine rupture • vomiting
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid.
- **RENAL IMPAIRMENT** Manufacturers advise avoid.
- **MONITORING REQUIREMENTS**
 - Monitor for disseminated intravascular coagulation after parturition.
 - Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
 - Care needed in monitoring uterine activity when used in sequence following oxytocin.
- **PRESCRIBING AND DISPENSING INFORMATION Important:** Do not confuse dose of Prostin E2® vaginal gel with that of Prostin E2® vaginal tablets—not bioequivalent.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary

► Prostin E2 (Pfizer Ltd)

Dinoprostone 3 mg Prostin E2 3mg vaginal tablets | 8 pessary [PoM] £106.23 (Hospital only)

Vaginal gel

► Prostin E2 (Pfizer Ltd)

Dinoprostone 400 microgram per 1 ml Prostin E2 1mg vaginal gel | 2.5 ml [PoM] £13.28 (Hospital only)
Dinoprostone 800 microgram per 1 ml Prostin E2 2mg vaginal gel | 2.5 ml [PoM] £13.28 (Hospital only)

Vaginal device

► Propress (Ferring Pharmaceuticals Ltd)

Dinoprostone 10 mg Propress 10mg vaginal delivery system | 5 device [PoM] £165.00

Oxytocin

• INDICATIONS AND DOSE

Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

Caesarean section

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units immediately after delivery

Prevention of postpartum haemorrhage after delivery of placenta

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 10 units, can be used instead of oxytocin with ergometrine (*Syntometrine*®).

Treatment of postpartum haemorrhage

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, repeated if necessary

Treatment of severe cases of postpartum haemorrhage (following intravenous injection)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

Incomplete, inevitable, or missed miscarriage

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 unit/minute if required, the rate of infusion can be faster if necessary

- **UNLICENSED USE** Oxytocin doses in the BNF may differ from those in the product literature. Administration by intramuscular injection is an unlicensed use.

IMPORTANT SAFETY INFORMATION

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

- **CONTRA-INDICATIONS** Any condition where spontaneous labour inadvisable · any condition where vaginal delivery inadvisable · avoid intravenous injection during labour · avoid prolonged administration in oxytocin-resistant uterine inertia · avoid rapid intravenous injection (may transiently reduce blood pressure) · fetal distress (discontinue immediately if this occurs) · hypertonic uterine contractions (discontinue immediately if this occurs) · severe cardiovascular disease · severe pre-eclamptic toxemia
- **CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) · enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant) · history of lower-uterine segment caesarean section · induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant) · mild

pregnancy-induced cardiac disease · mild pregnancy-induced hypertension · moderate pregnancy-induced cardiac disease · moderate pregnancy-induced hypertension · risk factors for disseminated intravascular coagulation · secondary uterine inertia · women over 35 years

• SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · headache · nausea · vomiting
- ▶ **Rare or very rare** Dyspnoea · hypotension · rash
- ▶ **Frequency not known** Angioedema · disseminated intravascular coagulation · electrolyte imbalance · flushing · haemorrhage · myocardial ischaemia · pulmonary oedema · QT interval prolongation · uterine rupture · water intoxication

SIDE-EFFECTS, FURTHER INFORMATION Avoid rapid intravenous injection (may transiently reduce blood pressure).

Uterine hyperstimulation Usually occurs with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture.

Overdose Placental abruption and amniotic fluid embolism reported on overdose.

• MONITORING REQUIREMENTS

- ▶ Careful monitoring of fetal heart rate and uterine motility essential for dose titration.
- ▶ Monitor for disseminated intravascular coagulation after parturition.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Syntocinon*®), give continuously in Glucose 5% or Sodium chloride 0.9%. Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or enhancement of labour, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for injection

▶ Oxytocin (Non-proprietary)

Oxytocin 10 unit per 1 mL Oxytocin 10units/1mL solution for infusion ampoules | 5 ampoule [PoM] £3.00
Oxytocin 10units/1mL concentrate for solution for infusion ampoules | 5 ampoule [PoM] £4.55 | 10 ampoule [PoM] £9.00

▶ Syntocinon (Novartis Pharmaceuticals UK Ltd)

Oxytocin 5 unit per 1 mL Syntocinon 5units/1mL solution for injection ampoules | 5 ampoule [PoM] £4.01 (Hospital only)

Oxytocin 10 unit per 1 mL Syntocinon 10units/1mL solution for injection ampoules | 5 ampoule [PoM] £4.53 (Hospital only)

5.2 Postpartum haemorrhage

Other drugs used for Postpartum haemorrhage Oxytocin, above

PROSTAGLANDINS AND OXYTOCICS

Carbetocin

06-Feb-2018

● INDICATIONS AND DOSE

Prevention of uterine atony after caesarean section

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta

- **CONTRA-INDICATIONS** Eclampsia · epilepsy · pre-eclampsia
- **CAUTIONS** Asthma · cardiovascular disease (avoid if severe) · hyponatraemia · migraine

● SIDE-EFFECTS

- ▶ Common or very common Chest pain · chills · dizziness · dyspnoea · feeling hot · flushing · headache · hypotension · nausea · pain · pruritus · taste metallic · tremor · vomiting
- ▶ Frequency not known Hyperhidrosis · tachycardia

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2018) that carbetocin (*Pabal*®) is **not** recommended for use within NHS Scotland for the prevention of uterine atony following delivery of the infant by Caesarean section under epidural or spinal anaesthesia as the economic case was not demonstrated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Pabal** (Ferring Pharmaceuticals Ltd)
Carbetocin 100 microgram per 1 ml Pabal 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £88.20 (Hospital only)

Carboprost

● INDICATIONS AND DOSE

Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 250 micrograms, repeated if necessary, to be given at intervals of not less than 15 minutes. Total dose should not exceed 2 mg (8 doses)

- **CONTRA-INDICATIONS** Cardiac disease · pulmonary disease · untreated pelvic infection

- **CAUTIONS** Excessive dosage may cause uterine rupture · history of anaemia · history of asthma · history of diabetes · history of epilepsy · history of glaucoma · history of hypertension · history of hypotension · history of jaundice · history of raised intra-ocular pressure · uterine scars

● SIDE-EFFECTS

- ▶ Common or very common Chills · cough · diarrhoea · headache · nausea · uterine disorders · vasodilation · vomiting
- ▶ Uncommon Abdominal pain upper · asthma · back pain · breast tenderness · chest discomfort · dizziness · drowsiness · dry mouth · dyspnoea · eye pain · haemorrhage · hiccups · hyperhidrosis · hypertension · increased risk of infection · movement disorders · muscle complaints · paraesthesia · pelvic pain · respiratory disorders · septic shock · sleep disorder · syncope · tachycardia · taste altered · tinnitus · uterine injuries · vertigo · vision blurred

- ▶ Frequency not known Anxiety · asthenia · blepharospasm · choking sensation · palpitations · rash · thirst · throat complaints · thyrotoxic crisis

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Hemabate** (Pfizer Ltd)
Carboprost (as Carboxiprost trometamol) 250 microgram per 1 ml Hemabate 250micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £182.01 (Hospital only)

Ergometrine maleate

● INDICATIONS AND DOSE

Postpartum haemorrhage caused by uterine atony

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 250–500 micrograms

- **CONTRA-INDICATIONS** Eclampsia · first stage of labour · induction of labour · second stage of labour · sepsis · severe cardiac disease · severe hypertension · vascular disease

- **CAUTIONS** Acute porphyrias p. 1025 · cardiac disease · hypertension · multiple pregnancy · risk of hypertension associated with intravenous administration

- **INTERACTIONS** → Appendix 1: ergometrine

- **SIDE-EFFECTS** Abdominal pain · arrhythmias · chest pain · coronary vasospasm · dizziness · dyspnoea · headache · hypertension · myocardial infarction · nausea · palpitations · pulmonary oedema · rash · tinnitus · vasoconstriction · vomiting

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Ergometrine maleate (Non-proprietary)**

Ergometrine maleate 500 microgram per 1 ml Ergometrine 500micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £12.00-£15.00

Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate above, oxytocin p. 804.

● INDICATIONS AND DOSE

Active management of the third stage of labour | Postpartum haemorrhage caused by uterine atony

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1 mL for one dose
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: No longer recommended

Bleeding due to incomplete miscarriage or abortion

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Adjusted according to response to, the patient's condition and blood loss

- **INTERACTIONS** → Appendix 1: ergometrine

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Syntometrine** (Alliance Pharmaceuticals Ltd)

Ergometrine maleate 500 microgram per 1 mL, Oxytocin 5 unit per 1 mL Syntometrine 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £7.87

5.3 Premature labour

Other drugs used for Premature labour Nifedipine, p. 162

• Salbutamol, p. 252 • Terbutaline sulfate, p. 254

OXYTOCIN RECEPTOR ANTAGONISTS

Atosiban

● INDICATIONS AND DOSE

Uncomplicated premature labour between 24 and 33 weeks of gestation

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

- **CONTRA-INDICATIONS** Abruptio placenta • antepartum haemorrhage (requiring immediate delivery) • eclampsia • intra-uterine fetal death • intra-uterine infection • intra-uterine growth restriction with abnormal fetal heart rate • placenta praevia • premature rupture of membranes after 30 weeks' gestation • severe pre-eclampsia

- **CAUTIONS** Abnormal placental site • intra-uterine growth restriction

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness • headache • hot flush • hyperglycaemia • hypotension • nausea • tachycardia • vomiting
- ▶ **Uncommon** Fever • insomnia • skin reactions
- ▶ **Rare or very rare** Uterine atony • uterine haemorrhage
- ▶ **Frequency not known** Dyspnoea • pulmonary oedema

- **HEPATIC IMPAIRMENT** No information available.

- **RENAL IMPAIRMENT** No information available.

- **MONITORING REQUIREMENTS** Monitor blood loss after delivery.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Atosiban (Non-proprietary)**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 6.75mg/0.9ml solution for injection vials | 1 vial [PoM] £18.41 (Hospital only)

- ▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile 6.75mg/0.9ml solution for injection vials | 1 vial [PoM] £18.41 (Hospital only)

Solution for infusion

- ▶ **Atosiban (Non-proprietary)**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 37.5mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £52.82 (Hospital only) | 1 vial [PoM] £51.99
Atosiban 37.5mg/5ml solution for infusion vials | 1 vial [PoM] £51.09

Atosiban 6.75mg/0.9ml solution for injection ampoules |

1 ampoule [PoM] £17.99

- ▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

5.4 Termination of pregnancy

PROGESTERONE RECEPTOR MODULATORS

Mifepristone

- **DRUG ACTION** Mifepristone, an antiprogesterone steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

● INDICATIONS AND DOSE

Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 200 mg for 1 dose, to be taken 36–48 hours before procedure

Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 • chronic adrenal failure • suspected ectopic pregnancy (use other specific means of termination) • uncontrolled severe asthma

- **CAUTIONS** Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · haemorrhagic disorders · history of endocarditis · prosthetic heart valve · risk factors for cardiovascular disease
- **INTERACTIONS** → Appendix 1: mifepristone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal cramps · diarrhoea · infection · nausea · pelvic inflammatory disease · uterine disorders · vaginal haemorrhage (sometimes severe) · vomiting
 - ▶ **Uncommon** Hypotension
 - ▶ **Rare or very rare** Angioedema · chills · dizziness · erythema nodosum · fever · headache · hot flush · malaise · skin reactions · toxic epidermal necrolysis · toxic shock syndrome · uterine rupture
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).
- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.
- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10

▶ Mifepristone (Non-proprietary)

Mifepristone 200 mg Mifepristone 200mg tablets | 1 tablet

Mifepristone 200 mg Mifegyne 200mg tablets | 3 tablet 
 £52.66 (Hospital only)

PROSTAGLANDINS AND OXYTOCICS

Gemeprost

● INDICATIONS AND DOSE

Cervical ripening prior to first trimester surgical abortion

- ▶ BY VAGINA
- ▶ Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

Second trimester abortion

- ▶ BY VAGINA
- ▶ Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix, second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

Second trimester intra-uterine death

- ▶ BY VAGINA
- ▶ Adult: 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone | **Medical termination of intra-uterine pregnancy of 50–63 days gestation following mifepristone**

- ▶ BY VAGINA
- ▶ Adult: 1 mg

Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) following mifepristone

- ▶ BY VAGINA
- ▶ Adult: 1 mg every 3 hours, if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension); maximum 5 mg per course

- **CONTRA-INDICATIONS** Placenta praevia · unexplained vaginal bleeding · uterine scarring
- **CAUTIONS** Cardiovascular insufficiency · cervicitis · obstructive airways disease · raised intra-ocular pressure · vaginitis
- **SIDE-EFFECTS** Back pain · chest pain · chills · coronary vasospasm · diarrhoea · dizziness · dyspnoea · fever · flushing · headache · hypotension · muscle weakness · myocardial infarction · nausea · palpitations · uterine pain · uterine rupture · vaginal haemorrhage · vomiting
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
 - ▶ If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
 - ▶ When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary

▶ Gemeprost (Non-proprietary)

Gemeprost 1 mg Gemeprost 1mg pessaries | 5 pessary  

Misoprostol

26-Apr-2018

- **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that acts as a potent uterine stimulant.

● INDICATIONS AND DOSE

Termination of pregnancy following mifepristone (gestation up to 49 days)

- ▶ BY MOUTH
- ▶ Adult: 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone

Termination of pregnancy following mifepristone (gestation 50 to 63 days)

- ▶ INITIALLY BY VAGINA, OR BY BUCCAL ADMINISTRATION, OR BY SUBLINGUAL ADMINISTRATION
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)

- ▶ INITIALLY BY VAGINA
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)

- ▶ INITIALLY BY VAGINA
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours continued →

if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

MYSODELLE® VAGINAL DELIVERY SYSTEM

Induction of labour (specialist supervision in hospital)

- ▶ BY VAGINA
- ▶ Adult: 200 micrograms for 1 dose, to be inserted (in vaginal delivery system) high into posterior fornix; if oxytocin required, remove at least 30 minutes before oxytocin administration, for information on when to remove the delivery system—consult product literature

- **UNLICENSED USE** Use of misoprostol for termination of pregnancy is an unlicensed use.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MISOPROSTOL VAGINAL DELIVERY SYSTEM (MYSODELLE®): REPORTS OF EXCESSIVE UTERINE CONTRACTIONS (TACHYSYSTOLE) UNRESPONSIVE TO Tocolytic THERAPY (FEBRUARY 2018)

Mysodelle® can cause excessive uterine tachysystole that may not respond to tocolytic treatment. Monitor patients closely and remove the vaginal delivery system immediately in cases of excessive or prolonged uterine contractions, at the onset of labour, or if there is clinical concern for mother or baby.

Be prepared to administer tocolytic therapy—if needed, it can be administered immediately after removal of *Mysodelle*®.

● CONTRA-INDICATIONS

MYSODELLE® VAGINAL DELIVERY SYSTEM Before 36 weeks' gestation · chorioamnionitis (unless adequate prior treatment initiated) · fetal malpresentation · placenta praevia · suspicion or evidence of fetal compromise · unexplained vaginal bleeding after 24 weeks gestation · uterine abnormality · uterine scar

● CAUTIONS

▶ When used for termination of pregnancy Cardiovascular disease · risk factors for cardiovascular disease

MYSODELLE® VAGINAL DELIVERY SYSTEM Modified Bishop score greater than 4

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · nausea · rash · vomiting
- ▶ **Uncommon** Fever · haemorrhage · menstrual cycle irregularities · postmenopausal haemorrhage · uterine cramps
- ▶ **Frequency not known** Chills · uterine rupture
- **BREAST FEEDING** Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants. [EYGr](#) Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose. [D](#)

● HANDLING AND STORAGE

MYSODELLE® VAGINAL DELIVERY SYSTEM Manufacturer advises store in a freezer (-10 to -25°C); no thawing required prior to use.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

MYSODELLE® VAGINAL DELIVERY SYSTEM

All Wales Medicines Strategy Group (AWMSG) Decisions
AWMSG No. 3627

The *All Wales Medicines Strategy Group* has advised (March 2018) that misoprostol (*Mysodelle*®) is recommended as an option for use within NHS Wales for the induction of labour in women with an unfavourable cervix, from 36 weeks gestation, in whom induction is clinically indicated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Vaginal delivery system

▶ **Mysodelle** (Ferring Pharmaceuticals Ltd)

Misoprostol 7 microgram per 1 hour *Mysodelle* 200micrograms vaginal delivery system | 5 unit [PoM](#) £465.00

▶ **Misoprostol (Non-proprietary)**

Misoprostol 200 microgram *Misoprostol* 200microgram vaginal tablets | 4 tablet [PoM](#) [N](#) (Hospital only)

▶ **Topogyne** (Nordic Pharma Ltd)

Misoprostol 400 microgram *Topogyne* 400microgram tablets | 16 tablet [PoM](#) £128.00 (Hospital only)

6 Vaginal and vulval conditions

Vaginal and vulval conditions

Management

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

Aqueous medicated douches may disturb normal vaginal acidity and bacterial flora.

Topical anaesthetic agents give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis.

Vaginal and vulval changes

Topical HRT for vaginal atrophy

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is **important** to bear in mind that topical oestrogens should be used in the **smallest effective** amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of *topical* vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

Non-hormonal preparations for vaginal atrophy

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole p. 810, econazole nitrate p. 811, fenticonazole nitrate p. 811, and miconazole p. 811) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 584 or itraconazole p. 586 is also effective.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 533 or tinidazole p. 534.

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin below cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir p. 623, famciclovir p. 625, and valaciclovir p. 625 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

6.1a Vaginal and vulval bacterial infections

Other drugs used for Vaginal and vulval bacterial infections Metronidazole, p. 533

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

● INDICATIONS AND DOSE

DALACIN® 2% CREAM

Bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 1 applicatorful daily for 3–7 nights, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 applicatorful delivers a 5 g dose of clindamycin 2%.

● INTERACTIONS → Appendix 1: clindamycin

● SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions
- ▶ **Frequency not known** Constipation · diarrhoea (discontinue) · dizziness · gastrointestinal discomfort · headache · increased risk of infection · nausea · vertigo · vomiting · vulvovaginal irritation

SIDE-EFFECTS, FURTHER INFORMATION Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

● CONCEPTION AND CONTRACEPTION

DALACIN® 2% CREAM Damages latex condoms and diaphragms.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

▶ **Dalacin** (Pfizer Ltd)

Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram [PoM] £10.86 DT = £10.86

ANTISEPTICS AND DISINFECTANTS

Dequalinium chloride

13-Mar-2017

- **DRUG ACTION** Dequalinium chloride is a bactericidal anti-infective which causes bacterial cell death by increasing cell permeability and reducing enzyme activity.

● INDICATIONS AND DOSE

Bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult 18–55 years: 10 mg once daily for 6 days, inserted at night

● CONTRA-INDICATIONS Vaginal ulceration

● SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection · vulvovaginal disorders
- ▶ **Uncommon** Haemorrhage · headache · nausea
- ▶ **Frequency not known** Cystitis · fever

- **CONCEPTION AND CONTRACEPTION** Does not affect efficacy of latex condoms; however, manufacturer advises avoid use of non-latex condoms and intravaginal devices—no information available

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2016) that dequalinium chloride (*Fluomizin*®) is accepted for restricted use within NHS Scotland for treatment of bacterial vaginosis in patients for whom the initial treatment is not effective or well tolerated.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (November 2016) that dequalinium chloride (*Fluomizin*®) is recommended as an option for restricted use within NHS Wales for the treatment of bacterial vaginosis only after initial treatment is ineffective or not tolerated, as an alternative option to clindamycin vaginal cream.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Fluomizin** (KoRa Healthcare)

Dequalinium chloride **10 mg** Fluomizin 10mg vaginal tablets | 6 tablet **[PoM]** £6.95 DT = £6.95

CARBOXYLIC ACIDS

Lactic acid

- **INDICATIONS AND DOSE**

BALANCE ACTIV RX® GEL
Prevention of bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)

RELACTAGEL® GEL
Prevention of bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 5 mL daily for 2–3 nights after menstruation, insert the contents of one tube

Treatment of bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 5 mL daily for 7 nights, insert the contents of one tube

- **SIDE-EFFECTS** Skin irritation

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in shellfish allergy.

- **CONCEPTION AND CONTRACEPTION**

RELACTAGEL® GEL Not recommended if trying to conceive.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Propylene glycol

- ▶ **Balance Activ** (BBI Healthcare Ltd)

6.2 Vaginal atrophy

OESTROGENS**Estradiol****INDICATIONS AND DOSE****ESTRING®**

Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)

► BY VAGINA

► **Adult:** To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

VAGIFEM®

Improve the vaginal epithelium in menopausal atrophic vaginitis

► BY VAGINA

► **Adult:** 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndrome (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 1025 · diabetes (increased risk of heart disease) · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia; factors predisposing to thromboembolism · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · interrupt treatment periodically to assess need for continued treatment · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- **Risk of breast cancer** It is estimated that using *all* types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.
Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.
- **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously.

However, this should be weighed against the increased risk of breast cancer.

- **Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- **Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- **Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- **Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

SIDE-EFFECTS

- **Common or very common** Abdominal pain · headaches · nausea · skin reactions · vaginal haemorrhage · vulvovaginal disorders
- **Uncommon** Hypertension · vulvovaginal fungal infection · weight increased
- **Rare or very rare** Diarrhoea · embolism and thrombosis · endometrial hyperplasia · fluid retention · genital pruritus · increased risk of ischaemic stroke · insomnia · neoplasm malignant · neoplasms · vaginismus

SIDE-EFFECTS, FURTHER INFORMATION Cyclic HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is

recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant. **VAGIFEM**® No evidence of damage to latex condoms and diaphragms.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **MONITORING REQUIREMENTS**
 - ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
 - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

- ▶ **Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- ▶ **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **SIDE-EFFECTS** Breast abnormalities · cervical mucus increased · dementia · erythema nodosum · gallbladder disorder · headache · increased risk of coronary artery disease · increased risk of ischaemic stroke · increased risk of venous thromboembolism · nausea · neoplasms · skin reactions · vaginal haemorrhage · vaginal spotting · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** Effect on latex condoms and diaphragms not yet known.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **RENAL IMPAIRMENT** Manufacturer advises caution in renal disease. Evidence for caution is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- **MONITORING REQUIREMENTS**
 - ▶ Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).
 - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Ovestin** (Aspen Pharma Trading Ltd)

Estriol 1 mg per 1 gram Ovestin 1mg cream | 15 gram **[PoM]** £4.45

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease

Azathioprine p. 816, ciclosporin p. 818, mercaptopurine p. 887, and methotrexate p. 888 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 993 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 826), calcineurin inhibitors (ciclosporin or tacrolimus p. 821), corticosteroids, or sirolimus p. 820. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised— **important:** normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 1086 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 871 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

Prednisolone p. 664 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab p. 825 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 828 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation.

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

Other drugs used for Immune system disorders and transplantation Chloroquine, p. 604 • Everolimus, p. 950 • Hydroxychloroquine sulfate, p. 1062 • Rituximab, p. 859

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

28-Nov-2017

● INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

► BY INTRAVENOUS INFUSION

- Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

► BY INTRAVENOUS INFUSION

- Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

► BY INTRAVENOUS INFUSION

- Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

● CONTRA-INDICATIONS Infection

● SIDE-EFFECTS

- **Common or very common** Chills · diarrhoea · dysphagia · dyspnoea · fever · hypotension · infection · lymphopenia · myalgia · nausea · neoplasm malignant · neoplasms · neutropenia · reactivation of infection · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting

- **Uncommon** Cytokine release syndrome · hepatic disorders · hypersensitivity · infusion related reaction

SIDE-EFFECTS, FURTHER INFORMATION Tolerability is

increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion (Thymoglobuline®) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution;

give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481

Antithymocyte immunoglobulin (rabbit) is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

► **Thymoglobulin** (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM] £158.77 (Hospital only)

IMMUNOSUPPRESSANTS > ANTIMETABOLITES

Azathioprine

21-Mar-2018

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

● INDICATIONS AND DOSE

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis

► BY MOUTH

- Adult: 2–2.5 mg/kg daily, some patients may respond to lower doses

Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance

► BY MOUTH

- Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

Autoimmune conditions

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Suppression of transplant rejection

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Severe refractory eczema, normal or high TPMT activity

► BY MOUTH

- Adult: 1–3 mg/kg daily

Severe refractory eczema, intermediate TPMT activity

► BY MOUTH

► Adult: 0.5–1.5 mg/kg daily

Generalised myasthenia gravis

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

● **UNLICENSED USE** Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

CONTRA-INDICATIONS

► When used for severe refractory eczema Absent thiopurine methyltransferase (TPMT) activity · very low thiopurine methyltransferase (TPMT) activity

● **CAUTIONS** Reduce dose in elderly · reduced thiopurine methyltransferase activity

● **INTERACTIONS** → Appendix 1: azathioprine

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

► **Common or very common** Bone marrow depression (dose-related) · increased risk of infection · leucopenia · thrombocytopenia

► **Uncommon** Anaemia · hepatic disorders · hypersensitivity · pancreatitis

► **Rare or very rare** Agranulocytosis · alopecia · bone marrow disorders · diarrhoea · gastrointestinal disorders · neoplasms · photosensitivity reaction · pneumonitis · severe cutaneous adverse reactions (SCARs)

► **Frequency not known** Nodular regenerative hyperplasia · sinusoidal obstruction syndrome

SPECIFIC SIDE-EFFECTS

► With oral use Nausea

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may require drug withdrawal.

Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.

Neutropenia and thrombocytopenia Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.

Nausea Nausea is common early in the course of treatment and usually resolves after a few weeks without an alteration in dose. Moderate nausea can be managed by using divided daily doses, taking doses after food, prescribing concurrent antiemetics or temporarily reducing the dose.

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.

● **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine

during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

● **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

HEPATIC IMPAIRMENT

Dose adjustments Reduce dose.

Monitoring Monitor liver function.

RENAL IMPAIRMENT

Dose adjustments Reduce dose.

PRE-TREATMENT SCREENING

Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

MONITORING REQUIREMENTS

► Monitor for toxicity throughout treatment.

► Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

► Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion* (Imuran®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant, intravenous route should therefore be used **only** if oral route not feasible.

PATIENT AND CARER ADVICE

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin

01-Sep-2016

(Cyclosporin)

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

● INDICATIONS AND DOSE

Severe acute ulcerative colitis refractory to corticosteroid treatment

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

Severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 2.5 mg/kg daily in 2 divided doses, increased if necessary up to 4 mg/kg daily after 6 weeks, if dose increases are necessary they should be made gradually, discontinue if response insufficient after 3 months, dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks)

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Organ transplantation (used alone)

- ▶ BY MOUTH
- ▶ Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome

- ▶ BY MOUTH
- ▶ Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

- **UNLICENSED USE** Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **CONTRA-INDICATIONS** Abnormal baseline renal function (in non-transplant indications) · malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications)
- **CAUTIONS** Elderly—monitor renal function · hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behcet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Malignancy In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.
- **INTERACTIONS** → Appendix 1: ciclosporin
- **SIDE-EFFECTS**
 - ▶ Common or very common Appetite decreased · diarrhoea · electrolyte imbalance · fatigue · fever · flushing · gastrointestinal discomfort · gingival hyperplasia · hair changes · headaches · hepatic disorders · hyperglycaemia · hyperlipidaemia · hypertension · hyperuricaemia · leucopenia · muscle complaints · nausea · paraesthesia · peptic ulcer · renal impairment (renal structural changes on long-term administration) · seizure · skin reactions · tremor · vomiting
 - ▶ Uncommon Anaemia · encephalopathy · oedema · thrombocytopenia · weight increased

- ▶ **Rare or very rare** Eye inflammation · gynaecomastia · haemolytic anaemia · idiopathic intracranial hypertension · menstrual disorder · multifocal motor neuropathy · muscle weakness · myopathy · pancreatitis
- ▶ **Frequency not known** Pain in extremity · thrombotic microangiopathy
- **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT**
Dose adjustments Extensively metabolised by the liver—manufacturer advises consider dose adjustment based on bilirubin and liver enzyme levels.
- **RENAL IMPAIRMENT**
Dose adjustments In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
 - ▶ Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.
 - ▶ Monitor liver function.
 - ▶ Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia).
 - ▶ Monitor serum magnesium.
 - ▶ Measure blood lipids before treatment and after the first month of treatment.
 - ▶ In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
 - ▶ Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
 - ▶ Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.
 - ▶ Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
 - ▶ In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.
 - ▶ In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).
 - ▶ Monitor hepatic function if concomitant NSAIDs given.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not

mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.

- ▶ With intravenous use For *intravenous infusion* (Sandimmun®), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.
- **PRESCRIBING AND DISPENSING INFORMATION**
Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). *Sandimmun*® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of different formulations of ciclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Alcohol, polyoxyl castor oils

Sirolimus

16-Nov-2017

- **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

● INDICATIONS AND DOSE

Prophylaxis of organ rejection in kidney allograft recipients

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should be given 4 hours after ciclosporin), ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

DOSE EQUIVALENCE AND CONVERSION

- ▶ The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

- **CAUTIONS** Hyperlipidaemia • increased susceptibility to infection (especially urinary-tract infection) • increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

- **INTERACTIONS** → Appendix 1: sirolimus

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain • anaemia • arthralgia • ascites • constipation • diabetes mellitus • diarrhoea • dyslipidaemia • electrolyte imbalance • embolism and thrombosis • fever • haemolytic uraemic syndrome • haemorrhage • headache • healing impaired • hyperglycaemia • hypertension • increased risk of infection • leucopenia • lymphatic vessel disorders • menstrual cycle irregularities • nausea • neoplasms • neutropenia • oedema • osteonecrosis • ovarian cyst • pain • pancreatitis • pericardial effusion • proteinuria • respiratory disorders •

sepsis • skin reactions • stomatitis • tachycardia • thrombocytopenia

- ▶ **Uncommon** Antibiotic associated colitis • focal segmental glomerulosclerosis • hepatic failure • nephrotic syndrome • pancytopenia • post transplant lymphoproliferative disorder

- ▶ **Frequency not known** Posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Clearance reduced in mild to moderate impairment.

Dose adjustments In severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration.

Monitoring Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

● MONITORING REQUIREMENTS

- ▶ Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- ▶ Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using **chromatographic** assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
- ▶ Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
- ▶ When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended.
- ▶ Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
- ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus.
 Patients should be advised to avoid excessive exposure to UV light.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
- ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481
 Sirolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within

the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Tacrolimus

19-Mar-2018

● DRUG ACTION Tacrolimus is a calcineurin inhibitor.

● INDICATIONS AND DOSE

ADOPORT®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

ADVAGRAF®

Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg once daily, to be taken in the morning

Allograft rejection resistant to conventional immunosuppressive therapy

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

CAPEXION®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

ENVARSUS® MODIFIED-RELEASE TABLETS

Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 110–130 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 170 micrograms/kg once daily, to be taken in the morning

Rejection therapy

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

MODIGRAF®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft

rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- **Adoport[®], Prograf[®], Capexion[®], Tacni[®], and Vivadex[®]** are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- **Modigraf[®]** granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- **Advagraf[®]** is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: **Envarsus[®]** is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: tacrolimus

● **SIDE-EFFECTS**

● **GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · ascites · asthenic conditions · bile duct disorders · confusion · consciousness impaired · constipation · coronary artery disease · cough · depression · diabetes mellitus · diarrhoea · dizziness · dysgraphia · dyslipidaemia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorder · febrile disorders · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · haemorrhage · hallucination · headache · hearing impairment · hepatic disorders · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypotension · increased risk of infection · ischaemia · joint disorders · leucocytosis · leucopenia · metabolic acidosis · mood altered · muscle spasms · nasal complaints · nausea · nephropathy · nervous system disorder · oedema · oral disorders · pain · peripheral neuropathy · peripheral vascular disease · primary transplant dysfunction · psychiatric disorder · renal impairment · renal tubular necrosis · respiratory disorders · seizure · sensation abnormal · skin reactions · sleep disorders · temperature sensation altered · thrombocytopenia · tremor · urinary tract disorder · urine abnormal · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Asthma · cardiac arrest · cardiomyopathy · cataract · central nervous system haemorrhage · chest discomfort · coagulation disorders · coma · dysmenorrhoea · encephalopathy · feeling abnormal · haemolytic anaemia · heart failure · hypoglycaemia · hypoproteinaemia · influenza like illness · memory loss · multi organ failure · neutropenia · palpitations · pancreatitis · pancytopenia · paralysis · paresis · photosensitivity reaction · psychotic disorder · shock · speech disorder · stroke · ventricular hypertrophy
- ▶ **Rare or very rare** Fall · hirsutism · mobility decreased · muscle tone increased · muscle weakness · pancreatic pseudocyst · pericardial effusion · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · sinusoidal obstruction syndrome · thirst · ulcer
- ▶ **Frequency not known** Agranulocytosis · malignancy · neoplasms · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy · pure red cell aplasia

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Anaphylactoid reaction (due to excipient) · hypersensitivity
- SIDE-EFFECTS, FURTHER INFORMATION** Cardiomyopathy has been reported to occur primarily in children with tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT**
Dose adjustments Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
 - ▶ Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Prograf[®]*); give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.
- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481
Immediate-release tacrolimus, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. Tacrolimus granules for oral suspension (*Modigraf[®]*) should be used only if the manufacturer provides it at the same price or lower than that agreed with the Commercial Medicines Unit. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/TA481
 - ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481
Prolonged-release tacrolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without

change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2010) that tacrolimus granules for suspension (*Modigraf*[®]) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

The *Scottish Medicines Consortium* has advised (April 2015) that tacrolimus (*Envarsus*[®]) is accepted for use in NHS Scotland for prophylaxis of graft rejection and treatment of rejection resistant to treatment with other immunosuppressive medicinal products in adults.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumab

- **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

• INDICATIONS AND DOSE

Acute gout in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them

► BY SUBCUTANEOUS INJECTION

- Adult: 150 mg for 1 dose, dose may be repeated at least 12 weeks after initial response if symptoms recur, patients who do not respond to initial dose should not be retreated

Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

► BY SUBCUTANEOUS INJECTION

- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Active infection • leucopenia • neutropenia
- **CAUTIONS** History of recurrent infection • latent and active tuberculosis • predisposition to infection
- **CAUTIONS, FURTHER INFORMATION**
 - Vaccinations Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - Common or very common Abdominal pain upper • arthralgia • asthenia • dizziness • increased risk of infection • leucopenia • neutropenia • pain • proteinuria • vertigo
 - Uncommon Gastrooesophageal reflux disease
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.
- **HEPATIC IMPAIRMENT** No information available.
- **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.
- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS**
 - Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
 - Monitor for signs and symptoms of tuberculosis during and after treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Ilaris** (Novartis Pharmaceuticals UK Ltd)

Canakinumab 150 mg per 1 mL Ilaris 150mg/1mL solution for injection vials | 1 vial [PoM] £9,927.80

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Basiliximab

16-Nov-2017

● **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

INDICATIONS AND DOSE

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

● **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS** Anaemia • capillary leak syndrome • constipation • cytokine release syndrome • diarrhoea • dyspnoea • electrolyte imbalance • headache • heart failure • hypercholesterolaemia • hypersensitivity • hypertension • hypotension • increased risk of infection • myocardial infarction • nausea • pain • peripheral oedema • post procedural wound complication • pulmonary oedema • respiratory disorders • skin reactions • sneezing • tachycardia • weight increased

● **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.

● **PREGNANCY** Manufacturer advises avoid—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Simulect*®) give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481

Basiliximab, when used as part of an immunosuppressive regimen that includes a calcineurin inhibitor, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. The use of basiliximab with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding

arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial [PoM] £758.69 (Hospital only)

Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £842.38 (Hospital only)

Belimumab

24-Oct-2016

INDICATIONS AND DOSE

Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

● **CAUTIONS** Do not initiate until active infections controlled • history or development of malignancy • predisposition to infection

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- ▶ **Common or very common** Cystitis • depression • diarrhoea • fever • hypersensitivity • increased risk of infection • insomnia • leucopenia • migraine • nausea • pain in extremity
- ▶ **Uncommon** Angioedema • skin reactions
- ▶ **Frequency not known** Progressive multifocal leukoencephalopathy • vomiting

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.

● **PREGNANCY** Avoid unless essential.

● **BREAST FEEDING** Avoid—present in milk in animal studies.

● **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Benlysta*®), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ **Belimumab** for treating active autoantibody-positive systemic lupus erythematosus (June 2016) NICE TA397
Belimumab is recommended as an add-on treatment option in adults with active autoantibody-positive systemic lupus erythematosus, only if all of the following criteria apply:

- there is evidence for serological disease activity (defined as positive anti-double-stranded DNA and low complement) and a Safety of Estrogen in Lupus National Assessment – Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of greater than or equal to 10 despite standard therapy;
- treatment with belimumab is continued after 24 weeks only if the SELENA-SLEDAI score has improved by 4 points or more;
- the manufacturer provides belimumab with the discount agreed in the patient access scheme; **and**
- under the conditions specified in the NICE managed access agreement documentation.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA397

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2017) that belimumab (*Benlysta*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy, and who have evidence of serological disease activity and a Safety of Estrogens in Lupus Erythematosus National Assessment-Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of 10 or greater. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► *Benlysta* (GlaxoSmithKline UK Ltd) ▼

Belimumab 120 mg Benlysta 120mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £121.50 (Hospital only)

Belimumab 400 mg Benlysta 400mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £405.00 (Hospital only)

IMMUNOSUPPRESSANTS ► PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

09-Mar-2018

• INDICATIONS AND DOSE

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

► BY MOUTH

► Adult: 1 g twice daily, to be started within 72 hours of transplantation

► BY INTRAVENOUS INFUSION

► Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

► BY MOUTH

► Adult: 1.5 g twice daily, to be started within 5 days of transplantation

Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

► INITIALLY BY INTRAVENOUS INFUSION

► Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of

transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated

CEPTAVA®

Renal transplantation (specialist use only)

► BY MOUTH

► Adult: 720 mg twice daily, to be started within 72 hours of transplantation

DOSE EQUIVALENCE AND CONVERSION

► For *Ceptava*®: mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

MYFORTIC®

Renal transplantation (specialist use only)

► BY MOUTH

► Adult: 720 mg twice daily, to be started within 72 hours of transplantation

DOSE EQUIVALENCE AND CONVERSION

► For *Myfortic*®: mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS (FEBRUARY 2018)

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see Conception and contraception and Patient and carer advice.

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION

- Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- **INTERACTIONS** → Appendix 1: mycophenolate
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- **Common or very common** Acidosis · alopecia · anaemia · appetite decreased · arthralgia · asthenia · bone marrow disorders · chills · constipation · cough · depression · diarrhoea · drowsiness · dyslipidaemia · dyspnoea · electrolyte imbalance · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · headache · hyperglycaemia · hypertension · hypotension · increased risk of infection · insomnia · leucocytosis · leucopenia · malaise · nausea · neoplasms · oedema · oral disorders · pain · pancreatitis · paraesthesia · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thinking abnormal · thrombocytopenia · tremor · vomiting · weight decreased
- **Uncommon** Agranulocytosis
- **Frequency not known** Endocarditis · hypogammaglobulinaemia · malignancy · meningitis ·

neutropenia · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy · pure red cell aplasia

SPECIFIC SIDE-EFFECTS

► Common or very common

- With intravenous use Hepatitis · muscle tone increased
- With oral use Anxiety · burping · confusion · dizziness · gout · hepatic disorders · hyperbilirubinaemia · hyperuricaemia · neuromuscular dysfunction · taste altered · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

● CONCEPTION AND CONTRACEPTION

Pregnancy prevention The MHRA advises to exclude pregnancy in females of child-bearing potential before treatment—2 pregnancy tests 8–10 days apart are recommended. Women should use at least 1 method of effective contraception before and during treatment, and for 6 weeks after discontinuation—2 methods of effective contraception are preferred. Male patients or their female partner should use effective contraception during treatment and for 90 days after discontinuation.

● PREGNANCY

Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.

● BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

● RENAL IMPAIRMENT

No data available in cardiac or hepatic transplant patients with renal impairment.

● MONITORING REQUIREMENTS

Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

● DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (*CellCept*®), give intermittently in Glucose 5%; reconstitute each 500–mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.

● PATIENT AND CARER ADVICE

Pregnancy prevention advice The MHRA advises that prescribers should ensure that female patients understand the need to comply with the pregnancy prevention advice, and they should be informed to seek immediate medical attention if there is a possibility of pregnancy; male patients planning to conceive children should be informed of the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy. **Bone marrow suppression** Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481
Mycophenolate mofetil, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. The use of mycophenolate mofetil with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding

arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

- Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481

Mycophenolate sodium (*Ceptava*®, *Myfortic*®) is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

1.1 Multiple sclerosis

Multiple sclerosis

02-Nov-2016

Description of condition

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

Relapsing-remitting multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into *secondary-progressive* multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

Primary-progressive multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

Progressive-relapsing multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

Disease activity in relapsing-remitting multiple sclerosis

Active disease is defined as at least two clinically significant relapses occurring within the last 2 years. *Highly active* disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 830. *Rapidly-evolving severe* relapsing-remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain

magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. [Evgri](#) A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. [A](#) The choice of drug also depends on the patient's disability status, individual tolerance, disease severity and disease activity (see *Disease activity in relapsing-remitting multiple sclerosis* above). [Evgri](#) Treatment should be initiated as early as possible, under the supervision of a specialist. [A](#)

Note: NHS England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 832, fingolimod p. 834 and natalizumab p. 837 for the treatment of multiple sclerosis in England, see *Useful resources* below. This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also *National funding/access decisions*, under individual monographs for teriflunomide p. 839, dimethyl fumarate p. 833 and alemtuzumab p. 837.

Low levels of vitamin D are believed to be a risk factor for developing multiple sclerosis. Patients with diagnosed multiple sclerosis are usually given regular vitamin D after assessment of their serum levels of vitamin D, but there is insufficient evidence to support its use as a treatment for multiple sclerosis. [Evgri](#) Patients should not be offered vitamin D solely for the purpose of treating multiple sclerosis. [A](#)

Relapsing-remitting multiple sclerosis

[Evgri](#) Disease-modifying drugs are the recommended treatment for patients presenting with *active* relapsing-remitting multiple sclerosis. Interferon beta and glatiramer acetate may be the preferred choice for some patients, due to their established safety profile, and the long term clinical experience associated with their use. [A](#) Peginterferon beta-1a p. 832 requires less frequent administration and is available as an alternative to the non-pegylated interferon beta therapies.

Teriflunomide and dimethyl fumarate are treatment options for patients with *active* disease. [Evgri](#) They may be preferred due to their oral route of administration. [A](#) There is insufficient evidence for the use of either drug to treat *highly active* or *rapidly-evolving severe* relapsing-remitting multiple sclerosis.

[Evgri](#) More active disease may be treated with natalizumab or alemtuzumab. Natalizumab may be preferred due to the complex safety profile associated with alemtuzumab. Natalizumab is only recommended for the treatment of *rapidly-evolving severe* relapsing-remitting multiple sclerosis. Although licensed as a treatment option in all patients with *active* disease, alemtuzumab may be used more frequently in patients for whom other disease-modifying treatments have not been effective, due to the risk of serious side effects associated with its use.

Fingolimod is also taken by the oral route and is the recommended treatment for patients with *highly active* disease. [A](#) The NHS England Clinical Commissioning Policy (see *Useful resources* below) advises that fingolimod is

a suitable alternative for patients receiving natalizumab who are at high risk of developing progressive multifocal leukoencephalopathy (defined as patients previously exposed to the JC virus or who are receiving immunosuppressants or who have been receiving treatment with natalizumab for more than 2 years).

Secondary progressive multiple sclerosis

Currently, only interferon beta 1b is licensed for use in secondary progressive multiple sclerosis. Interferon beta 1b reduces the risk of relapse and of short-term relapse-related disability, but does not prevent the development of permanent physical disability or retard progression once it is established. Therefore its role in secondary progressive disease is limited.

Primary progressive multiple sclerosis

Currently there are no effective disease-modifying treatments licensed for primary progressive multiple sclerosis. Interferon beta (unlicensed indication) has been used, but there is limited evidence to support its use due to the lack of a significant reduction in disability progression.

Progressive-relapsing multiple sclerosis

There are no specific treatment options for this type of multiple sclerosis. None of the currently licensed disease-modifying drugs are recommended in non-relapsing progressive disease.

Management of symptoms

Other than episodes of neurological dysfunction, chronic symptoms (such as fatigue, spasticity, visual problems, and emotional lability) produce much of the disability in multiple sclerosis. [Evgri](#) Smoking may increase the progression of disability in multiple sclerosis, and cessation should be encouraged. [A](#)

Relapses

Suspected relapses should be referred to a specialist for diagnosis and treatment. [Evgri](#) Corticosteroids are recommended for reducing inflammation and accelerating recovery in acute relapses of relapsing-remitting multiple sclerosis. Oral methylprednisolone p. 663 is recommended as the first-line option. Intravenous methylprednisolone should be considered as an alternative if oral methylprednisolone has failed or is not tolerated or if hospitalisation is required. [A](#)

Fatigue and impaired mobility

[Evgri](#) Regular exercise may have beneficial effects on mobility and fatigue in patients with multiple sclerosis, and should be encouraged. Cognitive behavioural techniques for fatigue should also be considered in combination with exercise. Amantadine hydrochloride p. 412 [unlicensed indication] may be used to treat fatigue related to multiple sclerosis. Vitamin B₁₂ injections are **not** recommended as a treatment for fatigue in patients with multiple sclerosis. [A](#) Fampridine p. 830 is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability. [Evgri](#) NICE do not consider it to be a cost-effective treatment and do not recommend its use. [A](#)

Spasticity

Many factors may aggravate spasticity in multiple sclerosis, including constipation, infection, poor mobility aids, pressure ulcers, posture and pain. [Evgri](#) These causes should be managed appropriately. The first-line options for managing spasticity in multiple sclerosis are baclofen p. 1092 or gabapentin p. 314 [unlicensed indication]. They may be used cautiously in combination if the individual drugs are ineffective or if side effects prevent an increase in the dose of either drug. Tizanidine p. 1094 or dantrolene sodium p. 1307 are second-line options; benzodiazepines may be used as third-line therapy and may also be effective in treating nocturnal spasms. [A](#) A cannabis extract p. 1092 containing dronabinol and cannabidiol is licensed as an

adjunct treatment for moderate-to-severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. **EvGr** NICE do not consider it to be a cost-effective treatment and do not recommend its use. **A**

Oscillopsia

EvGr Gabapentin [unlicensed indication] is the first-line treatment for oscillopsia; memantine hydrochloride p. 303 [unlicensed indication] is the second-line option. **A**

Emotional lability

EvGr Amitriptyline hydrochloride p. 369 [unlicensed indication] may be used to treat emotional lability in patients with multiple sclerosis. **A**

CHOLINERGIC RECEPTOR STIMULATING DRUGS

Fampridine

21-Mar-2017

● INDICATIONS AND DOSE

Improvement of walking disability in multiple sclerosis (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

- **CONTRA-INDICATIONS** History of seizures (discontinue treatment if seizures occur)
- **CAUTIONS** Atrioventricular conduction disorders · predisposition to seizures · sinoatrial conduction disorders · symptomatic cardiac rhythm disorders
- **INTERACTIONS** → Appendix 1: fampridine
- **SIDE-EFFECTS**
 - ▶ Common or very common Anxiety · asthenia · balance impaired · constipation · dizziness · dyspepsia · dyspnoea · headache · insomnia · laryngeal pain · nausea · pain · palpitations · paraesthesia · tremor · urinary tract infection · vomiting
 - ▶ Uncommon Seizure · skin reactions · tachycardia
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 80 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2016) that fampridine (*Fampyra*®) is **not** recommended for use within NHS Scotland for the improvement of walking in adult patients with multiple sclerosis (MS) with walking disability (EDSS [expanded disability status scale] 4 to 7) as the economic case was not demonstrated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Interferon beta

● INDICATIONS AND DOSE

AVONEX® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

AVONEX® VIAL

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

BETAFERON® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

EXTAVIA®

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

REBIF® CARTRIDGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature)

REBIF® PRE-FILLED PEN AND SYRINGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** Decompensated liver disease · severe depressive illness

CONTRA-INDICATIONS, FURTHER INFORMATION

Consult product literature for further information on contra-indications.

- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

CAUTIONS, FURTHER INFORMATION Consult product literature for further information on cautions.

- **INTERACTIONS** → Appendix 1: interferons

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Common or very common** Alopecia · appetite decreased · arrhythmias · arthralgia · asthenia · chills · confusion · depression · diarrhoea · fever · headaches · hypothyroidism · influenza like illness (decreasing over time) · insomnia · malaise · menstrual cycle irregularities · nausea · neuromuscular dysfunction · pain · skin reactions · sweat changes · vasodilation · vomiting · weight changes
- **Uncommon** Emotional lability · glomerulonephrosis · hepatic disorders · nephrotic syndrome · seizure · suicidal ideation · thrombocytopenia
- **Rare or very rare** Cardiomyopathy · dyspnoea · haemolytic uraemic syndrome · hyperthyroidism · thrombotic microangiopathy
- **Frequency not known** Anxiety · chest pain · dizziness · hypersensitivity · muscle weakness · palpitations · pulmonary arterial hypertension

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intramuscular use Muscle complaints · myeloskeletal stiffness · rhinorrhoea · sensation abnormal
- With subcutaneous use Anaemia
- **Rare or very rare**
- With subcutaneous use Bronchospasm · pancreatitis · thyroid disorder
- **Frequency not known**
- With intramuscular use Angioedema · arthritis · congestive heart failure · neurological effects · pancytopenia · psychosis · syncope · systemic lupus erythematosus (SLE)
- With subcutaneous use Abdominal pain · abscess · capillary leak syndrome · conjunctivitis · constipation · cough aggravated · ear pain · erectile dysfunction · eye disorder · hypertension · increased risk of infection · lupus-like

syndrome · lymphadenopathy · myalgia · paraesthesia · peripheral oedema · urinary disorders · visual impairment

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment.
- **RENAL IMPAIRMENT** Caution in severe renal impairment.
- **MONITORING REQUIREMENTS**
 - Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
 - Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
 - Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

● PRESCRIBING AND DISPENSING INFORMATION

REBIF® CARTRIDGE Cartridges for use with *RebiSmart*® auto-injector device.

BETAFERON® INJECTION An auto-injector device (*Betaject*® Light) is available from Bayer Schering.

EXTAVIA® An auto-injector device (*ExtaviPro*® 30G) is supplied as part of the *ExtaviPro*® 30G kit.

● NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

- **Interferon beta and glatiramer acetate for multiple sclerosis (January 2002)** NICE TA32
Interferon beta and glatiramer acetate are **not** recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

www.nice.org.uk/TA32

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of interferon beta for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/wp-content/uploads/sites/12/2013/10/d04-p-b.pdf.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- **Avonex** (Biogen Idec Ltd)

Interferon beta-1a 12 mega u per 1 ml Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 4 pre-filled disposable injection [POM] £654.00 | 12 pre-filled disposable injection [POM] £1,962.00

Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled pen | 4 pre-filled disposable injection [POM] £654.00 | 12 pre-filled disposable injection [POM] £1,962.00

► **Rebif** (Merck Serono Ltd)

Interferon beta-1a 12 mega u per 1 ml Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £613.52
 Rebif 22micrograms/0.5ml (6million units) solution for injection 1.5ml cartridges | 4 cartridge [PoM] £613.52
 Rebif 8.8micrograms/0.2ml (2.4million units) solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] [S]
 Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled pen | 12 pre-filled disposable injection [PoM] £613.52
Interferon beta-1a 24 mega u per 1 ml Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled pen | 12 pre-filled disposable injection [PoM] £813.21
 Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £813.21
 Rebif 44micrograms/0.5ml (12million units) solution for injection 1.5ml cartridges | 4 cartridge [PoM] £813.21

Powder and solvent for solution for injection

► **Betaferon** (Bayer Plc)

Interferon beta-1b 300 microgram Betaferon 300microgram powder and solvent for solution for injection vials | 15 vial [PoM] £596.63 (Hospital only)

► **Extavia** (Novartis Pharmaceuticals UK Ltd)

Interferon beta-1b 300 microgram Extavia 300microgram powder and solvent for solution for injection vials | 15 vial [PoM] £596.63

Peginterferon beta-1a

- **DRUG ACTION** Peginterferon beta-1a is a polyethylene glycol-conjugated ('pegylated') derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

● **INDICATIONS AND DOSE**

Treatment of relapsing, remitting multiple sclerosis

- BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Severe depression · suicidal ideation
- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

CAUTIONS, FURTHER INFORMATION Consult product literature for further information about cautions.

- **INTERACTIONS** → Appendix 1: peginterferon beta-1a
- **SIDE-EFFECTS**
 - **Common or very common** Arthralgia · asthenia · chills · depression · fever · headache · hyperthermia · influenza like illness · myalgia · nausea · pain · skin reactions · vomiting
 - **Uncommon** Seizure · thrombocytopenia
 - **Rare or very rare** Glomerulosclerosis · haemolytic uraemic syndrome · nephrotic syndrome · thrombotic microangiopathy
 - **Frequency not known** Pulmonary arterial hypertension
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment.
- **RENAL IMPAIRMENT** Caution in severe renal impairment.
- **MONITORING REQUIREMENTS**
 - Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
 - Thrombotic microangiopathy Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed,

interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).

- **Nephrotic syndrome** Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

● **MEDICAL FORMS**

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of glatiramer acetate for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/wp-content/uploads/sites/12/2013/10/d04-p-b.pdf.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Brabio (Mylan)

Glatiramer acetate 20 mg per 1 ml Brabio 20mg/1ml solution for injection pre-filled syringes | 28 pre-filled disposable injection [PoM] £462.56

Glatiramer acetate 40 mg per 1 ml Brabio 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £462.56

▶ Copaxone (Teva UK Ltd)

Glatiramer acetate 20 mg per 1 ml Copaxone 20mg/1ml solution for injection pre-filled syringes | 28 pre-filled disposable injection [PoM] £513.95

Glatiramer acetate 40 mg per 1 ml Copaxone 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £513.95

IMMUNOSUPPRESSANTS > IMMUNOMODULATING DRUGS

Dimethyl fumarate

06-Dec-2017

- **DRUG ACTION** Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

● INDICATIONS AND DOSE

SKILARENCE®

Plaque psoriasis [moderate-to-severe] (under expert supervision)

▶ BY MOUTH

- ▶ **Adult:** Initially 30 mg once daily for 1 week, dose to be taken in the evening, then increased in steps of 30 mg every week for 3 weeks, then increased in steps of 120 mg every week for 5 weeks, for further information on the dose titration and administration schedule, advice on establishing a maintenance dose, and for dose adjustments due to side-effects, consult product literature; maximum 720 mg per day

TECFIDERA®

Multiple sclerosis [relapsing-remitting] (initiated by a specialist)

▶ BY MOUTH

- ▶ **Adult:** Initially 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustments due to side effects—consult product literature

● CONTRA-INDICATIONS

- **SKILARENCE®** Do not initiate if leucocyte count below 3×10^9 /litre · do not initiate if lymphocyte count below 1×10^9 /litre · do not initiate if pathological haematological abnormalities identified · severe gastro-intestinal disorders

- **CAUTIONS** Reduced lymphocyte count

- **TECFIDERA®** Serious infection (do not initiate until infection resolved; consider suspending treatment if infection develops) · severe active gastro-intestinal disease

- **SKILARENCE®** Significant infection (consider avoiding initiation until infection resolved and suspending treatment if infection develops)

- **INTERACTIONS** → Appendix 1: dimethyl fumarate

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · constipation · decreased leucocytes · diarrhoea · eosinophilia · feeling hot · flatulence · gastrointestinal discomfort · headache · leucocytosis · nausea · paraesthesia · progressive multifocal leukoencephalopathy (PML) · skin reactions · vasodilation · vomiting
- ▶ **Uncommon** Dizziness · proteinuria
- ▶ **Rare or very rare** Acute lymphocytic leukaemia · pancytopenia
- ▶ **Frequency not known** Renal failure

SIDE-EFFECTS, FURTHER INFORMATION Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.

● PREGNANCY

- **TECFIDERA®** Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in *animal* studies.

SKILARENCE® Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid.

● HEPATIC IMPAIRMENT

- **TECFIDERA®** Manufacturer advises caution in severe impairment—no information available.

SKILARENCE® Manufacturer advises avoid in severe impairment—no information available.

● RENAL IMPAIRMENT

- **TECFIDERA®** Manufacturer advises caution in severe impairment—no information available.

SKILARENCE® Manufacturer advises avoid in severe impairment—no information available.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor full blood count before treatment initiation then every 3 months thereafter—consult product information for further information.
- ▶ Manufacturer advises monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
- ▶ Manufacturer advises monitor renal and hepatic function before treatment initiation and during treatment—consult product literature for further information.
- ▶ Manufacturer of *Tecfidera*® advises perform a baseline MRI as a reference and repeat as required during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

SKILARENCE® The manufacturer of Skilarence® has provided a *Healthcare Professional Guideline*, which includes important safety information on the risk of serious infections.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the possibility of experiencing symptoms of flushing; they should also be advised to report symptoms of infection to their doctor. The MHRA recommends that patients and their carers should be counselled on the risk of progressive multifocal leukoencephalopathy and advised to seek immediate medical attention if symptoms develop.

● NATIONAL FUNDING/ACCESS DECISIONS

TECFIDERA®

NICE decisions

- ▶ **Dimethyl fumarate (Tecfidera®) for treating relapsing-remitting multiple sclerosis (August 2014)** NICE TA320 Dimethyl fumarate (Tecfidera®) is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:

- the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
 - the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
- Patients currently receiving dimethyl fumarate whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA320

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2014) that dimethyl fumarate (Tecfidera®) is accepted for use within NHS Scotland for the treatment of patients with relapsing-remitting multiple sclerosis. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

SKILARENCE®

NICE decisions

- ▶ **Dimethyl fumarate for treating moderate-to-severe plaque psoriasis (September 2017)** NICE TA475

Dimethyl fumarate is recommended as an option for treating plaque psoriasis in adults, only if the disease:

- is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, and
- has not responded to other systemic therapies, including, ciclosporin, methotrexate and PUVA (psoralen and long-wave ultraviolet A radiation), or these options are contra-indicated or not tolerated.

Stop dimethyl fumarate treatment at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as:

- a 75% reduction in the PASI score (PASI 75) from when treatment started, or
- a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta475

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1313/18

The *Scottish Medicines Consortium* has advised (April 2018) that dimethyl fumarate (Skilarence®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis in adults in need of

systemic medicinal therapy, whom other non-biologic systemic treatments (methotrexate, ciclosporin and acitretin) are not appropriate or have failed and who are considered unsuitable for biologic therapy given their current disease state or personal preference.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ **Tecfidera** (Biogen Idec Ltd)

Dimethyl fumarate 120 mg Tecfidera 120mg gastro-resistant capsules | 14 capsule [PoM] £343.00

Dimethyl fumarate 240 mg Tecfidera 240mg gastro-resistant capsules | 56 capsule [PoM] £1,373.00

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ **Skilarence** (Almirall Ltd)

Dimethyl fumarate 30 mg Skilarence 30mg gastro-resistant tablets

| 42 tablet [PoM] £89.04

Dimethyl fumarate 120 mg Skilarence 120mg gastro-resistant tablets | 90 tablet [PoM] £190.80 | 180 tablet [PoM] £381.60

Fingolimod

17-Jul-2017

- **DRUG ACTION** Fingolimod is an immunomodulating drug.

● INDICATIONS AND DOSE

Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

▶ BY MOUTH

▶ Adult: 500 micrograms once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)

A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)

Fingolimod is known to cause transient bradycardia and heart block after the first dose—see Cautions, Contra-indications and Monitoring for further information.

MHRA/CHM ADVICE: FINGOLIMOD: NEW CONTRA-INDICATIONS IN RELATION TO CARDIAC RISK (DECEMBER 2017)

Fingolimod can cause persistent bradycardia, which can increase the risk of serious cardiac arrhythmias. New contra-indications have been introduced for patients with pre-existing cardiac disorders—see Contra-indications for further information.

MHRA/CHM ADVICE: FINGOLIMOD: UPDATED ADVICE ABOUT RISK OF CANCERS AND SERIOUS INFECTIONS (DECEMBER 2017)

Fingolimod has an immunosuppressive effect and can increase the risk of skin cancers and lymphoma. Following a recent EU review, the MHRA has recommended the following strengthened warnings:

- re-assess the benefit-risk balance of fingolimod therapy in individual patients, particularly those with

additional risk factors for malignancy—either closely monitor for skin cancers or consider discontinuation on a case-by-case basis

- examine all patients for skin lesions before they start fingolimod and then re-examine at least every 6 to 12 months
- advise patients to protect themselves against UV radiation exposure and seek urgent medical advice if they notice any skin lesions
- refer patients with suspicious lesions to a dermatologist

Fingolimod has also been associated with risk of fatal fungal infections and reports of progressive multifocal leukoencephalopathy (PML)—see Monitoring and Side effects for further information.

- **CONTRA-INDICATIONS** Heart failure in the previous 6 months (New York Heart Association class III/IV) · active malignancies · baseline QTc interval 500 milliseconds or greater · cerebrovascular disease (including transient ischaemic attack) · decompensated heart failure (requiring inpatient treatment) · increased risk for opportunistic infections (including immunosuppression) · myocardial infarction · second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker · severe active infection · severe cardiac arrhythmias requiring treatment with class Ia or class III anti-arrhythmic drugs · unstable angina
- **CAUTIONS** Check varicella zoster virus status—consult product literature for further information · chronic obstructive pulmonary disease · history of myocardial infarction · history of symptomatic bradycardia or recurrent syncope · patients receiving antiarrhythmic or heart-rate lowering drugs including beta blockers, heart rate-lowering calcium channel blockers (seek advice from cardiologist regarding switching to alternative drugs, or if appropriate monitoring if unable to switch) · pulmonary fibrosis · risk of bradycardia and cardiac rhythm disturbance · risk of macular oedema · severe respiratory disease · severe sleep apnoea · significant QT prolongation (QTc greater than 470 milliseconds in women, or QTc greater than 450 milliseconds in men); if QTc 500 milliseconds or greater—see Contra-indications · sino-atrial heart block · susceptibility to QT-interval prolongation (including electrolyte disturbances) · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- **Washout period** A washout period is recommended when switching treatment from some disease modifying therapies—consult product literature for further information.
- **Bradycardia and cardiac rhythm disturbance** Fingolimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Fingolimod is not recommended in patients with the cardiovascular risks listed above unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.
- **INTERACTIONS** → Appendix 1: fingolimod
- **SIDE-EFFECTS**

- **Common or very common** Alopecia · asthenia · atrioventricular block · back pain · bradycardia · cough · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · headaches · hypertension · increased risk of infection · neoplasms · skin reactions · vision blurred
- **Uncommon** Macular oedema · nausea · thrombocytopenia
- **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)
- **Frequency not known** Peripheral oedema · progressive multifocal leukoencephalopathy

SIDE-EFFECTS, FURTHER INFORMATION

Basal-cell carcinoma Patients should be advised to seek medical advice if they have any signs of basal-cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.

Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.
- **PREGNANCY** Avoid (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution when initiating treatment in mild-to-moderate impairment; avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring—before, during and after dose), and after treatment interruption (see note below); monitoring should include:
 - **Pre-treatment**
 - an ECG and blood pressure measurement before starting
 - **During the first 6 hours of treatment**
 - continuous ECG monitoring for 6 hours
 - blood pressure and heart rate measurement every hour
 - **After 6 hours of treatment**
 - a further ECG and blood pressure measurement
 - If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.
 - If post-dose bradyarrhythmia-related symptoms occur, appropriate clinical management should be initiated and monitoring should be continued until the symptoms have resolved. If pharmacological intervention is required during the first-dose monitoring, overnight monitoring should follow, and the first-dose monitoring should then be repeated after the second dose.
 - If after 6 hours, the heart rate is less than 45 beats per minute, or the ECG shows new onset second degree, higher grade AV block, or a QTc interval of 500 milliseconds or greater, or if third degree AV block occurs, monitoring should be extended (at least overnight, until side-effect resolution).
 - The occurrence at any time of third degree AV block requires extended monitoring (at least overnight, until side-effect resolution).
 - In case of T-wave inversion, ensure there are no associated signs or symptoms of myocardial ischaemia—if suspected seek advice from a cardiologist.
 - **Note**
 - First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:
 - 1 day or more during the first 2 weeks of treatment
 - more than 7 days during weeks 3 and 4 of treatment
 - more than 2 weeks after one month of treatment
 - If the treatment interruption is of shorter duration than the above, treatment should be continued with the next dose as planned.
 - Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
 - Manufacturer advises skin examination for skin lesions before starting treatment and then every 6 to 12 months thereafter or as clinically indicated.

- ▶ Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
- ▶ Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection (interrupt treatment if lymphocyte count reduced)—consult product literature.
- ▶ Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatosplenomegaly and adenopathy)—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.
- ▶ Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk; monitor for signs and symptoms of new neurological dysfunction.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254**
Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:
 - they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, **and**
 - the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme
 Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta254

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2012) that fingolimod (*Gilenya*®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

The *Scottish Medicines Consortium* has advised (October 2014) that fingolimod (*Gilenya*®) is accepted for restricted use within NHS Scotland as a single disease modifying therapy in highly active relapsing-remitting multiple sclerosis for adults with rapidly evolving severe relapsing-remitting multiple sclerosis. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (April 2015) that fingolimod (*Gilenya*®) is accepted for use within NHS Scotland as a single disease modifying therapy in highly active relapsing-remitting multiple sclerosis for adults with high disease activity despite treatment with at least one disease modifying therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (January 2017) that fingolimod (*Gilenya*®) is recommended as an option for use within NHS Wales as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more

gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous recent MRI, only if the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme or where the list price is equivalent or lower.

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of fingolimod for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/wp-content/uploads/sites/12/2013/10/d04-p-b.pdf.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Gilenya** (Novartis Pharmaceuticals UK Ltd) ▼
Fingolimod (as Fingolimod hydrochloride)
500 microgram Gilenya 0.5mg capsules | 7 capsule [PoM] £367.50
 | 28 capsule [PoM] £1,470.00

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · arthralgia · asthenia · back pain · chills · constipation · cough · cytokine release syndrome · depression · diarrhoea · dyspnoea · fever · flushing · headache · hypersensitivity (discontinue permanently) · hypertension · hypotension · increased risk of infection · infusion related reaction · leucopenia · nausea · neutropenia · pruritus · sweat changes · tachycardia · thrombocytopenia · tumour lysis syndrome · vomiting
- ▶ **Uncommon** Progressive multifocal leukoencephalopathy
- ▶ **Rare or very rare** Hepatitis B reactivation
- ▶ **Frequency not known** Anaphylactic reaction

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects - consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.
- **MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

F 836

Alemtuzumab

● INDICATIONS AND DOSE

Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **UNLICENSED USE** Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

IMPORTANT SAFETY INFORMATION

Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions.

- **CONTRA-INDICATIONS** Human immunodeficiency virus
- **CAUTIONS** Hepatitis B carriers · hepatitis C carriers · in patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled · not recommended for inactive disease · not recommended for stable disease · patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course · patients with previous autoimmune conditions other than multiple sclerosis · pretreatment before administration is required (consult product literature)

CAUTIONS, FURTHER INFORMATION For full details of cautions, consult product literature.

- Autoimmune mediated conditions The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature).
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anxiety · autoimmune thyroiditis · goitre · haemorrhage · hyperthyroidism · hypothyroidism · influenza like illness · lymphadenopathy · lymphopenia · malaise · menstrual cycle irregularities · multiple sclerosis exacerbated · muscle complaints · muscle weakness · oropharyngeal pain · pain · palpitations · peripheral oedema · proteinuria · sensation abnormal · skin reactions · stomatitis · tremor · vertigo · vision blurred
- **Uncommon** Cervical dysplasia · conjunctivitis · dysphagia · gastroesophageal reflux disease · hiccups · immune thrombocytopenic purpura · throat complaints · weight decreased
- **Frequency not known** Goodpasture's syndrome · nephropathy
- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 4 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).

- **BREAST FEEDING** Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.
- **PRE-TREATMENT SCREENING** Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS** HPV screening should be carried out annually in female patients.
- **PRESCRIBING AND DISPENSING INFORMATION** All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.
- **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card and patient guide.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NICE decisions**
- Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014) NICE TA312
Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis.
www.nice.org.uk/TA312

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **Lemtrada** (Genzyme Therapeutics Ltd) ▼
Alemtuzumab 10 mg per 1 ml Lemtrada 12mg/1.2ml concentrate for solution for infusion vials | 1 vial [PoM](#) £7,045.00 (Hospital only)
- **MabCampath** (Genzyme Therapeutics Ltd)
Alemtuzumab 30 mg per 1 ml MabCampath 30mg/1ml concentrate for solution for infusion vials | 3 vial [PoM](#) £792.34 (Hospital only)

F 836

Natalizumab

- **DRUG ACTION** Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination.

● INDICATIONS AND DOSE

Highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or glatiramer acetate, or those patients with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- BY INTRAVENOUS INFUSION
- Adult 18–65 years: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

- **CONTRA-INDICATIONS** Active infection · active malignancies (except cutaneous basal cell carcinoma) · immunosuppression · progressive multifocal leucoencephalopathy

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known. Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

For information on cautions consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Acute retinal necrosis · basophil count increased · eosinophilia · haemolytic anaemia · hyperbilirubinaemia · JC virus granule cell neuronopathy · liver injury · nucleated red cells

SIDE-EFFECTS, FURTHER INFORMATION

Progressive Multifocal Leukoencephalopathy (PML) If suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Liver injury Discontinue treatment if significant liver injury occurs.

Infusion-related reactions Infusion-related reactions including dizziness, nausea, urticaria, chills, vomiting and flushing have been reported either during infusion or within 1 hour after completion of infusion.

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—avoid.
- **PRE-TREATMENT SCREENING**

Progressive Multifocal Leukoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab.

Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

• MONITORING REQUIREMENTS

- ▶ Monitor liver function.
- ▶ Progressive Multifocal Leukoencephalopathy A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.
- ▶ Hypersensitivity reactions Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tysabri®), give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.

• PATIENT AND CARER ADVICE A patient alert card should be provided.

Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation).

Progressive Multifocal Leukoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.

Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007) NICE TA127

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in

1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI. www.nice.org.uk/TA127

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of natalizumab for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/wp-content/uploads/sites/12/2013/10/d04-p-b.pdf.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

F 836

14-Mar-2018

Ocrelizumab

• INDICATIONS AND DOSE

Multiple sclerosis (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 300 mg, then 300 mg after 2 weeks; maintenance 600 mg every 6 months, the first maintenance dose should be given 6 months after the first initial dose; a minimum interval of 5 months should be maintained between each maintenance dose, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to infusion-related reactions or side-effects—consult product literature

- **CONTRA-INDICATIONS** Active infection · active malignancies · severely immunocompromised patients
- **CAUTIONS** Complete required vaccinations at least 6 weeks before treatment initiation · hepatitis B reactivation
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use contraception during treatment and for 12 months after the last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available; monitor infants for B-cell depletion.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor for signs and symptoms of progressive multifocal leucoencephalopathy (PML) (including any new onset or worsening of neurological symptoms)—if PML is suspected, interrupt treatment; discontinue treatment permanently if PML is confirmed.
 - ▶ Manufacturer advises monitor for infusion-related reactions during the infusion and observe patients for 1 hour after completion of the infusion—if severe pulmonary symptoms occur, permanently discontinue treatment.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises to record the batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions after preparation of the infusion.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be advised that infusion-related reactions can occur within 24 hours of infusion.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Ocrevus** (Roche Products Ltd) ▼

Ocrelizumab 30 mg per 1 ml Ocrevus 300mg/10ml concentrate for solution for infusion vials | 1 vial **[PoM]** **[S]**

IMMUNOSUPPRESSANTS > PYRIMIDINE SYNTHESIS INHIBITORS

Teriflunomide

- **DRUG ACTION** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

● INDICATIONS AND DOSE

Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- ▶ **BY MOUTH**

• Adult: 14 mg once daily

- **CONTRA-INDICATIONS** Anaemia · leucopenia · neutropenia · serious infection · severe hypoproteinaemia · severe immunodeficiency · significantly impaired bone-marrow function · thrombocytopenia

- **CAUTIONS** Adult over 65 years · anaemia · dyspnoea—assess for interstitial lung disease and consider suspending treatment · hypoproteinaemia (avoid if severe) · impaired bone-marrow function (avoid if severe) · latent tuberculosis · leucopenia · persistent cough—assess for interstitial lung disease and consider suspending treatment · severe infection—delay or suspend treatment until resolved · significant alcohol consumption · signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment · switching between other immunomodulating drugs · thrombocytopenia

- **INTERACTIONS** → Appendix 1: teriflunomide

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain upper · alopecia · anaemia · anxiety · arthralgia · cystitis · diarrhoea · headache · hypersensitivity · hypertension · increased risk of infection · menorrhagia · myalgia · nausea · nerve disorders · neutropenia · oral disorders · pain · palpitations · sensation abnormal · skin reactions · urinary frequency increased · vomiting · weight decreased
- ▶ **Uncommon** Thrombocytopenia
- ▶ **Frequency not known** Asthenia · hepatitis acute · interstitial lung disease · nail disorder · pancreatitis · sepsis

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic injury Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

Important: accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).

- **CONCEPTION AND CONTRACEPTION** Effective contraception essential for women of child-bearing

potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

● MONITORING REQUIREMENTS

- ▶ Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
- ▶ Monitor blood pressure before treatment and periodically thereafter.
- ▶ Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

● TREATMENT CESSATION

Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give *either* colestyramine p. 196 *or* charcoal, activated p. 1326. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014)** NICE TA303
Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who:
 - do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis **and**
 - the manufacturer provides teriflunomide with the discount agreed in the patient access scheme

www.nice.org.uk/TA303

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that the use of teriflunomide (*Aubagio*)[®] in NHS Scotland is restricted to use in patients with relapsing-remitting multiple sclerosis who do not have highly active disease, and only as an alternative to treatment with interferon beta or glatiramer acetate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Atezolizumab

30-Jan-2018

- **DRUG ACTION** Atezolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

● INDICATIONS AND DOSE

Urothelial carcinoma (specialist use only) | Non-small cell lung cancer (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 1200 mg every 3 weeks, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to side-effects or infusion-related reactions—consult product literature

- **CAUTIONS** Abnormal thyroid function—manufacturer advises to consider appropriate treatment • patients may need pre-medication to minimise the development of infusion-related reactions—consult product literature

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Abdominal pain • appetite decreased • arthralgia • asthenia • chills • colitis • diarrhoea • dysphagia • dyspnoea • electrolyte imbalance • fever • hyperthyroidism • hypotension • hypothyroidism • hypoxia • influenza like illness • musculoskeletal pain • nasal congestion • nausea • pneumonitis • skin reactions • thrombocytopenia • vomiting
- **Uncommon** Adrenal insufficiency • diabetes mellitus • Guillain-Barre syndrome • hepatitis • meningitis non-infective • pancreatitis
- **Rare or very rare** Encephalitis non-infective • hypophysitis

SIDE-EFFECTS, FURTHER INFORMATION

Immune-related reactions Manufacturer advises most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature.

Infusion-related reactions Manufacturer advises permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential, during treatment and for 5 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises to record the brand name and batch number after each administration.

All prescribers should be familiar with the *Physician Information and Management Guidelines* provided by the manufacturer.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after dilution.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Missed doses Manufacturer advises if a dose is missed, it should be administered as soon as possible—administration schedule should be adjusted to maintain a 3-week interval between doses.

Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- Atezolizumab for untreated locally advanced or metastatic urothelial cancer when cisplatin is unsuitable (December 2017) NICE TA492

Atezolizumab is recommended for use within the Cancer Drugs Fund as an option for untreated locally advanced or metastatic urothelial carcinoma in adults, for whom cisplatin-based chemotherapy is unsuitable, only if the conditions of the managed access agreement for atezolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta492

- Atezolizumab for treating locally advanced or metastatic non-small-cell lung cancer after chemotherapy (May 2018) NICE TA520

Atezolizumab is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer (NSCLC) in adults who have had chemotherapy (and targeted treatment if they have an EGFR- or ALK-positive tumour), only if:

- atezolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, **and**
- the manufacturer provides atezolizumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta520

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1297/18

The *Scottish Medicines Consortium* has advised (March 2018) that atezolizumab (*Tecentriq*®) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of adults with locally advanced or metastatic urothelial carcinoma after prior platinum-containing chemotherapy, or who are considered cisplatin ineligible as the economic case was not demonstrated.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Atezolizumab 60 mg per 1 ml Tecentriq 1200mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £3,807.69

Avelumab

18-May-2018

- **DRUG ACTION** Avelumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

● INDICATIONS AND DOSE

Metastatic Merkel cell carcinoma (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every 2 weeks, for information on dose delay or interruption due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** Patients should receive pre-medication to minimise the development of adverse reactions (consult product literature)

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · appetite decreased · arthralgia · asthenia · chills · constipation · cough · diarrhoea · dizziness · dry mouth · dyspnoea · endocrine disorders · fever · headache · hypertension · hypotension · influenza like illness · lymphopenia · myalgia · nausea · nerve disorders · peripheral oedema · pneumonitis · skin reactions · vomiting · weight decreased
- **Uncommon** Adrenal insufficiency · diabetes mellitus · eosinophilia · flushing · gastrointestinal disorders · hepatic disorders · hypopituitarism · myositis · nephritis · tubulointerstitial · systemic inflammatory response syndrome · thrombocytopenia · uveitis
- **Rare or very rare** Myocarditis

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions For treatment modifications in patients with grade 1 or 2 infusion-related reactions, consult product literature. Manufacturer advises permanently discontinue treatment in patients with grade 3 or 4 infusion-related reaction.

Immune-related reactions Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during treatment and for at least 1 month after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least 1 month after stopping treatment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intermittent intravenous infusion (Bavencio®), dilute requisite dose with Sodium Chloride 0.9%; give over 60 minutes via a separate line using a low-protein binding 0.2 micron filter.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Avelumab for treating metastatic Merkel cell carcinoma (April 2018) NICE TA517
Avelumab is recommended as an option for treating metastatic Merkel cell carcinoma in adults, only if they

have had 1 or more lines of chemotherapy for metastatic disease.

Avelumab is recommended for use within the Cancer Drugs Fund as an option for treating metastatic Merkel cell carcinoma in adults, only if:

- they have not had chemotherapy for metastatic disease, and
- the conditions in the managed access agreement for avelumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta517

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1315/18

The Scottish Medicines Consortium has advised (May 2018) that avelumab (Bavencio®) is accepted for use within NHS Scotland as monotherapy for treating adults with metastatic Merkel cell carcinoma.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **Bavencio** (Merck Serono Ltd) ▼

Avelumab 20 mg per 1 ml Bavencio 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £768.00

Bevacizumab

28-Jun-2017

- **DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

● INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy | First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate | First-line treatment of metastatic breast cancer in combination with capecitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capecitabine) | Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a | First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy) | First-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel) | First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)

► BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEO NECROSIS OF THE JAW (JANUARY 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

- **CAUTIONS** Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) · history of arterial thromboembolism · history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) · history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) · increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) · increased risk of haemorrhage · increased risk of tumour-associated haemorrhage · intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation · uncontrolled hypertension · untreated CNS metastases
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abscess · anaemia · appetite decreased · arthralgia · asthenia · congestive heart failure · constipation · cough · decreased leucocytes · dehydration · diarrhoea · drowsiness · dysarthria · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorders · fever · fistula · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · healing impaired · hypersensitivity · hypertension · hypoxia · increased risk of infection · infusion related reaction · mucositis · muscle weakness · myalgia · nausea · neutropenia · ovarian failure · pain · pelvic pain · peripheral neuropathy · proteinuria · rectovaginal fistula · sepsis · skin reactions · stomatitis · stroke · supraventricular tachycardia · syncope · taste altered · thrombocytopenia · vomiting · weight decreased
 - ▶ **Rare or very rare** Encephalopathy · necrotising fasciitis (discontinue and initiate treatment promptly)
 - ▶ **Frequency not known** Chest pain · chills · flushing · gallbladder perforation · hyperglycaemia · hypotension · nasal septum perforation · osteonecrosis · pulmonary hypertension · renal thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 6 months after treatment in women.
- **PREGNANCY** Avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
 - ▶ Monitor blood pressure.
 - ▶ Monitor for congestive heart failure.
 - ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
 - ▶ Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118**
Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is **not** recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy.
www.nice.org.uk/guidance/TA118
- ▶ **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212**
Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer.
www.nice.org.uk/guidance/TA212
- ▶ **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242**
Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007).
www.nice.org.uk/guidance/TA242
- ▶ **Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TA178**
Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced and/or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced and/or metastatic renal cell carcinoma.
www.nice.org.uk/guidance/TA178
- ▶ **Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214**
Bevacizumab in combination with a taxane is **not** recommended for the first-line treatment of metastatic breast cancer.
www.nice.org.uk/guidance/TA214
- ▶ **Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263**
Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.
www.nice.org.uk/guidance/TA263
- ▶ **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284**
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).
www.nice.org.uk/guidance/TA284
- ▶ **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of**

platinum-sensitive advanced ovarian cancer (May 2013)
NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

www.nice.org.uk/guidance/TA285

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2012) that bevacizumab (*Avastin*®) is **not** recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

The *Scottish Medicines Consortium* has advised (September 2015) that bevacizumab (*Avastin*®) is accepted for restricted use within NHS Scotland in combination with paclitaxel for the treatment of adult patients with platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who received no more than two prior chemotherapy regimens and who have not received prior therapy with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

The *Scottish Medicines Consortium* has advised (November 2015) that bevacizumab (*Avastin*®) is accepted for restricted use within NHS Scotland in combination with carboplatin and paclitaxel for the first-line treatment of advanced FIGO stage IV epithelial ovarian, fallopian tube, or primary peritoneal cancer.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (September 2017) that bevacizumab (*Avastin*®) is not recommended for use within NHS Wales in combination with paclitaxel and cisplatin, or alternatively, paclitaxel and topotecan in patients who cannot receive platinum therapy, for the treatment of adults with persistent, recurrent, or metastatic carcinoma of the cervix. The case for cost-effectiveness has not been proven.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ *Avastin* (Roche Products Ltd)

Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial [PoM] £924.40 (Hospital only)
Avastin 100mg/4ml solution for infusion vials | 1 vial [PoM] £424.66 (Hospital only)

Blinatumomab

20-Jul-2017

• **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

• INDICATIONS AND DOSE**Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia**

▶ BY CONTINUOUS INTRAVENOUS INFUSION

▶ Adult (body-weight 45 kg and above): Initially 9 micrograms/24 hours on days 1–7 of first cycle, followed by 28 micrograms/24 hours on days 8–28, first cycle is followed by a 2 week treatment-free interval, then 28 micrograms/24 hours for days 1–28 of second and subsequent cycles—patients who achieve complete remission after 2 treatment cycles may receive up to 3 additional cycles of consolidation treatment, for dose adjustments due to side-effects and infusion-related

reactions or patients with high tumour burden—consult product literature

- **CAUTIONS** Aphasia · brain injuries (severe) · cerebellar disease · dementia · elderly—limited information available · epilepsy · paresis · Parkinson's disease · patients may need pre-medication to minimise adverse reactions · psychosis · seizure · severe hepatic impairment · severe renal impairment · stroke

CAUTIONS, FURTHER INFORMATION

- ▶ **Pre-medication** Manufacturer advises pre-medication with intravenous dexamethasone and an anti-pyretic—consult product literature.
- ▶ **Neurological events** There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology—manufacturer advises caution.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · aphasia · appetite decreased · arthralgia · chest pain · chills · cognitive disorder · confusion · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · encephalopathy · facial swelling · fatigue · fever · flushing · headache · hyperglycaemia · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · immune disorder · increased risk of infection · insomnia · leucocytosis · memory loss · nausea · neutropenia · oedema · pain · paraesthesia · rash · seizure · sepsis · tachycardia · thrombocytopenia · tremor · tumour lysis syndrome · vomiting · wheezing
 - ▶ **Uncommon** Capillary leak syndrome · cranial nerve disorder · pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Life-threatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).

Cytokine release syndrome, infusion-reactions and tumour lysis syndrome Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also Pregnancy and reproductive function in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment—consult product literature.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after reconstitution and dilution.

● **PATIENT AND CARER ADVICE** A patient alert card should be provided. Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Blinatumomab for previously treated Philadelphia-chromosome-negative acute lymphoblastic leukaemia** (June 2017) NICE TA450

Blinatumomab is recommended within its marketing authorisation as an option for treating Philadelphia-chromosome-negative relapsed or refractory precursor B-cell acute lymphoblastic leukaemia in adults, only if the company provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/TA450

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Blincyto** (Amgen Ltd) ▼

Blinatumomab 38.5 microgram Blincyto 38.5micrograms powder for concentrate and solution for solution for infusion vials | 1 vial [PoM] £2,017.00

Brentuximab vedotin

19-Jul-2017

● INDICATIONS AND DOSE

Treatment of relapsed or refractory CD-30 positive Hodgkin's disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option | Relapsed or refractory systemic anaplastic large cell lymphoma

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

● **CAUTIONS** Elevated BMI—risk of hyperglycaemia · high tumour burden—risk of tumour lysis syndrome · rapidly proliferating tumours—risk of tumour lysis syndrome

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · alopecia · anaemia · arthralgia · back pain · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · hyperglycaemia · increased risk of infection · infusion related reaction · myalgia · nausea · nerve disorders · neutropenia · sepsis · skin reactions · thrombocytopenia · vomiting · weight decreased

► **Uncommon** Cytomegalovirus infection reactivation · pancreatitis acute · tumour lysis syndrome

► **Rare or very rare** Severe cutaneous adverse reactions (SCARs)

► **Frequency not known** Acute respiratory distress syndrome (ARDS) · anaphylactic reaction · disease recurrence · gastrointestinal disorders · gastrointestinal haemorrhage · paraesthesia · progressive multifocal leukoencephalopathy

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 6 months after treatment in men and women.

● **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal studies*).

● **BREAST FEEDING** Avoid—no information available.

● MONITORING REQUIREMENTS

► Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).

► Monitor for new or worsening abdominal pain—investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).

► Monitor for pulmonary toxicity—treat symptoms promptly.

► Routinely monitor hepatic function.

► Monitor for infusion-related (including anaphylactic) reactions.

► Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Brentuximab vedotin for treating CD30-positive Hodgkin lymphoma** (June 2017) NICE TA446

Brentuximab vedotin is recommended as a treatment option for CD30-positive Hodgkin lymphoma in adults, only if:

- they have relapsed or refractory disease after autologous stem cell transplant, **and**
- the company provides brentuximab vedotin at the price agreed with NHS England in the commercial access agreement

Brentuximab vedotin is recommended for use within the Cancer Drugs Fund as a treatment option for CD30-positive Hodgkin lymphoma in adults, only if:

- they have relapsed or refractory disease after at least 2 previous therapies **and**
- they cannot have autologous stem cell transplant or multi-agent chemotherapy, **and**
- the conditions of the managed access agreement are followed

These recommendations are not intended to affect treatment that was started in the NHS before this guidance was published. Adults having treatment outside these recommendations may continue without change to the funding arrangements in place before this guidance was published, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA446

► **Brentuximab vedotin for treating relapsed or refractory systemic anaplastic large cell lymphoma** (October 2017) NICE TA478

Brentuximab vedotin is recommended as an option for treating relapsed or refractory systemic anaplastic large cell lymphoma in adults, only if:

- they have an Eastern Cooperative Oncology Group performance status of 0 or 1, **and**
- the manufacturer provides brentuximab vedotin according to the commercial access agreement with NHS England.

These recommendations are not intended to affect treatment that was started in the NHS before this guidance was published. Adults having treatment outside these recommendations may continue without change to the funding arrangements in place before this guidance was published, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA478

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Adcetris** (Takeda UK Ltd) ▼

Brentuximab vedotin 50 mg Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,500.00

Cetuximab

26-Jun-2017

INDICATIONS AND DOSE

Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated |

Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy) |
Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy)

▶ BY INTRAVENOUS INFUSION

▶ Adult (initiated by a specialist): (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

● **CONTRA-INDICATIONS** Combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status • RAS mutated colorectal tumours (or if RAS tumour status unknown)

● **CAUTIONS** Cardiopulmonary disease • cardiovascular disease • history of keratitis • pulmonary disease—discontinue if interstitial lung disease • risk factors for keratitis • severe dry eye • ulcerative keratitis (including contact lens use)

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

▶ **Common or very common** Appetite decreased • cytokine release syndrome • dehydration • diarrhoea • electrolyte imbalance • eye inflammation • fatigue • headache • infusion related reaction • mucositis • nausea • skin eruption • vomiting

▶ **Uncommon** Embolism and thrombosis • interstitial lung disease

▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)

▶ **Frequency not known** Meningitis aseptic • superinfection of skin lesions

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **PREGNANCY** Use only if potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Avoid breast-feeding during and for 2 months after treatment—no information available.

● **PRE-TREATMENT SCREENING** Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method.

● **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008) NICE TA145
 Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

www.nice.org.uk/guidance/TA145

▶ Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242

Cetuximab monotherapy or combination chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.

www.nice.org.uk/guidance/TA242

▶ Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017) NICE TA439

Cetuximab is recommended, within its marketing authorisation, as an option for previously untreated epidermal growth factor receptor-expressing, RAS wild-type metastatic colorectal cancer in patients in combination with:

- 5-fluorouracil, folinic acid and oxaliplatin (FOLFOX), or
- 5-fluorouracil, folinic acid and irinotecan (FOLFIRI).

This advice is contingent upon the manufacturer providing cetuximab with the discount agreed in the commercial access agreement.

www.nice.org.uk/guidance/TA439

▶ Cetuximab for treating recurrent or metastatic squamous cell cancer of the head and neck (August 2017) NICE TA473

Cetuximab in combination with platinum-based chemotherapy is recommended as an option for treating recurrent or metastatic squamous cell cancer of the head and neck in patients only:

- if the cancer started in the oral cavity, **and**
- when the company provides the drug in line with the commercial access agreement with NHS England.

Patients currently receiving cetuximab whose disease does not meet the above criteria may continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA473

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ **Erbixit** (Merck Serono Ltd)

Cetuximab 5 mg per 1 ml Erbixit 100mg/20ml solution for infusion vials | 1 vial [PoM] £178.10 (Hospital only)

Erbixit 500mg/100ml solution for infusion vials | 1 vial [PoM] £890.50 (Hospital only)

Daratumumab

12-Dec-2017

- **DRUG ACTION** Daratumumab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

● INDICATIONS AND DOSE

Treatment of relapsed and refractory multiple myeloma (as monotherapy after failure of a proteasome inhibitor and an immunomodulatory agent) (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 16 mg/kg once weekly for weeks 1 to 8, then 16 mg/kg every 2 weeks for weeks 9 to 24, then 16 mg/kg every 4 weeks for week 25 onwards until disease progression, for dose adjustments due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** History of obstructive pulmonary disorder (consider additional post-medication—consult product literature) · patients may need pre-medication to minimise adverse reactions · risk of herpes zoster reactivation (consider antiviral prophylaxis)

CAUTIONS, FURTHER INFORMATION

- Infusion-related reactions Serious infusion-related reactions can occur and daratumumab should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with intravenous corticosteroid, an antihistamine and an anti-pyretic and post-medication with oral corticosteroids—consult product literature. Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Anaemia · atrial fibrillation · chills · cough · diarrhoea · dyspnoea · fatigue · fever · headache · hypertension · hypoxia · increased risk of infection · lymphopenia · muscle spasms · nasal congestion · nausea · neutropenia · peripheral neuropathy · peripheral oedema · pulmonary oedema · respiratory disorders · throat irritation · thrombocytopenia · vomiting
- **Frequency not known** Allergic rhinitis · chest discomfort · hypotension · pruritus

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises treatment should be immediately interrupted if an infusion-related reaction of any grade or severity occurs—consult product literature for specific management recommendations.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for 3 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **EFFECT ON LABORATORY TESTS** Possible positive indirect Coombs test (may affect antibody screening).
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C; consult product literature for storage advice following dilution.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Daratumumab monotherapy for treating relapsed and refractory multiple myeloma (March 2018)** NICE TA510 Daratumumab monotherapy is recommended for use within the Cancer Drugs Fund as an option for treating relapsed and refractory multiple myeloma in adults whose previous therapy included a proteasome inhibitor and an immunomodulator, and whose disease progressed on the last therapy, only if:

- they have daratumumab after 3 previous therapies, and
- the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta510

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1205/17

The *Scottish Medicines Consortium* has advised (October 2017) that daratumumab (*Darzalex*[®]) is accepted for restricted use within NHS Scotland as monotherapy for use as a fourth-line treatment option for adults with relapsed and refractory multiple myeloma, only if a proteasome inhibitor and an immunomodulatory agent have been used as prior therapy and disease demonstrated progression on the last therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

Elotuzumab

07-Apr-2017

- **DRUG ACTION** Elotuzumab is a monoclonal antibody that targets the signalling lymphocytic activation molecule family member 7 (SLAMF7) protein, thereby activating natural killer cells and mediating myeloma cell death.

● INDICATIONS AND DOSE

Multiple myeloma in patients who have received at least one prior therapy (in combination with lenalidomide and dexamethasone) (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every week, on days 1, 8, 15 and 22 of cycles 1 and 2, then 10 mg/kg every 2 weeks, on days 1 and 15 of subsequent cycles

- **CAUTIONS** Pre-medication must be administered to minimise the development of infusion-related reactions—consult product literature · secondary primary malignancies

CAUTIONS, FURTHER INFORMATION

- Secondary primary malignancies Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with elotuzumab.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- **Common or very common** Chest pain · cough · deep vein thrombosis · diarrhoea · fatigue · fever · headache ·

hypersensitivity · increased risk of infection · lymphopenia · mood altered · night sweats · numbness · oropharyngeal pain · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Side-effects reported when used in combination with lenalidomide and dexamethasone or bortezomib and dexamethasone.

Infection-related reactions Manufacturer advises for mild-to-moderate infusion reactions interrupt treatment or reduce infusion rate, and monitor closely (consult product literature); permanently discontinue therapy in severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of childbearing potential; male patients should continue effective contraceptive measures for 180 days after stopping treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Gemtuzumab ozogamicin

21-May-2018

- **DRUG ACTION** Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

● INDICATIONS AND DOSE

CD33-positive acute myeloid leukaemia (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **CAUTIONS** Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) · haematopoietic stem cell transplantation (increased risk of hepatotoxicity) · pre-medication recommended to minimise adverse reactions

CAUTIONS, FURTHER INFORMATION

- ▶ **Pre-medication** Serious infusion-related reactions can occur and gemtuzumab ozogamicin should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, paracetamol and antihistamine 1 hour prior to dosing, and to take appropriate measures to help prevent the development of tumour lysis-related hyperuricaemia—consult product literature.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite decreased · ascites · chills · constipation · decreased leucocytes · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · infection · infusion related reaction (including fatal cases) · multi organ failure · nausea · neutropenia · oedema ·

pancytopenia · sinusoidal obstruction syndrome · skin reactions · stomatitis · tachycardia · thrombocytopenia · tumour lysis syndrome (including fatal cases) · vomiting

- ▶ **Frequency not known** Interstitial pneumonia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions (including fatal cases) can occur during the first 24 hours after administration. Manufacturer advises interrupt treatment immediately and treat as clinically indicated (consult product literature); permanent discontinuation should be strongly considered in patients who develop signs and symptoms of anaphylaxis.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use 2 methods of effective contraception during treatment and for at least 7 months after the last dose; male patients should use 2 methods of effective contraception during treatment and for at least 4 months after the last dose if their partner is of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least one month after the last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—increased risk of developing hepatotoxicity; postpone treatment if serum transaminases (ALT or AST) greater than 2.5 times the upper limit of normal or total bilirubin greater than 2 times the upper limit of normal.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppression during treatment; dose interruption or discontinuation of treatment may be required—consult product literature.
 - ▶ Manufacturer advises monitor for signs and symptoms of infusion-related reactions—close clinical monitoring, including pulse, blood pressure and temperature, should be performed during infusion; monitor for signs and symptoms of tumour lysis syndrome.
 - ▶ Manufacturer advises monitor for signs and symptoms of hepatotoxicity (including hepatic veno-occlusive disease); liver tests should be monitored prior to each dose—consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Gemtuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and headache.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Mylotarg** (Pfizer Ltd) ▼

Gemtuzumab ozogamicin 5 mg Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £6,300.00 (Hospital only)

Inotuzumab ozogamicin

11-Oct-2017

- **DRUG ACTION** Inotuzumab ozogamicin is a monoclonal antibody that binds to CD22-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

● INDICATIONS AND DOSE

Monotherapy for relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (under expert supervision)

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Prior confirmed severe or ongoing sinusoidal obstruction syndrome
- **CAUTIONS** History of, or predisposition to QT-interval prolongation (e.g. electrolyte disturbances, concomitant use of drugs that prolong the QT interval) • patients may need pre-medication to minimise adverse reactions • patients undergoing haematopoietic stem cell transplantation (increased risk of hepatotoxicity)
- **CAUTIONS, FURTHER INFORMATION**
 - Pre-medication Manufacturer advises pre-medication with a corticosteroid, antipyretic and antihistamine prior to dosing in all patients and pre-medication to reduce uric acid levels and hydration in patients with a high tumour burden (increased risk of tumour lysis syndrome)—consult product literature.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia • appetite decreased • ascites • bone marrow disorders • central nervous system haemorrhage • chills • constipation • decreased leucocytes • diarrhoea • fatigue • fever • gastrointestinal discomfort • haemorrhage • headache • hyperbilirubinaemia • hypersensitivity • hyperuricaemia • increased risk of infection • nausea • neutropenia • QT interval prolongation • sepsis • sinusoidal obstruction syndrome • stomatitis • thrombocytopenia • tumour lysis syndrome • vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises interrupt treatment if an infusion related reaction occurs; depending on the severity, discontinuation of the infusion or administration of steroids and antihistamines should be considered (consult product literature); permanently discontinue treatment in severe or life-threatening infusion reactions.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 8 months after the last dose; male patients should use effective contraception during treatment and for at least 5 months after the last dose if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least two months after the last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises careful pre-treatment evaluation in patients with hepatic impairment; dose interruption or discontinuation may be required if serum bilirubin or AST/ALT levels become raised (limited information available)—consult product literature; avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Manufacturer advises baseline CD22 positivity of greater than 0% is required prior to initiating treatment.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppression during treatment; dose reduction or interruption or discontinuation of treatment may be required—consult product literature.
- Manufacturer advises monitor for signs of infusion related-reactions during and for at least 1 hour after infusion; monitor for signs and symptoms of tumour lysis syndrome.
- Manufacturer advises ECG and electrolytes should be monitored prior to the start of treatment and periodically during treatment; monitor for increases in serum amylase and lipase.
- Manufacturer advises monitor for signs and symptoms of sinusoidal obstruction syndrome; liver tests should be monitored prior to and following each dose—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises resuscitation facilities should be available during administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Inotuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE**
 - **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- **Besponsa** (Pfizer Ltd) ▼

Inotuzumab ozogamicin 1 mg Besponsa 1mg powder for concentrate for solution for infusion vials 1 vial [\[POM\]](#) £8,048.00 (Hospital only)

Ipilimumab

24-May-2018

- **DRUG ACTION** Ipilimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.
- **INDICATIONS AND DOSE**
 - **Advanced melanoma (specialist use only)**
 - BY INTRAVENOUS INFUSION
 - Adult: 3 mg/kg every 3 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature
- **CAUTIONS**
 - **CAUTIONS, FURTHER INFORMATION** For full details consult product literature.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia • anaemia • appetite decreased • arthralgia • asthenia • cancer pain • chills • confusion • constipation • cough • dehydration • diarrhoea • dizziness • dyspnoea • electrolyte imbalance • eye discomfort • fever • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • headache •

hepatic disorders · hypophysitis · hypopituitarism · hypotension · hypothyroidism · influenza like illness · lethargy · lymphopenia · mucositis · muscle complaints · nausea · nerve disorders · night sweats · oedema · pain · skin reactions · vasodilation · vision disorders · vomiting · weight decreased

- ▶ **Uncommon** Adrenal hypofunction · alkalosis · allergic rhinitis · amenorrhoea · arrhythmias · arthritis · brain oedema · depression · dysarthria · eosinophilia · eye inflammation · glomerulonephritis · haemolytic anaemia · hair colour changes · hyperthyroidism · hypogonadism · increased risk of infection · infusion related reaction · libido decreased · meningitis · movement disorders · multi organ failure · muscle weakness · myopathy · nephritis · autoimmune · neutropenia · pancreatitis · paraneoplastic syndrome · peripheral ischaemia · polymyalgia rheumatica · psychiatric disorder · pulmonary oedema · renal failure · renal tubular acidosis · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · syncope · systemic inflammatory response syndrome · thrombocytopenia · tremor · tumour lysis syndrome · vascular disorders · vasculitis
- ▶ **Rare or very rare** Myasthenia gravis · proteinuria · thyroiditis

SIDE-EFFECTS, FURTHER INFORMATION A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor liver function tests and thyroid function prior to initiation of treatment and before each dose.
 - ▶ Manufacturer advises monitor for signs or symptoms of immune-related side-effects and gastrointestinal perforation—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, give undiluted or dilute to a concentration of 1–4 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 90 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C) and protect from light—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Ipilimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014)** NICE TA319
Ipilimumab is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
www.nice.org.uk/TA319

- ▶ **Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012)** NICE TA268
Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA268

- ▶ **Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016)** NICE TA400
Nivolumab in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA400

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2013) that ipilimumab (*Yervoy*®) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Yervoy** (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £3,750.00 (Hospital only)
Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £15,000.00 (Hospital only)

Necitumumab

21-Feb-2017

- **DRUG ACTION** Necitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

● INDICATIONS AND DOSE

Locally advanced or metastatic epidermal growth factor receptor expressing squamous non-small-cell lung cancer, in patients who have not received previous chemotherapy (in combination with gemcitabine and cisplatin) (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 800 mg once daily on days 1 and 8 of a 3-week cycle, for up to 6 cycles, patients whose disease has not progressed after combination therapy may continue with necitumumab monotherapy, for dose adjustments due to infusion-related reactions or skin reactions—consult product literature

- **CAUTIONS** Cardiorespiratory disorders (no information available) · history of thromboembolic events · patients may need pre-medication to minimise the development of infusion-related and skin reactions (consult product literature) · risk factors for thromboembolic events

CAUTIONS, FURTHER INFORMATION

- ▶ **Thromboembolic events** Manufacturer advises that necitumumab should not be administered to patients with multiple risk factors for thromboembolic events unless the benefits outweigh the risks. Thromboprophylaxis should be considered after assessment of a patient's risk factors.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies

• SIDE-EFFECTS

- ▶ **Common or very common** Conjunctivitis · dysuria · electrolyte imbalance · embolism and thrombosis · fever · haemorrhage · headache · hypomagnesaemia (severe) · increased risk of infection · infusion related reaction · muscle spasms · oral disorders · skin reactions · taste altered · vomiting · weight decreased
- ▶ **Frequency not known** Cardiac arrest · eyelash trichomegaly
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least 4 months after the last dose—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor patients during and following each infusion for signs of hypersensitivity and infusion-related reactions; monitor electrolytes (including magnesium, potassium and calcium) prior to each infusion and after completion of treatment, until within normal limits—correct any electrolyte disturbance promptly.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises necitumumab should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities and resources for the treatment of infusion-related reactions are immediately available.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be made aware of the symptoms of thromboembolism and advised to seek medical attention if they experience sudden breathlessness, chest pain, or swelling of a limb.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Necitumumab for untreated advanced or metastatic squamous non-small-cell lung cancer (September 2016)**
NICE TA411
Necitumumab, in combination with gemcitabine and cisplatin, is **not** recommended within its marketing authorisation for adults with locally advanced or metastatic epidermal growth factor receptor (EGFR)-expressing squamous non-small-cell lung cancer that has not been treated with chemotherapy.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA411

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Portrazza** (Eli Lilly and Company Ltd) ▼
Necitumumab 16 mg per 1 ml Portrazza 800mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £1,450.00 (Hospital only)

Nivolumab

17-May-2018

- **DRUG ACTION** Nivolumab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

• INDICATIONS AND DOSE

Unresectable or metastatic advanced melanoma in combination with ipilimumab (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Unresectable or metastatic advanced melanoma (as monotherapy) (specialist use only) | Advanced renal cell carcinoma (as monotherapy) (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 240 mg every 2 weeks, alternatively 480 mg every 4 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

Locally advanced or metastatic non-small cell lung cancer (as monotherapy) (specialist use only) | Locally advanced unresectable or metastatic urothelial carcinoma (as monotherapy) (specialist use only) | Squamous cell cancer of the head and neck (as monotherapy) (specialist use only) | Relapsed or refractory classical Hodgkin lymphoma (as monotherapy) (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 240 mg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: NIVOLUMAB (OPDIVO®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)

A European review of worldwide data concluded that nivolumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with nivolumab versus the risk of possible organ transplant rejection for each patient.

- **CAUTIONS** May increase risk of severe graft-versus-host reaction in patients who have had prior haematopoietic stem cell transplant (particularly in those with a prior history) · patients may need pre-medication to minimise the development of infusion-related reactions
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · anaemia · appetite decreased · arthralgia · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · fatigue · fever · headache · hyperglycaemia · hypersensitivity · hypertension · hyperthyroidism · hypothyroidism · increased risk of infection · nausea · nerve disorders · neutropenia · oedema · pain · respiratory disorders · skin reactions · stomatitis · thrombocytopenia · vomiting · weight decreased
 - ▶ **Uncommon** Adrenal insufficiency · arrhythmias · arthritis · chest pain · dehydration · dry eye · eosinophilia · eye inflammation · gastrointestinal disorders · hepatic disorders · hypophysitis · hypopituitarism · metabolic acidosis · nephritis tubulointerstitial · pancreatitis · polymyalgia rheumatica · renal failure · thyroiditis · vision blurred
 - ▶ **Rare or very rare** Demyelination · diabetes mellitus · histiocytic necrotising lymphadenitis · myasthenic syndrome · myocarditis · myopathy · severe cutaneous adverse reactions (SCARs) · vasculitis

- ▶ **Frequency not known** Solid organ transplant rejection

SIDE-EFFECTS, FURTHER INFORMATION

Immune-related reactions Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modifications—consult product literature for further information.

Infusion-related reactions Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of pre-medication according to local guidelines; discontinue treatment if severe infusion reactions occur.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.
 - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
 - **BREAST FEEDING** Manufacturer advises avoid—no information available.
 - **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate to severe impairment—limited information available.
 - **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions, cardiac and pulmonary reactions, and electrolyte disturbances before and periodically during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose.
 - **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion*, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 or 60 minutes (depending on dose—consult product literature) through an in-line filter (pore size 0.2–1.2 micron).
 - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.
 - **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card with each prescription.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
- NICE decisions**
- ▶ **Nivolumab for treating advanced (unresectable or metastatic) melanoma** (February 2016) NICE TA384
Nivolumab as monotherapy is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults.
www.nice.org.uk/guidance/ta384
 - ▶ **Nivolumab in combination with ipilimumab for treating advanced melanoma** (July 2016) NICE TA400
Nivolumab in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta400
 - ▶ **Nivolumab for previously treated advanced renal cell carcinoma** (updated November 2017) NICE TA417
Nivolumab is recommended, within its marketing authorisation, as an option for previously treated advanced renal cell carcinoma in adults, when the manufacturer provides nivolumab in line with the commercial access agreement with NHS England.
www.nice.org.uk/guidance/ta417

- ▶ **Nivolumab for treating relapsed or refractory classical Hodgkin lymphoma** (updated November 2017) NICE TA462
Nivolumab is recommended, within its marketing authorisation, as an option for treating relapsed or refractory classical Hodgkin lymphoma in adults after autologous stem cell transplant and treatment with brentuximab vedotin, when the manufacturer provides nivolumab in line with the commercial access agreement with NHS England.
www.nice.org.uk/guidance/ta462
 - ▶ **Nivolumab for previously treated squamous non-small-cell lung cancer** (November 2017) NICE TA483
Nivolumab is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic squamous non-small-cell lung cancer in adults after chemotherapy, only if:
 - nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, **and**
 - the conditions in the managed access agreement are followed.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta483
 - ▶ **Nivolumab for previously treated non-squamous non-small-cell lung cancer** (November 2017) NICE TA484
Nivolumab is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic non-squamous non-small-cell lung cancer in adults after chemotherapy, only if:
 - their tumours are PD-L1 positive, **and**
 - nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, **and**
 - the conditions in the managed access agreement are followed.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta484
 - ▶ **Nivolumab for treating squamous cell carcinoma of the head and neck after platinum-based chemotherapy** (November 2017) NICE TA490
Nivolumab is recommended for use within the Cancer Drugs Fund as an option for treating squamous cell carcinoma of the head and neck in adults whose disease has progressed on platinum-based chemotherapy, only if:
 - the disease has progressed within 6 months of having chemotherapy, **and**
 - nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, **and**
 - the conditions in the managed access agreement are followed.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta490
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (July 2016) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic squamous non-small cell lung cancer after prior chemotherapy in adults. This advice is contingent upon

the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (August 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (October 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-squamous non-small cell lung cancer after prior chemotherapy in adults, subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (November 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland in combination with ipilimumab for the first-line treatment of advanced (unresectable or metastatic) melanoma in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (June 2017) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland as monotherapy for treating adults with advanced renal cell carcinoma after prior therapy. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (July 2017) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland for the treatment of patients with relapsed or refractory classical Hodgkin lymphoma after autologous stem cell transplant and treatment with brentuximab vedotin. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (September 2017) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland as monotherapy, for the treatment of squamous cell cancer of the head and neck in adults progressing on or after platinum-based therapy. Treatment with nivolumab is subject to a two year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised that nivolumab (*Opdivo*®) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of locally advanced unresectable or metastatic urothelial carcinoma in adults after failure of prior platinum-containing therapy, as the economic case was not demonstrated.

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Obinutuzumab

• INDICATIONS AND DOSE

Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities |

Treatment of previously untreated advanced follicular lymphoma | Treatment of follicular lymphoma in patients who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

• CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

For obinutuzumab contra-indications, consult product literature.

• CAUTIONS

CAUTIONS, FURTHER INFORMATION For full details on the cautions of obinutuzumab, consult product literature.

▶ **Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **obinutuzumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

• **INTERACTIONS** → Appendix 1: monoclonal antibodies

• SIDE-EFFECTS

▶ **Common or very common** Arrhythmias · chest pain · dyspepsia · eczema · eye erythema · gastrointestinal disorders · heart failure · hyperuricaemia · lymph node pain · nasal complaints · pain · squamous cell carcinoma · urinary disorders · weight increased

▶ **Frequency not known** Acute coronary syndrome · angina pectoris · dizziness · viral infection reactivation

• **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 18 months after treatment.

• **PREGNANCY** Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.

• **BREAST FEEDING** Avoid breast-feeding during and for 18 months after treatment—present in milk in *animal* studies.

• **MONITORING REQUIREMENTS** Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

• **PRESCRIBING AND DISPENSING INFORMATION** Infusion related side-effects have been reported; Patients should receive premedication with paracetamol, an antihistamine, and a corticosteroid before each dose—consult product literature for details.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)

NICE TA343

Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:

• bendamustine-based therapy is not suitable **and**

- the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
- Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta343

- ▶ **Obinutuzumab with bendamustine for treating follicular lymphoma refractory to rituximab (August 2017) NICE TA472**
Obinutuzumab in combination with bendamustine followed by obinutuzumab maintenance, is recommended for use within the Cancer Drugs Fund as an option for treating adults with follicular lymphoma that did not respond or progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen, only if the conditions in the managed access agreement for obinutuzumab are followed.

www.nice.org.uk/guidance/ta472

- ▶ **Obinutuzumab for untreated advanced follicular lymphoma (March 2018) NICE TA513**
Obinutuzumab is recommended as an option for untreated advanced follicular lymphoma in adults (that is, first as induction treatment with chemotherapy, then alone as maintenance therapy), only if:
 - the person has a Follicular Lymphoma International Prognostic Index (FLIPI) score of 2 or more, **and**
 - the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta513

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2017) that obinutuzumab (*Gazyvaro*®) is accepted for use within NHS Scotland in combination with bendamustine followed by obinutuzumab maintenance for the treatment of patients with follicular lymphoma who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (January 2018) that obinutuzumab (*Gazyvaro*®) is **not** recommended for use within NHS Scotland in combination with chemotherapy followed by obinutuzumab maintenance therapy in patients achieving a response, for the treatment of patients with previously untreated advanced follicular lymphoma, as the economic case was not demonstrated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Gazyvaro** (Roche Products Ltd) ▼

Obinutuzumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial (PoM) £3,312.00 (Hospital only)

Ofatumumab

● INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia (CLL) in patients refractory to fludarabine and alemtuzumab | Treatment of CLL in patients who have not received prior therapy and who are not eligible for fludarabine based therapy (in combination with chlorambucil or bendamustine)

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Premedication must be given 30 minutes to 2 hours before each dose—consult product literature for details

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on the contra-indications for ofatumumab, consult product literature.

- **CAUTIONS** History of cardiac disease—monitor closely and discontinue treatment if cardiac arrhythmias occur

CAUTIONS, FURTHER INFORMATION

- ▶ **Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **ofatumumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details about the cautions for ofatumumab, consult product literature

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Bronchospasm · chest discomfort · febrile neutropenia · hypoxia · laryngeal pain · nasal congestion · sepsis · skin reactions
- ▶ **Uncommon** Agranulocytosis · bradycardia · coagulation disorder · gastrointestinal disorders · lymphopenia · pulmonary oedema · pure red cell aplasia
- ▶ **Rare or very rare** Hepatitis B

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related side-effects (including cytokine release syndrome) have been reported with ofatumumab; premedication with paracetamol, an antihistamine, and a corticosteroid must be given—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Discontinue breast-feeding during and for 12 months after treatment—no information available.
- **RENAL IMPAIRMENT** No information available for creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor electrolytes (including potassium and magnesium) before and during administration and correct if abnormal.
 - ▶ Patients must be monitored closely during each infusion for the onset of infusion reactions.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab (October 2010) NICE TA202**
Ofatumumab is **not** recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.
Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA202
- **Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344**
Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
 - the person is ineligible for fludarabine-based therapy **and**
 - bendamustine is not suitable **and**
 - the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.
 Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA344

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2015) that ofatumumab (*Arzerra*®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients who have not received prior therapy and who are not eligible for fludarabine-based therapy. It is restricted to use in patients who would not be considered for bendamustine therapy and who would receive chlorambucil-based therapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- **Arzerra** (Novartis Pharmaceuticals UK Ltd)

Ofatumumab 20 mg per 1 mL Arzerra 100mg/5mL concentrate for solution for infusion vials | 3 vial [PoM] £546.00 (Hospital only)
Arzerra 1000mg/50mL concentrate for solution for infusion vials | 1 vial [PoM] £1,820.00 (Hospital only)

Olaratumab

15-Aug-2017

- **DRUG ACTION** Olaratumab is a monoclonal antibody that binds to platelet-derived growth factor receptor alpha to inhibit tumour growth.

● INDICATIONS AND DOSE

Advanced soft tissue sarcoma (in combination with doxorubicin) in patients that are not amenable to curative treatment with surgery or radiotherapy, and who have not been previously treated with doxorubicin (specialist use only)

- **BY INTRAVENOUS INFUSION**

➤ **Adult:** 15 mg/kg once daily on days 1 and 8 of a 3-week cycle, for up to 8 cycles, patients whose disease has not progressed after combination therapy may continue with olaratumab monotherapy, for dose adjustments due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** Patients should receive pre-medication to minimise the development of adverse reactions (consult product literature)

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Arthralgia · diarrhoea · headache · lymphopenia · mucositis · muscle complaints · nausea · neutropenia · pain · vomiting
 - **Rare or very rare** Flushing
 - **Frequency not known** Bronchospasm · cardiac arrest · chills · dyspnoea · fever · hypersensitivity · hypotension
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects were reported for use of olaratumab in combination with doxorubicin.

Infusion-related reactions Infusion related reactions have been reported; for grade 1 or 2 infusion-related reactions, manufacturer advises interrupt treatment and treat as clinically indicated; treatment may be recommenced at a reduced dose once the reaction has resolved and pre-medication should be given prior to subsequent infusions—consult product literature. Permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for at least 3 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid during and for at least 3 months after stopping treatment—no information available.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor for signs and symptoms of infusion-related reactions during the infusion.
- Manufacturer advises monitor neutrophil and platelet count prior to each dose and during treatment; monitor coagulation profile in patients with increased risk of bleeding.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion* (*Lartruvo*®), dilute requisite dose to a final volume of 250 mL with Sodium Chloride 0.9%; give over approx. 60 minutes at a rate not exceeding 25 mg/minute. Manufacturer advises resuscitation facilities should be available.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Olaratumab in combination with doxorubicin for treating advanced soft tissue sarcoma (August 2017) NICE TA465**
Olaratumab, in combination with doxorubicin, is recommended for use within the Cancer Drugs Fund as an option for advanced soft tissue sarcoma in adults, only if:
 - they have not had any previous systemic chemotherapy for advanced soft tissue sarcoma
 - they cannot have curative treatment with surgery or their disease does not respond to radiotherapy
 - the conditions in the managed access agreement for olaratumab are followed.

This recommendation is not intended to affect treatment with olaratumab that was started in the NHS before this guidance was published. Patients having treatment outside this recommendation may continue without change to the funding arrangements in place for them

before this guidance was published, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA465

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2017) that laratumumab (*Lartuvo*®), in combination with doxorubicin, is accepted for restricted use within NHS Scotland for the first-line treatment of patients with advanced soft-tissue sarcoma not amenable to curative treatment with surgery or radiotherapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

► *Lartuvo* (Eli Lilly and Company Ltd) ▼

Laratumab 10 mg per 1 ml *Lartuvo* 500mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £1,000.00
Lartuvo 190mg/19ml concentrate for solution for infusion vials | 1 vial [PoM] £380.00

Panitumumab

02-Aug-2017

● **DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

● INDICATIONS AND DOSE

Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) | Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SEVERE SKIN REACTIONS

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

● **CONTRA-INDICATIONS** Interstitial pulmonary disease · the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown

- **CAUTIONS** History of keratitis · history of severe dry eye · history of ulcerative keratitis · pulmonary disease—discontinue if interstitial lung disease develops · risk factors for keratitis · risk factors for severe dry eye · risk factors for ulcerative keratitis (including contact lens use)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · asthenia · chest pain · chills · constipation · cough · dehydration · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastroesophageal reflux disease · haemorrhage · hair changes · headache · hyperglycaemia · hyperhidrosis · hypersensitivity (may be delayed) · hypertension · hypotension · increased risk of infection · insomnia · leucopenia · mucositis · nail disorders · nausea · oral disorders · pain · peripheral oedema · skin reactions · skin ulcer · tachycardia · vomiting · weight decreased
 - **Uncommon** Angioedema · cyanosis · infusion related reaction · nasal dryness · onycholysis · respiratory disorders
 - **Rare or very rare** Anaphylactic reaction · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment.
- **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 2 months after treatment.
- **PRE-TREATMENT SCREENING** Evidence of non-mutated RAS status (at exons 2, 3 and 4 of *KRAS* and *NRAS*) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- **MONITORING REQUIREMENTS**
 - Monitor for hypomagnesaemia.
 - Monitor for hypocalcaemia.
 - Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
Panitumumab monotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.
www.nice.org.uk/guidance/TA242
 - Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017) NICE TA439
Panitumumab is recommended, within its marketing authorisation, as an option for previously untreated RAS wild-type metastatic colorectal cancer in adults in combination with:
 - 5-fluorouracil, folinic acid and oxaliplatin (FOLFOX), or
 - 5-fluorouracil, folinic acid and irinotecan (FOLFIRI).
This advice is contingent upon the manufacturer providing panitumumab with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/TA439

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Vectibix** (Amgen Ltd)

Panitumumab 20 mg per 1 ml Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,517.16 (Hospital only)

Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £379.29 (Hospital only)

Pembrolizumab

20-Oct-2017

- **DRUG ACTION** Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

INDICATIONS AND DOSE

Melanoma (specialist use only) | Locally advanced or metastatic non-small cell lung cancer (following prior chemotherapy) (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 2 mg/kg every 3 weeks, for dose adjustments due to side-effects or infusion-related reactions—consult product literature

Metastatic non-small cell lung cancer (first-line treatment) (specialist use only) | Urothelial carcinoma (specialist use only) | Classical Hodgkin lymphoma (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 200 mg every 3 weeks, for dose adjustments due to side-effects or infusion-related reactions—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PEMBROLIZUMAB (KEYTRUDA®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)

A European review of worldwide data concluded that pembrolizumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with pembrolizumab versus the risk of possible organ transplant rejection for each patient.

- **CAUTIONS** Patients may need pretreatment to minimise the development of adverse reactions (consult product literature)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain • anaemia • appetite decreased • arthralgia • arthritis • asthenia • chills • constipation • cough • cytokine release syndrome • diarrhoea • dizziness • dry mouth • dyspnoea • fever • gastrointestinal disorders • headache • hypersensitivity • hyperthyroidism • hypothyroidism • influenza like illness • myositis • nausea • oedema • pain • pneumonitis • severe cutaneous adverse reactions (SCARs) • skin reactions • taste altered • vomiting
 - **Uncommon** Adrenal insufficiency • alopecia • decreased leucocytes • dry eye • electrolyte imbalance • eosinophilia • epilepsy • hair colour changes • hepatitis • hypertension • hypophosphitis • insomnia • lethargy • myocarditis • nephritis • nerve disorders • neutropenia • pancreatitis • tenosynovitis • thrombocytopenia • thyroiditis • type 1 diabetes mellitus • uveitis
 - **Rare or very rare** Erythema nodosum • haemolytic anaemia • myasthenic syndrome • sarcoidosis
 - **Frequency not known** Solid organ transplant rejection
- SIDE-EFFECTS, FURTHER INFORMATION**
- Immune-related reactions** Most immune-related adverse reactions are reversible and managed by

temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

Infusion-related reactions Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment and for at least 4 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NICE decisions**
 - Pembrolizumab for treating advanced melanoma after disease progression with ipilimumab (updated September 2017) NICE TA357
Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma in adults only:
 - after the disease has progressed with ipilimumab and, for BRAF V600 mutation-positive disease, a BRAF or MEK inhibitor, **and**
 - the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.www.nice.org.uk/guidance/ta357
 - Pembrolizumab for advanced melanoma not previously treated with ipilimumab (updated September 2017) NICE TA366
Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma that has not been previously treated with ipilimumab, in adults, only when the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.
www.nice.org.uk/guidance/ta366
 - Pembrolizumab for treating PD-L1-positive non-small-cell lung cancer after chemotherapy (updated September 2017) NICE TA428
Pembrolizumab is recommended as an option for treating locally advanced or metastatic PD-L1-positive non-small-cell lung cancer in adults who have had at least one chemotherapy (and targeted treatment if they have an epidermal growth factor receptor (EGFR)- or anaplastic lymphoma kinase (ALK)-positive tumour), only if:
 - pembrolizumab is stopped at 2 years of uninterrupted treatment and no documented disease progression, **and**
 - the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they or their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta428
 - Pembrolizumab for untreated PD-L1-positive metastatic non-small-cell lung cancer (June 2017) NICE TA447
Pembrolizumab is recommended for use within the Cancer Drugs Fund as an option for untreated PD-L1-positive metastatic non-small-cell lung cancer in adults, only if:

- their tumours express PD-L1 with at least a 50% tumour proportion score and have no epidermal growth factor receptor- or anaplastic lymphoma kinase-positive mutations
- pembrolizumab is stopped at 2 years of uninterrupted treatment and no documented disease progression
- the conditions in the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta447

► **Pembrolizumab for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy (April 2018) NICE TA519**

Pembrolizumab is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic urothelial carcinoma in adults who have had platinum-containing chemotherapy, only if:

- pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier in the event of disease progression, and
- the conditions in the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta519

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1086/15

The *Scottish Medicines Consortium* has advised (November 2015) that pembrolizumab (*Keytruda*®) is accepted for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1087/15

The *Scottish Medicines Consortium* has advised (December 2016) that pembrolizumab (*Keytruda*®) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously treated with ipilimumab as the economic case was not demonstrated.

SMC No. 1204/17

The *Scottish Medicines Consortium* has advised (January 2017) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) and who have received at least one prior chemotherapy regimen, subject to a two-year clinical stopping rule. The advice is contingent upon the continuing availability of pembrolizumab at the price agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1239/17

The *Scottish Medicines Consortium* has advised (July 2017) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) with a $\geq 50\%$ tumour proportion score with no epidermal growth factor receptor or anaplastic lymphoma kinase positive tumour mutations, subject to a two-year clinical stopping rule. The

advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1291/18

The *Scottish Medicines Consortium* has advised (February 2018) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of locally advanced or metastatic urothelial carcinoma in adults who have received prior platinum-containing chemotherapy. Treatment with pembrolizumab is subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1296/18

The *Scottish Medicines Consortium* has advised (March 2018) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of adults with relapsed or refractory classical Hodgkin lymphoma who have failed autologous stem cell transplant and brentuximab vedotin, or who are transplant-ineligible and have failed brentuximab vedotin. Treatment with pembrolizumab is subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 3

► *Keytruda* (Merck Sharp & Dohme Ltd) ▼

Pembrolizumab 25 mg per 1 ml *Keytruda* 100mg/4ml concentrate for solution for infusion vials | 1 vial (PoM) £2,630.00 (Hospital only)

Pembrolizumab 50 mg *Keytruda* 50mg powder for concentrate for solution for infusion vials | 1 vial (PoM) £1,315.00 (Hospital only)

Pertuzumab

18-Jul-2017

- **DRUG ACTION** Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

● **INDICATIONS AND DOSE**

Treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy (initiated by a specialist)

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **CAUTIONS** Conditions that could impair left ventricular function · history of congestive heart failure · impaired left ventricular function · prior anthracycline exposure · radiotherapy to the chest area · recent myocardial infarction · serious cardiac arrhythmia · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · congestive heart failure · constipation · cough · cytokine release syndrome · diarrhoea · dizziness · dyspepsia · dyspnoea · excessive tearing · fever · headache · hypersensitivity · increased risk of infection · infusion related reaction · insomnia · left ventricular dysfunction · leucopenia · mucositis · myalgia · nail disorder · nausea · neutropenia · oedema · pain ·

peripheral neuropathy · respiratory disorders · skin reactions · stomatitis · taste altered · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side effects mostly described for pertuzumab in combination with trastuzumab and docetaxel.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for six months after treatment in women of childbearing potential.
- **PREGNANCY** Avoid (toxicity in *animal studies*). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution—no information available.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary.
 - ▶ Monitor for febrile neutropenia.
- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Pertuzumab for the neoadjuvant treatment of HER2-positive breast cancer (December 2016) NICE TA424
Pertuzumab, in combination with trastuzumab and chemotherapy, is recommended, within its marketing authorisation, as an option for neoadjuvant treatment in adults with human epidermal growth factor receptor 2 (HER2-positive), locally advanced, inflammatory or early-stage breast cancer at high risk of recurrence, only if the manufacturer provides it with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta424
- ▶ Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018) NICE TA509
Pertuzumab, in combination with trastuzumab and docetaxel, is recommended, within its marketing authorisation, for treating HER2-positive metastatic or locally recurrent unresectable breast cancer, in adults who have not had previous anti-HER2 therapy or chemotherapy for their metastatic disease, only if the manufacturer provides pertuzumab within the agreed commercial access arrangement.
www.nice.org.uk/guidance/ta509

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1121/16

The *Scottish Medicines Consortium* has advised (December 2016) that pertuzumab (*Perjeta*®) is **not** recommended for use within NHS Scotland in combination with trastuzumab and chemotherapy for the neoadjuvant treatment of patients with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early stage breast cancer at high risk of recurrence, as the economic case was not demonstrated.
SMC No. 897/13

The *Scottish Medicines Consortium* has advised (June 2017) that pertuzumab (*Perjeta*®) is **not** recommended for use within NHS Scotland for the treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in adults who have not received previous anti-HER2 therapy or chemotherapy as the economic case was not sufficient to gain acceptance.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ **Perjeta** (Roche Products Ltd) ▼

Pertuzumab 30 mg per 1 ml Perjeta 420mg/14ml concentrate for solution for infusion vials | 1 vial [PoM] £2,395.00 (Hospital only)

Ramucirumab

31-May-2016

- **DRUG ACTION** Ramucirumab is a human monoclonal antibody that binds to the vascular endothelial growth factor receptor-2 (VEGFR-2), inhibiting VEGF-induced angiogenesis.

INDICATIONS AND DOSE

Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, in combination with paclitaxel, in patients with disease progression after prior platinum and fluoropyrimidine chemotherapy

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 8 mg/kg on days 1 and 15 of a 28 day cycle, dose to be administered prior to paclitaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, as monotherapy, in patients with disease progression after prior platinum or fluoropyrimidine chemotherapy, and for whom treatment in combination with paclitaxel is not appropriate

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 8 mg/kg every 2 weeks, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of metastatic colorectal cancer, in combination with FOLFIRI (irinotecan, fluorouracil and folinic acid), in patients with disease progression on, or after, prior therapy with bevacizumab, oxaliplatin and a fluoropyrimidine

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 8 mg/kg every 2 weeks, dose to be administered prior to FOLFIRI administration, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of locally advanced or metastatic non-small cell lung cancer, in combination with docetaxel, in patients with disease progression after platinum-based chemotherapy

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg on day 1 of a 21 day cycle, dose to be administered prior to docetaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

- **CAUTIONS** Elective surgery—discontinue treatment for at least 4 weeks prior to surgery · hypertension—must be controlled before initiation · impaired wound healing—discontinue treatment until wound fully healed · pretreatment is recommended to minimise the development of adverse reactions (consult product literature) · risk of bleeding
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · diarrhoea · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal perforation · haemorrhage · hand and foot syndrome · headache · hepatic pain · hypertension · hyponatraemia · leucopenia · mucositis · neutropenia ·

peripheral oedema • proteinuria • sepsis • stomatitis • thrombocytopenia

- ▶ **Frequency not known** Arterial thrombosis • back pain • back spasms • cardiac arrest • cerebrovascular insufficiency • chest discomfort • chills • dyspnoea • flushing • hypersensitivity • hypotension • hypoxia • myocardial infarction • paraesthesia • respiratory disorders • supraventricular tachycardia • tremor

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related hypersensitivity reactions have been reported with ramucirumab, particularly during or following the first or second infusion; if the patient experiences a grade 1 or 2 infusion-related reaction, the manufacturer advises to reduce rate of infusion by 50% and give premedication for all subsequent infusions—consult product literature. Manufacturer advises to permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for up to 3 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 3 months after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe cirrhosis, cirrhosis with hepatic encephalopathy, cirrhosis with clinically significant ascites, or hepatorenal syndrome—use only if potential benefit outweighs risk of progressive hepatic failure.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs of infusion-related hypersensitivity reactions; monitor blood pressure prior to each infusion; monitor for development or worsening of proteinuria during treatment—consult product literature; monitor blood counts and coagulation parameters in patients at risk of bleeding.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cymaza[®]), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and invert gently to mix. Do not exceed a rate of 25 mg/minute, and give over approximately 60 minutes via an infusion pump using a separate infusion line with a protein sparing 0.22 micron filter.
- **PRESCRIBING AND DISPENSING INFORMATION** For Cymaza[®], each 10 mL vial contains sodium 17 mg (equivalent to Na⁺ 0.74 mmol).
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Ramucirumab for treating advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy (January 2016)** NICE TA378
Ramucirumab alone or in combination with paclitaxel is not recommended for the treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy.

Patients whose treatment was started before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA378

- ▶ **Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer (August 2016)** NICE TA403
Ramucirumab, in combination with docetaxel, is not recommended for treating locally advanced or metastatic non-small-cell lung cancer in patients whose disease has progressed after platinum-based chemotherapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA403

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Cymaza** (Eli Lilly and Company Ltd) ▼

£ 836

Rituximab

21-Feb-2018

INDICATIONS AND DOSE

Treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (in combination with methotrexate)

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 1 g, then 1 g after 2 weeks, patients should receive premedication before each infusion (consult product literature for details)

Treatment of previously untreated stage III-IV follicular lymphoma (in combination with other chemotherapy) | Maintenance therapy in patients with follicular non-Hodgkin's lymphoma that has responded to induction therapy (in combination with other chemotherapy) | Treatment of diffuse large B-cell non-Hodgkin's lymphoma (in combination with other chemotherapy) | Treatment of chemotherapy-resistant or relapsed stage III-IV follicular non-Hodgkin's lymphoma | Previously untreated or relapsed chronic lymphocytic leukaemia | Induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis (in combination with glucocorticoids)

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Patients should receive premedication before each dose (consult product literature for details) (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Severe heart failure (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis) • severe infection • severe, uncontrolled heart disease (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis)

CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on contra-indications, consult product literature.

CAUTIONS

GENERAL CAUTIONS History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported • patients receiving cardiotoxic chemotherapy; in adults exacerbation of angina, arrhythmia, and heart failure have been reported • transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

SPECIFIC CAUTIONS

- When used for rheumatoid arthritis Predisposition to infection

CAUTIONS, FURTHER INFORMATION

- Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **rituximab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

- INTERACTIONS** → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- Common or very common** Angioedema · anxiety · appetite decreased · arrhythmias · bone marrow disorders · bursitis · cancer pain · cardiac disorder · chest pain · conjunctivitis · cough aggravated · dizziness · dysphagia · ear pain · gastrointestinal discomfort · gastrointestinal disorders · hearing impairment · hepatitis B · hypercholesterolaemia · hyperglycaemia · hypocalcaemia · increased risk of infection · insomnia · lacrimation disorder · malaise · migraine · multi organ failure · muscle tone increased · myalgia · myocardial infarction · nerve disorders · neutropenia · oedema · oral disorders · oropharyngeal pain · osteoarthritis · pain · postural hypotension · respiratory disorders · sensation abnormal · sepsis · skin reactions · throat irritation · vasodilation · weight decreased
- Uncommon** Asthma · coagulation disorder · haemolytic anaemia · heart failure · hypoxia · ischaemic heart disease · lymphadenopathy · taste altered
- Rare or very rare** Facial paralysis · hypersensitivity · renal failure · Stevens-Johnson syndrome (discontinue) · toxic epidermal necrolysis (discontinue) · vasculitis · vision disorders
- Frequency not known** Hypogammaglobulinaemia · posterior reversible encephalopathy syndrome (PRES) · psychiatric disorder · seizure

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation.

Progressive multifocal leucoencephalopathy has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.
- PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.
- BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.
- MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.
- DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*MabThera*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1–4 mg/mL and gently invert bag to avoid foaming.
- PRESCRIBING AND DISPENSING INFORMATION** Rituximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

PATIENT AND CARER ADVICE

Alert card Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis or rheumatoid arthritis should be provided with a patient alert card with each infusion.

NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

- Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014) NICE TA308**
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody [ANCA]-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener's] and microscopic polyangiitis), only if:
 - further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, **or**
 - cyclophosphamide is contra-indicated or not tolerated, **or**
 - the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, **or**
 - the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months **or**
 - the patient has had uroepithelial malignancy.www.nice.org.uk/TA308
- Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195**
Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.
www.nice.org.uk/TA195
- Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012) NICE TA243**
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:
 - cyclophosphamide, vincristine and prednisolone (CVP);
 - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
 - mitoxantrone, chlorambucil and prednisolone (MCP);
 - cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon- α (CHVPi); or
 - chlorambucil
 is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.
www.nice.org.uk/TA243
- Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma (February 2008) NICE TA137**
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma.
Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma in remission induced with chemotherapy (with or without rituximab).
Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma, when all alternative

treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

www.nice.org.uk/TA137

▶ **Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010) NICE TA193**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:

- is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), **or**
- has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.

www.nice.org.uk/TA193

▶ **Rituximab for the first-line maintenance treatment of follicular non-Hodgkin's lymphoma (June 2011) NICE TA226**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkin's lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.

www.nice.org.uk/TA226

▶ **Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009) NICE TA174**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

www.nice.org.uk/TA174

▶ **Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359**

Rituximab, in combination with idelalisib, is recommended as an option for treatment in adults:

- who have untreated chronic lymphocytic leukaemia **or**
 - who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months **and**
 - if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.
- Patients who are already receiving idelalisib should continue treatment until they or their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA359

▶ **Rituximab for aggressive non-Hodgkin's lymphoma (September 2003) NICE TA65**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV.

The use of rituximab for localised (stage I) disease should be limited to clinical trials.

www.nice.org.uk/TA65

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2013) that Rituximab (*MabThera*®) is accepted for restricted use within NHS Scotland, in combination with

glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

The *Scottish Medicines Consortium* has advised (June 2014) that subcutaneous rituximab (*MabThera*®) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Siltuximab

- **DRUG ACTION** Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

● **INDICATIONS AND DOSE**

Treatment of multicentric Castleman's disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative

▶ **BY INTRAVENOUS INFUSION**

▶ Adult: 11 mg/kg every 3 weeks

- **CAUTIONS** Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation · severe infection—withhold treatment until resolved · treat infection prior to treatment

CAUTIONS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment.

Consult product literature for further information about siltuximab cautions.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · hypersensitivity · hypertension · hypertriglyceridaemia · increased risk of infection · localised oedema · neutropenia · renal impairment · skin reactions · thrombocytopenia · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines,

paracetamol, and corticosteroids may be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.
 - ▶ Monitor for infection during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Sylvant[®]), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Sylvant (Janssen-Cilag Ltd) ▼

- **Siltuximab 100 mg** Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £415.00 (Hospital only)

Trastuzumab

01-May-2018

● INDICATIONS AND DOSE

Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist) | Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist) | Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature or local protocols)

Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Severe dyspnoea at rest
- **CAUTIONS** Coronary artery disease · history of hypertension · symptomatic heart failure · uncontrolled arrhythmias
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · angioedema · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · asthma · ataxia · breast abnormalities · cardiomyopathy · chest pain · chills · constipation · cough · cystitis · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · haemorrhoids · headache · heart failure · hepatic disorders · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · influenza like illness · infusion related reaction (may be delayed) · insomnia · leucopenia · malaise · mucositis · muscle complaints · muscle tone increased · nail disorders · nausea · neutropenia · oedema · oral disorders · pain · palpitations · pancreatitis · paraesthesia · peripheral neuropathy · renal disorder · respiratory disorders · rhinorrhoea · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · tremor · vasodilation · vomiting · weight decreased
 - ▶ **Uncommon** Deafness · pericardial effusion
 - ▶ **Rare or very rare** Paresis
 - ▶ **Frequency not known** Brain oedema · cancer progression · cardiogenic shock · glomerulonephritis · hyperkalaemia · hypoproteinaemia · hypoxia · pericarditis · pulmonary fibrosis (may be delayed) · pulmonary oedema (may be delayed) · renal failure
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Avoid breast-feeding during treatment and for 7 months afterwards.
- **MONITORING REQUIREMENTS**
 - ▶ Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab.
- **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is **not** interchangeable with trastuzumab emtansine.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34

Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.

Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients.

www.nice.org.uk/guidance/ta34

► Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107

Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable).

www.nice.org.uk/guidance/ta107

► Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta257

► Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018) NICE TA509

Pertuzumab, in combination with trastuzumab and docetaxel, is recommended, within its marketing authorisation, for treating HER2-positive metastatic or locally recurrent unresectable breast cancer, in adults who have not had previous anti-HER2 therapy or chemotherapy for their metastatic disease, only if the manufacturer provides pertuzumab within the agreed commercial access arrangement.

www.nice.org.uk/guidance/ta509

► Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208

Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

- have not received treatment for metastatic disease **and**
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

www.nice.org.uk/guidance/ta208

Scottish Medicines Consortium (SMC) Decisions

SMC No. 928/13

The *Scottish Medicines Consortium* has advised (January 2014) that subcutaneous trastuzumab injection (*Herceptin*[®]) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive

metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.

SMC No. 623/10

The *Scottish Medicines Consortium* has advised (October 2015) that trastuzumab solution for infusion (*Herceptin*[®]) is accepted for restricted use within NHS Scotland in combination with capecitabine or fluorouracil and cisplatin for the treatment of patients with HER2 positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction, who have not received prior anti-cancer treatment for their metastatic disease. It is restricted to patients with metastatic gastric cancer whose tumours have HER2 over-expression, as determined by an accurate and validated assay.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Trastuzumab emtansine

02-Aug-2017

- **DRUG ACTION** Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

● INDICATIONS AND DOSE

Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist) | Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist)

► BY INTRAVENOUS INFUSION

- Adult: (consult product literature or local protocols)

- **CAUTIONS** Dyspnoea at rest—increased risk of pulmonary events · history of congestive heart failure · patients over 75 years · peripheral neuropathy (temporarily discontinue treatment—consult product literature) · recent history of myocardial infarction · recent history of unstable angina · risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment · serious arrhythmias
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- **Common or very common** Alopecia · anaemia · arthralgia · asthenia · chills · conjunctivitis · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · fever · gastrointestinal discomfort · haemorrhage · headache · hypersensitivity · hypertension · hypokalaemia · infusion related reaction · insomnia · left

ventricular dysfunction · leucopenia · memory loss · musculoskeletal pain · myalgia · nail disorder · nausea · neutropenia · peripheral neuropathy · peripheral oedema · skin reactions · stomatitis · taste altered · thrombocytopenia · urinary tract infection · vision blurred · vomiting

- **Uncommon** Hepatic disorders · nodular regenerative hyperplasia · pneumonitis

● **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for 6 months after stopping treatment in women and men.

● **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 6 months after treatment.

● **HEPATIC IMPAIRMENT** Consult product literature for initiating treatment and discontinuation in cases of abnormal liver function tests.

Dose adjustments Consult product literature for dose modification in cases of abnormal liver function tests.

● **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.

● **MONITORING REQUIREMENTS**

- Monitor hepatic function before each dose.
- Monitor for signs and symptoms of neurotoxicity.
- Monitor closely for infusion-related and hypersensitivity reactions.
- Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
- Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
- Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).

● **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab emtansine.

● **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are **not** interchangeable.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Trastuzumab emtansine for treating HER2-positive advanced breast cancer after trastuzumab and a taxane (updated November 2017)** NICE TA458

Trastuzumab emtansine is recommended, within its marketing authorisation, as an option for treating human epidermal growth factor receptor 2 (HER2)-positive, unresectable, locally advanced or metastatic breast cancer in adults who previously received trastuzumab and a taxane, separately or in combination. Patients should have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within 6 months of completing adjuvant therapy.

Trastuzumab emtansine is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/TA458

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2017) that trastuzumab emtansine (*Kadcyla*®) is accepted for use within NHS Scotland as monotherapy for the treatment of patients with human epidermal growth factor type 2 (HER2)-positive, unresectable locally advanced or metastatic breast cancer who previously received

trastuzumab and a taxane, separately or in combination, and have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within six months of completing adjuvant therapy. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Kadcyla** (Roche Products Ltd) ▼

Trastuzumab emtansine 100 mg Kadcyla 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,641.01

Trastuzumab emtansine 160 mg Kadcyla 160mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,625.62

2 Carcinoid syndrome

ENZYME INHIBITORS

Telotristat ethyl

14-Dec-2017

● **DRUG ACTION** Telotristat ethyl and its active metabolite inhibit L-tryptophan hydroxylases TPH-1 and TPH-2 which reduces the production of serotonin, thereby alleviating symptoms associated with carcinoid syndrome.

● **INDICATIONS AND DOSE**

Carcinoid syndrome diarrhoea (specialist use only)

- **BY MOUTH**

► **Adult:** 250 mg 3 times a day, review treatment if no response after 12 weeks

● **INTERACTIONS** → Appendix 1: telotristat ethyl

● **SIDE-EFFECTS**

- **Common or very common** Appetite decreased · constipation · fatigue · fever · flatulence · gastrointestinal discomfort · headache · peripheral oedema

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

Dose adjustments Manufacturer advises consider dose reduction to 250 mg twice daily in mild impairment; consider dose reduction to 250 mg once daily in moderate impairment—reduce dose according to tolerability and monitor for adverse effects and worsening of liver function.

● **RENAL IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment; avoid in severe impairment—no information available.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function at initiation and during treatment as clinically indicated—discontinue if liver injury suspected.

● **PATIENT AND CARER ADVICE** Manufacturer advises inform patients to report any symptoms of depression or decreased interest.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

3 Cytotoxic responsive malignancy

Cytotoxic drugs

Overview

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

Cytotoxic drug handling guidelines

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from:

Department of Health
PO Box 777
London
SE1 6XH
Fax: 01623 724524

It is available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work

collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment.

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

Cytotoxic drugs: important safety information

Risk of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Cytotoxic drug doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should **not** be repeated except on the instructions of a specialist.

Cytotoxic drug side-effects

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such

as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 886, methotrexate p. 888, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 1086 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 887 or azathioprine p. 816 should be reduced if allopurinol needs to be given concomitantly. Febuxostat p. 1087 may also be used and should be started 2 days before cytotoxic therapy is initiated.

Rasburicase p. 917, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 904 and bleomycin p. 894 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 870, lomustine p. 873, and melphalan p. 873. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.06×10^7 /litre) requires immediate broad-spectrum

antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

See advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Cytotoxic drugs: effect on pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins—women of childbearing age should use effective contraception during and after treatment.

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Cytotoxic drugs: nausea and vomiting

Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide p. 898, methotrexate p. 888 (less than 100 mg/m^2 , low dose

in children), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin hydrochloride p. 876, intermediate and low doses of cyclophosphamide p. 871, mitoxantrone p. 879, and high doses of methotrexate (0.1–1.2 g/m²).

Highly emetogenic treatment—cisplatin p. 897, dacarbazine p. 872, and high doses of cyclophosphamide.

Prevention of acute symptoms

For patients at *low risk of emesis*, pretreatment with dexamethasone p. 660 or lorazepam p. 335 may be used.

For patients at *high risk of emesis*, a 5HT₃-receptor antagonist, usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant p. 427 is effective.

Prevention of delayed symptoms

For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT₃-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Rolapitant p. 428 and metoclopramide hydrochloride p. 426 are also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms

Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Treatment of cytotoxic-induced side-effects

Anthracycline side-effects

Anthracycline-induced cardiotoxicity

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Anthracycline extravasation

Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

Chemotherapy-induced mucositis and myelosuppression

Folinic acid p. 916 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 888 and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 563.

When folinic acid and fluorouracil p. 886 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 917, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 871 and ifosfamide p. 872; it is caused by the metabolite acrolein. Mesna p. 915 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving

cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity. Daunorubicin p. 876, doxorubicin hydrochloride p. 876, epirubicin hydrochloride p. 877 and idarubicin hydrochloride p. 878 are anthracycline antibiotics. Mitoxantrone p. 879 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both *conventional* and *liposomal* formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. *Conventional* doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and clinical trials suggest that it is as effective in the treatment of breast cancer.

Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pixantrone p. 879 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 894 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 895 is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity and therefore it is usually administered at 6-weekly intervals.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 904, vincristine sulfate p. 904, and vindesine sulfate p. 905, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer).

Vinorelbine p. 906 is a semi-synthetic vinca alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide is related to cyclophosphamide and is given intravenously.

Melphalan p. 873 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 873 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 870 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin's lymphomas, and brain tumours. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

Estramustine phosphate p. 872 is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

Bendamustine hydrochloride

31-Jul-2017

● INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin's lymphoma | Treatment of multiple myeloma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BENDAMUSTINE (Levact[®]): INCREASED MORTALITY OBSERVED IN RECENT CLINICAL STUDIES IN OFF-LABEL USE; MONITOR FOR OPPORTUNISTIC INFECTIONS, HEPATITIS B REACTIVATION (JULY 2017)

Recent clinical trials have shown increased mortality when bendamustine was used in combination treatments outside its approved indications. In addition, a recent European review of post-marketing data has suggested that the risk of opportunistic infections for all patients receiving bendamustine treatment may be greater than previously recognised.

The MHRA recommends monitoring patients for opportunistic infections as well as cardiac, neurological, and respiratory adverse events; known carriers of hepatitis B virus (HBV) should be monitored for signs and symptoms of active HBV infection. Patients should be advised to report promptly new signs of infection; consider discontinuing bendamustine if there are signs of opportunistic infections.

- **CONTRA-INDICATIONS** Jaundice · low leucocyte count · low platelet count · major surgery less than 30 days before start of treatment · severe bone marrow suppression
- **CAUTIONS** Cardiac disorders—monitor serum potassium and ECG
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · amenorrhoea · anaemia · angina pectoris · appetite decreased · arthralgias · cardiac disorder · chills · constipation · decreased leucocytes · dehydration · diarrhoea · dizziness ·

fatigue · fever · haemorrhage · headache · hepatitis B reactivation · hypersensitivity · hypertension · hypokalaemia · hypotension · increased risk of infection · insomnia · mucositis · nausea · neutropenia · pain · palpitations · respiratory disorders · skin reactions · stomatitis · thrombocytopenia · tumour lysis syndrome · vomiting

- ▶ **Uncommon** Bone marrow disorders · heart failure · myocardial infarction · neoplasms · pericardial effusion
- ▶ **Rare or very rare** Anticholinergic syndrome · aphonia · ataxia · circulatory collapse · drowsiness · haemolysis · hyperhidrosis · infertility · multi organ failure · nervous system disorder · paraesthesia · peripheral neuropathy · sepsis · taste altered

- ▶ **Frequency not known** Hepatic failure · necrosis · renal failure · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION

Secondary malignancy Use of bendamustine is associated with an increased incidence of acute leukaemias.

Infections Serious and fatal infections are reported, including opportunistic infections such as Pneumocystis jirovecii pneumonia (PJP), varicella zoster virus (VZV) and cytomegalovirus (CMV)—manufacturer advises monitoring for respiratory signs and symptoms throughout treatment; patients should be advised to report new signs of infection, including fever or respiratory symptoms, promptly. Reactivation of hepatitis B is reported in patients who are chronic carriers of the virus—manufacturer advises monitoring for signs and symptoms of active hepatitis B during treatment and for several months after stopping treatment.

- **CONCEPTION AND CONTRACEPTION** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic and mutagenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Consider a 30% dose reduction in moderate impairment.
- **RENAL IMPAIRMENT** No information available on use in patients with creatinine clearance less than 10 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - ▶ Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011) NICE TA216 Bendamustine is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia (Binet stage B or C) in patients for whom fludarabine combination chemotherapy is not appropriate.
www.nice.org.uk/guidance/TA216
 - ▶ Obinutuzumab with bendamustine for treating follicular lymphoma refractory to rituximab (August 2017) NICE TA472 Bendamustine in combination with obinutuzumab followed by obinutuzumab maintenance, is recommended for use within the Cancer Drugs Fund as an option for treating adults with follicular lymphoma that did not respond or progressed during or up to 6 months after treatment with rituximab or a rituximab-containing regimen, only if the conditions in the managed access agreement for obinutuzumab are followed.
www.nice.org.uk/guidance/TA472

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2011) that bendamustine (Levact[®]) is accepted for use within NHS Scotland for first-line treatment of chronic lymphocytic leukaemia (Binet stage B or C) in patients for

whom fludarabine combination chemotherapy is not appropriate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Bendamustine hydrochloride (Non-proprietary)

Bendamustine hydrochloride 25 mg Bendamustine 25mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £6.85-£65.98 | 5 vial [PoM] £312.53-£347.26 (Hospital only) | 20 vial [PoM] £1,241.14 (Hospital only)

Bendamustine hydrochloride 100 mg Bendamustine 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £277-£262.02 | 5 vial [PoM] £1,241.14-£1,379.04 (Hospital only)

▶ Levact (Napp Pharmaceuticals Ltd)

Bendamustine hydrochloride 25 mg Levact 25mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £347.26 (Hospital only)

Bendamustine hydrochloride 100 mg Levact 100mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £1,379.04 (Hospital only)

Busulfan

(Busulphan)

INDICATIONS AND DOSE

Chronic myeloid leukaemia, induction of remission

▶ BY MOUTH

- Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily

Conditioning treatment before haematopoietic progenitor cell transplantation

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

Conditioning treatment before haematopoietic progenitor cell transplantation in patients who are candidates for a reduced-intensity conditioning (RIC) regimen

▶ BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

DOSES AT EXTREMES OF BODY-WEIGHT

- Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

- **INTERACTIONS** → Appendix 1: alkylating agents

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · diarrhoea · hepatic disorders · nausea · respiratory disorders · sinusoidal obstruction syndrome · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Seizure
- ▶ **Rare or very rare** Cataract · eye disorders

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · ascites · asthenia · asthma ·

cardiomegaly · chest pain · chills · confusion · constipation · cough · depression · dizziness · dyspnoea · dysuria · electrolyte imbalance · embolism and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hiccups · hyperglycaemia · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · increased risk of infection · insomnia · mucositis · myalgia · nervous system disorder · neutropenia · oedema · pain · pancytopenia · pericardial effusion · pericarditis · reactivation of infections · renal disorder · renal impairment · stomatitis · vasodilation · weight increased

- ▶ With oral use Amenorrhoea (may be reversible) · azoospermia · bone marrow disorders · cardiac tamponade · delayed puberty · hyperbilirubinaemia · infertility male · leucopenia · leukaemia · menopausal symptoms · oral disorders · ovarian and fallopian tube disorders · testicular atrophy
- ▶ **Uncommon**
- ▶ With intravenous use Capillary leak syndrome · delirium · encephalopathy · hallucination · hypoxia · intracranial haemorrhage
- ▶ **Rare or very rare**
- ▶ With oral use Dry mouth · erythema nodosum · gynaecomastia · myasthenia gravis · radiation injury · Sjögren's syndrome
- ▶ **Frequency not known**
- ▶ With intravenous use Hypogonadism · ovarian failure · premature menopause · sepsis

SIDE-EFFECTS, FURTHER INFORMATION

Lung toxicity Discontinue if lung toxicity develops.

Secondary malignancy Use of busulfan is associated with an increased incidence of secondary malignancy.

- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Avoid (teratogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Monitoring In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.

MONITORING REQUIREMENTS

- ▶ Monitor cardiac and liver function.
- ▶ Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

▶ Busulfan (Non-proprietary)

Busulfan 2 mg Busulfan 2mg tablets | 25 tablet [PoM] £69.02 DT = £69.02

Solution for infusion

▶ Busilvex (Pierre Fabre Ltd)

Busulfan 6 mg per 1 ml Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule [PoM] £1,610.00 (Hospital only)

Carmustine

• INDICATIONS AND DOSE

Multiple myeloma | Non-Hodgkin's lymphomas | Brain tumours

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

Recurrent glioblastoma multiforme as an adjunct to surgery | High-grade malignant glioma as adjunctive treatment to surgery and radiotherapy

► BY INTRALESIONAL IMPLANTATION

► Adult: (consult product literature)

- **CAUTIONS** Avoid in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · abscess · alopecia · anaemia · anxiety · asthenia · ataxia · chest pain · coma · confusion · conjunctival oedema · constipation · depression · diabetes mellitus · diarrhoea · dizziness · drowsiness · dysphagia · electrolyte imbalance · embolism and thrombosis · eye pain · faecal incontinence · fever · gait abnormal · haemorrhage · hallucination · headache · healing impaired · hydrocephalus · hyperglycaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · injury · insomnia · intracranial pressure increased · leucocytosis · memory loss · meningitis · nausea · oedema · pain · paralysis · paranoia · peripheral neuropathy · personality disorder · rash · seizures · sensation abnormal · sepsis · speech impairment · stupor · thinking abnormal · thrombocytopenia · tremor · urinary incontinence · vision disorders · vomiting
 - **Uncommon** Cerebral infarction · intracranial haemorrhage
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121 Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma **only** for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.
www.nice.org.uk/TA121

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

► **Glidel** (Eisai Ltd)

Carmustine 7.7 mg Glidel 7.7mg implant | 8 device **[PoM]** £5,203.00 (Hospital only)

Chlorambucil

• INDICATIONS AND DOSE

Some lymphomas and chronic leukaemias (used either alone or in combination therapy)

► BY MOUTH

► Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CAUTIONS** Children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · bone marrow disorders · diarrhoea · gastrointestinal disorder · leucopenia · nausea · neoplasms · neutropenia · oral ulceration · seizures · thrombocytopenia · vomiting
 - **Uncommon** Skin reactions
 - **Rare or very rare** Cystitis · fever · hepatic disorders · movement disorders · muscle twitching · peripheral neuropathy · respiratory disorders · severe cutaneous adverse reactions (SCARs) · tremor
 - **Frequency not known** Amenorrhoea · azoospermia
- **SIDE-EFFECTS, FURTHER INFORMATION**

Secondary malignancy Use of chlorambucil is associated with an increased incidence of acute leukaemia, particularly with prolonged use.

Skin reactions Manufacturer advises assessing continued use if rash occurs—has been reported to progress to Stevens-Johnson syndrome and toxic epidermal necrolysis.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises consider dose reduction in severe impairment—limited information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015) NICE TA343
Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:
 - bendamustine-based therapy is not suitable **and**
 - the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
 Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA343
 - Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344
Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
 - the person is ineligible for fludarabine-based therapy **and**
 - bendamustine is not suitable **and**

- the manufacturer provides ofatumumab with the discount agreed in the patient access scheme. Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
- www.nice.org.uk/TA344

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Chlorambucil (Non-proprietary)

Chlorambucil 2mg tablets | 25 tablet PoM
£42.87 DT = £42.87

Cyclophosphamide

INDICATIONS AND DOSE

Rheumatoid arthritis with severe systemic manifestations

BY MOUTH

- Adult: 1–1.5 mg/kg daily

Severe systemic rheumatoid arthritis | Other connective tissue diseases (especially with active vasculitis)

BY INTRAVENOUS INJECTION

- Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna

Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours

BY MOUTH, OR BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

- UNLICENSED USE** Not licensed for rheumatoid arthritis with severe systemic manifestations.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- CONTRA-INDICATIONS** Haemorrhagic cystitis
- CAUTIONS** Avoid in Acute porphyrias p. 1025 · diabetes mellitus · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- INTERACTIONS** → Appendix 1: alkylating agents
- SIDE-EFFECTS**
 - Common or very common** Agranulocytosis · alopecia · anaemia · asthenia · bone marrow disorders · cystitis · decreased leucocytes · fever · haemolytic uraemic syndrome · haemorrhage · hepatic disorders · immunosuppression · increased risk of infection · mucosal abnormalities · neutropenia · progressive multifocal leukoencephalopathy · reactivation of infections · sperm abnormalities · thrombocytopenia
 - Uncommon** Appetite decreased · embolism and thrombosis · flushing · hypersensitivity · ovarian and fallopian tube disorders · sepsis
 - Rare or very rare** Bladder disorders · chest pain · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · eye inflammation · fluid imbalance · headache · hyponatraemia · menstrual cycle irregularities · nail discolouration · nausea · neoplasms · oral disorders · pancreatitis acute · renal failure · secondary neoplasm · seizure · severe cutaneous adverse reactions (SCARs) · SIADH · skin reactions · visual impairment · vomiting
 - Frequency not known** Abdominal pain · altered smell sensation · arrhythmias · arthralgia · ascites · cardiac inflammation · cardiogenic shock · cardiomyopathy · cough · dyspnoea · encephalopathy · excessive tearing · facial

swelling · gastrointestinal disorders · hearing impairment · heart failure · hyperhidrosis · hypoxia · infertility · influenza like illness · multi organ failure · muscle complaints · myelopathy · myocardial infarction · nasal complaints · nephropathy · nerve disorders · neuralgia · neurotoxicity · oedema · oropharyngeal pain · palpitations · pericardial effusion · peripheral ischaemia · pulmonary hypertension · pulmonary oedema · QT interval prolongation · radiation injuries · renal tubular disorder · renal tubular necrosis · respiratory disorders · rhabdomyolysis · scleroderma · sensation abnormal · sinusoidal obstruction syndrome · taste altered · testicular atrophy · tremor · tumour lysis syndrome · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION

Haemorrhagic cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication that may be prevented by increasing fluid intake for 24–48 hours after intravenous injection. When high-dose therapy (e.g. more than 2g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna can also help prevent cystitis.

Secondary malignancy As with all cytotoxic therapy, treatment with cyclophosphamide is associated with an increased incidence of secondary malignancies.

- CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.
- HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose—consult local treatment protocol for details.
- RENAL IMPAIRMENT**
Dose adjustments Reduce dose if serum creatinine concentration greater than 120 micromol/litre.
- DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use For *intravenous infusion* (cyclophosphamide injection; *Baxter*) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

 - **Common or very common** Alopecia · appetite decreased · bone marrow disorders · haemorrhage · hepatic disorders · infection · leucopenia · nausea · reactivation of infection · renal impairment · thrombocytopenia · vascular disorders · vomiting
 - **Uncommon** Cardiotoxicity · diarrhoea · hypotension · oral disorders
 - **Rare or very rare** Skin reactions
 - **Frequency not known** Abdominal pain · agranulocytosis · amenorrhoea · anaemia · angina pectoris · angioedema · arrhythmias · arthralgia · asterixis · behaviour abnormal · blood disorders · bone disorders · cancer progression · cardiac arrest · cardiomyopathy · chills · conjunctivitis · constipation · cough · delirium · delusions · disseminated intravascular coagulation · dysarthria · dyspnoea · electrolyte imbalance · embolism and thrombosis · encephalopathy · eye irritation · fatigue · fever · flushing · gait abnormal · gastrointestinal disorders · growth retardation · haemolytic anaemia · hearing impairment ·

heart failure · hyperglycaemia · hyperhidrosis · hyperphosphaturia · hypertension · hypoxia · immunosuppression · infertility · malaise · mania · memory loss · metabolic acidosis · movement disorders · mucosal ulceration · multi organ failure · muscle complaints · myocardial infarction · nail disorder · neoplasms · nephritis tubulointerstitial · nephrogenic diabetes insipidus · neurotoxicity · oedema · ovarian and fallopian tube disorders · pain · pancreatitis · panic attack · peripheral neuropathy · polydipsia · premature menopause · psychiatric disorders · pulmonary hypertension · pulmonary oedema · radiation recall reaction · respiratory disorders · rhabdomyolysis · secondary malignancy · sensation abnormal · sepsis · severe cutaneous adverse reactions (SCARs) · SIADH · sinusoidal obstruction syndrome · sperm abnormalities · status epilepticus · tumour lysis syndrome · urinary disorders · vasculitis · vertigo · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION

Urothelial toxicity Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

Secondary malignancy Use of ifosfamide is associated with an increased incidence of acute leukaemia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if serum creatinine concentration greater than 120 micromol/litre.
- **MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Melphalan

INDICATIONS AND DOSE

Multiple myeloma

► BY MOUTH

- **Adult:** 150 micrograms/kg daily for 4 days, dose to be repeated every 6 weeks, dose may vary according to regimen

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- **Adult:** (consult product literature)

Polycythaemia vera

► BY MOUTH

- **Adult:** Initially 6–10 mg daily for 5–7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly

Localised malignant melanoma of the extremities | Localised soft-tissue sarcoma of the extremities

► BY REGIONAL ARTERIAL PERFUSION

- **Adult:** (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - **Common or very common** Alopecia · anaemia · bone marrow depression (delayed) · diarrhoea · nausea · stomatitis · thrombocytopenia · vomiting
 - **Rare or very rare** Haemolytic anaemia · hepatic disorders · respiratory disorders · skin reactions

SPECIFIC SIDE-EFFECTS

 - **Common or very common**
 - **With oral use** Leucopenia
 - **With parenteral use** Feeling hot · myalgia · myopathy · paraesthesia
 - **Rare or very rare**
 - **With parenteral use** Peripheral vascular disease

SIDE-EFFECTS, FURTHER INFORMATION Use of melphalan is associated with an increased incidence of acute leukaemias.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose initially (consult product literature).
- **MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Melphalan (Non-proprietary)

Melphalan 2 mg Melphalan 2mg tablets | 25 tablet [PoM] £45.38 DT = £45.38

Temozolomide

- **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

INDICATIONS AND DOSE

Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy | Second-line treatment of malignant glioma in adults

- BY MOUTH
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · asthenia · chills · concentration impaired · confusion · constipation · cough · decreased leucocytes · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · emotional lability · fever · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hemiparesis · hyperglycaemia · hypersensitivity · increased risk of infection · insomnia · level of consciousness decreased · malaise · memory loss · movement disorders · muscle weakness · nausea · neutropenia · oedema · oral disorders · pain · peripheral neuropathy · radiation injury · seizures · sensation abnormal · skin reactions · speech impairment · taste altered · thrombocytopenia · tremor · urinary disorders · vision disorders · vomiting · weight changes
 - **Uncommon** Altered smell sensation · anaemia · behaviour disorder · bone marrow disorders · cognitive impairment · condition aggravated · Cushing's syndrome · depression · diabetes insipidus · ear pain · erectile dysfunction · eye pain · gait abnormal · hallucination · hepatic disorders ·

hyperacusis · hyperbilirubinaemia · hypertension · hypokalaemia · intracranial haemorrhage · myalgia · myopathy · nasal congestion · nervous system disorder · palpitations · photosensitivity reaction · reactivation of infections · thirst · vasodilation

- **Rare or very rare** Neoplasms · respiratory disorders · secondary malignancy · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
 - Monitor for myelodysplastic syndrome.
 - Monitor for secondary malignancies.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001) NICE TA23**
Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.
www.nice.org.uk/guidance/ta23
- **Carbimide implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121**
Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1.
www.nice.org.uk/TA121

Thiotepa

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

- **CAUTIONS** Avoid in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · amenorrhoea · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · azoospermia · cataract · chills · cognitive disorder · confusion · conjunctivitis · constipation · cough · cystitis · delirium · diarrhoea · dizziness · dysuria · embolism · encephalopathy · fever · gastrointestinal discomfort · gastrointestinal disorders · generalised oedema · graft versus host disease · haemorrhage · headache · hearing impairment · heart failure · hepatic disorders · hyperglycaemia · hypersensitivity · hypertension · hypopituitarism · increased risk of infection · infertility · intracranial aneurysm · intracranial haemorrhage · leucopenia · lymphoedema · menopausal symptoms · movement disorders · mucositis · multi organ failure · myalgia · nausea · neutropenia · pain · pancytopenia · paraesthesia · psychiatric disorder · pulmonary oedema · renal impairment · respiratory disorders · secondary malignancy · seizure · sepsis · sinusoidal obstruction syndrome · skin reactions · stomatitis · thrombocytopenia · toxic shock syndrome · vision blurred · vomiting · weight increased
 - ▶ **Uncommon** Cardiomyopathy · hallucination · hypoxia · myocarditis
 - ▶ **Frequency not known** Severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (June 2012) that thiotepa (Tepadina[®]) is **not** recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Tepadina** (Adienne Pharma & Biotech)

Thiotepa 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial [PoM] 

Thiotepa 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] 

Treosulfan

● INDICATIONS AND DOSE

Ovarian cancer

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAPERITONEAL INSTILLATION
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Avoid in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ **Common or very common** Alopecia · anaemia · bone marrow disorders · increased risk of infection · leucopenia · nausea · skin reactions · thrombocytopenia · vomiting
 - ▶ **Uncommon** Neoplasms · treatment related secondary malignancy
 - ▶ **Rare or very rare** Addison's disease · cardiomyopathy · cystitis haemorrhagic · hypoglycaemia · influenza like illness · paraesthesia · respiratory disorders · scleroderma · sepsis

SPECIFIC SIDE-EFFECTS

 - ▶ **Uncommon**
 - ▶ With oral use Stomatitis

SIDE-EFFECTS, FURTHER INFORMATION Prolonged use of treosulfan is associated with an increased incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Treosulfan (Non-proprietary)**

Treosulfan 250 mg Treosulfan 250mg capsules | 100 capsule [PoM]
£653.20

Powder for solution for injection

- ▶ **Treosulfan (Non-proprietary)**

Treosulfan 1 gram Treosulfan 1g powder for solution for injection vials | 5 vial [PoM] £269.17

Treosulfan 5 gram Treosulfan 5g powder for solution for injection vials | 5 vial [PoM] £1,040.17

ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

• INDICATIONS AND DOSE

Acute myelogenous leukaemia | Acute lymphocytic leukaemia

- BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

Advanced AIDS-related Kaposi's sarcoma (liposomal formulation only)

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: anthracyclines

- **SIDE-EFFECTS** Abdominal pain · alopecia · amenorrhoea · anaemia · arrhythmias · ascites · atrioventricular block · azoospermia · bone marrow disorders · cardiac inflammation · cardiomyopathy · chills · congestive heart failure · cyanosis · death · dehydration · diarrhoea · dyspnoea · extravasation · fever · flushing · gastrointestinal disorders · haemorrhage · hepatomegaly · hyperpyrexia · hyperuricaemia · hypoxia · increased risk of infection · ischaemic heart disease · leucopenia · mucositis · myocardial infarction · nail discolouration · nausea · nephropathy · neutropenia · oedema · pain · paraesthesia · pleural effusion · radiation injuries · shock · skin reactions · soft tissue necrosis · stomatitis · thrombocytopenia · thrombophlebitis · urine red · vascular disorders · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Reduce dose according to serum bilirubin concentration—consult local protocol for details.

- **RENAL IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Reduce dose by 25% if serum creatinine 105–265 micromol/litre.

Reduce dose by 50% if serum creatinine greater than 265 micromol/litre.

- **MONITORING REQUIREMENTS** Cardiac monitoring essential.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **DaunoXome** (Galen Ltd)
Daunorubicin (as Daunorubicin hydrochloride citrate) 2 mg per 1 ml DaunoXome 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £250.00

Powder for solution for infusion

- **Daunorubicin (Non-proprietary)**
Daunorubicin (as Daunorubicin hydrochloride)
20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial [PoM] £650.00 (Hospital only)

Doxorubicin hydrochloride

04-Oct-2017

• INDICATIONS AND DOSE

Acute leukaemias | Hodgkin's lymphoma | Non-Hodgkin's lymphoma | Some solid tumours including breast cancer | Advanced soft-tissue sarcoma

- BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)

- BY INTRAVESICAL INSTILLATION
- Adult: (consult product literature)

CAELYX®

For AIDS-related Kaposi's sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

MYOCET®

For use with cyclophosphamide for metastatic breast cancer

- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Cardiac disease · caution in handling—irritant to tissues · consult product literature · elderly · hypertension · previous myocardial irradiation
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bone marrow depression · breast pain · cachexia · cardiovascular disorder · chest discomfort · chills · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · dysuria · electrolyte imbalance · epistaxis · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hyperhidrosis · hypersensitivity · hypertension · hyperthermia · hypotension · increased risk of infection · influenza like illness · infusion related reaction · insomnia · malaise · mucosal abnormalities · muscle complaints · muscle tone increased · muscle weakness · nail disorder · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · scrotal erythema · sensation abnormal · sepsis · skin reactions · skin ulcer · syncope · taste altered · thrombocytopenia · vasodilation · vision blurred · vomiting · weight decreased
 - **Uncommon** Confusion · embolism and thrombosis
 - **Rare or very rare** Secondary oral neoplasms · severe cutaneous adverse reactions (SCARs)
 - **Frequency not known** Asthma · congestive heart failure · secondary malignancy · throat tightness

SIDE-EFFECTS, FURTHER INFORMATION Extravasation can cause tissue necrosis.

Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m².

Liposomal formulations Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot

syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear. It may also occur with non-liposomal formulations.

Elevated bilirubin concentrations Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details.

- **RENAL IMPAIRMENT** Consult product literature in severe impairment.

- **MONITORING REQUIREMENTS** Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

- **DIRECTIONS FOR ADMINISTRATION** Conventional doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.

- **PRESCRIBING AND DISPENSING INFORMATION** Doxorubicin is available as both *conventional* and *liposomal* formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389
Pegylated liposomal doxorubicin hydrochloride (PLDH) monotherapy or in combination with platinum, is recommended as an option for treating recurrent ovarian cancer.

PLDH, in combination with trabectedin, is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving PLDH in combination with trabectedin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA389

- ▶ **Olaratumab in combination with doxorubicin for treating advanced soft tissue sarcoma (August 2017)** NICE TA465
Doxorubicin, in combination with olaratumab, is recommended for use within the Cancer Drugs Fund as an option for advanced soft tissue sarcoma in patients, only if:

- they have not had any previous systemic chemotherapy for advanced soft tissue sarcoma;
- they cannot have curative treatment with surgery or their disease does not respond to radiotherapy;
- the conditions in the managed access agreement for olaratumab are followed.

www.nice.org.uk/guidance/TA465

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

▶ Doxorubicin hydrochloride (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 10mg/5ml solution for injection vials | 1 vial [PoM] £18.54 (Hospital only)
Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £103.00 (Hospital only)
Doxorubicin 50mg/25ml solution for infusion vials | 1 vial [PoM] £103.00 (Hospital only)
Doxorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [PoM] £20.60 (Hospital only)
Doxorubicin 10mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £19.57
Doxorubicin 10mg/5ml solution for infusion vials | 1 vial [PoM] £20.60 (Hospital only)
Doxorubicin 50mg/25ml solution for injection vials | 1 vial [PoM] £92.70 (Hospital only)
Doxorubicin 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £97.85

Solution for infusion

▶ Doxorubicin hydrochloride (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 200mg/100ml solution for injection Cytosafe vials | 1 vial [PoM] £412.00 (Hospital only)
Doxorubicin 200mg/100ml solution for infusion vials | 1 vial [PoM] £412.00 (Hospital only)
Doxorubicin 200mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £391.40
▶ **Caelyx** (Janssen-Cilag Ltd)
Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml Caelyx 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £712.49
Caelyx 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £360.23

Powder for solution for injection

- ▶ **Doxorubin** (medac UK)
Doxorubicin hydrochloride 50 mg Doxorubin 50mg powder for solution for injection vials | 10 vial [PoM] £914.00

Powder and solvent for suspension for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Myocet** (Teva UK Ltd)
Doxorubicin hydrochloride 50 mg Myocet 50mg powder and solvent for suspension for infusion vials | 2 vial [PoM] £912.26 (Hospital only)

Epirubicin hydrochloride

INDICATIONS AND DOSE

Treatment of breast cancer | Treatment and prophylaxis of certain forms of superficial bladder cancer

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVESICAL INSTILLATION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bladder inflammation or contraction (when used as a bladder instillation) · catheterisation difficulties (when used as a bladder instillation) · haematuria (when used as a bladder instillation) · invasive tumours penetrating the bladder (when used as a bladder instillation) · myocardiopathy · previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina · urinary tract infections (when used as a bladder instillation)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: anthracyclines

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Paraesthesia · urinary frequency increased

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With intravenous use Chemical cystitis
 - ▶ With parenteral use Alopecia · anaemia · appetite decreased · bone marrow depression · dehydration · diarrhoea · increased risk of infection · leucopenia · mucositis · nausea · neutropenia · oesophagitis · stomatitis · urine red · vasodilation · vomiting
- ▶ **Uncommon**
 - ▶ With parenteral use Embolism and thrombosis · thrombocytopenia
- ▶ **Rare or very rare**
 - ▶ With parenteral use Amenorrhoea · arrhythmias · ascites · asthenia · azoospermia · cardiac conduction disorders · cardiomyopathy · cardiotoxicity · chills · congestive heart failure · dizziness · dyspnoea · fever · hepatomegaly · hyperuricaemia · malaise · neoplasms · oedema · pleural effusion · pulmonary oedema · skin reactions
- ▶ **Frequency not known**
 - ▶ With intravenous use Cystitis bacterial
 - ▶ With parenteral use Eye inflammation · haemorrhage · hypoxia · nail discolouration · photosensitivity reaction · radiation injuries · sepsis · shock

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises extreme caution with cumulative doses exceeding 900 mg/m²—risk of congestive heart failure increased.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (carcinogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose according to bilirubin concentration—consult local treatment protocol for details.
- **RENAL IMPAIRMENT**
Dose adjustments Dose reduction may be necessary in severe impairment.

Mitoxantrone

(Mitozantrone)

INDICATIONS AND DOSE

Metastatic breast cancer | Non-Hodgkin's lymphoma | Adult acute non-lymphocytic leukaemia | Non-resectable primary hepatocellular carcinoma

▶ BY INTRAVENOUS INFUSION

Adult: (consult local protocol)

CAUTIONS Intrathecal administration not recommended

INTERACTIONS → Appendix 1: anthracyclines

SIDE-EFFECTS Abdominal pain · acute leukaemia · alopecia · amenorrhoea · anxiety · appetite decreased · arrhythmia · asthenia · bone marrow depression · confusion · constipation · diarrhoea · drowsiness · dyspnoea · fever · gastrointestinal haemorrhage · heart failure · mucositis · nail discolouration · nail dystrophy · nausea · neurological effects · paraesthesia · scleral discolouration · skin discolouration · stomatitis · thrombocytopenia · urine blue · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Cardiac examinations are recommended after a cumulative dose of 160mg/m².

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

BREAST FEEDING Discontinue breast-feeding.

HEPATIC IMPAIRMENT Use with caution—consult local treatment protocol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Mitoxantrone (Non-proprietary)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per

1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [\[PoM\]](#) £121.85 (Hospital only) | 1 vial [\[PoM\]](#) £51.43

1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [\[PoM\]](#) £103.57

Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [\[PoM\]](#) £129.48

Pixantrone

INDICATIONS AND DOSE

Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

▶ BY INTRAVENOUS INFUSION

Adult: (consult product literature)

CONTRA-INDICATIONS Active severe infection · risk factors for severe infection

CAUTIONS Active cardiovascular disease · cardiac risk factors · caution in handling—irritant to tissues · concurrent radiotherapy to the mediastinal area · history of cardiovascular disease · previous radiotherapy to the mediastinal area · previous therapy with anthracenediones · previous therapy with anthracyclines

INTERACTIONS → Appendix 1: anthracyclines

SIDE-EFFECTS

Common or very common Alopecia · anaemia · appetite decreased · arrhythmias · asthenia · blood disorder · bundle branch block · cancer progression · cardiac disorder (during or following treatment) · chest pain · congestive heart failure · constipation · cough · decreased leucocytes · diarrhoea · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · headache · hypotension · increased risk of infection · left ventricular dysfunction · mucositis · nail disorder · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · proteinuria · secondary malignancy · skin reactions · taste altered · thrombocytopenia · urine discolouration · vascular disorders · vomiting

Uncommon Anxiety · arthralgia · arthritis · bone marrow failure · chills · dizziness · dry eye · eosinophilia · hyperbilirubinaemia · hyperuricaemia · meningitis · muscle weakness · musculoskeletal stiffness · night sweats · oesophagitis · oliguria · respiratory disorders · rhinorrhoea · septic shock · skin ulcer · sleep disorders · spontaneous penile erection · vertigo · weight decreased

CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT No information available—manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT No information available—manufacturer advises caution.

MONITORING REQUIREMENTS

Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine. Full blood count and cardiac function should be monitored throughout treatment.

PATIENT AND CARER ADVICE

Photosensitivity Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma** (February 2014) NICE TA306
Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma in patients:
 - who have previously been treated with rituximab **and**
 - who are receiving third- or fourth-line treatment **and**
 - if the manufacturer provides pixantrone with the discount agreed in the patient access scheme.www.nice.org.uk/TA306

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Azacitidine

28-Sep-2016

- **DRUG ACTION** Azacitidine is a pyrimidine analogue.

● INDICATIONS AND DOSE

Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Advanced malignant hepatic tumour
- **CAUTIONS** History of severe congestive heart failure · unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) · unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)
- **INTERACTIONS** → Appendix 1: azacitidine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fever · gastrointestinal discomfort · haemorrhage · headache · hypertension · hypokalaemia · hypotension · increased risk of infection · inflammation · insomnia · intracranial haemorrhage · laryngeal pain · leucopenia · malaise · muscle complaints · nausea · neutropenia · pain · renal failure · respiratory disorders · sepsis · skin reactions · stomatitis · syncope · thrombocytopenia · vomiting · weight decreased
 - ▶ **Uncommon** Hepatic coma · hepatic failure · pyoderma gangrenosum · renal tubular acidosis
 - ▶ **Rare or very rare** Tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.
- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in severe impairment.

● RENAL IMPAIRMENT

Dose adjustments Delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle.

Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle.
- ▶ Monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated.
- ▶ Monitor for bleeding.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Azacitidine for treating acute myeloid leukaemia with more than 30% bone marrow blasts** (July 2016) NICE TA399
Azacitidine is **not** recommended, within its marketing authorisation, for treating acute myeloid leukaemia with greater than 30% bone marrow blasts in patients aged 65 years or above who are not eligible for haematopoietic stem cell transplant.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA399

- ▶ **Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia** (March 2011) NICE TA218
Azacitidine is recommended in adults who are not eligible for haematopoietic stem cell transplantation as an option for the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, or acute myeloid leukaemia.

www.nice.org.uk/TA218

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for suspension for injection

- ▶ **Vidaza** (Celgene Ltd)
Azacitidine 100 mg Vidaza 100mg powder for suspension for injection vials | 1 vial **[PoM]** £321.00

Capecitabine

- **DRUG ACTION** Capecitabine is metabolised to fluorouracil.

● INDICATIONS AND DOSE

Stage III colon cancer, adjuvant following surgery (monotherapy)

- ▶ BY MOUTH
- ▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Stage III colon cancer, adjuvant following surgery (combination therapy)

- ▶ BY MOUTH
- ▶ Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (monotherapy)

- ▶ BY MOUTH
- ▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (combination therapy)

► BY MOUTH

- Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)

► BY MOUTH

- Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated) Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)

► BY MOUTH

- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency

- **CAUTIONS** Diabetes mellitus · diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption · electrolyte disturbances · history of angina pectoris · history of arrhythmias · history of significant cardiovascular disease · nervous system disease

- **INTERACTIONS** → Appendix 1: capecitabine

● **SIDE-EFFECTS**

- **Common or very common** Alopecia · anaemia · appetite abnormal · asthenia · chest pain · constipation · cough · dehydration · depression · diarrhoea · dizziness · dry mouth · dyspnoea · embolism and thrombosis · eye disorders · eye inflammation · eye irritation · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hyperbilirubinaemia · increased risk of infection · insomnia · joint disorders · lethargy · malaise · nail disorder · nausea · neutropenia · oedema · pain · rhinorrhoea · sensation abnormal · skin reactions · stomatitis · taste altered · vomiting · weight decreased
- **Uncommon** Acute coronary syndrome · aphasia · arrhythmias · ascites · asthma · chills · confusion · diabetes mellitus · dysphagia · ear pain · facial swelling · haemolytic anaemia · hepatic disorders · hot flush · hydropneumothorax · hypertension · hypertriglyceridaemia · hypokalaemia · hypotension · influenza like illness · ischaemic heart disease · leucopenia · libido decreased · lipoma · malnutrition · memory loss · movement disorders · muscle weakness · musculoskeletal stiffness · palpitations · pancytopenia · panic attack · peripheral coldness · peripheral neuropathy · photosensitivity reaction · pneumothorax · radiation recall reaction · sepsis · skin ulcer · syncope · thrombocytopenia · urinary disorders · vertigo · vision disorders
- **Rare or very rare** Cutaneous lupus erythematosus · encephalopathy · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · vasospasm
- **Frequency not known** Cardiomyopathy · heart failure · sudden death

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.

- Dose adjustments Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute.

● **MONITORING REQUIREMENTS**

- Monitor plasma-calcium concentration.
- Monitor for eye disorders (including keratitis and corneal disorders).
- Severe skin reactions Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur.
- Hand-foot syndrome Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- **Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012)** NICE TA263

Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.

www.nice.org.uk/TA263

- **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010)** NICE TA212
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer.

www.nice.org.uk/TA212

- **Capecitabine for the treatment of advanced gastric cancer (July 2010)** NICE TA191

Capecitabine in combination with a platinum-based regimen is recommended for the first-line treatment of inoperable advanced gastric cancer.

www.nice.org.uk/TA191

- **Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003)** NICE TA61

Capecitabine or tegafur with uracil [now discontinued] (in combination with folinic acid) is an option for the first-line treatment of metastatic colorectal cancer.

www.nice.org.uk/TA61

- **Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006)** NICE TA100
- Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer.

www.nice.org.uk/TA100

Cladribine

20-Feb-2018

- **DRUG ACTION** Cladribine is a nucleoside analogue that is cytotoxic particularly to lymphocytes and monocytes, inhibiting both DNA synthesis and repair. Its effect on B- and T-lymphocytes is thought to interrupt the cascade of immune events central to multiple sclerosis.

INDICATIONS AND DOSE**Hairy cell leukaemia (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

B-cell chronic lymphocytic leukaemia (specialist use only)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

Highly active relapsing-remitting multiple sclerosis (specialist use only)

▶ BY MOUTH

▶ Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLADRIBINE FOR LEUKAEMIA: REPORTS OF PROGRESSIVE MULTIFOCAL ENCEPHALOPATHY (PML); STOP TREATMENT IF PML SUSPECTED (DECEMBER 2017)

The MHRA is aware of 3 confirmed cases of progressive multifocal encephalopathy (PML) that developed 6 months to several years after cladribine treatment for haematological conditions. An association between cladribine and prolonged lymphopenia has been reported.

PML should be considered in the differential diagnosis for patients with new or worsening neurological signs or symptoms. Patients should be monitored for signs and symptoms of new neurological dysfunction, and advised to seek urgent medical attention if they experience symptoms—stop treatment immediately if PML is suspected and ensure specialist investigation is received.

CONTRA-INDICATIONS

- ▶ With oral use Active chronic hepatitis · active chronic tuberculosis · active malignancy · HIV infection · immunocompromised patients

CAUTIONS

GENERAL CAUTIONS Acute infection · use irradiated blood only (haematology consultation advised)

SPECIFIC CAUTIONS

- ▶ With intravenous use or subcutaneous use High tumour burden—consult product literature · symptomatic or severe bone marrow depression
- ▶ With oral use No prior exposure to varicella zoster virus · prior malignancy (consider if potential benefit outweighs risk)

CAUTIONS, FURTHER INFORMATION

- ▶ Immunosuppressive effect of cladribine
- ▶ With intravenous use or subcutaneous use Cladribine has potent and prolonged myelosuppressive and immunosuppressive effects. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy should be considered in those at risk. Acute infections should be treated before initiating cladribine. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- ▶ Varicella zoster virus

- ▶ With oral use Manufacturer advises vaccination prior to initiation of therapy in patients who have no history of exposure to varicella zoster virus; delay treatment for 4–6 weeks after vaccination.

- **INTERACTIONS** → Appendix 1: cladribine

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Increased risk of infection · secondary malignancy · skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With intravenous use Anaemia · anxiety · appetite decreased · arrhythmias · arthritis · asthenia · chest pain · chills · confusion · conjunctivitis · constipation · cough · diarrhoea · dizziness · dyspnoea · febrile neutropenia · fever · flatulence · gastrointestinal discomfort · haemolytic anaemia · headache · hyperhidrosis · hypersensitivity · insomnia · joint disorders · malaise · muscle weakness · myalgia · myocardial ischaemia · nausea · oedema · pain · renal impairment · respiratory disorders · septic shock · thrombocytopenia · vomiting
- ▶ With oral use Alopecia · lymphopenia
- ▶ With subcutaneous use Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · fever · gastrointestinal disorders · gastrointestinal pain · haemorrhage · headache · hyperhidrosis · hypotension · immunosuppression · insomnia · lymphopenia · malaise · mucositis · myalgia · myocardial ischaemia · nausea · neutropenia · oedema · pain · respiratory disorders · sepsis · thrombocytopenia · vomiting

- ▶ **Uncommon**

- ▶ With intravenous use Bone marrow disorders · hyper eosinophilia · level of consciousness decreased · nerve disorders · neurotoxicity (with high doses) · paralysis · paraparesis · Stevens-Johnson syndrome · tumour lysis syndrome
- ▶ With subcutaneous use Ataxia · cachexia · confusion · drowsiness · eye inflammation · haemolytic anaemia · paraesthesia · polyneuropathy

- ▶ **Rare or very rare**

- ▶ With intravenous use Heart failure
- ▶ With subcutaneous use Amyloidosis · cholecystitis · depression · dysphagia · epilepsy · graft versus host disease · heart failure · hepatic failure · hyper eosinophilia · pulmonary embolism · renal failure · severe cutaneous adverse reactions (SCARs) · speech disorder · tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 6 months after the last dose in men and women of childbearing potential.

- ▶ With oral use Manufacturer advises exclude pregnancy before each treatment course; if using a hormonal

contraceptive, a barrier method should also be used for at least 4 weeks after the last dose of each course.

- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● BREAST FEEDING

- ▶ With intravenous use or subcutaneous use Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.
- ▶ With oral use Manufacturer advises avoid during treatment and for 1 week after the last dose—no information available.

● HEPATIC IMPAIRMENT

- ▶ With intravenous use Manufacturer advises caution—limited information available.
- ▶ With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate-to-severe impairment.
- ▶ With oral use Manufacturer advises avoid in moderate-to-severe impairment—no information available.

● RENAL IMPAIRMENT

- ▶ With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate-to-severe impairment.
- ▶ With oral use Manufacturer advises avoid in moderate-to-severe impairment—no information available.
- ▶ With intravenous use Manufacturer advises caution—limited information available.

● PRE-TREATMENT SCREENING

- ▶ With oral use Manufacturer advises exclude HIV infection, active or latent tuberculosis and active or latent hepatitis before starting each treatment course—delay treatment until infection adequately treated.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor for malignancy—follow routine cancer screening guidelines.
- ▶ Manufacturer advises monitor for progressive multifocal leucoencephalopathy—perform a baseline MRI.
- ▶ Manufacturer advises monitor for haemolysis in patients who are or who become Coombs' positive.
- ▶ Manufacturer advises haematological monitoring required—consult product literature.
- ▶ With intravenous use or subcutaneous use Renal and hepatic function should be monitored periodically as clinically indicated.

- **DIRECTIONS FOR ADMINISTRATION** *Litak*® for subcutaneous use only—no dilution required; manufacturer advises patients may self-administer, after appropriate training.

Leustat® for infusion use only.

● HANDLING AND STORAGE

LITAK® Manufacturer advises store in a refrigerator (2–8°C).

LEUSTAT® Manufacturer advises store in a refrigerator (2–8°C).

● PATIENT AND CARER ADVICE

Driving and skilled tasks ▶ With intravenous use or subcutaneous use Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Cladribine tablets for treating relapsing–remitting multiple sclerosis (December 2017)** NICE TA493

Cladribine tablets are recommended as an option for treating highly active multiple sclerosis in adults, only if the person has:

- rapidly evolving severe relapsing–remitting multiple sclerosis, that is, at least 2 relapses in the previous year and at least 1 T1 gadolinium-enhancing lesion at baseline MRI, or

- relapsing–remitting multiple sclerosis that has responded inadequately to treatment with disease-modifying therapy, defined as 1 relapse in the previous year and MRI evidence of disease activity.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta493

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2018) that cladribine (*Mavenclad*®) is accepted for restricted use within NHS Scotland for the treatment of adults with:

- rapidly evolving severe relapsing–remitting multiple sclerosis: patients with two or more relapses in the prior year whether on treatment or not, and at least one T1 gadolinium-enhancing lesion, or
- sub-optimal therapy relapsing–remitting multiple sclerosis: patients with one or more relapses in the previous year while on disease modifying therapy, and at least one T1 gadolinium-enhancing lesion or nine T2 lesions.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Litak** (Lipomed GmbH)

Cladribine 2 mg per 1 ml Litak 10mg/5ml solution for injection vials | 1 vial [PoM] £165.00 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Leustat** (Janssen-Cilag Ltd)

Cladribine 1 mg per 1 ml Leustat 10mg/10ml solution for infusion vials | 1 vial [PoM] £159.70

Tablet

- ▶ **Mavenclad** (Merck Serono Ltd)

Cladribine 10 mg Mavenclad 10mg tablets | 1 tablet [PoM] £2,047.24 | 4 tablet [PoM] £8,188.97 | 6 tablet [PoM] £12,283.46

Clofarabine

● INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult 18–20 years: (consult local protocol)

- **CAUTIONS** Cardiac disease

- **INTERACTIONS** → Appendix 1: clofarabine

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · capillary leak syndrome · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · feeling abnormal · feeling hot · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hepatic disorders · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · irritability · mucositis · multi organ failure · myalgia · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · psychiatric disorder · renal impairment · respiratory disorders · sepsis · sinusoidal obstruction syndrome · skin reactions · systemic inflammatory response syndrome · tachycardia · tremor · tumour lysis syndrome · vomiting · weight decreased
- ▶ **Frequency not known** Antibiotic associated colitis · gastrointestinal disorders · hyponatraemia · pancreatitis · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► Clofarabine (Non-proprietary)

Clofarabine 1 mg per 1 ml Clofarabine 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM](#) £1,259.87 (Hospital only)

► Evoltra (Sanofi) ▼

Clofarabine 1 mg per 1 ml Evoltra 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM](#) £1,326.18 (Hospital only)

Cytarabine

- **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

INDICATIONS AND DOSE

Induction of remission of acute myeloblastic leukaemia

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: (consult local protocol)

Lymphomatous meningitis

- BY INTRATHECAL INJECTION
- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- **INTERACTIONS** → Appendix 1: cytarabine
- **SIDE-EFFECTS**
 - Common or very common Alopecia · anaemia · appetite decreased · consciousness impaired · diarrhoea · dysarthria · dysphagia · eye disorders · eye inflammation · eye stinging · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhagic conjunctivitis (consider prophylactic corticosteroid eye drops) · hyperuricaemia · leucopenia · nausea · oral disorders · renal impairment · skin reactions · thrombocytopenia · urinary retention · vasculitis · vision disorders · vomiting
 - Uncommon Arthralgia · dyspnoea · headache · increased risk of infection · myalgia · nerve disorders · pain · paralysis · pericarditis · sepsis · skin ulcer · throat pain
 - Rare or very rare Arrhythmias
 - Frequency not known Acute respiratory distress syndrome (ARDS) · amenorrhoea · ataxia · azoospermia · bone marrow disorders · cardiomyopathy · cerebellar dysfunction · chest pain · coma · confusion · cytarabine syndrome · dizziness · drowsiness · haemorrhage · hepatic disorders · hyperbilirubinaemia · neurotoxicity · neurotoxicity rash · neutropenia · pancreatitis · personality change · pulmonary oedema · reticulocytopenia · rhabdomyolysis · seizure · tremor
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Reduce dose—consult product literature.
- **MONITORING REQUIREMENTS**
 - Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

NATIONAL FUNDING/ACCESS DECISIONS

DEPOCYTE®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2007) that liposomal cytarabine suspension (*DepoCyte*®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Cytarabine (Non-proprietary)

Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial [PoM](#) £19.50 (Hospital only) | 1 vial [PoM](#) £19.50

Cytarabine 100mg/5ml solution for injection vials | 5 vial [PoM](#) £20.48-£30.00 (Hospital only) | 5 vial [PoM](#) £20.98

Decitabine

- **DRUG ACTION** Decitabine is a pyrimidine analogue.

INDICATIONS AND DOSE

Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy

- BY INTRAVENOUS INFUSION
- Elderly: (consult local protocol)

- **CAUTIONS** History of severe congestive heart failure · history of unstable cardiac disease
- **INTERACTIONS** → Appendix 1: decitabine
- **SIDE-EFFECTS**
 - Common or very common Anaemia · diarrhoea · epistaxis · fever · headache · hypersensitivity · increased risk of infection · leucopenia · nausea · neutropenia · sepsis · stomatitis · thrombocytopenia · vomiting
 - Uncommon Acute febrile neutrophilic dermatosis · pancytopenia
 - Frequency not known Gastrointestinal disorders · interstitial lung disease
- **CONCEPTION AND CONTRACEPTION** Men must avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

● MEDICINAL FORMS

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

- ▶ **Dacogen** (Janssen-Cilag Ltd)

Dectabine 50 mg Dacogen 50mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £970.86

Fludarabine phosphate

● INDICATIONS AND DOSE

Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves

- ▶ **BY MOUTH**
- ▶ Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles
- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Haemolytic anaemia
- **CAUTIONS** Increased susceptibility to skin cancer · worsening of existing skin cancer
- CAUTIONS, FURTHER INFORMATION**
Co-trimoxazole is used to prevent pneumocystis infection.
- ▶ **Immunosuppression** Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.
- **INTERACTIONS** → Appendix 1: fludarabine
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · appetite decreased · asthenia · bone marrow depression (may be cumulative) · chills · cough · diarrhoea · fever · increased risk of infection · malaise · mucositis · nausea · neoplasms · nerve disorders · neutropenia · oedema · stomatitis · thrombocytopenia · vision disorders · vomiting
- ▶ **Uncommon** Autoimmune disorder · confusion · haemorrhage · respiratory disorders · tumour lysis syndrome
- ▶ **Rare or very rare** Agitation · arrhythmia · coma · heart failure · seizure · severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Progressive multifocal leukoencephalopathy · skin reactions · viral infection reactivation
- ▶ With parenteral use Rash
- ▶ **Uncommon**
- ▶ With oral use Acquired haemophilia · crystalluria · dyspnoea · electrolyte imbalance · haemolytic anaemia · hyperuricaemia · metabolic acidosis · renal failure
- ▶ With parenteral use Pulmonary toxicity

- ▶ **Frequency not known**
- ▶ With parenteral use Encephalopathy · intracranial haemorrhage
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (embryotoxic and teratogenic in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.
Dose adjustments Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute.
- **MONITORING REQUIREMENTS**
- ▶ Monitor for signs of haemolysis.
- ▶ Monitor for neurological toxicity.
- ▶ Assess creatinine clearance in patients over 65 years before treatment initiation.
- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007) NICE TA119
Fludarabine monotherapy is **not** recommended for the first-line treatment of chronic lymphocytic leukaemia.
www.nice.org.uk/TA119
- ▶ Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001) NICE TA29
Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
 - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
 - cyclophosphamide, doxorubicin and prednisolone (CAP) **or**
 - cyclophosphamide, vincristine and prednisolone (CVP)
 Intravenous fludarabine should only be used when oral fludarabine is contra-indicated.
www.nice.org.uk/TA29

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

Fluorouracil

• INDICATIONS AND DOSE

Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer | In combination with folinic acid in advanced colorectal cancer

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION
- Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: fluorouracil

• SIDE-EFFECTS

SPECIFIC SIDE-EFFECTS

- **Common or very common** Agranulocytosis · alopecia · anaemia · anal inflammation · appetite decreased · asthenia · bone marrow disorders · diarrhoea · gastrointestinal disorders · hand and foot syndrome (long term use) · ischaemic heart disease · leucopenia · malaise · nausea · skin reactions · stomatitis · thrombocytopenia · vomiting
- **Uncommon** Arrhythmia · cardiomyopathy congestive · dizziness · drowsiness · euphoric mood · eye disorders · gastrointestinal haemorrhage · headache · hypotension · movement disorders · myocardial infarction · nail discoloration · nail disorders · paronychia · photosensitivity reaction · vision disorders
- **Rare or very rare** Cardiac arrest · cerebral ischaemia · coma · confusion · embolism and thrombosis · fever · leukoencephalopathy · muscle weakness · peripheral vascular disease · renal failure · seizure · speech impairment · sudden cardiac death
- **Frequency not known** Peripheral neuropathy
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Fluorouracil (Non-proprietary)

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial [PoM] £64.00 (Hospital only)

Fluorouracil 250mg/10ml solution for injection vials | 5 vial [PoM] £24.00 (Hospital only)

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 1g/20ml solution for injection vials | 1 vial [PoM] £12.16-£12.80
Fluorouracil 500mg/10ml solution for injection vials | 1 vial [PoM] £6.08-£6.40 | 5 vial [PoM] £32.00 (Hospital only)

Solution for infusion

► Fluorouracil (Non-proprietary)

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 2.5g/100ml solution for infusion vials | 1 vial [PoM] £32.00 (Hospital only) | 1 vial [PoM] £32.00

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 5g/100ml solution for infusion vials | 1 vial [PoM] £64.00 (Hospital only) | 1 vial [PoM] £60.80-£64.00
Fluorouracil 2.5g/50ml solution for infusion vials | 1 vial [PoM] £32.00 (Hospital only) | 1 vial [PoM] £30.40-£32.00

Gemcitabine

04-Jul-2017

• INDICATIONS AND DOSE

First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel)

- BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

- **INTERACTIONS** → Appendix 1: gemcitabine

• SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · back pain · bone marrow depression · chills · constipation · cough · diarrhoea · drowsiness · dyspnoea · fever · haematuria · headache · hyperhidrosis · influenza like illness · insomnia · leucopenia · myalgia · nausea · neutropenia · oedema · oral disorders · proteinuria · rhinitis · skin reactions · thrombocytopenia · vomiting
- **Uncommon** Respiratory disorders
- **Rare or very rare** Capillary leak syndrome · hypotension · myocardial infarction · posterior reversible encephalopathy syndrome (PRES) · severe cutaneous adverse reactions (SCARs) · skin ulcer · thrombocytosis
- **Frequency not known** Arrhythmias · colitis ischaemic · gangrene · haemolytic uraemic syndrome · heart failure · hepatic disorders · pulmonary oedema · radiation injuries · renal failure · stroke · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies). See *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Gemcitabine for the treatment of pancreatic cancer (May 2001)** NICE TA25

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].

Gemcitabine is **not** recommended for patients who can have potentially curative surgery. There is insufficient evidence to support its use for second-line treatment of pancreatic adenocarcinoma.

www.nice.org.uk/guidance/TA25

► **Gemcitabine for the treatment of metastatic breast cancer (January 2007)** NICE TA116

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer **only** when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate.

www.nice.org.uk/guidance/TA116

- ▶ **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

www.nice.org.uk/guidance/TA285

- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389

Gemcitabine, in combination with carboplatin, is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving gemcitabine in combination with carboplatin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA389

- ▶ **Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017)** NICE TA476

Gemcitabine with paclitaxel as albumin-bound nanoparticles (nab-paclitaxel) is recommended as an option for untreated metastatic adenocarcinoma of the pancreas in adults, only if:

- other combination chemotherapies are unsuitable and they would otherwise have gemcitabine monotherapy, and
- the manufacturer provides nab-paclitaxel with the discount agreed in the patient access scheme.

Patients whose treatment with nab-paclitaxel was started before this guidance was published, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA476

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2006) that gemcitabine (*Gemzar*®) is accepted for restricted use within NHS Scotland for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Gemcitabine (Non-proprietary)**

Gemcitabine (as Gemcitabine hydrochloride)

200 mg Gemcitabine 200mg/5.3ml concentrate for solution for infusion vials | 1 vial [PoM] £32.00 (Hospital only)
Gemcitabine 200mg/2ml concentrate for solution for infusion vials | 1 vial [PoM] £6.40

Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemcitabine 1g/26.3ml concentrate for solution for infusion vials | 1 vial [PoM] £162.00 (Hospital only)

Gemcitabine 1g/25ml concentrate for solution for infusion vials | 1 vial [PoM] £13.09
Gemcitabine 1g/10ml concentrate for solution for infusion vials | 1 vial [PoM] £13.09

Gemcitabine (as Gemcitabine hydrochloride) 2 gram Gemcitabine 2g/50ml concentrate for solution for infusion vials | 1 vial [PoM] £26.86

Gemcitabine 2g/20ml concentrate for solution for infusion vials | 1 vial [PoM] £26.86

Gemcitabine 2g/52.6ml concentrate for solution for infusion vials | 1 vial [PoM] £324.00 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 10 mg per

1 ml Gemcitabine 1.6g/160ml infusion bags | 1 bag [PoM] £140.00

Gemcitabine 2.2g/220ml infusion bags | 1 bag [PoM] £200.00

Gemcitabine 2g/200ml infusion bags | 1 bag [PoM] £180.00

Gemcitabine 1.2g/120ml infusion bags | 1 bag [PoM] £120.00

Gemcitabine 1.8g/180ml infusion bags | 1 bag [PoM] £160.00

Powder for solution for infusion

- ▶ **Gemcitabine (Non-proprietary)**

Gemcitabine (as Gemcitabine hydrochloride)

200 mg Gemcitabine 200mg powder for solution for infusion vials | 1 vial [PoM] £32.00-£32.55 (Hospital only) | 1 vial [PoM] £30.93-£32.00

Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemcitabine

1g powder for solution for infusion vials | 1 vial [PoM] £162.00-

£162.76 (Hospital only) | 1 vial [PoM] £154.62-£162.00

Gemcitabine (as Gemcitabine hydrochloride)

1.5 gram Gemcitabine 1.5g powder for solution for infusion vials | 1 vial [PoM] £231.93

Gemcitabine (as Gemcitabine hydrochloride) 2 gram Gemcitabine

2g powder for solution for infusion vials | 1 vial [PoM] £324.00

(Hospital only) | 1 vial [PoM] £324.00

- ▶ **Gemzar** (Eli Lilly and Company Ltd)

Gemcitabine (as Gemcitabine hydrochloride) 200 mg Gemzar

200mg powder for solution for infusion vials | 1 vial [PoM] £32.55 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemzar 1g powder for solution for infusion vials | 1 vial [PoM] £162.76 (Hospital only)

Mercaptopurine

(6-Mercaptopurine)

• INDICATIONS AND DOSE

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Ulcerative colitis

- ▶ BY MOUTH

- ▶ Adult: 1–1.5 mg/kg daily, some patients may respond to lower doses

Acute leukaemias | Chronic myeloid leukaemia

- ▶ BY MOUTH USING TABLETS

- ▶ Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response

- ▶ BY MOUTH USING ORAL SUSPENSION

- ▶ Adult: Initially 25–75 mg/m² daily, adjusted according to response

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Mercaptopurine tablets and *Xaluprine*® oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

- **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptopurine has been confused with mercaptamine; care must be taken to ensure the correct drug is prescribed and dispensed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of

myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

● **INTERACTIONS** → Appendix 1: mercaptopurine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · appetite decreased · bone marrow depression · diarrhoea · hepatic disorders · hepatotoxicity (more common at high doses) · leucopenia · nausea · oral disorders · thrombocytopenia · vomiting
- ▶ **Uncommon** Arthralgia · fever · increased risk of infection · neutropenia · pancreatitis · rash
- ▶ **Rare or very rare** Alopecia · face oedema · intestinal ulcer · neoplasms · oligozoospermia
- ▶ **Frequency not known** Photosensitivity reaction

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT**

Dose adjustments May need dose reduction.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose.

● **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.

● **MONITORING REQUIREMENTS** Monitor liver function.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

▶ **Mercaptopurine (Non-proprietary)**

Mercaptopurine 50 mg Mercaptopurine 50mg tablets | 25 tablet (PoM) £49.15 DT = £49.15

Methotrexate

17-May-2017

● **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

● **INDICATIONS AND DOSE**

Severe Crohn's disease

▶ BY INTRAMUSCULAR INJECTION

▶ Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

Maintenance of remission of severe Crohn's disease

▶ BY MOUTH

▶ Adult: 10–25 mg once weekly

Moderate to severe active rheumatoid arthritis

▶ BY MOUTH

▶ Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

Severe active rheumatoid arthritis

▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

▶ Adult: Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

Neoplastic diseases

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRATHECAL INJECTION

▶ Adult: (consult product literature)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

▶ Adult: Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

● **UNLICENSED USE** Not licensed for use in severe Crohn's disease.

IMPORTANT SAFETY INFORMATION

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

● **CONTRA-INDICATIONS** Active infection (in non-malignant conditions) · ascites · immunodeficiency syndromes (in non-malignant conditions) · significant pleural effusion

● **CAUTIONS** Photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis

CAUTIONS, FURTHER INFORMATION

- ▶ **Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another antifolate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- ▶ **Gastro-intestinal toxicity** Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- ▶ **Liver toxicity** Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate.
- ▶ **Pulmonary toxicity** Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

● **INTERACTIONS** → Appendix 1: methotrexate

● SIDE-EFFECTS

SPECIFIC SIDE-EFFECTS

► Common or very common

- With intra-arterial and intravenous use Abdominal distress · fever · headache · leucopenia · nausea · oral disorders · vomiting
- With intramuscular and subcutaneous use Anaemia · appetite decreased · chest pain · cough · diarrhoea · drowsiness · dyspnoea · fatigue · fever · gastrointestinal discomfort · headache · leucopenia · malaise · nausea · oral disorders · respiratory disorders · skin reactions · throat complaints · thrombocytopenia · vomiting
- With intrathecal use Arachnoiditis · fever · headache · nausea · necrotising demyelinating leukoencephalopathy · neurotoxicity · vomiting
- With oral use Anaemia · appetite decreased · diarrhoea · drowsiness · fatigue · fever · gastrointestinal discomfort · headache · increased risk of infection · leucopenia · nausea · oral disorders · respiratory disorders · skin reactions · throat ulcer · thrombocytopenia · vomiting

► Uncommon

- With intramuscular use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · lipotrophy · local reaction · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · sterile abscess · vasculitis · vertigo · vulvovaginal disorders
- With oral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · chills · confusion · cystitis · depression · diabetes mellitus · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · myalgia · neoplasms · nephropathy · osteoporosis · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders
- With subcutaneous use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders

► Rare or very rare

- With intra-arterial and intravenous use Anaemia · bone marrow depression · gastrointestinal disorders · hepatic disorders · hypogammaglobulinaemia · necrosis · respiratory disorders · skin reactions · thrombocytopenia
- With intramuscular and subcutaneous use Apnoea · asthma-like conditions · azotaemia · conjunctivitis · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · influenza like illness · insomnia · lymphadenopathy · meningism · meningitis aseptic · menstrual disorder · mood swings · muscle weakness · nail discolouration · neutropenia · oligozoospermia · paralysis · pericardial disorders · pericarditis · proteinuria · reactivation of infection · renal impairment · retinopathy · sepsis · sexual dysfunction · stress fracture · taste altered · telangiectasia · thromboembolism · visual impairment
- With oral use Azotaemia · brain oedema · cognitive impairment · conjunctivitis · cough · dyspnoea · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · insomnia · lymphadenopathy · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discolouration · neutropenia · oligozoospermia · pain · pancreatitis · paresis · pericardial disorders · pericarditis · proteinuria · psychosis · radiation

injuries · renal impairment · retinopathy · sensation abnormal · sepsis · sexual dysfunction · speech impairment · stress fracture · taste metallic · telangiectasia · tinnitus · visual impairment

► Frequency not known

- With intra-arterial and intravenous use Alopecia · aphasia · appetite decreased · arthralgia · azotaemia · chills · cognitive disorder · conjunctivitis · cystitis · defective oogenesis · diabetes mellitus · diarrhoea · dizziness · drowsiness · embolism and thrombosis · fatigue · haemorrhage · hemiparesis · hypotension · increased risk of infection · infertility · leukoencephalopathy · malaise · menstrual disorder · metabolic change · mood altered · mucositis · myalgia · neoplasms · nephropathy · osteoporosis · pancreatitis · pericardial effusion · pericarditis · photosensitivity reaction · pulmonary oedema · renal failure · seizure · sepsis · severe cutaneous adverse reactions (SCARs) · skin ulcer · sperm abnormalities · sudden death · telangiectasia · tinnitus · vaginal ulceration · vasculitis · vision blurred
- With oral use Encephalopathy
- With intramuscular and subcutaneous use Leukoencephalopathy

SIDE-EFFECTS, FURTHER INFORMATION Give folic acid to reduce side-effects. Folic acid decreases mucosal and gastrointestinal side-effects of methotrexate and may prevent hepatotoxicity; there is no evidence of a reduction in haematological side-effects.

Withdraw treatment if ulcerative stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 3 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Risk of nephrotoxicity at high doses. Avoid in severe impairment.
- **Dose adjustments** Reduce dose.
- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.
Patients should have full blood count and renal and liver function tests before starting treatment.
- **MONITORING REQUIREMENTS**
 - In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:
 - have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months.
 - be advised to report all symptoms and signs suggestive of infection, especially sore throat
 - Local protocols for frequency of monitoring may vary.
 - Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **PRESCRIBING AND DISPENSING INFORMATION** Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

- PATIENT AND CARER ADVICE** Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs.

Methotrexate treatment booklets Methotrexate treatment booklets should be issued where appropriate.

In **England, Wales, and Northern Ireland**, they are available for purchase from:

Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In **Scotland**, treatment booklets can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

Methotrexate (Non-proprietary)

Solution for infusion

Methotrexate (Non-proprietary)

Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 5g/200ml solution for infusion vials | 1 vial [PoM](#)

£200.57

Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial [PoM](#)

£400.00 (Hospital only)

Oral solution► **Methotrexate (Non-proprietary)**

Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Methotrexate 2mg/ml oral solution sugar free sugar-free | 35 ml [PoM] £95.00 DT = £95.00 sugar-free | 65 ml [PoM] £125.00 DT = £125.00

► **Jylamvo** (Intrapharm Laboratories Ltd)

Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Jylamvo 2mg/ml oral solution sugar-free | 60 ml [PoM] £112.50

Nelarabine● **INDICATIONS AND DOSE**

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

● **INTERACTIONS** → Appendix 1: nelarabine

● **SIDE-EFFECTS**

► **Common or very common** Abdominal pain · anaemia · appetite decreased · arthralgia · asthenia · confusion · constipation · cough · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · fever · gait abnormal · headache · hyperbilirubinaemia · hypotension · increased risk of infection · leucopenia · memory loss · movement disorders · muscle weakness · myalgia · nausea · neutropenia · oedema · pain · peripheral neuropathy · respiratory disorders · seizures · sensation abnormal · stomatitis · taste altered · thrombocytopenia · tremor · tumour lysis syndrome · vision blurred · vomiting

► **Rare or very rare** Rhabdomyolysis

► **Frequency not known** Progressive multifocal leukoencephalopathy

SIDE-EFFECTS, FURTHER INFORMATION If neurotoxicity occurs, treatment should be discontinued.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

● **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **MONITORING REQUIREMENTS**

► **Neurotoxicity** Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (March 2008) that the use of nelarabine (*Atriance*®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Atriance** (Novartis Pharmaceuticals UK Ltd) ▼

Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial [PoM] £1,332.00

Pemetrexed

07-Jul-2017

● **DRUG ACTION** Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

● **INDICATIONS AND DOSE**

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) | First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● **CAUTIONS** Diabetes · history of cardiovascular disease · prophylactic folic acid supplementation required (consult product literature) · prophylactic vitamin B₁₂ supplementation required (consult product literature)

● **INTERACTIONS** → Appendix 1: pemetrexed

● **SIDE-EFFECTS**

► **Common or very common** Appetite decreased · fatigue · mucositis · nausea · neuropathy sensory · oedema · pain · renal disorder · skin reactions · stomatitis · vomiting

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

● **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

► **Pemetrexed for the treatment of non-small cell lung cancer (August 2007)** NICE TA124

Pemetrexed is **not** recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy. www.nice.org.uk/TA124

► **Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009)** NICE TA181

Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma. www.nice.org.uk/TA181

► **Pemetrexed for the maintenance treatment of non-small-cell lung cancer (updated August 2017)** NICE TA190

Pemetrexed is recommended as an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology if disease has not progressed immediately following platinum-based chemotherapy in combination with gemcitabine, paclitaxel or docetaxel. www.nice.org.uk/guidance/TA190

► **Pemetrexed maintenance treatment for non-squamous non-small cell lung cancer after pemetrexed and cisplatin (August 2016)** NICE TA402

Pemetrexed is recommended as an option for the maintenance treatment of locally advanced or metastatic

non-squamous non-small cell lung cancer in patients when:

- their disease has not progressed immediately after 4 cycles of pemetrexed and cisplatin induction therapy
- their Eastern Cooperative Oncology Group performance status is 0 or 1 at the start of maintenance treatment, and,
- the company provides the drug according to the terms of the commercial access agreement as agreed with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA402

- ▶ **Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135**
Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

www.nice.org.uk/TA135

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2008) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology. It is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The *Scottish Medicines Consortium* has advised (February 2010) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology. It is restricted to patients in whom histology has been confirmed as adenocarcinoma or large cell carcinoma.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Pemetrexed (Non-proprietary)

Pemetrexed (as Pemetrexed ditrometamol) 25 mg per

Tegafur with gimeracil and oteracil

- **DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

• INDICATIONS AND DOSE

Treatment of advanced gastric cancer when used in combination with cisplatin

▶ BY MOUTH

▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS** → Appendix 1: tegafur
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite abnormal · asthenia · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dry mouth · dysphagia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorders · eye inflammation · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hearing impairment · hiccups · hyperbilirubinaemia · hypertension · hypoproteinaemia · hypotension · insomnia · nausea · nerve disorders · neutropenia · oral disorders · taste altered · thrombocytopenia · vision disorders · vomiting
 - ▶ **Uncommon** Aerophagia · allergic rhinitis · alopecia · angina pectoris · anxiety · aphasia · arrhythmias · ascites · breast abnormalities · burping · cerebrovascular insufficiency · chills · coagulation disorders · confusion · depression · drowsiness · dysphonia · ear discomfort · encephalopathy · eosinophilia · fever · gout · hallucination · heart failure · hemiparesis · hyperglobulinaemia · hyperglycaemia · hyperlipidaemia · hypertrichosis · hypovolaemic shock · increased leucocytes · increased risk of infection · joint disorders · limb discomfort · loss of consciousness · memory loss · movement disorders · mucositis · muscle complaints · muscle weakness · myocardial infarction · nail disorders · nasal complaints · neoplasm complications · nephrotoxicity · oedema · pain · palpitations · pancytopenia · pericardial effusion · personality disorder · renal impairment · seizure · sensation abnormal · sepsis · sexual dysfunction · skin reactions · smell altered · sweat changes · syncope · throat complaints · thrombocytosis · tremor · urinary frequency increased · vascular disorders · vasodilation · vertigo · weight changes
 - ▶ **Rare or very rare** Acute hepatic failure · chest discomfort · feeling cold · interstitial lung disease · local swelling · malaise · multi organ failure · pancreatitis acute · performance status decreased · photosensitivity reaction · rhabdomyolysis · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 6 months after treatment.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
Dose adjustments Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2012) that tegafur with gimeracil and oteracil (*Tegsuno*®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

► *Tegsuno* (Nordic Pharma Ltd)

Gimeracil 4.35 mg, Oteracil (as Oteracil potassium) 11.8 mg, Tegafur 15 mg *Tegsuno* 15mg/4.35mg/11.8mg capsules | 126 capsule *[PoM]* £279.72

Gimeracil 5.8 mg, Oteracil (as Oteracil potassium) 15.8 mg, Tegafur 20 mg *Tegsuno* 20mg/5.8mg/15.8mg capsules | 84 capsule *[PoM]* £248.40

Tioguanine

(Thioguanine)

● INDICATIONS AND DOSE

Acute leukaemia | Chronic myeloid leukaemia

► BY MOUTH

Adult: 100–200 mg/m² daily, can be given at various stages of treatment in short-term cycles

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity

- **CAUTIONS** Thiopurine methyltransferase status

CAUTIONS, FURTHER INFORMATION

- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.

- **INTERACTIONS** → Appendix 1: tioguanine

● SIDE-EFFECTS

- **Common or very common** Bone marrow failure · gastrointestinal disorders · hepatic disorders · hyperbilirubinaemia · hyperuricaemia · hyperuricosuria · nodular regenerative hyperplasia · oral disorders · sinusoidal obstruction syndrome · splenomegaly · thrombocytopenia · uric acid nephropathy · weight increased
- **Frequency not known** Photosensitivity reaction
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.
- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Dose adjustments Reduce dose.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose.

- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

- **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet

► *Tioguanine* (Non-proprietary)

Tioguanine 40 mg *Tioguanine* 40mg tablets | 25 tablet *[PoM]* £109.57

Trifluridine with tipiracil

24-Apr-2017

- **DRUG ACTION** Trifluridine is an antimetabolite that interferes with cancer cell DNA synthesis and inhibits cell proliferation; tipiracil is a TPase inhibitor that boosts trifluridine concentrations.

● INDICATIONS AND DOSE

Metastatic colorectal cancer, in patients previously treated with (or unsuitable for treatment with) available therapies including fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapies, or anti-vascular endothelial growth factor (VEGF) agents, or anti-epidermal growth factor receptor (EGFR) agents (specialist use only)

► BY MOUTH

Adult: Initially 35 mg/m² twice daily (max. per dose 80 mg), given on days 1 to 5 and days 8 to 12 of each 28-day cycle, consult product literature for further information on dose adjustment

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

● SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hyperbilirubinaemia · hypoaalbuminaemia · increased leucocytes · increased risk of infection · insomnia · malaise · mucositis · nausea · neutropenia · oedema · oral disorders · peripheral neuropathy · skin reactions · taste altered · thrombocytopenia · urine abnormalities · vomiting · weight decreased
- **Uncommon** Angina pectoris · anxiety · arrhythmia · ascites · bile duct disorders · cancer pain · cataract · conjunctivitis · cystitis · dehydration · dry eye · dysphonia · ear discomfort · electrolyte imbalance · embolism and thrombosis · erythropenia · feeling of body temperature change · gastrointestinal disorders · gout · haemorrhage · hepatotoxicity · hyperglycaemia · hyperhidrosis · hypertension · hypotension · joint disorders · lethargy · menstrual disorder · muscle complaints · muscle weakness · nail disorder · neurotoxicity · oropharyngeal pain · pain · palpitations · pancreatitis acute · pancytopenia · photosensitivity reaction · pleural effusion · QT interval prolongation · renal failure · rhinorrhoea · sensation abnormal · sensation of pressure · septic shock (including fatal cases) · syncope · urinary disorder · vertigo · vision disorders

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for 6 months after stopping treatment. Manufacturer also advises use of an additional barrier method in women using hormonal contraceptives—effect of trifluridine with tipiracil on hormonal contraception unknown.
- **PREGNANCY** Manufacturer advises avoid unless essential—reproductive toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR 30–59 mL/minute/1.73 m²—monitor for haematological toxicities; manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises obtain baseline blood cell counts before and during treatment; monitor closely for myelosuppression. Manufacturer also advises monitoring for proteinuria before and during treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Trifluridine with tipiracil for previously treated metastatic colorectal cancer (August 2016) NICE TA405
Trifluridine with tipiracil is recommended, within its marketing authorisation, as an option for treating metastatic colorectal cancer in adults, only when provided by the manufacturer with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/TA405

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2017) that trifluridine with tipiracil (*Lonsurf*®) is accepted for use within NHS Scotland for the treatment of adults with metastatic colorectal cancer who have been previously treated with, or are not considered candidates for, available therapies including fluoropyrimidine-, oxaliplatin- and irinotecan-based chemotherapies, anti-vascular endothelial growth factor agents, and anti-epidermal growth factor receptor agents.

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Tipiracil (as Tipiracil hydrochloride) 8.19 mg, Trifluridine 20 mg Lonsurf 20mg/8.19mg tablets | 20 tablet [PoM] £666.67 | 60 tablet [PoM] £2,000.00

ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES

Bleomycin

• INDICATIONS AND DOSE

Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin's lymphoma

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION, OR BY LOCAL INFILTRATION
- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: bleomycin

• SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · angular stomatitis · appetite decreased · chills · fever (after administration) · haemorrhage · headache · interstitial pneumonia · leucopenia · malaise · nail discolouration · nail disorder · nausea · pain · pulmonary fibrosis (dose-related) · scleroderma · skin reactions · stomatitis · vomiting · weight decreased
- ▶ **Uncommon** Diarrhoea · dizziness · hepatocellular injury · oliguria · shock · urinary disorders · vein wall hypertrophy · venous stenosis

SIDE-EFFECTS, FURTHER INFORMATION

Progressive pulmonary fibrosis Progressive pulmonary fibrosis is dose-related, and may occur at lower doses in the elderly. Suspicious chest X-ray changes are an indication to stop therapy with this drug.

Pulmonary toxicity Patients who have received bleomycin may be at risk of developing pulmonary toxicity if exposed to high inspired oxygen concentrations, for example peri-operatively, or during lung function testing.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Bleo-Kyowa** (Kyowa Kirin Ltd)

Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa 15,000unit powder for solution for injection vials | 10 vial [PoM] £190.60

Mitomycin

● INDICATIONS AND DOSE

Recurrent superficial bladder tumours (bladder instillation)

- BY INTRAVESICAL INSTILLATION
- Adult: (consult product literature or local protocols)

Upper gastro-intestinal cancers | Breast cancers

- BY INTRAVENOUS INJECTION
- Adult: (consult product literature or local protocols)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: mitomycin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Skin reactions

SPECIFIC SIDE-EFFECTS

- **Common or very common**

- With intravenous use Bone marrow depression · cough · dyspnoea · glomerulonephropathy · interstitial pneumonia · leucopenia · nausea · nephrotoxicity · renal impairment · thrombocytopenia · vomiting
- With intravesical use Bladder irritation · cystitis · haemorrhage · urinary disorders

- **Uncommon**

- With intravenous use Alopecia · appetite decreased · diarrhoea · fever · mucositis · stomatitis

- **Rare or very rare**

- With intravenous use Haemolytic anaemia · heart failure · hepatic disorders · infection · pulmonary hypertension · sepsis · sinusoidal obstruction syndrome

- **Frequency not known**

- With intravenous use Neoplasms

SIDE-EFFECTS, FURTHER INFORMATION Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a cumulative effect.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pentostatin

● INDICATIONS AND DOSE

Hairy cell leukaemia (initiated in specialist centres)

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: To be given on alternate weeks (consult product literature)

- **INTERACTIONS** → Appendix 1: pentostatin

● SIDE-EFFECTS

- **Common or very common** Agranulocytosis · alopecia · amenorrhoea · anaemia · angina pectoris · anxiety · appetite decreased · arrhythmias · arthritis · asthenia · asthma · atrioventricular block · blood disorder · bone disorder · bone marrow disorders · breast mass · cardiac arrest · chest pain · chills · confusion · constipation · cough · death · depersonalisation · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dysarthria · dysphagia · dyspnoea · ear pain · electrolyte imbalance · embolism and thrombosis · emotional lability · eosinophilia · eye disorders · eye inflammation · eye pain · febrile neutropenia · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · gout · graft versus host disease · haemorrhage · hallucination · hangover · headaches · hearing impairment · heart failure · hostility · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · hypotension · increased risk of infection · influenza like illness · jaundice · joint disorders · leucopenia · lymphadenopathy · malaise · memory loss · meningism · movement disorders · muscle complaints · nausea · neoplasms · nephrolithiasis · nephropathy · nerve disorders · neurotoxicity (withhold or discontinue) · oedema · oral disorders · pain · paralysis · pericardial effusion · photosensitivity reaction · pulmonary oedema · rash (withhold if severe) · renal impairment · respiratory disorders · retinopathy · seborrhoea · seizures · sensation abnormal · sepsis · sexual dysfunction · skin reactions · sleep disorders · splenomegaly · syncope · taste altered · thinking abnormal · thrombocytopenia · tremor · urinary disorders · urogenital disorder · vascular disorders · vasculitis · vertigo · vision disorders · vomiting · weight changes

- **Uncommon** Angioedema · antibiotic associated colitis · cardiomyopathy · cystitis · haemolytic anaemia · mucositis · multi organ failure · myocardial infarction · pure red cell aplasia · transplant failure · tumour lysis syndrome

- **Rare or very rare** Dementia · pericarditis · shock · Stevens-Johnson syndrome · systemic inflammatory response syndrome

SIDE-EFFECTS, FURTHER INFORMATION Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 6 months after treatment.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.

- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 60 mL/minute.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Nipent (Pfizer Ltd)

Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial [PoM] £734.21 (Hospital only)

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Trabectedin

10-Jun-2016

INDICATIONS AND DOSE

Treatment of advanced soft-tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated | Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

CONTRA-INDICATIONS

Elevated creatine phosphokinase (consult product literature)

INTERACTIONS

→ Appendix 1: trabectedin

SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · back pain · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hyperbilirubinaemia · hypersensitivity · hypokalaemia · hypotension · infection · insomnia · leucopenia · mucositis · myalgia · nausea · neutropenia · oedema · paraesthesia · peripheral neuropathy · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting · weight decreased
- **Uncommon** Capillary leak syndrome · septic shock
- **Rare or very rare** Hepatic failure
- **Frequency not known** Rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).

CONCEPTION AND CONTRACEPTION

Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.

PREGNANCY

See *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

BREAST FEEDING

Manufacturer advises avoid breast-feeding during and for 3 months after treatment.

HEPATIC IMPAIRMENT

Avoid in patients with raised bilirubin.

Dose adjustments Manufacturer advises caution in impairment—consider dose reduction.

Monitoring Monitor hepatic function closely in patients with hepatic impairment.

RENAL IMPAIRMENT

Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.

MONITORING REQUIREMENTS

- Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
- Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010) NICE TA185

Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

www.nice.org.uk/TA185

► Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389

Trabectedin in combination with pegylated liposomal doxorubicin hydrochloride (PLDH) is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving trabectedin in combination with PLDH should have the option to continue their treatment until they or their clinician consider it appropriate to stop.

www.nice.org.uk/TA389

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Yondelis (Pharma Mar, S.A.)

Trabectedin 250 microgram Yondelis 0.25mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £363.00 (Hospital only)

Trabectedin 1 mg Yondelis 1mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,366.00 (Hospital only)

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

10-Jun-2016

INDICATIONS AND DOSE

Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)

► BY INTRAVENOUS INFUSION

► Adult: The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

INTERACTIONS

→ Appendix 1: platinum compounds

SIDE-EFFECTS

- **Common or very common** Abdominal pain · alopecia · anaemia · asthenia · cardiovascular disorder · constipation · diarrhoea · haemorrhage · hypersensitivity · increased risk of infection · leucopenia · mucosal abnormalities · musculoskeletal disorder · nausea · neutropenia · ototoxicity · peripheral neuropathy · reflexes decreased · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · urogenital disorder · vision disorders · vomiting
- **Rare or very rare** Cardiac discomfort · dyspnoea
- **Frequency not known** Abdominal cramps · appetite decreased · bone marrow failure · chills · dehydration · embolism · encephalopathy · fever · haemolytic uraemic syndrome · heart failure · hypertension · hyponatraemia · hypotension · malaise · pancreatitis · stomatitis · stroke · treatment related secondary malignancy
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 20 mL/minute.

Dose adjustments Reduce dose.

Monitoring Monitor haematological parameters in renal impairment.

Monitor renal function in renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)** NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

www.nice.org.uk/TA284

- ▶ **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

www.nice.org.uk/guidance/ta285

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Carboplatin (Non-proprietary)

Carboplatin 10 mg per 1 mL Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £22.04 (Hospital only) | 1 vial [PoM] £20.00–£20.20

Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial [PoM] £56.92 (Hospital only) | 1 vial [PoM] £50.00–£60.59

Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial [PoM] £232.64–£260.00

Carboplatin 600mg/60ml solution for infusion vials | 1 vial [PoM] £260.00 (Hospital only)

Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial [PoM] £168.85 (Hospital only) | 1 vial [PoM] £160.00–£181.77

Carboplatin 450mg/45ml solution for infusion vials | 1 vial [PoM] £197.48 (Hospital only)

Carboplatin 150mg/15ml solution for infusion vials | 1 vial [PoM] £65.83 (Hospital only)

Carboplatin 50mg/5ml solution for infusion vials | 1 vial [PoM] £22.86 (Hospital only)

nephrotoxicity (dose-related and potentially cumulative) · sepsis · thrombocytopenia

- ▶ **Uncommon** Anaphylactoid reaction · ototoxicity (dose-related and potentially cumulative) · spermatogenesis abnormal
- ▶ **Rare or very rare** Acute leukaemia · cardiac arrest · encephalopathy · myocardial infarction · nerve disorders · seizure · stomatitis

- ▶ **Frequency not known** Alopecia · appetite decreased · asthenia · autonomic dysfunction · cardiac disorder · cerebrovascular insufficiency · dehydration · diarrhoea · haemolytic anaemia · hearing impairment · hiccups · hyperuricaemia · infection · Lhermitte's sign · malaise · muscle spasms · myelopathy · nausea · papilloedema · pulmonary embolism · rash · Raynaud's phenomenon · renal impairment · renal tubular disorder · retinal discoloration · SIADH · taste loss · tetany · thrombotic microangiopathy · vision disorders · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865).

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic.

● MONITORING REQUIREMENTS

- ▶ Monitor full blood count.
- ▶ Monitor audiology.
- ▶ Monitor plasma electrolytes.
- ▶ Nephrotoxicity Monitoring of renal function is essential.

- **DIRECTIONS FOR ADMINISTRATION** Cisplatin is increasingly given in a day care setting.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Cisplatin (Non-proprietary)

Cisplatin 1 mg per 1 mL Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £26.70 DT = £26.51 | 1 vial [PoM] £25.11–£28.11 DT = £26.51 (Hospital only)

Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] £50.22

Cisplatin 10mg/10ml solution for infusion vials | 1 vial [PoM] £5.90 (Hospital only) | 1 vial [PoM] £5.90

Cisplatin 50mg/50ml solution for infusion vials | 1 vial [PoM] £25.37–£28.11 DT = £26.51 | 1 vial [PoM] £25.37 DT = £26.51 (Hospital only)

Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £5.36

Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £50.22–£55.64 (Hospital only) | 1 vial [PoM] £52.86

Cisplatin

● INDICATIONS AND DOSE

Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.
- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · arrhythmias · bone marrow failure · electrolyte imbalance · fever · leucopenia ·

Oxaliplatin

● INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) | Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Peripheral neuropathy with functional impairment

- **INTERACTIONS** → Appendix 1: platinum compounds

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · conjunctivitis · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · flushing ·

gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hiccups · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · increased risk of infection · insomnia · meningism · mucositis · nail disorder · nausea · necrosis · nerve disorders · neutropenia · neutropenic sepsis · pain · peripheral neuropathy (dose-limiting) · sensation abnormal · skin reactions · stomatitis · taste altered · thrombocytopenia · urinary disorders · vision disorders · vomiting · weight changes

- ▶ **Uncommon** Hearing impairment · metabolic acidosis · nervousness
- ▶ **Rare or very rare** Acute kidney injury · acute tubular necrosis · antibiotic associated colitis · disseminated intravascular coagulation · dysarthria · haemolytic anaemia · hepatic disorders · immuno-allergic thrombocytopenia · nephritis acute interstitial · nodular regenerative hyperplasia · pancreatitis · posterior reversible encephalopathy syndrome (PRES) (with oxaliplatin combination chemotherapy) · respiratory disorders · sinusoidal obstruction syndrome · vision loss (reversible on discontinuation)
- ▶ **Frequency not known** Autoimmune pancytopenia · chest discomfort · dysphagia · gait abnormal · hypersensitivity vasculitis · movement disorders · muscle complaints · muscle contractions involuntary · QT interval prolongation · rhabdomyolysis · throat complaints

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity is dose limiting.

Respiratory symptoms If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.
Dose adjustments Reduce dose in mild to moderate impairment (consult product literature).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006) NICE TA100
Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer.
www.nice.org.uk/TA100
- ▶ Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.
Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.
www.nice.org.uk/TA93

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Oxaliplatin (Non-proprietary)

Oxaliplatin 5 mg per 1 ml Oxaliplatin 100mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £297.49–£330.00 (Hospital only) | 1 vial [PoM] £295.63–£311.00

Oxaliplatin 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £148.55–£165.00 (Hospital only) | 1 vial [PoM] £147.82–£155.00

Oxaliplatin 200mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £595.65–£627.00 (Hospital only) | 1 vial [PoM] £591.26

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

● INDICATIONS AND DOSE

Small cell carcinoma of the bronchus, the lymphomas and testicular cancer

- ▶ **BY MOUTH**
- ▶ **Adult:** 120–240 mg/m² daily for 5 days
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** (consult product literature)

● IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **INTERACTIONS** → Appendix 1: etoposide

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · acute leukaemia · alopecia · anaemia · appetite decreased · arrhythmia · asthenia · bone marrow depression · constipation · diarrhoea · dizziness · extravasation · hepatotoxicity · hypertension · leucopenia · malaise · mucositis · myocardial infarction · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Nerve disorders
- ▶ **Rare or very rare** Dysphagia · neurotoxicity · radiation recall reaction · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · vision loss

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ **With intravenous use** Anaphylactic reaction · hypotension · infection
- ▶ **With oral use** Oesophagitis · stomatitis · transient systolic hypotension
- ▶ **Uncommon**
- ▶ **With intravenous use** Haemorrhage
- ▶ **Rare or very rare**
- ▶ **With intravenous use** Fever
- ▶ **With oral use** Drowsiness
- ▶ **Frequency not known**
- ▶ **With intravenous use** Angioedema · infertility · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Consider dose reduction—consult local treatment protocol for details.

- **DIRECTIONS FOR ADMINISTRATION** Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ **Etoposide (Non-proprietary)**

Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM](#) £11.50 (Hospital only) | 1 vial [PoM](#) £11.50 | 10 vial [PoM](#) £115.00

ANTINEOPLASTIC DRUGS > TAXANES

Cabazitaxel

17-Mar-2017

● INDICATIONS AND DOSE

Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: taxanes

● SIDE-EFFECTS

- ▶ **Common or very common** Acute kidney injury · alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chest pain · chills · confusion · conjunctivitis · constipation · cough · cystitis · deep vein thrombosis · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · excessive tearing · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hydronephrosis · hyperglycaemia · hypersensitivity · hypertension · hypokalaemia · hypotension · increased risk of infection · lethargy · leucopenia · malaise · mucositis · muscle complaints · nausea · nerve disorders · neutropenia · oedema · oropharyngeal pain · pain · pelvic pain · renal colic · renal failure (fatal cases of renal failure reported) · sensation abnormal · sepsis · skin reactions · taste altered · thrombocytopenia · tinnitus · ureteral obstruction · urinary disorders · vasodilation · vertigo · vomiting · weight decreased

- ▶ **Frequency not known** Respiratory disorders

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).

- **PREGNANCY** See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 50 mL/minute.

- **MONITORING REQUIREMENTS** Monitor electrolytes—correct dehydration.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous infusion incompatible with PVC.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Cabazitaxel for hormone-relapsed metastatic prostate cancer treated with docetaxel (updated August 2016)** NICE TA391

Cabazitaxel in combination with prednisone or prednisolone is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients whose disease has progressed during or after docetaxel chemotherapy, only if the following criteria are met:

- the patient has an eastern cooperative oncology group (ECOG) performance status of 0 or 1
- the patient has had 225 mg/m² or more of docetaxel
- treatment with cabazitaxel is stopped when the disease progresses or after a maximum of 10 cycles
- the manufacturer provides cabazitaxel with the discount agreed in the patient access scheme
- NHS trusts purchase cabazitaxel in accordance with the commercial access agreement, either in vials (at a reduced price to reflect the average cost of waste per patient), or in pre-prepared intravenous infusion bags.

Patients currently receiving cabazitaxel that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA391

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2016) that cabazitaxel (*Jevtana*®) in combination with prednisone or prednisolone is accepted for restricted use within NHS Scotland for the treatment of adult patients with hormone refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (patients who have received at least 225 mg/m² (three cycles) of docetaxel and have an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

▶ **Jevtana** (Sanofi)

Cabazitaxel 40 mg per 1 ml JEVTANA 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial [PoM](#) £3,696.00 (Hospital only)

Docetaxel

30-Apr-2018

• INDICATIONS AND DOSE

Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capecitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer where previous chemotherapy has failed | Initial chemotherapy of unresectable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

• **CAUTIONS** Avoid in Acute porphyrias p. 1025 · consult product literature

• **INTERACTIONS** → Appendix 1: taxanes

• SIDE-EFFECTS

- **Common or very common** Abdominal pain · alopecia · anaemia · appetite decreased · arrhythmia · arthralgia · asthenia · constipation · diarrhoea · dyspnoea · fluid imbalance · haemorrhage · hypersensitivity · hypertension · hypotension · increased risk of infection · myalgia · nail disorders · nausea · neutropenia · pain · peripheral neuropathy · sepsis · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting
- **Uncommon** Gastrointestinal disorders · heart failure
- **Frequency not known** Ascites · bone marrow depression · chest tightness · chills · cutaneous lupus erythematosus · disseminated intravascular coagulation · eye disorders · eye inflammation · fever · hearing impairment · hepatitis · hyponatraemia · loss of consciousness · multi organ failure · myocardial infarction · nail discolouration · neurotoxicity · pericardial effusion · peripheral lymphoedema · peripheral oedema · pulmonary oedema · radiation injuries · renal impairment · respiratory disorders · sclerodermal-like changes · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · vasodilation · venous thromboembolism · vision disorders · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.

• **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

• **BREAST FEEDING** Discontinue breast-feeding.

• **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Reduce dose according to liver enzymes (consult product literature).

Monitoring

Monitor liver function in hepatic impairment.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101

Docetaxel is an option for hormone-refractory metastatic prostate cancer only if their Karnofsky score is at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].

www.nice.org.uk/guidance/ta101

► Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA109

Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer.

www.nice.org.uk/guidance/ta109

► Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018) NICE TA509
Pertuzumab, in combination with trastuzumab and docetaxel, is recommended, within its marketing authorisation, for treating HER2-positive metastatic or locally recurrent unresectable breast cancer, in adults who have not had previous anti-HER2 therapy or chemotherapy for their metastatic disease, only if the manufacturer provides pertuzumab within the agreed commercial access arrangement.

www.nice.org.uk/guidance/ta509

Scottish Medicines Consortium (SMC) Decisions

SMC No. 369/07

The *Scottish Medicines Consortium* has advised (May 2007) that docetaxel (*Taxotere*®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable locally advanced squamous cell carcinoma of the head and neck.

SMC No. 481/08

The *Scottish Medicines Consortium* has advised (July 2008) that docetaxel (*Taxotere*®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with resectable locally advanced squamous cell carcinoma of the head and neck.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Docetaxel 10 mg per 1 ml Docetaxel 80mg/8ml concentrate for solution for infusion vials | 1 vial [Pom] £534.75 (Hospital only)
Docetaxel 160mg/16ml concentrate for solution for infusion vials | 1 vial [Pom] £1,069.50 (Hospital only)

Docetaxel 20mg/2ml concentrate for solution for infusion vials | 1 vial [Pom] £162.75 (Hospital only)

Docetaxel 20 mg per 1 ml Docetaxel 80mg/4ml concentrate for solution for infusion vials | 1 vial [Pom] £478.06-£530.00

Docetaxel 160mg/8ml concentrate for solution for infusion vials | 1 vial [Pom] £958.11-£1,000.00

Docetaxel 140mg/7ml concentrate for solution for infusion vials | 1 vial [Pom] £900.00

Docetaxel 20mg/1ml concentrate for solution for infusion vials | 1 vial [Pom] £145.80-£160.00

► Taxceus (medac UK)

Docetaxel 20 mg per 1 ml Taxceus 80mg/4ml concentrate for solution for infusion vials | 1 vial [Pom] £508.01

Taxceus 140mg/7ml concentrate for solution for infusion vials | 1 vial [Pom] £720.10

Taxceus 20mg/1ml concentrate for solution for infusion vials | 1 vial [Pom] £154.61

Paclitaxel

17-Jul-2017

- **DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

● INDICATIONS AND DOSE

Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only) | Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only) | Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only) | Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only) | Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only) | Treatment of advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only) | First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only) | Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only) | In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · consult product literature · patients aged over 75 years with metastatic adenocarcinoma of the pancreas

- **INTERACTIONS** → Appendix 1: taxanes

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bone marrow disorders · chest discomfort · chills · constipation · cough · decreased leucocytes · depression · diarrhoea · dizziness · drowsiness · dry eye · dyspnoea · electrolyte imbalance · excessive tearing · eye inflammation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hyperpyrexia · hypertension · increased risk of infection · influenza like illness · insomnia · laryngeal pain · lymphoedema · malaise · movement disorders · mucositis · muscle complaints · nail discolouration · nail disorders · nasal complaints · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · performance status decreased · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · vasodilation · vertigo · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Allergic rhinitis · breast pain · dry mouth · dysphagia · ear pain · embolism and thrombosis · eye discomfort · facial swelling · gait abnormal · hepatomegaly · hoarseness · hyperglycaemia · hypoalbuminaemia · hypoglycaemia · hypotension · limb discomfort · muscle weakness · neoplasm complications · peripheral coldness · photosensitivity reaction · polydipsia · reflexes abnormal · sepsis · sweat changes · swelling · syncope · tinnitus · tremor · urinary disorders
- ▶ **Rare or very rare** Atrioventricular block · cardiac arrest · congestive heart failure · left ventricular dysfunction · radiation injuries · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises routine premedication with a corticosteroid, an antihistamine and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.
 - ▶ Patients should be monitored for signs and symptoms of pneumonitis and sepsis.
- **PRESCRIBING AND DISPENSING INFORMATION** Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Prescribers should specify the brand to be dispensed.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Paclitaxel for ovarian cancer (January 2003) NICE TA55
Either paclitaxel in combination with a platinum compound (cisplatin or carboplatin) or a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery). www.nice.org.uk/guidance/TA55
- ▶ Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA108
Paclitaxel, within its licensed indication, is **not** recommended for the adjuvant treatment of women with early node-positive breast cancer. www.nice.org.uk/guidance/TA108
- ▶ Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). www.nice.org.uk/guidance/TA284
- ▶ Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389
Paclitaxel, in combination with platinum or as monotherapy, is recommended as an option for treating recurrent ovarian cancer. www.nice.org.uk/guidance/TA389
- ▶ Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017) NICE TA476
Paclitaxel as albumin-bound nanoparticles (nab-paclitaxel) with gemcitabine is recommended as an option for untreated metastatic adenocarcinoma of the pancreas in adults, only if:
 - other combination chemotherapies are unsuitable and they would otherwise have gemcitabine monotherapy, **and**
 - the manufacturer provides nab-paclitaxel with the discount agreed in the patient access scheme.
 Patients whose treatment with nab-paclitaxel was started before this guidance was published, should have the

option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA476

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2010) that paclitaxel albumin (*Abraxane*®) is accepted for restricted use within NHS Scotland for treatment of metastatic breast cancer in patients who have failed first-line treatment for metastatic disease and for whom standard anthracycline containing therapy is not indicated; use is restricted to patients who would otherwise receive docetaxel or 3-weekly solvent-based paclitaxel as second-line treatment for metastatic breast cancer.

The *Scottish Medicines Consortium* has advised (February 2015) that paclitaxel albumin (*Abraxane*®) is accepted for use within NHS Scotland in combination with gemcitabine for the first-line treatment of adult patients with metastatic adenocarcinoma of the pancreas.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polyoxyl castor oils

► Paclitaxel (Non-proprietary)

Paclitaxel 6 mg per 1 ml Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £504.90-£561.00 (Hospital only) | 1 vial [PoM] £300.52

Paclitaxel 30mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £112.31-£116.05 (Hospital only) | 1 vial [PoM] £66.85-£105.84

Paclitaxel 300mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £1,009.80-£1,122.00 (Hospital only) | 1 vial [PoM] £601.03-£951.63

Paclitaxel 100mg/16.7ml concentrate for solution for infusion vials | 1 vial [PoM] £336.60-£374.00 (Hospital only) | 1 vial [PoM] £200.35-£326.28

Powder for suspension for infusion

ELECTROLYTES: May contain Sodium

► Abraxane (Celgene Ltd)

Paclitaxel albumin 100 mg Abraxane 100mg powder for suspension for infusion vials | 1 vial [PoM] £246.00 (Hospital only)

ANTINEOPLASTIC DRUGS > TOPOISOMERASE I INHIBITORS

Irinotecan hydrochloride

23-May-2017

- **DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

● INDICATIONS AND DOSE

Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed | Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab) | **First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab)** | **First-line treatment of metastatic colorectal carcinoma (in combination with capecitabine with or without bevacizumab)**

► BY INTRAVENOUS INFUSION

Adult: (consult product literature or local protocols)

Metastatic adenocarcinoma of the pancreas in patients who have progressed following gemcitabine based therapy (in combination with fluorouracil and leucovorin) (specialist use only)

► BY INTRAVENOUS INFUSION USING LIPID FORMULATION

Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bowel obstruction · chronic inflammatory bowel disease
- **CAUTIONS** Raised plasma-bilirubin concentration · risk factors for cardiac disease · risk factors for pulmonary toxicity · underweight patients—increased risk of adverse events
- **INTERACTIONS** → Appendix 1: irinotecan
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · alopecia · anaemia (dose-limiting) · appetite decreased · asthenia · cholinergic syndrome · constipation · diarrhoea (delayed diarrhoea requires prompt treatment) · febrile neutropenia (dose-limiting) · fever · infection · mucositis · nausea · neutropenia (dose-limiting) · thrombocytopenia (dose-limiting) · vomiting
- **CONCEPTION AND CONTRACEPTION** For *conventional* formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 3 months after treatment in men. For *liposomal* formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 4 months after treatment in men.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 865.
- **BREAST FEEDING** For *conventional* formulations, manufacturer advises avoid. For *liposomal* formulations, manufacturer advises avoid until one month after the last dose—no information available.
- **HEPATIC IMPAIRMENT** For *conventional* formulations, manufacturer advises monitor liver function at baseline and before each cycle; also monitor complete blood counts weekly if plasma-bilirubin concentration 1.5–3 times the upper limit of normal; avoid if plasma-bilirubin concentration greater than 3 times the upper limit of normal. For *liposomal* formulations, manufacturer advises use with caution; avoid if bilirubin greater than 2 mg/dL or if plasma-transaminase greater than 2.5 times the upper limit of normal (greater than 5 times the upper limit of normal if liver metastasis present)—limited information available.
- **Dose adjustments** For *conventional* formulations, manufacturer advises dose adjustment—consult product literature.
- **RENAL IMPAIRMENT** For *conventional* formulations, manufacturer advises avoid—no information available. For *liposomal* formulations, manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor respiratory function.
- **PRESCRIBING AND DISPENSING INFORMATION** Irinotecan is available as both *conventional* and *liposomal* formulations. Manufacturers advise that the different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93

A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.

Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.

www.nice.org.uk/TA93

► **Pegylated liposomal irinotecan for treating pancreatic cancer after gemcitabine (April 2017) NICE TA440**

Pegylated liposomal irinotecan, in combination with fluorouracil and leucovorin, is **not** recommended for treating metastatic adenocarcinoma of the pancreas in adults whose disease has progressed after gemcitabine-based therapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA440

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2017) that liposomal irinotecan (*Onivyde*®) is **not** recommended for use within NHS Scotland for the treatment of metastatic adenocarcinoma of the pancreas, in combination with fluorouracil and leucovorin (folinic acid), in patients who have progressed following gemcitabine based therapy as there was insufficient evidence submitted.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Irinotecan hydrochloride (Non-proprietary)**

Irinotecan hydrochloride trihydrate 20 mg per 1 ml Irinotecan 500mg/25ml concentrate for solution for infusion vials | 1 vial (PoM) £601.25–£650.00 (Hospital only) | 1 vial (PoM) £601.25
Irinotecan 40mg/2ml concentrate for solution for infusion vials | 1 vial (PoM) £49.03–£53.00 (Hospital only) | 1 vial (PoM) £49.03–£50.35

Irinotecan 300mg/15ml concentrate for solution for infusion vials | 1 vial (PoM) £390.00 (Hospital only) | 1 vial (PoM) £365.84–£390.00
Irinotecan 100mg/5ml concentrate for solution for infusion vials | 1 vial (PoM) £120.25–£130.00 (Hospital only) | 1 vial (PoM) £120.25–£123.50

► **Campto (Pfizer Ltd)**

Irinotecan hydrochloride trihydrate 20 mg per 1 ml Campto 100mg/5ml concentrate for solution for infusion vials | 1 vial (PoM) £130.00 (Hospital only)

Campto 40mg/2ml concentrate for solution for infusion vials | 1 vial (PoM) £53.00 (Hospital only)
Campto 300mg/15ml concentrate for solution for infusion vials | 1 vial (PoM) £390.00 (Hospital only)

► **Onivyde (Baxalta UK Ltd)**

Irinotecan hydrochloride trihydrate 5 mg per 1 ml Onivyde 50mg/10ml concentrate for solution for infusion vials | 1 vial (PoM) £615.35 (Hospital only)

Topotecan

10-JUN-2016

● **DRUG ACTION** Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

● **INDICATIONS AND DOSE**

Metastatic ovarian cancer when first-line or subsequent treatment has failed | Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin)

► **BY INTRAVENOUS INFUSION**

► **Adult:** (consult product literature or local protocols)

Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate

► **BY INTRAVENOUS INFUSION, OR BY MOUTH**

► **Adult:** (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

● **INTERACTIONS** → Appendix 1: topotecan

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

► **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · colitis neutropenic · constipation · diarrhoea · fever · gastrointestinal discomfort · hyperbilirubinaemia · hypersensitivity · infection · leucopenia · malaise · mucositis · nausea · neutropenia · pancytopenia · sepsis · skin reactions · thrombocytopenia · vomiting

► **Rare or very rare** Angioedema · interstitial lung disease

► **Frequency not known** Bone marrow depression (dose-limiting) · haemorrhage

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment.

● **RENAL IMPAIRMENT** Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.

Dose adjustments Reduce dose.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183**

Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.

www.nice.org.uk/TA183

► **Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184**

Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated.

Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.

www.nice.org.uk/TA184

► **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389**

Topotecan is **not** recommended for treating first recurrence of platinum-sensitive ovarian cancer, recurrent platinum-resistant ovarian cancer, or platinum-refractory ovarian cancer.

Patients currently receiving topotecan should have the option to continue their treatment until they or their clinician consider it appropriate to stop.

www.nice.org.uk/TA389

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2007) that topotecan (*Hycamtin*®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Topotecan (Non-proprietary)

Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml Topotecan 4mg/4ml concentrate for solution for infusion vials | 1 vial [PoM] £261.55 (Hospital only) | 1 vial [PoM] £290.00 | 5 vial [PoM] £1,453.10 (Hospital only)
Topotecan 1mg/1ml concentrate for solution for infusion vials | 1 vial [PoM] £87.88 (Hospital only) | 1 vial [PoM] £97.00

Powder for solution for infusion

► Hycamtin (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £97.65

Topotecan (as Topotecan hydrochloride) 4 mg Hycamtin 4mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £348.76

► Potactasol (Actavis UK Ltd)

Topotecan (as Topotecan hydrochloride) 1 mg Potactasol 1mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £97.00 (Hospital only)

Topotecan (as Topotecan hydrochloride) 4 mg Potactasol 4mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £290.00 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 25

► Hycamtin (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 250 microgram Hycamtin 0.25mg capsules | 10 capsule [PoM] £75.00

Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg capsules | 10 capsule [PoM] £360.00

ANTINEOPLASTIC DRUGS ► VINCA ALKALOIDS

Vinblastine sulfate

● INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

► Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

● CAUTIONS

Caution in handling—irritant to tissues

● INTERACTIONS

→ Appendix 1: vinca alkaloids

● SIDE-EFFECTS

- **Rare or very rare** Hearing impairment · nerve disorders
- **Frequency not known** Abdominal pain · acute respiratory distress syndrome (ARDS) · alopecia (reversible) · anaemia · appetite decreased · asthenia · balance impaired · cancer pain · constipation · depression · diarrhoea · dizziness · dyspnoea · haemorrhage · headache · hypertension · ileus · increased risk of infection · leucopenia (dose-limiting) · malaise · mediastinal disorder · myalgia · myocardial infarction · nausea · nystagmus · oral blistering · pain · Raynaud's phenomenon · reflexes absent · seizure · sensation abnormal · SIADH · skin reactions · stroke · thrombocytopenia · vertigo · vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Dose adjustments Dose reduction may be necessary—consult local treatment protocol for details.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Vinblastine sulfate (Non-proprietary)

Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial [PoM] £85.00 (Hospital only)

Vincristine sulfate

● INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

► Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · neuromuscular disease

- **INTERACTIONS** → Appendix 1: vinca alkaloids

● SIDE-EFFECTS

- **Rare or very rare** Hypersensitivity · rash · SIADH
- **Frequency not known** Abdominal cramps · adrenal disorder · alopecia · anaemia · appetite decreased · azotaemia · bladder atony · bronchospasm · connective tissue disorders · constipation · coronary artery disease · dehydration · diarrhoea · dizziness · dyspnoea · eighth cranial nerve damage · eye disorders · fever · gait abnormalities · gastrointestinal disorders · haemolytic anaemia · headache · hearing impairment · hypertension · hyponatraemia · hypotension · infection · leucopenia · movement disorders · muscle atrophy · myalgia · myocardial infarction · nausea · neuromuscular effects (dose-limiting) · neutropenia · oedema · oral disorders · pain · paralysis · paresis · reflexes absent · renal disorder · secondary malignancy · sensation abnormal · sepsis · throat pain · thrombocytopenia · urinary disorders · vertigo · vision loss · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION

Bronchospasm Severe bronchospasm following administration is more common when used in combination with mitomycin-C.

Neurotoxicity Sensory and motor neuropathies are common and are cumulative. Manufacturer advises monitoring patients for symptoms of neuropathy, such as hypoaesthesia, hyperaesthesia, paresthesia, hyporeflexia,

areflexia, neuralgia, jaw pain, decreased vibratory sense, cranial neuropathy, ileus, burning sensation, arthralgia, myalgia, muscle spasm, or weakness, both before and during treatment—requires dose reduction, treatment interruption or treatment discontinuation, depending on severity.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenicity and fetal loss in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Dose reduction may be necessary—consult local treatment protocol for details.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Vincristine sulfate (Non-proprietary)

Vincristine sulfate 1 mg per 1 ml Vincristine 2mg/2ml solution for injection vials | 1 vial [PoM] £26.66 (Hospital only) | 5 vial [PoM] £133.30 (Hospital only)
Vincristine 1mg/1ml solution for injection vials | 1 vial [PoM] £13.47 (Hospital only) | 5 vial [PoM] £67.35 (Hospital only)
Vincristine 5mg/5ml solution for injection vials | 5 vial [PoM] £329.50 (Hospital only)

Vindesine sulfate

● INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Vindesine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION
Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues • neuromuscular disease
- **INTERACTIONS** → Appendix 1: vinca alkaloids
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia
 - **Frequency not known** Anaemia • appetite decreased • asthenia • balance impaired • cellulitis • chills • constipation • depression • diarrhoea • dizziness • dysphagia • fever • gastrointestinal discomfort • gastrointestinal disorders • granulocytopenia (dose-limiting) • headache • hearing impairment • malaise • nausea • nerve disorders • nystagmus • oral disorders • pain • peroneal nerve palsy • rash • maculopapular • reflexes absent • seizure • sensation abnormal • thrombocytopenia • thrombocytosis • vertigo • vision loss • vomiting

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes; and ototoxicity has been reported. There have been instances in which neurotoxicity has made it necessary to reduce the dosage or temporarily discontinue use of vindesine.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Dose reduction may be necessary.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Eldisine (Thornton & Ross Ltd)

Vindesine sulfate 5 mg Eldisine 5mg powder for solution for injection vials | 1 vial [PoM] £66.55 (Hospital only)

Vinflunine

● INDICATIONS AND DOSE

Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)

- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Vinflunine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION
Intrathecal injection **contra-indicated**.

- **CAUTIONS** Cardiovascular disease • QT-interval prolongation (avoid hypokalaemia)
- **INTERACTIONS** → Appendix 1: vinca alkaloids
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia • anaemia • appetite decreased • arthralgia • asthenia • chest pain • chills • constipation • cough • dehydration • diarrhoea • dizziness • dyspnoea • ear pain • fever • gastrointestinal discomfort • gastrointestinal disorders • headache • hyperhidrosis • hypersensitivity • hypertension • hyponatraemia • hypotension • increased risk of infection • insomnia • leucopenia • muscle weakness • myalgia • nausea • neutropenia • oedema • oral disorders • pain • peripheral neuropathy • skin reactions • swallowing difficulty • syncope • tachycardia • taste altered • thrombocytopenia • venous thrombosis • vomiting • weight changes
 - **Uncommon** Acute respiratory distress syndrome (ARDS) • cancer pain • laryngeal pain • myocardial infarction • myocardial ischaemia • neutropenic sepsis • renal failure • SIADH • tinnitus • vertigo • visual impairment

- ▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 3 months after treatment.
- **PREGNANCY** Avoid unless essential—teratogenicity and embryotoxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose—consult product literature.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
▶ **Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract** (January 2013) NICE TA272
Vinflunine is **not** recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy.
www.nice.org.uk/TA272

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Javlor** (Pierre Fabre Ltd)
Vinflunine (as Vinflunine ditartrate) 25 mg per 1 mL Javlor
250mg/10mL concentrate for solution for infusion vials | 1 vial [PoM]
£1,062.50
Javlor 50mg/2mL concentrate for solution for infusion vials |
1 vial [PoM] £212.50

Vinorelbine

- **DRUG ACTION** Vinorelbine is a semi-synthetic vinca alkaloid.

● INDICATIONS AND DOSE

Advanced breast cancer | Advanced non-small cell lung cancer

- ▶ **BY MOUTH**
▶ **Adult:** 60 mg/m² once weekly for 3 weeks, then increased if tolerated to 80 mg/m² once weekly (max. per dose 160 mg once weekly)
- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
▶ **Adult:** (consult product literature)

IMPORTANT SAFETY INFORMATION

Vinorelbine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues • ischaemic heart disease
- **INTERACTIONS** → Appendix 1: vinca alkaloids
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
▶ **Common or very common** Alopecia • anaemia • appetite decreased • arthralgia • bone marrow depression (dose-limiting) • constipation • diarrhoea • dyspnoea • fever • hypertension • hypotension • increased risk of infection • leucopenia • myalgia • nausea • neutropenia (dose-limiting) • pain • reflexes absent • stomatitis • thrombocytopenia • vomiting
▶ **Uncommon** Flushing • peripheral coldness • respiratory disorders • sepsis
▶ **Rare or very rare** Circulatory collapse • hyponatraemia • myocardial infarction • pancreatitis
▶ **Frequency not known** SIADH

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
▶ **With intravenous use** Asthenia • cancer pain • chest pain • muscle weakness in legs • nervous system disorder • vascular disorders
▶ **With oral use** Abdominal pain • chills • cough • dizziness • dysphagia • dysuria • fatigue • gastrointestinal disorders • headache • insomnia • liver disorder • neuromuscular disorders • sensory disorder • skin eruption • taste altered • urogenital disorder • vision disorder • weight changes
- ▶ **Uncommon**
▶ **With intravenous use** Paraesthesia
- ▶ **With oral use** Ataxia
- ▶ **Rare or very rare**
▶ **With intravenous use** Arrhythmias • ischaemic heart disease • necrosis • palpitations • paralytic ileus • skin reactions
- ▶ **Frequency not known**
▶ **With intravenous use** Febrile neutropenia
▶ **With oral use** Gastrointestinal haemorrhage • hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION

Bronchospasm Severe bronchospasm following administration of the vinca alkaloids is more common when used in combination with mitomycin-C.

Neurotoxicity Neurotoxicity reported in clinical trials, most commonly as constipation, paresthesia, hyperesthesia, and hyporeflexia

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.
- **PREGNANCY** Avoid unless essential (teratogenicity, and fetal loss in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid *oral* use in severe impairment.
Dose adjustments ▶ **With oral use** Reduce *oral* dose in moderate impairment.
▶ **With injectable use** Reduce *intravenous dose* in severe impairment.

● CONTRA-INDICATIONS

- ▶ **With oral use** concurrent radiotherapy if treating the liver • long-term oxygen therapy • previous significant surgical resection of small bowel • previous significant surgical resection of stomach

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Vinorelbine (Non-proprietary)

Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml Vinorelbine 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £139.00 | 10 vial [PoM] £1,539.80

Vinorelbine 10mg/1ml concentrate for solution for infusion vials | 1 vial [PoM] £29.00 | 10 vial [PoM] £329.50

Navelbine (Pierre Fabre Ltd)

Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml Navelbine 10mg/1ml concentrate for solution for infusion vials | 10 vial [PoM] £297.45 (Hospital only)

Navelbine 50mg/5ml concentrate for solution for infusion vials | 10 vial [PoM] £1,399.79 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

Navelbine (Pierre Fabre Ltd)

Vinorelbine (as Vinorelbine tartrate) 20 mg Navelbine 20mg capsules | 1 capsule [PoM] £43.98 (Hospital only)

Vinorelbine (as Vinorelbine tartrate) 30 mg Navelbine 30mg capsules | 1 capsule [PoM] £65.98 (Hospital only)

Vinorelbine (as Vinorelbine tartrate) 80 mg Navelbine 80mg capsules | 1 capsule [PoM] £175.92 (Hospital only)

ANTINEOPLASTIC DRUGS > OTHER

Amsacrine

24-May-2017

INDICATIONS AND DOSE

Acute leukaemia (refractory to anthracycline chemotherapy used alone or in combination with other chemotherapy agents) (specialist use only)

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

● **CAUTIONS** Hypokalaemia—increased risk of ventricular fibrillation (correct hypokalaemia before initiating treatment)

● **INTERACTIONS** → Appendix 1: amsacrine

SIDE-EFFECTS

► **Common or very common** Abdominal pain · alopecia · arrhythmias · bone marrow disorders · cardiotoxicity · congestive heart failure · diarrhoea · dyspnoea · emotional lability · fever · generalised tonic-clonic seizure · haemorrhage · hepatic disorders · hypokalaemia · hypotension · infection · nausea · necrosis · skin reactions · stomatitis · thrombocytopenia · vomiting

► **Rare or very rare** Anaemia · cardiomyopathy · confusion · dizziness · granulocytopenia · headache · lethargy · leucopenia · numbness · peripheral neuropathy · proteinuria · renal impairment · visual impairment · weight changes

► **Frequency not known** Cardiac arrest · hyperuricaemia

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in women of child-bearing potential, and during and for 6 months after treatment in men.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function at baseline and during treatment—increased risk of toxicity.

Dose adjustments Manufacturer advises consider dose reduction in hepatic impairment.

● **RENAL IMPAIRMENT** Manufacturer advises monitor renal function at baseline and during treatment—increased risk of toxicity.

Dose adjustments Manufacturer advises consider dose reduction in renal impairment.

MONITORING REQUIREMENTS

► Manufacturer advises monitor full blood count, liver function and renal function regularly; electrolytes should be re-evaluated prior to each treatment.

► Manufacturer advises monitor for cardiotoxicity during treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Amsidine** (Eurocept International bv)

Amsacrine 50 mg per 1 ml Amsidine 75mg/1.5ml solution for infusion ampoules and diluent | 6 ampoule [PoM] £1,200.00 (Hospital only)

Arsenic trioxide

INDICATIONS AND DOSE

Acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● **CAUTIONS** Hypokalaemia (correct before treatment) · hypomagnesaemia (correct before treatment) · previous treatment with anthracyclines (increased risk of QT interval prolongation)

● **INTERACTIONS** → Appendix 1: arsenic trioxide

SIDE-EFFECTS

► **Common or very common** Abdominal pain · alveolar haemorrhage · anaemia · arrhythmias · arthralgia · chest pain · chills · diarrhoea · differentiation syndrome · dizziness · dyspnoea · electrolyte imbalance · fatigue · fever · headache · hyperbilirubinaemia · hyperglycaemia · hypotension · hypoxia · increased risk of infection · ketoacidosis · leucocytosis · myalgia · nausea · neutropenia · oedema · pain · pancytopenia · paraesthesia · pericardial effusion · QT interval prolongation · renal failure · respiratory disorders · seizure · skin reactions · thrombocytopenia · vasculitis · vision blurred · vomiting · weight increased

► **Frequency not known** Confusion · decreased leucocytes · fluid imbalance · heart failure · hepatotoxicity · peripheral neuropathy · sepsis

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms of differentiation syndrome (leucocyte activation syndrome) include unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men and women.

● **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution—limited information available.

● **MONITORING REQUIREMENTS** ECG required before and during treatment—consult product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion► **Trisenox** (Teva UK Ltd)

Arsenic trioxide 1 mg per 1 ml Trisenox 10mg/10ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £2,920.00 (Hospital only)

Asparaginase

18-May-2018

- **DRUG ACTION** Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

INDICATIONS AND DOSE**Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)**► **BY INTRAVENOUS INFUSION**

► Adult: 5000 units/m² every 3 days

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy · history of serious haemorrhage related to asparaginase therapy · history of serious thrombosis related to asparaginase therapy · pancreatitis · pre-existing known coagulopathy

- **CAUTIONS** Diabetes (may raise blood glucose) · hypersensitivity reactions · hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

CAUTIONS, FURTHER INFORMATION

- Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.

- **INTERACTIONS** → Appendix 1: asparaginase

SIDE-EFFECTS

- **Common or very common** Abdominal pain · agitation · anaemia · angioedema · appetite decreased · arthralgia · back pain · bronchospasm · confusion · depression · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · embolism and thrombosis · fatigue · flushing · haemorrhage · hallucination · hyperglycaemia · hypersensitivity · hypoalbuminaemia · hypoglycaemia · hypotension · increased risk of infection · leucopenia · nausea · neurological effects · oedema · pancreatitis · skin reactions · thrombocytopenia · vomiting · weight decreased
- **Uncommon** Headache · hyperammonaemia · hyperuricaemia
- **Rare or very rare** Coma · consciousness impaired · diabetic ketoacidosis · hepatic disorders · hyperparathyroidism · hypoparathyroidism · ischaemic stroke · necrotising pancreatitis · pancreatic pseudocyst · posterior reversible encephalopathy syndrome (PRES) · seizure · tremor

SIDE-EFFECTS, FURTHER INFORMATION

There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also

Pregnancy and reproductive function in Cytotoxic drugs p. 865.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
 - Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

SMC No. 1319/18

The *Scottish Medicines Consortium* has advised (April 2018) that asparaginase (*Spectrila*®) is accepted for use within NHS Scotland when used as a component of antineoplastic combination therapy for the treatment of acute lymphoblastic leukaemia in paediatric patients from birth to 18 years and adults.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion► **Spectrila** (medac UK) ▼

Asparaginase 10000 unit Spectrila 10,000unit powder for concentrate for solution for infusion vials | 1 vial [PoM] £450.00 (Hospital only)

Crisantaspase

16-Mar-2017

- **DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by *Erwinia chrysanthemi*.

INDICATIONS AND DOSE**Acute lymphoblastic leukaemia**► **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy
- **CAUTIONS** Diabetes (may raise blood glucose)
- **INTERACTIONS** → Appendix 1: crisantaspase
- **SIDE-EFFECTS**
 - **Common or very common** Chills · coagulation disorders · confusion · diarrhoea · dizziness · drowsiness · dyspnoea · face oedema · fever · headache · hepatic disorders · hypersensitivity · limb swelling · lip swelling · neurotoxicity · pain · pallor · pancreatitis · seizures · skin reactions · thrombosis
 - **Uncommon** Hyperglycaemia · hyperlipidaemia · hypoxia · increased risk of infection · respiratory disorders

- ▶ **Rare or very rare** Arthritis reactive · coma · diabetic ketoacidosis · dysphagia · dysphasia · encephalopathy · haemorrhage · level of consciousness decreased · myalgia · myocardial infarction · necrotising pancreatitis · neutropenia · paresis · sepsis · thrombocytopenia
- ▶ **Frequency not known** Abdominal pain · flushing · hyperammonaemia · hypertension · hypotension · nausea · pseudocyst · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid. See also, *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Erwinase** (Jazz Pharmaceuticals UK)
Crisantaspase 10000 unit Erwinase 10,000 unit powder for solution for injection vials | 5 vial [PoM] £3,065.00

Eribulin

01-May-2018

● INDICATIONS AND DOSE

Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease

▶ BY INTRAVENOUS INJECTION

- ▶ **Adult:** Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Bradyarrhythmias (increased susceptibility to QT-interval prolongation) · congestive heart failure (increased susceptibility to QT-interval prolongation) · electrolyte disturbances (increased susceptibility to QT-interval prolongation) · susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: eribulin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chest pain · chills · conjunctivitis · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · dry mouth · dyspnoea · dysuria · electrolyte imbalance · embolism and thrombosis · excessive tearing · fever · gastrointestinal discomfort · gastroesophageal reflux disease · haemorrhage · headache · hot flush · hyperbilirubinaemia · hyperglycaemia · increased risk of infection · influenza like illness · insomnia · lethargy · mucositis · muscle complaints · muscle weakness · nail disorder · nausea · nerve disorders · neurotoxicity · neutropenia · oral disorders · oropharyngeal pain · pain · peripheral oedema · rhinorrhoea · sensation abnormal · skin reactions · sweat changes · tachycardia · taste altered · thrombocytopenia · tinnitus · vertigo · vomiting · weight decreased
- ▶ **Uncommon** Angioedema · hepatotoxicity · interstitial lung disease · pancreatitis · proteinuria · renal failure · sepsis
- ▶ **Rare or very rare** Disseminated intravascular coagulation
- ▶ **Frequency not known** QT interval prolongation · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for up to 3 months after treatment in men or women.
- **PREGNANCY** Avoid unless essential (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT**
Dose adjustments Consider dose reduction if creatinine clearance less than 40 mL/minute.
- **MONITORING REQUIREMENTS**
- ▶ Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).
- ▶ ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.
- ▶ Monitor electrolytes periodically.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Eribulin for treating locally advanced or metastatic breast cancer after 2 or more chemotherapy regimens (December 2016)** NICE TA423

Eribulin is recommended for the treatment of locally advanced or metastatic breast cancer, only if:

- the condition has progressed after at least 2 chemotherapy regimens (which may include an anthracycline or a taxane, and capecitabine), and
- the manufacturer provides eribulin with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta423

- ▶ **Eribulin for treating locally advanced or metastatic breast cancer after 1 chemotherapy regimen (March 2018)**

NICE TA515

Eribulin is **not** recommended for treating locally advanced or metastatic breast cancer in adults who have had only 1 chemotherapy regimen.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta515

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1065/15

The *Scottish Medicines Consortium* has advised (March 2016) that eribulin (*Halaven*®) is accepted for restricted use within NHS Scotland for the treatment of patients with locally advanced or metastatic breast cancer that has progressed after at least two prior chemotherapy regimens for advanced disease, which includes capecitabine if indicated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Ethanol

- ▶ **Halaven** (Eisai Ltd)

Eribulin 44 mg per 1 ml Halaven 0.88mg/2ml solution for injection vials | 1 vial [PoM] £361.00 (Hospital only)
Halaven 1.32mg/3ml solution for injection vials | 1 vial [PoM] £541.50 (Hospital only)

Hydroxycarbamide

22-Mar-2018

(Hydroxyurea)

• INDICATIONS AND DOSE

Polycythaemia vera (specialist use only)

► BY MOUTH

- Adult: Initially 15–20 mg/kg daily, adjusted according to response, for information on dose adjustment based on haematocrit and platelet count—consult product literature; usual dose 500–1000 mg daily, dosage should be based on actual or ideal body weight, whichever is less

Essential thrombocythaemia (specialist use only)

► BY MOUTH

- Adult: Initially 15 mg/kg daily, adjusted according to response, for information on dose adjustment based on platelet count and white cell count—consult product literature, dosage should be based on actual or ideal body weight, whichever is less

Chronic myeloid leukaemia (specialist use only)

► BY MOUTH

- Adult: Initially 40 mg/kg daily, then reduced to 20 mg/kg daily, adjusted according to response, for information on dose adjustment based on white cell count—consult product literature, dosage should be based on actual or ideal body weight, whichever is less

HYDREA®

Chronic myeloid leukaemia (specialist use only) | Cancer of the cervix (specialist use only)

► BY MOUTH

- Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days, for information on dose adjustment based on platelet count, white cell count and actual or ideal body weight—consult product literature

SIKLOS®

Sickle-cell disease [prevention of recurrent vaso-occlusive crises] (initiated by a specialist)

► BY MOUTH

- Adult: Initially 15 mg/kg daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)
- **INTERACTIONS** → Appendix 1: hydroxycarbamide
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · bone marrow failure · chills · constipation · cutaneous vasculitis · dermatomyositis · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · dysuria · fever · gastrointestinal discomfort · hallucination · headache · hepatic disorders · leucopenia · malaise · melaena · mucositis · nail disorder · nausea · pancreatitis · peripheral neuropathy · pulmonary oedema · respiratory disorders · seizure · skin cancer · skin reactions · skin ulcer · sperm abnormalities · stomatitis · thrombocytopenia · vomiting
 - **Rare or very rare** Gangrene
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.
- **RENAL IMPAIRMENT** In sickle-cell disease, avoid if eGFR less than 30 mL/minute/1.73 m². Use with caution in malignant disease.
Dose adjustments In sickle-cell disease, reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - Monitor renal and hepatic function before and during treatment.
 - Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
 - Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.
- **PATIENT AND CARER ADVICE** Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Siklos (Nordic Pharma Ltd)

Hydroxycarbamide 100 mg Siklos 100mg tablets | 60 tablet [PoM](#)
£100.00 DT = £100.00

Hydroxycarbamide 1 gram Siklos 1000mg tablets | 30 tablet [PoM](#)
£500.00 DT = £500.00

Capsule

► Hydroxycarbamide (Non-proprietary)

Hydroxycarbamide 500 mg Hydroxycarbamide 500mg capsules | 100 capsule [PoM](#) £86.00 DT = £12.14

► Droxia (Imported (United States))

Hydroxycarbamide 300 mg Droxia 300mg capsules | 60 capsule [PoM](#) [S](#)

► Hydrea (Bristol-Myers Squibb Pharmaceuticals Ltd)

Hydrea 500mg capsules | 100 capsule [PoM](#) £10.47 DT = £12.14

Mitotane

- **DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

• INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

► BY MOUTH

- Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring, in severe illness initial dose can be increased up to 6 g daily, reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · risk of accumulation in overweight patients
- **INTERACTIONS** → Appendix 1: mitotane
- **SIDE-EFFECTS**
 - **Common or very common** Adrenal insufficiency · anaemia · appetite decreased · asthenia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · dyslipidaemia · gastrointestinal discomfort ·

gynaecomastia · headache · hepatic disorders · leucopenia · movement disorders · mucositis · muscle weakness · nausea · paraesthesia · polyneuropathy · rash · thrombocytopenia · vertigo · vomiting

- **Frequency not known** Encephalopathy · eye disorders · flushing · fungal infection · generalised pain · growth retardation · haemorrhage · hyperpyrexia · hypersalivation · hypertension · hypothyroidism · hypouricaemia · lens opacity · neuro-psychological retardation · ovarian cyst · postural hypotension · proteinuria · taste altered · thyroid disorder · vision disorders

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

Monitoring In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.

● **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

Monitoring In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.

● **MONITORING REQUIREMENTS**

- Plasma-mitotane concentration for optimum response 14–20 mg/litre.
- Monitor plasma-mitotane concentration—consult product literature.

● **PRESCRIBING AND DISPENSING INFORMATION**

Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

● **PATIENT AND CARER ADVICE** Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency). **Driving and skilled tasks** Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10, 21

► **Lysodren** (HRA Pharma UK Ltd)

Mitotane 500 mg Lysodren 500mg tablets | 100 tablet [PoM]
£590.97

Panobinostat

01-Feb-2017

● **DRUG ACTION** Panobinostat is a histone deacetylase inhibitor, which promotes cell-cycle arrest and apoptosis of tumour cells via multiple pathways.

● **INDICATIONS AND DOSE**

Treatment of relapsed or refractory multiple myeloma (in combination with bortezomib and dexamethasone), in patients who have received at least two prior regimens, including bortezomib and an immunomodulatory agent

► **BY MOUTH**

- **Adult 18–74 years:** 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks),

for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

- **Adult 75 years and over:** 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), alternatively initially 15 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 1 cycle, increased if tolerated to 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 7 subsequent cycles, patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), lower dose may be used for the first cycle depending on patient's condition and co-morbidities, for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to 10 mg with concurrent use of potent inhibitors of CYP3A4; if the potent inhibitor of CYP3A4 is to be continued, consider increasing the dose to 15 mg if tolerated.
- Manufacturer advises avoid potent inhibitors of CYP3A4 if possible in patients taking a reduced panobinostat dose due to side-effects, or in those with hepatic impairment.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Coagulation disorders · elderly · QT-interval prolongation · risk factors for QT-interval prolongation
- CAUTIONS, FURTHER INFORMATION**
 - Risk factors for QT-interval prolongation Patients at risk of developing QT-interval prolongation include those with long QT syndrome, or uncontrolled or significant cardiac disease.
- **INTERACTIONS** → Appendix 1: panobinostat
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · antibiotic associated colitis · appetite decreased · arrhythmias · asthenia · cheilitis · chills · cough · decreased leucocytes · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypoalbuminaemia · hypotension · hypothyroidism · increased risk of infection · insomnia · intracranial haemorrhage · joint swelling · malaise · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · QT interval prolongation · renal failure · respiratory disorders · sepsis · skin reactions · syncope · taste altered · thrombocytopenia · tremor · urinary incontinence · vomiting · weight decreased
 - **Uncommon** Haemorrhagic shock · myocardial infarction
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects are reported when used in combination with bortezomib and dexamethasone.

Gastro-intestinal disorders Manufacturer advises that patients are treated with anti-diarrhoeals, or any additional treatment, in accordance with local treatment guidelines at the first sign of abdominal cramping or onset of diarrhoea.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before starting treatment in women of child-bearing potential, and ensure highly effective contraception used during treatment and for 3 months after last dose. Women using hormonal contraceptives should also use a barrier method of contraception. Highly

effective contraception also required for men and their female partners during treatment and for 6 months after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises frequent monitoring of hepatic function in mild and moderate impairment, particularly during the dose escalation phase; avoid in severe impairment—no information available.
Dose adjustments Manufacturer advises reduce initial dose to 15 mg during the first treatment cycle in mild impairment—dose may be increased to 20 mg based on patient tolerability; reduce initial dose to 10 mg during the first treatment cycle in moderate impairment—dose may be increased to 15 mg based on patient tolerability.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor full blood count before treatment, then frequently during treatment; reduce dose or interrupt treatment if thrombocytopenia or neutropenia occur—consult product literature.
 - ▶ Manufacturer advises monitor ECG before treatment and repeat periodically before each treatment cycle; QTcF should be <480 milliseconds before treatment initiation—consult product literature.
 - ▶ Manufacturer advises monitor electrolytes before treatment and periodically as clinically indicated, especially in patients with diarrhoea; monitor thyroid and pituitary function (free T4 and TSH) as clinically indicated; monitor hepatic function before treatment and regularly during treatment as clinically indicated.
 - ▶ Manufacturer advises monitor patients over 65 years more frequently, especially for thrombocytopenia and gastro-intestinal toxicity.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be told to seek medical advice if severe gastro-intestinal toxicity occurs.
Missed doses Manufacturer advises if a dose is missed, it can be taken up to 12 hours after the specified dose time.
Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Panobinostat for treating multiple myeloma after at least 2 previous treatments (January 2016)** NICE TA380
Panobinostat, in combination with bortezomib and dexamethasone, is recommended as an option for treating relapsed or refractory multiple myeloma in patients who have received at least 2 prior regimens including bortezomib and an immunomodulatory agent when the manufacturer provides panobinostat with the discount agreed in the patient access scheme.
www.nice.org.uk/TA380

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

20 mg Farydak 20mg capsules | 6 capsule [PoM] £4,656.00

Pegaspargase

16-Mar-2017

- **DRUG ACTION** Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult 18–21 years: 2500 units/m² every 14 days
- ▶ Adult 22 years and over: 2000 units/m² every 14 days

- **CONTRA-INDICATIONS** History of pancreatitis · history of serious haemorrhagic event with previous L-asparaginase therapy · history of serious thrombosis with previous L-asparaginase therapy
- **CAUTIONS** Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function · diabetes (may raise blood glucose) · hypersensitivity reactions · marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

- **INTERACTIONS** → Appendix 1: pegaspargase

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · bone marrow depression · diarrhoea · hyperglycaemia · hypersensitivity · hypoxia · pain in extremity · pancreatitis (discontinue if suspected and do not restart if confirmed) · peripheral neuropathy · rash · seizure · stomatitis · syncope · thrombosis (discontinue) · vomiting
 - ▶ **Rare or very rare** Acute kidney injury · posterior reversible encephalopathy syndrome (PRES) · tremor
 - ▶ **Frequency not known** Confusion · diabetic ketoacidosis · drowsiness · hepatobiliary disorder · hyperammonaemia (monitor if symptoms present) · toxic epidermal necrolysis
- SIDE-EFFECTS, FURTHER INFORMATION** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome in patients receiving pegaspargase.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Manufacturer advises avoid unless essential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of

pegaspargase; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.

- ▶ Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intramuscular injection, volumes over 3 mL must be divided between more than one site.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator between 2–8°C.

● **PATIENT AND CARER ADVICE**

Pancreatitis Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Pegaspargase for treating acute lymphoblastic leukaemia (September 2016)** NICE TA408
Pegaspargase, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.

Patients whose treatment was started within the NHS before this guidance was published may continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta408

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that pegaspargase (*Oncaspar*®) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

● **INDICATIONS AND DOSE**

Hodgkin's lymphoma

- ▶ **BY MOUTH**

▶ **Adult:** (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia · pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease · cerebrovascular disease · epilepsy · phaeochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)

- **INTERACTIONS** → Appendix 1: procarbazine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased
- ▶ **Frequency not known** Azoospermia · hepatic disorders · infection · lethargy · leucopenia · nausea · neutropenia · ovarian failure · pneumonitis · skin reactions · thrombocytopenia · vomiting

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

- ▶ **Procabazine (Non-proprietary)**

Procabazine (as Procarbazine hydrochloride)

50 mg Procabazine 50mg capsules | 50 capsule PoM £411.34-£411.35 DT = £411.35

Raltitrexed

- **DRUG ACTION** Raltitrexed is a thymidylate synthase inhibitor.

● **INDICATIONS AND DOSE**

Palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used

- ▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** (consult local protocol)

- **INTERACTIONS** → Appendix 1: raltitrexed

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cellulitis · conjunctivitis · constipation · dehydration · diarrhoea · fever · gastrointestinal discomfort · headache · hyperbilirubinaemia · hyperhidrosis · influenza like illness · leucopenia · malaise · mucositis · muscle cramps · muscle tone increased · nausea · neutropenia · oral disorders · pain · peripheral oedema · sepsis · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased
- ▶ **Frequency not known** Gastrointestinal haemorrhage

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.

● **PREGNANCY** See *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 25 mL/minute.

Dose adjustments Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature).

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005)** NICE TA93
Raltitrexed is **not** recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies.
www.nice.org.uk/TA93

RETINOID AND RELATED DRUGS

Bexarotene

- **DRUG ACTION** Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.

INDICATIONS AND DOSE

Skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 300 mg/m² once daily, adjusted according to response, to be taken with a meal

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** History of pancreatitis · hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism
- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · hyperlipidaemia · hypothyroidism
- **INTERACTIONS** → Appendix 1: retinoids
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · constipation · diarrhoea · dizziness · dry eye · dry mouth · dyslipidaemia · eye disorders · gastrointestinal discomfort · gastrointestinal disorders · headaches · hearing impairment · hyperhidrosis · hypersensitivity · hypoproteinaemia · hypothyroidism · increased risk of infection · insomnia · leucopenia · lymphadenopathy · muscle complaints · nausea · oedema · oral disorders · pain · pseudolymphoma · sensation abnormal · skin nodule · skin reactions · skin ulcer · thyroid disorder · vomiting · weight changes
 - ▶ **Uncommon** Albuminuria · anxiety · arrhythmias · ataxia · blood disorder · cataract · coagulation disorder · depression · ear disorder · eosinophilia · eye inflammation · fever · gout · haemorrhage · hair disorder · hepatic failure · hyperbilirubinaemia · hypertension · hyperthyroidism · increased leucocytes · mucous membrane disorder · muscle weakness · nail disorder · neoplasms · nerve disorders · pancreatitis · renal impairment · serous drainage · thrombocytopenia · thrombocytosis · varicose veins · vasodilation · vertigo · vision disorders

Bexarotene 75 mg Targretin 75mg capsules | 100 capsule **[PoM]** £937.50

Tretinoin

INDICATIONS AND DOSE

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

- ▶ **BY MOUTH**
- ▶ **Adult:** 45 mg/m² daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

- **CAUTIONS** Increased risk of thromboembolism during first month of treatment
- **INTERACTIONS** → Appendix 1: retinoids
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · anxiety · appetite decreased · arrhythmia · asthma · bone pain · cheilitis · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · flushing · headache · hearing impairment · hyperhidrosis · idiopathic intracranial hypertension · insomnia · intracranial pressure increased · malaise · nasal dryness · nausea · pancreatitis · paraesthesia · respiratory disorders · skin reactions · visual impairment · vomiting
 - ▶ **Frequency not known** Embolism and thrombosis · erythema nodosum · genital ulceration · hepatotoxicity · hypercalcaemia · increased leucocytes · myocardial infarction · myositis · necrotising fasciitis · QT interval prolongation · stroke · thrombocytosis · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION

Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Teratogenic. See *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Avoid (discontinue breast-feeding).

● HEPATIC IMPAIRMENT

Dose adjustments Reduce dose to 25 mg/m².

● RENAL IMPAIRMENT

Dose adjustments Reduce dose to 25 mg/m².

● MONITORING REQUIREMENTS

Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

Tretinoin is the acid form of vitamin A.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

3.1 Cytotoxic drug-induced side effects

ANTIDOTES AND CHELATORS > IRON CHELATORS

Dextrazoxane

● DRUG ACTION

Dextrazoxane is an iron chelator.

● INDICATIONS AND DOSE

CARDIOXANE®

Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m² of doxorubicin or a prior cumulative dose of 540 mg/m² of epirubicin when further anthracycline treatment is required

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

SAVENE®

Anthracycline extravasation

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 1 g/m² daily (max. per dose 2 g) for 2 days, then 500 mg/m² for 1 day, first dose to be given as soon as possible and within 6 hours after injury

● CONTRA-INDICATIONS

Children

● CAUTIONS

Myelosuppression (effects may be additive to those of chemotherapy)

CARDIOXANE® Manufacturer advises caution in patients with heart failure—no information available • manufacturer advises caution in patients with myocardial infarction in previous 12 months—no information available • manufacturer advises caution in patients with symptomatic valvular heart disease—no information available • manufacturer advises caution in patients with uncontrolled angina—no information available

● INTERACTIONS

→ Appendix 1: iron chelators

● SIDE-EFFECTS

▶ **Common or very common** Alopecia • anaemia • appetite decreased • asthenia • constipation • cough • diarrhoea • dizziness • drowsiness • dry mouth • dyspnoea • embolism and thrombosis • fever • gastrointestinal discomfort • headache • increased risk of infection • leucopenia • myalgia • nail disorder • nausea • neutropenia • peripheral neuropathy • peripheral oedema • post procedural infection • sensation abnormal • skin reactions • stomatitis • syncope •

tachycardia • thrombocytopenia • tremor • vaginal haemorrhage • vomiting • weight decreased • wound complications

▶ **Uncommon** Acute myeloid leukaemia • lymphoedema • sepsis • thirst • vertigo

▶ **Frequency not known** Anaphylactic reaction

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 3 months after treatment in men and women.

● **PREGNANCY** Avoid unless essential (toxicity in *animal* studies).

● **BREAST FEEDING** Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

CARDIOXANE® **Dose adjustments** Manufacturer advises that if anthracycline dose is reduced, reduce the *Cardioxane®* dose by a similar ratio.

SAVENE® Manufacturer advises avoid—no information available.

● RENAL IMPAIRMENT

CARDIOXANE® **Dose adjustments** Manufacturer advises reduce dose by 50% if creatinine clearance less than 40 mL/minute.

SAVENE® Manufacturer advises avoid—risk of accumulation.

● MONITORING REQUIREMENTS

▶ Monitor full blood count.
▶ Monitor for cardiac toxicity.
▶ Monitor liver function.

● **DIRECTIONS FOR ADMINISTRATION** Local coolants such as ice packs should be removed at least 15 minutes before administration.

CARDIOXANE® For *intravenous infusion*, give intermittently in Compound sodium lactate; reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes.

SAVENE® For *intravenous infusion*, give intermittently in diluent; reconstitute each 500-mg vial with 25 mL of diluent; dilute requisite dose further in remaining diluent and give over 1–2 hours into a large vein in an area other than the one affected.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

VITAMINS AND TRACE ELEMENTS > FOLATES

Folinic acid

● INDICATIONS AND DOSE

Prevention of methotrexate-induced adverse effects

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

Suspected methotrexate overdose

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

SODIOFOLIN®

As an antidote to methotrexate

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

Adjunct to fluorouracil in colorectal cancer

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Avoid simultaneous administration of methotrexate · not indicated for pernicious anaemia or

other megaloblastic anaemias caused by vitamin B₁₂ deficiency

- **INTERACTIONS** → Appendix 1: folates

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Fever
- ▶ **Rare or very rare** Agitation (with high doses) · depression (with high doses) · epilepsy exacerbated · gastrointestinal disorder (with high doses) · insomnia (with high doses) · urticaria

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Bone marrow failure · dehydration · diarrhoea (with high doses) · mucositis · nausea · oral disorders · skin reactions · vomiting
- ▶ **Rare or very rare**
- ▶ With intravenous use Sensitisation
- ▶ **Frequency not known**
- ▶ With intravenous use Hyperammonaemia
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212 Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer.

▶ Sodiofolin (medac UK)

Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodiofolin 400mg/8ml solution for injection vials | 1 vial [PoM] £126.25 (Hospital only)
 Sodiofolin 100mg/2ml solution for injection vials | 1 vial [PoM] £35.09 (Hospital only)

Levofolinic acid

- **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

● INDICATIONS AND DOSE

Prevention of methotrexate-induced adverse effects

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

Suspected methotrexate overdosage

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Avoid simultaneous administration of methotrexate • **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dehydration • diarrhoea • mucosal toxicity • nausea • vomiting
 - ▶ **Uncommon** Fever
 - ▶ **Rare or very rare** Agitation (with high doses) • depression (with high doses) • epilepsy exacerbated • gastrointestinal disorder • insomnia (with high doses) • urticaria
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

 - ▶ **Isovorin** (Pfizer Ltd)
 - Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovorin 175mg/17.5ml solution for injection vials | 1 vial [PoM] £81.33 (Hospital only)
 - Isovorin 25mg/2.5ml solution for injection vials | 1 vial [PoM] £11.62 (Hospital only)

- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea • fever • headache • nausea • skin reactions • vomiting
 - ▶ **Uncommon** Bronchospasm • haemolysis • haemolytic anaemia • hypersensitivity • hypotension • methaemoglobinemia • seizure
 - ▶ **Rare or very rare** Rhinitis
 - ▶ **Frequency not known** Muscle contractions involuntary
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Fasturtec*®), give intermittently in Sodium chloride 0.9%; reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

 - ▶ **Fasturtec** (Sanofi)
 - Rasburicase 1.5 mg** Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial [PoM] £208.39 (Hospital only)
 - Rasburicase 7.5 mg** Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial [PoM] £347.32 (Hospital only)

4 Hormone responsive malignancy

Breast cancer

01-Jun-2016

Description of condition

Breast cancer is the most common form of malignancy in women. The causes of breast cancer are complex and there are several risk factors. Established risk factors include age, early onset of menstruation, late menopause, greater age at first completed pregnancy, and a family history. The use of oral contraceptives and postmenopausal HRT are also associated with a small excess risk.

Non-invasive breast cancer, also known as ductal carcinoma *in situ*, is when the cancer remains localised in the ducts. However, in most cases, the cancer is invasive at the time of diagnosis, which means that malignant cells are liable to spread beyond the immediate area of the tumour. Invasive breast cancer, where malignant cells spread beyond the ducts, can be defined as early breast cancer (operable, primary, stage I/II), locally advanced disease (inoperable local, stage III) and advanced disease (metastatic, stage IV).

Aims of treatment

Reducing mortality, increasing progression-free and disease-free survival and improving quality of life are the main aims of the available treatments for breast cancer and are dependant on the stage of the disease.

Surgery and radiotherapy aim to remove the tumour mass, while adjuvant drug therapy aims to reduce the risk of recurrence and the risk of developing invasive disease. Advanced breast cancer is not curable and treatment aims to achieve remission, to prolong the disease free survival, to relieve symptoms and improve quality of life.

3.1a Hyperuricaemia associated with cytotoxic drugs

Other drugs used for Hyperuricaemia associated with cytotoxic drugs Allopurinol, p. 1086 • Febuxostat, p. 1087

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

● INDICATIONS AND DOSE

Prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and high tumour burden at risk of rapid lysis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

Treatment

The course of the disease and the therapeutic approach vary depending on the characteristics of the cancer; factors such as patient age and menopausal status, tumour size and grade, involvement of axillary lymph nodes or skin, and presence of hormone receptors within the tumour may inform the extent and aggressiveness of the disease. The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

Early and locally advanced breast cancer

EvGr For operable breast cancer, primary treatment is surgical using breast-conserving surgery or mastectomy, followed by adjuvant therapy to eradicate the micro-metastases that cause relapses. Radiotherapy is recommended after breast conserving surgery, as it reduces local recurrence rates. It is also used after mastectomy if there is a high risk of recurrence.

Drug therapy can be used after surgery (adjuvant therapy) or may be offered before surgery (neoadjuvant therapy) to achieve local tumour downsizing in order to make breast-conserving surgery possible. The choice of adjuvant therapy is determined by the safety and efficacy of the drugs, the oestrogen-receptor status, and the human epidermal growth factor 2 (HER2) status of the primary tumour.

Adjuvant chemotherapy or radiotherapy should be considered for all patients, irrespective of age, and it should be started as soon as clinically possible within 31 days of surgery.

A high-dose anthracycline-based chemotherapy regimen is usually preferred to a low-dose anthracycline-based regimen or to a non-anthracycline-based regimen. Choice of chemotherapy regimen is usually guided by local policy, Clinical Cancer Networks, and funding arrangements.

Adjuvant anthracycline-taxane combination chemotherapy should be considered in patients where the additional benefit outweighs risk. For patients with lymph node-positive breast cancer, docetaxel p. 900 can be added as part of an adjuvant chemotherapy regimen; paclitaxel p. 901 is not recommended.

Following surgery, tamoxifen p. 927, alone or in combination with chemotherapy, can be given to premenopausal women with oestrogen-receptor-positive early invasive breast cancer. If chemotherapy has not been selected, tamoxifen can be used in combination with ovarian ablation or suppression. Tamoxifen is not recommended for non-invasive (ductal carcinoma *in situ*) early breast cancer. Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin p. 721 or ovarian ablation.

For postmenopausal women with oestrogen-receptor-positive early invasive breast cancer, not considered to be low risk, an aromatase inhibitor, such as anastrozole p. 928 or letrozole p. 929, is first-line therapy. Tamoxifen is an alternative if an aromatase inhibitor is not tolerated or is contra-indicated. An aromatase inhibitor should be given as initial adjuvant therapy for 5 years, or by switching to an aromatase inhibitor after 2–3 years of tamoxifen for a total of 5 years. Postmenopausal women who have already received tamoxifen for 5 years may be considered for extended therapy (5 years) with letrozole. **⚡**

There is some evidence that in postmenopausal women with early breast cancer, adjuvant bisphosphonate therapy can prevent breast cancer recurrence in the bone and improve survival. **EvGr** Intravenous zoledronic acid p. 715 [unlicensed indication] or oral sodium clodronate p. 714 [unlicensed indication] are the preferred options in these patients. **⚡** There is no evidence of benefit in premenopausal women.

EvGr Adjuvant trastuzumab p. 862 is recommended as an option in patients with HER2 positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant)

and radiotherapy. Trastuzumab should not be given concurrently with anthracycline-containing regimens (because of the risk of congestive heart failure) but it may be given either concurrently with taxane-based regimens or sequentially. **⚡**

Advanced breast cancer

Treatment of advanced breast cancer depends on the patient's drug history, disease severity, and oestrogen receptor and HER2 status.

EvGr For the majority of patients with oestrogen-receptor-positive advanced breast cancer, endocrine therapy is first-line treatment. Aromatase inhibitors, such as anastrozole, letrozole and exemestane p. 928, may be offered to patients with no previous history of endocrine treatment or in those previously treated with tamoxifen.

Tamoxifen should be considered as first-line treatment for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen.

In patients with advanced breast cancer that is imminently life-threatening or with visceral organ involvement, which requires early relief of symptoms, an anthracycline-based chemotherapy regimen is the preferred treatment. If anthracyclines are not suitable, the alternative is docetaxel monotherapy as first-line treatment, vinorelbine p. 906 or capecitabine p. 880 as second-line treatment or, for third-line treatment, whichever of the two drugs was not used second line. Gemcitabine p. 886 in combination with paclitaxel is recommended for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel with capecitabine are also considered appropriate.

Trastuzumab is recommended for the treatment of HER2-positive advanced breast cancer. It is used in combination with paclitaxel in those who have not received chemotherapy for metastatic breast cancer and as monotherapy for patients who have received at least two chemotherapy regimens for metastatic breast cancer (see trastuzumab *National funding/access decisions*). **⚡**

Lapatinib p. 956 in combination with an aromatase inhibitor, fulvestrant p. 926, trastuzumab emtansine p. 863, and toremifene p. 927 are all licensed for use in patients with metastatic breast cancer, however their use is not recommended (see drug monographs for *Indications and National funding/access decisions*).

The gonadorelin analogue, goserelin p. 721 is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation. Some progestogen preparations, such as medroxyprogesterone acetate p. 791, norethisterone p. 747, megestrol acetate p. 926 are also licensed for the treatment of breast cancer (see drug monographs).

EvGr The use of bisphosphonates in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases. **⚡**

Familial breast cancer

EvGr Chemoprevention should be offered to all women who have been identified as **high-risk** of developing breast cancer. For women at **moderate-risk**, chemoprevention should only be considered. Other strategies should also be considered to reduce the risk.

Chemoprevention should not be given to patients at high-risk of developing breast cancer who have had a risk-reducing bilateral mastectomy. **⚡**

Treatment options for chemoprevention

EvGr Chemoprevention should only be continued for 5 years. Tamoxifen p. 927 [unlicensed indication] is recommended for premenopausal women who do not have a history or increased risk of thromboembolic disease or endometrial cancer.

In *post-menopausal* women (who do not have severe osteoporosis), anastrozole p. 928 [unlicensed indication] is recommended. Women who have severe osteoporosis, or who do not wish to take anastrozole, can be treated with tamoxifen provided there is no history or risk of thromboembolic disease or endometrial cancer. Alternatively, raloxifene hydrochloride p. 736 is an option [unlicensed indication] in *post-menopausal* women with a uterus who do not wish to take tamoxifen, unless there is a history or increased risk of thromboembolic disease. ▶

Treatment of menopausal symptoms

EVGr Discontinue hormone replacement therapy (HRT) in women who are diagnosed with breast cancer. Do not offer HRT routinely to women with menopausal symptoms and a history of breast cancer. HRT may, in exceptional cases, be offered to women with severe menopausal symptoms and with whom the associated risks have been discussed. Paroxetine p. 363 or fluoxetine p. 362 [unlicensed indications] may be offered to women with breast cancer for relieving menopausal symptoms, particularly hot flushes, but not to those taking tamoxifen—risk of interactions. Clonidine hydrochloride p. 144, venlafaxine p. 365 [unlicensed indication] and gabapentin p. 314 [unlicensed indication] should only be offered to treat hot flushes in women with breast cancer after they have been fully informed of the significant side effects. ▶

Breast cancer in men

Breast cancer in men is rare. Although, not fully understood, risk factors may be associated with sex hormone metabolism, including those acquired through liver disease or testicular trauma, environmental risk factors such as industrial exposure to heat, and genetic predisposition. Treatment is similar to that for women involving surgery, radiotherapy, drug therapy, or a combination of these.

Prostate Cancer

31-May-2016

Description of condition

Prostate cancer is the most common form of cancer affecting men. The main risk factors are age (most cases being diagnosed in men over 65 years of age), ethnicity (more common in black African-Caribbean men), and a familial component. Prostate cancer is usually slow-growing and asymptomatic at diagnosis, however, the presenting symptoms of advanced disease are usually urinary outflow obstruction, or, pelvic or back pain due to bone metastases. Treatment decisions are guided by baseline prostate specific antigen (PSA) levels, tumour grade (Gleason score), the stage of the tumour, the patient's life expectancy (based on age

and comorbid conditions), treatment morbidity, and patient preference.

Aims of treatment

In early or locally advanced prostate cancer, radical treatment aims to eliminate the malignancy. In metastatic disease, drug therapy is aimed at prolonging survival and reducing symptoms.

Drug treatment

Treatment options for patients with prostate cancer include active monitoring, radical prostatectomy, external beam radiotherapy, and brachytherapy. Hormone therapy (androgen deprivation or anti-androgens) is the primary treatment for metastatic prostate cancer, but is also increasingly being used for patients with locally advanced, non-metastatic disease.

In patients with localised prostate cancer, the choice of treatment is guided by whether the disease is considered low, intermediate, or high risk according to the Gleason score, the serum PSA level, and the tumour stage.

Localised or locally advanced prostate cancer

EVGr In patients with **low-risk localised prostate cancer**, and those at **intermediate risk** who decline radical treatments (prostatectomy or radiotherapy), active monitoring is a suitable option. This involves close monitoring to avoid unnecessary treatment until disease progression occurs (or until the patient requests treatment).

In patients with **intermediate-risk or high-risk localised prostate cancer** (when there is a realistic prospect of long-term disease control) and in those with **locally advanced disease**, radical prostatectomy or radical radiotherapy should be offered. Other treatment options include a combination of radical radiotherapy and androgen deprivation therapy, consisting of 6 months of androgen deprivation therapy before, during or after radiotherapy. Pelvic radiotherapy should be considered in those with locally advanced prostate cancer who have a higher than 15% risk of pelvic lymph node involvement and are to receive neoadjuvant hormonal therapy.

Androgen deprivation therapy involves the use of a luteinising hormone-releasing hormone (LHRH) agonist (buserelin p. 720, goserelin p. 721, leuprorelin acetate p. 722, or triptorelin p. 723), or bilateral orchidectomy, which removes the supply of endogenous hormone. Androgen deprivation therapy may be continued for up to 3 years in patients with high-risk localised prostate cancer.

Patients should be informed about the side-effects of treatment, particularly urinary and sexual dysfunction, loss of fertility, radiation-induced enteropathy, and hot flushes. Although there is limited evidence, intermittent therapy may be considered for patients who are having long-term androgen deprivation therapy, to reduce drug toxicity. Tumour flare, due to an initial surge in testosterone concentrations, has been reported in the initial stages of treatment with androgen deprivation therapy and prophylactic anti-androgen therapy (such as cyproterone acetate p. 753) may be added.

Medroxyprogesterone acetate p. 791 [unlicensed indication] can be used, initially for up to 10 weeks, to manage androgenic hot flushes caused by long-term androgen suppression; cyproterone acetate is an alternative if medroxyprogesterone acetate is not effective or not tolerated.

Patients who experience a reduction in libido and loss of sexual function should have access to specialist erectile dysfunction services and be considered for treatment with a phosphodiesterase type-5 inhibitor.

Osteoporosis and fatigue may also be a problem with androgen deprivation therapy. A bisphosphonate can be offered to men who have osteoporosis; denosumab p. 717 is an alternative if bisphosphonates are not appropriate.

Gynaecomastia can occur with long-term (longer than 6 months) bicalutamide p. 921 treatment. Prophylactic radiotherapy (within the first month of treatment), or weekly tamoxifen p. 927 [unlicensed indication], if radiotherapy is unsuccessful, can be considered. 

Metastatic prostate cancer

 Bilateral orchidectomy should be offered to all patients with **metastatic prostate cancer** as an alternative to continuous LHRH agonist treatment. Anti-androgen monotherapy with bicalutamide [unlicensed indication] can be offered to those who are willing to accept the adverse impact on overall survival and gynaecomastia in the hope of retaining sexual function. However, if satisfactory sexual function is not maintained, stop bicalutamide and start androgen deprivation therapy.

Abiraterone acetate below (in combination with prednisone p. 666 or prednisolone p. 664) and enzalutamide p. 921 are both recommended as options for the treatment of castration-resistant metastatic prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel p. 900-containing chemotherapy regimen.

In patients who develop **hormone-relapsed metastatic tumour**, chemotherapy with docetaxel can be used. It is recommended to stop the treatment with docetaxel after 10 cycles, or if severe adverse events occurred, or if there is evidence of disease progression.

Abiraterone acetate (in combination with prednisone or prednisolone) is also recommended as an option for treating **metastatic hormone-relapsed prostate cancer** in patients who have no or mild symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated.

In patients with hormone-relapsed prostate cancer, a corticosteroid, such as dexamethasone p. 660, can be offered as third line therapy, after androgen deprivation therapy and anti-androgen therapy.

ANTINEOPLASTIC DRUGS > ANTI-ANDROGENS

Abiraterone acetate

31-May-2016

● INDICATIONS AND DOSE

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone) **Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone)**

► BY MOUTH

► Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature

- **CAUTIONS** Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) · history of cardiovascular disease

CAUTIONS, FURTHER INFORMATION

- Cardiovascular disease Correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure,

uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).

- **INTERACTIONS** → Appendix 1: abiraterone

● SIDE-EFFECTS

- **Common or very common** Angina pectoris · arrhythmias · bone fracture · diarrhoea · dyspepsia · haematuria · heart failure · hepatic disorders · hypertension · hypertriglyceridaemia · hypokalaemia · left ventricular dysfunction · osteoporosis · peripheral oedema · rash · sepsis · urinary tract infection
- **Uncommon** Adrenal insufficiency · myopathy
- **Rare or very rare** Alveolitis allergic
- **Frequency not known** Myocardial infarction · QT interval prolongation

- **CONCEPTION AND CONTRACEPTION** Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment and only if benefit clearly outweighs risk. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

- Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.
- Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012) NICE TA259
Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:

- their disease has progressed on or after one docetaxel-containing chemotherapy regimen, **and**
- the manufacturer provides abiraterone with the discount agreed in the patient access scheme.

Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA259

- Abiraterone for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (April 2016) NICE TA387
Abiraterone, in combination with prednisone or prednisolone, is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have mild or no symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated. In addition, the manufacturer is required to rebate the cost of abiraterone from the 11th month until the end of treatment for patients who remain on treatment for more than 10 months.

www.nice.org.uk/TA387

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2012) that abiraterone (*Zytiga*®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

OESTROGENS

Diethylstilbestrol (Stilboestrol)

• INDICATIONS AND DOSE

Breast cancer in postmenopausal women

- ▶ **BY MOUTH**
- ▶ **Adult:** 10–20 mg daily

Prostate cancer

- ▶ **BY MOUTH**
- ▶ **Adult:** 1–3 mg daily

- **CAUTIONS** Cardiovascular disease

- **SIDE-EFFECTS** Bone pain (in breast cancer) · breast abnormalities · cervical mucus increased · cholelithiasis · contact lens intolerance · depression · erectile dysfunction · erythema nodosum · feminisation · fluid retention · gynaecomastia · headaches · hypercalcaemia (in breast cancer) · hypertension · increased risk of thrombosis · jaundice cholestatic · mood altered · nausea · neoplasms · skin reactions · sodium retention · testicular atrophy · uterine disorders · vomiting · weight changes · withdrawal bleed

- **PREGNANCY** In first trimester, high doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in female offspring. Increased risk of hypospadias in male offspring.

- **HEPATIC IMPAIRMENT** Avoid. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ **Diethylstilbestrol (Non-proprietary)**

Diethylstilbestrol 1 mg Diethylstilbestrol 1mg tablets | 28 tablet PoM £123.00 DT = £120.34

Diethylstilbestrol 5 mg Diethylstilbestrol 5mg tablets | 28 tablet PoM £185.00–£208.00 DT = £208.00

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

Degarelix

• INDICATIONS AND DOSE

Advanced hormone-dependent prostate cancer

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ **Adult:** Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region

- **CAUTIONS** Diabetes · susceptibility to QT-interval prolongation

• SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · chills · diarrhoea · dizziness · fatigue · fever · gynaecomastia · headache · hot flush · influenza like illness · insomnia · musculoskeletal discomfort · musculoskeletal pain · nausea · sexual dysfunction · skin reactions · sweat changes · testicular disorders · weight changes
- ▶ **Uncommon** Alopecia · appetite decreased · arrhythmias · bone disorders · breast pain · cognitive impairment · constipation · depression · diabetes mellitus · dry mouth · dyspnoea · gastrointestinal discomfort · genital discomfort · hyperglycaemia · hypertension · hypotension · joint disorders · malaise · muscle spasms · muscle weakness ·

numbness · palpitations · pelvic pain · peripheral oedema · QT interval prolongation · renal impairment · urinary disorders · vision blurred · vomiting

- ▶ **Rare or very rare** Febrile neutropenia · heart failure · myocardial infarction

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS** Monitor bone density.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Degarelix for treating advanced hormone-dependent prostate cancer (August 2016)** NICE TA404

Degarelix is recommended as an option for treating advanced hormone-dependent prostate cancer in patients with spinal metastases, only if at least the same discounted drug cost which was available to the NHS in June 2016 is achieved by the commissioner.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA404

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Firmagon** (Ferring Pharmaceuticals Ltd)

Degarelix (as Degarelix acetate) 80 mg Firmagon 80mg powder and solvent for solution for injection vials | 1 vial [PoM] £129.37 DT = £129.37

Degarelix (as Degarelix acetate) 120 mg Firmagon 120mg powder and solvent for solution for injection vials | 2 vial [PoM] £260.00 DT = £260.00

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES

Somatostatin analogues, malignant disease

Overview

Lanreotide below, octreotide p. 924 and pasireotide p. 925 are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Lanreotide (*Somatuline Autogel*®) is also licensed for the treatment of unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but no hindgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care and in stopping variceal bleeding [unlicensed indication]—see also vasopressin p. 655 and terlipressin acetate p. 90. Pasireotide is licensed for the treatment of Cushing's disease when surgery has failed or is inappropriate.

Somatostatin analogues

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses) · may cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Adrenal insufficiency · alopecia · appetite decreased · arrhythmias · arthralgia · asthenia · biliary dilatation · cholelithiasis (following long term use) · constipation · diabetes mellitus · diarrhoea · dizziness · dyspnoea · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · glucose tolerance impaired (following long term use) · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia (long term use) · hypoglycaemia · hypotension · hypothyroidism · lethargy · musculoskeletal pain · myalgia · nausea · QT interval prolongation · skin reactions · thyroid disorder · vomiting · weight decreased
 - ▶ **Uncommon** Anaemia · dehydration · hot flush · insomnia
 - ▶ **Frequency not known** Pancreatitis · pancreatitis acute (after administration)
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of tumour expansion (e.g. visual field defects).
 - ▶ Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Injection sites should be rotated.

▶ above

Lanreotide

● INDICATIONS AND DOSE

SOMATULINE AUTOGEL®

Acromegaly (if somatostatin analogue not given previously)

- ▶ **BY DEEP SUBCUTANEOUS INJECTION**
- ▶ **Adult:** Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region

Neuroendocrine (particularly carcinoid) tumours

- ▶ **BY DEEP SUBCUTANEOUS INJECTION**
- ▶ **Adult:** Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded

- ▶ **BY DEEP SUBCUTANEOUS INJECTION**
- ▶ **Adult:** 120 mg every 28 days

SOMATULINE LA®

Acromegaly and neuroendocrine (particularly carcinoid) tumours

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ **Adult:** Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response

Thyroid tumours

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ **Adult:** Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response

- **CAUTIONS** Cardiac disorders (including bradycardia) - patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment
- **INTERACTIONS** → Appendix 1: lanreotide
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor for hypothyroidism when clinically indicated.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Somatuline Autogel (Ipssen Ltd)

Lanreotide (as Lanreotide acetate) 120 mg per 1 ml Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £551.00 DT = £551.00

Lanreotide (as Lanreotide acetate) 180 mg per 1 ml Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £736.00 DT = £736.00

Lanreotide (as Lanreotide acetate) 240 mg per 1 ml Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £937.00 DT = £937.00

Powder and solvent for suspension for injection

► Somatuline LA (Ipssen Ltd)

Lanreotide (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £323.00

P 923

17-01-2016

Ocreotide

● INDICATIONS AND DOSE

Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response; increased to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect, if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring and after dilution)

Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective

► BY SUBCUTANEOUS INJECTION

- Adult: 100–200 micrograms 3 times a day, discontinue if no improvement within 3 months

Prevention of complications following pancreatic surgery

► BY SUBCUTANEOUS INJECTION

- Adult: (consult product literature)

Test dose before use of depot preparation

► BY SUBCUTANEOUS INJECTION

- Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous ocreotide not previously given

Acromegaly | Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous ocreotide

► BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- Adult: Initially 20 mg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for *acromegaly*, start depot 1 day after

the last dose of subcutaneous ocreotide, for *neuroendocrine tumours*, continue subcutaneous ocreotide for 2 weeks after first dose of depot ocreotide

Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded

- BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- Adult: 30 mg every 4 weeks

Reduce intestinal secretions in palliative care | Reduce vomiting due to bowel obstruction in palliative care

► BY CONTINUOUS SUBCUTANEOUS INFUSION

- Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required

- **INTERACTIONS** → Appendix 1: ocreotide

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION Administering non-depot injections of ocreotide between meals and at bedtime may reduce gastrointestinal side-effects.

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal studies*.

● HEPATIC IMPAIRMENT

Dose adjustments Adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis.

● MONITORING REQUIREMENTS

- Monitor thyroid function on long-term therapy.
- Monitor liver function.
- With intravenous use ECG monitoring required with intravenous administration.

● **TREATMENT CESSATION** Avoid abrupt withdrawal of short-acting subcutaneous ocreotide (associated with biliary colic and pancreatitis).

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection* or *intravenous infusion*, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of ocreotide in palliative care, see www.palliativedrugs.com/formulary/en/ocreotide.html.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Ocreotide (Non-proprietary)

Ocreotide (as Ocreotide acetate) 50 microgram per

1 ml Ocreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £18.85 DT = £18.85

 Ocreotide 500micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £154.22-£169.00 DT = £154.22

► **Sandostatatin** (Novartis Pharmaceuticals UK Ltd)

Ocreotide (as Ocreotide acetate) 50 microgram per 1 ml Sandostatatin 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.87
Ocreotide (as Ocreotide acetate) 100 microgram per 1 ml Sandostatatin 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £27.97 DT = £27.97
Ocreotide (as Ocreotide acetate) 500 microgram per 1 ml Sandostatatin 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £135.47 DT = £135.47

Powder and solvent for suspension for injection

► **Sandostatatin LAR** (Novartis Pharmaceuticals UK Ltd)

Ocreotide (as Ocreotide acetate) 10 mg Sandostatatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial [PoM] £549.71 DT = £549.71
Ocreotide (as Ocreotide acetate) 20 mg Sandostatatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial [PoM] £799.33 DT = £799.33
Ocreotide (as Ocreotide acetate) 30 mg Sandostatatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £998.41 DT = £998.41

F 923

02-Mar-2018

Pasireotide

● INDICATIONS AND DOSE

Cushing's disease [when surgery has failed or is inappropriate]

► **BY SUBCUTANEOUS INJECTION**

Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to 900 micrograms twice daily, consider discontinuation if no response after 2 months of treatment, for dose adjustment due to side-effects—consult product literature

► **BY DEEP INTRAMUSCULAR INJECTION**

Adult: Initially 10 mg every 4 weeks, increased if necessary up to 40 mg every 4 weeks, dose may be titrated every 2–4 months based on response and tolerability, consider discontinuation if no clinical benefit observed, for dose adjustment due to side-effects—consult product literature

Acromegaly [when surgery has failed or is inappropriate, and control with another somatostatin analogue is inadequate]

► **BY DEEP INTRAMUSCULAR INJECTION**

Adult: Initially 40 mg every 4 weeks, increased if necessary up to 60 mg every 4 weeks, dose may be increased if levels of growth hormone and/or insulin-like growth factor-1 are not fully controlled after 3 months of initial dosing, for dose adjustment due to side-effects—consult product literature

● **CAUTIONS** Cardiac disorders (including bradycardia) - susceptibility to QT-interval prolongation (including electrolyte disturbances)

● **INTERACTIONS** → Appendix 1: pasireotide

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

Dose adjustments ► With subcutaneous use for Cushing's disease Manufacturer advises reduce initial dose to 300 micrograms twice daily (max. dose 600 micrograms twice daily) in moderate impairment.

► With intramuscular use for Cushing's disease Manufacturer advises max. dose 20 mg in moderate impairment.

► When used for Acromegaly Manufacturer advises reduce initial dose to 20 mg (max. dose 40 mg) in moderate impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—increased plasma-pasireotide exposure.

● MONITORING REQUIREMENTS

► Manufacturer advises consider monitoring pituitary function before treatment initiation and periodically thereafter.

► With subcutaneous use Manufacturer advises monitor liver function before treatment initiation, after 1, 2, 4, 8, and 12 weeks of treatment, and thereafter as clinically indicated. Manufacturer advises assess glycaemic status before treatment initiation, weekly for the first 2–3 months of treatment, over the first 2–4 weeks after any dose increase, periodically thereafter, and 3 months after treatment is complete—if glycaemic control is poor, diabetes management and monitoring should be intensified before and during treatment. Manufacturer advises monitor ECG and electrolytes before treatment initiation, after one week of treatment, and periodically thereafter.

► With intramuscular use Manufacturer advises monitor liver function before treatment initiation, after the first 2–3 weeks of treatment, then monthly for 3 months, and thereafter as clinically indicated. Manufacturer advises assess glycaemic status before treatment initiation, weekly for the first 3 months of treatment, over the first 4–6 weeks after any dose increase, periodically thereafter, and 3 months after treatment is complete—if glycaemic control is poor, diabetes management and monitoring should be intensified before and during treatment. Manufacturer advises monitor ECG and electrolytes before treatment initiation, after 3 weeks of treatment, and periodically thereafter.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations

► When used for Cushing's disease There are no clinical data available on switching between formulations; if a switch is required, manufacturer advises to maintain an interval of at least 28 days between the last intramuscular injection and the first subcutaneous injection—for further information, consult product literature.

● **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the signs and symptoms of hypocortisolism (including weakness, fatigue, anorexia, nausea, vomiting, hypotension, hyperkalaemia, hyponatraemia, hypoglycaemia).

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Signifor** (Novartis Pharmaceuticals UK Ltd)

Pasireotide (as Pasireotide diaspargate) 300 microgram per 1 ml Signifor 0.3mg/1ml solution for injection ampoules | 60 ampoule [PoM] £2,800.00

Pasireotide (as Pasireotide diaspargate) 600 microgram per 1 ml Signifor 0.6mg/1ml solution for injection ampoules | 60 ampoule [PoM] £3,240.00

£2,300.00

PROGESTOGENS

Megestrol acetate

● INDICATIONS AND DOSE

Treatment of breast cancer

- ▶ BY MOUTH
- ▶ Adult: 160 mg once daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis · history during pregnancy of severe pruritus · history of liver tumours · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Adrenal insufficiency · alopecia · appetite increased · asthenia · carpal tunnel syndrome · constipation · Cushing's syndrome · diabetes mellitus · diarrhoea · dyspnoea · embolism and thrombosis · erectile dysfunction · flatulence · glucose tolerance impaired · heart failure · hot flush · hypercalcaemia · hyperglycaemia · hypertension · lethargy · menorrhagia · mood altered · nausea · oedema · pain · skin reactions · tumour flare · urinary frequency increased · vomiting · weight increased
- **PREGNANCY** Avoid. Reversible feminisation of male fetuses reported in *animal* studies. Risk of hypospadias in male fetuses and masculinisation of female fetuses.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension
 - Oral suspension**
 - ▶ **Megestrol acetate (Non-proprietary)**
Megestrol acetate 40 mg per 1 ml Megestrol 200mg/5ml oral suspension | 240 ml [PoM] 
- Tablet**
 - ▶ **Megestrol acetate (Non-proprietary)**
Megestrol acetate 40 mg Megestrol 40mg tablets | 100 tablet 
 - ▶ **Megace** (Swedish Orphan Biovitrum Ltd)
Megestrol acetate 160 mg Megace 160mg tablets | 30 tablet [PoM]
£19.52 DT = £19.52

4.1 Hormone responsive breast cancer

ANTINEOPLASTIC DRUGS > ANTI-OESTROGENS

Fulvestrant

20-Mar-2018

● INDICATIONS AND DOSE

Oestrogen-receptor-positive breast cancer

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every month, to be administered into the buttock

- **INTERACTIONS** → Appendix 1: fulvestrant
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · arthralgia · asthenia · diarrhoea · headache · hot flush · hypersensitivity · increased risk of infection · nausea · pain · rash · vaginal haemorrhage · venous thromboembolism · vomiting
 - ▶ **Uncommon** Hepatic disorders · vaginal discharge
 - ▶ **Frequency not known** Myalgia
- **PREGNANCY** Manufacturer advises avoid—increased incidence of fetal abnormalities and death in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.
- **DIRECTIONS FOR ADMINISTRATION** 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - NICE decisions**
 - ▶ **Fulvestrant for untreated locally advanced or metastatic oestrogen-receptor positive breast cancer (January 2018)**
NICE TA503
Fulvestrant is **not** recommended, within its marketing authorisation, for treating locally advanced or metastatic oestrogen-receptor positive breast cancer in postmenopausal women who have not had endocrine therapy before.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta503

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Faslodex** (AstraZeneca UK Ltd)
Fulvestrant 50 mg per 1 ml Faslodex 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM]
£522.41

Tamoxifen

07-Sep-2017

- **DRUG ACTION** An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct in the treatment of female infertility.

● INDICATIONS AND DOSE

Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen

► BY MOUTH

Adult: 20 mg daily

Anovulatory infertility

► BY MOUTH

Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

Gynaecomastia [prevention in men undergoing long-term bicalutamide treatment, if radiotherapy unsuccessful]

► BY MOUTH

Adult: 20 mg once weekly

Breast cancer [chemoprevention in women at moderate-to-high risk]

► BY MOUTH

Adult: 20 mg daily for 5 years

- **UNLICENSED USE** [\[EvGr\]](#) Not licensed for prevention of gynaecomastia in men.
- Not licensed for chemoprevention of breast cancer. [\[E\]](#)
- **CONTRA-INDICATIONS** Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

- **CAUTIONS** Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: tamoxifen

● SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · cataract · cerebral ischaemia · constipation · diarrhoea · dizziness · embolism and thrombosis · fatigue · fluid retention · headache · hepatic disorders · hot flush · hypersensitivity · hypertriglyceridaemia · muscle complaints · nausea · neoplasms · retinopathy · sensation abnormal · skin reactions · taste altered · uterine disorders · vaginal haemorrhage · vomiting · vulvovaginal disorders
- **Uncommon** Hypercalcaemia · interstitial pneumonitis · leucopenia · pancreatitis · thrombocytopenia · vision disorders
- **Rare or very rare** Agranulocytosis · angioedema · corneal changes · cutaneous lupus erythematosus · cutaneous vasculitis · cystic ovarian swelling · nerve disorders · neutropenia · radiation recall reaction · Stevens-Johnson syndrome · tumour flare
- **Frequency not known** Amenorrhoea

SIDE-EFFECTS, FURTHER INFORMATION

Endometrial changes Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

Risk of thromboembolism Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment and initiating anticoagulant measures).

- **CONCEPTION AND CONTRACEPTION** Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).
- **PREGNANCY** Avoid—possible effects on fetal development.
- **BREAST FEEDING** Suppresses lactation. Avoid unless potential benefit outweighs risk.
- **PATIENT AND CARER ADVICE**
Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly.
Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

► Tamoxifen (Non-proprietary)

Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml Tamoxifen 10mg/5ml oral solution sugar free sugar-free | 150 ml [\[PoM\]](#) £29.61 DT = £29.61

Oral suspension

► Tamoxifen (Non-proprietary)

Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml Tamoxifen 10mg/5ml oral suspension | 150 ml [\[PoM\]](#) [\[S\]](#)

Tablet

► Tamoxifen (Non-proprietary)

Tamoxifen (as Tamoxifen citrate) 10 mg Tamoxifen 10mg tablets | 30 tablet [\[PoM\]](#) £47.21 DT = £40.71

Tamoxifen (as Tamoxifen citrate) 20 mg Tamoxifen 20mg tablets | 30 tablet [\[PoM\]](#) £13.00 DT = £2.48

Tamoxifen (as Tamoxifen citrate) 40 mg Tamoxifen 40mg tablets | 30 tablet [\[PoM\]](#) £54.75 DT = £48.72

Toremifene

● INDICATIONS AND DOSE

Hormone-dependent metastatic breast cancer in postmenopausal women

► BY MOUTH

Adult: 60 mg daily

- **CONTRA-INDICATIONS** Bradycardia · electrolyte disturbances (particularly uncorrected hypokalaemia) · endometrial hyperplasia · heart failure with reduced left-ventricular ejection fraction · history of arrhythmias · QT prolongation
- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · history of severe thromboembolic disease
- **INTERACTIONS** → Appendix 1: toremifene
- **SIDE-EFFECTS**
 - **Common or very common** Dizziness · fatigue · hot flush · hyperhidrosis · nausea · oedema · skin reactions · vaginal discharge · vomiting
 - **Uncommon** Appetite decreased · constipation · depression · dyspnoea · headache · insomnia · thromboembolism · uterine disorders · weight increased
 - **Rare or very rare** Alopecia · corneal opacity · endometrial cancer · hepatic disorders · uterine haemorrhage · vertigo
 - **Frequency not known** Anaemia · leucopenia · thrombocytopenia
- **SIDE-EFFECTS, FURTHER INFORMATION** Increased endometrial changes, including hyperplasia, polyps and cancer reported.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Elimination decreased in hepatic impairment—avoid if severe.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Fareston** (Orion Pharma (UK) Ltd)
Toremifene (as Toremifene citrate) 60 mg Fareston 60mg tablets | 30 tablet [PoM] £29.08

HORMONE ANTAGONISTS AND RELATED AGENTS > AROMATASE INHIBITORS

Anastrozole

INDICATIONS AND DOSE

Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women |

Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

- BY MOUTH
- Adult: 1 mg daily

Breast cancer [chemoprevention in postmenopausal women at moderate to high risk] (initiated under specialist supervision)

- BY MOUTH
- Adult: 1 mg daily for 5 years

- **UNLICENSED USE** [EvGr] Not licensed for chemoprevention of breast cancer. (€)

- **CONTRA-INDICATIONS** Not for premenopausal women

- **CAUTIONS** Susceptibility to osteoporosis

SIDE-EFFECTS

- **Common or very common** Alopecia · appetite decreased · arthritis · asthenia · bone pain · carpal tunnel syndrome · diarrhoea · drowsiness · headache · hot flush · hypercholesterolaemia · hypersensitivity · joint disorders · myalgia · nausea · osteoporosis · sensation abnormal · skin reactions · taste altered · vaginal haemorrhage · vomiting · vulvovaginal dryness
- **Uncommon** Hepatitis · hypercalcaemia · trigger finger
- **Rare or very rare** Angioedema · Stevens-Johnson syndrome · vasculitis
- **Frequency not known** Mood altered

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 20 mL/minute.

- **PRE-TREATMENT SCREENING** Laboratory test for menopause if doubt.

MONITORING REQUIREMENTS

- Osteoporosis Assess bone mineral density before treatment and at regular intervals.

PATIENT AND CARER ADVICE

Driving and skilled tasks Asthenia and drowsiness may initially affect ability to drive or operate machinery.

NATIONAL FUNDING/ACCESS DECISIONS

ARIMIDEX®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2005 and October 2006) that anastrozole (*Arimidex*®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Anastrozole (Non-proprietary)

Anastrozole 1 mg Anastrozole 1mg tablets | 28 tablet [PoM] £65.13 DT = £6.34

► Arimidex (AstraZeneca UK Ltd)

Anastrozole 1 mg Arimidex 1mg tablets | 28 tablet [PoM] £68.56 DT = £6.34

Exemestane

INDICATIONS AND DOSE

Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

- BY MOUTH
- Adult: 25 mg daily

- **CONTRA-INDICATIONS** Not indicated for premenopausal women

- **INTERACTIONS** → Appendix 1: exemestane

SIDE-EFFECTS

- **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · bone fracture · carpal tunnel syndrome · constipation · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · hot flush · hyperhidrosis · insomnia · leucopenia · nausea · osteoporosis · pain · paraesthesia · peripheral oedema · skin reactions · thrombocytopenia · vomiting
- **Rare or very rare** Acute generalised exanthematous pustulosis (AGEP) · drowsiness · hepatic disorders

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2005) that exemestane (*Aromasin*®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Exemestane 25 mg Exemestane 25mg tablets | 30 tablet [PoM] £88.80 DT = £17.25

► Aromasin (Pfizer Ltd)

Exemestane 25 mg Aromasin 25mg tablets | 30 tablet [PoM] £88.80 DT = £17.25

Letrozole

• INDICATIONS AND DOSE

First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer | Adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women | Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom other anti-oestrogen therapy has failed | Extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years | Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated

► BY MOUTH

Adult: 2.5 mg daily

• **CONTRA-INDICATIONS** Not indicated for premenopausal women

• **CAUTIONS** Susceptibility to osteoporosis

• SIDE-EFFECTS

► **Common or very common** Alopecia · appetite abnormal · arthralgia · asthenia · bone fracture · bone pain · constipation · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · hot flush · hypercholesterolaemia · hyperhidrosis · hypertension · malaise · myalgia · nausea · oedema · osteoporosis · skin reactions · vaginal haemorrhage · vomiting · weight changes

► **Uncommon** Anxiety · arthritis · breast pain · cancer pain · carpal tunnel syndrome · cataract · cerebrovascular insufficiency · cough · drowsiness · dry mouth · dysaesthesia · dyspnoea · embolism and thrombosis · eye irritation · fever · insomnia · irritability · ischaemic heart disease · leucopenia · memory loss · mucosal dryness · myocardial infarction · palpitations · stomatitis · tachycardia · taste altered · thirst · urinary frequency increased · urinary tract infection · vision blurred · vulvovaginal disorders

► **Frequency not known** Angioedema · hepatitis · toxic epidermal necrolysis · trigger finger

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women).

• **PREGNANCY** Avoid (isolated cases of birth defects reported).

• **BREAST FEEDING** Manufacturer advises avoid.

• **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

• **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 10 mL/minute.

• MONITORING REQUIREMENTS

► Osteoporosis Assess bone mineral density before treatment and at regular intervals.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Letrozole (Non-proprietary)

Letrozole 2.5 mg Letrozole 2.5mg tablets | 14 tablet **[PoM]** £49.90
DT = £0.79 | 28 tablet **[PoM]** £1.58-£73.24

► Femara (Novartis Pharmaceuticals UK Ltd)

Letrozole 2.5 mg Femara 2.5mg tablets | 30 tablet **[PoM]** £90.92

5 Immunotherapy responsive malignancy

ANTINEOPLASTIC DRUGS

Talimogene laherparepvec

10-Feb-2017

• **DRUG ACTION** Talimogene laherparepvec is an oncolytic immunotherapy derived from herpes simplex virus type-1 which causes tumour lysis and the release of tumour-derived antigens.

• INDICATIONS AND DOSE

Unresectable metastatic melanoma with no bone, brain, or visceral disease

► BY INTRALESIONAL INJECTION

Adult: (consult product literature)

• **CONTRA-INDICATIONS** Severely immunocompromised patients

CONTRA-INDICATIONS, FURTHER INFORMATION

Manufacturer advises avoid in patients who are severely immunocompromised, for example, those with severe congenital or acquired cellular and/or humoral immune deficiency—may be at increased risk of disseminated herpetic infection.

• **CAUTIONS** Administration of antivirals (may interfere with effectiveness of *Imlytic*®) · autoimmune disease · immunocompromised patients · multiple myeloma (risk of plasmacytoma at injection site)

CAUTIONS, FURTHER INFORMATION

► Immunocompromised patients Manufacturer advises caution in patients who are immunocompromised, for example, those with HIV/AIDS, leukaemia, lymphoma, common variable immunodeficiency, or in those who require chronic high-dose steroids or other immunosuppressive agents—risk of disseminated herpetic infection.

• SIDE-EFFECTS

► **Common or very common** Anaemia · anxiety · arthralgia · chills · confusion · constipation · cough · deep vein thrombosis · dehydration · depression · diarrhoea · dizziness · dyspnoea exertional · ear pain · fatigue · fever · flushing · gastrointestinal discomfort · headache · hypertension · immune-mediated events · increased risk of infection · influenza like illness · insomnia · malaise · myalgia · nausea · neoplasm complications · oropharyngeal pain · pain · peripheral oedema · secretion discharge · skin reactions · tachycardia · vomiting · weight decreased · wound complications

► **Uncommon** Glomerulonephritis · injection site plasmacytoma · post procedural infection · respiratory disorders · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Necrosis or ulceration of tumour tissue may occur, and impaired healing at the injection site has been reported.

Manufacturer advises careful wound care and infection precautions; if persistent infection or delayed healing develops, the risks and benefits of continuing treatment should be considered.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of latex condoms.

• **PREGNANCY** Manufacturer advises avoid—no information available.

• **BREAST FEEDING** Manufacturer advises avoid—no information available.

• **DIRECTIONS FOR ADMINISTRATION** Consult product literature for information on injection technique.

- **HANDLING AND STORAGE** Manufacturer advises caution in handling—risk of accidental exposure; avoid preparation or administration if immunocompromised or pregnant. For further information, see the *Physician's Brochure* provided by the manufacturer. Store and transport frozen at -90°C to -70°C—consult product literature for further information on thawing and storage after thawing.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and carers should be informed about the risks of treatment, advised to avoid touching or scratching injection sites, and to keep these sites covered with occlusive dressings. Close contacts should avoid direct contact with injected lesions or body fluids of treated patients during treatment and for up to 30 days after last treatment—if exposed, clean the affected area and seek medical attention if symptoms of herpetic infection develop; close contacts who are immunocompromised or pregnant should not be exposed to potentially contaminated materials. For further information, see the *Information for Patients and Close Contacts* provided by the manufacturer.

Provide patient alert card—record batch number for each administration of *Imlygic*®.

Driving and skilled tasks Manufacturer advises that patients and their carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and confusion.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Talimogene laherparepvec for treating unresectable metastatic melanoma (September 2016)**
Talimogene laherparepvec is recommended as an option for treating unresectable, regionally or distantly metastatic (Stage IIIB, IIIC or IVM1a) melanoma that has not spread to bone, brain or other internal organs, only if:
 - treatment with systemically administered immunotherapies is not suitable **and**,
 - the manufacturer provides talimogene laherparepvec with the discount agreed in the patient access scheme.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

IMMUNOSTIMULANTS > INTERFERONS

Interferon alfa

- **DRUG ACTION** Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

● INDICATIONS AND DOSE

INTRONA® PEN

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: (consult local protocol)

INTRONA® VIALS

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

ROFERON-A®

Chronic myelogenous leukaemia | Hairy cell leukaemia | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | AIDS-related Kaposi's sarcoma | Advanced renal cell carcinoma | Progressive cutaneous T-cell lymphoma | Follicular non-Hodgkin's lymphoma

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: (consult local protocol)

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications consult product literature and local treatment protocol.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION For cautions consult product literature and local treatment protocol.

● INTERACTIONS → Appendix 1: interferons

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia • anaemia • anxiety • appetite abnormal • arrhythmias • arthralgia • arthritis • asthenia • atrioventricular block • breast pain • chest pain • chills • concentration impaired • confusion • constipation • cough • cyanosis • decreased leucocytes • dehydration • depression • diarrhoea • dizziness • drowsiness • dry mouth • dyspnoea • electrolyte imbalance • eye disorders • eye inflammation • eye pain • fever • flushing • gastrointestinal discomfort • haemorrhage • headaches • hearing impairment • hepatic disorders • hyperhidrosis • hypertension • hyperthyroidism • hyperuricaemia • hypothyroidism • increased risk of infection • influenza like illness • lymphadenopathy • malaise • menstrual cycle irregularities • mood altered • muscle complaints • nasal complaints • nausea • oedema • oral disorders • pain • palpitations • respiratory disorders • sensation abnormal • sexual dysfunction • skin reactions • sleep disorders • taste altered • thirst • thrombocytopenia • tremor • urinary disorders • vaginal disorder • vertigo • vision disorders • vomiting • weight decreased
- ▶ **Uncommon** Behaviour abnormal • hypotension • memory loss • nerve disorders • pericarditis • proteinuria • psychiatric disorders
- ▶ **Rare or very rare** Agranulocytosis • angioedema • aplastic anaemia • autoimmune disorder • cardiac arrest •

cardiomyopathy · central nervous system haemorrhage · cerebrovascular insufficiency · coma (more common with high doses in the elderly) · congestive heart failure · consciousness impaired · diabetes mellitus · embolism and thrombosis · encephalopathy · gastrointestinal disorders · haemolytic anaemia · hallucination · hyperglycaemia · hyperlipidaemia · hypertriglyceridaemia (sometimes severe) · mucosal dryness · myocardial infarction · myocardial ischaemia · myopathy · nephrotic syndrome · pancreatitis · peripheral ischaemia · psychosis · pulmonary oedema · renal impairment · retinopathy · sarcoidosis · seizure (more common at high doses) · sepsis · severe cutaneous adverse reactions (SCARs) · suicidal tendencies; systemic lupus erythematosus (SLE) · thyroid disorder · ulcerative colitis · vasculitis

- ▶ **Frequency not known** Hepatitis B reactivation · neutropenia · pericardial effusion · pulmonary arterial hypertension · pure red cell aplasia · transplant rejection

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

● **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

● **BREAST FEEDING** Unlikely to be harmful.

● **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. **Monitoring** Close monitoring required in mild to moderate hepatic impairment.

● **RENAL IMPAIRMENT** Avoid in severe renal impairment. **Monitoring** Close monitoring required in mild to moderate renal impairment.

● **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.

● DIRECTIONS FOR ADMINISTRATION

INTRONA® VIALS *Introna*® injection vials for subcutaneous injection or intravenous infusion.

ROFERON-A® *Roferon-A*® injection for subcutaneous injection.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200

Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

IMMUNOSTIMULANTS > INTERLEUKINS

Aldesleukin

- **DRUG ACTION** Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

● **INDICATIONS AND DOSE****Metastatic renal cell carcinoma (specialist use only)**

- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **UNLICENSED USE** Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.

● **CONTRA-INDICATIONS****CONTRA-INDICATIONS, FURTHER INFORMATION**

Consult product literature for information about aldesleukin contra-indications.

● **CAUTIONS**

CAUTIONS, FURTHER INFORMATION Consult product literature for information about aldesleukin cautions.

● **SIDE-EFFECTS**

- **Common or very common** Acidosis · alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · ascites · asthenia · cardiovascular disorders · chest pain · chills · coagulation disorders · confusion · conjunctivitis · constipation · cough · cyanosis · dehydration · depression · diarrhoea · dizziness · drowsiness · dyspepsia · dysphagia · dyspnoea · electrolyte imbalance · eosinophilia · fever · gastrointestinal disorders · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypertension · hyperthyroidism · hypotension · hypothermia · hypothyroidism · hypoxia · increased risk of infection · insomnia · irritability · ischaemic heart disease · leucopenia · malaise · mucositis · myalgia · nasal congestion · nausea · nerve disorders · oedema · oral disorders · pain · palpitations · paraesthesia · pulmonary oedema · renal impairment · respiratory disorders · sepsis · skin reactions · speech disorder · syncope · taste loss · thrombocytopenia · vascular disorders · vomiting · weight changes
- **Uncommon** Angioedema · cardiac arrest · cardiac inflammation · cardiomyopathy · coma · embolism and thrombosis · hypoglycaemia · muscle weakness · myopathy · neutropenia · pancreatitis · paralysis · pericardial disorders · seizure
- **Rare or very rare** Agranulocytosis · aplastic anaemia · cholecystitis · Crohn's disease aggravated · diabetes mellitus · haemolytic anaemia · Stevens-Johnson syndrome · ventricular dysfunction
- **Frequency not known** Immune complex RPGN · inflammatory arthritis · intracranial haemorrhage · leukoencephalopathy · myocardial infarction · oculo-bulbar myasthenia gravis · psychiatric disorder · stroke · thyroiditis · vasculitis cerebral
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.
- **PREGNANCY** Use only if potential benefit outweighs risk (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Aldesleukin is now rarely given by intravenous infusion because of an

increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

TICE strain Bacillus of Calmette-Guérin 12.5 mg OncoTICE 12.5mg powder for reconstitution for instillation vials | 1 vial [PoM] £71.61 (Hospital only)

Mifamurtide

● INDICATIONS AND DOSE

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients over 30 years of age at initial diagnosis.
- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease

- **INTERACTIONS** → Appendix 1: mifamurtide

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · cancer pain · chest discomfort · chills · confusion · constipation · cough · cyanosis · dehydration · depression · diarrhoea · dizziness · drowsiness · dysmenorrhoea · dyspnoea · feeling cold · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hepatic pain · hyperhidrosis · hypertension · hypokalaemia · hypotension · hypothermia · increased risk of infection · insomnia · laryngeal pain · leucopenia · malaise · mucositis · muscle complaints · musculoskeletal stiffness · nasal congestion · nausea · neutropenia · oedema · pain · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · tachycardia · thrombocytopenia · tremor · urinary disorders · vascular disorders · vertigo · vision blurred · vomiting · weight decreased

- **CONCEPTION AND CONTRACEPTION** Effective contraception required.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution—no information available.

- **RENAL IMPAIRMENT** Use with caution—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor renal function, hepatic function and clotting parameters.
- ▶ Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Mifamurtide for the treatment of osteosarcoma (October 2011)** NICE TA235
Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.
www.nice.org.uk/TA235

IMMUNOSUPPRESSANTS > THALIDOMIDE AND RELATED ANOLOGUES

Lenalidomide

12-Jul-2017

- **DRUG ACTION** Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties.

● INDICATIONS AND DOSE

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with dexamethasone until disease progression

- ▶ BY MOUTH
- ▶ Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with melphalan and prednisone followed by maintenance monotherapy

- ▶ BY MOUTH
- ▶ Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 9 cycles, for doses of melphalan and prednisone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma in patients who have received at least one prior therapy, given in combination with dexamethasone

- ▶ BY MOUTH
- ▶ Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Treatment of transfusion-dependent anaemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate

- ▶ BY MOUTH
- ▶ Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustments due to side-effects, consult product literature

- **CAUTIONS** High tumour burden—risk of tumour lysis syndrome · patients with risk factors for myocardial infarction

CAUTIONS, FURTHER INFORMATION

- ▶ **Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.
- ▶ **Second primary malignancy** Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- **INTERACTIONS** → Appendix 1: lenalidomide

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · appetite decreased · arthralgia · asthenia · atrial fibrillation · chills · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · fall · fever · gastrointestinal discomfort · haemorrhage · headache · heart failure · hyperglycaemia · hypertension · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness · insomnia · iron overload · lethargy · mood altered · muscle complaints · muscle weakness · myocardial infarction ·

nausea · neoplasms · neutropenia · night sweats · pain · pancytopenia · paraesthesia · peripheral neuropathy · peripheral oedema · renal failure · rhinorrhoea · sepsis · skin reactions · taste altered · thrombocytopenia · toothache · tumour flare · vertigo · vomiting · weight decreased

► **Uncommon** Angioedema

► **Rare or very rare** Severe cutaneous adverse reactions (SCARs) · tumour lysis syndrome

► **Frequency not known** Acquired haemophilia · gastrointestinal disorders · hepatic disorders · hypersensitivity · hypersensitivity vasculitis · interstitial pneumonitis · pancreatitis · reactivation of infections

SIDE-EFFECTS, FURTHER INFORMATION If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.

Discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected.

● **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with lenalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

● **PREGNANCY** **Important: teratogenic risk.** Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

● **BREAST FEEDING** Discontinue breast-feeding—no information available.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose in moderate to severe impairment—consult product literature.

● **MONITORING REQUIREMENTS**

► Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).

► Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).

► Monitor thyroid function.

► Monitor for signs and symptoms of peripheral neuropathy.

► Monitor visual ability regularly (risk of cataract).

► Hepatic disorders Liver function should be monitored particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

● **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

● **PATIENT AND CARER ADVICE**

Thromboembolism Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Conception and contraception Patient counselling is advised for lenalidomide capsules (pregnancy and contraception).

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (September 2014)** NICE TA322

Lenalidomide is recommended as an option, within its marketing authorisation, for treating transfusion-dependent anaemia caused by low or intermediate-1-risk myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality when other therapeutic options are insufficient or inadequate, with the following condition:

- the drug cost of lenalidomide (excluding any related costs) for people who remain on treatment for more than 26 cycles (each of 28 days; normally a period of 2 years) will be met by the company.

www.nice.org.uk/guidance/ta322

► **Lenalidomide for the treatment of multiple myeloma (updated April 2014)** NICE TA171

Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.

www.nice.org.uk/guidance/ta171

► **Ixazomib with lenalidomide and dexamethasone for treating relapsed or refractory multiple myeloma (February 2018)** NICE TA505

Ixazomib, with lenalidomide and dexamethasone, is recommended for use within the Cancer Drugs Fund as an option for treating multiple myeloma in adults only if:

- they have already had 2 or 3 lines of therapy, **and**
- the conditions in the managed access agreement for ixazomib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta505

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies.

The *Scottish Medicines Consortium* has advised (April 2014) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for treatment of multiple myeloma in adults to use at first relapse in those who have received prior therapy with bortezomib and for whom thalidomide has not been tolerated or is contra-indicated.

The *Scottish Medicines Consortium* has advised (December 2015) that lenalidomide is accepted for restricted use within NHS Scotland for patients with previously untreated multiple myeloma who are not eligible for transplant and when thalidomide-containing regimens are unsuitable.

Pomalidomide

02-Jun-2017

- **DRUG ACTION** Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity.

● INDICATIONS AND DOSE

Treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone)

▶ BY MOUTH

- ▶ **Adult:** 4 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises halve dose with concurrent use of potent inhibitors of CYP1A2 and ciprofloxacin.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B REACTIVATION

An EU wide review has concluded that pomalidomide can cause hepatitis B reactivation; the MHRA recommends to establish hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease · cardiac risk factors · hepatitis B infection · high tumour burden—risk of tumour lysis syndrome · interstitial lung disease—discontinue if suspected · peripheral neuropathy

CAUTIONS, FURTHER INFORMATION

- ▶ **Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors.
- ▶ **Second primary malignancy** Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.
- ▶ **Hepatitis B infection** The MHRA advises that those with a history of hepatitis B infection should be closely monitored for signs and symptoms of active infection throughout treatment; expert advice should be sought for patients who test positive for active infection.

- **INTERACTIONS** → Appendix 1: pomalidomide

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · angioedema · appetite decreased · atrial fibrillation · bone pain · confusion · constipation · cough · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · embolism and thrombosis · fatigue · fever · haemorrhage · heart failure · hyperuricaemia · increased risk of infection · interstitial lung disease · intracranial haemorrhage · leucopenia · level of consciousness decreased · muscle spasms · myocardial infarction · nausea · neutropenia · neutropenic sepsis · pancytopenia · pelvic pain · peripheral neuropathy · peripheral oedema · renal failure · skin reactions · thrombocytopenia · tremor · urinary retention · vertigo · vomiting

- ▶ **Uncommon** Hepatitis · hyperbilirubinaemia · neoplasms · stroke · tumour lysis syndrome

- ▶ **Frequency not known** Hepatitis B reactivation

- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with pomalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

- **PREGNANCY Important: teratogenic risk.**

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- ▶ Manufacturer advises monitor for arterial or venous thromboembolism.
- ▶ Manufacturer advises monitor for signs and symptoms of cardiac failure.
- ▶ Manufacturer advises monitor for acute onset or unexplained worsening of respiratory symptoms.
- ▶ Manufacturer advises monitor liver function for 6 months after initiation, then as clinically indicated.

- **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

- **PATIENT AND CARER ADVICE** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Conception and contraception Patient counselling is advised for pomalidomide capsules (pregnancy and contraception).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Pomalidomide for multiple myeloma previously treated with lenalidomide and bortezomib (January 2017)** NICE TA427
Pomalidomide, in combination with low-dose dexamethasone, is recommended as an option for treating multiple myeloma in adults at third or subsequent relapse (that is, after three previous treatments including both lenalidomide and bortezomib), only when the manufacturer provides pomalidomide with the discount agreed in the patient access scheme. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA427

Thalidomide

- **DRUG ACTION** Thalidomide has immunomodulatory and anti-inflammatory activity.

● INDICATIONS AND DOSE

First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone

► BY MOUTH

- Adult 18–75 years: 200 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime
- Adult 76 years and over: 100 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime

- **CAUTIONS** High tumour burden—risk of tumour lysis syndrome · patients aged 76 years and over—increased risk of serious side-effects

CAUTIONS, FURTHER INFORMATION

- **Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.
- **Second primary malignancy** Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.
- **Peripheral neuropathy** Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.
- **INTERACTIONS** → Appendix 1: thalidomide

● SIDE-EFFECTS

- **Common or very common** Anaemia · arrhythmias · asthenia · confusion · constipation · decreased leucocytes · depression · dizziness · drowsiness · dry mouth · dyspnoea · embolism and thrombosis · fever · heart failure · increased risk of infection · malaise · movement disorders · neutropenia · peripheral neuropathy · peripheral oedema · respiratory disorders · sensation abnormal · skin reactions · thrombocytopenia · tremor · vomiting
- **Frequency not known** Atrioventricular block · gastrointestinal disorders · gastrointestinal haemorrhage · hearing impairment · hypothyroidism · liver disorder · menstrual cycle irregularities · myocardial infarction · neoplasms · pancreatitis · pancytopenia · posterior reversible encephalopathy syndrome (PRES) · pulmonary hypertension · reactivation of infections · renal failure · seizure · sexual dysfunction · toxic epidermal necrolysis · tumour lysis syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Rash If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.

Peripheral neuropathy If symptoms suggestive of peripheral neuropathy develop (such as paraesthesia, abnormal coordination, or weakness) dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature.

- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

- **PREGNANCY Important: teratogenic risk.**

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

- Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- Monitor for arterial or venous thromboembolism.
- Monitor patients for signs and symptoms of peripheral neuropathy.
- Hepatic disorder Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

- **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

- **PATIENT AND CARER ADVICE** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patients and their carers should be advised to seek medical advice if symptoms of peripheral neuropathy such as paraesthesia, abnormal coordination, or weakness develop.

Conception and contraception Patient counselling advised for thalidomide capsules (pregnancy and contraception).

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)** NICE TA228
Thalidomide in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma in people for whom high-dose chemotherapy with stem cell transplantation is considered inappropriate.

ANTINEOPLASTIC DRUGS > PROTEASOME INHIBITORS

Bortezomib

14-Apr-2016

● **DRUG ACTION** Bortezomib is a proteasome inhibitor.

● INDICATIONS AND DOSE

Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone) | Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone) | Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide)

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Bortezomib injection is for **intravenous or subcutaneous administration** only. Inadvertent intrathecal administration with fatal outcome has been reported.

- **CONTRA-INDICATIONS** Acute diffuse infiltrative pulmonary disease · pericardial disease
- **CAUTIONS** Amyloidosis · cardiovascular disease · consider antiviral prophylaxis for herpes zoster infection · dehydration · diabetes (may affect blood glucose) · history of syncope · pulmonary disease (discontinue if interstitial lung disease develops) · risk factors for seizures · risk of neuropathy → consult product literature
- **INTERACTIONS** → Appendix 1: bortezomib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · anxiety · appetite abnormal · arrhythmias · asthenia · chills · constipation · cough · decreased leucocytes · diabetes mellitus · diarrhoea · dizziness · dysphagia · dyspnoea · electrolyte imbalance · encephalopathy · enzyme abnormality · eye inflammation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair disorder · headaches · hearing impairment · heart failure · hepatic disorders · hiccups · hyperbilirubinaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · ischaemic heart disease · lethargy · loss of consciousness · malaise · mood altered · muscle complaints · muscle weakness · nausea · nerve disorders · neuromuscular dysfunction · neutropenia · oedema · oral disorders · oropharyngeal complaints · pain · renal impairment · sensation abnormal · sepsis · skin reactions · sleep disorder · syncope · taste altered · thrombocytopenia · ventricular dysfunction · vertigo · vision disorders · vomiting · weight changes
 - ▶ **Uncommon** Altered smell sensation · angioedema · antibiotic associated colitis · arthritis · azotaemia · cardiac arrest · cardiomyopathy · cardiovascular disorder · cerebrovascular insufficiency · chest discomfort · circulation impaired · circulatory collapse · coagulation

disorders · concentration impaired · confusion · Cushing's syndrome · dry eye · dysphonia · ear discomfort · embolism and thrombosis · eye discomfort · eye disorders · failure to thrive · gait abnormal · gas exchange abnormal · genital pain · haemolytic anaemia · hallucination · hyperthyroidism · increased leucocytes · injury · irritable bowel syndrome · joint disorders · lymphadenopathy · memory loss · movement disorders · mucous membrane disorder · myopathy · neurotoxicity · palpitations · pancreatitis · pancytopenia · pericardial disorders · pericarditis · posterior reversible encephalopathy syndrome (PRES) (discontinue) · proteinuria · psychiatric disorders · psychotic disorder · pulmonary hypertension · pulmonary oedema · reflexes abnormal · respiratory disorders · rhinorrhoea · seizure · sensation of pressure · severe cutaneous adverse reactions (SCARs) · sexual dysfunction · shock · SIADH · skin mass · skin ulcers · speech disorder · sweat changes · temperature sensation altered · thirst change · tremor · tumour lysis syndrome · urinary disorders · urinary tract disorder · vascular disorders · vasculitis · vasodilation

- ▶ **Rare or very rare** Acidosis · acute coronary syndrome · alcohol intolerance · amyloidosis · apnoea · ascites · atrioventricular block · bladder irritation · blood disorders · bone disorder · bone fracture · brain oedema · breast disorder · cardiac valve disorder · cholelithiasis · CNS haemorrhage · cognitive disorder · coma · coronary artery insufficiency · delirium · drooling · ear disorder · erythromelalgia · fistula · gout · healing impaired · hypothyroidism · inflammation · lymphoedema · macrophage activation · mass · meningitis · metabolic disorder · multi organ failure · musculoskeletal and connective tissue infections and inflammations · nail disorder · neoplasm malignant · neoplasms · nervous system disorder · paralysis · paresis · pelvic pain · perforation · photosensitivity reaction · platelet abnormalities · prostatitis · radiation injury · seborrhoea · sudden death · suicidal ideation · testicular disorders · throat complaints · ulcer · vaginal ulceration · venous insufficiency · vitamin deficiencies

- ▶ **Frequency not known** Herpes zoster reactivation · JC virus infection · progressive multifocal leukoencephalopathy

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

- **PREGNANCY** Toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Dose adjustments Reduce dose in moderate to severe impairment—consult product literature.

- **RENAL IMPAIRMENT** No information available for creatinine clearance less than 20 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Monitor blood-glucose concentration in patients on oral antidiabetics.
- ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.
- ▶ Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Bortezomib for previously untreated mantle cell lymphoma (December 2015) NICE TA370
Bortezomib is recommended as an option for the treatment of previously untreated mantle cell lymphoma

in adults for whom haematopoietic stem cell transplantation is unsuitable.

www.nice.org.uk/TA370

► **Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014) NICE TA311**

Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

www.nice.org.uk/TA311

► **Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011) NICE TA228**

Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:

- high-dose chemotherapy with stem cell transplantation is considered inappropriate **and**
- the person is unable to tolerate or has contra-indications to thalidomide.

www.nice.org.uk/TA228

► **Bortezomib monotherapy for relapsed multiple myeloma (October 2007) NICE TA129**

Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) **and**
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

www.nice.org.uk/TA129

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium*, has advised (December 2013) that bortezomib (*Velcade*®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► **Velcade** (Janssen-Cilag Ltd)

Bortezomib 3.5 mg Velcade 3.5mg powder for solution for injection vials | 1 vial (PoM) £762.38 (Hospital only)

Carfilzomib

14-Sep-2017

- **DRUG ACTION** Carfilzomib is an irreversible selective proteasome inhibitor that disrupts tumour cell turnover and induces apoptosis.

● **INDICATIONS AND DOSE**

Treatment of multiple myeloma in patients who have received at least one prior therapy (in combination with dexamethasone, or with dexamethasone and lenalidomide) (specialist use only)

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

- **CAUTIONS** Elderly (over 75 years)—higher incidence of adverse effects · ensure adequate hydration · infusion-related reactions · recent history of myocardial infarction · risk of cardiac failure · risk of herpes zoster reactivation · uncontrolled angina · uncontrolled arrhythmias

CAUTIONS, FURTHER INFORMATION

- **Infusion-related reactions** Manufacturer advises premedication with dexamethasone to reduce incidence and severity of infusion-related reactions.
- **Risk of herpes zoster reactivation** Manufacturer advises consider antiviral prophylaxis for herpes zoster infection.
- **INTERACTIONS** → Appendix 1: carfilzomib
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · cataract · chest pain · chills · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · heart failure · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypocalcaemia · hypotension · increased risk of infection · infusion related reaction · insomnia · muscle complaints · muscle weakness · nausea · neutropenia · oropharyngeal pain · pain · palpitations · peripheral neuropathy · peripheral oedema · pulmonary hypertension · pulmonary oedema · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions · thrombocytopenia · tinnitus · toothache · vision blurred · vomiting
 - **Uncommon** Cardiac arrest · gastrointestinal perforation · haemolytic uraemic syndrome · hepatic disorders · intracranial haemorrhage · multi organ failure · myocardial infarction · myocardial ischaemia · pericardial effusion · pericarditis · stroke · tumour lysis syndrome
 - **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES) · thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 1 month after treatment in women of childbearing potential; efficacy of oral contraceptives may be reduced, and hormonal contraceptives associated with a risk of thrombosis should be avoided. Male patients should use effective contraception during and for 3 months after treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 2 days after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment (increased incidence of adverse effects), and in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution—increased incidence of adverse effects.
- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: serum potassium concentration at least monthly; signs and symptoms of fluid overload, especially in those at risk of cardiac failure; renal function at treatment initiation and at least monthly during treatment—consider dose modification; hepatic function at treatment initiation and monthly during treatment—consider dose modification; platelet count and blood pressure. Also monitor for signs and symptoms of thrombotic microangiopathy.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and carers are warned to report signs and symptoms of thromboembolism (such as dyspnoea, chest pain, arm or leg swelling or pain).
- **Driving and skilled tasks** Patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness, hypotension and blurred vision.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Carfilzomib for previously treated multiple myeloma (July 2017)** NICE TA457
Carfilzomib in combination with dexamethasone is recommended as an option for treating multiple myeloma in adults, only if:
 - they have had only 1 previous therapy, which did not include bortezomib **and**
 - the company provides carfilzomib with the discount agreed in the patient access scheme.
 Patients currently receiving carfilzomib whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA457

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2017) that carfilzomib (*Kyprolis*®) in combination with lenalidomide and dexamethasone is **not** recommended for use within NHS Scotland for the treatment of patients with multiple myeloma who have received at least one prior therapy as the economic case was not demonstrated.

The *Scottish Medicines Consortium* has advised (August 2017) that carfilzomib (*Kyprolis*®) is accepted for use within NHS Scotland, in combination with dexamethasone alone for the treatment of patients with multiple myeloma who have received at least one prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ *Kyprolis* (Amgen Ltd) ▼

Carfilzomib 10 mg Kyprolis 10mg powder for solution for infusion vials | 1 vial [PoM] £176.00

Carfilzomib 30 mg Kyprolis 30mg powder for solution for infusion vials | 1 vial [PoM] £528.00

Carfilzomib 60 mg Kyprolis 60mg powder for solution for infusion vials | 1 vial [PoM] £1,056.00

Ixazomib

21-Mar-2018

- **DRUG ACTION** Ixazomib is a proteasome inhibitor.

● INDICATIONS AND DOSE

Multiple myeloma in patients who have received at least one prior therapy, in combination with lenalidomide and dexamethasone (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** 4 mg once weekly on days 1, 8, and 15 of a 28-day treatment cycle, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Risk of herpes zoster reactivation
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Herpes zoster reactivation Manufacturer advises consider concomitant antiviral prophylaxis to decrease the risk of herpes zoster reactivation.
- **INTERACTIONS** → Appendix 1: ixazomib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Back pain · constipation · diarrhoea · increased risk of infection · nausea · neutropenia · peripheral neuropathy (monitor for symptoms) · peripheral oedema · rash · thrombocytopenia · vomiting
 - ▶ **Frequency not known** Posterior reversible encephalopathy syndrome (PRES) (discontinue)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for at least 90 days after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Manufacturer advises reduce dose to 3 mg in moderate-to-severe impairment.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Manufacturer advises reduce dose to 3 mg in severe impairment (creatinine clearance less than 30 mL/min).
- **MONITORING REQUIREMENTS** Manufacturer advises to monitor hepatic function regularly and adjust dose accordingly—consult product literature.
- **PATIENT AND CARER ADVICE**
 - Missed doses** Manufacturer advises if less than 72 hours remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Ixazomib with lenalidomide and dexamethasone for treating relapsed or refractory multiple myeloma (February 2018)** NICE TA505
Ixazomib, with lenalidomide and dexamethasone, is recommended for use within the Cancer Drugs Fund as an option for treating multiple myeloma in adults only if:
 - they have already had 2 or 3 lines of therapy, **and**
 - the conditions in the managed access agreement for ixazomib are followed.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta505

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25

Ixazomib (as Ixazomib citrate) 2.3 mg Ninlaro 2.3mg capsules | 3 capsule [PoM] £6,336.00

Ixazomib (as Ixazomib citrate) 3 mg Ninlaro 3mg capsules | 3 capsule [PoM] £6,336.00

Ixazomib (as Ixazomib citrate) 4 mg Ninlaro 4mg capsules | 3 capsule [PoM] £6,336.00

ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS

Afatinib

- **DRUG ACTION** Afatinib is a protein kinase inhibitor.

● INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor

► BY MOUTH

- **Adult:** 40 mg once daily; increased if tolerated to up to 50 mg once daily, dose increase may be considered after 3 weeks at initial dose; consult product literature for details on dosing and dose adjustment due to side effects

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Cardiac risk factors · conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment · diarrhoea—proactive management recommended (consult product literature) · exposure to sun (protect skin from exposure to sun) · history of keratitis · new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded · severe dry eyes · signs and symptoms of keratitis—promptly refer to ophthalmologist for assessment · signs and symptoms of skin reaction—treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) · ulcerative keratitis · use of contact lenses · worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded

- **INTERACTIONS** → Appendix 1: afatinib

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · cystitis · dehydration · diarrhoea · dry eye · dyspepsia · epistaxis · eye inflammation · fever · hypokalaemia · muscle spasms · nausea · oral disorders · paronychia · renal impairment · rhinorrhoea · skin reactions · taste altered · vomiting · weight decreased
- **Uncommon** Interstitial lung disease · pancreatitis
- **Rare or very rare** Severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.

- **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe hepatic impairment.
Dose adjustments Monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken whole on an empty stomach. Food should not be

consumed for at least 3 hours before and at least 1 hour after each dose.

Giotrif® tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.

- **PATIENT AND CARER ADVICE** Patient counselling advised (administration).

Driving and skilled tasks Ocular adverse reactions may affect performance of skilled tasks e.g. driving.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014)** NICE TA310

Afatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:

- whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, **and**
- who have not previously had an EGFR-TK inhibitor, **and**
- if the manufacturer provides afatinib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA310

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Alectinib

17-Jul-2017

- **DRUG ACTION** Alectinib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib (specialist use only)

► BY MOUTH

- **Adult:** 600 mg twice daily, for dose adjustments due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **INTERACTIONS** → Appendix 1: alectinib

● SIDE-EFFECTS

- **Common or very common** Anaemia · arrhythmias · constipation · diarrhoea · eye disorders · eye inflammation · hyperbilirubinaemia · musculoskeletal pain · myalgia · nausea · oedema · photosensitivity reaction · skin reactions · vision disorders · vomiting
- **Uncommon** Drug-induced liver injury · respiratory disorders

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for at least 3 months after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor creatine phosphokinase every 2 weeks for the first month and as clinically indicated thereafter in patients reporting symptoms of myalgia.
 - ▶ Manufacturer advises monitor heart rate and blood pressure as clinically indicated.
 - ▶ Manufacturer advises monitor liver function at baseline then every 2 weeks during the first 3 months and periodically thereafter as clinically indicated.
 - ▶ Manufacturer advises monitor for symptoms of interstitial lung disease and pneumonitis.
- **PATIENT AND CARER ADVICE**

Photosensitivity Manufacturer advises patients should use a broad spectrum sunscreen and lip balm and be advised to avoid prolonged sun exposure during treatment, and for 7 days after discontinuation.

Myalgia Manufacturer advises patients should be advised to report any unexplained muscle pain, tenderness or weakness.

Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of symptomatic bradycardia and vision disorders.

Axitinib

- **DRUG ACTION** Axitinib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Recent active gastro-intestinal bleeding · untreated brain metastases
- **CAUTIONS** Hypertension (blood pressure should be well-controlled before starting and monitored during treatment)
- **INTERACTIONS** → Appendix 1: axitinib

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · constipation · cough · dehydration · diarrhoea · dizziness · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hyperbilirubinaemia · hypertension · hyperthyroidism · hypothyroidism · mucositis · myalgia · nausea · oral disorders · oropharyngeal pain · pain in extremity · polycythaemia · proteinuria · renal failure · skin reactions · taste altered · thrombocytopenia · tinnitus · vomiting · weight decreased
- ▶ **Uncommon** Leucopenia · neutropenia · posterior reversible encephalopathy syndrome (PRES)
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for up to 1 week after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.
Dose adjustments Reduce starting dose in moderate impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for thyroid dysfunction.
 - ▶ Monitor haemoglobin or haematocrit before and during treatment.
 - ▶ Monitor for symptoms of gastro-intestinal perforation.
 - ▶ Monitor for symptoms of fistula.
 - ▶ Monitor for proteinuria before and during treatment.
 - ▶ Monitor liver function before and during treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Axitinib for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015)**

NICE TA333

Axitinib is recommended as an option for treating adults with advanced renal cell carcinoma after failure of treatment with a first-line tyrosine kinase inhibitor or a cytokine, **only** if the company provides axitinib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA333

Bosutinib

17-May-2018

● INDICATIONS AND DOSE

Previously treated chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily, consult product literature for dose adjustment due to side-effects, or incomplete

haematologic response by week 8, or incomplete cytogenetic response by week 12

Newly-diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)

► BY MOUTH

- Adult: 400 mg once daily, consult product literature for dose adjustment due to side-effects, or failure to demonstrate breakpoint cluster region-Abelson (BCR-ABL) transcripts $\leq 10\%$ by month 3

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 865.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS An EU wide review has concluded that bosutinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease · hepatitis B infection · history of pancreatitis—withdraw treatment if lipase elevated and abdominal symptoms occur · history of QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · recent cardiac event—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · risk factors for QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · significant gastrointestinal disorder

CAUTIONS, FURTHER INFORMATION

- **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: bosutinib

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · appetite decreased · arthralgia · asthenia · chest discomfort · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · fever · gastritis · gastrointestinal discomfort · headache · hepatic disorders · hypersensitivity · hypertension · increased risk of infection · leucopenia · long QT syndrome · malaise · myalgia · nausea · neutropenia · oedema · pain · pericardial effusion · QT interval prolongation · renal impairment · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vomiting
- **Uncommon** Haemorrhage · pancreatitis acute · pericarditis · pulmonary hypertension · pulmonary oedema · tinnitus · tumour lysis syndrome
- **Frequency not known** Severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment in women.

- **PREGNANCY** Avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Caution—no information available.

● **RENAL IMPAIRMENT**

Dose adjustments For chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, manufacturer advises reduce dose to 400 mg in moderate impairment; reduce dose to 300 mg in severe

impairment; consult product literature for dose adjustment due to side-effects, or incomplete haematological, cytogenetic, or molecular response.

For newly-diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia, manufacturer advises reduce dose to 300 mg in moderate impairment; reduce dose to 200 mg in severe impairment; consult product literature for dose adjustment due to side-effects, or incomplete haematological, cytogenetic, or molecular response.

● **MONITORING REQUIREMENTS**

- Manufacturer advises monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases.
- Manufacturer advises monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated.
- Manufacturer advises monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema).

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Bosutinib for previously treated chronic myeloid leukaemia (August 2016)** NICE TA401

Bosutinib is recommended as a treatment option, within its marketing authorisation, for chronic, accelerated and blast phase Philadelphia-chromosome-positive CML in adults, when:

- they have previously been treated with 1 or more tyrosine kinase inhibitor, **and**
- imatinib, nilotinib and dasatinib are not appropriate, **and**
- the manufacturer provides bosutinib with the discount agreed in the patient access scheme.

Cabozantinib

29-Aug-2017

- **DRUG ACTION** Cabozantinib is an inhibitor of several protein kinases.

● **INDICATIONS AND DOSE**

Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma (initiated by a specialist)

► BY MOUTH USING CAPSULES

- **Adult:** 140 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

Advanced renal cell carcinoma following prior vascular endothelial growth factor (VEGF)-targeted therapy (initiated by a specialist)

► BY MOUTH USING TABLETS

- **Adult:** 60 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

continued →

DOSE EQUIVALENCE AND CONVERSION

- Cabozantinib tablets and capsules are not bioequivalent—consult product literature when switching formulations.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Reversible Posterior Leukoencephalopathy Syndrome
- **CAUTIONS** Hypertension—discontinue treatment if uncontrolled despite medical intervention · palmar-plantar erythrodysesthesia syndrome—consider treatment interruption if severe and restart at a lower dose when resolved to grade 1 · patients at increased risk of fistulas—consult product literature · patients at increased risk of gastro-intestinal perforation—consult product literature · patients at increased risk of intra-abdominal abscess—consult product literature · patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi)—discontinue if symptoms develop · patients at risk of thromboembolic events including myocardial infarction—discontinue if symptoms develop · risk of osteonecrosis of the jaw · susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)—monitor ECG and electrolytes periodically
- **CAUTIONS, FURTHER INFORMATION**
 - Elective surgery Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.
 - Risk of osteonecrosis of the jaw Discontinue treatment at least 28 days before elective invasive dental procedures—monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.
- **INTERACTIONS** → Appendix 1: cabozantinib
- **SIDE-EFFECTS**
 - **Common or very common** Abscess · alopecia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chills · cholelithiasis · confusion · constipation · dehydration · depression · diarrhoea · dizziness · dysphagia · dysphonia · dysuria · ear pain · electrolyte imbalance · embolism and thrombosis · fistula · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair changes · headache · healing impaired · hearing impairment · hyperbilirubinaemia · hypertension · hypoalbuminaemia · hypotension · hypothyroidism · increased risk of infection · lymphopenia · mucositis · muscle spasms · nausea · neutropenia · oedema · oral disorders · oropharyngeal pain · osteonecrosis of jaw · pain · pallor · pancreatitis · paraesthesia · peripheral coldness · peripheral neuropathy · proteinuria · skin reactions · taste altered · thrombocytopenia · tremor · vision blurred · vomiting · weight decreased
 - **Uncommon** Abnormal dreams · acute kidney injury · amenorrhoea · angina pectoris · ataxia · cataract · concentration impaired · conjunctivitis · cyst · delirium · encephalopathy · loss of consciousness · respiratory disorders · rhabdomyolysis · skin ulcer · speech disorder · telangiectasia · throat oedema · transient ischaemic attack
- **CONCEPTION AND CONTRACEPTION** Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also

Pregnancy and reproductive function in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
Dose adjustments For *capsules* manufacturer recommends dose of 60 mg once daily in mild-to-moderate impairment—monitor for adverse events and consult product literature for dose adjustments or dose interruption as needed.
For *tablets* manufacturer recommends dose of 40 mg once daily in mild-to-moderate impairment—monitor for adverse events and consult product literature for dose adjustments or dose interruption as needed.
- **RENAL IMPAIRMENT** Manufacturer advises caution in renal impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS** Monitor urine protein regularly and discontinue if nephrotic syndrome develops.
- **PATIENT AND CARER ADVICE** Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.

Driving and skilled tasks Fatigue and weakness may affect performance of skilled tasks e.g. driving.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- Cabozantinib for previously treated advanced renal cell carcinoma (August 2017) NICE TA463
Cabozantinib (*Cabometyx*®) is recommended, within its marketing authorisation, as an option for treating advanced renal cell carcinoma in adults after vascular endothelial growth factor (VEGF)-targeted therapy, only if the company provides cabozantinib with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta463
- Cabozantinib for treating medullary thyroid cancer (March 2018) NICE TA516
Cabozantinib (*Cometriq*®) is recommended, within its marketing authorisation, as an option for treating progressive medullary thyroid cancer in adults with unresectable, locally advanced or metastatic disease, only if the manufacturer provides cabozantinib with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta516

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1234/17

The *Scottish Medicines Consortium* has advised (June 2017) that cabozantinib (*Cabometyx*®) is accepted for use within NHS Scotland for the treatment of advanced renal cell carcinoma in adults following vascular endothelial growth factor (VEGF)-targeted therapy. This advice is contingent upon continuing availability of the patient access scheme or a list price that is equivalent or lower.

Ceritinib

31-Jul-2017

- **DRUG ACTION** Ceritinib is a tyrosine kinase inhibitor, with particular activity against anaplastic lymphoma kinase (ALK).

● INDICATIONS AND DOSE

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only)

► BY MOUTH

- **Adult:** 750 mg once daily, dose should be taken at the same time every day, temporary dose interruption or dose reduction may be required based on tolerability—consult product literature; discontinue treatment if patient unable to tolerate at least 300 mg daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce the dose by one-third (rounded to the nearest multiple of the 150 mg dosage form).

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Diabetes mellitus · history or susceptibility to QT-interval prolongation
CAUTIONS, FURTHER INFORMATION
 - QT-interval prolongation QT-interval prolongation has been observed in clinical studies, which may lead to an increased risk for ventricular tachyarrhythmias (e.g. torsade de pointes) or sudden death. Risk factors include pre-existing bradycardia, other relevant pre-existing cardiac disease or electrolyte disturbances; manufacturer advises to monitor ECG and electrolytes periodically.
- **INTERACTIONS** → Appendix 1: ceritinib
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · appetite decreased · arrhythmias · asthenia · azotaemia · constipation · diarrhoea · dysphagia · gastrointestinal discomfort · gastroesophageal reflux disease · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypophosphataemia · nausea · oesophageal disorder · pericardial effusion · pericarditis · QT interval prolongation · renal impairment · respiratory disorders · skin reactions · vision disorders · vitreous floater · vomiting · weight decreased
 - **Uncommon** Pancreatitis
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - **Gastro-intestinal effects** Manufacturer advises monitor for signs of gastro-intestinal toxicity and consider dose reduction or discontinuation of treatment.
 - **Interstitial lung disease** Manufacturer advises monitor patients who exhibit pulmonary symptoms and consider dose reduction or discontinuation of treatment.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential during treatment and for up to 3 months after discontinuation of treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment—no information available but extensively metabolised by the liver.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - Manufacturer advises to monitor fasting blood glucose concentration prior to initiation of treatment and periodically thereafter. Also monitor for amylase and lipase elevations periodically during treatment. Consider dose reduction, interruption or discontinuation of treatment if outside of normal range.
 - In addition, manufacturer advises measure baseline liver function, then monitor every 2 weeks for the first month and monthly thereafter; consider discontinuation if severe changes in liver function occur—increased risk of hepatotoxicity. Monitor heart rate and blood pressure regularly; consider dose reduction or discontinuation if bradycardia is reported—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Capsules should be taken on an empty stomach—no food should be eaten for 2 hours before or after dose.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of capsules.
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
Driving and skilled tasks Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of fatigue and vision disorders.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Ceritinib for previously treated anaplastic lymphoma kinase-positive non small cell lung cancer (June 2016)** NICE TA395 Ceritinib is recommended, within its marketing authorisation, as an option for treating advanced anaplastic lymphoma kinase-positive non-small-cell lung cancer in adults previously treated with crizotinib; only if the manufacturer provides the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta395
 - **Ceritinib for untreated ALK-positive non-small-cell lung cancer (January 2018)** NICE TA500 Ceritinib is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase (ALK)-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta500
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (December 2015) that ceritinib (Zykadia[®]) is accepted for use within NHS Scotland for the treatment of adults with anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (NSCLC) previously treated with crizotinib. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25
EXCIPIENTS: May contain Gelatin, propylene glycol

Ceritinib 150 mg Zykadia 150mg capsules | 150 capsule [PoM] £4,923.45

Cobimetinib

12-Jun-2017

- **DRUG ACTION** Cobimetinib is a mitogen-activated protein kinase (MAPK) inhibitor.

● INDICATIONS AND DOSE

Treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with vemurafenib) (specialist use only)

- **BY MOUTH**
- **Adult:** 60 mg once daily for 21 days; subsequent cycles repeated after a 7-day interval, for dose adjustment due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Left ventricular dysfunction · risk factors for bleeding
- **INTERACTIONS** → Appendix 1: cobimetinib
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · basal cell carcinoma · chills · dehydration · diarrhoea · electrolyte imbalance · fever · haemorrhage · hyperglycaemia · hypertension · nausea · photosensitivity reaction · pneumonitis · serous retinopathy · skin reactions · vision disorders · vomiting
 - **Uncommon** Rhabdomyolysis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of two effective contraceptive methods during treatment and for at least 3 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.
- **MONITORING REQUIREMENTS**
 - Creatine kinase elevation Manufacturer advises baseline creatine kinase and creatinine levels should be measured before starting treatment, and then at monthly intervals during treatment or as clinically indicated—consult product literature if elevated.
 - Left ventricular function Manufacturer advises ejection fraction should be evaluated before initiation of treatment, then after the first month of treatment and at least every 3 months thereafter (or as clinically indicated) until treatment discontinuation.
 - Liver function Manufacturer advises liver function should be evaluated before initiation of treatment and monthly thereafter (or more frequently as clinically indicated).
 - Visual disturbances Manufacturer advises assess for new or worsening visual disturbances at each visit; if symptoms of new or worsening visual disturbances are identified, an ophthalmologic examination is recommended.
- **PATIENT AND CARER ADVICE**
 - Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.
 - Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
 - Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Cobimetinib in combination with vemurafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2016) NICE TA414
Cobimetinib in combination with vemurafenib is **not** recommended within its marketing authorisation for treating unresectable or metastatic melanoma with a BRAF V600 mutation.
Patients currently receiving cobimetinib may continue without change to prior funding arrangements, until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA414

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cobimetinib (as Cobimetinib hemifumarate) 20 mg Cotellic 20mg tablets | 63 tablet (PoM) £4,275.67

Crizotinib

10-Feb-2017

- **DRUG ACTION** Crizotinib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

Treatment of previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer | First-line treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer

- **BY MOUTH**
- **Adult:** 250 mg twice daily, consult product literature for information on dose adjustments based on individual patient safety and tolerability

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF CARDIAC FAILURE
Severe, sometimes fatal cases of cardiac failure have been reported in patients treated with crizotinib. The MHRA has issued the following advice:

- Monitor all patients for signs and symptoms of heart failure (including dyspnoea, oedema, or rapid weight gain from fluid retention)
- Consider reducing the dose, or interrupting or stopping treatment if symptoms of heart failure occur

- **CAUTIONS** History of diverticulitis (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · patients with susceptibility to QT-prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required · risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs · vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

CAUTIONS, FURTHER INFORMATION

- Fatal interstitial lung disease and pneumonitis Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdraw treatment if suspected, and permanently discontinue treatment if diagnosed).
- **INTERACTIONS** → Appendix 1: crizotinib

● SIDE-EFFECTS

- **Common or very common** Anaemia • appetite decreased • arrhythmias • constipation • diarrhoea • dizziness • fatigue • gait abnormal • gastrointestinal discomfort • gastrointestinal disorders • heart failure • hepatic function abnormal • hypogonadism • hypophosphataemia • leucopenia • local swelling • movement disorders • muscle atrophy • muscle tone decreased • muscle weakness • nausea • nerve disorders • neuralgia • neurotoxicity • neutropenia • oedema • periorbital oedema • peroneal nerve palsy • pulmonary oedema • QT interval prolongation • renal abscess • renal cyst • respiratory disorders • sensation abnormal • skin reactions • syncope • taste altered • vision disorders • vitreous floater • vomiting

- **Uncommon** Gastrointestinal perforation (including fatal cases) • hepatic failure (including fatal cases) • renal impairment

SIDE-EFFECTS, FURTHER INFORMATION Consider reducing the dose, or interrupting or stopping treatment if symptoms of cardiac failure occur.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 90 days after treatment.

- **PREGNANCY** Avoid (toxicity in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose to 250 mg once daily in severe impairment not requiring peritoneal dialysis or hemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.

- **MONITORING REQUIREMENTS** Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated. Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter. Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.

- **PATIENT AND CARER ADVICE** Counsel all patients on the early signs and symptoms of gastrointestinal perforation—advice to seek immediate medical attention.

Driving and skilled tasks Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Crizotinib for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (September 2016)** NICE TA406
Crizotinib is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme. www.nice.org.uk/TA406
- **Crizotinib for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (December 2016)** NICE TA422
Crizotinib is recommended, within its marketing authorisation, as an option for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer

provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/TA422

Dabrafenib

21-Feb-2017

- **DRUG ACTION** Dabrafenib is a BRAF kinase inhibitor, which inhibits BRAF V600 mutation-positive melanoma cell growth.

● INDICATIONS AND DOSE

Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with trametinib)

- **BY MOUTH**

- **Adult:** 150 mg every 12 hours, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** BRAF wild-type melanoma
- **CAUTIONS** Elderly (more frequent dose adjustments may be required) • prior or concurrent cancer associated with RAS mutations—risk of secondary or recurrent malignancy
- **INTERACTIONS** → Appendix 1: dabrafenib

● SIDE-EFFECTS

- **Common or very common** Alopecia • appetite decreased • arthralgia • asthenia • chills • constipation • cough • diarrhoea • fever • headache • hyperglycaemia • hypophosphataemia • influenza like illness • myalgia • nausea • neoplasms • pain in extremity • photosensitivity reaction • skin reactions • vomiting
- **Uncommon** Nephritis • pancreatitis • panniculitis • renal impairment • uveitis

SIDE-EFFECTS, FURTHER INFORMATION Additional side-effects reported when used in combination with trametinib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective non-hormonal contraception during and for 4 weeks after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation

of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature; monitor full blood count as clinically indicated; monitor for ophthalmologic reactions including uveitis, iridocyclitis and iritis; monitor serum creatinine.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients should be informed to immediately report new skin lesions—risk of cutaneous squamous cell carcinoma and new primary melanoma.
- Missed doses** Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of ocular adverse reactions.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Dabrafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2014)** NICE TA321 Dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma only if the manufacturer provides dabrafenib with the discount agreed in the patient access scheme.
www.nice.org.uk/TA321
- ▶ **Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016)** NICE TA396 Trametinib in combination with dabrafenib is recommended within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation, only when the company provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.
www.nice.org.uk/TA396

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that dabrafenib (*Tafinlar*®) is accepted for restricted use within NHS Scotland, as monotherapy, for the treatment of unresectable or metastatic BRAFV600 mutation-positive melanoma in patients who have received no prior therapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

See Cytotoxic drugs p. 865.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS

An EU wide review has concluded that dasatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Hepatitis B infection · risk of cardiac dysfunction (monitor closely) · susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)
- CAUTIONS, FURTHER INFORMATION**
 - ▶ **Pulmonary arterial hypertension** Patients should be evaluated for signs and symptoms of underlying cardiopulmonary disease before starting treatment; echocardiography should be performed at the start of treatment in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease. Treatment should be interrupted or the dose reduced in patients who develop dyspnoea or fatigue, while they are evaluated for common aetiologies (e.g. pleural effusion, pulmonary oedema, anaemia or lung infiltration); pulmonary arterial hypertension should be considered in the absence of these conditions, and if there is no improvement following dose reduction or interruption. If pulmonary arterial hypertension is confirmed, dasatinib should be permanently discontinued.
 - ▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.
- **INTERACTIONS** → Appendix 1: dasatinib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · appetite abnormal · arrhythmias · arthralgia · asthenia · bone marrow depression · cardiac disorder · cardiomyopathy · chest pain · chills · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry eye · dyspnoea · eye inflammation · facial swelling · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · genital abnormalities · haemorrhage · headache · hearing impairment · heart failure · hypertension · hyperuricaemia · increased risk of infection · insomnia · milia · mucositis · muscle complaints · muscle weakness · musculoskeletal stiffness · myocardial dysfunction · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · palpitations · pericardial effusion · perinephric effusion · pulmonary hypertension · pulmonary oedema · respiratory disorders · sepsis · skin reactions · sweat changes · taste altered · thrombocytopenia · vision disorders · vomiting · weight changes
 - ▶ **Uncommon** Acute coronary syndrome · anxiety · arthritis · ascites · asthma · cardiac inflammation · cardiomegaly · cerebrovascular insufficiency · cholecystitis · CNS haemorrhage · confusion · dysphagia · embolism and thrombosis · emotional lability · excessive tearing · gynaecomastia · hair disorder · hepatic disorders ·

hypercholesterolaemia · hypoalbuminaemia · hypotension · hypothyroidism · ischaemic heart disease · libido decreased · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual disorder · movement disorders · myopathy · nail disorder · osteonecrosis · pancreatitis · panniculitis · penile disorders · photosensitivity reaction · proteinuria · QT interval prolongation · renal impairment · scrotal oedema · skin ulcer · syncope · tendinitis · testicular swelling · tremor · tumour lysis syndrome · urinary frequency increased · vertigo · vulvovaginal swelling

► **Rare or very rare** Cardiac arrest · dementia · diabetes mellitus · facial paralysis · gait abnormal · hypersensitivity vasculitis · hyperthyroidism · pure red cell aplasia · seizure · thyroiditis

► **Frequency not known** Hepatitis B reactivation · nephrotic syndrome · Stevens-Johnson syndrome

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426 Dasatinib is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML, only if the manufacturer provides it with the discount agreed in the patient access scheme.
www.nice.org.uk/TA426

► **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425 Dasatinib is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant **and** the manufacturer provides dasatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA425

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2016) that dasatinib (*Sprycel*®) is accepted for use within NHS Scotland for the treatment of adults with chronic, accelerated or blast phase chronic myelogenous leukaemia (CML) with resistance or intolerance to prior therapy including imatinib mesilate, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (September 2016) that dasatinib (*Sprycel*®) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed Philadelphia chromosome positive (Ph+) chronic myelogenous leukaemia (CML) in the chronic phase, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

Erlotinib

18-Apr-2016

● **DRUG ACTION** Erlotinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy | Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy

► BY MOUTH

► Adult: 150 mg once daily

Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

► BY MOUTH

► Adult: 100 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, increase dose to 300 mg daily, if well tolerated for more than 2 weeks, further increase to 450 mg daily could be considered with close monitoring.

IMPORTANT SAFETY INFORMATION

EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

● **INTERACTIONS** → Appendix 1: erlotinib

SIDE-EFFECTS

- **Common or very common** Alopecia · diarrhoea · eye inflammation · haemorrhage · increased risk of infection · renal failure · skin reactions
- **Uncommon** Brittle nails · eye disorders · gastrointestinal disorders · hair changes · interstitial lung disease · nephritis · proteinuria
- **Rare or very rare** Hepatic failure · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Appetite decreased · chills · cough · depression · dyspnoea · fatigue · fever · gastrointestinal discomfort · headache · nausea · neuropathy sensory · stomatitis · vomiting · weight decreased

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 2 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. Monitor liver function in pre-existing liver disease.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011) NICE TA227
Erlotinib monotherapy is **not** recommended for maintenance treatment in patients with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.
www.nice.org.uk/TA227
- ▶ Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012) NICE TA258
Erlotinib is recommended as an option in patients for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:
 - they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation **and**
 - the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012).
www.nice.org.uk/TA258
- ▶ Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374
Erlotinib is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours of unknown epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation status, only if all of the following criteria are met:
 - the result of an EGFR-TK mutation diagnostic test is unobtainable because of an inadequate tissue sample or poor-quality DNA,
 - the treating clinician considers that the tumour is very likely to be EGFR-TK mutation-positive,
 - the patient's condition responds to the first 2 cycles of treatment with erlotinib, **and**,
 - the manufacturer provides erlotinib with the discount agreed in the patient access scheme.
 Erlotinib is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-negative.

Patients who are already receiving erlotinib should continue treatment until they and their clinician consider it appropriate to stop.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** History of bleeding disorders
- **INTERACTIONS** → Appendix 1: everolimus
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cough · decreased leucocytes · dehydration · diabetes mellitus · diarrhoea · dry

mouth · dyslipidaemia · dysphagia · dyspnoea · electrolyte imbalance · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · headache · hyperglycaemia · hypertension · increased risk of infection · insomnia · menstrual cycle irregularities · mucositis · nail disorders · nausea · neutropenia · oral disorders · peripheral oedema · proteinuria · renal impairment · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased

- **Uncommon** Congestive heart failure · embolism and thrombosis · flushing · healing impaired · hepatitis B · musculoskeletal chest pain · pancytopenia · sepsis · urinary frequency increased

- **Rare or very rare** Pure red cell aplasia

- **Frequency not known** Hepatitis B reactivation

SIDE-EFFECTS, FURTHER INFORMATION Reduce dose or discontinue if severe side-effects occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Consult product literature.

● **MONITORING REQUIREMENTS**

- For *Votubia*® preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.
- For *Certican*®: manufacturer advises pre-dose ('trough') whole blood everolimus concentration should be 3–8 nanograms/mL; monitoring should be performed every 4–5 days (using **chromatographic** assay) after initiation or dose adjustment until 2 consecutive stable concentrations; monitor patients with hepatic impairment taking concomitant strong CYP3A4 inducers and inhibitors when switching formulation, and/or if concomitant ciclosporin dose is reduced.
- Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
- Monitor renal function before treatment and periodically thereafter.

● **DIRECTIONS FOR ADMINISTRATION**

VOTUBIA® DISPERSIBLE TABLETS Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.

VOTUBIA® TABLETS Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION** *Votubia*® is available as both *tablets* and *dispersible tablets*. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

● **PATIENT AND CARER ADVICE**

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Everolimus with exemestane for treating advanced breast cancer after endocrine therapy (December 2016)** NICE TA421
Everolimus, in combination with exemestane, is recommended within its marketing authorisation for treating advanced human epidermal growth factor receptor 2 (HER2)-negative, hormone-receptor-positive

breast cancer in postmenopausal women without symptomatic visceral disease that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor. Everolimus is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/TA421

- **Everolimus for advanced renal cell carcinoma after previous treatment (February 2017)** NICE TA432
Everolimus is recommended within its marketing authorisation as an option for treating advanced renal cell carcinoma that has progressed during or after treatment with vascular endothelial growth factor targeted therapy. Everolimus is only recommended if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/TA432

- **Everolimus and sunitinib for treating unresectable or metastatic neuroendocrine tumours in people with progressive disease (June 2017)** NICE TA449
Everolimus and sunitinib are recommended, within their marketing authorisations, as options for treating well- or moderately differentiated unresectable or metastatic neuroendocrine tumours (NETs) of pancreatic origin in adults with progressive disease.

Everolimus is recommended, within its marketing authorisation, as an option for treating well-differentiated (grade 1 or grade 2) non-functional unresectable or metastatic NETs of gastrointestinal or lung origin in adults with progressive disease.

Everolimus is recommended only when the company provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/TA449

AFINITOR®

NICE decisions

- **Lenvatinib with everolimus for previously treated advanced renal cell carcinoma (January 2018)** NICE TA498
Lenvatinib plus everolimus is recommended as an option for treating advanced renal cell carcinoma in adults who have had one previous vascular endothelial growth factor (VEGF)-targeted therapy, only if:
 - their Eastern Cooperative Oncology Group (ECOG) performance status score is 0 or 1, **and**
 - the manufacturer provides lenvatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta498

CERTICAN®

NICE decisions

- **Everolimus for preventing organ rejection in liver transplantation (July 2015)** NICE TA348
Everolimus (*Certican*®) is **not** recommended within its marketing authorisation for preventing organ rejection in patients who have undergone a liver transplant. Patients currently receiving everolimus for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA348

- **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481
Everolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their

funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Gefitinib

27-May-2016

• DRUG ACTION Gefitinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

▶ BY MOUTH

▶ Adult: 250 mg once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCEBRATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

• INTERACTIONS → Appendix 1: gefitinib

• SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · angioedema · appetite decreased · asthenia · cystitis · dehydration · diarrhoea · dry eye · dry mouth · eye inflammation · fever · haemorrhage · hypersensitivity · interstitial lung disease · nail disorder · nausea · proteinuria · skin reactions · stomatitis · vomiting
- ▶ **Uncommon** Corneal erosion · gastrointestinal perforation · hepatitis · pancreatitis
- ▶ **Rare or very rare** Cutaneous vasculitis · severe cutaneous adverse reactions (SCARs)

• **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

• **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

• **BREAST FEEDING** Discontinue breast-feeding.

• **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment due to cirrhosis.

• **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 20 mL/minute.

• MONITORING REQUIREMENTS

- ▶ Monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed.
- ▶ Monitor liver function—consider discontinuing if severe changes in liver function occur.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010)** NICE TA192
Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.

www.nice.org.uk/TA192

- ▶ **Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015)** NICE TA374

Gefitinib is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-positive.

Patients who are already receiving gefitinib should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA374

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2015) that gefitinib (*Iressa*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with previously untreated locally advanced or metastatic non-small cell lung cancer (NSCLC) with activating mutations of epidermal growth factor receptor tyrosine kinase (EGFR-TK).

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Iressa (AstraZeneca UK Ltd)

Gefitinib 250 mg Iressa 250mg tablets | 30 tablet (PoM) £2,167.71

Ibrutinib

19-Sep-2017

• DRUG ACTION Ibrutinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Treatment of relapsed or refractory mantle cell lymphoma

▶ BY MOUTH

▶ Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy | Treatment of Waldenström's macroglobulinaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients who are unsuitable for chemo-immunotherapy

► **BY MOUTH**

- Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4, amiodarone or ciprofloxacin is unavoidable, reduce dose to 280 mg once daily.
- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 140 mg once daily, or withhold ibrutinib for up to 7 days.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

MHRA/CHM ADVICE: IBRUTINIB (IMBRUVICA®): REPORTS OF VENTRICULAR TACHYARRHYTHMIA; RISK OF HEPATITIS B REACTIVATION AND OF OPPORTUNISTIC INFECTIONS (AUGUST 2017)

Cases of ventricular tachyarrhythmia have been reported with the use of ibrutinib. The MHRA advises that ibrutinib should be temporarily discontinued in patients who develop symptoms suggestive of ventricular arrhythmia and to assess benefit-risk before restarting therapy.

Hepatitis B virus status should be established before initiating therapy—for patients with positive hepatitis B serology, consultation with a liver disease expert is recommended before the start of treatment; monitor and manage patients according to local protocols to minimise the risk of hepatitis B virus reactivation. Prophylaxis should be considered for those at an increased risk of opportunistic infections.

- **CAUTIONS** Family history of congenital short QT syndrome • increased lymphocytes—increased risk of leukostasis, consider withholding treatment temporarily and monitor closely • patients at risk from further shortening of QTc interval • personal history of congenital short QT syndrome • risk of haemorrhagic events—withdraw ibrutinib treatment for at least 3 to 7 days before and after surgery depending on risk of bleeding
- **INTERACTIONS** → Appendix 1: ibrutinib
- **SIDE-EFFECTS**
 - **Common or very common** Arrhythmias • arthralgia • broken nails • CNS haemorrhage • constipation • diarrhoea • dizziness • fever • haemorrhage • headache • hypertension • hyperuricaemia • increased leucocytes • increased risk of infection • interstitial lung disease • muscle spasms • musculoskeletal pain • nausea • neoplasms • neutropenia • peripheral oedema • sepsis • skin reactions • stomatitis • thrombocytopenia • tumour lysis syndrome • vision blurred • vomiting
 - **Uncommon** Angioedema • hepatitis B reactivation • leukostasis syndrome • panniculitis
 - **Frequency not known** Anaemia • hepatic failure • progressive multifocal leukoencephalopathy • Stevens-Johnson syndrome
- **CONCEPTION AND CONTRACEPTION** Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose to 280 mg daily in mild impairment and reduce dose to 140 mg daily in moderate impairment—monitor for toxicity and adjust dose if necessary (consult product literature).
- **RENAL IMPAIRMENT** Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity.
Monitoring Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.
- **MONITORING REQUIREMENTS**
 - Monitor full blood count once a month.
 - Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Ibrutinib for previously treated chronic lymphocytic leukaemia and untreated chronic lymphocytic leukaemia with 17p deletion or TP53 mutation (January 2017)** NICE TA429
Ibrutinib alone is recommended within its marketing authorisation as an option for treating chronic lymphocytic leukaemia in adults who have had at least one prior therapy or who have a 17p deletion or TP53 mutation, and in whom chemo-immunotherapy is unsuitable, only when the manufacturer provides ibrutinib with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta429
- **Ibrutinib for treating Waldenström's macroglobulinaemia (November 2017)** NICE TA491
Ibrutinib is recommended for use in the Cancer Drugs Fund as an option for treating Waldenström's macroglobulinaemia in adults who have had at least 1 prior therapy, only if the conditions in the managed access agreement for ibrutinib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta491

- **Ibrutinib for treating relapsed or refractory mantle cell lymphoma (January 2018)** NICE TA502
Ibrutinib is recommended as an option for treating relapsed or refractory mantle cell lymphoma in adults, only if:
 - they have had only one previous line of therapy, and
 - the manufacturer provides ibrutinib with the discount agreed in the commercial access agreement with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta502

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2017) that ibrutinib (Imbruvica®) is accepted for restricted use within NHS Scotland for the treatment of relapsed or refractory chronic lymphocytic leukaemia in adults who have received at least one prior therapy and for whom fludarabine-based regimens are inappropriate. This advice

is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capable

CAUTIONARY AND ADVISORY LABELS 25

Imbruvica (Janssen-Cilag Ltd) ▼

Ibrutinib 140 mg Imbruvica 140mg capsules | 90 capsule [PoM] £4,599.00 | 120 capsule [PoM] £6,132.00

Idelalisib

16-Nov-2016

DRUG ACTION Idelalisib is a protein kinase inhibitor.

INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients who are not eligible for any other therapies (in combination with rituximab) | Treatment of follicular lymphoma refractory to two lines of treatment (monotherapy)

BY MOUTH

- Adult: 150 mg twice daily, for dose adjustment due to side effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 865.

MHRA/CHM ADVICE: IDELALISIB (ZYDELIG®): UPDATED INDICATIONS AND ADVICE ON MINIMISING THE RISK OF INFECTION (SEPTEMBER 2016)

In light of a recent safety review the indications for idelalisib have been updated. Manufacturer recommendations regarding monitoring for infection and prophylaxis of *Pneumocystis jirovecii* pneumonia have also been updated. Patients should be advised on the risk of serious or fatal infections during treatment, and idelalisib should not be initiated in patients with any evidence of infection.

- CAUTIONS** Active hepatitis · diarrhoea—symptomatic management recommended (consult product literature) · pneumonitis—withhold treatment (consult product literature)

- INTERACTIONS** → Appendix 1: idelalisib

SIDE-EFFECTS

- Common or very common** Colitis · diarrhoea · fever · infection · neutropenia · pneumonitis · rash
- Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION** Highly effective contraception (in addition to barrier method) required during and for one month after treatment.
- PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- BREAST FEEDING** Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment.
- MONITORING REQUIREMENTS**
 - Manufacturer advises monitor liver function—consult product literature.
 - Manufacturer advises monitor for signs and symptoms of infection, including *cytomegalovirus* infection and respiratory infections; new symptoms should be reported promptly. Neutrophil count should be monitored in all

patients every 2 weeks for the first 6 months of treatment; patients with neutrophil count <1000 per mm³ should be monitored weekly.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359

Idelalisib, in combination with rituximab, is recommended as an option for treatment in adults:

- who have untreated chronic lymphocytic leukaemia **or**
- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months **and**
- if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.

Patients who are already receiving idelalisib should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA359

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2015) that idelalisib (Zydelig®) is accepted for restricted use within NHS Scotland, in combination with rituximab, for the treatment of relapsed chronic lymphocytic leukaemia in patients who are unsuitable for chemotherapy and treatment naïve patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy, only whilst idelalisib is available at the price agreed in the patient access scheme.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (April 2017) that idelalisib (Zydelig®) is recommended as an option for use within NHS Wales as monotherapy for the treatment of patients with follicular lymphoma, that is refractory to two prior lines of treatment. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Imatinib

21-Jul-2016

DRUG ACTION Imatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of chronic myeloid leukaemia in chronic phase after failure with interferon alfa

BY MOUTH

- Adult: 400 mg once daily, increased if necessary up to 800 mg daily in 2 divided doses

Treatment of chronic myeloid leukaemia in accelerated phase, or in blast crisis

BY MOUTH

- Adult: 600 mg once daily, then increased if necessary up to 800 mg daily in 2 divided doses

Treatment of newly diagnosed acute lymphoblastic leukaemia (in combination with other chemotherapy) | Monotherapy for relapsed or refractory acute lymphoblastic leukaemia

BY MOUTH

- Adult: 600 mg once daily

Treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST) | Adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse | Treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement

► BY MOUTH

► Adult: 400 mg once daily

Treatment of unresectable dermatofibrosarcoma protuberans | Recurrent or metastatic dermatofibrosarcoma protuberans, in patients who cannot have surgery

► BY MOUTH

► Adult: 800 mg daily in 2 divided doses

Treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia

► BY MOUTH

► Adult: 100–400 mg once daily

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS
An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

● **CAUTIONS** Cardiac disease · hepatitis B infection · history of renal failure · risk factors for heart failure

CAUTIONS, FURTHER INFORMATION

► **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

● **INTERACTIONS** → Appendix 1: imatinib

● SIDE-EFFECTS

► **Common or very common** Alopecia · anaemia · appetite abnormal · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · insomnia · joint disorders · muscle complaints · nausea · neutropenia · oedema · pain · photosensitivity reaction · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vision blurred · vomiting · weight changes

► **Uncommon** Anxiety · arrhythmias · ascites · breast abnormalities · broken nails · burping · chest pain · CNS haemorrhage · congestive heart failure · depression · drowsiness · dysphagia · electrolyte imbalance · eosinophilia · eye discomfort · gout · gynaecomastia · hearing impairment · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypotension · increased risk of infection · laryngeal pain · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual cycle irregularities · nerve disorders · oral disorders · palpitations · pancreatitis · peripheral coldness · pulmonary oedema · Raynaud's phenomenon · renal impairment · renal pain · respiratory disorders · restless legs · scrotal oedema · sepsis · sexual dysfunction · syncope · thrombocytosis · tremor · urinary frequency increased · vertigo

► **Rare or very rare** Angina pectoris · angioedema · arthritis · cardiac arrest · cataract · confusion · glaucoma · haemolytic anaemia · haemorrhagic ovarian cyst · hepatic failure (including fatal cases) · hypersensitivity vasculitis · inflammatory bowel disease · intracranial pressure increased · muscle weakness · myocardial infarction · myopathy · nail discolouration · pericardial disorders · pulmonary hypertension · seizure · severe cutaneous adverse reactions (SCARs) · tumour lysis syndrome

► **Frequency not known** Embolism and thrombosis · hepatitis B reactivation · neoplasm complications · osteonecrosis · pericarditis

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Dose adjustments Max. 400 mg daily; reduce dose further if not tolerated.

● RENAL IMPAIRMENT

Dose adjustments Maximum starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated.

● MONITORING REQUIREMENTS

► Monitor for gastrointestinal haemorrhage.
► Monitor complete blood counts regularly.
► Monitor for fluid retention.
► Monitor liver function.
► Monitor growth in children (may cause growth retardation).

● **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water or apple juice.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer imatinib tablets.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (November 2014)** NICE TA326
Imatinib is recommended as an option for adjuvant treatment of adult patients who are at high risk of relapse after surgery for KIT (CD117)-positive gastro-intestinal stromal tumours, as defined by the Miettinen 2006 criteria (based on tumour size, location, and mitotic rate), for up to 3 years.

Patients currently receiving treatment initiated within the NHS with imatinib that is not recommended for them by NICE in this guidance should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/TA326

► **Imatinib for chronic myeloid leukaemia (updated January 2016)** NICE TA70

Imatinib is recommended as an option for patients with Philadelphia-chromosome-positive chronic myeloid leukaemia who initially present in the accelerated phase or with blast crisis. Imatinib is also recommended as an option for patients who present in the chronic phase and then progress to the accelerated phase or blast crisis if they have not received imatinib previously.

www.nice.org.uk/TA70

► **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)** NICE TA86
Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86] is achieved

within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.

www.nice.org.uk/TA86

- **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)** NICE TA209

Imatinib 600 mg daily or 800 mg daily is **not** recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.

www.nice.org.uk/TA209

- **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426
- Imatinib is recommended as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults.

www.nice.org.uk/TA426

- **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425
- High-dose imatinib (600 mg in the chronic phase or 800 mg in the accelerated and blast-crisis phases) is **not** recommended for treating Philadelphia-chromosome-positive CML in adults whose disease is imatinib-resistant.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA425

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2002) that imatinib (*Glivec*®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

The *Scottish Medicines Consortium* has also advised (February 2012) that imatinib (*Glivec*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Imatinib (as imatinib mesilate) 400 mg Glivec 400mg tablets | 30 tablet [POM] £1,946.67 DT = £811.72

Lapatinib

- **DRUG ACTION** Lapatinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)

► BY MOUTH

► Adult: 1 g once daily

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)

► BY MOUTH

► Adult: 1.25 g once daily

Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)

► BY MOUTH

► Adult: 1.5 g once daily

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Diarrhoea—withhold treatment if severe (consult product literature) • low gastric pH (reduced absorption) • susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1: lapatinib
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia • appetite decreased • arthralgia • asthenia • constipation • cough • dehydration • diarrhoea (treat promptly) • dyspnoea • epistaxis • gastrointestinal discomfort • headache • hepatotoxicity (discontinue permanently if severe) • hot flush • hyperbilirubinaemia • insomnia • mucositis • nail disorder • nausea • pain • paronychia • skin reactions • stomatitis • vomiting
 - **Uncommon** Respiratory disorders
 - **Frequency not known** Severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment—metabolism reduced.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor left ventricular function.
 - Monitor for pulmonary toxicity.
 - Monitor liver function before treatment and at monthly intervals.
- **DIRECTIONS FOR ADMINISTRATION** Always take at the same time in relation to food: either one hour before or one hour after food.

- **PATIENT AND CARER ADVICE** Counselling advised (administration). Patients should be advised to report any unexpected changes in bowel habit.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2** (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA257

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Tyverb** (Novartis Pharmaceuticals UK Ltd)

Lapatinib dityrosate monohydrate 250 mg Tyverb 250mg tablets
| 84 tablet (PoM) £965.16 | 105 tablet (PoM) £1,206.45

Lenvatinib

20-Mar-2018

- **DRUG ACTION** Lenvatinib is a multireceptor tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

KISPLIX[®]

Advanced renal cell carcinoma following one prior vascular endothelial growth factor-targeted therapy (in combination with everolimus) (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** 18 mg once daily, dose should be taken at the same time every day, for dose adjustment due to side-effects—consult product literature

LENVIMA[®]

Progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** 24 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Fistulae
- **CAUTIONS** Arterial thromboembolism within the previous 6 months · elderly (75 years and over)—reduced tolerability · hypertension—blood pressure should be well-controlled prior to treatment
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · cerebrovascular insufficiency · cholecystitis · constipation · dehydration · diarrhoea · dizziness · dry mouth · dysphonia · electrolyte imbalance · embolism and thrombosis · gastrointestinal discomfort · gastrointestinal disorders · headache · heart failure · hepatic disorders · hypercholesterolaemia · hypertension ·

hypalbuminaemia · hypotension · hypothyroidism · increased risk of infection · insomnia · lymphopenia · malaise · metrorrhagia · mucositis · myalgia · myocardial infarction · nausea · oral disorders · oropharyngeal pain · pain · peripheral oedema · proteinuria · QT interval prolongation · renal impairment · renal tubular necrosis · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased

- ▶ **Uncommon** Pancreatitis · paresis · posterior reversible encephalopathy syndrome (PRES) · splenic infarction

- ▶ **Frequency not known** Fistula

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises gastrointestinal toxicity should be actively managed—dehydration and/or hypovolaemia caused by gastrointestinal toxicity are identified as primary risk factors for renal impairment or failure.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use highly effective contraception during treatment and for 1 month after the last dose, an additional barrier method of contraception should be used in women using oral hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenic in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

KISPLIX[®] Manufacturer advises use only if potential benefit outweighs risk in severe impairment.

Dose adjustments Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature.

LENVIMA[®] **Dose adjustments** Manufacturer advises reduce dose to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

● RENAL IMPAIRMENT

KISPLIX[®] Manufacturer advises avoid in end-stage renal disease.

Dose adjustments Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature.

LENVIMA[®] Manufacturer advises avoid in end-stage renal disease.

Dose adjustments Manufacturer advises reduce dose to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor blood pressure after 1 week of treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor for signs and symptoms of cardiac decompensation (adjust dose as necessary—consult product literature).
- ▶ Manufacturer advises monitor liver function before treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor urine protein regularly.
- ▶ Manufacturer advises monitor ECG and electrolytes before and periodically during treatment (calcium levels should be monitored at least monthly), correct electrolyte abnormalities prior to treatment; monitor thyroid function before and regularly during treatment.

● DIRECTIONS FOR ADMINISTRATION

KISPLIX[®] Manufacturer advises capsules should be swallowed whole, or alternatively, capsules may be

dissolved in a tablespoon of water or apple juice (do not break or crush capsules), allow to sit for at least 10 minutes for capsule shell to dissolve.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

KISPLYX[®]

NICE decisions

- ▶ Lenvatinib with everolimus for previously treated advanced renal cell carcinoma (January 2018) NICE TA498
Lenvatinib plus everolimus is recommended as an option for treating advanced renal cell carcinoma in adults who have had one previous vascular endothelial growth factor (VEGF)-targeted therapy, only if:
 - their Eastern Cooperative Oncology Group (ECOG) performance status score is 0 or 1, **and**
 - the manufacturer provides lenvatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta498

LENVIMA[®]

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that lenvatinib (*Lenvima*[®]) is accepted for use within NHS Scotland for treatment of adults with progressive, locally advanced or metastatic, differentiated (papillary/follicular/Hürthle cell) thyroid carcinoma, refractory to radioactive iodine. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that lenvatinib (*Lenvima*[®]) is recommended as an option for restricted use within NHS Wales for the treatment of adults with progressive, locally advanced or metastatic, differentiated (papillary/follicular/Hürthle cell) thyroid carcinoma, refractory to radioactive iodine. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Midostaurin

11-May-2018

- **DRUG ACTION** Midostaurin is an inhibitor of multiple tyrosine kinases.

● INDICATIONS AND DOSE

Acute myeloid leukaemia (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** 50 mg twice daily, on days 8–21 of induction and consolidation chemotherapy cycles; for administration following consolidation chemotherapy, and dose adjustment or treatment interruption due to side-effects—consult product literature

Aggressive systemic mastocytosis (specialist use only) | Systemic mastocytosis with associated haematological neoplasm (specialist use only) | Mast cell leukaemia (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** 100 mg twice daily, for dose adjustment or treatment interruption due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Active severe infection (control before initiation of monotherapy) · elderly (limited experience) · patients at risk of congestive heart failure · risk factors for QT-interval prolongation
- **INTERACTIONS** → Appendix 1: midostaurin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Concentration impaired · constipation · cough · diarrhoea · dizziness · dyspepsia · dyspnoea · fatigue · febrile neutropenia · fever · haemorrhage · headache · hypotension · infection · nausea · oropharyngeal pain · peripheral oedema · respiratory disorders · tremor · vertigo · vomiting · weight increased
 - ▶ **Frequency not known** Congestive heart failure · QT interval prolongation
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises perform pregnancy test in women of childbearing potential within 7 days prior to treatment initiation; effective contraception must be used during treatment and for at least 4 months after stopping treatment—additional barrier method recommended in women using hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 4 months after stopping treatment—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment and monitor for toxicity—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and monitor for toxicity—limited information available.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor white blood cell count regularly, especially at treatment initiation; also monitor for signs and symptoms of infection.
 - ▶ Manufacturer advises assess left ventricular ejection fraction in patients at risk of congestive heart failure at baseline and during treatment as clinically indicated; consider performing ECGs if concomitant use with drugs that can prolong QT-interval.

- ▶ Manufacturer advises monitor for pulmonary symptoms indicative of interstitial lung disease or pneumonitis.

Nilotinib

10-Apr-2018

- **DRUG ACTION** Nilotinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (initiated by a specialist)

- ▶ BY MOUTH

- ▶ Adult: 300 mg twice daily, for dose adjustments due to side-effects—consult product literature

Chronic and accelerated phase Philadelphia chromosome-positive chronic myeloid leukaemia resistant or intolerant to previous therapy, including imatinib (initiated by a specialist)

- ▶ BY MOUTH

- ▶ Adult: 400 mg twice daily, for dose adjustments due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH TYROSINE KINASE INHIBITORS

An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Clinically significant bradycardia · congestive heart failure · hepatitis B infection · history of pancreatitis · recent myocardial infarction · susceptibility to QT-interval prolongation (including electrolyte disturbances) · unstable angina

CAUTIONS, FURTHER INFORMATION

- ▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: nilotinib

SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · angina pectoris · anxiety · appetite abnormal · arrhythmias · arthralgia · asthenia · bone marrow disorders · cardiac conduction disorders · chest discomfort · constipation · cough · decreased leucocytes · depression · diabetes mellitus · diarrhoea · dizziness · dry eye · dyslipidaemia · dyspnoea · electrolyte imbalance · eosinophilia · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · headaches · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · increased risk of infection · insomnia · muscle complaints · muscle weakness · myocardial infarction · nausea · neoplasms · neutropenia · oedema · pain · palpitations ·

peripheral neuropathy · QT interval prolongation · respiratory disorders · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vertigo · vomiting · weight changes

- ▶ **Uncommon** Atherosclerosis · cerebrovascular insufficiency · chills · cyanosis · erectile dysfunction · gout · haemorrhage · heart failure · hyperaemia · malaise · oral disorders · pancreatitis · peripheral vascular disease · temperature sensation altered · vision disorders

- ▶ **Frequency not known** Breast abnormalities · chorioretinopathy · diastolic dysfunction · dry mouth · facial swelling · gynaeomastia · hepatitis B reactivation · hyperparathyroidism · hyperuricaemia · hypoglycaemia · lethargy · memory loss · menorrhagia · oropharyngeal pain · pericardial effusion · pericarditis · restless legs · sebaceous hyperplasia · syncope · tremor · urinary disorders · urine discolouration

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for up to two weeks after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor lipid profiles before initiating treatment, at 3 and 6 months, and then yearly thereafter; monitor blood glucose before initiating treatment and then periodically during treatment, as clinically indicated.
- ▶ Manufacturer advises monitor full blood count every 2 weeks for the first 2 months of treatment, then monthly thereafter, or as clinically indicated.
- ▶ Manufacturer advises perform baseline ECG before treatment and as clinically indicated thereafter; correct any electrolyte disturbances before treatment and monitor periodically during treatment.
- ▶ Manufacturer advises monitor and actively manage cardiovascular risk factors during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules should either be swallowed whole or the contents of each capsule may be dispersed in one teaspoon of apple sauce and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** All prescribers should be familiar with the *Summary of Key Safety Recommendations for Tasigna® (nilotinib)* provided by the manufacturer.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should seek immediate medical attention if signs or symptoms of cardiovascular events occur.

All patients should be provided with the *Important Information About How to Take Your Medication* leaflet provided by the manufacturer.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426 Nilotinib is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta426

- ▶ **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425**
Nilotinib is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant **and** the manufacturer provides nilotinib with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta425

Nintedanib

23-Feb-2016

- **DRUG ACTION** Nintedanib is a tyrosine protein kinase inhibitor.

● INDICATIONS AND DOSE

OFEV®

Treatment of idiopathic pulmonary fibrosis

▶ **BY MOUTH**

- ▶ **Adult:** 150 mg twice daily, reduced if not tolerated to 100 mg twice daily, for dose adjustments due to side-effects, consult product literature

VARGATEF®

Treatment of locally advanced, metastatic or locally recurrent non-small cell lung cancer of adenocarcinoma histology after first-line chemotherapy (in combination with docetaxel) (initiated under specialist supervision)

▶ **BY MOUTH**

- ▶ **Adult:** 200 mg twice daily on days 2–21 of a standard 21 day docetaxel cycle, for treatment following discontinuation of docetaxel and for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

FOR **VARGATEF®**—RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CAUTIONS** History or risk factors for QT prolongation • impaired wound healing • increased risk of bleeding • patients at high risk of cardiovascular disease • previous abdominal surgery • recent history of hollow organ perforation • theoretical increased risk of gastrointestinal perforation • theoretical increased risk of venous thromboembolism
- **INTERACTIONS** → Appendix 1: nintedanib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain • appetite decreased • diarrhoea • haemorrhage • nausea • vomiting • weight decreased
 - ▶ **Uncommon** Dehydration • hyperbilirubinaemia • hypertension • pancreatitis • thrombocytopenia
 - ▶ **Frequency not known** Drug-induced liver injury
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with peanut or soya hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception (in addition to barrier method) during treatment and for at least 3 months after last dose.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
VARGATEF® See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment—no information available.
Dose adjustments Consult product literature for dose adjustment in worsening liver function.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** For **Vargatef®**, monitor full blood count and hepatic function before each treatment cycle and regularly thereafter, monitor prothrombin time and INR if used concomitantly with anticoagulants and monitor for signs and symptoms of cerebral bleeding.
- **PRESCRIBING AND DISPENSING INFORMATION**
VARGATEF® Not to be taken on the same day as docetaxel therapy.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Nintedanib for previously treated locally advanced, metastatic, or locally recurrent non-small cell lung cancer (July 2015) NICE TA347**
Nintedanib (**Vargatef®**), in combination with docetaxel is recommended as an option for the treatment of patients with locally advanced, metastatic, or locally recurrent non-small cell lung cancer of adenocarcinoma histology, that has progressed after first-line chemotherapy, only if the manufacturer provides nintedanib with the discount agreed in the patient access scheme.
www.nice.org.uk/TA347
- ▶ **Nintedanib for treating idiopathic pulmonary fibrosis (January 2016) NICE TA379**
Nintedanib is recommended as an option for treating idiopathic pulmonary fibrosis, only if:
 - the patient has a forced vital capacity (FVC) between 50% and 80% of predicted,
 - the manufacturer provides nintedanib with the discount agreed in the patient access scheme, **and**,
 - treatment is stopped if disease progresses (a confirmed decline in percent predicted FVC of 10% or more) in any 12-month period.

www.nice.org.uk/TA379

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2015) that nintedanib (**Ofev®**) is accepted for restricted use within NHS Scotland for the treatment of idiopathic pulmonary fibrosis in patients with a predicted forced vital capacity less than or equal to 80%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Osimertinib

21-Apr-2017

● **DRUG ACTION** Osimertinib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

Locally advanced or metastatic epidermal growth factor receptor T790M mutation-positive non-small-cell lung cancer (specialist use only)

► BY MOUTH

► Adult: 80 mg once daily, for dose adjustment due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

● **CONTRA-INDICATIONS** Congenital long QT syndrome

● **CAUTIONS** Elderly (more frequent dose adjustments may be required) · history of interstitial lung disease · radiation pneumonitis requiring steroid treatment · risk factors for QTc interval prolongation

● **INTERACTIONS** → Appendix 1: osimertinib

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · eyelid pruritus · increased risk of infection · nail discolouration · nail disorders · respiratory disorders · skin reactions · stomatitis

► **Uncommon** Eye disorders · eye inflammation · QT interval prolongation

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of effective, non-hormonal, contraception during and for 2 months after treatment in women, and 4 months after treatment in men.

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Manufacturer advises avoid—may be present in milk based on *animal studies*.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate and severe impairment—limited information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe and end-stage impairment—limited information available.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor ECG and electrolytes periodically in patients with risk factors for QTc interval prolongation; dose adjustment is advised if QTc interval is more than 500 milliseconds on at least 2 separate ECGs—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablet may be dispersed in 50 mL of non-carbonated water, by stirring until dispersed and swallowed immediately (do not crush). The residue must then be re-dispersed in an additional half a glass of water and immediately swallowed. Manufacturer advises if administration via a nasogastric tube is required, the tablet may be dispersed in 15 mL of non-carbonated water, by stirring until dispersed and the residue re-dispersed in an additional 15 mL of water (do not crush). The total 30 mL of liquid should then be administered as per the nasogastric tube manufacturer's instructions with appropriate water flushes; the solution should be administered within 30 minutes of adding the tablets to water.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Osimertinib for treating locally advanced or metastatic EGFR T790M mutation-positive non-small-cell lung cancer (October 2016) NICE TA416

Osimertinib is recommended as an option, for use within the Cancer Drugs Fund, for treating locally advanced or metastatic epidermal growth factor receptor (EGFR)

T790M mutation-positive non-small-cell lung cancer in adults whose disease has progressed only:

- after first-line treatment with an EGFR tyrosine kinase inhibitor, and
- if the conditions in the managed access agreement for osimertinib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA416

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2017) that osimertinib (*Tagrisso*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer, only in patients who have received previous treatment with an EGFR tyrosine kinase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Palbociclib

29-Jan-2018

● **DRUG ACTION** Palbociclib is a highly selective inhibitor of cyclin-dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

● INDICATIONS AND DOSE

Locally advanced or metastatic breast cancer (initiated by a specialist)

► BY MOUTH

► Adult: 125 mg once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► If concomitant use with potent CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole, lopinavir boosted with ritonavir, posaconazole, saquinavir, or voriconazole) is unavoidable, reduce palbociclib dose to 75 mg once daily. If the CYP3A4 inhibitor is stopped, increase the palbociclib dose (after 3–5 half lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

● **INTERACTIONS** → Appendix 1: palbociclib

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · diarrhoea · dry eye · epistaxis · excessive tearing · fever · infection · leucopenia · mucositis · nausea · neutropenia · oral disorders · oropharyngeal complaints · skin reactions · taste altered · thrombocytopenia · vision blurred · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects are reported when used in combination with letrozole or fulvestrant.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. Male patients should use effective contraception during treatment and for at least 14 weeks after completing treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 865.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution and close monitoring for signs of toxicity in moderate-to-severe impairment.

Dose adjustments Manufacturer advises reduce dose to 75 mg once daily in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution and monitor closely for signs of toxicity in moderate-to-severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count prior to starting therapy, at the start of each cycle, on day 14 of the first 2 cycles and as clinically indicated.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises to take palbociclib at the same time each day; if a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Palbociclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (December 2017)** NICE TA495

Palbociclib, with an aromatase inhibitor, is recommended within its marketing authorisation, as an option for treating hormone receptor-positive, human epidermal growth factor receptor 2-negative, locally advanced or metastatic breast cancer as initial endocrine-based therapy in adults. Palbociclib is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta495

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2017) that palbociclib (*Ibrance*®) is accepted for restricted use within NHS Scotland in combination with an aromatase inhibitor for the first-line treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Pazopanib

02-Jun-2017

- **DRUG ACTION** Pazopanib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma | Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy

- ▶ **BY MOUTH**

▶ **Adult:** 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

Treatment of selective subtypes of advanced soft-tissue sarcoma

- ▶ **BY MOUTH**

▶ **Adult:** (consult product literature)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg daily.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Cerebral haemorrhage · clinically significant gastro-intestinal haemorrhage · haemoptysis in the past 6 months

- **CAUTIONS** Cardiac disease · increased risk of gastro-intestinal fistulas · increased risk of gastro-intestinal perforation · increased risk of haemorrhage · increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop · ischaemic stroke · myocardial infarction · risk of thrombotic events · susceptibility to QT-interval prolongation (including electrolyte disturbances) · transient ischaemic attack

CAUTIONS, FURTHER INFORMATION

- ▶ **Elective surgery** Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.
- ▶ **Blood pressure** Blood pressure must be controlled before initiating treatment.

- **INTERACTIONS** → Appendix 1: pazopanib

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · bradycardia · cancer pain · cardiac disorder · chest pain · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dry mouth · dysphonia · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair colour changes · headache · hepatic disorders · hiccups · hyperbilirubinaemia · hyperhidrosis · hypertension · hypoalbuminaemia · hypothyroidism · increased risk of infection · insomnia · left ventricular dysfunction · leucopenia · mucosal abnormalities · muscle complaints · musculoskeletal pain · nail disorder · nausea · neutropenia · oedema · oral disorders · peripheral neuropathy · proteinuria · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia ·

vasodilation • venous thromboembolism • vision blurred • vomiting • weight decreased

- **Uncommon** Cerebrovascular insufficiency • eye disorders • haemolytic uraemic syndrome • menstrual cycle irregularities • myocardial infarction • myocardial ischaemia • oropharyngeal pain • pancreatitis • photosensitivity reaction • polycythaemia • QT interval prolongation • rhinorrhoea • skin ulcer • thrombotic microangiopathy
- **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION** Effective contraception advised during treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment. **Dose adjustments** Reduce dose to 200 mg once daily in moderate impairment.
- **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 30 mL/minute—no information available.

● MONITORING REQUIREMENTS

- Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.
- Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).
- Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.
- Monitor for proteinuria.
- Monitor thyroid function.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013)** NICE TA215 Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:
 - who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1 **and**
 - if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

www.nice.org.uk/TA215

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2011) that pazopanib (*Votrient*®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is **not** recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

- **Votrient** (Novartis Pharmaceuticals UK Ltd)

Pazopanib (as Pazopanib hydrochloride) 200 mg *Votrient* 200mg tablets | 30 tablet **[PoM]** £560.50

Pazopanib (as Pazopanib hydrochloride) 400 mg *Votrient* 400mg tablets | 30 tablet **[PoM]** £1,121.00

Ponatinib

19-Jul-2017

● INDICATIONS AND DOSE

Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T3151 mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate | Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T3151 mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate

► BY MOUTH

- **Adult:** 45 mg once daily, for dose adjustments due to side-effects or dose reduction due to risk of vascular occlusive events, consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises consider a reduced initial dose of 30 mg daily with concurrent use of potent inhibitors of CYP3A4.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS—UPDATED ADVICE ON POSSIBLE DOSE REDUCTION (UPDATED APRIL 2017)

The benefits and risks of ponatinib were reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use in 2014, which recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. Additional long-term follow-up data are now available that supports new advice on dose modification to reduce this risk. The MHRA advise that although the recommended starting dose of ponatinib remains unchanged, prescribers should consider reducing the dose for patients with chronic phase chronic myeloid leukaemia (CP-CML) who have achieved a major cytogenetic response while on treatment. The following factors should be taken into account in the individual patient assessment:

- cardiovascular risk;
- side-effects of ponatinib therapy (including cardiovascular and other dose-related toxicity);
- time to cytogenetic response;
- BCR-ABL transcript levels.

The MHRA recommends close monitoring of response, if dose reduction is undertaken.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS

An EU wide review has concluded that ponatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Alcohol abuse—increased risk of pancreatitis • current severe hypertriglyceridaemia—increased risk of

pancreatitis · discontinue treatment if a complete haematologic response has not occurred within 3 months · hepatitis B infection · history of myocardial infarction—do not use unless potential benefit outweighs potential risk · history of pancreatitis · history of stroke—do not use unless potential benefit outweighs potential risk · hypertension—medically control during treatment and interrupt treatment if uncontrolled

CAUTIONS, FURTHER INFORMATION

- ▶ **Cardiovascular status** Assess cardiovascular status before treatment—manage cardiovascular risk factors before and during treatment.
- ▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

● **INTERACTIONS** → Appendix 1: ponatinib

● SIDE-EFFECTS

- ▶ **Common or very common** Acute coronary syndrome · alopecia · anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · cerebrovascular insufficiency · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · erectile dysfunction · eye inflammation · febrile neutropenia · fever · fluid imbalance · gastrointestinal discomfort · gastroesophageal reflux disease · haemorrhage · headaches · heart failure · hyperglycaemia · hypertension · hypertriglyceridaemia · hyperuricaemia · hypothyroidism · increased risk of infection · influenza like illness · insomnia · ischaemic heart disease · lethargy · mass · muscle complaints · nausea · oedema · pain · pancreatitis · pancytopenia · pericardial effusion · peripheral neuropathy · peripheral vascular disease · pleural effusion · pulmonary hypertension · sensation abnormal · sepsis · skin reactions · stomatitis · sweat changes · vasodilation · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Cardiac discomfort · cardiomyopathy ischaemic · coronary vasospasm · hepatic disorders · hepatic failure (including fatal cases) · intracranial haemorrhage · left ventricular dysfunction · renal artery stenosis · splenic infarction · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown—alternative or additional methods of contraception should be used.
- **PREGNANCY** Avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter—withhold treatment if lipase elevated and abdominal symptoms occur.
 - ▶ Manufacturer advises a full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.
 - ▶ Manufacturer advises monitor liver function periodically.

- ▶ Manufacturer advises monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Ponatinib for treating chronic myeloid leukaemia and acute lymphoblastic leukaemia (June 2017)** NICE TA451

Ponatinib is recommended, within its marketing authorisation, as an option for treating chronic-, accelerated- or blast-phase chronic myeloid leukaemia in adults when:

- the disease is resistant to dasatinib or nilotinib **or**
- they cannot tolerate dasatinib or nilotinib and for whom subsequent treatment with imatinib is not clinically appropriate **or**
- the T315I gene mutation is present.

Ponatinib is recommended, within its marketing authorisation, as an option for treating Philadelphia-chromosome-positive acute lymphoblastic leukaemia in adults when:

- the disease is resistant to dasatinib **or**
- they cannot tolerate dasatinib and for whom subsequent treatment with imatinib is not clinically appropriate **or**
- the T315I gene mutation is present.

Ponatinib is recommended only if the company provides the drug with the discount agreed in the patient access scheme.

Regorafenib

21-Dec-2017

- **DRUG ACTION** Regorafenib is an inhibitor of several protein kinases.

● INDICATIONS AND DOSE

Metastatic colorectal cancer (specialist use only) | Unresectable or metastatic gastrointestinal stromal tumours (specialist use only) | Hepatocellular carcinoma (specialist use only)

- ▶ **BY MOUTH**

- ▶ **Adult:** 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 865.

- **CAUTIONS** Ensure measures to prevent hand-foot skin reaction · Gilbert's syndrome—risk of hyperbilirubinaemia · history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop · hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs) · may

impair wound healing— withhold treatment for major surgical procedures · predisposition to bleeding

● **INTERACTIONS** → Appendix 1: regorafenib

● **SIDE-EFFECTS**

► **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · diarrhoea · dry mouth · dysphonia · electrolyte imbalance · fever · gastroesophageal reflux disease · headache · hyperbilirubinaemia · hypertension · hyperuricaemia · hypothyroidism · increased risk of infection · leucopenia · mucositis · musculoskeletal stiffness · nausea · pain · proteinuria · skin reactions · stomatitis · taste altered · thrombocytopenia · tremor · vomiting · weight decreased

► **Uncommon** Gastrointestinal fistula (discontinue) · gastrointestinal perforation (including fatal cases, discontinue) · hepatic disorders · myocardial infarction · myocardial ischaemia · nail disorder

► **Rare or very rare** Neoplasms · posterior reversible encephalopathy syndrome (PRES) · severe cutaneous adverse reactions (SCARs)

● **CONCEPTION AND CONTRACEPTION** Women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk— toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

● **BREAST FEEDING** Avoid— present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Caution in severe impairment— no information available.

● **MONITORING REQUIREMENTS**

► Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.

► Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated— consult product literature if changes in liver function observed.

► Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)— discontinue treatment if symptoms occur.

► Monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction— consult product literature if signs or symptoms develop.

● **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.

● **PATIENT AND CARER ADVICE** Counselling advised (administration).

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► Regorafenib for previously treated unresectable or metastatic gastrointestinal stromal tumours (November 2017) NICE TA488

Regorafenib is recommended as an option for treating unresectable or metastatic gastrointestinal stromal tumours in adults whose disease has progressed on, or who are intolerant to, prior treatment with imatinib and sunitinib, only if:

- their Eastern Cooperative Oncology Group (ECOG) performance status is 0 to 1, **and**
- the manufacturer provides regorafenib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta488

► Regorafenib for previously treated advanced hepatocellular carcinoma (March 2018) NICE TA514

Regorafenib is **not** recommended for treating advanced unresectable hepatocellular carcinoma in adults who have had sorafenib.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta514

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1316/18

The *Scottish Medicines Consortium* has advised (May 2018) that regorafenib (*Stivarga*®) is accepted for use within NHS Scotland as monotherapy for the treatment of adults with hepatocellular carcinoma who have been previously treated with sorafenib. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Ribociclib

29-Jan-2018

● **DRUG ACTION** Ribociclib is an inhibitor of cyclin-dependent kinases 4 and 6, which are involved in cancer cell proliferation; their inhibition results in prevention of cancer cell growth.

● **INDICATIONS AND DOSE**

Locally advanced or metastatic breast cancer (specialist use only)

► **BY MOUTH**

► Adult: 600 mg once daily for 21 consecutive days of repeated 28 day cycles, to be taken at approximately the same time each day, preferably in the morning, for dose adjustments due to side-effects— consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg once daily; in those already taking 400 mg once daily, reduce dose to 200 mg once daily.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

● **CONTRA-INDICATIONS** Pre-existing QTc prolongation · risk factors for QTc prolongation (including concomitant use of drugs known to prolong QTc interval)

● **INTERACTIONS** → Appendix 1: ribociclib

● **SIDE-EFFECTS**

► **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · back pain · constipation · decreased leucocytes · diarrhoea · dry eye · dyspnoea · electrolyte

imbalance · epistaxis · excessive tearing · fever · gastrointestinal discomfort · headache · hepatotoxicity · insomnia · nausea · neutropenia · peripheral oedema · QT interval prolongation · skin reactions · stomatitis · syncope · taste altered · thrombocytopenia · urinary tract infection · vomiting · weight decreased

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to peanut or soya products.

● HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises reduce starting dose to 400 mg once daily in moderate-to-severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe renal impairment—limited information available.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises to perform full blood counts and liver function tests before initiating treatment, every 2 weeks for the first 2 cycles, at the beginning of the subsequent 4 cycles, and then as clinically indicated thereafter.
- ▶ Manufacturer advises to assess ECG before initiating treatment (only initiate treatment in patients with QTcF values <450 milliseconds); ECG should be repeated at approx. day 14 of the first cycle and at the beginning of the second cycle, then as clinically indicated.
- ▶ Manufacturer advises to monitor serum electrolytes (including potassium, calcium, phosphorus and magnesium) before initiating treatment, at the beginning of the first 6 cycles and then as clinically indicated; any abnormality should be corrected before initiating treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Ribiciclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (December 2017)

NICE TA496

Ribiciclib, with an aromatase inhibitor, is recommended within its marketing authorisation, as an option for treating hormone receptor-positive, human epidermal growth factor receptor 2-negative, locally advanced or metastatic breast cancer as initial endocrine-based therapy in adults. Ribiciclib is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta496

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1295/18

The *Scottish Medicines Consortium* has advised (March 2018) that ribiciclib (*Kisqali*®) is accepted for use within NHS Scotland in combination with an aromatase inhibitor, for the treatment of postmenopausal women with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer as initial endocrine-based therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

Ruxolitinib

02-Jun-2016

- **DRUG ACTION** Ruxolitinib is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2.

● INDICATIONS AND DOSE

Treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis

▶ BY MOUTH

▶ Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 865.

- **CAUTIONS** Assess risk of developing infection before treatment—do not initiate until active serious infections are resolved

CAUTIONS, FURTHER INFORMATION

- ▶ **Tuberculosis** Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment.

- **INTERACTIONS** → Appendix 1: ruxolitinib

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · bruising · constipation · dizziness · dyslipidaemia · flatulence · haemorrhage · headache · hypertension · increased risk of infection · intracranial haemorrhage · neutropenia · sepsis · thrombocytopenia · weight increased

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

Dose adjustments Reduce dose (consult product literature).

● RENAL IMPAIRMENT

Dose adjustments Reduce dose in severe impairment (consult product literature).

● MONITORING REQUIREMENTS

- ▶ Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
- ▶ Monitor for infection during treatment.
- ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Ruxolitinib for treating disease-related splenomegaly or symptoms in adults with myelofibrosis (March 2016)

NICE TA386

Ruxolitinib is recommended as an option for treating disease-related splenomegaly or symptoms in patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythaemia vera myelofibrosis or post essential thrombocythaemia myelofibrosis, only if the patient has intermediate-2 or high-risk disease, **and** if the manufacturer provides ruxolitinib with the discount agreed in the patient access scheme.

Patients currently receiving ruxolitinib whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA386

Sorafenib

29-Jun-2017

● DRUG ACTION Sorafenib is an inhibitor of multiple kinases.**● INDICATIONS AND DOSE**

Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable | Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine | Treatment of hepatocellular carcinoma

► BY MOUTH

► Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Cardiac ischaemia · major surgical procedures · potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding · susceptibility to QT-interval prolongation

● INTERACTIONS → Appendix 1: sorafenib**● SIDE-EFFECTS**

- **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · congestive heart failure · constipation · decreased leucocytes · depression · diarrhoea · dry mouth · dysphagia · dysphonia · electrolyte imbalance · erectile dysfunction · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypertension · hypothyroidism · increased risk of infection · influenza like illness · intracranial haemorrhage · mucositis · muscle complaints · myocardial infarction · myocardial ischaemia · nausea · neoplasms · neutropenia · oral disorders · pain · peripheral neuropathy · proteinuria · renal failure · rhinorrhoea · skin reactions · taste altered · thrombocytopenia · tinnitus · vomiting · weight decreased
- **Uncommon** Cholangitis · cholecystitis · dehydration · encephalopathy · gynaecomastia · hepatic disorders · hyperthyroidism · pancreatitis · radiation injuries · respiratory disorders
- **Rare or very rare** Angioedema · hypersensitivity vasculitis · nephrotic syndrome · QT interval prolongation · rhabdomyolysis · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

- Consider periodic monitoring of ECG and electrolytes in patients susceptible to QT-interval prolongation.
- Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
- Monitor plasma-calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
- Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.

● NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TA178

Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced and/or metastatic renal cell carcinoma.

Sorafenib and sunitinib are **not** recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

www.nice.org.uk/TA178

- Sorafenib for treating advanced hepatocellular carcinoma (September 2017) NICE TA474

Sorafenib is recommended as an option for treating advanced hepatocellular carcinoma only for patients with Child-Pugh grade A liver impairment, only if the company provides sorafenib within the agreed commercial access arrangement. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA474

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2016) that sorafenib (*Nexavar*®) is accepted for restricted use within NHS Scotland for the treatment of advanced hepatocellular carcinoma in patients where surgical or loco-regional therapies have failed or are unsuitable. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23

► **Nexavar** (Bayer Plc)

Sorafenib (as Sorafenib tosylate) 200 mg Nexavar 200mg tablets | 112 tablet [PoM] £3,576.56

Sunitinib

24-Jul-2017

● DRUG ACTION Sunitinib is a tyrosine kinase inhibitor.**● INDICATIONS AND DOSE**

Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib | Treatment of advanced or metastatic renal cell carcinoma

► BY MOUTH

- Adult: 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25–75 mg daily

continued →

Treatment of unresectable or metastatic pancreatic neuroendocrine tumours

► BY MOUTH

- Adult: 37.5 mg once daily without treatment-free period; increased in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, dose may need to be increased in steps of 12.5 mg to a max. dose of 87.5 mg per day for gastro-intestinal stromal tumours or renal cell carcinoma, or to a max. dose of 62.5 mg per day for pancreatic neuroendocrine tumours.
- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, dose may need to be decreased to a minimum of 37.5 mg per day for gastrointestinal stromal tumours or renal cell carcinoma, or to a minimum of 25 mg per day for pancreatic neuroendocrine tumours.

IMPORTANT SAFETY INFORMATION**RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)**

Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 865.

- **CAUTIONS** Cardiovascular disease—discontinue if congestive heart failure develops • hypertension • increased risk of bleeding • susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1: sunitinib

● SIDE-EFFECTS

- **Common or very common** Abscess • alopecia • anaemia • appetite decreased • arthralgia • burping • chest pain • chills • constipation • cough • dehydration • depression • diarrhoea • dizziness • dry mouth • dysphagia • dyspnoea • embolism and thrombosis • excessive tearing • eye inflammation • fatigue • fever • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • hair colour changes • headache • hypertension • hypoglycaemia • hypothyroidism • increased risk of infection • influenza like illness • insomnia • leucopenia • mucositis • muscle complaints • muscle weakness • myocardial ischaemia • nail disorder • nasal complaints • nausea • neutropenia • oedema • oral disorders • oropharyngeal pain • pain • peripheral neuropathy • proteinuria • renal impairment • respiratory disorders • sensation abnormal • sepsis • skin reactions • taste altered • thrombocytopenia • urine discoloration • vasodilation • vomiting • weight decreased
- **Uncommon** Anal fistula (interrupt treatment) • cardiomyopathy • cerebrovascular insufficiency • cholecystitis • fistula (interrupt treatment) • healing impaired • heart failure • hepatic disorders • hypersensitivity • hyperthyroidism • intracranial haemorrhage • myocardial infarction • osteonecrosis of jaw • pancreatitis • pancytopenia • pericardial effusion • QT interval prolongation • tumour haemorrhage
- **Rare or very rare** Angioedema • myopathy • nephrotic syndrome • posterior reversible encephalopathy syndrome (PRES) • pyoderma gangrenosum • severe cutaneous

adverse reactions (SCARs) • thrombotic microangiopathy • thyroiditis • torsade de pointes • tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Discontinue breast-feeding.
- **MONITORING REQUIREMENTS** Monitor for thyroid dysfunction.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Sunitinib for advanced or metastatic renal cell carcinoma (March 2009)** NICE TA169
Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1. www.nice.org.uk/TA169
 - **Sunitinib for the treatment of gastrointestinal stromal tumours (September 2009)** NICE TA179
Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer. www.nice.org.uk/TA179
 - **Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009)** NICE TA178
Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. www.nice.org.uk/TA178
 - **Everolimus and sunitinib for treating unresectable or metastatic neuroendocrine tumours in people with progressive disease (June 2017)** NICE TA449
Everolimus and sunitinib are recommended, within their marketing authorisations, as options for treating well- or moderately differentiated unresectable or metastatic neuroendocrine tumours (NETs) of pancreatic origin in adults with progressive disease. www.nice.org.uk/guidance/TA449
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (November 2009) that sunitinib (*Sutent*®) is accepted for use within NHS Scotland for the treatment of unresectable and/or metastatic malignant gastrointestinal stromal tumours after failure of imatinib.
- The *Scottish Medicines Consortium* has advised (May 2011) that sunitinib (*Sutent*®) is accepted for use within NHS Scotland for the treatment of unresectable or metastatic, well-differentiated pancreatic neuroendocrine tumours with disease progression in adults.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 14

► **Sutent** (Pfizer Ltd)

Sunitinib (as Sunitinib malate) 12.5 mg Sutent 12.5mg capsules | 28 capsule [PoM] £784.70 (Hospital only)

Sunitinib (as Sunitinib malate) 25 mg Sutent 25mg capsules | 28 capsule [PoM] £1,569.40 (Hospital only)

Sunitinib (as Sunitinib malate) 50 mg Sutent 50mg capsules | 28 capsule [PoM] £3,138.80 (Hospital only)

Temsirolimus

- **DRUG ACTION** Temsirolimus is a protein kinase inhibitor.

● INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma

- BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **INTERACTIONS** → Appendix 1: temsirolimus

● SIDE-EFFECTS

- ▶ **Common or very common** Abscess · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · conjunctivitis · constipation · cough · cystitis · decreased leucocytes · dehydration · depression · diabetes mellitus · diarrhoea · dizziness · drowsiness · dyslipidaemia · dysphagia · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · genital oedema · haemorrhage · headache · hypersensitivity · hypertension · increased risk of infection · insomnia · lacrimation disorder · mucositis · myalgia · nail disorder · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · post procedural infection · renal failure · respiratory disorders · scrotal oedema · sepsis · skin reactions · taste altered · thrombocytopenia · vomiting

- ▶ **Uncommon** Healing impaired · intracranial haemorrhage · pericardial effusion

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution. In mantle cell lymphoma, avoid in moderate or severe impairment. **Dose adjustments** In renal cell carcinoma, reduce dose in severe impairment (consult product literature).

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor respiratory function.
- ▶ Monitor blood lipids.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
- ▶ Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. www.nice.org.uk/TA178

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol, propylene glycol

- ▶ **Torisel** (Pfizer Ltd)

Temsirolimus 25 mg per 1 ml Torisel 30mg/1.2ml concentrate for solution for infusion vials and diluent | 1 vial [PoM] £620.00 (Hospital only)

Tivozanib

26-Apr-2018

- **DRUG ACTION** Tivozanib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

Advanced renal cell carcinoma (specialist use only)

- ▶ BY MOUTH

- ▶ Adult: 1340 micrograms once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** History of arterial thromboembolic events · history of bleeding disorders · history of posterior reversible encephalopathy syndrome following tivozanib treatment · history of QT-interval prolongation · history of venous thromboembolic events · major surgical procedures—interrupt treatment · patients aged over 65 years—increased risk of adverse effects · pre-existing cardiac disease · risk factors for arterial thromboembolic events · risk factors for gastro-intestinal fistula · risk factors for gastro-intestinal perforation · risk factors for venous thromboembolic events · risk of bleeding

- **INTERACTIONS** → Appendix 1: tivozanib

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · angina pectoris · appetite decreased · arthralgia · asthenia · chills · constipation · cough · diarrhoea · dizziness · dry mouth · dysphagia · dysphonia · dyspnoea · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypertension · hypothyroidism · increased risk of infection · insomnia · myalgia · myocardial infarction · nasal complaints · nausea · oral disorders · pain · pancreatitis · peripheral neuropathy · peripheral oedema · proteinuria · skin reactions · tachycardia · taste altered · tinnitus · vertigo · visual impairment · vomiting · weight decreased
- ▶ **Uncommon** Ear congestion · excessive tearing · goitre · hyperhidrosis · hyperthyroidism · memory loss · mucositis · muscle weakness · pulmonary oedema · QT interval prolongation · thrombocytopenia · transient ischaemic attack

- ▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men, women of childbearing potential, and their partners during treatment and for at least one month after the last dose; an additional barrier method of contraception should be used in women using hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment—monitor patients for tolerability; avoid in severe impairment.

Dose adjustments Manufacturer advises reduce dose to 1340 micrograms on alternate days in moderate impairment—increased risk of adverse effects due to increased exposure.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises perform liver function tests (including ALT, AST and AP) before and during treatment; monitor for proteinuria before treatment and periodically thereafter.
- ▶ Manufacturer advises monitor blood pressure before and during treatment; monitor for signs or symptoms of cardiac failure during treatment.
- ▶ Manufacturer advises perform baseline ECG and monitor electrolytes before treatment and as clinically indicated thereafter.
- ▶ Manufacturer advises monitor thyroid function before treatment and periodically thereafter.
- ▶ Manufacturer advises monitor for symptoms of gastrointestinal perforation or fistula.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Tivozanib for treating advanced renal cell carcinoma (March 2018)** NICE TA512

Tivozanib is recommended as an option for treating advanced renal cell carcinoma in adults, only if:

- they have had no previous treatment, **and**
- the manufacturer provides tivozanib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Trametinib

04-May-2017

- **DRUG ACTION** Trametinib is a protein kinase inhibitor.

● **INDICATIONS AND DOSE**

Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with dabrafenib)

- ▶ **BY MOUTH**

- ▶ **Adult:** 2 mg once daily, when used in combination with dabrafenib, the dose should be taken at the same time each day with *either* the morning or evening dose of dabrafenib, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2016): TRAMETINIB: RISK OF GASTROINTESTINAL PERFORATION AND COLITIS

A review by EU medicines regulators has concluded that trametinib can cause gastrointestinal perforation or colitis.

Trametinib should be used with caution in patients with risk factors for gastrointestinal perforation, such as gastrointestinal metastases, diverticulitis, or use of concomitant medicines that can cause gastrointestinal perforation. Prescribers should be vigilant for signs and symptoms of gastrointestinal perforation and should advise patients to seek urgent medical attention if they develop severe abdominal pain.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** History of retinal vein occlusion

- **CAUTIONS** Concomitant antiplatelet or anticoagulant therapy—increased risk of haemorrhage · conditions that could impair left ventricular function · elderly (more frequent dose adjustments may be required) · impaired left ventricular function · predisposing factors for retinal vein occlusion · risk factors for gastrointestinal perforation

- **INTERACTIONS** → Appendix 1: trametinib

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · alopecia · anaemia · asthenia · bradycardia · constipation · cough · dehydration · diarrhoea · dry mouth · dyspnoea · eye inflammation · fever · haemorrhage · hypersensitivity · hypertension · increased risk of infection · intracranial haemorrhage · left ventricular dysfunction · lymphoedema · mucositis · nausea · oedema · respiratory disorders · skin reactions · stomatitis · vision disorders · vomiting
- ▶ **Uncommon** Chorioretinopathy · gastrointestinal disorders · heart failure · retinal detachment · retinal occlusion · rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION Additional side-effects reported when used in combination with dabrafenib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use highly effective non-hormonal contraception during, and for 4 months after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises measure blood pressure at baseline and monitor during treatment; evaluate left ventricular ejection fraction before treatment, after one month of treatment, and then approximately every 3 months thereafter; monitor liver function every 4 weeks for 6 months after treatment initiation, and thereafter as clinically indicated.

- **HANDLING AND STORAGE** Manufacturer advises store in refrigerator (2–8 °C); once opened, bottle may be stored for 30 days at not more than 30 °C.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told to seek immediate medical attention if symptoms of pulmonary embolism or deep vein thrombosis occur; patients and their carers should also be advised to report new visual disturbances.

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and

performance of skilled tasks—risk of dizziness and visual disturbances.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016)** NICE TA396
Trametinib in combination with dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation only when the company provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.
www.nice.org.uk/TA396

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2016) that trametinib (*Mekinist*®), in combination with dabrafenib, is accepted for restricted use within NHS Scotland for first-line treatment of adult patients with unresectable or metastatic melanoma with a BRAF V600 mutation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 23, 25

Vandetanib

- **DRUG ACTION** Vandetanib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease

- ▶ BY MOUTH

Adult: 300 mg once daily, for dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Congenital long QT syndrome · QT interval greater than 480 milliseconds
- **CAUTIONS** Brain metastases (intracranial haemorrhage reported) · electrolyte disturbances · history of torsades de pointes · hypertension · phototoxicity reactions reported (wear protective clothing and/or sunscreen) · susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1: vandetanib
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anxiety · appetite decreased · asthenia · cerebral ischaemia · cholelithiasis · constipation · corneal deposits · cystitis · dehydration · depression · diarrhoea · dizziness · dry eye · dry mouth · dysphagia · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · glaucoma · haemorrhage · headache · hyperglycaemia · hypertension · hypothyroidism · increased risk of infection · insomnia · lethargy · loss of consciousness · movement disorders · nail disorder · nausea · nephrolithiasis · oedema · pain · photosensitivity reaction · proteinuria · QT interval prolongation · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions · stomatitis ·

taste altered · tremor · urinary disorders · vision disorders · vomiting · weight decreased

- ▶ **Uncommon** Arrhythmias · brain oedema · cardiac arrest · cardiac conduction disorder · cataract · healing impaired · heart failure · malnutrition · pancreatitis · posterior reversible encephalopathy syndrome (PRES) · seizure · Stevens-Johnson syndrome · urine discolouration
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 4 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal).
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.
Dose adjustments Reduce dose to 200 mg if creatinine clearance 30–49 mL/minute.
- **MONITORING REQUIREMENTS** Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vandetanib tablets. Phototoxicity reactions Patients should be advised to wear protective clothing and/or sunscreen.
Alert card should be provided.

● MEDICINAL FORMS

Vemurafenib

- **DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

● INDICATIONS AND DOSE

Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma

- ▶ BY MOUTH

Adult: 960 mg twice daily, for dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)

DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it

can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF POTENTIATION OF RADIATION TOXICITY

Potential of radiation toxicity has been reported in patients treated with vemurafenib before, during, or after radiotherapy—use with caution.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CONTRA-INDICATIONS** Wild-type BRAF malignant melanoma
- **CAUTIONS** Electrolyte disturbances · prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression · susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1: vemurafenib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** 7th nerve paralysis · alopecia · appetite decreased · arthralgia · arthritis · asthenia · connective tissue disorders · constipation · cough · diarrhoea · dizziness · eye inflammation · fever · folliculitis · headache · myalgia · nausea · neoplasms · pain · panniculitis · peripheral oedema · photosensitivity reaction · QT interval prolongation · radiation injuries · skin reactions · taste altered · vomiting · weight decreased
 - ▶ **Uncommon** Liver injury · neutropenia · pancreatitis · peripheral neuropathy · retinal occlusion · severe cutaneous adverse reactions (SCARs) · vasculitis
 - ▶ **Rare or very rare** Acute tubular necrosis · nephritis acute interstitial
 - ▶ **Frequency not known** Acute kidney injury
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during for at least 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT**

Monitoring Manufacturer advises more frequent monitoring in moderate to severe hepatic impairment (including monthly ECG monitoring during first 3 months of treatment).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline).
 - ▶ Monitor liver function before treatment and periodically thereafter.
 - ▶ Monitor for uveitis, iritis and retinal vein occlusion.
 - ▶ Monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food).
- **PATIENT AND CARER ADVICE** Counselling advised (administration).
Drug rash with eosinophilia and systemic symptoms (DRESS syndrome) Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012)** NICE TA269

Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides vemurafenib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA269

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2013) that vemurafenib (*Zelboraf*®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Niraparib (as Niraparib tosylate monohydrate) 100 mg Zejula 100mg capsules | 56 capsule [PoM] £4,500.00 (Hospital only) | 84 capsule [PoM] £6,750.00 (Hospital only)

Olaparib

09-Feb-2018

- **DRUG ACTION** Olaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore inhibition of PARP results in an antineoplastic effect.

● INDICATIONS AND DOSE

Ovarian cancer (initiated by a specialist) | Fallopian tube cancer (initiated by a specialist) | Peritoneal cancer (initiated by a specialist)

▶ BY MOUTH

- ▶ **Adult:** 400 mg twice daily; reduced if not tolerated to 200 mg twice daily, then reduced if not tolerated to 100 mg twice daily, take at least 1 hour after food and avoid food for 2 hours after taking, patients should start treatment within 8 weeks of receiving the final dose of their platinum-containing chemotherapy regimen

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 is unavoidable, reduce dose to 200 mg twice daily.
- ▶ Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 150 mg twice daily.

PHARMACOKINETICS

- ▶ Peak plasma concentrations are typically achieved 1 to 3 hours after dosing; steady-state is achieved within 3 to 4 days.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **INTERACTIONS** → Appendix 1: olaparib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite decreased · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · headache · lymphopenia · nausea · neutropenia · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Haematological toxicity Withhold treatment if severe haematological toxicity develops; further analysis recommended if toxicity still present 4 weeks after treatment withdrawal.

Pneumonitis If dyspnoea, cough and fever, or radiological abnormalities develop, withhold treatment and investigate; if pneumonitis confirmed, discontinue.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for 1 month after receiving the last dose. Consider an additional non-hormonal method of contraception.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment unless benefit outweighs potential risk—no information available.
- **Dose adjustments** Manufacturer advises reduce dose to 300 mg twice daily in moderate impairment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count every month for the first 12 months of treatment and periodically thereafter.
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

Driving and skilled tasks Malaise and dizziness may affect performance of skilled tasks e.g. driving or operating machinery.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Olaparib for maintenance treatment of relapsed, platinum-sensitive, BRCA mutation-positive ovarian, fallopian tube and peritoneal cancer after response to second-line or subsequent platinum-based chemotherapy (January 2016) NICE TA381
Olaparib is recommended as an option for treating adults with relapsed, platinum sensitive ovarian, fallopian tube or peritoneal cancer who have BRCA1 or BRCA2 mutations and whose disease has responded to platinum based chemotherapy only if:

- they have had 3 or more courses of platinum-based chemotherapy and;
- the drug cost of olaparib for people who remain on treatment after 15 months will be met by the company.

www.nice.org.uk/guidance/ta381

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2016) that olaparib (*Lynparza*®) is accepted for use within NHS Scotland as monotherapy for the maintenance treatment of adults with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Olaparib 50 mg Lynparza 50mg capsules | 448 capsule [PoM] £3,550.00

Venetoclax

07-Sep-2017

- **DRUG ACTION** Venetoclax is a potent, selective inhibitor of B-cell lymphoma-2 (BCL-2).

● INDICATIONS AND DOSE

Chronic lymphocytic leukaemia in the presence of 17p deletion or TP53 mutation when a B-cell receptor pathway inhibitor is unsuitable or ineffective (specialist use only) | Chronic lymphocytic leukaemia in the absence of 17p deletion or TP53 mutation when both chemo-immunotherapy and a B-cell receptor pathway inhibitor has been ineffective (specialist use only)

► BY MOUTH

- **Adult:** Initially 20 mg once daily for 7 days, then increased to 50 mg once daily for 7 days, then increased to 100 mg once daily for 7 days, then increased to 200 mg once daily for 7 days, then maintenance 400 mg once daily, dose to be taken in the morning during dose-titration phase; dose should be taken at the same time every day, for dose adjustment due to side effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Avoid concomitant use of potent or moderate CYP3A4 inhibitors during initiation and dose-titration; once stable reduce dose by 75% with concomitant use of potent CYP3A4 inhibitors and by 50% with concomitant use of moderate CYP3A4 inhibitors.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **CAUTIONS** Ensure adequate hydration
- **INTERACTIONS** → Appendix 1: venetoclax
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · constipation · diarrhoea · electrolyte imbalance · fatigue · hyperuricaemia · increased risk of infection · lymphopenia · nausea · neutropenia · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises ensure effective, non-hormonal contraception during and for 30 days after treatment in women of child-bearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 865.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring during initiation and dose titration in moderate impairment (increased risk of toxicity); avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring (increased risk of tumour lysis syndrome); use only if potential benefit outweighs risk in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function before starting treatment.
- **PATIENT AND CARER ADVICE**
 - Hydration Manufacturer advises patients should drink 1.5–2 L of water daily, starting 2 days before and throughout the dose-titration phase; intravenous fluids should be administered for those who cannot maintain an adequate level of oral hydration with consideration of overall risk of tumour lysis syndrome.
 - Vomiting Manufacturer advises that if vomiting occurs following dose administration, no additional doses should

be taken on that day and the next dose should be taken at the normal time.

Missed doses Manufacturer advises that if a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Venetoclax for treating chronic lymphocytic leukaemia (November 2017) NICE TA487

Venetoclax is recommended for use within the Cancer Drugs Fund, within its authorisation, as an option for treating chronic lymphocytic leukaemia in adults:

- with a 17p deletion or TP53 mutation and when a B-cell receptor pathway inhibitor is unsuitable, or whose disease has progressed after a B-cell receptor pathway inhibitor or
- without a 17p deletion or TP53 mutation, and whose disease has progressed after both chemo-immunotherapy and a B-cell receptor pathway inhibitor, and
- only if the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA487

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2017) that venetoclax (*Venclyxto*®) is accepted for use within NHS Scotland as monotherapy for the treatment of chronic lymphocytic leukaemia:

- in the presence of 17p deletion or TP53 mutation in patients who are unsuitable for or have failed a B-cell receptor pathway inhibitor; or
 - in the absence of 17p deletion or TP53 mutation in patients who have failed both chemoimmunotherapy and a B-cell receptor pathway inhibitor.
- This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

Vismodegib

17-Jan-2018

- **DRUG ACTION** Vismodegib is a hedgehog pathway inhibitor.

● INDICATIONS AND DOSE

Symptomatic metastatic basal cell carcinoma | Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy

► BY MOUTH

- **Adult:** 150 mg once daily

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 865.

- **INTERACTIONS** → Appendix 1: vismodegib

● SIDE-EFFECTS

► **Common or very common** Alopecia · amenorrhoea · appetite decreased · arthralgia · asthenia · constipation · dehydration · diarrhoea · gastrointestinal discomfort · hair growth abnormal · muscle complaints · nausea · pain · skin reactions · taste altered · vomiting · weight decreased

► **Frequency not known** Epiphyses premature fusion

● **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.

● **PREGNANCY Important: teratogenic risk**—may cause severe birth defects and embryo-fetal death.

● **BREAST FEEDING** Avoid during treatment and for 24 months after final dose.

● **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution in moderate to severe impairment.

● **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.

● **PRESCRIBING AND DISPENSING INFORMATION** Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer's Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme's pregnancy prevention measures—consult product literature for further information.

● **PATIENT AND CARER ADVICE**
Conception and contraception Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer's pregnancy prevention programme.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Vismodegib for treating basal cell carcinoma (November 2017)** NICE TA489

Vismodegib is not recommended within its marketing authorisation for treating symptomatic metastatic basal cell carcinoma, or locally advanced basal cell carcinoma that is inappropriate for surgery or radiotherapy, in adults.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

ANTINEOVASCULARISATION DRUGS > VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

06-Dec-2017

● **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

● INDICATIONS AND DOSE

In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● **CONTRA-INDICATIONS** Moderate or severe congestive heart failure · uncontrolled hypertension

● **CAUTIONS** Febrile neutropenia · history of cardiovascular disease (may be exacerbated by hypertension) · increased risk of haemorrhage (including fatal events) · increased risk of hypertension · increased risk of thromboembolic events (consult product literature if event occurs) · may impair wound healing—withdraw treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed · neutropenic infection · risk of fistula formation (discontinue if fistula develops) · risk of neutropenia · risk of thrombocytopenia

● **INTERACTIONS** → Appendix 1: aflibercept

● SIDE-EFFECTS

► **Common or very common** Cataract · eye discomfort · eye disorders · eye inflammation · haemorrhage · retinal pigment epithelial tear · vision disorders

► **Uncommon** Lens opacity

● **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

► Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult product literature if hypertension develops during treatment.

► Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).

► Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.

- ▶ Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).
- ▶ Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.
- ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) NICE TA307
Aflibercept in combination with irinotecan and fluorouracil-based therapy is **not** recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.

Blood and blood-forming organs

1 Anaemias

Anaemias

Anaemia treatment considerations

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza

vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 910 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylthioninium chloride
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonyleureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 1047, antilymphocyte immunoglobulin, rituximab p. 859 [unlicensed indication], and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin p. 818 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in *aplastic anaemia* for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological

effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid p. 576 treatment, pyridoxine hydrochloride is also indicated.

Corticosteroids have an important place in the management of haematological disorders. They include conditions with an *autoimmune haemolytic anaemia*, *immune thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 982 is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol.

Darbepoetin alfa p. 979 is a hyperglycosylated derivative of epoetin; it has a longer half life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta p. 984 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

EPOETINS

Epoetins

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008) ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of *symptomatic* anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

- **CONTRA-INDICATIONS** Patients unable to receive thromboprophylaxis · pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the

response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident · risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine-like pain (warning of a hypertensive crisis) · thrombocytosis (monitor platelet count for first 8 weeks)

• SIDE-EFFECTS

- **Common or very common** Arthralgia · embolism and thrombosis · headache · hypertension (dose-dependent) · influenza like illness · skin reactions · stroke
- **Uncommon** Hypertensive crisis (in isolated patients with normal or low blood pressure) · respiratory tract congestion · seizure
- **Rare or very rare** Thrombocytosis
- **Frequency not known** Pure red cell aplasia (more common following subcutaneous administration in patients with chronic renal failure)

SIDE-EFFECTS, FURTHER INFORMATION

Hypertensive crisis In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

• MONITORING REQUIREMENTS

- Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

► above

Darbepoetin alfa

• INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at continued →

a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

► BY INTRAVENOUS INJECTION

- Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 6.75 micrograms/kg every 3 weeks, alternatively initially 2.25 micrograms/kg once weekly, if response inadequate after 9 weeks further treatment may not be effective; if adequate response obtained then reduce dose by 25–50%, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

● **INTERACTIONS** → Appendix 1: darbopoetin alfa

● **SIDE-EFFECTS**

- **Common or very common** Hypersensitivity • oedema

● **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Epoetin alfa

● INDICATIONS AND DOSE

BINOCRIT® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

► BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

► BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

► BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

► BY INTRAVENOUS INJECTION

- Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

► BY SUBCUTANEOUS INJECTION

- Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

EPREX® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

► BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

► BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

► BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds continued →

12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

► BY INTRAVENOUS INJECTION

- Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

► BY SUBCUTANEOUS INJECTION

- Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

● **INTERACTIONS** → Appendix 1: epoetin alfa

● **SIDE-EFFECTS**

- **Common or very common** Chills · cough · diarrhoea · fever · myalgia · nausea · pain · peripheral oedema · vomiting
- **Uncommon** Hyperkalaemia

● **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

● **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.

● **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.

● **PRESCRIBING AND DISPENSING INFORMATION** Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● **INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic renal failure

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

► BY INTRAVENOUS INJECTION

- Adult: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL

over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 450 units/kg once weekly for 4 weeks, dose to be given weekly as a single dose or in 3–7 divided doses, increase dose after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved), increased to 900 units/kg once weekly, dose to be given weekly as a single dose or in 3–7 divided doses, if adequate response obtained reduce dose by 25–50%, discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable

Methoxy polyethylene glycol-epoetin beta

29-Nov-2017

● **INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins

► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION

- **Adult:** Initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis, dose to be adjusted according to response at intervals of at least 1 month, maintenance dose of double the previous fortnightly dose may be given once a month if haemoglobin concentration is above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration is obtained

Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and not currently treated with erythropoietins

► INITIALLY BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 1.2 micrograms/kg every month, alternatively (by subcutaneous injection or by intravenous injection) initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis, dose to be adjusted according to response at intervals of at least 1 month, patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose once a month if haemoglobin concentration is

above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration is obtained

Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

- **CONTRA-INDICATIONS** Pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- **CAUTIONS** Bone marrow fibrosis (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · haematological disease (can impair the response to erythropoietin) · haemolysis (can impair the response to erythropoietin) · inflammatory or traumatic episodes (can impair the response to erythropoietin) · malignant disease · occult blood loss (can

impair the response to erythropoietin) · severe aluminium toxicity (can impair the response to erythropoietin)

● SIDE-EFFECTS

- ▶ **Common or very common** Hypertension (dose-dependent)
- ▶ **Uncommon** Embolism and thrombosis · headache
- ▶ **Rare or very rare** Hot flush · hypertensive encephalopathy · rash maculopapular
- ▶ **Frequency not known** Pure red cell aplasia (discontinue) · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Manufacturer advises caution with escalation of doses in chronic renal failure.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor haemoglobin concentration every 2 weeks until stabilised and periodically thereafter—if patient fails to respond, check reticulocyte count, and search for causative factors such as deficiencies of iron, folic acid or vitamin B12, and correct if necessary. Monitor iron status before and during treatment.
- ▶ Manufacturer advises monitor blood pressure before and during treatment—if inadequately controlled, reduce dose or discontinue treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Methoxy polyethylene glycol-epoetin beta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

The manufacturer of *Mircera*® has provided a *Physician's Guide* which includes important safety information to minimise the risk of pure red cell aplasia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Mircera** (Roche Products Ltd)

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Eculizumab

04-Dec-2017

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

● INDICATIONS AND DOSE

Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

► BY INTRAVENOUS INFUSION

- Adult. Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week; maintenance 900 mg every 12–16 days

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult. Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week; maintenance 1.2 g every 12–16 days

- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection
- **CAUTIONS** Active systemic infection
- **CAUTIONS, FURTHER INFORMATION**
 - Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · asthenia · chills · cough · decreased leucocytes · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · hypertension · increased risk of infection · influenza like illness · joint disorders · muscle complaints · nausea · oropharyngeal pain · pain · skin reactions · sleep disorders · taste altered · tremor · vomiting
 - **Uncommon** Abscess · anxiety · appetite decreased · chest discomfort · constipation · cystitis · depression · dysuria · haemorrhage · hot flush · hyperhidrosis · hypersensitivity · hypotension · meningitis meningococcal · mood swings · nasal complaints · oedema · palpitations · paraesthesia · sepsis · spontaneous penile erection · throat irritation · tinnitus · vascular disorders · vertigo · vision blurred
 - **Rare or very rare** Abnormal clotting factor · conjunctival irritation · feeling hot · gastroesophageal reflux disease · gingival discomfort · Grave's disease · infusion related reaction · jaundice · malignant melanoma · menstrual disorder · syncope · urogenital tract gonococcal infection

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.
 - **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.
 - **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.
 - **MONITORING REQUIREMENTS**
 - Monitor for 1 hour after infusion.
 - For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
 - For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
 - **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Soliris®)*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur).
 - **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.
 - **PATIENT AND CARER ADVICE** Patient or carers should be advised to report promptly any signs of meningococcal infection.
A patient information card should be provided.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE decisions**
 - **Eculizumab for treating atypical haemolytic uraemic syndrome (January 2015)** NICE HST1 Eculizumab, within its marketing authorisation, is recommended for funding for treating atypical haemolytic uraemic syndrome, only if all the following arrangements are in place:
 - coordination of eculizumab use through an expert centre, **and**
 - monitoring systems to record the number of people with a diagnosis of atypical haemolytic uraemic syndrome and the number who have eculizumab, and the dose and duration of treatment, **and**
 - a national protocol for starting and stopping eculizumab for clinical reasons, **and**
 - a research programme with robust methods to evaluate when stopping treatment or dose adjustment might occur.
- The long-term budget impact of eculizumab for treating atypical haemolytic uraemic syndrome is uncertain but will be considerable. NHS England and the manufacturer should consider what opportunities might exist to reduce the cost of eculizumab to the NHS.

1.2 Iron deficiency anaemia

Anaemia, iron deficiency

Iron deficiency, treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastro-intestinal cancer).

Prophylaxis with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

Iron content of different iron salts		
Iron salt/amount		Content of ferrous iron
ferrous fumarate	200 mg	65 mg
ferrous gluconate	300 mg	35 mg
ferrous sulfate	300 mg	60 mg
ferrous sulfate, dried	200 mg	65 mg

Compound preparations

Preparations containing iron and folic acid p. 993 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 1049 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins** (except folic acid for pregnant women).

Modified-release preparations

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 988, iron sucrose p. 989, ferric carboxymaltose p. 988, or iron isomaltoside 1000 p. 988. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it

reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

Iron (injectable)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

• SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · flushing · headache · hypertension · hypophosphataemia · hypotension · nausea · taste altered
- ▶ **Uncommon** Arrhythmias · arthralgia · bronchospasm · chest pain · chills · constipation · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · hyperhidrosis · hypersensitivity · loss of consciousness · muscle complaints · pain · peripheral oedema · sensation abnormal · skin reactions · vascular disorders · vision blurred · vomiting
- ▶ **Rare or very rare** Angioedema · anxiety · circulatory collapse · influenza like illness · malaise · palpitations · psychiatric disorder · seizure · syncope · tremor

SIDE-EFFECTS, FURTHER INFORMATION Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1319.

Ferric carboxymaltose

• INDICATIONS AND DOSE

Iron-deficiency anaemia

- **BY SLOW INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
- **Adult:** Dose calculated according to body-weight and iron deficit (consult product literature)

- **CAUTIONS** Allergic disorders · asthma · eczema · hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · infection (discontinue if ongoing bacteraemia) · oral iron should not be given until 5 days after last injection

- **INTERACTIONS** → Appendix 1: iron (injectable)

• SIDE-EFFECTS

- **Rare or very rare** Face oedema · flatulence · presyncope
- **PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.

- **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Ferinject*®), give intermittently in Sodium chloride 0.9%, dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

- **INTERACTIONS** → Appendix 1: iron (injectable)

• SIDE-EFFECTS

- **Uncommon** Dermatitis · infection

- **Rare or very rare** Anaphylactic reaction · dysphonia

- **PREGNANCY** Avoid in first trimester.

- **HEPATIC IMPAIRMENT** Avoid in decompensated liver disease and hepatitis.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2017) that iron (III) isomaltoside 1000 5% (*Diafer*®) is accepted for use within NHS Scotland for the treatment of iron deficiency in adults with chronic kidney disease on dialysis, when oral iron preparations are ineffective or cannot be used. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

• MEDICINAL FORMS

MINERALS AND TRACE ELEMENTS > IRON, ORAL

Iron (oral)

● SIDE-EFFECTS

- **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · nausea
- **Uncommon** Vomiting
- **Frequency not known** Appetite decreased · faeces discoloured

SIDE-EFFECTS, FURTHER INFORMATION Iron can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1319.

Iron preparations are an important cause of accidental overdose in children and as little as 20mg/kg of elemental iron can lead to symptoms of toxicity.

● MONITORING REQUIREMENTS

- **Therapeutic response** The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

● PRESCRIBING AND DISPENSING INFORMATION

- **In children** Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

- **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

above

Ferric maltol

● INDICATIONS AND DOSE

Treatment of iron-deficiency anaemia in patients with inflammatory bowel disease

- **BY MOUTH**
- **Adult:** 30 mg twice daily continued until iron stores are replenished; usual duration at least 12 weeks

- **CONTRA-INDICATIONS** Exacerbation of inflammatory bowel disease · haemochromatosis · haemoglobin less than 9.5 g/dL · iron overload syndromes · repeated blood transfusions

- **INTERACTIONS** → Appendix 1: iron (oral)

● SIDE-EFFECTS

- **Common or very common** Flatulence
- **Uncommon** Headache · joint stiffness · pain in extremity · skin reactions · small intestinal bacterial overgrowth · thirst

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2016) that ferric maltol (*Feracru*®) is **not** recommended for use within NHS Scotland for the treatment of iron deficiency anaemia in adults with inflammatory bowel disease as the economic case was not demonstrated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Iron-deficiency anaemia (prophylactic and therapeutic)

► BY MOUTH

- Child 12–17 years: 1 tablet daily
- Adult: 1 tablet daily

IRONORM® DROPS

Iron-deficiency anaemia (prophylactic)

► BY MOUTH

- Adult: 2.4–4.8 mL daily

Iron-deficiency anaemia (therapeutic)

► BY MOUTH

- Adult: 4 mL 1–2 times a day

- **INTERACTIONS** → Appendix 1: iron (oral)

- **SIDE-EFFECTS** Tooth discolouration

- **PRESCRIBING AND DISPENSING INFORMATION**

Iron content Ferrous sulfate 200 mg is equivalent to 65 mg iron; *Ironorm*® drops contain ferrous sulfate 125 mg (equivalent to 25 mg iron)/mL; *Feospan*® spansules contain ferrous sulfate 150 mg (47 mg iron) (spanule (= capsules m/r)); *Ferrograd*® tablets contain ferrous sulfate 325 mg (105 mg iron).

- With oral use in adults Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

- ▶ Child 12–17 years: 5 mL 3 times a day, increased to 10 mL 3 times a day, dose to be increased gradually

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Most megaloblastic anaemias result from a lack of either vitamin B₁₂ or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is *pernicious anaemia* in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B₁₂.

Vitamin B₁₂ is also needed in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare syndrome of *congenital transcobalamin II deficiency*.

Vitamin B₁₂ should be given prophylactically after *total gastrectomy* or *total ileal resection* (or after *partial gastrectomy* if a vitamin B₁₂ absorption test shows vitamin B₁₂ malabsorption).

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 994 has completely replaced cyanocobalamin p. 993 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid p. 993 has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is

administered concurrently otherwise neuropathy may be precipitated.

In **folate-deficient megaloblastic anaemia** (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in **chronic haemolytic states**, **malabsorption**, or in **renal dialysis**, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn's disease, rheumatic disease, and severe psoriasis.

Folinic acid p. 916 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 1057.

VITAMINS AND TRACE ELEMENTS > FOLATES

Folic acid

09-Jun-2016

● INDICATIONS AND DOSE

Folate-deficient megaloblastic anaemia

► BY MOUTH

- Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states
- Adult: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see Neural tube defects (prevention in pregnancy) p. 1057)

► BY MOUTH

- Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see Neural tube defects (prevention in pregnancy) p. 1057)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those with sickle-cell disease)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

Prevention of methotrexate-induced side-effects in rheumatic disease

► BY MOUTH

- Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

► BY MOUTH

- Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis in chronic haemolytic states

► BY MOUTH

- Adult: 5 mg every 1-7 days, frequency dependent on underlying disease

Prophylaxis of folate deficiency in dialysis

► BY MOUTH

- Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12-17 years: 5-10 mg once daily
- Adult: 5 mg every 1-7 days

Prophylaxis of folate deficiency in patients receiving parenteral nutrition

► BY INTRAVENOUS INFUSION

- Adult: 15 mg 1-2 times a week, usually given by *intravenous infusion* in the parenteral nutrition solution

- **UNLICENSED USE** Not licensed for prevention of methotrexate-induced side-effects in severe Crohn's disease, rheumatic disease and severe psoriasis.
- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS** Abdominal distension • appetite decreased • flatulence • nausea • vitamin B12 deficiency exacerbated
- **PATIENT AND CARER ADVICE**

Hydroxocobalamin

20-Jul-2017

● INDICATIONS AND DOSE

Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency

- BY INTRAMUSCULAR INJECTION
- Adult: 1 mg every 2–3 months

Pernicious anaemia and other macrocytic anaemias without neurological involvement

- BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg 3 times a week for 2 weeks, then 1 mg every 3 months

Pernicious anaemia and other macrocytic anaemias with neurological involvement

- BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

Tobacco amblyopia

- BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

Leber's optic atrophy

- BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

CYANOKIT®

Poisoning with cyanides

- BY INTRAVENOUS INFUSION
- Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability
- Adult: Initially 5 g, to be given over 15 minutes, then 5 g if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

● CAUTIONS

- With intramuscular use Should not be given before diagnosis fully established

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Diarrhoea · dizziness · hot flush · skin reactions · urine discolouration

SPECIFIC SIDE-EFFECTS

- With intramuscular use Arrhythmia · chills · drug fever · headache · hypokalaemia · malaise · nausea · pain · thrombocytosis · tremor · vomiting
- With intravenous use Angioedema · dysphagia · extrasystole · gastrointestinal discomfort · hypersensitivity · memory loss · mucosal discolouration red · peripheral oedema · pleural effusion · rash pustular · red discolouration of plasma · restlessness · swelling · throat complaints
- **BREAST FEEDING** Present in milk but not known to be harmful.

● EFFECT ON LABORATORY TESTS

- With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Cyanokit*)®, given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).

● PRESCRIBING AND DISPENSING INFORMATION

- With intramuscular use The BP directs that when vitamin B₁₂ injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied. Poisoning by cyanides
- With intravenous use *Cyanokit*® is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions *Cobalin-H*® is not prescribable in NHS primary care.

Neo-Cytamen® is not prescribable in NHS primary care.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2 Iron overload

Iron overload

Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be

used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 996 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid (vitamin C) p. 1049 daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS > IRON CHELATORS

Deferasirox

18-Jul-2017

- **DRUG ACTION** Deferasirox is an oral iron chelator.

● INDICATIONS AND DOSE

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

► BY MOUTH

- **Adult:** Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only) | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

► BY MOUTH

- **Adult:** Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

► BY MOUTH

- **Adult:** Initially 7 mg/kg once daily, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 14 mg/kg per day

- **CAUTIONS** Elderly (increased risk of side-effects) · history of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than $50 \times 10^9/\text{litre}$ · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption

- **INTERACTIONS** → Appendix 1: iron chelators

● SIDE-EFFECTS

- **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · urine abnormalities · vomiting
- **Uncommon** Anxiety · cataract · cholelithiasis · deafness · dizziness · fatigue · fever · gastrointestinal disorders · gastrointestinal haemorrhage (including fatal cases) · hepatic disorders · laryngeal pain · maculopathy · oedema · renal tubular disorders · sleep disorder
- **Rare or very rare** Optic neuritis
- **Frequency not known** Acute kidney injury · alopecia · anaemia aggravated · angioedema · hypersensitivity vasculitis · metabolic acidosis · nephritis tubulointerstitial · nephrolithiasis · neutropenia · pancreatitis acute · pancytopenia · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- **PREGNANCY** Manufacturer advises avoid unless essential— toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute. **Dose adjustments** Manufacturer advises reduce dose if creatinine clearance less than 90 mL/minute and serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—consult product literature.
- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.
- **DIRECTIONS FOR ADMINISTRATION** For *film-coated tablets*, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferiasirox tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2017) that deferiasirox (*Exjade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

Patients with myelodysplastic syndromes, the commonest cause of transfusion-dependent anaemia, were poorly represented in the clinical trial population and the economic case was not demonstrated in this group.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

► **Exjade** (Novartis Pharmaceuticals UK Ltd) ▼

Deferasirox 90 mg Exjade 90mg tablets | 30 tablet [PoM] £126.00

Deferasirox 180 mg Exjade 180mg tablets | 30 tablet [PoM] £252.00

Deferasirox 360 mg Exjade 360mg tablets | 30 tablet [PoM] £504.00

Deferiprone

● **DRUG ACTION** Deferiprone is an oral iron chelator.

INDICATIONS AND DOSE

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate

► **BY MOUTH**

► Adult: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

● **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

● **INTERACTIONS** → Appendix 1: deferiprone

SIDE-EFFECTS

► **Common or very common** Abdominal pain (reducing dose and increasing gradually may improve tolerance) · agranulocytosis · appetite increased · arthralgia · diarrhoea (reducing dose and increasing gradually may improve tolerance) · fatigue · headache · nausea (reducing dose and increasing gradually may improve tolerance) · neutropenia · urine discolouration · vomiting (reducing dose and increasing gradually may improve tolerance)

► **Frequency not known** Skin reactions · zinc deficiency

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.

● **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

MONITORING REQUIREMENTS

► Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.

► Monitor plasma-zinc concentration.

PATIENT AND CARER ADVICE

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 14

► **Ferriprox** (Swedish Orphan Biovitrum Ltd)

Deferiprone 100 mg per 1 ml Ferriprox 100mg/ml oral solution sugar-free | 500 ml [PoM] £152.39 DT = £152.39

Tablet

CAUTIONARY AND ADVISORY LABELS 14

► **Ferriprox** (Swedish Orphan Biovitrum Ltd)

Deferiprone 500 mg Ferriprox 500mg tablets | 100 tablet [PoM] £152.39 DT = £152.39

Deferiprone 1 gram Ferriprox 1000mg tablets | 50 tablet [PoM] £175.25 DT = £175.25

Desferrioxamine mesilate

(Deferoxamine Mesilate)

INDICATIONS AND DOSE

Iron poisoning

► **BY CONTINUOUS INTRAVENOUS INFUSION**

► Adult: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

Aluminium overload in dialysis patients

► **BY INTRAVENOUS INFUSION**

► Adult: (consult product literature or local protocols)

Chronic iron overload (low iron overload)

► **BY SUBCUTANEOUS INFUSION**

► Adult: The dose should reflect the degree of iron overload

Chronic iron overload (established overload)

► **BY SUBCUTANEOUS INFUSION**

► Adult: 20–50 mg/kg daily

● **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

● **INTERACTIONS** → Appendix 1: iron chelators

SIDE-EFFECTS

► **Common or very common** Arthralgia · bone disorder · fever · growth retardation · headache · muscle complaints · nausea · skin reactions

► **Uncommon** Abdominal pain · asthma · hearing impairment · vomiting

► **Rare or very rare** Angioedema · blood disorder · cataract · diarrhoea · dizziness · encephalopathy · eye disorders · hypersensitivity · hypotension (more common when given too rapidly by intravenous injection) · increased risk of infection · nerve disorders · nervous system disorder · paraesthesia · respiratory disorders · shock · tachycardia · thrombocytopenia · vision disorders

► **Frequency not known** Acute kidney injury · hypocalcaemia · leucopenia · renal tubular disorder · seizure · urine red

● **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **RENAL IMPAIRMENT** Use with caution.

MONITORING REQUIREMENTS

► Eye and ear examinations before treatment and at 3-month intervals during treatment.

► Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.

● **DIRECTIONS FOR ADMINISTRATION** For full details and warnings relating to administration, consult product literature.

For *intravenous infusion* (*Desferal*®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Desferrioxamine mesilate (Non-proprietary)

Desferrioxamine mesilate 500 mg Desferrioxamine 500mg powder for solution for injection vials | 10 vial [PoM] £39.90 | 10 vial [PoM] £50.00 (Hospital only)

Desferrioxamine mesilate 2 gram Desferrioxamine 2g powder for solution for injection vials | 1 vial [PoM] £20.00 (Hospital only)

Desferal (Novartis Pharmaceuticals UK Ltd)

Desferrioxamine mesilate 500 mg Desferal 500mg powder for solution for injection vials | 10 vial [PoM] £46.63

3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival.

Filgrastim below (unglycosylated rhG-CSF) and lenograstim p. 998 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Pegfilgrastim p. 999 is a polyethylene glycol-conjugated ('pegylated') derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lippegfilgrastim p. 999 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

• **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

• **CAUTIONS** Malignant myeloid conditions • pre-malignant myeloid conditions • risk of splenomegaly and rupture—spleen size should be monitored • sickle-cell disease

CAUTIONS, FURTHER INFORMATION

• **Acute respiratory distress syndrome** There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

SIDE-EFFECTS

• **Common or very common** Arthralgia • cutaneous vasculitis • dyspnoea • haemoptysis • headache • hypersensitivity • leucocytosis • pain • spleen abnormalities • thrombocytopenia

• **Uncommon** Acute febrile neutrophilic dermatosis • capillary leak syndrome • hypoxia • pulmonary oedema • respiratory disorders • sickle cell anaemia with crisis

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.

• **PREGNANCY** There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

• **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

MONITORING REQUIREMENTS

• Full blood counts including differential white cell and platelet counts should be monitored.

• Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

Filgrastim

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

• BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION

• **Adult:** 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

• BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION

• **Adult:** 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

• BY SUBCUTANEOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

• **Adult:** 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

• BY SUBCUTANEOUS INJECTION

• **Adult:** 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

• BY SUBCUTANEOUS INJECTION

• **Adult 18–59 years:** 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

continued →

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

- **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics
- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · diarrhoea · dysuria · haemorrhage · hepatomegaly · hyperuricaemia · hypotension · osteoporosis · rash
- **Uncommon** Fluid imbalance · graft versus host disease · peripheral vascular disease · pseudogout · rheumatoid arthritis aggravated · urine abnormalities

- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Neupogen[®]); (Nivestim[®]); (Zarzio[®]) give continuously or intermittently in Glucose 5%; for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.

- **PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Neulasta 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £686.38

Neulasta 6mg/0.6ml solution for injection pre-filled syringes with Onpro kit | 1 pre-filled disposable injection [PoM] £686.38 (Hospital only)

3.2 Stem cell mobilisation

IMMUNOSTIMULANTS > CHEMOKINE RECEPTOR ANTAGONISTS

Plerixafor

- **DRUG ACTION** Plerixafor is a chemokine receptor antagonist.

● INDICATIONS AND DOSE

Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

● SIDE-EFFECTS

- ▶ Common or very common Arthralgia · constipation · diarrhoea · dizziness · dry mouth · erythema · fatigue · flatulence · gastrointestinal discomfort · headache · hyperhidrosis · malaise · musculoskeletal pain · nausea · oral hypoaesthesia · sleep disorders · vomiting
- ▶ Uncommon Hypersensitivity

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during treatment—teratogenic in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless essential—teratogenic in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** No information available if creatinine clearance less than 20 mL/minute.

Dose adjustments Reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute.

- **MONITORING REQUIREMENTS** Monitor platelets and white blood cell count.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Mozobil** (Sanofi)

Plerixafor 20 mg per 1 ml Mozobil 24mg/1.2ml solution for injection vials | 1 vial [PoM] £4,882.77

4 Platelet disorders

Platelet disorders

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a **corticosteroid**, e.g. prednisolone p. 664, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (Rh₀) immunoglobulin p. 1254 is effective in raising the platelet count in about 80% of unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin p. 1255 for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 816, cyclophosphamide p. 871, vincristine sulfate p. 904, ciclosporin p. 818, and danazol p. 725. Rituximab p. 859 [unlicensed indication] may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 110 may be given to reduce the severity of haemorrhage.

Eltrombopag p. 1001 and romiplostim p. 1002 are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

Essential thrombocythaemia

Anagrelide below inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than $1000 \times 10^9/L$ or history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.

4.1 Essential thrombocythaemia

Other drugs used for Essential thrombocythaemia

Hydroxycarbamide, p. 910

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

• INDICATIONS AND DOSE

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

► BY MOUTH

- Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment • concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment • risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- **INTERACTIONS** → Appendix 1: anagrelide

• SIDE-EFFECTS

- **Common or very common** Anaemia • arrhythmias • asthenia • diarrhoea • dizziness • fluid retention • gastrointestinal discomfort • gastrointestinal disorders • headaches • nausea • palpitations • skin reactions • vomiting

- **Uncommon** Alopecia • appetite decreased • arthralgia • chest pain • chills • confusion • congestive heart failure • constipation • depression • dry mouth • dyspnoea • erectile dysfunction • fever • haemorrhage • hypertension • insomnia • malaise • memory loss • myalgia • nervousness • oedema • pain • pancreatitis • pancytopenia • pneumonia • pulmonary hypertension • respiratory disorders • sensation abnormal • syncope • thrombocytopenia • weight changes

- **Rare or very rare** Angina pectoris • cardiomegaly • cardiomyopathy • coordination abnormal • drowsiness • dysarthria • influenza like illness • myocardial infarction • nocturia • pericardial effusion • postural hypotension • renal failure • tinnitus • vasodilation • vision disorders

- **Frequency not known** Hepatitis • nephritis • tubulointerstitial

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m².

• MONITORING REQUIREMENTS

- Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).

- Monitor liver function.
- Monitor serum creatinine.
- Monitor urea.
- Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Anagrelide (Non-proprietary)

Anagrelide (as Anagrelide hydrochloride)

500 microgram Anagrelide 500microgram capsules |

100 capsule [PoM] £280.00-£404.57 DT = £350.70

Xagrid (Shire Pharmaceuticals Ltd) ▼

Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid

500microgram capsules | 100 capsule [PoM] £404.57 DT = £350.70

4.2 Idiopathic thrombocytopenic purpura

ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

09-Jun-2017

INDICATIONS AND DOSE

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

► BY MOUTH

- Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)

► BY MOUTH

- Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of $50\text{--}75 \times 10^9$ /litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day

Acquired severe aplastic anaemia in patients either refractory to or heavily pretreated with prior immunosuppressive therapy and are unsuitable for haematopoietic stem cell transplantation (under expert supervision)

► BY MOUTH

- Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day
- Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day.

- **CAUTIONS** Patients of East Asian origin • risk factors for thromboembolism

- **INTERACTIONS** → Appendix 1: eltrombopag

SIDE-EFFECTS

- **Common or very common** Abnormal loss of weight • alopecia • anaemia • anxiety • appetite abnormal • arthralgia • asthenia • chills • concentration impaired • confusion • constipation • cough • depression • diarrhoea • dizziness • dry eye • dry mouth • dysphagia • dyspnoea • fever • gastrointestinal discomfort • gastrointestinal disorders • haemolytic anaemia • hepatic disorders • hyperbilirubinaemia • hyperglycaemia • hypoglycaemia • increased risk of infection • influenza like illness • iron overload • lymphopenia • malaise • memory loss • menorrhagia • muscle complaints • nausea • neutropenia • oedema • oral disorders • pain • palpitations • QT interval prolongation • sensation abnormal • skin reactions • sleep disorders • splenic infarction • sweat changes • syncope • taste altered • urine discolouration • vertigo • vision disorders • vomiting • weight decreased
